$$

where $l+1\le k$, $l-2\ge 1$, and $h_1(\tau),\ldots,h_k(\tau)$ are continuous functions on the interval $[t,T]$.

Applying (193) to $C_{j_k\ldots j_{l+1}j_l j_l j_{l-2}\ldots\ldots j_1}$, we obtain for $l+1\le k$, $l-2\ge 1$

$$\sum_{j_l=p+1}^{\infty} C_{j_k\ldots j_{l+1}j_l j_l j_{l-2}\ldots\ldots j_1} =$$

$$= \int\limits_{[t,T]^{k-2}} \sum_{d=1}^{4} H_p^{(d)}(t_1,\ldots,t_{l-2},t_{l+1},\ldots,t_k)\times$$

$$\times \prod_{\substack{g=1\\ g\neq l-1,l}}^{k} \psi_g(t_g)\phi_{j_g}(t_g)dt_1\ldots dt_{l-2}dt_{l+1}\ldots dt_k =$$

$$= \sum_{d=1}^{4} C^{**(d)}_{j_k\ldots j_{l+1}j_{l-2}\ldots j_1} = \sum_{d=1}^{4} C^{**(d)}_{j_k\ldots j_q\ldots j_1}\Big|_{q\neq l-1,l}, \tag{194}$$

where

$$H_p^{(1)}(t_1,\ldots,t_{l-2},t_{l+1},\ldots,t_k) =$$

$$= \mathbf{1}_{\{t_1<\ldots<t_{l-2}<t_{l+1}<\ldots<t_k\}} \sum_{j_l=p+1}^{\infty} \int\limits_t^{t_{l+1}} \psi_l(\tau)\phi_{j_l}(\tau)d\tau \int\limits_t^{t_{l+1}} \psi_{l-1}(\tau)\phi_{j_l}(\tau)d\tau, \tag{195}$$

$$H_p^{(2)}(t_1,\ldots,t_{l-2},t_{l+1},\ldots,t_k) =$$

$$= -\mathbf{1}_{\{t_1<\ldots<t_{l-2}<t_{l+1}<\ldots<t_k\}} \sum_{j_l=p+1}^{\infty} \int\limits_t^{t_{l+1}} \psi_l(\tau)\phi_{j_l}(\tau)d\tau \int\limits_t^{t_{l-2}} \psi_{l-1}(\tau)\phi_{j_l}(\tau)d\tau, \tag{196}$$

$$H_p^{(3)}(t_1,\ldots,t_{l-2},t_{l+1},\ldots,t_k) =$$

$$= -\mathbf{1}_{\{t_1<\ldots<t_{l-2}<t_{l+1}<\ldots<t_k\}} \sum_{j_l=p+1}^{\infty} \int\limits_t^{t_{l+1}} \psi_{l-1}(\tau)\phi_{j_l}(\tau) \int\limits_t^{\tau} \psi_l(\theta)\phi_{j_l}(\theta)d\theta d\tau, \tag{197}$$

$$H_p^{(4)}(t_1,\ldots,t_{l-2},t_{l+1},\ldots,t_k) =$$

$$= \mathbf{1}_{\{t_1<\ldots<t_{l-2}<t_{l+1}<\ldots<t_k\}} \sum_{j_l=p+1}^{\infty} \int\limits_t^{t_{l-2}} \psi_{l-1}(\tau)\phi_{j_l}(\tau) \int\limits_t^{\tau} \psi_l(\theta)\phi_{j_l}(\theta)d\theta d\tau. \tag{198}$$

By analogy with (194) we can consider the expressions

$$\sum_{j_l=p+1}^{\infty} C_{j_k\ldots j_{l+1}j_l j_l}, \tag{199}$$

$$\sum_{j_l=p+1}^{\infty} C_{j_l j_l j_{k-2}\ldots j_1}. \tag{200}$$

Then we have for (199), (200) (see (193) and its analogue for $t_{l+1} = T$)

$$\sum_{j_l=p+1}^{\infty} C_{j_k\ldots j_{l+1}j_lj_l} = \int\limits_{[t,T]^{k-2}} L_p(t_3,\ldots,t_k)\prod_{g=3}^{k}\psi_g(t_g)\phi_{j_g}(t_g)dt_3\ldots dt_k, \tag{201}$$

$$\sum_{j_l=p+1}^{\infty} C_{j_lj_lj_{k-2}\ldots j_1} = \int\limits_{[t,T]^{k-2}} \sum_{d=1}^{4} M_p^{(d)}(t_1,\ldots,t_{k-2})\prod_{g=1}^{k-2}\psi_g(t_g)\phi_{j_g}(t_g)dt_1\ldots dt_{k-2}, \tag{202}$$

where

$$L_p(t_3,\ldots,t_k) = \mathbf{1}_{\{t_3<\ldots<t_k\}}\sum_{j_l=p+1}^{\infty}\int\limits_t^{t_3}\psi_2(\tau)\phi_{j_l}(\tau)\int\limits_t^{\tau}\psi_1(\theta)\phi_{j_l}(\theta)d\theta d\tau,$$

$$M_p^{(1)}(t_1,\ldots,t_{k-2}) =$$

$$= \mathbf{1}_{\{t_1<\ldots<t_{k-2}\}}\sum_{j_l=p+1}^{\infty}\int\limits_t^{T}\psi_k(\tau)\phi_{j_l}(\tau)d\tau\int\limits_t^{T}\psi_{k-1}(\tau)\phi_{j_l}(\tau)d\tau,$$

$$M_p^{(2)}(t_1,\ldots,t_{k-2}) =$$

$$= -\mathbf{1}_{\{t_1<\ldots<t_{k-2}\}}\sum_{j_l=p+1}^{\infty}\int\limits_t^{T}\psi_k(\tau)\phi_{j_l}(\tau)d\tau\int\limits_t^{t_{k-2}}\psi_{k-1}(\tau)\phi_{j_l}(\tau)d\tau,$$

$$M_p^{(3)}(t_1,\ldots,t_{k-2}) =$$

$$= -\mathbf{1}_{\{t_1<\ldots<t_{k-2}\}}\sum_{j_l=p+1}^{\infty}\int\limits_t^{T}\psi_{k-1}(\tau)\phi_{j_l}(\tau)\int\limits_t^{\tau}\psi_k(\theta)\phi_{j_l}(\theta)d\theta d\tau,$$

$$M_p^{(4)}(t_1,\ldots,t_{k-2}) =$$

$$= \mathbf{1}_{\{t_1<\ldots<t_{k-2}\}}\sum_{j_l=p+1}^{\infty}\int\limits_t^{t_{k-2}}\psi_{k-1}(\tau)\phi_{j_l}(\tau)\int\limits_t^{\tau}\psi_k(\theta)\phi_{j_l}(\theta)d\theta d\tau.$$

It is important to note that $C^{*(d)}_{j_k\ldots j_{l+1}j_{l-2}\ldots j_1}$, $C^{**(d)}_{j_k\ldots j_{l+1}j_{l-2}\ldots j_1}$ $(d=1,\ldots,4)$ are Fourier coefficients (see (182), (194)), that is, we can use Parseval's equality in the further proof.

Combining the equalities (182)–(186) (the case $g_2 > g_1+1$), using Parseval's equality and applying the estimates for integrals from basis functions that we used in the proof of Theorems 15, 16, we obtain for (182)

$$\sum_{j_{q_1},\ldots,j_{q_{k-2}}=0}^{p}\left(\sum_{j_{g_1}=p+1}^{\infty} C_{j_k\ldots j_1}\Bigg|_{j_{g_1}=j_{g_2},\,g_2>g_1+1}\right)^2 =$$

$$= \sum_{\substack{j_1,\ldots,j_q,\ldots,j_k=0\\ q\ne g_1,g_2}}^{p} \left(\sum_{j_{g_1}=p+1}^{\infty} C_{j_k\ldots j_1}\Biggl|_{j_{g_1}=j_{g_2},g_2>g_1+1}\right)^2 =$$

$$= \sum_{\substack{j_1,\ldots,j_q,\ldots,j_k=0\\ q\ne g_1,g_2}}^{p} \left(\sum_{d=1}^{4} C^{*(d)}_{j_k\ldots j_q\ldots j_1}\Biggl|_{q\ne g_1,g_2}\right)^2 \le \sum_{\substack{j_1,\ldots,j_q,\ldots,j_k=0\\ q\ne g_1,g_2}}^{\infty} \left(\sum_{d=1}^{4} C^{*(d)}_{j_k\ldots j_q\ldots j_1}\Biggl|_{q\ne g_1,g_2}\right)^2 =$$

$$= \sum_{\substack{j_1,\ldots,j_q,\ldots,j_k=0\\ q\ne g_1,g_2}}^{\infty} \left(\int\limits_{[t,T]^{k-2}} \sum_{d=1}^{4} F_p^{(d)}(t_1,\ldots,t_{g_1-1},t_{g_1+1},\ldots,t_{g_2-1},t_{g_2+1},\ldots,t_k)\times\right.$$

$$\left.\times \prod_{\substack{q=1\\ q\ne g_1,g_2}}^{k} \psi_q(t_q)\phi_{j_q}(t_q)dt_1\ldots dt_{g_1-1}dt_{g_1+1}\ldots dt_{g_2-1}dt_{g_2+1}\ldots dt_k\right)^2 =$$

$$= \int\limits_{[t,T]^{k-2}} \left(\sum_{d=1}^{4} F_p^{(d)}(t_1,\ldots,t_{g_1-1},t_{g_1+1},\ldots,t_{g_2-1},t_{g_2+1},\ldots,t_k) \prod_{\substack{q=1\\ q\ne g_1,g_2}}^{k} \psi_q(t_q)\right)^2 \times$$

$$\times dt_1\ldots dt_{g_1-1}dt_{g_1+1}\ldots dt_{g_2-1}dt_{g_2+1}\ldots dt_k \le$$

$$\le 4\sum_{d=1}^{4} \int\limits_{[t,T]^{k-2}} \left(F_p^{(d)}(t_1,\ldots,t_{g_1-1},t_{g_1+1},\ldots,t_{g_2-1},t_{g_2+1},\ldots,t_k) \prod_{\substack{q=1\\ q\ne g_1,g_2}}^{k} \psi_q(t_q)\right)^2 \times$$

$$\times dt_1\ldots dt_{g_1-1}dt_{g_1+1}\ldots dt_{g_2-1}dt_{g_2+1}\ldots dt_k \le$$

$$\le \frac{K}{p^{2-\varepsilon}} \ \to\ 0 \tag{203}$$

if $p\to\infty$, where ε is an arbitrary small positive real number for the polynomial case and $\varepsilon=0$ for the trigonometric case, constant K does not depend on p. The cases (187)–(189) are considered analogously.

Absolutely similarly (see (203)) combining the equalities (194)–(198) (the case $g_2=g_1+1$), using Parseval's equality and applying the estimates for integrals from basis functions that we used in the proof of Theorems 15, 16, we get for (194)

$$\sum_{j_{q_1},\ldots,j_{q_{k-2}}=0}^{p} \left(\sum_{j_{g_1}=p+1}^{\infty} C_{j_k\ldots j_1}\Biggl|_{j_{g_1}=j_{g_2},g_2=g_1+1}\right)^2 =$$

$$= \sum_{\substack{j_1,\ldots,j_q,\ldots,j_k=0\\ q\ne g_1,g_2}}^{p} \left(\sum_{j_{g_1}=p+1}^{\infty} C_{j_k\ldots j_1}\Biggl|_{j_{g_1}=j_{g_2},g_2=g_1+1}\right)^2 =$$

$$
=\sum_{\substack{j_1,\ldots,j_q,\ldots,j_k=0\\ q\ne g_1,g_2}}^{p}\left(\sum_{d=1}^{4}C_{j_k\ldots j_q\ldots j_1}^{**(d)}\Biggl|_{q\ne g_1,g_2}\right)^2\le\sum_{\substack{j_1,\ldots,j_q,\ldots,j_k=0\\ q\ne g_1,g_2}}^{\infty}\left(\sum_{d=1}^{4}C_{j_k\ldots j_q\ldots j_1}^{**(d)}\Biggl|_{q\ne g_1,g_2}\right)^2=
$$

$$
=\sum_{\substack{j_1,\ldots,j_q,\ldots,j_k=0\\ q\ne g_1,g_2}}^{\infty}\left(\int\limits_{[t,T]^{k-2}}\sum_{d=1}^{4}H_p^{(d)}(t_1,\ldots,t_{g_1-1},t_{g_1+2},\ldots,t_k)\times\right.
$$

$$
\left.\times\prod_{\substack{q=1\\ q\ne g_1,g_2}}^{k}\psi_q(t_q)\phi_{j_q}(t_q)dt_1\ldots dt_{g_1-1}dt_{g_1+2}\ldots dt_k\right)^2=
$$

$$
=\int\limits_{[t,T]^{k-2}}\left(\sum_{d=1}^{4}H_p^{(d)}(t_1,\ldots,t_{g_1-1},t_{g_1+2},\ldots,t_k)\prod_{\substack{q=1\\ q\ne g_1,g_2}}^{k}\psi_q(t_q)\right)^2dt_1\ldots dt_{g_1-1}dt_{g_1+2}\ldots\ldots dt_k\le
$$

$$
\le 4\sum_{d=1}^{4}\int\limits_{[t,T]^{k-2}}\left(H_p^{(d)}(t_1,\ldots,t_{g_1-1},t_{g_1+2},\ldots,t_k)\prod_{\substack{q=1\\ q\ne g_1,g_2}}^{k}\psi_q(t_q)\right)^2dt_1\ldots dt_{g_1-1}dt_{g_1+2}\ldots dt_k\le
$$

$$
\le\frac{K}{p^{2-\varepsilon}}\ \to\ 0 \tag{204}
$$

if $p\to\infty$, where ε is an arbitrary small positive real number for the polynomial case and $\varepsilon=0$ for the trigonometric case, constant K does not depend on p. The cases (199), (200) are considered analogously.

From (203), (204) and their analogues for the cases (187)–(189), (199), (200) we obtain

$$
\sum_{j_{q_1},\ldots,j_{q_{k-2}}=0}^{p}\left(\sum_{j_{g_1}=p+1}^{\infty}C_{j_k\ldots j_1}\Biggl|_{j_{g_1}=j_{g_2}}\right)^2\le\frac{K}{p^{2-\varepsilon}}, \tag{205}
$$

where constant K is independent of p. Thus the equality (176) is proved.

Let us prove the equality (177). Consider the following cases

1. $g_2>g_1+1,\ g_4=g_3+1,$ 2. $g_2=g_1+1,\ g_4>g_3+1,$
3. $g_2>g_1+1,\ g_4>g_3+1,$ 4. $g_2=g_1+1,\ g_4=g_3+1.$

The proof for Cases 1–3 will be similar. Consider, for example, Case 2. Using (71), we obtain

$$
\sum_{j_{q_1}=0}^{p}\left(\sum_{j_{g_1}=p+1}^{\infty}\sum_{j_{g_3}=p+1}^{\infty}C_{j_5\ldots j_1}\Biggl|_{j_{g_1}=j_{g_2},j_{g_3}=j_{g_4},g_4>g_3+1,g_2=g_1+1}\right)^2=
$$

$$= \sum_{j_{q_1}=0}^{p}\left(\sum_{j_{g_1}=p+1}^{\infty}\sum_{j_{g_3}=0}^{p} C_{j_5\ldots j_1}\Bigg|_{j_{g_1}=j_{g_2},j_{g_3}=j_{g_4},g_4>g_3+1,g_2=g_1+1}\right)^2 =$$

$$= \sum_{j_{q_1}=0}^{p}\left(\sum_{j_{g_3}=0}^{p}\sum_{j_{g_1}=p+1}^{\infty} C_{j_5\ldots j_1}\Bigg|_{j_{g_1}=j_{g_2},j_{g_3}=j_{g_4},g_4>g_3+1,g_2=g_1+1}\right)^2 \le \tag{206}$$

$$\le (p+1)\sum_{j_{q_1}=0}^{p}\sum_{j_{g_3}=0}^{p}\left(\sum_{j_{g_1}=p+1}^{\infty} C_{j_5\ldots j_1}\Bigg|_{j_{g_1}=j_{g_2},j_{g_3}=j_{g_4},g_4>g_3+1,g_2=g_1+1}\right)^2 =$$

$$= (p+1)\sum_{j_{q_1}=0}^{p}\sum_{j_{g_3},j_{g_4}=0}^{p}\left(\sum_{j_{g_1}=p+1}^{\infty} C_{j_5\ldots j_1}\Bigg|_{j_{g_1}=j_{g_2},g_4>g_3+1,g_2=g_1+1}\right)^2\Bigg|_{j_{g_3}=j_{g_4}} \le$$

$$\le (p+1)\sum_{j_{q_1}=0}^{p}\sum_{j_{g_3},j_{g_4}=0}^{p}\left(\sum_{j_{g_1}=p+1}^{\infty} C_{j_5\ldots j_1}\Bigg|_{j_{g_1}=j_{g_2},g_4>g_3+1,g_2=g_1+1}\right)^2. \tag{207}$$

It is easy to see that the expression (207) (without the multiplier $p+1$) is a particular case ($g_4 > g_3+1, g_2 = g_1+1$) of the left-hand side of (205). Combining (205) and (207), we have

$$\sum_{j_{q_1}=0}^{p}\left(\sum_{j_{g_1}=p+1}^{\infty}\sum_{j_{g_3}=p+1}^{\infty} C_{j_5\ldots j_1}\Bigg|_{j_{g_1}=j_{g_2},j_{g_3}=j_{g_4},g_4>g_3+1,g_2=g_1+1}\right)^2 \le \frac{(p+1)K}{p^{2-\varepsilon}} \le \frac{K_1}{p^{1-\varepsilon}} \to 0 \tag{208}$$

if $p\to\infty$, where constant K_1 does not depend on p.

Consider Case 4 ($g_2 = g_1+1,\ g_4 = g_3+1$). We have (see (72))

$$\sum_{j_{q_1}=0}^{p}\left(\sum_{j_{g_1}=p+1}^{\infty}\sum_{j_{g_3}=p+1}^{\infty} C_{j_5\ldots j_1}\Bigg|_{j_{g_1}=j_{g_2},j_{g_3}=j_{g_4}}\right)^2 =$$

$$= \sum_{j_{q_1}=0}^{p}\left(\sum_{j_{g_1}=p+1}^{\infty}\left(\sum_{j_{g_3}=0}^{\infty}-\sum_{j_{g_3}=0}^{p}\right) C_{j_5\ldots j_1}\Bigg|_{j_{g_1}=j_{g_2},j_{g_3}=j_{g_4}}\right)^2 =$$

$$= \sum_{j_{q_1}=0}^{p}\left(\frac{1}{2}\sum_{j_{g_1}=p+1}^{\infty} C_{j_5\ldots j_1}\Bigg|_{j_{g_1}=j_{g_2},(j_{g_3}j_{g_3})\frown(\cdot)} - \sum_{j_{g_3}=0}^{p}\sum_{j_{g_1}=p+1}^{\infty} C_{j_5\ldots j_1}\Bigg|_{j_{g_1}=j_{g_2},j_{g_3}=j_{g_4}}\right)^2 \le$$

$$\le \frac{1}{2}\sum_{j_{q_1}=0}^{p}\left(\sum_{j_{g_1}=p+1}^{\infty} C_{j_5\ldots j_1}\Bigg|_{j_{g_1}=j_{g_2},(j_{g_3}j_{g_3})\frown(\cdot)}\right)^2 + \tag{209}$$

$$+2\sum_{j_{q_1}=0}^{p}\left(\sum_{j_{g_3}=0}^{p}\sum_{j_{g_1}=p+1}^{\infty}C_{j_5\ldots j_1}\Bigg|_{j_{g_1}=j_{g_2},j_{g_3}=j_{g_4}}\right)^2. \tag{210}$$

An expression similar to (210) was estimated (see (206)–(208)). Let us estimate (209). We have

$$\sum_{j_{q_1}=0}^{p}\left(\sum_{j_{g_1}=p+1}^{\infty}C_{j_5\ldots j_1}\Bigg|_{j_{g_1}=j_{g_2},(j_{g_3}j_{g_3})\frown(\cdot)}\right)^2=$$

$$=(T-t)\sum_{j_{q_1}=0}^{p}\left(\sum_{j_{g_1}=p+1}^{\infty}C_{j_5\ldots j_1}\Bigg|_{j_{g_1}=j_{g_2},(j_{g_3}j_{g_3})\frown 0}\right)^2\le$$

$$\le(T-t)\sum_{j_{q_1}=0}^{p}\sum_{j_{g_3}=0}^{p}\left(\sum_{j_{g_1}=p+1}^{\infty}C_{j_5\ldots j_1}\Bigg|_{j_{g_1}=j_{g_2},(j_{g_3}j_{g_3})\frown j_{g_3}}\right)^2, \tag{211}$$

where the notations are the same as in the proof of Theorem 12.

The expression (211) without the multiplier $T-t$ is an expression of type (135)–(140) before passing to the limit $\lim\limits_{p\to\infty}$ (the only difference is the replacement of one of the weight functions $\psi_1(\tau),\ldots,\psi_4(\tau)$ in (135)–(140) by the product $\psi_{l+1}(\tau)\psi_l(\tau)$ $(l=1,\ldots,4)$. Therefore, for Case 4 $(g_2=g_1+1,\ g_4=g_3+1)$, we obtain the estimate

$$\sum_{j_{q_1}=0}^{p}\left(\sum_{j_{g_1}=p+1}^{\infty}\sum_{j_{g_3}=p+1}^{\infty}C_{j_5\ldots j_1}\Bigg|_{j_{g_1}=j_{g_2},j_{g_3}=j_{g_4},g_4=g_3+1,g_2=g_1+1}\right)^2\le\frac{K}{p^{1-\varepsilon}}, \tag{212}$$

where constant K is independent of p.

The estimates (208), (212) prove (177). Let us prove (178). By analogy with (211) we have

$$\sum_{j_{q_1}=0}^{p}\left(\sum_{j_{g_3}=p+1}^{\infty}C_{j_5\ldots j_1}\Bigg|_{(j_{g_2}j_{g_1})\frown(\cdot),j_{g_1}=j_{g_2},j_{g_3}=j_{g_4},g_2=g_1+1}\right)^2=$$

$$=\sum_{j_{q_1}=0}^{p}\left(\sum_{j_{g_3}=p+1}^{\infty}C_{j_5\ldots j_1}\Bigg|_{(j_{g_1}j_{g_1})\frown(\cdot),j_{g_3}=j_{g_4},g_2=g_1+1}\right)^2=$$

$$=(T-t)\sum_{j_{q_1}=0}^{p}\left(\sum_{j_{g_3}=p+1}^{\infty}C_{j_5\ldots j_1}\Bigg|_{(j_{g_1}j_{g_1})\frown 0,j_{g_3}=j_{g_4},g_2=g_1+1}\right)^2\le$$

$$\le(T-t)\sum_{j_{q_1}=0}^{p}\sum_{j_{g_1}=0}^{p}\left(\sum_{j_{g_3}=p+1}^{\infty}C_{j_5\ldots j_1}\Bigg|_{(j_{g_1}j_{g_1})\frown j_{g_1},j_{g_3}=j_{g_4},g_2=g_1+1}\right)^2. \tag{213}$$

Thus, we obtain the estimate (see (211) and the proof of Theorem 16)

$$\sum_{j_{q_1}=0}^{p}\left(\sum_{j_{g_3}=p+1}^{\infty} C_{j_5\ldots j_1}\Biggl|_{(j_{g_2}j_{g_1})\curvearrowright(\cdot),j_{g_1}=j_{g_2},j_{g_3}=j_{g_4},g_2=g_1+1}\right)^2 \le \frac{K}{p^{2-\varepsilon}}, \tag{214}$$

where ε is an arbitrary small positive real number for the polynomial case and $\varepsilon = 0$ for the trigonometric case, constant K does not depend on p.

The estimate (214) proves (178). Theorem 17 is proved.

9. Estimates for the Mean-Square Approximation Error of Expansions of Iterated Stratonovich Stochastic Integrals of Multiplicity k in Theorems 12, 14

In this section, we estimate the mean-square approximation error for iterated Stratonovich stochastic integrals of multiplicity k ($k \in \mathbb{N}$) in Theorems 12, 14.

Theorem 18 [12], [36], [37], [51]. *Suppose that every $\psi_l(\tau)$ $(l = 1,\ldots,k)$ is a continuously differentiable nonrandom function at the interval $[t,T]$. Furthermore, let $\{\phi_j(x)\}_{j=0}^{\infty}$ is a complete orthonormal system of Legendre polynomials or trigonometric functions in the space $L_2([t,T])$. Then the following estimates*

$$\mathsf{M}\left\{\left(J^*[\psi^{(k)}]_{T,t}^{(i_1\ldots i_k)} - \sum_{j_1,\ldots,j_k=0}^{p} C_{j_k\ldots j_1}\prod_{l=1}^{k}\zeta_{j_l}^{(i_l)}\right)^2\right\} \le$$

$$\le K_1\left(\frac{1}{p} + \sum_{r=1}^{[k/2]}\ \sum_{\substack{(\{\{g_1,g_2\},\ldots,\{g_{2r-1},g_{2r}\}\},\{q_1,\ldots,q_{k-2r}\})\\ \{g_1,g_2,\ldots,g_{2r-1},g_{2r},q_1,\ldots,q_{k-2r}\}=\{1,2,\ldots,k\}}} \mathsf{M}\left\{\left(R_{T,t}^{(p)r,g_1,g_2,\ldots,g_{2r-1},g_{2r}}\right)^2\right\}\right), \tag{215}$$

$$\mathsf{M}\left\{\left(J^*[\psi^{(k)}]_{s,t}^{(i_1\ldots i_k)} - \sum_{j_1,\ldots,j_k=0}^{p} C_{j_k\ldots j_1}(s)\prod_{l=1}^{k}\zeta_{j_l}^{(i_l)}\right)^2\right\} \le$$

$$\le K_2(s)\left(\frac{1}{p} + \sum_{r=1}^{[k/2]}\ \sum_{\substack{(\{\{g_1,g_2\},\ldots,\{g_{2r-1},g_{2r}\}\},\{q_1,\ldots,q_{k-2r}\})\\ \{g_1,g_2,\ldots,g_{2r-1},g_{2r},q_1,\ldots,q_{k-2r}\}=\{1,2,\ldots,k\}}} \mathsf{M}\left\{\left(R_{s,t}^{(p)r,g_1,g_2,\ldots,g_{2r-1},g_{2r}}\right)^2\right\}\right) \tag{216}$$

hold, where $s \in (t,T]$ (s is fixed), $i_1,\ldots,i_k = 1,\ldots,m$,

$$R_{s,t}^{(p)r,g_1,g_2,\ldots,g_{2r-1},g_{2r}} = R_{T,t}^{(p)r,g_1,g_2,\ldots,g_{2r-1},g_{2r}}\Biggl|_{T=s},$$

$R_{T,t}^{(p)r}$ is defined by (84), $J^*[\psi^{(k)}]_{T,t}^{(i_1\ldots i_k)}$ and $J^*[\psi^{(k)}]_{s,t}^{(i_1\ldots i_k)}$ are iterated Stratonovich stochastic integrals (39) and (95), $C_{j_k\ldots j_1}$ and $C_{j_k\ldots j_1}(s)$ are Fourier coefficients (31) and (93), constants K_1 and $K_2(s)$ are independent of p; another notations are the same as in Theorems 1, 12, 14.

Proof. Note that Conditions 1 and 2 of Theorems 12, 14 are satisfied under the conditions of Theorem 18 (see Remark 2.4 in [12] or see Sect. 5 from this paper). Then from the proof of Theorem 12 it follows that the expression (89) before passing to limit $\underset{p\to\infty}{\text{l.i.m.}}$ has the form

$$\sum_{j_1,\ldots,j_k=0}^{p} C_{j_k\ldots j_1}\prod_{l=1}^{k}\zeta_{j_l}^{(i_l)} = J[\psi^{(k)}]_{T,t}^{(i_1\ldots i_k)p}+$$

$$+\sum_{r=1}^{[k/2]}\Biggl(\frac{1}{2^r}\sum_{(s_r,\ldots,s_1)\in\mathrm{A}_{k,r}} I[\psi^{(k)}]_{T,t}^{(i_1\ldots i_{s_1-1}i_{s_1+2}\ldots i_{s_r-1}i_{s_r+2}\ldots i_k)p}+$$

$$+\sum_{\substack{(\{\{g_1,g_2\},\ldots,\{g_{2r-1},g_{2r}\}\},\{q_1,\ldots,q_{k-2r}\})\\ \{g_1,g_2,\ldots,g_{2r-1},g_{2r},q_1,\ldots,q_{k-2r}\}=\{1,2,\ldots,k\}}} R_{T,t}^{(p)r,g_1,g_2,\ldots,g_{2r-1},g_{2r}}\Biggr), \qquad (217)$$

where $J[\psi^{(k)}]_{T,t}^{(i_1\ldots i_k)p}$ is the approximation for the iterated Ito stochastic integral (1), which is obtained using Theorem 1 (see (16)), i.e. (see Theorem 1.2 in [12]-[15] for details)

$$J[\psi^{(k)}]_{T,t}^{(i_1\ldots i_k)p} = \sum_{j_1,\ldots,j_k=0}^{p} C_{j_k\ldots j_1}\Biggl(\prod_{l=1}^{k}\zeta_{j_l}^{(i_l)}+\sum_{r=1}^{[k/2]}(-1)^r\times$$

$$\times\sum_{\substack{(\{\{g_1,g_2\},\ldots,\{g_{2r-1},g_{2r}\}\},\{q_1,\ldots,q_{k-2r}\})\\ \{g_1,g_2,\ldots,g_{2r-1},g_{2r},q_1,\ldots,q_{k-2r}\}=\{1,2,\ldots,k\}}} \prod_{s=1}^{r}\mathbf{1}_{\{i_{g_{2s-1}}=\ i_{g_{2s}}\neq 0\}}\mathbf{1}_{\{j_{g_{2s-1}}=\ j_{g_{2s}}\}}\prod_{l=1}^{k-2r}\zeta_{j_{q_l}}^{(i_{q_l})}\Biggr), \qquad (218)$$

$I[\psi^{(k)}]_{T,t}^{(i_1\ldots i_{s_1-1}i_{s_1+2}\ldots i_{s_r-1}i_{s_r+2}\ldots i_k)p}$ is the approximation obtained using (218) for the iterated Ito stochastic integral $J[\psi^{(k)}]_{T,t}^{s_r,\ldots,s_1}$ (see (23)).

Using (217) and Theorem 4, we have

$$\sum_{j_1,\ldots,j_k=0}^{p} C_{j_k\ldots j_1}\prod_{l=1}^{k}\zeta_{j_l}^{(i_l)} = J[\psi^{(k)}]_{T,t}^{(i_1\ldots i_k)}+\sum_{r=1}^{[k/2]}\frac{1}{2^r}\sum_{(s_r,\ldots,s_1)\in\mathrm{A}_{k,r}} I[\psi^{(k)}]_{T,t}^{(i_1\ldots i_{s_1-1}i_{s_1+2}\ldots i_{s_r-1}i_{s_r+2}\ldots i_k)}+$$

$$+\biggl(J[\psi^{(k)}]_{T,t}^{(i_1\ldots i_k)p}-J[\psi^{(k)}]_{T,t}^{(i_1\ldots i_k)}\biggr)+$$

$$+\sum_{r=1}^{[k/2]}\sum_{(s_r,\ldots,s_1)\in\mathrm{A}_{k,r}}\frac{1}{2^r}\biggl(I[\psi^{(k)}]_{T,t}^{(i_1\ldots i_{s_1-1}i_{s_1+2}\ldots i_{s_r-1}i_{s_r+2}\ldots i_k)p}-I[\psi^{(k)}]_{T,t}^{(i_1\ldots i_{s_1-1}i_{s_1+2}\ldots i_{s_r-1}i_{s_r+2}\ldots i_k)}\biggr)+$$

$$+\sum_{r=1}^{[k/2]}\sum_{\substack{(\{\{g_1,g_2\},\ldots,\{g_{2r-1},g_{2r}\}\},\{q_1,\ldots,q_{k-2r}\})\\ \{g_1,g_2,\ldots,g_{2r-1},g_{2r},q_1,\ldots,q_{k-2r}\}=\{1,2,\ldots,k\}}} R_{T,t}^{(p)r,g_1,g_2,\ldots,g_{2r-1},g_{2r}} =$$

$$= J^*[\psi^{(k)}]_{T,t}^{(i_1\ldots i_k)} + \left(J[\psi^{(k)}]_{T,t}^{(i_1\ldots i_k)p} - J[\psi^{(k)}]_{T,t}^{(i_1\ldots i_k)}\right)+$$

$$+\sum_{r=1}^{[k/2]}\sum_{(s_r,\ldots,s_1)\in \mathrm{A}_{k,r}}\frac{1}{2^r}\left(I[\psi^{(k)}]_{T,t}^{(i_1\ldots i_{s_1-1}i_{s_1+2}\ldots i_{s_r-1}i_{s_r+2}\ldots i_k)p} - I[\psi^{(k)}]_{T,t}^{(i_1\ldots i_{s_1-1}i_{s_1+2}\ldots i_{s_r-1}i_{s_r+2}\ldots i_k)}\right)+$$

$$+\sum_{r=1}^{[k/2]}\sum_{\substack{(\{\{g_1,g_2\},\ldots,\{g_{2r-1},g_{2r}\}\},\{q_1,\ldots,q_{k-2r}\})\\ \{g_1,g_2,\ldots,g_{2r-1},g_{2r},q_1,\ldots,q_{k-2r}\}=\{1,2,\ldots,k\}}} R_{T,t}^{(p)r,g_1,g_2,\ldots,g_{2r-1},g_{2r}} \tag{219}$$

w. p. 1, where we denote $J[\psi^{(k)}]_{T,t}^{s_r,\ldots,s_1}$ as $I[\psi^{(k)}]_{T,t}^{(i_1\ldots i_{s_1-1}i_{s_1+2}\ldots i_{s_r-1}i_{s_r+2}\ldots i_k)}$.

In [12] (Sect. 1.7.2, Remark 1.7) it is shown that under the conditions of Theorem 18 the following estimate

$$\mathsf{M}\left\{\left(J[\psi^{(k)}]_{T,t}^{(i_1\ldots i_k)} - J[\psi^{(k)}]_{T,t}^{(i_1\ldots i_k)p}\right)^2\right\} \le \frac{C}{p} \tag{220}$$

holds, where $J[\psi^{(k)}]_{T,t}^{(i_1\ldots i_k)}$ is defined by (1), $J[\psi^{(k)}]_{T,t}^{(i_1\ldots i_k)p}$ has the form (218), $i_1,\ldots,i_k=0,1,\ldots,m$, constant C depends only on k and $T-t$.

Applying (220), we obtain the following estimates

$$\mathsf{M}\left\{\left(J[\psi^{(k)}]_{T,t}^{(i_1\ldots i_k)p} - J[\psi^{(k)}]_{T,t}^{(i_1\ldots i_k)}\right)^2\right\} \le \frac{C}{p}, \tag{221}$$

$$\mathsf{M}\left\{\left(I[\psi^{(k)}]_{T,t}^{(i_1\ldots i_{s_1-1}i_{s_1+2}\ldots i_{s_r-1}i_{s_r+2}\ldots i_k)p} - I[\psi^{(k)}]_{T,t}^{(i_1\ldots i_{s_1-1}i_{s_1+2}\ldots i_{s_r-1}i_{s_r+2}\ldots i_k)}\right)^2\right\} \le$$

$$\le \frac{C}{p}, \tag{222}$$

where constant C does not depend on p.

From (219)–(222) and the elementary inequality

$$(a_1+a_2+\ldots+a_n)^2 \le n\left(a_1^2+a_2^2+\ldots+a_n^2\right), \quad n\in\mathbb{N}$$

we obtain (215).

The estimate (216) is obtained similarly to the estimate (215) using Theorem 1.11 in [12], Theorem 14 and the estimate [12] (Sect. 1.8.1, Remark 1.12)

$$\mathsf{M}\left\{\left(J[\psi^{(k)}]_{s,t}^{(i_1\ldots i_k)} - J[\psi^{(k)}]_{s,t}^{(i_1\ldots i_k)p}\right)^2\right\} \le \frac{C}{p},$$

where

$$
J[\psi^{(k)}]_{s,t}^{(i_1\ldots i_k)}=\int\limits_t^s\psi_k(t_k)\ldots\int\limits_t^{t_2}\psi_1(t_1)d{\bf f}_{t_1}^{(i_1)}\ldots d{\bf f}_{t_k}^{(i_k)},
$$

$$
J[\psi^{(k)}]_{s,t}^{(i_1\ldots i_k)p}=\sum_{j_1,\ldots,j_k=0}^{p}C_{j_k\ldots j_1}(s)\Biggl(\prod_{l=1}^k\zeta_{j_l}^{(i_l)}+\sum_{r=1}^{[k/2]}(-1)^r\times
$$

$$
\times\sum_{\stackrel{(\{\{g_1,g_2\},\ldots,\{g_{2r-1},g_{2r}\}\},\{q_1,\ldots,q_{k-2r}\})}{\{g_1,g_2,\ldots,g_{2r-1},g_{2r},q_1,\ldots,q_{k-2r}\}=\{1,2,\ldots,k\}}}\prod_{s=1}^r{\bf 1}_{\{i_{g_{2s-1}}=\ i_{g_{2s}}\ne 0\}}{\bf 1}_{\{j_{g_{2s-1}}=\ j_{g_{2s}}\}}\prod_{l=1}^{k-2r}\zeta_{j_{q_l}}^{(i_{q_l})}\Biggr),
$$

where $s\in(t,T]$ (s is fixed), $C_{j_k\ldots j_1}(s)$ is the Fourier coefficient (93), $i_1,\ldots,i_k=0,1,\ldots,m$, constant C depends only on k and $s-t$; another notations are the same as in Theorems 2, 13.

Theorem 18 is proved.

10. Rate of the Mean-Square Convergence of Expansions of Iterated Stratonovich Stochastic Integrals of Multiplicities 3–5 in Theorems 15–17

In this section, we consider the rate of convergence of approximations of iterated Stratonovich stochastic integrals in Theorems 15–17. It is easy to see that in Theorems 15–17 the second term in parentheses on the right-hand side of (215) is estimated. Combining these results with Theorem 18, we obtain the following theorems.

Theorem 19 [12], [36], [37], [51]. *Suppose that $\{\phi_j(x)\}_{j=0}^{\infty}$ is a complete orthonormal system of Legendre polynomials or trigonometric functions in the space $L_2([t,T])$. Furthermore, let $\psi_1(\tau),\psi_2(\tau)$, $\psi_3(\tau)$ are continuously differentiable nonrandom functions on $[t,T]$. Then, for the iterated Stratonovich stochastic integral of third multiplicity*

$$
J^{*}[\psi^{(3)}]_{T,t}=\int\limits_t^{*T}\psi_3(t_3)\int\limits_t^{*t_3}\psi_2(t_2)\int\limits_t^{*t_2}\psi_1(t_1)d{\bf f}_{t_1}^{(i_1)}d{\bf f}_{t_2}^{(i_2)}d{\bf f}_{t_3}^{(i_3)}
$$

the following estimate

$$
{\sf M}\left\{\left(J^{*}[\psi^{(3)}]_{T,t}-\sum_{j_1,j_2,j_3=0}^{p}C_{j_3j_2j_1}\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}\zeta_{j_3}^{(i_3)}\right)^2\right\}\le\frac{C}{p}
$$

is fulfilled, where $i_1,i_2,i_3=1,\ldots,m$, constant C is independent of p,

$$
C_{j_3j_2j_1}=\int\limits_t^T\psi_3(t_3)\phi_{j_3}(t_3)\int\limits_t^{t_3}\psi_2(t_2)\phi_{j_2}(t_2)\int\limits_t^{t_2}\psi_1(t_1)\phi_{j_1}(t_1)dt_1dt_2dt_3
$$

and

$$\zeta_j^{(i)}=\int\limits_t^T \phi_j(\tau)d\mathbf{w}_{\tau}^{(i)}$$

are independent standard Gaussian random variables for various i or j.

Theorem 20 [12], [36], [37], [51]. *Let $\{\phi_j(x)\}_{j=0}^{\infty}$ be a complete orthonormal system of Legendre polynomials or trigonometric functions in the space $L_2([t,T])$. Furthermore, let $\psi_1(\tau),\ldots,\ \psi_4(\tau)$ be continuously differentiable nonrandom functions on $[t,T]$. Then, for the iterated Stratonovich stochastic integral of fourth multiplicity*

$$J^*[\psi^{(4)}]_{T,t}=\int\limits_t^{*T}\psi_4(t_4)\int\limits_t^{*t_4}\psi_3(t_3)\int\limits_t^{*t_3}\psi_2(t_2)\int\limits_t^{*t_2}\psi_1(t_1)d\mathbf{f}_{t_1}^{(i_1)}d\mathbf{f}_{t_2}^{(i_2)}d\mathbf{f}_{t_3}^{(i_3)}d\mathbf{f}_{t_4}^{(i_4)}$$

the following estimate

$$\mathsf{M}\left\{\left(J^*[\psi^{(4)}]_{T,t}-\sum_{j_1,j_2,j_3,j_4=0}^{p}C_{j_4j_3j_2j_1}\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}\zeta_{j_3}^{(i_3)}\zeta_{j_4}^{(i_4)}\right)^2\right\}\le\frac{C}{p^{1-\varepsilon}}$$

holds, where $i_1,i_2,i_3,i_4=1,\ldots,m$, constant C does not depend on p, ε is an arbitrary small positive real number for the case of complete orthonormal system of Legendre polynomials in the space $L_2([t,T])$ and $\varepsilon=0$ for the case of complete orthonormal system of trigonometric functions in the space $L_2([t,T])$,

$$C_{j_4j_3j_2j_1}=\int\limits_t^T\psi_4(t_4)\phi_{j_4}(t_4)\int\limits_t^{t_4}\psi_3(t_3)\phi_{j_3}(t_3)\int\limits_t^{t_3}\psi_2(t_2)\phi_{j_2}(t_2)\int\limits_t^{t_2}\psi_1(t_1)\phi_{j_1}(t_1)dt_1\times$$

$$\times dt_2dt_3dt_4;$$

another notations are the same as in Theorem 19.

Theorem 21 [12], [36], [37], [51]. *Assume that $\{\phi_j(x)\}_{j=0}^{\infty}$ is a complete orthonormal system of Legendre polynomials or trigonometric functions in the space $L_2([t,T])$ and $\psi_1(\tau),\ldots,\ \psi_5(\tau)$ are continuously differentiable nonrandom functions on $[t,T]$. Then, for the iterated Stratonovich stochastic integral of fifth multiplicity*

$$J^*[\psi^{(5)}]_{T,t}=\int\limits_t^{*T}\psi_5(t_5)\ldots\int\limits_t^{*t_2}\psi_1(t_1)d\mathbf{f}_{t_1}^{(i_1)}\ldots d\mathbf{f}_{t_5}^{(i_5)}$$

the following estimate

$$\mathsf{M}\left\{\left(J^*[\psi^{(5)}]_{T,t}-\sum_{j_1,\ldots,j_5=0}^{p}C_{j_5\ldots j_1}\zeta_{j_1}^{(i_1)}\ldots\zeta_{j_5}^{(i_5)}\right)^2\right\}\le\frac{C}{p^{1-\varepsilon}}$$

is valid, where $i_1,\ldots,i_5=1,\ldots,m$, constant C is independent of p, ε is an arbitrary small positive real number for the case of complete orthonormal system of Legendre polynomials in the space $L_2([t,T])$

and $\varepsilon = 0$ *for the case of complete orthonormal system of trigonometric functions in the space* $L_2([t,T])$,

$$C_{j_5\ldots j_1} = \int\limits_t^T \psi_5(t_5)\phi_{j_5}(t_5)\ldots\int\limits_t^{t_2}\psi_1(t_1)\phi_{j_1}(t_1)dt_1\ldots dt_5;$$

another notations are the same as in Theorem 19, 20.

11. Expansion of Iterated Stratonovich Stochastic Integrals of Multiplicity 6. The Case $p_1 = \ldots = p_6 \to \infty$ and $\psi_1(\tau), \ldots, \psi_6(\tau) \equiv 1$ (The Cases of Legendre Polynomials and Trigonometric Functions)

Theorem 22 [12], [36], [37], [61]. *Suppose that* $\{\phi_j(x)\}_{j=0}^{\infty}$ *is a complete orthonormal system of Legendre polynomials or trigonometric functions in the space* $L_2([t,T])$. *Then, for the iterated Stratonovich stochastic integral of sixth multiplicity*

$$J_{T,t}^{*(i_1\ldots i_6)} = \int\limits_t^{*T}\ldots\int\limits_t^{*t_2} d\mathbf{w}_{t_1}^{(i_1)}\ldots d\mathbf{w}_{t_6}^{(i_6)} \tag{223}$$

the following expansion

$$J_{T,t}^{*(i_1\ldots i_6)} = \underset{p\to\infty}{\text{l.i.m.}} \sum_{j_1,\ldots,j_6=0}^{p} C_{j_6\ldots j_1}\zeta_{j_1}^{(i_1)}\ldots\zeta_{j_6}^{(i_6)}$$

that converges in the mean-square sense is valid, where $i_1,\ldots,i_6 = 0,1,\ldots,m$,

$$C_{j_6\ldots j_1} = \int\limits_t^T \phi_{j_6}(t_6)\ldots\int\limits_t^{t_2}\phi_{j_1}(t_1)dt_1\ldots dt_6$$

and

$$\zeta_j^{(i)} = \int\limits_t^T \phi_j(s)d\mathbf{w}_s^{(i)}$$

are independent standard Gaussian random variables for various i *or* j *(in the case when* $i \neq 0$*),* $\mathbf{w}_\tau^{(i)} = \mathbf{f}_\tau^{(i)}$ *for* $i = 1,\ldots,m$ *and* $\mathbf{w}_\tau^{(0)} = \tau$.

Proof. As noted in Sect. 5, Conditions 1 and 2 of Theorem 12 are satisfied for complete orthonormal systems of Legendre polynomials and trigonometric functions in the space $L_2([t,T])$. Let us verify Condition 3 of Theorem 12 for the iterated Stratonovich stochastic integral (223). Thus, we have to check the following conditions

$$\lim_{p\to\infty}\sum_{j_{q_1},j_{q_2},j_{q_3},j_{q_4}=0}^{p}\left(\sum_{j_{g_1}=p+1}^{\infty} C_{j_6\ldots j_1}\Big|_{j_{g_1}=j_{g_2}}\right)^2 = 0, \tag{224}$$

$$\lim_{p\to\infty}\sum_{j_{q_1},j_{q_2}=0}^{p}\left(\sum_{j_{g_1}=p+1}^{\infty}\sum_{j_{g_3}=p+1}^{\infty}C_{j_6\ldots j_1}\Bigg|_{j_{g_1}=j_{g_2},j_{g_3}=j_{g_4}}\right)^2=0, \tag{225}$$

$$\lim_{p\to\infty}\sum_{j_{q_1},j_{q_2}=0}^{p}\left(\sum_{j_{g_1}=p+1}^{\infty}C_{j_6\ldots j_1}\Bigg|_{(j_{g_4}j_{g_3})\frown(\cdot),j_{g_1}=j_{g_2},j_{g_3}=j_{g_4},g_4=g_3+1}\right)^2=0, \tag{226}$$

$$\lim_{p\to\infty}\left(\sum_{j_{g_1}=p+1}^{\infty}\sum_{j_{g_3}=p+1}^{\infty}\sum_{j_{g_5}=p+1}^{\infty}C_{j_6\ldots j_1}\Bigg|_{j_{g_1}=j_{g_2},j_{g_3}=j_{g_4},j_{g_5}=j_{g_6}}\right)^2=0, \tag{227}$$

$$\lim_{p\to\infty}\left(\sum_{j_{g_1}=p+1}^{\infty}\sum_{j_{g_3}=p+1}^{\infty}C_{j_6\ldots j_1}\Bigg|_{(j_{g_6}j_{g_5})\frown(\cdot),j_{g_1}=j_{g_2},j_{g_3}=j_{g_4},j_{g_5}=j_{g_6},g_6=g_5+1}\right)^2=0, \tag{228}$$

$$\lim_{p\to\infty}\left(\sum_{j_{g_1}=p+1}^{\infty}C_{j_6\ldots j_1}\Bigg|_{(j_{g_4}j_{g_3})\frown(\cdot)(j_{g_6}j_{g_5})\frown(\cdot),j_{g_1}=j_{g_2},j_{g_3}=j_{g_4},j_{g_5}=j_{g_6},g_4=g_3+1,g_6=g_5+1}\right)^2=0, \tag{229}$$

where the expressions

$$(\{g_1,g_2\},\{g_3,g_4\},\{g_5,g_6\}),\quad (\{g_1,g_2\},\{g_3,g_4\},\{q_1,q_2\}),\quad (\{g_1,g_2\},\{q_1,q_2,q_3,q_4\})$$

are partitions of the set $\{1,2,\ldots,6\}$ that is $\{g_1,g_2,g_3,\,g_4,g_5,g_6\}=\{g_1,g_2,g_3,g_4,q_1,q_2\}=\{g_1,g_2,q_1,$ $q_2,q_3,q_4\}=\{1,2,\,\ldots,6\}$; braces mean an unordered set, and parentheses mean an ordered set.

The equalities (224), (226) were proved earlier (see the proof of equalities (205), (211)). The relation (229) follows from the estimate (97) for the polynomial case and its analogue for the trigonometric case. It is easy to see that the equalities (225) and (228) are proved in complete analogy with the proof of (177), (211).

Thus, we have to prove the relation (227). The equality (227) is equivalent to the following equalities

$$\lim_{p\to\infty}\sum_{j_1=p+1}^{\infty}\sum_{j_2=p+1}^{\infty}\sum_{j_3=p+1}^{\infty}C_{j_3j_2j_1j_3j_2j_1}=0, \tag{230}$$

$$\lim_{p\to\infty}\sum_{j_1=p+1}^{\infty}\sum_{j_2=p+1}^{\infty}\sum_{j_3=p+1}^{\infty}C_{j_1j_3j_2j_3j_2j_1}=0, \tag{231}$$

$$\lim_{p\to\infty}\sum_{j_1=p+1}^{\infty}\sum_{j_2=p+1}^{\infty}\sum_{j_3=p+1}^{\infty}C_{j_3j_2j_3j_1j_2j_1}=0, \tag{232}$$

$$\lim_{p\to\infty}\sum_{j_1=p+1}^{\infty}\sum_{j_2=p+1}^{\infty}\sum_{j_3=p+1}^{\infty}C_{j_1j_2j_3j_3j_2j_1}=0, \tag{233}$$

$$\lim_{p\to\infty}\sum_{j_1=p+1}^{\infty}\sum_{j_2=p+1}^{\infty}\sum_{j_3=p+1}^{\infty} C_{j_1j_2j_2j_3j_3j_1}=0, \tag{234}$$

$$\lim_{p\to\infty}\sum_{j_1=p+1}^{\infty}\sum_{j_2=p+1}^{\infty}\sum_{j_3=p+1}^{\infty} C_{j_3j_3j_2j_2j_1j_1}=0, \tag{235}$$

$$\lim_{p\to\infty}\sum_{j_1=p+1}^{\infty}\sum_{j_2=p+1}^{\infty}\sum_{j_3=p+1}^{\infty} C_{j_2j_3j_3j_2j_1j_1}=0, \tag{236}$$

$$\lim_{p\to\infty}\sum_{j_1=p+1}^{\infty}\sum_{j_2=p+1}^{\infty}\sum_{j_3=p+1}^{\infty} C_{j_3j_2j_3j_2j_1j_1}=0, \tag{237}$$

$$\lim_{p\to\infty}\sum_{j_1=p+1}^{\infty}\sum_{j_2=p+1}^{\infty}\sum_{j_3=p+1}^{\infty} C_{j_3j_3j_2j_1j_2j_1}=0, \tag{238}$$

$$\lim_{p\to\infty}\sum_{j_1=p+1}^{\infty}\sum_{j_2=p+1}^{\infty}\sum_{j_3=p+1}^{\infty} C_{j_3j_3j_1j_2j_2j_1}=0, \tag{239}$$

$$\lim_{p\to\infty}\sum_{j_1=p+1}^{\infty}\sum_{j_2=p+1}^{\infty}\sum_{j_3=p+1}^{\infty} C_{j_2j_1j_3j_3j_2j_1}=0, \tag{240}$$

$$\lim_{p\to\infty}\sum_{j_1=p+1}^{\infty}\sum_{j_2=p+1}^{\infty}\sum_{j_3=p+1}^{\infty} C_{j_3j_1j_2j_3j_2j_1}=0, \tag{241}$$

$$\lim_{p\to\infty}\sum_{j_1=p+1}^{\infty}\sum_{j_2=p+1}^{\infty}\sum_{j_3=p+1}^{\infty} C_{j_2j_3j_1j_3j_2j_1}=0, \tag{242}$$

$$\lim_{p\to\infty}\sum_{j_1=p+1}^{\infty}\sum_{j_2=p+1}^{\infty}\sum_{j_3=p+1}^{\infty} C_{j_3j_1j_3j_2j_2j_1}=0, \tag{243}$$

$$\lim_{p\to\infty}\sum_{j_1=p+1}^{\infty}\sum_{j_2=p+1}^{\infty}\sum_{j_3=p+1}^{\infty} C_{j_2j_3j_3j_1j_2j_1}=0. \tag{244}$$

Consider in detail the case of Legendre polynomials (the case of trigonometric functions is considered in complete analogy).

First, we prove the following equality for the Fourier coefficients for the case $\psi_1(\tau),\ldots,\psi_6(\tau)\equiv 1$

$$C_{j_6j_5j_4j_3j_2j_1}+C_{j_1j_2j_3j_4j_5j_6}=C_{j_6}C_{j_5j_4j_3j_2j_1}-C_{j_5j_6}C_{j_4j_3j_2j_1}+$$

$$+C_{j_4j_5j_6}C_{j_3j_2j_1}-C_{j_3j_4j_5j_6}C_{j_2j_1}+C_{j_2j_3j_4j_5j_6}C_{j_1}. \tag{245}$$

Using the integration order replacement, we have

$$C_{j_6j_5j_4j_3j_2j_1} =$$

$$= \int\limits_t^T \phi_{j_6}(t_6) \int\limits_t^{t_6} \phi_{j_5}(t_5) \ldots \int\limits_t^{t_2} \phi_{j_1}(t_1) dt_1 \ldots dt_5 dt_6 =$$

$$= \int\limits_t^T \phi_{j_6}(t_6) \int\limits_t^{T} \phi_{j_5}(t_5) \int\limits_t^{t_5} \phi_{j_4}(t_4) \ldots \int\limits_t^{t_2} \phi_{j_1}(t_1) dt_1 \ldots dt_4 dt_5 dt_6 -$$

$$- \int\limits_t^T \phi_{j_6}(t_6) \int\limits_{t_6}^{T} \phi_{j_5}(t_5) \int\limits_t^{t_5} \phi_{j_4}(t_4) \ldots \int\limits_t^{t_2} \phi_{j_1}(t_1) dt_1 \ldots dt_4 dt_5 dt_6 =$$

$$= C_{j_6} C_{j_5j_4j_3j_2j_1} -$$

$$- \int\limits_t^T \phi_{j_6}(t_6) \int\limits_{t_6}^{T} \phi_{j_5}(t_5) \int\limits_t^{T} \phi_{j_4}(t_4) \int\limits_t^{t_4} \phi_{j_3}(t_3) \ldots \int\limits_t^{t_2} \phi_{j_1}(t_1) dt_1 \ldots dt_3 dt_4 dt_5 dt_6 +$$

$$+ \int\limits_t^T \phi_{j_6}(t_6) \int\limits_{t_6}^{T} \phi_{j_5}(t_5) \int\limits_{t_5}^{T} \phi_{j_4}(t_4) \int\limits_t^{t_4} \phi_{j_3}(t_3) \ldots \int\limits_t^{t_2} \phi_{j_1}(t_1) dt_1 \ldots dt_3 dt_4 dt_5 dt_6 =$$

$$= C_{j_6} C_{j_5j_4j_3j_2j_1} -$$

$$- \int\limits_t^T \phi_{j_6}(t_6) \int\limits_{t_6}^{T} \phi_{j_5}(t_5) dt_5 dt_6 \ C_{j_4j_3j_2j_1} +$$

$$+ \int\limits_t^T \phi_{j_6}(t_6) \int\limits_{t_6}^{T} \phi_{j_5}(t_5) \int\limits_{t_5}^{T} \phi_{j_4}(t_4) \int\limits_t^{t_4} \phi_{j_3}(t_3) \ldots \int\limits_t^{t_2} \phi_{j_1}(t_1) dt_1 \ldots dt_3 dt_4 dt_5 dt_6 =$$

$$= C_{j_6} C_{j_5j_4j_3j_2j_1} - C_{j_5j_6} C_{j_4j_3j_2j_1} +$$

$$+ \int\limits_t^T \phi_{j_6}(t_6) \int\limits_{t_6}^{T} \phi_{j_5}(t_5) \int\limits_{t_5}^{T} \phi_{j_4}(t_4) \int\limits_t^{t_4} \phi_{j_3}(t_3) \ldots \int\limits_t^{t_2} \phi_{j_1}(t_1) dt_1 \ldots dt_3 dt_4 dt_5 dt_6 =$$

$$\ldots$$

$$= C_{j_6} C_{j_5j_4j_3j_2j_1} - C_{j_5j_6} C_{j_4j_3j_2j_1} + C_{j_4j_5j_6} C_{j_3j_2j_1} - C_{j_3j_4j_5j_6} C_{j_2j_1} + C_{j_2j_3j_4j_5j_6} C_{j_1} -$$

$$- \int\limits_t^T \phi_{j_6}(t_6) \int\limits_{t_6}^{T} \phi_{j_5}(t_5) \ldots \int\limits_{t_2}^{T} \phi_{j_1}(t_1) dt_1 \ldots dt_5 dt_6 =$$

$$= C_{j_6}C_{j_5j_4j_3j_2j_1} - C_{j_5j_6}C_{j_4j_3j_2j_1} + C_{j_4j_5j_6}C_{j_3j_2j_1} -$$

(246) $$-C_{j_3j_4j_5j_6}C_{j_2j_1} + C_{j_2j_3j_4j_5j_6}C_{j_1} - C_{j_1j_2j_3j_4j_5j_6}.$$

The equality (246) completes the proof of the relation (245).
Let us consider (230). From (65) we obtain

(247) $$\sum_{j_1=p+1}^{\infty}\sum_{j_2=p+1}^{\infty}\sum_{j_3=p+1}^{\infty} C_{j_3j_2j_1j_3j_2j_1} = -\sum_{j_1=0}^{p}\sum_{j_2=0}^{p}\sum_{j_3=0}^{p} C_{j_3j_2j_1j_3j_2j_1}.$$

Applying (245), we get

$$\sum_{j_1,j_2,j_3=0}^{p} C_{j_3j_2j_1j_3j_2j_1} + \sum_{j_1,j_2,j_3=0}^{p} C_{j_1j_2j_3j_1j_2j_3} = 2\sum_{j_1,j_2,j_3=0}^{p} C_{j_3j_2j_1j_3j_2j_1} =$$

$$= \sum_{j_1,j_2,j_3=0}^{p}\Biggl(C_{j_3}C_{j_2j_1j_3j_2j_1} - C_{j_2j_3}C_{j_1j_3j_2j_1} + C_{j_1j_2j_3}C_{j_3j_2j_1} -$$

(248) $$-C_{j_3j_1j_2j_3}C_{j_2j_1} + C_{j_2j_3j_1j_2j_3}C_{j_1}\Biggr).$$

The complete orthonormal system of Legendre polynomials in the space $L_2([t,T])$ looks as follows

(249) $$\phi_j(x) = \sqrt{\frac{2j+1}{T-t}}P_j\left(\left(x - \frac{T+t}{2}\right)\frac{2}{T-t}\right), \quad j = 0,1,2,\ldots,$$

where

$$P_j(x) = \frac{1}{2^j j!}\frac{d^j}{dx^j}\left(x^2-1\right)^j$$

is the Legendre polynomial.
Note that

$$C_{j_2j_1} = \int\limits_t^T \phi_{j_2}(\tau)\int\limits_t^{\tau}\phi_{j_1}(\theta)d\theta d\tau =$$

(250) $$= \frac{T-t}{2}\begin{cases} 1/\sqrt{(2j_1+1)(2j_1+3)} & \text{if } j_2 = j_1+1,\ j_1 = 0,1,2,\ldots \\ -1/\sqrt{4j_1^2-1} & \text{if } j_2 = j_1-1,\ j_1 = 1,2,\ldots \\ 1 & \text{if } j_1 = j_2 = 0 \\ 0 & \text{otherwise} \end{cases},$$

$$C_{j_1}=\int\limits_t^T\phi_{j_1}(\tau)d\tau=\begin{cases}\sqrt{T-t} & \text{if } j_1=0\\ \\ 0 & \text{if } j_1\ne 0\end{cases}. \tag{251}$$

Moreover, the generalized Parseval equality gives

$$\lim_{p\to\infty}\sum_{j_1,j_2,j_3=0}^{p}C_{j_1j_2j_3}C_{j_3j_2j_1}=$$

$$=\lim_{p\to\infty}\sum_{j_1,j_2,j_3=0}^{p}\int\limits_t^T\phi_{j_1}(t_3)\int\limits_t^{t_3}\phi_{j_2}(t_2)\int\limits_t^{t_2}\phi_{j_3}(t_1)dt_1dt_2dt_3\times$$

$$\times\int\limits_t^T\phi_{j_3}(t_3)\int\limits_t^{t_3}\phi_{j_2}(t_2)\int\limits_t^{t_2}\phi_{j_1}(t_1)dt_1dt_2dt_3=$$

$$=\lim_{p\to\infty}\sum_{j_1,j_2,j_3=0}^{p}\int\limits_t^T\phi_{j_3}(t_3)\int\limits_{t_3}^{T}\phi_{j_2}(t_2)\int\limits_{t_2}^{T}\phi_{j_1}(t_1)dt_1dt_2dt_3\times$$

$$\times\int\limits_t^T\phi_{j_3}(t_3)\int\limits_t^{t_3}\phi_{j_2}(t_2)\int\limits_t^{t_2}\phi_{j_1}(t_1)dt_1dt_2dt_3=$$

$$=\lim_{p\to\infty}\sum_{j_1,j_2,j_3=0}^{p}\int\limits_{[t,T]^3}\mathbf{1}_{\{t_3<t_2<t_1\}}\prod_{l=1}^{3}\phi_{j_l}(t_l)dt_1dt_2dt_3\times$$

$$\times\int\limits_{[t,T]^3}\mathbf{1}_{\{t_1<t_2<t_3\}}\prod_{l=1}^{3}\phi_{j_l}(t_l)dt_1dt_2dt_3=$$

$$=\int\limits_{[t,T]^3}\mathbf{1}_{\{t_3<t_2<t_1\}}\mathbf{1}_{\{t_1<t_2<t_3\}}dt_1dt_2dt_3=0. \tag{252}$$

Using the above arguments and also (65), (247), and (248), we get

$$-\lim_{p\to\infty}\sum_{j_1=p+1}^{\infty}\sum_{j_2=p+1}^{\infty}\sum_{j_3=p+1}^{\infty}C_{j_3j_2j_1j_3j_2j_1}=\lim_{p\to\infty}\sum_{j_1,j_2,j_3=0}^{p}C_{j_3j_2j_1j_3j_2j_1}=$$

$$=\frac{1}{2}\lim_{p\to\infty}\sum_{j_1,j_2,j_3=0}^{p}\Biggl(C_{j_3}C_{j_2j_1j_3j_2j_1}-C_{j_2j_3}C_{j_1j_3j_2j_1}-$$

$$-C_{j_3j_1j_2j_3}C_{j_2j_1}+C_{j_2j_3j_1j_2j_3}C_{j_1}\Biggr)=$$

$$=\lim_{p\to\infty}\sum_{j_1,j_2,j_3=0}^{p}\biggl(C_{j_3}C_{j_2j_1j_3j_2j_1}-C_{j_3j_1j_2j_3}C_{j_2j_1}\biggr)=$$

$$=\sqrt{T-t}\lim_{p\to\infty}\sum_{j_1,j_2=0}^{p}C_{j_2j_10j_2j_1}-\lim_{p\to\infty}\sum_{j_1,j_2,j_3=0}^{p}C_{j_3j_1j_2j_3}C_{j_2j_1}=$$

$$=\sqrt{T-t}\lim_{p\to\infty}\sum_{j_1,j_2=0}^{p}C_{j_2j_10j_2j_1}+\lim_{p\to\infty}\sum_{j_1,j_2=0}^{p}\sum_{j_3=p+1}^{\infty}C_{j_3j_1j_2j_3}C_{j_2j_1}. \tag{253}$$

By analogy with the proof of (141) (see the proof of Theorem 16) we obtain

$$\lim_{p\to\infty}\sum_{j_1,j_2=0}^{p}C_{j_2j_10j_2j_1}=\lim_{p\to\infty}\sum_{j_1=p+1}^{\infty}\sum_{j_2=p+1}^{\infty}C_{j_2j_10j_2j_1}=0, \tag{254}$$

where we used the following representation

$$C_{j_2j_10j_2j_1}=$$

$$=\frac{1}{\sqrt{T-t}}\int\limits_t^T\phi_{j_2}(t_5)\int\limits_t^{t_5}\phi_{j_1}(t_4)\int\limits_t^{t_4}\int\limits_t^{t_3}\phi_{j_2}(t_2)\int\limits_t^{t_2}\phi_{j_1}(t_1)dt_1dt_2dt_3dt_4dt_5=$$

$$=\frac{1}{\sqrt{T-t}}\int\limits_t^T\phi_{j_2}(t_5)\int\limits_t^{t_5}\phi_{j_1}(t_4)\int\limits_t^{t_4}\phi_{j_2}(t_2)\int\limits_t^{t_2}\phi_{j_1}(t_1)dt_1\int\limits_{t_2}^{t_4}dt_3dt_2dt_4dt_5=$$

$$=\frac{1}{\sqrt{T-t}}\int\limits_t^T\phi_{j_2}(t_5)\int\limits_t^{t_5}\phi_{j_1}(t_4)(t_4-t)\int\limits_t^{t_4}\phi_{j_2}(t_2)\int\limits_t^{t_2}\phi_{j_1}(t_1)dt_1dt_2dt_4dt_5+$$

$$+\frac{1}{\sqrt{T-t}}\int\limits_t^T\phi_{j_2}(t_5)\int\limits_t^{t_5}\phi_{j_1}(t_4)\int\limits_t^{t_4}\phi_{j_2}(t_2)(t-t_2)\int\limits_t^{t_2}\phi_{j_1}(t_1)dt_1dt_2dt_4dt_5\stackrel{\sf def}{=}$$

$$\stackrel{\sf def}{=}\bar C_{j_2j_1j_2j_1}+\tilde C_{j_2j_1j_2j_1}.$$

Further, we have (see (250))

$$\lim_{p\to\infty}\sum_{j_1,j_2=0}^{p}\sum_{j_3=p+1}^{\infty}C_{j_3j_1j_2j_3}C_{j_2j_1}=\lim_{p\to\infty}\sum_{j_3=p+1}^{\infty}\biggl(C_{00}C_{j_300j_3}+$$

$$+\sum_{j_1=1}^{p}C_{j_1-1,j_1}C_{j_3j_1,j_1-1,j_3}+\sum_{j_1=1}^{p-1}C_{j_1+1,j_1}C_{j_3j_1,j_1+1,j_3}+C_{1,0}C_{j_301j_3}\biggr). \tag{255}$$

Observe that

$$|C_{j_1-1,j_1}|+|C_{j_1+1,j_1}|\le \frac{K}{j_1}\quad (j_1=1,\ldots,p), \tag{256}$$

$$|C_{j_300j_3}|+|C_{j_3j_1,j_1-1,j_3}|+|C_{j_3j_1,j_1+1,j_3}|+|C_{j_301j_3}|\le \frac{K_1}{j_3^2}\quad (j_3\ge p+1), \tag{257}$$

where constants K, K_1 do not depend on j_1, j_3.

The estimate (256) follow from (250). At the same time, the estimate (257) can be obtained using the following reasoning. First note that the integration order replacement gives

$$C_{j_3j_1j_2j_3}=\int\limits_t^T\phi_{j_3}(t_4)\int\limits_t^{t_4}\phi_{j_1}(t_3)\int\limits_t^{t_3}\phi_{j_2}(t_2)\int\limits_t^{t_2}\phi_{j_3}(t_1)dt_1dt_2dt_3dt_4=$$

$$=\int\limits_t^T\phi_{j_1}(t_3)\int\limits_t^{t_3}\phi_{j_2}(t_2)\left(\int\limits_t^{t_2}\phi_{j_3}(t_1)dt_1\right)dt_2\left(\int\limits_{t_3}^{T}\phi_{j_3}(t_4)dt_4\right)dt_3. \tag{258}$$

Consider the well-known estimate for Legendre polynomials

$$|P_j(y)|<\frac{K}{\sqrt{j+1}(1-y^2)^{1/4}},\quad y\in(-1,1),\quad j\in\mathbb{N}, \tag{259}$$

where constant K does not depend on y and j.

The estimate (259) can be rewritten for the function $\phi_j(x)$ (see (249)) in the following form

$$|\phi_j(x)|<\sqrt{\frac{2j+1}{j+1}}\frac{K}{\sqrt{T-t}}\frac{1}{\left(1-z^2(x)\right)^{1/4}}<\frac{K_1}{\sqrt{T-t}}\frac{1}{\left(1-z^2(x)\right)^{1/4}}, \tag{260}$$

where $K_1=K\sqrt{2}$, $x\in(t,T)$, $j\in\mathbb{N}$,

$$z(x)=\left(x-\frac{T+t}{2}\right)\frac{2}{T-t}.$$

Note analogues of the estimates (103), (104)

$$\left|\int\limits_t^x\phi_{j_1}(s)ds\right|<\frac{C}{j_1(1-(z(x))^2)^{1/4}},\quad \left|\int\limits_x^T\phi_{j_1}(s)ds\right|<\frac{C}{j_1(1-(z(x))^2)^{1/4}},\quad x\in(t,T), \tag{261}$$

where $j_1>0$, constant C does not depend on j_1.

Applying the estimates (260) and (261) to (258) gives the estimate (257). Using (255), (256), and (257), we obtain

$$\left|\sum_{j_1,j_2=0}^{p}\sum_{j_3=p+1}^{\infty}C_{j_3j_1j_2j_3}C_{j_2j_1}\right|\le K\sum_{j_3=p+1}^{\infty}\frac{1}{j_3^2}\left(1+\sum_{j_1=1}^{p}\frac{1}{j_1}\right)\le$$

$$\leq K\int\limits_p^{\infty}\frac{dx}{x^2}\left(2+\int\limits_1^p\frac{dx}{x}\right)=\frac{K(2+lnp)}{p}\to 0 \qquad (262)$$

if $p\to\infty$, where constant K is independent of p. Thus, the equality (230) is proved (see (253), (254), (262)).

The relation (231) is proved in complete analogy with the proof of equality (230). For (231) we have (see (245))

$$\lim_{p\to\infty}\left(\sum_{j_1,j_2,j_3=0}^{p}C_{j_1j_3j_2j_3j_2j_1}+\sum_{j_1,j_2,j_3=0}^{p}C_{j_1j_2j_3j_2j_3j_1}\right)=2\lim_{p\to\infty}\sum_{j_1,j_2,j_3=0}^{p}C_{j_1j_3j_2j_3j_2j_1}=$$

$$=\lim_{p\to\infty}\sum_{j_1,j_2,j_3=0}^{p}\Biggl(C_{j_1}C_{j_3j_2j_3j_2j_1}-C_{j_3j_1}C_{j_2j_3j_2j_1}+C_{j_2j_3j_1}C_{j_3j_2j_1}-$$

$$-C_{j_3j_2j_3j_1}C_{j_2j_1}+C_{j_2j_3j_2j_3j_1}C_{j_1}\Biggr)=$$

$$=2\lim_{p\to\infty}\left(\sqrt{T-t}\sum_{j_2,j_3=0}^{p}C_{j_3j_2j_3j_20}-\sum_{j_1,j_2,j_3=0}^{p}C_{j_2j_1}C_{j_3j_2j_3j_1}\right)=$$

$$=-2\lim_{p\to\infty}\sum_{j_1,j_2,j_3=0}^{p}C_{j_2j_1}C_{j_3j_2j_3j_1}.$$

To estimate the Fourier coefficient $C_{j_3j_2j_3j_1}$, we use the following (see the proof of (230) for more details)

$$C_{j_3j_2j_3j_1}=\int\limits_t^T\phi_{j_3}(t_4)\int\limits_t^{t_4}\phi_{j_2}(t_3)\int\limits_t^{t_3}\phi_{j_3}(t_2)\int\limits_t^{t_2}\phi_{j_1}(t_1)dt_1dt_2dt_3dt_4=$$

$$=\int\limits_t^T\phi_{j_3}(t_4)\int\limits_t^{t_4}\phi_{j_2}(t_3)\int\limits_t^{t_3}\phi_{j_1}(t_1)\int\limits_{t_1}^{t_3}\phi_{j_3}(t_2)dt_2dt_1dt_3dt_4=$$

$$=\int\limits_t^T\phi_{j_3}(t_4)\int\limits_t^{t_4}\phi_{j_2}(t_3)\left(\int\limits_t^{t_3}\phi_{j_3}(t_2)dt_2\right)\int\limits_t^{t_3}\phi_{j_1}(t_1)dt_1dt_3dt_4-$$

$$-\int\limits_t^T\phi_{j_3}(t_4)\int\limits_t^{t_4}\phi_{j_2}(t_3)\int\limits_t^{t_3}\phi_{j_1}(t_1)\left(\int\limits_t^{t_1}\phi_{j_3}(t_2)dt_2\right)dt_1dt_3dt_4=$$

$$=\int\limits_t^T\phi_{j_2}(t_3)\left(\int\limits_t^{t_3}\phi_{j_3}(t_2)dt_2\right)\int\limits_t^{t_3}\phi_{j_1}(t_1)dt_1\left(\int\limits_{t_3}^T\phi_{j_3}(t_4)dt_4\right)dt_3-$$

$$
-\int\limits_t^T \phi_{j_2}(t_3)\int\limits_t^{t_3}\phi_{j_1}(t_1)\left(\int\limits_t^{t_1}\phi_{j_3}(t_2)dt_2\right)dt_1\left(\int\limits_{t_3}^T\phi_{j_3}(t_4)dt_4\right)dt_3.
$$

Let us prove (232). From (65) we obtain

$$
\sum_{j_1=p+1}^{\infty}\sum_{j_2=p+1}^{\infty}\sum_{j_3=p+1}^{\infty}C_{j_3j_2j_3j_1j_2j_1}=-\sum_{j_1=0}^{p}\sum_{j_2=0}^{p}\sum_{j_3=0}^{p}C_{j_3j_2j_3j_1j_2j_1}. \tag{263}
$$

Applying (245) and (263), we get (we replaced j_3 by j_4)

$$
\sum_{j_1,j_2,j_4=0}^{p}C_{j_4j_2j_4j_1j_2j_1}+\sum_{j_1,j_2,j_4=0}^{p}C_{j_1j_2j_1j_4j_2j_4}=2\sum_{j_1,j_2,j_4=0}^{p}C_{j_4j_2j_4j_1j_2j_1}=
$$

$$
=\sum_{j_1,j_2,j_4=0}^{p}\Biggl(C_{j_4}C_{j_2j_4j_1j_2j_1}-C_{j_2j_4}C_{j_4j_1j_2j_1}+C_{j_4j_2j_4}C_{j_1j_2j_1}-
$$

$$
-C_{j_1j_4j_2j_4}C_{j_2j_1}+C_{j_2j_1j_4j_2j_4}C_{j_1}\Biggr)=
$$

$$
=2\sum_{j_1,j_2,j_4=0}^{p}\Bigl(C_{j_2j_1j_4j_2j_4}C_{j_1}-C_{j_1j_4j_2j_4}C_{j_2j_1}\Bigr)+
$$

$$
+\sum_{j_1,j_2,j_4=0}^{p}C_{j_4j_2j_4}C_{j_1j_2j_1}. \tag{264}
$$

Further, we have (see (65))

$$
\lim_{p\to\infty}\sum_{j_1,j_2,j_4=0}^{p}C_{j_4j_2j_4}C_{j_1j_2j_1}=\lim_{p\to\infty}\sum_{j_2=0}^{p}\left(\sum_{j_1=0}^{p}C_{j_1j_2j_1}\right)^2=
$$

$$
=\lim_{p\to\infty}\sum_{j_2=0}^{p}\left(\sum_{j_1=p+1}^{\infty}C_{j_1j_2j_1}\right)^2=0, \tag{265}
$$

where we applied the equality (114).

Furthermore, by analogy with the proof of (230), we have

$$
\lim_{p\to\infty}\sum_{j_1,j_2,j_4=0}^{p}\Bigl(C_{j_2j_1j_4j_2j_4}C_{j_1}-C_{j_1j_4j_2j_4}C_{j_2j_1}\Bigr)=0. \tag{266}
$$

To estimate the Fourier coefficient $C_{j_1j_4j_2j_4}$ in (266), we use the following (see the proof of (230) for more details)

$$C_{j_1j_4j_2j_4}=\int\limits_t^T\phi_{j_1}(t_4)\int\limits_t^{t_4}\phi_{j_4}(t_3)\int\limits_t^{t_3}\phi_{j_2}(t_2)\left(\int\limits_t^{t_2}\phi_{j_4}(t_1)dt_1\right)dt_2dt_3dt_4=$$

$$=\int\limits_t^T\phi_{j_1}(t_4)\int\limits_t^{t_4}\phi_{j_2}(t_2)\left(\int\limits_t^{t_2}\phi_{j_4}(t_1)dt_1\right)\int\limits_{t_2}^{t_4}\phi_{j_4}(t_3)dt_3dt_2dt_4=$$

$$=\int\limits_t^T\phi_{j_1}(t_4)\left(\int\limits_t^{t_4}\phi_{j_4}(t_3)dt_3\right)\int\limits_t^{t_4}\phi_{j_2}(t_2)\left(\int\limits_t^{t_2}\phi_{j_4}(t_1)dt_1\right)dt_2dt_4-$$

$$-\int\limits_t^T\phi_{j_1}(t_4)\int\limits_t^{t_4}\phi_{j_2}(t_2)\left(\int\limits_t^{t_2}\phi_{j_4}(t_3)dt_3\right)\left(\int\limits_t^{t_2}\phi_{j_4}(t_1)dt_1\right)dt_2dt_4.$$

The relations (263)–(266) complete the proof of equality (232).
Let us prove (233). Using (65), we get

$$\sum_{j_1=p+1}^{\infty}\sum_{j_2=p+1}^{\infty}\sum_{j_3=p+1}^{\infty}C_{j_1j_2j_3j_3j_2j_1}=\sum_{j_1=0}^{p}\sum_{j_2=0}^{p}\sum_{j_3=p+1}^{\infty}C_{j_1j_2j_3j_3j_2j_1}. \tag{267}$$

Applying (245) and (267), we obtain

$$2\sum_{j_1,j_2=0}^{p}\sum_{j_3=p+1}^{\infty}C_{j_1j_2j_3j_3j_2j_1}=$$

$$=\sum_{j_1,j_2=0}^{p}\sum_{j_3=p+1}^{\infty}\Biggl(C_{j_1}C_{j_2j_3j_3j_2j_1}-C_{j_2j_1}C_{j_3j_3j_2j_1}+\left(C_{j_3j_2j_1}\right)^2-$$

$$-C_{j_3j_3j_2j_1}C_{j_2j_1}+C_{j_2j_3j_3j_2j_1}C_{j_1}\Biggr)=$$

$$=2\sum_{j_1,j_2=0}^{p}\sum_{j_3=p+1}^{\infty}\left(C_{j_1}C_{j_2j_3j_3j_2j_1}-C_{j_2j_1}C_{j_3j_3j_2j_1}\right)+$$

$$+\sum_{j_1,j_2=0}^{p}\sum_{j_3=p+1}^{\infty}\left(C_{j_3j_2j_1}\right)^2. \tag{268}$$

In [12] (Sect. 1.7.2) the following estimate

$$\sum_{j_1=0}^{\infty}\ldots\sum_{j_{s-1}=0}^{\infty}\sum_{j_s=p+1}^{\infty}\sum_{j_{s+1}=0}^{\infty}\ldots\sum_{j_k=0}^{\infty}C_{j_k\ldots j_1}^2\le$$

$$\leq L_k \sum_{j_s=p+1}^{\infty} \frac{1}{j_s^2} \leq L_k \int\limits_{p}^{\infty} \frac{dx}{x^2} = \frac{L_k}{p} \tag{269}$$

is proved for the polynomial and trigonometric cases, where $s = 1, \ldots, k$, constant L_k depends on k and $T - t$.

Using the estimate (269), we get

$$\lim_{p\to\infty} \sum_{j_1,j_2=0}^{p} \sum_{j_3=p+1}^{\infty} \left(C_{j_3j_2j_1}\right)^2 = 0. \tag{270}$$

By analogy with the proof of (230), we have

$$\lim_{p\to\infty} \sum_{j_1,j_2=0}^{p} \sum_{j_3=p+1}^{\infty} \Biggl(C_{j_1}C_{j_2j_3j_3j_2j_1} - C_{j_2j_1}C_{j_3j_3j_2j_1}\Biggr) = 0, \tag{271}$$

where we applied the equality (142). To estimate the Fourier coefficient $C_{j_3j_3j_2j_1}$ in (271), we used the following (see the proof of (230) for more details)

$$C_{j_3j_3j_2j_1} = \int\limits_{t}^{T} \phi_{j_3}(t_4) \int\limits_{t}^{t_4} \phi_{j_3}(t_3) \int\limits_{t}^{t_3} \phi_{j_2}(t_2) \int\limits_{t}^{t_2} \phi_{j_1}(t_1) dt_1 dt_2 dt_3 dt_4 =$$

$$= \int\limits_{t}^{T} \phi_{j_1}(t_1) \int\limits_{t_1}^{T} \phi_{j_2}(t_2) \int\limits_{t_2}^{T} \phi_{j_3}(t_3) \int\limits_{t_3}^{T} \phi_{j_3}(t_4) dt_4 dt_3 dt_2 dt_1 =$$

$$= \frac{1}{2} \int\limits_{t}^{T} \phi_{j_1}(t_1) \int\limits_{t_1}^{T} \phi_{j_2}(t_2) \left(\int\limits_{t_2}^{T} \phi_{j_3}(t_3) dt_3\right)^2 dt_2 dt_1. \tag{272}$$

Combining the equalities (267)–(271), we obtain (233).

Let us prove (234) (we replace j_2 by j_4 and j_3 by j_2 in (234)). As noted in Sect. 5, the sequential order of the series

$$\sum_{j_1=p+1}^{\infty} \sum_{j_2=p+1}^{\infty} \sum_{j_4=p+1}^{\infty}$$

is not important. This follows directly from the formulas (72) and (65).

Applying the mentioned property and (65), we get

$$\sum_{j_1=p+1}^{\infty} \sum_{j_2=p+1}^{\infty} \sum_{j_4=p+1}^{\infty} C_{j_1j_4j_4j_2j_2j_1} = -\sum_{j_1=0}^{p} \sum_{j_2=p+1}^{\infty} \sum_{j_4=p+1}^{\infty} C_{j_1j_4j_4j_2j_2j_1}. \tag{273}$$

Observe that (see the above reasoning)

$$\sum_{j_2=p+1}^{\infty}\sum_{j_4=p+1}^{\infty}C_{j_1j_4j_4j_2j_2j_1}=\sum_{j_4=p+1}^{\infty}\sum_{j_2=p+1}^{\infty}C_{j_1j_4j_4j_2j_2j_1}. \tag{274}$$

Using (245) and (274), we obtain

$$\sum_{j_1=0}^{p}\sum_{j_2=p+1}^{\infty}\sum_{j_4=p+1}^{\infty}\Bigl(C_{j_1j_4j_4j_2j_2j_1}+C_{j_1j_2j_2j_4j_4j_1}\Bigr)=2\sum_{j_1=0}^{p}\sum_{j_2=p+1}^{\infty}\sum_{j_4=p+1}^{\infty}C_{j_1j_4j_4j_2j_2j_1}=$$

$$=\sum_{j_1=0}^{p}\sum_{j_2=p+1}^{\infty}\sum_{j_4=p+1}^{\infty}\Bigl(C_{j_1}C_{j_4j_4j_2j_2j_1}-C_{j_4j_1}C_{j_4j_2j_2j_1}+C_{j_4j_4j_1}C_{j_2j_2j_1}-$$

$$-C_{j_2j_4j_4j_1}C_{j_2j_1}+C_{j_2j_2j_4j_4j_1}C_{j_1}\Bigr)=$$

$$=\sum_{j_1=0}^{p}\sum_{j_2=p+1}^{\infty}\sum_{j_4=p+1}^{\infty}\Bigl(C_{j_1}C_{j_4j_4j_2j_2j_1}-C_{j_4j_1}C_{j_4j_2j_2j_1}-C_{j_2j_4j_4j_1}C_{j_2j_1}+C_{j_2j_2j_4j_4j_1}C_{j_1}\Bigr)+$$

$$+\sum_{j_1=0}^{p}\left(\sum_{j_2=p+1}^{\infty}C_{j_2j_2j_1}\right)^2. \tag{275}$$

The equality

$$\lim_{p\to\infty}\sum_{j_1=0}^{p}\left(\sum_{j_2=p+1}^{\infty}C_{j_2j_2j_1}\right)^2=0 \tag{276}$$

follows from the relation (113).

By analogy with the proof of equality (230) we obtain

$$\lim_{p\to\infty}\sum_{j_1=0}^{p}\sum_{j_2=p+1}^{\infty}\sum_{j_4=p+1}^{\infty}\Bigl(C_{j_1}C_{j_4j_4j_2j_2j_1}-C_{j_4j_1}C_{j_4j_2j_2j_1}-$$

$$-C_{j_2j_4j_4j_1}C_{j_2j_1}+C_{j_2j_2j_4j_4j_1}C_{j_1}\Bigr)=0, \tag{277}$$

where we applied the equality (143). To estimate the Fourier coefficient $C_{j_2j_4j_4j_1}$ in (277), we used the following (see the proof of (230) for more details)

$$C_{j_2j_4j_4j_1}=\int\limits_t^T\phi_{j_2}(t_4)\int\limits_t^{t_4}\phi_{j_4}(t_3)\int\limits_t^{t_3}\phi_{j_4}(t_2)\int\limits_t^{t_2}\phi_{j_1}(t_1)dt_1dt_2dt_3dt_4=$$

$$=\int\limits_t^T\phi_{j_2}(t_4)\int\limits_t^{t_4}\phi_{j_1}(t_1)\int\limits_{t_1}^{t_4}\phi_{j_4}(t_2)\int\limits_{t_2}^{t_4}\phi_{j_4}(t_3)dt_3dt_2dt_1dt_4=$$

$$=\frac{1}{2}\int\limits_t^T\phi_{j_2}(t_4)\int\limits_t^{t_4}\phi_{j_1}(t_1)\left(\int\limits_{t_1}^{t_4}\phi_{j_4}(t_2)dt_2\right)^2dt_1dt_4=$$

$$=\frac{1}{2}\int\limits_t^T\phi_{j_2}(t_4)\left(\int\limits_t^{t_4}\phi_{j_4}(t_2)dt_2\right)^2\int\limits_t^{t_4}\phi_{j_1}(t_1)dt_1dt_4+$$

$$+\frac{1}{2}\int\limits_t^T\phi_{j_2}(t_4)\int\limits_t^{t_4}\phi_{j_1}(t_1)\left(\int\limits_t^{t_1}\phi_{j_4}(t_2)dt_2\right)^2dt_1dt_4-$$

$$-\int\limits_t^T\phi_{j_2}(t_4)\left(\int\limits_t^{t_4}\phi_{j_4}(t_2)dt_2\right)\int\limits_t^{t_4}\phi_{j_1}(t_1)\left(\int\limits_t^{t_1}\phi_{j_4}(t_2)dt_2\right)dt_1dt_4.$$

The relation (234) follows from (273), (275)–(277).

Consider (235). Using the integration order replacement, we obtain

$$C_{j_3j_3j_2j_2j_1j_1}=$$

$$=\frac{1}{2}\int\limits_t^T\phi_{j_3}(t_6)\int\limits_t^{t_6}\phi_{j_3}(t_5)\int\limits_t^{t_5}\phi_{j_2}(t_4)\int\limits_t^{t_4}\phi_{j_2}(t_3)\left(\int\limits_t^{t_3}\phi_{j_1}(t_1)dt_1\right)^2dt_3dt_4dt_5dt_6=$$

$$=\frac{1}{2}\int\limits_t^T\phi_{j_2}(t_3)\left(\int\limits_t^{t_3}\phi_{j_1}(t_1)dt_1\right)^2\int\limits_{t_3}^T\phi_{j_2}(t_4)\int\limits_{t_4}^T\phi_{j_3}(t_5)\int\limits_{t_5}^T\phi_{j_3}(t_6)dt_6dt_5dt_4dt_3=$$

$$=\frac{1}{4}\int\limits_t^T\phi_{j_2}(t_3)\left(\int\limits_t^{t_3}\phi_{j_1}(t_1)dt_1\right)^2\int\limits_{t_3}^T\phi_{j_2}(t_4)\left(\int\limits_{t_4}^T\phi_{j_3}(t_5)dt_5\right)^2dt_4dt_3. \qquad (278)$$

Applying the estimates (261) to (278) gives the following estimate

$$|C_{j_3j_3j_2j_2j_1j_1}|\le\frac{K}{j_1^2j_3^2}\quad (j_1,j_3>0,\ j_2\ge 0), \qquad (279)$$

where constant K does not depend on j_1,j_2,j_3.

Further, we get (see (72))

$$\sum_{j_1=p+1}^{\infty}\sum_{j_2=p+1}^{\infty}\sum_{j_3=p+1}^{\infty}C_{j_3j_3j_2j_2j_1j_1}=\sum_{j_1=p+1}^{\infty}\sum_{j_3=p+1}^{\infty}\sum_{j_2=p+1}^{\infty}C_{j_3j_3j_2j_2j_1j_1}=$$

$$=\frac{1}{2}\sum_{j_1=p+1}^{\infty}\sum_{j_3=p+1}^{\infty}C_{j_3j_3j_2j_2j_1j_1}\Biggl|_{(j_2j_2)\frown(\cdot)}-\sum_{j_2=0}^{p}\sum_{j_1=p+1}^{\infty}\sum_{j_3=p+1}^{\infty}C_{j_3j_3j_2j_2j_1j_1}, \qquad (280)$$

where

$$C_{j_3j_3j_2j_2j_1j_1}\Biggl|_{(j_2j_2)\frown(\cdot)}=$$

$$=\int\limits_t^T\phi_{j_3}(t_6)\int\limits_t^{t_6}\phi_{j_3}(t_5)\int\limits_t^{t_5}\int\limits_t^{t_4}\phi_{j_1}(t_2)\int\limits_t^{t_2}\phi_{j_1}(t_1)dt_1dt_2dt_4dt_5dt_6=$$

$$=\int\limits_t^T\phi_{j_3}(t_6)\int\limits_t^{t_6}\phi_{j_3}(t_5)\int\limits_t^{t_5}\phi_{j_1}(t_2)\int\limits_t^{t_2}\phi_{j_1}(t_1)dt_1\int\limits_{t_2}^{t_5}dt_4dt_2dt_5dt_6=$$

$$=\int\limits_t^T\phi_{j_3}(t_6)\int\limits_t^{t_6}\phi_{j_3}(t_5)(t_5-t)\int\limits_t^{t_5}\phi_{j_1}(t_2)\int\limits_t^{t_2}\phi_{j_1}(t_1)dt_1dt_2dt_5dt_6+$$

$$+\int\limits_t^T\phi_{j_3}(t_6)\int\limits_t^{t_6}\phi_{j_3}(t_5)\int\limits_t^{t_5}\phi_{j_1}(t_2)(t-t_2)\int\limits_t^{t_2}\phi_{j_1}(t_1)dt_1dt_2dt_5dt_6\stackrel{\sf def}{=}$$

$$\stackrel{\sf def}{=}C'_{j_3j_3j_1j_1}+C''_{j_3j_3j_1j_1}. \tag{281}$$

Let us substitute (281) into (280)

$$\sum_{j_1=p+1}^{\infty}\sum_{j_2=p+1}^{\infty}\sum_{j_3=p+1}^{\infty}C_{j_3j_3j_2j_2j_1j_1}=\frac{1}{2}\sum_{j_1=p+1}^{\infty}\sum_{j_3=p+1}^{\infty}C'_{j_3j_3j_1j_1}+$$

$$+\frac{1}{2}\sum_{j_1=p+1}^{\infty}\sum_{j_3=p+1}^{\infty}C''_{j_3j_3j_1j_1}-\sum_{j_2=0}^{p}\sum_{j_1=p+1}^{\infty}\sum_{j_3=p+1}^{\infty}C_{j_3j_3j_2j_2j_1j_1}. \tag{282}$$

The relation (143) implies that

$$\lim_{p\to\infty}\sum_{j_1=p+1}^{\infty}\sum_{j_3=p+1}^{\infty}C'_{j_3j_3j_1j_1}=0,\quad \lim_{p\to\infty}\sum_{j_1=p+1}^{\infty}\sum_{j_3=p+1}^{\infty}C''_{j_3j_3j_1j_1}=0. \tag{283}$$

From the estimate (279) we get

$$\left|\sum_{j_2=0}^{p}\sum_{j_1=p+1}^{\infty}\sum_{j_3=p+1}^{\infty}C_{j_3j_3j_2j_2j_1j_1}\right|\le K(p+1)\sum_{j_1=p+1}^{\infty}\frac{1}{j_1^2}\sum_{j_3=p+1}^{\infty}\frac{1}{j_3^2}\le$$

$$\le K(p+1)\left(\int\limits_p^{\infty}\frac{dx}{x^2}\right)^2\le\frac{K(p+1)}{p^2}\ \to\ 0 \tag{284}$$

if $p\to\infty$, where constant K is independent of p.

The relations (282)–(284) complete the proof of (235).

Let us prove (236). Using the integration order replacement, we get

$$C_{j_2j_3j_3j_2j_1j_1}=$$

$$=\frac{1}{2}\int\limits_t^T\phi_{j_2}(t_6)\int\limits_t^{t_6}\phi_{j_3}(t_5)\int\limits_t^{t_5}\phi_{j_3}(t_4)\int\limits_t^{t_4}\phi_{j_2}(t_3)\left(\int\limits_t^{t_3}\phi_{j_1}(t_1)dt_1\right)^2dt_3dt_4dt_5dt_6=$$

$$=\frac{1}{2}\int\limits_t^T\phi_{j_2}(t_3)\left(\int\limits_t^{t_3}\phi_{j_1}(t_1)dt_1\right)^2\int\limits_{t_3}^T\phi_{j_3}(t_4)\int\limits_{t_4}^T\phi_{j_3}(t_5)\int\limits_{t_5}^T\phi_{j_2}(t_6)dt_6dt_5dt_4dt_3=$$

$$=\frac{1}{2}\int\limits_t^T\phi_{j_2}(t_3)\left(\int\limits_t^{t_3}\phi_{j_1}(t_1)dt_1\right)^2\int\limits_{t_3}^T\phi_{j_3}(t_5)\int\limits_{t_5}^T\phi_{j_2}(t_6)dt_6\int\limits_{t_3}^{t_5}\phi_{j_3}(t_4)dt_4dt_5dt_3=$$

$$=\frac{1}{2}\int\limits_t^T\phi_{j_2}(t_3)\left(\int\limits_t^{t_3}\phi_{j_1}(t_1)dt_1\right)^2\int\limits_{t_3}^T\phi_{j_3}(t_5)\left(\int\limits_{t_5}^T\phi_{j_2}(t_6)dt_6\right)\left(\int\limits_t^{t_5}\phi_{j_3}(t_4)dt_4\right)dt_5dt_3-$$

$$-\frac{1}{2}\int\limits_t^T\phi_{j_2}(t_3)\left(\int\limits_t^{t_3}\phi_{j_1}(t_1)dt_1\right)^2\left(\int\limits_t^{t_3}\phi_{j_3}(t_4)dt_4\right)\int\limits_{t_3}^T\phi_{j_3}(t_5)\left(\int\limits_{t_5}^T\phi_{j_2}(t_6)dt_6\right)dt_5dt_3. \tag{285}$$

Applying (65) and (72), we obtain

$$-\sum_{j_1=p+1}^{\infty}\sum_{j_2=p+1}^{\infty}\sum_{j_3=p+1}^{\infty}C_{j_2j_3j_3j_2j_1j_1}=-\sum_{j_1=p+1}^{\infty}\sum_{j_3=p+1}^{\infty}\sum_{j_2=p+1}^{\infty}C_{j_2j_3j_3j_2j_1j_1}=$$

$$=\sum_{j_2=0}^{p}\sum_{j_1=p+1}^{\infty}\sum_{j_3=p+1}^{\infty}C_{j_2j_3j_3j_2j_1j_1}=$$

$$=\frac{1}{2}\sum_{j_2=0}^{p}\sum_{j_1=p+1}^{\infty}C_{j_2j_3j_3j_2j_1j_1}\Biggl|_{(j_3j_3)\frown(\cdot)}-\sum_{j_2=0}^{p}\sum_{j_3=0}^{p}\sum_{j_1=p+1}^{\infty}C_{j_2j_3j_3j_2j_1j_1}=$$

$$=\frac{1}{2}\sum_{j_2=0}^{p}\sum_{j_1=p+1}^{\infty}C_{j_2j_3j_3j_2j_1j_1}\Biggl|_{(j_3j_3)\frown(\cdot)}-\sum_{j_1=p+1}^{\infty}C_{0000j_1j_1}-$$

$$-\sum_{j_3=1}^{p}\sum_{j_1=p+1}^{\infty}C_{0j_3j_30j_1j_1}-\sum_{j_2=1}^{p}\sum_{j_1=p+1}^{\infty}C_{j_200j_2j_1j_1}-$$

$$-\sum_{j_2=1}^{p}\sum_{j_3=1}^{p}\sum_{j_1=p+1}^{\infty}C_{j_2j_3j_3j_2j_1j_1}. \tag{286}$$

The equality

$$\lim_{p\to\infty}\frac{1}{2}\sum_{j_2=0}^{p}\sum_{j_1=p+1}^{\infty}C_{j_2j_3j_3j_2j_1j_1}\Biggl|_{(j_3j_3)\curvearrowright(\cdot)}=0 \tag{287}$$

follows from the inequality similar to (169) (see the proof of Theorem 16), where we used the following representation

$$C_{j_2j_3j_3j_2j_1j_1}\Biggl|_{(j_3j_3)\curvearrowright(\cdot)}=$$

$$=\int\limits_t^T\phi_{j_2}(t_6)\int\limits_t^{t_6}\int\limits_t^{t_4}\phi_{j_2}(t_3)\int\limits_t^{t_3}\phi_{j_1}(t_2)\int\limits_t^{t_2}\phi_{j_1}(t_1)dt_1dt_2dt_3dt_4dt_6=$$

$$=\int\limits_t^T\phi_{j_2}(t_6)\int\limits_t^{t_6}\phi_{j_2}(t_3)\int\limits_t^{t_3}\phi_{j_1}(t_2)\int\limits_t^{t_2}\phi_{j_1}(t_1)dt_1dt_2\int\limits_{t_3}^{t_6}dt_4dt_3dt_6=$$

$$+\int\limits_t^T\phi_{j_2}(t_6)(t_6-t)\int\limits_t^{t_6}\phi_{j_2}(t_3)\int\limits_t^{t_3}\phi_{j_1}(t_2)\int\limits_t^{t_2}\phi_{j_1}(t_1)dt_1dt_2dt_3dt_6+$$

$$+\int\limits_t^T\phi_{j_2}(t_6)\int\limits_t^{t_6}\phi_{j_2}(t_3)(t-t_3)\int\limits_t^{t_3}\phi_{j_1}(t_2)\int\limits_t^{t_2}\phi_{j_1}(t_1)dt_1dt_2dt_3dt_6\stackrel{\sf def}{=}$$

$$\stackrel{\sf def}{=}C^{*}_{j_2j_2j_1j_1}+C^{**}_{j_2j_2j_1j_1}. \tag{288}$$

Applying the estimates (261) and (129) ($\varepsilon=1/2$) to (285) gives the following estimates

$$|C_{j_2j_3j_3j_2j_1j_1}|\le\frac{K}{j_1^2j_2j_3^{3/4}}\quad (j_1,j_2,j_3>0), \tag{289}$$

$$|C_{j_200j_2j_1j_1}|\le\frac{K}{j_1^2j_2}\quad (j_1,j_2>0), \tag{290}$$

$$|C_{0j_3j_30j_1j_1}|\le\frac{K}{j_1^2j_3}\quad (j_1,j_3>0), \tag{291}$$

$$|C_{0000j_1j_1}|\le\frac{K}{j_1^2}\quad (j_1>0). \tag{292}$$

Using the estimate (289), we have

$$\left|\sum_{j_2=1}^{p}\sum_{j_3=1}^{p}\sum_{j_1=p+1}^{\infty}C_{j_2j_3j_3j_2j_1j_1}\right|\le K\sum_{j_1=p+1}^{\infty}\frac{1}{j_1^2}\sum_{j_2=1}^{p}\frac{1}{j_2}\sum_{j_3=1}^{p}\frac{1}{j_3^{3/4}}\le$$

$$\leq K\int\limits_{p}^{\infty}\frac{dx}{x^2}\left(1+\int\limits_{1}^{p}\frac{dx}{x}\right)\left(1+\int\limits_{1}^{p}\frac{dx}{x^{3/4}}\right)\leq K_1\frac{1+lnp}{p^{3/4}}\ \to 0 \tag{293}$$

if $p\to\infty$, where constants K, K_1 do not depend on p.

Similarly we get (see (290)–(292))

$$\left|\sum_{j_1=p+1}^{\infty}C_{0000j_1j_1}\right|+\left|\sum_{j_3=1}^{p}\sum_{j_1=p+1}^{\infty}C_{0j_3j_30j_1j_1}\right|+\left|\sum_{j_2=1}^{p}\sum_{j_1=p+1}^{\infty}C_{j_200j_2j_1j_1}\right|\to 0 \tag{294}$$

if $p\to\infty$.

The relations (286), (287), (293), (294) prove (236).

Consider (237). Using the integration order replacement, we get

$$C_{j_3j_2j_3j_2j_1j_1}=$$

$$=\frac{1}{2}\int\limits_{t}^{T}\phi_{j_3}(t_6)\int\limits_{t}^{t_6}\phi_{j_2}(t_5)\int\limits_{t}^{t_5}\phi_{j_3}(t_4)\int\limits_{t}^{t_4}\phi_{j_2}(t_3)\left(\int\limits_{t}^{t_3}\phi_{j_1}(t_1)dt_1\right)^2dt_3dt_4dt_5dt_6=$$

$$=\frac{1}{2}\int\limits_{t}^{T}\phi_{j_2}(t_3)\left(\int\limits_{t}^{t_3}\phi_{j_1}(t_1)dt_1\right)^2\int\limits_{t_3}^{T}\phi_{j_3}(t_4)\int\limits_{t_4}^{T}\phi_{j_2}(t_5)\int\limits_{t_5}^{T}\phi_{j_3}(t_6)dt_6dt_5dt_4dt_3=$$

$$=\frac{1}{2}\int\limits_{t}^{T}\phi_{j_2}(t_3)\left(\int\limits_{t}^{t_3}\phi_{j_1}(t_1)dt_1\right)^2\int\limits_{t_3}^{T}\phi_{j_2}(t_5)\int\limits_{t_5}^{T}\phi_{j_3}(t_6)dt_6\int\limits_{t_3}^{t_5}\phi_{j_3}(t_4)dt_4dt_5dt_3=$$

$$=\frac{1}{2}\int\limits_{t}^{T}\phi_{j_2}(t_3)\left(\int\limits_{t}^{t_3}\phi_{j_1}(t_1)dt_1\right)^2\int\limits_{t_3}^{T}\phi_{j_2}(t_5)\left(\int\limits_{t}^{t_5}\phi_{j_3}(t_4)dt_4\right)\left(\int\limits_{t_5}^{T}\phi_{j_3}(t_6)dt_6\right)dt_5dt_3-$$

$$-\frac{1}{2}\int\limits_{t}^{T}\phi_{j_2}(t_3)\left(\int\limits_{t}^{t_3}\phi_{j_1}(t_1)dt_1\right)^2\left(\int\limits_{t}^{t_3}\phi_{j_3}(t_4)dt_4\right)\int\limits_{t_3}^{T}\phi_{j_2}(t_5)\left(\int\limits_{t_5}^{T}\phi_{j_3}(t_6)dt_6\right)dt_5dt_3. \tag{295}$$

Applying (65), we obtain

$$\sum_{j_1=p+1}^{\infty}\sum_{j_2=p+1}^{\infty}\sum_{j_3=p+1}^{\infty}C_{j_3j_2j_3j_2j_1j_1}=\sum_{j_1=p+1}^{\infty}\sum_{j_3=p+1}^{\infty}\sum_{j_2=p+1}^{\infty}C_{j_3j_2j_3j_2j_1j_1}=$$

$$=-\sum_{j_2=0}^{p}\sum_{j_1=p+1}^{\infty}\sum_{j_3=p+1}^{\infty}C_{j_3j_2j_3j_2j_1j_1}. \tag{296}$$

Further proof of the equality (237) is based on the relations (295), (296) and is similar to the proof of the formula (236).

Let us prove (238). Applying the integration order replacement, we obtain

$$C_{j_3j_3j_2j_1j_2j_1}=$$

$$=\int\limits_t^T\phi_{j_3}(t_6)\int\limits_t^{t_6}\phi_{j_3}(t_5)\int\limits_t^{t_5}\phi_{j_2}(t_4)\int\limits_t^{t_4}\phi_{j_1}(t_3)\int\limits_t^{t_3}\phi_{j_2}(t_2)\int\limits_t^{t_2}\phi_{j_1}(t_1)dt_1dt_2dt_3dt_4dt_5dt_6=$$

$$=\int\limits_t^T\phi_{j_1}(t_1)\int\limits_{t_1}^T\phi_{j_2}(t_2)\int\limits_{t_2}^T\phi_{j_1}(t_3)\int\limits_{t_3}^T\phi_{j_2}(t_4)\int\limits_{t_4}^T\phi_{j_3}(t_5)\int\limits_{t_5}^T\phi_{j_3}(t_6)dt_6dt_5dt_4dt_3dt_2dt_1=$$

$$=\frac{1}{2}\int\limits_t^T\phi_{j_1}(t_1)\int\limits_{t_1}^T\phi_{j_2}(t_2)\int\limits_{t_2}^T\phi_{j_1}(t_3)\int\limits_{t_3}^T\phi_{j_2}(t_4)\left(\int\limits_{t_4}^T\phi_{j_3}(t_5)dt_5\right)^2dt_4dt_3dt_2dt_1=$$

$$=\frac{1}{2}\int\limits_t^T\phi_{j_2}(t_4)\left(\int\limits_{t_4}^T\phi_{j_3}(t_5)dt_5\right)^2\int\limits_t^{t_4}\phi_{j_1}(t_3)\int\limits_t^{t_3}\phi_{j_2}(t_2)\int\limits_t^{t_2}\phi_{j_1}(t_1)dt_1dt_2dt_3dt_4=$$

$$=\frac{1}{2}\int\limits_t^T\phi_{j_2}(t_4)\left(\int\limits_{t_4}^T\phi_{j_3}(t_5)dt_5\right)^2\int\limits_t^{t_4}\phi_{j_2}(t_2)\int\limits_t^{t_2}\phi_{j_1}(t_1)dt_1\int\limits_{t_2}^{t_4}\phi_{j_1}(t_3)dt_3dt_2dt_4=$$

$$=\frac{1}{2}\int\limits_t^T\phi_{j_2}(t_4)\left(\int\limits_{t_4}^T\phi_{j_3}(t_5)dt_5\right)^2\left(\int\limits_t^{t_4}\phi_{j_1}(t_3)dt_3\right)\int\limits_t^{t_4}\phi_{j_2}(t_2)\left(\int\limits_t^{t_2}\phi_{j_1}(t_1)dt_1\right)dt_2dt_4-$$

$$-\frac{1}{2}\int\limits_t^T\phi_{j_2}(t_4)\left(\int\limits_{t_4}^T\phi_{j_3}(t_5)dt_5\right)^2\int\limits_t^{t_4}\phi_{j_2}(t_2)\left(\int\limits_t^{t_2}\phi_{j_1}(t_1)dt_1\right)^2dt_2dt_4. \tag{297}$$

Using (65), we get

$$\sum_{j_1=p+1}^{\infty}\sum_{j_2=p+1}^{\infty}\sum_{j_3=p+1}^{\infty}C_{j_3j_3j_2j_1j_2j_1}=\sum_{j_1=p+1}^{\infty}\sum_{j_3=p+1}^{\infty}\sum_{j_2=p+1}^{\infty}C_{j_3j_3j_2j_1j_2j_1}=$$

$$=-\sum_{j_2=0}^{p}\sum_{j_1=p+1}^{\infty}\sum_{j_3=p+1}^{\infty}C_{j_3j_3j_2j_1j_2j_1}. \tag{298}$$

Further proof of the equality (238) is based on the relations (297), (298) and is similar to the proof of the relations (236), (237).

Consider (239). Using the integration order replacement, we have

$$C_{j_3j_3j_1j_2j_2j_1}=$$

$$=\int\limits_t^T \phi_{j_3}(t_6)\int\limits_t^{t_6}\phi_{j_3}(t_5)\int\limits_t^{t_5}\phi_{j_1}(t_4)\int\limits_t^{t_4}\phi_{j_2}(t_3)\int\limits_t^{t_3}\phi_{j_2}(t_2)\int\limits_t^{t_2}\phi_{j_1}(t_1)dt_1dt_2dt_3dt_4dt_5dt_6=$$

$$=\int\limits_t^T \phi_{j_1}(t_1)\int\limits_{t_1}^{T}\phi_{j_2}(t_2)\int\limits_{t_2}^{T}\phi_{j_2}(t_3)\int\limits_{t_3}^{T}\phi_{j_1}(t_4)\int\limits_{t_4}^{T}\phi_{j_3}(t_5)\int\limits_{t_5}^{T}\phi_{j_3}(t_6)dt_6dt_5dt_4dt_3dt_2dt_1=$$

$$=\frac{1}{2}\int\limits_t^T \phi_{j_1}(t_1)\int\limits_{t_1}^{T}\phi_{j_2}(t_2)\int\limits_{t_2}^{T}\phi_{j_2}(t_3)\int\limits_{t_3}^{T}\phi_{j_1}(t_4)\left(\int\limits_{t_4}^{T}\phi_{j_3}(t_5)dt_5\right)^2 dt_4dt_3dt_2dt_1=$$

$$=\frac{1}{2}\int\limits_t^T \phi_{j_1}(t_4)\left(\int\limits_{t_4}^{T}\phi_{j_3}(t_5)dt_5\right)^2\int\limits_t^{t_4}\phi_{j_2}(t_3)\int\limits_t^{t_3}\phi_{j_2}(t_2)\int\limits_t^{t_2}\phi_{j_1}(t_1)dt_1dt_2dt_3dt_4=$$

$$=\frac{1}{2}\int\limits_t^T \phi_{j_1}(t_4)\left(\int\limits_{t_4}^{T}\phi_{j_3}(t_5)dt_5\right)^2\int\limits_t^{t_4}\phi_{j_2}(t_2)\int\limits_t^{t_2}\phi_{j_1}(t_1)dt_1\int\limits_{t_2}^{t_4}\phi_{j_2}(t_3)dt_3dt_2dt_4=$$

$$=\frac{1}{2}\int\limits_t^T \phi_{j_1}(t_4)\left(\int\limits_{t_4}^{T}\phi_{j_3}(t_5)dt_5\right)^2\left(\int\limits_t^{t_4}\phi_{j_2}(t_3)dt_3\right)\int\limits_t^{t_4}\phi_{j_2}(t_2)\left(\int\limits_t^{t_2}\phi_{j_1}(t_1)dt_1\right)dt_2dt_4-$$

$$-\frac{1}{2}\int\limits_t^T \phi_{j_1}(t_4)\left(\int\limits_{t_4}^{T}\phi_{j_3}(t_5)dt_5\right)^2\int\limits_t^{t_4}\phi_{j_2}(t_2)\left(\int\limits_t^{t_2}\phi_{j_1}(t_1)dt_1\right)\left(\int\limits_t^{t_2}\phi_{j_2}(t_3)dt_3\right)dt_2dt_4. \qquad (299)$$

Applying (65) and (72), we obtain

$$-\sum_{j_1=p+1}^{\infty}\sum_{j_2=p+1}^{\infty}\sum_{j_3=p+1}^{\infty}C_{j_3j_3j_1j_2j_2j_1}=-\sum_{j_2=p+1}^{\infty}\sum_{j_3=p+1}^{\infty}\sum_{j_1=p+1}^{\infty}C_{j_2j_3j_1j_2j_2j_1}=$$

$$=\sum_{j_1=0}^{p}\sum_{j_2=p+1}^{\infty}\sum_{j_3=p+1}^{\infty}C_{j_2j_3j_1j_2j_2j_1}=\sum_{j_1=0}^{p}\sum_{j_3=p+1}^{\infty}\sum_{j_2=p+1}^{\infty}C_{j_2j_3j_1j_2j_2j_1}=$$

$$=\frac{1}{2}\sum_{j_1=0}^{p}\sum_{j_3=p+1}^{\infty}C_{j_3j_3j_1j_2j_2j_1}\Biggl|_{(j_2j_2)\curvearrowright(\cdot)}-\sum_{j_1=0}^{p}\sum_{j_2=0}^{p}\sum_{j_3=p+1}^{\infty}C_{j_3j_3j_1j_2j_2j_1}. \qquad (300)$$

The equality

$$\lim_{p\to\infty}\frac{1}{2}\sum_{j_1=0}^{p}\sum_{j_3=p+1}^{\infty}C_{j_3j_3j_1j_2j_2j_1}\Biggl|_{(j_2j_2)\curvearrowright(\cdot)}=0 \qquad (301)$$

follows from the inequality (169), where we proceed similarly to the proof of equality (287) (see (288)).

The relation

$$\lim_{p\to\infty}\sum_{j_1=0}^{p}\sum_{j_2=0}^{p}\sum_{j_3=p+1}^{\infty} C_{j_3j_3j_1j_2j_2j_1}=0 \tag{302}$$

is proved on the basis of (299) and similarly with the proof of (236). The equalities (300)–(302) prove (239).

Let us prove (240). Using (65) and (72), we get

$$\sum_{j_1=p+1}^{\infty}\sum_{j_2=p+1}^{\infty}\sum_{j_3=p+1}^{\infty} C_{j_2j_1j_3j_3j_2j_1}=\sum_{j_3=p+1}^{\infty}\sum_{j_1,j_2=0}^{p} C_{j_2j_1j_3j_3j_2j_1}=$$

$$=\frac{1}{2}\sum_{j_1,j_2=0}^{p} C_{j_2j_1j_3j_3j_2j_1}\Biggr|_{(j_3j_3)\curvearrowright(\cdot)}-\sum_{j_1,j_2,j_3=0}^{p} C_{j_2j_1j_3j_3j_2j_1}. \tag{303}$$

Using the equality (141) we have

$$\lim_{p\to\infty}\frac{1}{2}\sum_{j_1,j_2=0}^{p} C_{j_2j_1j_3j_3j_2j_1}\Biggr|_{(j_3j_3)\curvearrowright(\cdot)}=0, \tag{304}$$

where we proceed similarly to the proof of equality (287) (see (288)).

Further, we will prove the following relation

$$\lim_{p\to\infty}\sum_{j_1,j_2,j_3=0}^{p} C_{j_2j_1j_3j_3j_2j_1}=0 \tag{305}$$

using the equality (245). From (245) we have

$$\sum_{j_1,j_2,j_3=0}^{p} C_{j_2j_1j_3j_3j_2j_1}=\frac{1}{2}\sum_{j_1,j_2,j_3=0}^{p}\Bigl(C_{j_2j_1j_3j_3j_2j_1}+C_{j_1j_2j_3j_3j_1j_2}\Bigr)=$$

$$=\frac{1}{2}\sum_{j_1,j_2,j_3=0}^{p}\Bigl(C_{j_2}C_{j_1j_3j_3j_2j_1}-C_{j_1j_2}C_{j_3j_3j_2j_1}+C_{j_3j_1j_2}C_{j_3j_2j_1}-$$

$$-C_{j_3j_3j_1j_2}C_{j_2j_1}+C_{j_2j_3j_3j_1j_2}C_{j_1}\Bigr)=$$

$$=\sum_{j_1,j_2,j_3=0}^{p}\Bigl(C_{j_2j_3j_3j_1j_2}C_{j_1}-C_{j_3j_3j_1j_2}C_{j_2j_1}\Bigr)+$$

$$+\frac{1}{2}\sum_{j_1,j_2,j_3=0}^{p} C_{j_3j_1j_2}C_{j_3j_2j_1}. \tag{306}$$

The generalized Parseval equality gives (by analogy with (252))

$$\lim_{p\to\infty}\frac{1}{2}\sum_{j_1,j_2,j_3=0}^{p} C_{j_3j_1j_2}C_{j_3j_2j_1}=0. \tag{307}$$

Let us prove the following equality

$$\lim_{p\to\infty}\sum_{j_1,j_2,j_3=0}^{p}\Biggl(C_{j_2j_3j_3j_1j_2}C_{j_1}-C_{j_3j_3j_1j_2}C_{j_2j_1}\Biggr)=0. \tag{308}$$

The relation

$$\lim_{p\to\infty}\sum_{j_1,j_2,j_3=0}^{p} C_{j_2j_3j_3j_1j_2}C_{j_1}=0 \tag{309}$$

is proved by the same methods as in the proof of equality (230) and also using Theorem 16 and (72).

Further, we have (see (72))

$$\sum_{j_3=0}^{p} C_{j_3j_3j_1j_2}=\frac{1}{2}C_{j_3j_3j_1j_2}\Biggl|_{(j_3j_3)\frown(\cdot)}-\sum_{j_3=p+1}^{\infty}C_{j_3j_3j_1j_2}. \tag{310}$$

Moreover,

$$C_{j_3j_3j_1j_2}\Biggl|_{(j_3j_3)\frown(\cdot)}=\int\limits_t^T\int\limits_t^{t_3}\phi_{j_1}(t_2)\int\limits_t^{t_2}\phi_{j_2}(t_1)dt_1dt_2dt_3=$$

$$=\int\limits_t^T\phi_{j_1}(t_2)\int\limits_t^{t_2}\phi_{j_2}(t_1)dt_1\int\limits_{t_2}^{T}dt_3dt_2=\int\limits_t^T(T-t_2)\phi_{j_1}(t_2)\int\limits_t^{t_2}\phi_{j_2}(t_1)dt_1dt_2=$$

$$=\int\limits_t^T\phi_{j_2}(t_1)\int\limits_{t_1}^{T}(T-t_2)\phi_{j_1}(t_2)dt_2dt_1=\int\limits_t^T\phi_{j_2}(t_2)\int\limits_{t_2}^{T}(T-t_1)\phi_{j_1}(t_1)dt_1dt_2=$$

$$=\int\limits_{[t,T]^2}(T-t_1)\mathbf{1}_{\{t_2<t_1\}}\phi_{j_1}(t_1)\phi_{j_2}(t_2)dt_1dt_2\stackrel{\sf def}{=}\tilde{C}_{j_2j_1}. \tag{311}$$

Using (310), (311), and the generalized Parseval equality, we obtain

$$\lim_{p\to\infty}\sum_{j_1,j_2,j_3=0}^{p} C_{j_3j_3j_1j_2}C_{j_2j_1}=\frac{1}{2}\lim_{p\to\infty}\sum_{j_1,j_2=0}^{p}C_{j_2j_1}\tilde{C}_{j_2j_1}-$$

$$-\lim_{p\to\infty}\sum_{j_1,j_2=0}^{p}\sum_{j_3=p+1}^{\infty}C_{j_3j_3j_1j_2}C_{j_2j_1}=-\lim_{p\to\infty}\sum_{j_1,j_2=0}^{p}\sum_{j_3=p+1}^{\infty}C_{j_3j_3j_1j_2}C_{j_2j_1}. \tag{312}$$

We have (see (272))

$$C_{j_3j_3j_1j_2} = \frac{1}{2}\int\limits_t^T \phi_{j_2}(t_1)\int\limits_{t_1}^T \phi_{j_1}(t_2)\left(\int\limits_{t_2}^T \phi_{j_3}(t_3)dt_3\right)^2 dt_2dt_1. \tag{313}$$

By analogy with (262) and also using (313), we get

$$\lim_{p\to\infty}\sum_{j_1,j_2=0}^{p}\sum_{j_3=p+1}^{\infty} C_{j_3j_3j_1j_2}C_{j_2j_1} = 0. \tag{314}$$

Combining (312) and (314), we obtain

$$\lim_{p\to\infty}\sum_{j_1,j_2,j_3=0}^{p} C_{j_3j_3j_1j_2}C_{j_2j_1} = 0. \tag{315}$$

The relation (308) follows from (309) and (315). From (306)–(308) we get (305). The equalities (303)–(305) complete the proof of (240).

For the proof of (241)–(244) we will use a new idea. More precisely, we will consider the sums of expressions (241)–(244) with the expressions already studied throughout this proof.

Let us begin from (241). Applying the integration order replacement, we obtain

$$C_{j_3j_1j_2j_3j_2j_1} + C_{j_3j_1j_2j_3j_1j_2} =$$

$$= \int\limits_t^T \phi_{j_3}(t_6)\int\limits_t^{t_6} \phi_{j_1}(t_5)\int\limits_t^{t_5} \phi_{j_2}(t_4)\int\limits_t^{t_4} \phi_{j_3}(t_3)\left(\int\limits_t^{t_3} \phi_{j_2}(t_2)dt_2\right)\left(\int\limits_t^{t_3} \phi_{j_1}(t_1)dt_1\right)dt_3dt_4dt_5dt_6 =$$

$$= \int\limits_t^T \phi_{j_3}(t_6)\int\limits_t^{t_6} \phi_{j_1}(t_5)\int\limits_t^{t_5} \phi_{j_3}(t_3)\left(\int\limits_t^{t_3} \phi_{j_2}(t_2)dt_2\right)\left(\int\limits_t^{t_3} \phi_{j_1}(t_1)dt_1\right)\int\limits_{t_3}^{t_5} \phi_{j_2}(t_4)dt_4dt_3dt_5dt_6 =$$

$$= \int\limits_t^T \phi_{j_3}(t_6)\int\limits_t^{t_6} \phi_{j_1}(t_5)\left(\int\limits_t^{t_5} \phi_{j_2}(t_4)dt_4\right)\int\limits_t^{t_5} \phi_{j_3}(t_3)\left(\int\limits_t^{t_3} \phi_{j_2}(t_2)dt_2\right)\left(\int\limits_t^{t_3} \phi_{j_1}(t_1)dt_1\right)dt_3dt_5dt_6-$$

$$- \int\limits_t^T \phi_{j_3}(t_6)\int\limits_t^{t_6} \phi_{j_1}(t_5)\int\limits_t^{t_5} \phi_{j_3}(t_3)\left(\int\limits_t^{t_3} \phi_{j_2}(t_2)dt_2\right)^2\left(\int\limits_t^{t_3} \phi_{j_1}(t_1)dt_1\right)dt_3dt_5dt_6 =$$

$$= \int\limits_t^T \phi_{j_1}(t_5)\left(\int\limits_t^{t_5} \phi_{j_2}(t_4)dt_4\right)\int\limits_t^{t_5} \phi_{j_3}(t_3)\left(\int\limits_t^{t_3} \phi_{j_2}(t_2)dt_2\right)\left(\int\limits_t^{t_3} \phi_{j_1}(t_1)dt_1\right)dt_3\left(\int\limits_{t_5}^T \phi_{j_3}(t_6)dt_6\right)dt_5-$$

$$-\int\limits_t^T \phi_{j_1}(t_5)\int\limits_t^{t_5}\phi_{j_3}(t_3)\left(\int\limits_t^{t_3}\phi_{j_2}(t_2)dt_2\right)^2\left(\int\limits_t^{t_3}\phi_{j_1}(t_1)dt_1\right)dt_3\left(\int\limits_{t_5}^{T}\phi_{j_3}(t_6)dt_6\right)dt_5. \tag{316}$$

Using (65), we get

$$\sum_{j_1=p+1}^{\infty}\sum_{j_2=p+1}^{\infty}\sum_{j_3=p+1}^{\infty}\Bigl(C_{j_3j_1j_2j_3j_2j_1}+C_{j_3j_1j_2j_3j_1j_2}\Bigr)=$$

$$=\sum_{j_1=0}^{p}\sum_{j_3=0}^{p}\sum_{j_2=p+1}^{\infty}\Bigl(C_{j_3j_1j_2j_3j_2j_1}+C_{j_3j_1j_2j_3j_1j_2}\Bigr). \tag{317}$$

Further, by analogy with the proof of equality (236) and using (316), we obtain

$$\lim_{p\to\infty}\sum_{j_1=0}^{p}\sum_{j_3=0}^{p}\sum_{j_2=p+1}^{\infty}\Bigl(C_{j_3j_1j_2j_3j_2j_1}+C_{j_3j_1j_2j_3j_1j_2}\Bigr)=0. \tag{318}$$

From (317) and (318) we get

$$\lim_{p\to\infty}\sum_{j_1=p+1}^{\infty}\sum_{j_2=p+1}^{\infty}\sum_{j_3=p+1}^{\infty}\Bigl(C_{j_3j_1j_2j_3j_2j_1}+C_{j_3j_1j_2j_3j_1j_2}\Bigr)=0. \tag{319}$$

Moreover (see (230)),

$$\lim_{p\to\infty}\sum_{j_1=p+1}^{\infty}\sum_{j_2=p+1}^{\infty}\sum_{j_3=p+1}^{\infty}C_{j_3j_1j_2j_3j_1j_2}=0. \tag{320}$$

Combining (319) and (320), we have

$$\lim_{p\to\infty}\sum_{j_1=p+1}^{\infty}\sum_{j_2=p+1}^{\infty}\sum_{j_3=p+1}^{\infty}C_{j_3j_1j_2j_3j_2j_1}=0.$$

The equality (241) is proved.

Consider (242). Using the integration order replacement, we have

$$C_{j_2j_3j_1j_3j_2j_1}+C_{j_2j_3j_1j_3j_1j_2}=$$

$$=\int\limits_t^T\phi_{j_2}(t_6)\int\limits_t^{t_6}\phi_{j_3}(t_5)\int\limits_t^{t_5}\phi_{j_1}(t_4)\int\limits_t^{t_4}\phi_{j_3}(t_3)\left(\int\limits_t^{t_3}\phi_{j_2}(t_2)dt_2\right)\left(\int\limits_t^{t_3}\phi_{j_1}(t_1)dt_1\right)dt_3dt_4dt_5dt_6=$$

$$=\int\limits_t^T \phi_{j_2}(t_6)\int\limits_t^{t_6}\phi_{j_3}(t_5)\int\limits_t^{t_5}\phi_{j_3}(t_3)\left(\int\limits_t^{t_3}\phi_{j_2}(t_2)dt_2\right)\left(\int\limits_t^{t_3}\phi_{j_1}(t_1)dt_1\right)\int\limits_{t_3}^{t_5}\phi_{j_1}(t_4)dt_4dt_3dt_5dt_6=$$

$$=\int\limits_t^T \phi_{j_2}(t_6)\int\limits_t^{t_6}\phi_{j_3}(t_5)\left(\int\limits_t^{t_5}\phi_{j_1}(t_4)dt_4\right)\int\limits_t^{t_5}\phi_{j_3}(t_3)\left(\int\limits_t^{t_3}\phi_{j_2}(t_2)dt_2\right)\left(\int\limits_t^{t_3}\phi_{j_1}(t_1)dt_1\right)dt_3dt_5dt_6-$$

$$-\int\limits_t^T \phi_{j_2}(t_6)\int\limits_t^{t_6}\phi_{j_3}(t_5)\int\limits_t^{t_5}\phi_{j_3}(t_3)\left(\int\limits_t^{t_3}\phi_{j_2}(t_2)dt_2\right)\left(\int\limits_t^{t_3}\phi_{j_1}(t_1)dt_1\right)^2 dt_3dt_5dt_6=$$

$$=\int\limits_t^T \phi_{j_3}(t_5)\left(\int\limits_t^{t_5}\phi_{j_1}(t_4)dt_4\right)\int\limits_t^{t_5}\phi_{j_3}(t_3)\left(\int\limits_t^{t_3}\phi_{j_2}(t_2)dt_2\right)\left(\int\limits_t^{t_3}\phi_{j_1}(t_1)dt_1\right)dt_3\left(\int\limits_{t_5}^{T}\phi_{j_2}(t_6)dt_6\right)dt_5-$$

$$-\int\limits_t^T \phi_{j_3}(t_5)\int\limits_t^{t_5}\phi_{j_3}(t_3)\left(\int\limits_t^{t_3}\phi_{j_2}(t_2)dt_2\right)\left(\int\limits_t^{t_3}\phi_{j_1}(t_1)dt_1\right)^2 dt_3\left(\int\limits_{t_5}^{T}\phi_{j_2}(t_6)dt_6\right)dt_5. \tag{321}$$

Using (65), we obtain

$$-\sum_{j_1=p+1}^{\infty}\sum_{j_2=p+1}^{\infty}\sum_{j_3=p+1}^{\infty}\Bigl(C_{j_2j_3j_1j_3j_2j_1}+C_{j_2j_3j_1j_3j_1j_2}\Bigr)=$$

$$=\sum_{j_3=0}^{p}\sum_{j_1=p+1}^{\infty}\sum_{j_2=p+1}^{\infty}\Bigl(C_{j_2j_3j_1j_3j_2j_1}+C_{j_2j_3j_1j_3j_1j_2}\Bigr). \tag{322}$$

By analogy with the proof of (236) and applying (321), we get

$$\lim_{p\to\infty}\sum_{j_3=0}^{p}\sum_{j_1=p+1}^{\infty}\sum_{j_2=p+1}^{\infty}\Bigl(C_{j_2j_3j_1j_3j_2j_1}+C_{j_2j_3j_1j_3j_1j_2}\Bigr)=0. \tag{323}$$

From (322) and (323) we have

$$\lim_{p\to\infty}\sum_{j_1=p+1}^{\infty}\sum_{j_2=p+1}^{\infty}\sum_{j_3=p+1}^{\infty}\Bigl(C_{j_2j_3j_1j_3j_2j_1}+C_{j_2j_3j_1j_3j_1j_2}\Bigr)=0. \tag{324}$$

Moreover (see (231)),

$$\lim_{p\to\infty}\sum_{j_1=p+1}^{\infty}\sum_{j_2=p+1}^{\infty}\sum_{j_3=p+1}^{\infty}C_{j_2j_3j_1j_3j_1j_2}=0. \tag{325}$$

Combining (324) and (325), we finally obtain

$$\lim_{p\to\infty}\sum_{j_1=p+1}^{\infty}\sum_{j_2=p+1}^{\infty}\sum_{j_3=p+1}^{\infty}C_{j_2j_3j_1j_3j_2j_1}=0.$$

The equality (242) is proved.

Now consider (243). Using the integration order replacement, we obtain

$$C_{j_3j_1j_3j_2j_2j_1}+C_{j_3j_1j_3j_2j_1j_2}=$$

$$=\int_t^T\phi_{j_3}(t_6)\int_t^{t_6}\phi_{j_1}(t_5)\int_t^{t_5}\phi_{j_3}(t_4)\int_t^{t_4}\phi_{j_2}(t_3)\left(\int_t^{t_3}\phi_{j_2}(t_2)dt_2\right)\left(\int_t^{t_3}\phi_{j_1}(t_1)dt_1\right)dt_3dt_4dt_5dt_6=$$

$$=\int_t^T\phi_{j_3}(t_6)\int_t^{t_6}\phi_{j_1}(t_5)\int_t^{t_5}\phi_{j_2}(t_3)\left(\int_t^{t_3}\phi_{j_2}(t_2)dt_2\right)\left(\int_t^{t_3}\phi_{j_1}(t_1)dt_1\right)\int_{t_3}^{t_5}\phi_{j_3}(t_4)dt_4dt_3dt_5dt_6=$$

$$=\int_t^T\phi_{j_3}(t_6)\int_t^{t_6}\phi_{j_1}(t_5)\left(\int_t^{t_5}\phi_{j_3}(t_4)dt_4\right)\int_t^{t_5}\phi_{j_2}(t_3)\left(\int_t^{t_3}\phi_{j_2}(t_2)dt_2\right)\left(\int_t^{t_3}\phi_{j_1}(t_1)dt_1\right)dt_3dt_5dt_6-$$

$$-\int_t^T\phi_{j_3}(t_6)\int_t^{t_6}\phi_{j_1}(t_5)\int_t^{t_5}\phi_{j_2}(t_3)\left(\int_t^{t_3}\phi_{j_2}(t_2)dt_2\right)\left(\int_t^{t_3}\phi_{j_1}(t_1)dt_1\right)\left(\int_t^{t_3}\phi_{j_3}(t_4)dt_4\right)dt_3dt_5dt_6=$$

$$=\int_t^T\phi_{j_1}(t_5)\left(\int_t^{t_5}\phi_{j_3}(t_4)dt_4\right)\int_t^{t_5}\phi_{j_2}(t_3)\left(\int_t^{t_3}\phi_{j_2}(t_2)dt_2\right)\left(\int_t^{t_3}\phi_{j_1}(t_1)dt_1\right)dt_3\left(\int_{t_5}^T\phi_{j_3}(t_6)dt_6\right)dt_5-$$

(326)

$$-\int_t^T\phi_{j_1}(t_5)\int_t^{t_5}\phi_{j_2}(t_3)\left(\int_t^{t_3}\phi_{j_2}(t_2)dt_2\right)\left(\int_t^{t_3}\phi_{j_1}(t_1)dt_1\right)\left(\int_t^{t_3}\phi_{j_3}(t_4)dt_4\right)dt_3\left(\int_{t_5}^T\phi_{j_3}(t_6)dt_6\right)dt_5.$$

Applying (65) and (72), we obtain

$$\sum_{j_1=p+1}^{\infty}\sum_{j_2=p+1}^{\infty}\sum_{j_3=p+1}^{\infty}\left(C_{j_3j_1j_3j_2j_2j_1}+C_{j_3j_1j_3j_2j_1j_2}\right)=$$

$$=-\sum_{j_1=0}^{p}\sum_{j_3=p+1}^{\infty}\sum_{j_2=p+1}^{\infty}\left(C_{j_3j_1j_3j_2j_2j_1}+C_{j_3j_1j_3j_2j_1j_2}\right)=$$

$$=\sum_{j_1=0}^{p}\sum_{j_2=0}^{p}\sum_{j_3=p+1}^{\infty}\left(C_{j_3j_1j_3j_2j_2j_1}+C_{j_3j_1j_3j_2j_1j_2}\right)-$$

$$
-\frac{1}{2}\sum_{j_1=0}^{p}\sum_{j_3=p+1}^{\infty} C_{j_3j_1j_3j_2j_2j_1}\Biggl|_{(j_2j_2)\curvearrowright(\cdot)}. \tag{327}
$$

The equality

$$
\lim_{p\to\infty}\frac{1}{2}\sum_{j_1=0}^{p}\sum_{j_3=p+1}^{\infty} C_{j_3j_1j_3j_2j_2j_1}\Biggl|_{(j_2j_2)\curvearrowright(\cdot)} = 0 \tag{328}
$$

follows from the equality (141), where we proceed similarly to the proof of equality (287) (see (288)).

By analogy with the proof of (236) and applying (326), we get

$$
\lim_{p\to\infty}\sum_{j_1=0}^{p}\sum_{j_2=0}^{p}\sum_{j_3=p+1}^{\infty}\left(C_{j_3j_1j_3j_2j_2j_1}+C_{j_3j_1j_3j_2j_1j_2}\right)=0. \tag{329}
$$

From (327)–(329) we have

$$
\lim_{p\to\infty}\sum_{j_1=p+1}^{\infty}\sum_{j_2=p+1}^{\infty}\sum_{j_3=p+1}^{\infty}\left(C_{j_3j_1j_3j_2j_2j_1}+C_{j_3j_1j_3j_2j_1j_2}\right)=0. \tag{330}
$$

Moreover (see (232)),

$$
\lim_{p\to\infty}\sum_{j_1=p+1}^{\infty}\sum_{j_2=p+1}^{\infty}\sum_{j_3=p+1}^{\infty} C_{j_3j_1j_3j_2j_1j_2}=0. \tag{331}
$$

Combining (330) and (331), we finally obtain

$$
\lim_{p\to\infty}\sum_{j_1=p+1}^{\infty}\sum_{j_2=p+1}^{\infty}\sum_{j_3=p+1}^{\infty} C_{j_3j_1j_3j_2j_2j_1}=0.
$$

The equality (243) is proved.

Finally consider (244). Using the integration order replacement, we have

$$
C_{j_2j_3j_3j_1j_2j_1}+C_{j_2j_3j_3j_1j_1j_2}=
$$

$$
=\int\limits_t^T\phi_{j_2}(t_6)\int\limits_t^{t_6}\phi_{j_3}(t_5)\int\limits_t^{t_5}\phi_{j_3}(t_4)\int\limits_t^{t_4}\phi_{j_1}(t_3)\left(\int\limits_t^{t_3}\phi_{j_2}(t_2)dt_2\right)\left(\int\limits_t^{t_3}\phi_{j_1}(t_1)dt_1\right)dt_3dt_4dt_5dt_6=
$$

$$
=\int\limits_t^T\phi_{j_2}(t_6)\int\limits_t^{t_6}\phi_{j_3}(t_5)\int\limits_t^{t_5}\phi_{j_1}(t_3)\left(\int\limits_t^{t_3}\phi_{j_2}(t_2)dt_2\right)\left(\int\limits_t^{t_3}\phi_{j_1}(t_1)dt_1\right)\int\limits_{t_3}^{t_5}\phi_{j_3}(t_4)dt_4dt_3dt_5dt_6=
$$

$$
=\int\limits_t^T \phi_{j_2}(t_6)\int\limits_t^{t_6}\phi_{j_3}(t_5)\left(\int\limits_t^{t_5}\phi_{j_3}(t_4)dt_4\right)\int\limits_t^{t_5}\phi_{j_1}(t_3)\left(\int\limits_t^{t_3}\phi_{j_2}(t_2)dt_2\right)\left(\int\limits_t^{t_3}\phi_{j_1}(t_1)dt_1\right)dt_3dt_5dt_6-
$$

$$
-\int\limits_t^T \phi_{j_2}(t_6)\int\limits_t^{t_6}\phi_{j_3}(t_5)\int\limits_t^{t_5}\phi_{j_1}(t_3)\left(\int\limits_t^{t_3}\phi_{j_2}(t_2)dt_2\right)\left(\int\limits_t^{t_3}\phi_{j_1}(t_1)dt_1\right)\left(\int\limits_t^{t_3}\phi_{j_3}(t_4)dt_4\right)dt_3dt_5dt_6=
$$

$$
=\int\limits_t^T \phi_{j_3}(t_5)\left(\int\limits_t^{t_5}\phi_{j_3}(t_4)dt_4\right)\int\limits_t^{t_5}\phi_{j_1}(t_3)\left(\int\limits_t^{t_3}\phi_{j_2}(t_2)dt_2\right)\left(\int\limits_t^{t_3}\phi_{j_1}(t_1)dt_1\right)dt_3\left(\int\limits_{t_5}^{T}\phi_{j_2}(t_6)dt_6\right)dt_5-
$$

(332)

$$
-\int\limits_t^T \phi_{j_3}(t_5)\int\limits_t^{t_5}\phi_{j_1}(t_3)\left(\int\limits_t^{t_3}\phi_{j_2}(t_2)dt_2\right)\left(\int\limits_t^{t_3}\phi_{j_1}(t_1)dt_1\right)\left(\int\limits_t^{t_3}\phi_{j_3}(t_4)dt_4\right)dt_3\left(\int\limits_{t_5}^{T}\phi_{j_2}(t_6)dt_6\right)dt_5.
$$

Using (65) and (72), we get

$$
\sum_{j_1=p+1}^{\infty}\sum_{j_2=p+1}^{\infty}\sum_{j_3=p+1}^{\infty}\Bigl(C_{j_2j_3j_3j_1j_2j_1}+C_{j_2j_3j_3j_1j_1j_2}\Bigr)=
$$

$$
=\frac{1}{2}\sum_{j_1=p+1}^{\infty}\sum_{j_2=p+1}^{\infty}\Biggl(C_{j_2j_3j_3j_1j_2j_1}\Bigl.\Bigr|_{(j_3j_3)\frown(\cdot)}+C_{j_2j_3j_3j_1j_1j_2}\Bigl.\Bigr|_{(j_3j_3)\frown(\cdot)}\Biggr)-
$$

$$
-\sum_{j_3=0}^{p}\sum_{j_1=p+1}^{\infty}\sum_{j_2=p+1}^{\infty}\Bigl(C_{j_2j_3j_3j_1j_2j_1}+C_{j_2j_3j_3j_1j_1j_2}\Bigr)=
$$

$$
=\frac{1}{2}\sum_{j_1=p+1}^{\infty}\sum_{j_2=p+1}^{\infty}\Biggl(C_{j_2j_3j_3j_1j_2j_1}\Bigl.\Bigr|_{(j_3j_3)\frown(\cdot)}+C_{j_2j_3j_3j_1j_1j_2}\Bigl.\Bigr|_{(j_3j_3)\frown(\cdot)}\Biggr)+
$$

$$
+\sum_{j_1=0}^{p}\sum_{j_3=0}^{p}\sum_{j_2=p+1}^{\infty}\Bigl(C_{j_2j_3j_3j_1j_2j_1}+C_{j_2j_3j_3j_1j_1j_2}\Bigr)-
$$

$$
-\frac{1}{2}\sum_{j_3=0}^{p}\sum_{j_2=p+1}^{\infty}C_{j_2j_3j_3j_1j_1j_2}\Bigl.\Bigr|_{(j_1j_1)\frown(\cdot)}. \tag{333}
$$

The equalities

$$
\lim_{p\to\infty}\frac{1}{2}\sum_{j_1=p+1}^{\infty}\sum_{j_2=p+1}^{\infty}\Biggl(C_{j_2j_3j_3j_1j_2j_1}\Bigl.\Bigr|_{(j_3j_3)\frown(\cdot)}+C_{j_2j_3j_3j_1j_1j_2}\Bigl.\Bigr|_{(j_3j_3)\frown(\cdot)}\Biggr)=0, \tag{334}
$$

$$\lim_{p\to\infty}\frac{1}{2}\sum_{j_3=0}^{p}\sum_{j_2=p+1}^{\infty}C_{j_2j_3j_3j_1j_1j_2}\Biggr|_{(j_1j_1)\curvearrowright(\cdot)}=$$

$$=\lim_{p\to\infty}\frac{1}{4}\sum_{j_2=p+1}^{\infty}C_{j_2j_3j_3j_1j_1j_2}\Biggr|_{(j_1j_1)\curvearrowright(\cdot)(j_3j_3)\curvearrowright(\cdot)}-$$

$$-\lim_{p\to\infty}\frac{1}{2}\sum_{j_3=p+1}^{\infty}\sum_{j_2=p+1}^{\infty}C_{j_2j_3j_3j_1j_1j_2}\Biggr|_{(j_1j_1)\curvearrowright(\cdot)}=0 \qquad (335)$$

follows from the equalities (141), (142), where we used the same technique as in (288). When proving (335), we also applied (72) and (97).

By analogy with the proof of (236) and applying (332), we obtain

$$\lim_{p\to\infty}\sum_{j_1=0}^{p}\sum_{j_3=0}^{p}\sum_{j_2=p+1}^{\infty}\Bigl(C_{j_2j_3j_3j_1j_2j_1}+C_{j_2j_3j_3j_1j_1j_2}\Bigr)=0. \qquad (336)$$

From (333)–(336) we have

$$\lim_{p\to\infty}\sum_{j_1=p+1}^{\infty}\sum_{j_2=p+1}^{\infty}\sum_{j_3=p+1}^{\infty}\Bigl(C_{j_2j_3j_3j_1j_2j_1}+C_{j_2j_3j_3j_1j_1j_2}\Bigr)=0. \qquad (337)$$

Furthermore (see (234)),

$$\lim_{p\to\infty}\sum_{j_1=p+1}^{\infty}\sum_{j_2=p+1}^{\infty}\sum_{j_3=p+1}^{\infty}C_{j_2j_3j_3j_1j_1j_2}=0. \qquad (338)$$

Combining (337) and (338), we finally obtain

$$\lim_{p\to\infty}\sum_{j_1=p+1}^{\infty}\sum_{j_2=p+1}^{\infty}\sum_{j_3=p+1}^{\infty}C_{j_2j_3j_3j_1j_2j_1}=0.$$

The equality (244) is proved. Theorem 22 is proved.

12. Generalization of Theorem 15. The Case p_1, p_2, $p_3\to\infty$ and Continuously Differetiable Weight Functions (The Cases of Legendre Polynomials and Trigonometric Functions)

This section is devoted to the following theorem.

Theorem 23 [12], [36], [37]. *Suppose that $\{\phi_j(x)\}_{j=0}^{\infty}$ is a complete orthonormal system of Legendre polynomials or trigonometric functions in the space $L_2([t,T])$. Furthermore, let $\psi_1(\tau),\psi_2(\tau),\psi_3(\tau)$ are continuously differentiable nonrandom functions on $[t,T]$. Then, for the iterated Stratonovich stochastic integral of third multiplicity*

$$J^*[\psi^{(3)}]_{T,t}^{(i_1i_2i_3)}=\int\limits_t^{*T}\psi_3(t_3)\int\limits_t^{*t_3}\psi_2(t_2)\int\limits_t^{*t_2}\psi_1(t_1)d\mathbf{w}_{t_1}^{(i_1)}d\mathbf{w}_{t_2}^{(i_2)}d\mathbf{w}_{t_3}^{(i_3)}$$

the following expansion

$$J^*[\psi^{(3)}]_{T,t}^{(i_1i_2i_3)}=\underset{p_1,p_2,p_3\to\infty}{\text{l.i.m.}}\sum_{j_1=0}^{p_1}\sum_{j_2=0}^{p_2}\sum_{j_3=0}^{p_3}C_{j_3j_2j_1}\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}\zeta_{j_3}^{(i_3)} \tag{339}$$

that converges in the mean-square sense is valid, where $i_1,i_2,i_3=0,1,\ldots,m,$

$$C_{j_3j_2j_1}=\int\limits_t^T\psi_3(t_3)\phi_{j_3}(t_3)\int\limits_t^{t_3}\psi_2(t_2)\phi_{j_2}(t_2)\int\limits_t^{t_2}\psi_1(t_1)\phi_{j_1}(t_1)dt_1dt_2dt_3$$

and

$$\zeta_j^{(i)}=\int\limits_t^T\phi_j(s)d\mathbf{w}_s^{(i)}$$

are independent standard Gaussian random variables for various i *or* j *(in the case when* $i\neq 0$*),* $\mathbf{w}_\tau^{(i)}=\mathbf{f}_\tau^{(i)}$ *for* $i=1,\ldots,m$ *and* $\mathbf{w}_\tau^{(0)}=\tau.$

Proof. Let us consider the case of Legendre polynomials (the trigonometric case is simpler and can be considered similarly). Applying (60), we obtain

$$\sum_{j_1=0}^{p_1}\sum_{j_2=0}^{p_2}\sum_{j_3=0}^{p_3}C_{j_3j_2j_1}\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}\zeta_{j_3}^{(i_3)}=J'[K_{p_1p_2p_3}]_{T,t}^{(i_1i_2i_3)}+$$

$$+\mathbf{1}_{\{i_1=i_2\neq 0\}}\sum_{j_3=0}^{p_3}\sum_{j_1=0}^{\min\{p_1,p_2\}}C_{j_3j_1j_1}J'[\phi_{j_3}]_{T,t}^{(i_3)}+$$

$$+\mathbf{1}_{\{i_2=i_3\neq 0\}}\sum_{j_1=0}^{p_1}\sum_{j_3=0}^{\min\{p_2,p_3\}}C_{j_3j_3j_1}J'[\phi_{j_1}]_{T,t}^{(i_1)}+$$

$$+\mathbf{1}_{\{i_1=i_3\neq 0\}}\sum_{j_2=0}^{p_2}\sum_{j_1=0}^{\min\{p_1,p_3\}}C_{j_1j_2j_1}J'[\phi_{j_2}]_{T,t}^{(i_2)} \tag{340}$$

w. p. 1, where notations are the same as in (60).

Using Theorem 4 (see (25) for the case $k=3$), Theorem 1 (see (44)) as well as (77) (see the derivation of (77)) and (72), we get

$$J^*[\psi^{(3)}]_{T,t}^{(i_1i_2i_3)}=J[\psi^{(3)}]_{T,t}^{(i_1i_2i_3)}+\frac{1}{2}\mathbf{1}_{\{i_1=i_2\neq 0\}}\int\limits_t^T\psi_3(t_3)\int\limits_t^{t_3}\psi_2(t_2)\psi_1(t_2)dt_2d\mathbf{w}_{t_3}^{(i_3)}+$$

$$+\frac{1}{2}\mathbf{1}_{\{i_2=i_3\neq 0\}}\int\limits_t^T\psi_3(t_3)\psi_2(t_3)\int\limits_t^{t_3}\psi_1(t_1)d\mathbf{w}_{t_1}^{(i_1)}dt_3=$$

$$= J[\psi^{(3)}]_{T,t}^{(i_1 i_2 i_3)} + \frac{1}{2} J[\psi^{(3)}]_{T,t}^{1} + \frac{1}{2} J[\psi^{(3)}]_{T,t}^{2} =$$

$$= \underset{p_1,p_2,p_3\to\infty}{\text{l.i.m.}} \ J'[K_{p_1p_2p_3}]_{T,t}^{(i_1 i_2 i_3)} +$$

$$+\mathbf{1}_{\{i_1=i_2\ne 0\}} \underset{p_3\to\infty}{\text{l.i.m.}} \ \frac{1}{2}\sum_{j_3=0}^{p_3} C_{j_3j_2j_1}\Biggl|_{(j_2j_1)\curvearrowright(\cdot),\, j_1=j_2} J'[\phi_{j_3}]_{T,t}^{(i_3)} +$$

$$+\mathbf{1}_{\{i_2=i_3\ne 0\}} \underset{p_1\to\infty}{\text{l.i.m.}} \ \frac{1}{2}\sum_{j_1=0}^{p_1} C_{j_3j_2j_1}\Biggl|_{(j_3j_2)\curvearrowright(\cdot),\, j_2=j_3} J'[\phi_{j_1}]_{T,t}^{(i_1)} =$$

$$= \underset{p_1,p_2,p_3\to\infty}{\text{l.i.m.}} \ J'[K_{p_1p_2p_3}]_{T,t}^{(i_1 i_2 i_3)} +$$

$$+\mathbf{1}_{\{i_1=i_2\ne 0\}} \underset{p_3\to\infty}{\text{l.i.m.}} \ \sum_{j_3=0}^{p_3}\sum_{j_1=0}^{\infty} C_{j_3j_1j_1} J'[\phi_{j_3}]_{T,t}^{(i_3)} +$$

$$+\mathbf{1}_{\{i_2=i_3\ne 0\}} \underset{p_1\to\infty}{\text{l.i.m.}} \ \sum_{j_1=0}^{p_1}\sum_{j_3=0}^{\infty} C_{j_3j_3j_1} J'[\phi_{j_1}]_{T,t}^{(i_1)} \tag{341}$$

w. p. 1.

Using (340), (341) and the elementary inequality

$$(a+b+c+d)^2 \le 4\left(a^2+b^2+c^2+d^2\right),$$

we obtain

$$\mathsf{M}\left\{\left(J^*[\psi^{(3)}]_{T,t}^{(i_1 i_2 i_3)} - \sum_{j_1=0}^{p_1}\sum_{j_2=0}^{p_2}\sum_{j_3=0}^{p_3} C_{j_3j_2j_1}\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}\zeta_{j_3}^{(i_3)}\right)^2\right\} \le$$

$$\le 4\mathsf{M}\left\{\left(J[\psi^{(3)}]_{T,t}^{(i_1 i_2 i_3)} - J'[K_{p_1p_2p_3}]_{T,t}^{(i_1 i_2 i_3)}\right)^2\right\} +$$

$$+4\cdot\mathbf{1}_{\{i_1=i_2\ne 0\}}\times$$

$$\times\mathsf{M}\left\{\left(\underset{p_3\to\infty}{\text{l.i.m.}} \ \sum_{j_3=0}^{p_3}\sum_{j_1=0}^{\infty} C_{j_3j_1j_1} J'[\phi_{j_3}]_{T,t}^{(i_3)} - \sum_{j_3=0}^{p_3}\sum_{j_1=0}^{\min\{p_1,p_2\}} C_{j_3j_1j_1} J'[\phi_{j_3}]_{T,t}^{(i_3)}\right)^2\right\} +$$

$$+4\cdot\mathbf{1}_{\{i_2=i_3\ne 0\}}\times$$

$$\times\mathsf{M}\left\{\left(\underset{p_1\to\infty}{\text{l.i.m.}}\sum_{j_1=0}^{p_1}\sum_{j_3=0}^{\infty}C_{j_3j_3j_1}J'[\phi_{j_1}]_{T,t}^{(i_1)}-\sum_{j_1=0}^{p_1}\sum_{j_3=0}^{\min\{p_2,p_3\}}C_{j_3j_3j_1}J'[\phi_{j_1}]_{T,t}^{(i_1)}\right)^2\right\}+$$

$$+4\cdot\mathbf{1}_{\{i_1=i_3\neq 0\}}\mathsf{M}\left\{\left(\sum_{j_2=0}^{p_2}\sum_{j_1=0}^{\min\{p_1,p_3\}}C_{j_1j_2j_1}J'[\phi_{j_2}]_{T,t}^{(i_2)}\right)^2\right\}=$$

$$=4A_{p_1p_2p_3}+4\cdot\mathbf{1}_{\{i_1=i_2\neq 0\}}B_{p_1p_2p_3}+4\cdot\mathbf{1}_{\{i_2=i_3\neq 0\}}C_{p_1p_2p_3}+4\cdot\mathbf{1}_{\{i_1=i_3\neq 0\}}D_{p_1p_2p_3}. \tag{342}$$

Theorem 1 gives (see (44))

$$\lim_{p_1,p_2,p_3\to\infty}A_{p_1p_2p_3}=0. \tag{343}$$

Further, in complete analogy with (133) and using (65), we obtain

$$D_{p_1p_2p_3}=\sum_{j_2=0}^{p_2}\left(\sum_{j_1=0}^{\min\{p_1,p_3\}}C_{j_1j_2j_1}\right)^2=\sum_{j_2=0}^{p_2}\left(\sum_{j_1=\min\{p_1,p_3\}+1}^{\infty}C_{j_1j_2j_1}\right)^2\le$$

$$\le\sum_{j_2=0}^{\infty}\left(\sum_{j_1=\min\{p_1,p_3\}+1}^{\infty}C_{j_1j_2j_1}\right)^2\le\frac{K}{\left(\min\{p_1,p_3\}\right)^{2-\varepsilon}}\ \to\ 0 \tag{344}$$

if $p_1,p_2,p_3\to\infty$, where ε is an arbitrary small positive real number, constant K is independent of p.

We have

$$B_{p_1p_2p_3}=\mathsf{M}\left\{\left(\left(\underset{p_3\to\infty}{\text{l.i.m.}}\sum_{j_3=0}^{p_3}\sum_{j_1=0}^{\infty}C_{j_3j_1j_1}J'[\phi_{j_3}]_{T,t}^{(i_3)}-\sum_{j_3=0}^{p_3}\sum_{j_1=0}^{\infty}C_{j_3j_1j_1}J'[\phi_{j_3}]_{T,t}^{(i_3)}\right)+\right.\right.$$

$$\left.\left.+\left(\sum_{j_3=0}^{p_3}\sum_{j_1=0}^{\infty}C_{j_3j_1j_1}J'[\phi_{j_3}]_{T,t}^{(i_3)}-\sum_{j_3=0}^{p_3}\sum_{j_1=0}^{\min\{p_1,p_2\}}C_{j_3j_1j_1}J'[\phi_{j_3}]_{T,t}^{(i_3)}\right)\right)^2\right\}\le$$

$$\le 2E_{p_3}+2F_{p_1p_2p_3}, \tag{345}$$

where

$$E_{p_3}=\mathsf{M}\left\{\left(\underset{p_3\to\infty}{\text{l.i.m.}}\sum_{j_3=0}^{p_3}\sum_{j_1=0}^{\infty}C_{j_3j_1j_1}J'[\phi_{j_3}]_{T,t}^{(i_3)}-\sum_{j_3=0}^{p_3}\sum_{j_1=0}^{\infty}C_{j_3j_1j_1}J'[\phi_{j_3}]_{T,t}^{(i_3)}\right)^2\right\},$$

$$F_{p_1p_2p_3} = \mathsf{M}\left\{\left(\sum_{j_3=0}^{p_3}\sum_{j_1=0}^{\infty} C_{j_3j_1j_1} J'[\phi_{j_3}]_{T,t}^{(i_3)} - \sum_{j_3=0}^{p_3}\sum_{j_1=0}^{\min\{p_1,p_2\}} C_{j_3j_1j_1} J'[\phi_{j_3}]_{T,t}^{(i_3)}\right)^2\right\} =$$

$$= \mathsf{M}\left\{\left(\sum_{j_3=0}^{p_3}\sum_{j_1=\min\{p_1,p_2\}+1}^{\infty} C_{j_3j_1j_1} J'[\phi_{j_3}]_{T,t}^{(i_3)}\right)^2\right\} =$$

$$= \sum_{j_3=0}^{p_3}\left(\sum_{j_1=\min\{p_1,p_2\}+1}^{\infty} C_{j_3j_1j_1}\right)^2. \tag{346}$$

By analogy with (119) we get

$$\sum_{j_3=0}^{p_3}\left(\sum_{j_1=\min\{p_1,p_2\}+1}^{\infty} C_{j_3j_1j_1}\right)^2 \le \sum_{j_3=0}^{\infty}\left(\sum_{j_1=\min\{p_1,p_2\}+1}^{\infty} C_{j_3j_1j_1}\right)^2 \le$$

$$\le \frac{K}{\left(\min\{p_1,p_2\}\right)^2} \ \to\ 0 \tag{347}$$

if $p_1, p_2, p_3 \to \infty$, where constant K does not depend on p.

Moreover,

$$\lim_{p_3\to\infty} E_{p_3} = \lim_{p_1,p_2,p_3\to\infty} E_{p_3} = 0. \tag{348}$$

Combining (345)–(348), we obtain

$$\lim_{p_1,p_2,p_3\to\infty} B_{p_1p_2p_3} = 0. \tag{349}$$

Consider $C_{p_1p_2p_3}$. We have

$$C_{p_1p_2p_3} = \mathsf{M}\left\{\left(\left(\underset{p_1\to\infty}{\text{l.i.m.}} \sum_{j_1=0}^{p_1}\sum_{j_3=0}^{\infty} C_{j_3j_3j_1} J'[\phi_{j_1}]_{T,t}^{(i_1)} - \sum_{j_1=0}^{p_1}\sum_{j_3=0}^{\infty} C_{j_3j_3j_1} J'[\phi_{j_1}]_{T,t}^{(i_1)}\right)+\right.\right.$$

$$\left.\left.+\left(\sum_{j_1=0}^{p_1}\sum_{j_3=0}^{\infty} C_{j_3j_3j_1} J'[\phi_{j_1}]_{T,t}^{(i_1)} - \sum_{j_1=0}^{p_1}\sum_{j_3=0}^{\min\{p_2,p_3\}} C_{j_3j_3j_1} J'[\phi_{j_1}]_{T,t}^{(i_1)}\right)\right)^2\right\} \le$$

$$\le 2G_{p_1} + 2H_{p_1p_2p_3}, \tag{350}$$

where

$$G_{p_1}=\mathsf{M}\left\{\left(\underset{p_1\to\infty}{\text{l.i.m.}}\sum_{j_1=0}^{p_1}\sum_{j_3=0}^{\infty}C_{j_3j_3j_1}J'[\phi_{j_1}]_{T,t}^{(i_1)}-\sum_{j_1=0}^{p_1}\sum_{j_3=0}^{\infty}C_{j_3j_3j_1}J'[\phi_{j_1}]_{T,t}^{(i_1)}\right)^2\right\},$$

$$H_{p_1p_2p_3}=\mathsf{M}\left\{\left(\sum_{j_1=0}^{p_1}\sum_{j_3=0}^{\infty}C_{j_3j_3j_1}J'[\phi_{j_1}]_{T,t}^{(i_1)}-\sum_{j_1=0}^{p_1}\sum_{j_3=0}^{\min\{p_2,p_3\}}C_{j_3j_3j_1}J'[\phi_{j_1}]_{T,t}^{(i_1)}\right)^2\right\}=$$

$$=\mathsf{M}\left\{\left(\sum_{j_1=0}^{p_1}\sum_{j_3=\min\{p_2,p_3\}+1}^{\infty}C_{j_3j_3j_1}J'[\phi_{j_1}]_{T,t}^{(i_1)}\right)^2\right\}=$$

$$=\sum_{j_1=0}^{p_1}\left(\sum_{j_3=\min\{p_2,p_3\}+1}^{\infty}C_{j_3j_3j_1}\right)^2. \tag{351}$$

By analogy with (123) we get

$$\sum_{j_1=0}^{p_1}\left(\sum_{j_3=\min\{p_2,p_3\}+1}^{\infty}C_{j_3j_3j_1}\right)^2\le\sum_{j_1=0}^{\infty}\left(\sum_{j_3=\min\{p_2,p_3\}+1}^{\infty}C_{j_3j_3j_1}\right)^2\le$$

$$\le\frac{K}{\left(\min\{p_2,p_3\}\right)^2}\ \to\ 0 \tag{352}$$

if $p_1,p_2,p_3\to\infty$, where constant K does not depend on p.

Moreover,

$$\lim_{p_1\to\infty}G_{p_1}=\lim_{p_1,p_2,p_3\to\infty}G_{p_1}=0. \tag{353}$$

Combining (350)–(353), we obtain

$$\lim_{p_1,p_2,p_3\to\infty}C_{p_1p_2p_3}=0. \tag{354}$$

The relations (342)–(344), (349), (354) complete the proof of Theorem 23. Theorem 23 is proved.

13. Theorems 1, 2, 5-12, 15-17, 22, 23 from Point of View of the Wong–Zakai Approximation

The iterated Ito stochastic integrals and solutions of Ito SDEs are complex and important functionals from the independent components $\mathbf{f}_s^{(i)}$, $i=1,\ldots,m$ of the multidimensional Wiener process $\mathbf{f}_s$, $s\in[0,T]$. Let $\mathbf{f}_s^{(i)p}$, $p\in\mathbb{N}$ be some approximation of $\mathbf{f}_s^{(i)}$, $i=1,\ldots,m$. Suppose that $\mathbf{f}_s^{(i)p}$ converges to $\mathbf{f}_s^{(i)}$, $i=1,\ldots,m$ if $p\to\infty$ in some sense and has differentiable sample trajectories.

A natural question arises: if we replace $\mathbf{f}_s^{(i)}$ by $\mathbf{f}_s^{(i)p}$, $i=1,\ldots,m$ in the functionals mentioned above, will the resulting functionals converge to the original functionals from the components $\mathbf{f}_s^{(i)}$, $i=1,\ldots,m$ of the multidimentional Wiener process $\mathbf{f}_s$? The answere to this question is negative in the general case. However, in the pioneering works of Wong E. and Zakai M. [58], [59], it was shown that under the special conditions and for some types of approximations of the Wiener process the answere is affirmative with one peculiarity: the convergence takes place to the iterated Stratonovich stochastic integrals and solutions of Stratonovich SDEs and not to the iterated Ito stochastic integrals and solutions of Ito SDEs. The piecewise linear approximation as well as the regularization by convolution [58]-[60] relate the mentioned types of approximations of the Wiener process. The above approximation of stochastic integrals and solutions of SDEs is often called the Wong–Zakai approximation.

Let $\mathbf{f}_s$, $s\in[0,T]$ be an m-dimensional standard Wiener process with independent components $\mathbf{f}_s^{(i)}$, $i=1,\ldots,m$. It is well known that the following representation takes place [62], [63]

$$\mathbf{f}_\tau^{(i)}-\mathbf{f}_t^{(i)}=\sum_{j=0}^{\infty}\int\limits_t^{\tau}\phi_j(s)ds\ \zeta_j^{(i)},\quad \zeta_j^{(i)}=\int\limits_t^{T}\phi_j(s)d\mathbf{f}_s^{(i)}, \tag{355}$$

where $\tau\in[t,T]$, $t\geq 0$, $\{\phi_j(x)\}_{j=0}^{\infty}$ is an arbitrary complete orthonormal system of functions in the space $L_2([t,T])$, and $\zeta_j^{(i)}$ are independent standard Gaussian random variables for various i or j. Moreover, the series (355) converges for any $\tau\in[t,T]$ in the mean-square sense.

Let $\mathbf{f}_\tau^{(i)p}-\mathbf{f}_t^{(i)p}$ be the mean-square approximation of the process $\mathbf{f}_\tau^{(i)}-\mathbf{f}_t^{(i)}$, which has the following form

$$\mathbf{f}_\tau^{(i)p}-\mathbf{f}_t^{(i)p}=\sum_{j=0}^{p}\int\limits_t^{\tau}\phi_j(s)ds\ \zeta_j^{(i)}. \tag{356}$$

From (356) we obtain

$$d\mathbf{f}_\tau^{(i)p}=\sum_{j=0}^{p}\phi_j(\tau)\zeta_j^{(i)}d\tau. \tag{357}$$

Consider the following iterated Riemann–Stieltjes integral

$$\int\limits_t^{T}\psi_k(t_k)\ldots\int\limits_t^{t_2}\psi_1(t_1)d\mathbf{w}_{t_1}^{(i_1)p_1}\ldots d\mathbf{w}_{t_k}^{(i_k)p_k}, \tag{358}$$

where $p_1,\ldots,p_k\in\mathbb{N}$, $i_1,\ldots,i_k=0,1,\ldots,m$,

$$d\mathbf{w}_\tau^{(i)p}=\begin{cases}d\mathbf{f}_\tau^{(i)p} & \text{for}\quad i=1,\ldots,m\\ \\ d\tau & \text{for}\quad i=0\end{cases}, \tag{359}$$

and $d\mathbf{f}_\tau^{(i)p}$ in defined by the relation (357).

Let us substitute (357) into (358)

$$\int\limits_t^T \psi_k(t_k)\ldots\int\limits_t^{t_2}\psi_1(t_1)d\mathbf{w}_{t_1}^{(i_1)p_1}\ldots d\mathbf{w}_{t_k}^{(i_k)p_k} = \sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k} C_{j_k\ldots j_1}\prod_{l=1}^{k}\zeta_{j_l}^{(i_l)}, \tag{360}$$

where

$$\zeta_j^{(i)} = \int\limits_t^T \phi_j(\tau)d\mathbf{w}_\tau^{(i)}$$

are independent standard Gaussian random variables for various i or j (in the case when $i\neq 0$), $\mathbf{w}_s^{(i)} = \mathbf{f}_s^{(i)}$ for $i=1,\ldots,m$ and $\mathbf{w}_s^{(0)} = s$,

$$C_{j_k\ldots j_1} = \int\limits_t^T \psi_k(t_k)\phi_{j_k}(t_k)\ldots\int\limits_t^{t_2}\psi_1(t_1)\phi_{j_1}(t_1)dt_1\ldots dt_k$$

is the Fourier coefficient.

To best of our knowledge [58]-[60] the approximations of the Wiener process in the Wong–Zakai approximation must satisfy fairly strong restrictions [60] (see Definition 7.1, pp. 480–481). Moreover, approximations of the Wiener process that are similar to (356) were not considered in [58], [59] (also see [60], Theorems 7.1, 7.2). Therefore, the proof of analogs of Theorems 7.1 and 7.2 [60] for approximations of the Wiener process based on its series expansion (355) should be carried out separately. Thus, the mean-square convergence of the right-hand side of (360) to the iterated Stratonovich stochastic integral (2) does not follow from the results of the papers [58], [59] (also see [60], Theorems 7.1, 7.2).

From the other hand, Theorems 1, 2, 5-12, 15-17, 22, 23 from this paper can be considered as the proof of the Wong–Zakai approximation for the iterated Stratonovich stochastic integrals (2) of multiplicities 1 to 6 (or of multiplicity k under the condition of convergence of trace series (Theorem 12)) based on the approximation (356) of the Wiener process. At that, the Riemann–Stieltjes integrals (358) converge (according to Theorems 5-12, 15-17, 22, 23) to the appropriate Stratonovich stochastic integrals (2). Recall that $\{\phi_j(x)\}_{j=0}^{\infty}$ (see (355), (356), and Theorems 5-12, 15-17, 22, 23) is a complete orthonormal system of Legendre polynomials or trigonometric functions in the space $L_2([t,T])$.

To illustrate the above reasoning, consider two examples for the case $k=2$, $\psi_1(s)$, $\psi_2(s)\equiv 1$; $i_1,i_2=1,\ldots,m$.

The first example relates to the piecewise linear approximation of the multidimensional Wiener process (these approximations were considered in [58]-[60]).

Let $\mathbf{b}_\Delta^{(i)}(t)$, $t\in[0,T]$ be the piecewise linear approximation of the ith component $\mathbf{f}_t^{(i)}$ of the multidimensional standard Wiener process $\mathbf{f}_t$, $t\in[0,T]$ with independent components $\mathbf{f}_t^{(i)}$, $i=1,\ldots,m$, i.e.

$$\mathbf{b}_\Delta^{(i)}(t) = \mathbf{f}_{k\Delta}^{(i)} + \frac{t-k\Delta}{\Delta}\Delta\mathbf{f}_{k\Delta}^{(i)},$$

where

$$\Delta\mathbf{f}_{k\Delta}^{(i)} = \mathbf{f}_{(k+1)\Delta}^{(i)} - \mathbf{f}_{k\Delta}^{(i)},\quad t\in[k\Delta,(k+1)\Delta),\quad k=0,1,\ldots,N-1.$$

Note that w. p. 1

(361) $$\frac{d\mathbf{b}_{\Delta}^{(i)}}{dt}(t)=\frac{\Delta\mathbf{f}_{k\Delta}^{(i)}}{\Delta},\quad t\in[k\Delta,(k+1)\Delta),\quad k=0,1,\ldots,N-1.$$

Consider the following iterated Riemann–Stieltjes integral

$$\int\limits_0^T\int\limits_0^s d\mathbf{b}_{\Delta}^{(i_1)}(\tau)d\mathbf{b}_{\Delta}^{(i_2)}(s),\quad i_1,i_2=1,\ldots,m.$$

Using (361) and additive property of Riemann–Stieltjes integrals, we can write w. p. 1

$$\int\limits_0^T\int\limits_0^s d\mathbf{b}_{\Delta}^{(i_1)}(\tau)d\mathbf{b}_{\Delta}^{(i_2)}(s)=\int\limits_0^T\int\limits_0^s \frac{d\mathbf{b}_{\Delta}^{(i_1)}}{d\tau}(\tau)d\tau\frac{d\mathbf{b}_{\Delta}^{(i_2)}}{ds}(s)ds=$$

$$=\sum_{l=0}^{N-1}\int\limits_{l\Delta}^{(l+1)\Delta}\left(\sum_{q=0}^{l-1}\int\limits_{q\Delta}^{(q+1)\Delta}\frac{\Delta\mathbf{f}_{q\Delta}^{(i_1)}}{\Delta}d\tau+\int\limits_{l\Delta}^{s}\frac{\Delta\mathbf{f}_{l\Delta}^{(i_1)}}{\Delta}d\tau\right)\frac{\Delta\mathbf{f}_{l\Delta}^{(i_2)}}{\Delta}ds=$$

$$=\sum_{l=0}^{N-1}\sum_{q=0}^{l-1}\Delta\mathbf{f}_{q\Delta}^{(i_1)}\Delta\mathbf{f}_{l\Delta}^{(i_2)}+\frac{1}{\Delta^2}\sum_{l=0}^{N-1}\Delta\mathbf{f}_{l\Delta}^{(i_1)}\Delta\mathbf{f}_{l\Delta}^{(i_2)}\int\limits_{l\Delta}^{(l+1)\Delta}\int\limits_{l\Delta}^{s}d\tau ds=$$

(362) $$=\sum_{l=0}^{N-1}\sum_{q=0}^{l-1}\Delta\mathbf{f}_{q\Delta}^{(i_1)}\Delta\mathbf{f}_{l\Delta}^{(i_2)}+\frac{1}{2}\sum_{l=0}^{N-1}\Delta\mathbf{f}_{l\Delta}^{(i_1)}\Delta\mathbf{f}_{l\Delta}^{(i_2)}.$$

Using (362) and Theorem 4, it is not difficult to show that

$$\underset{N\to\infty}{\text{l.i.m.}}\int\limits_0^T\int\limits_0^s d\mathbf{b}_{\Delta}^{(i_1)}(\tau)d\mathbf{b}_{\Delta}^{(i_2)}(s)=\int\limits_0^T\int\limits_0^s d\mathbf{f}_{\tau}^{(i_1)}d\mathbf{f}_{s}^{(i_2)}+\frac{1}{2}\mathbf{1}_{\{i_1=i_2\}}\int\limits_0^T ds=$$

(363) $$=\int\limits_0^{*T}\int\limits_0^{*s} d\mathbf{f}_{\tau}^{(i_1)}d\mathbf{f}_{s}^{(i_2)},$$

where $\Delta\to 0$ if $N\to\infty$ $(N\Delta=T)$.

Obviously, (363) agrees with Theorem 7.1 (see [60], p. 486).

The next example relates to the approximation of the Wiener process based on its series expansion (355) for $t=0$, where $\{\phi_j(x)\}_{j=0}^{\infty}$ is a complete orthonormal system of Legendre polynomials or trigonometric functions in the space $L_2([0,T])$.

Consider the following iterated Riemann–Stieltjes integral

$$\int\limits_0^T \int\limits_0^s d\mathbf{f}_\tau^{(i_1)p} d\mathbf{f}_s^{(i_2)p}, \quad i_1, i_2 = 1, \ldots, m, \tag{364}$$

where $d\mathbf{f}_\tau^{(i)p}$ is defined by the relation (357).

Let us substitute (357) into (364)

$$\int\limits_0^T \int\limits_0^s d\mathbf{f}_\tau^{(i_1)p} d\mathbf{f}_s^{(i_2)p} = \sum_{j_1, j_2 = 0}^{p} C_{j_2 j_1} \zeta_{j_1}^{(i_1)} \zeta_{j_2}^{(i_2)}, \tag{365}$$

where

$$C_{j_2 j_1} = \int\limits_0^T \phi_{j_2}(s) \int\limits_0^s \phi_{j_1}(\tau) d\tau ds$$

is the Fourier coefficient; another notations are the same as in (360).

As we noted above, approximations of the Wiener process that are similar to (356) were not considered in [58], [59] (also see Theorems 7.1, 7.2 in [60]). Furthermore, the extension of the results of Theorems 7.1 and 7.2 [60] to the case under consideration is not obvious.

On the other hand, we can apply the theory built in Chapters 1 and 2 of the monographs [12]-[15]. More precisely, using Theorems 5, 6, we obtain from (365) the desired result

$$\underset{p\to\infty}{\text{l.i.m.}} \int\limits_0^T \int\limits_0^s d\mathbf{f}_\tau^{(i_1)p} d\mathbf{f}_s^{(i_2)p} = \underset{p\to\infty}{\text{l.i.m.}} \sum_{j_1, j_2 = 0}^{p} C_{j_2 j_1} \zeta_{j_1}^{(i_1)} \zeta_{j_2}^{(i_2)} =$$

$$= \int\limits_0^{*T} \int\limits_0^{*s} d\mathbf{f}_\tau^{(i_1)} d\mathbf{f}_s^{(i_2)}. \tag{366}$$

From the other hand, by Theorems 1, 2 (see (9)) for the case $k = 2$ we obtain from (365) the following relation

$$\underset{p\to\infty}{\text{l.i.m.}} \int\limits_0^T \int\limits_0^s d\mathbf{f}_\tau^{(i_1)p} d\mathbf{f}_s^{(i_2)p} = \underset{p\to\infty}{\text{l.i.m.}} \sum_{j_1, j_2 = 0}^{p} C_{j_2 j_1} \zeta_{j_1}^{(i_1)} \zeta_{j_2}^{(i_2)} =$$

$$= \underset{p\to\infty}{\text{l.i.m.}} \sum_{j_1, j_2 = 0}^{p} C_{j_2 j_1} \left(\zeta_{j_1}^{(i_1)} \zeta_{j_2}^{(i_2)} - \mathbf{1}_{\{i_1 = i_2\}} \mathbf{1}_{\{j_1 = j_2\}} \right) + \mathbf{1}_{\{i_1 = i_2\}} \sum_{j_1 = 0}^{\infty} C_{j_1 j_1} =$$

$$= \int\limits_0^T \int\limits_0^s d\mathbf{f}_\tau^{(i_1)} d\mathbf{f}_s^{(i_2)} + \mathbf{1}_{\{i_1 = i_2\}} \sum_{j_1 = 0}^{\infty} C_{j_1 j_1}. \tag{367}$$

Since

$$\sum_{j_1 = 0}^{\infty} C_{j_1 j_1} = \frac{1}{2} \sum_{j_1 = 0}^{\infty} \left(\int\limits_0^T \phi_j(\tau) d\tau \right)^2 = \frac{1}{2} \left(\int\limits_0^T \phi_0(\tau) d\tau \right)^2 = \frac{1}{2} \int\limits_0^T ds,$$

then from Theorem 4 ($k=2$) and (367) we obtain (366).

14. Generalization of Theorem 12 for Complete Orthonormal Systems of Functions in $L_2([t,T])$ and $\psi_1(\tau),\ \ldots,\ \psi_k(\tau)\in L_2([t,T])$ such that the Condition (369) is Satisfied

First, note that (see the proof of Thorem 12 and (86))

$$\underset{p\to\infty}{\text{l.i.m.}}\sum_{j_1,\ldots,j_k=0}^{p} C_{j_k\ldots j_1}\prod_{s=1}^{r}\mathbf{1}_{\{j_{g_{2s-1}}=\ j_{g_{2s}}\}}\prod_{s=1}^{r}\mathbf{1}_{\{i_{g_{2s-1}}=\ i_{g_{2s}}\ne 0\}}J'[\phi_{j_{q_1}}\ldots\phi_{j_{q_{k-2r}}}]_{T,t}^{(i_{q_1}\ldots i_{q_{k-2r}})}=$$

$$=\underset{p\to\infty}{\text{l.i.m.}}\sum_{\substack{j_1,\ldots,j_q,\ldots,j_k=0\\ q\ne g_1,g_2,\ldots,g_{2r-1},g_{2r}}}^{p}\ \sum_{j_{g_1},j_{g_3},\ldots,j_{g_{2r-1}}=0}^{p} C_{j_k\ldots j_1}\Biggr|_{j_{g_1}=\ j_{g_2},\ldots,j_{g_{2r-1}}=\ j_{g_{2r}}}\times$$

$$\times\prod_{s=1}^{r}\mathbf{1}_{\{i_{g_{2s-1}}=\ i_{g_{2s}}\ne 0\}}J'[\phi_{j_{q_1}}\ldots\phi_{j_{q_{k-2r}}}]_{T,t}^{(i_{q_1}\ldots i_{q_{k-2r}})}=$$

$$=\underset{p\to\infty}{\text{l.i.m.}}\sum_{\substack{j_1,\ldots,j_q,\ldots,j_k=0\\ q\ne g_1,g_2,\ldots,g_{2r-1},g_{2r}}}^{p}\left(\sum_{j_{g_1},j_{g_3},\ldots,j_{g_{2r-1}}=0}^{p} C_{j_k\ldots j_1}\Biggr|_{j_{g_1}=\ j_{g_2},\ldots,j_{g_{2r-1}}=\ j_{g_{2r}}}-\right.$$

$$\left.-\frac{1}{2^r}\prod_{l=1}^{r}\mathbf{1}_{\{g_{2l}=g_{2l-1}+1\}}C_{j_k\ldots j_1}\Biggr|_{(j_{g_2}j_{g_1})\frown(\cdot)\ldots(j_{g_{2r}}j_{g_{2r-1}})\frown(\cdot),j_{g_1}=\ j_{g_2},\ldots,j_{g_{2r-1}}=\ j_{g_{2r}}}\right)\times$$

$$\times\prod_{s=1}^{r}\mathbf{1}_{\{i_{g_{2s-1}}=\ i_{g_{2s}}\ne 0\}}J'[\phi_{j_{q_1}}\ldots\phi_{j_{q_{k-2r}}}]_{T,t}^{(i_{q_1}\ldots i_{q_{k-2r}})}+$$

$$+\underset{p\to\infty}{\text{l.i.m.}}\sum_{\substack{j_1,\ldots,j_q,\ldots,j_k=0\\ q\ne g_1,g_2,\ldots,g_{2r-1},g_{2r}}}^{p}\frac{1}{2^r}C_{j_k\ldots j_1}\Biggr|_{(j_{g_2}j_{g_1})\frown(\cdot)\ldots(j_{g_{2r}}j_{g_{2r-1}})\frown(\cdot),j_{g_1}=\ j_{g_2},\ldots,j_{g_{2r-1}}=\ j_{g_{2r}}}\times$$

$$\times\prod_{s=1}^{r}\mathbf{1}_{\{i_{g_{2s-1}}=\ i_{g_{2s}}\ne 0\}}\prod_{s=1}^{r}\mathbf{1}_{\{g_{2s}=g_{2s-1}+1\}}J'[\phi_{j_{q_1}}\ldots\phi_{j_{q_{k-2r}}}]_{T,t}^{(i_{q_1}\ldots i_{q_{k-2r}})}=$$

$$=\underset{p\to\infty}{\text{l.i.m.}}\sum_{\substack{j_1,\ldots,j_q,\ldots,j_k=0\\ q\ne g_1,g_2,\ldots,g_{2r-1},g_{2r}}}^{p}\left(\sum_{j_{g_1},j_{g_3},\ldots,j_{g_{2r-1}}=0}^{p} C_{j_k\ldots j_1}\Biggr|_{j_{g_1}=\ j_{g_2},\ldots,j_{g_{2r-1}}=\ j_{g_{2r}}}-\right.$$

$$-\frac{1}{2^r}\prod_{l=1}^{r}\mathbf{1}_{\{g_{2l}=g_{2l-1}+1\}}C_{j_k\ldots j_1}\Biggl|_{(j_{g_2}j_{g_1})\curvearrowright(\cdot)\ldots(j_{g_{2r}}j_{g_{2r-1}})\curvearrowright(\cdot),j_{g_1}=\ j_{g_2},\ldots,j_{g_{2r-1}}=\ j_{g_{2r}}}\Biggr)\times$$

$$\times\prod_{s=1}^{r}\mathbf{1}_{\{i_{g_{2s-1}}=\ i_{g_{2s}}\neq 0\}}J'[\phi_{j_{q_1}}\ldots\phi_{j_{q_{k-2r}}}]_{T,t}^{(i_{q_1}\ldots i_{q_{k-2r}})}+$$

$$+\frac{1}{2^r}\prod_{s=1}^{r}\mathbf{1}_{\{g_{2s}=g_{2s-1}+1\}}J[\psi^{(k)}]_{T,t}^{s_r,\ldots,s_1}\quad \text{w. p. 1.} \tag{368}$$

Using (368) and the condition (92), we obtain (87). This means that we get (89). Thus the expansion (40) is proved.

Analyzing the proof of Theorems 12 and 4 and taking into account the above arguments, it is easy to see that the following theorem is true.

Theorem 24 [12], [36]. *Assume that the continuous functions $\psi_1(\tau),\ldots,\psi_k(\tau)$ at the interval $[t,T]$ and the complete orthonormal system $\{\phi_j(x)\}_{j=0}^{\infty}$ of functions ($\phi_0(x)=1/\sqrt{T-t}$) in the space $L_2([t,T])$ are such that the following condition*

$$\lim_{p_1,\ldots,p_k\to\infty}\sum_{j_1=0}^{p_1}\ldots\sum_{j_q=0}^{p_q}\ldots\sum_{j_k=0}^{p_k}\Biggl|_{q\neq g_1,g_2,\ldots,g_{2r-1},g_{2r}}\times$$

$$\times\Biggl(\sum_{j_{g_1}=0}^{\min\{p_{g_1},p_{g_2}\}}\ldots\sum_{j_{g_{2r-1}}=0}^{\min\{p_{g_{2r-1}},p_{g_{2r}}\}}C_{j_k\ldots j_1}\Biggl|_{j_{g_1}=j_{g_2},\ldots,j_{g_{2r-1}}=j_{g_{2r}}}-$$

$$-\frac{1}{2^r}\prod_{l=1}^{r}\mathbf{1}_{\{g_{2l}=g_{2l-1}+1\}}C_{j_k\ldots j_1}\Biggl|_{(j_{g_2}j_{g_1})\curvearrowright(\cdot)\ldots(j_{g_{2r}}j_{g_{2r-1}})\curvearrowright(\cdot),j_{g_1}=\ j_{g_2},\ldots,j_{g_{2r-1}}=\ j_{g_{2r}}}\Biggr)^2=0 \tag{369}$$

is satisfied for all $r=1,2,\ldots,[k/2]$. Then, for the iterated Stratonovich stochastic integral of arbitrary multiplicity k

$$J^*[\psi^{(k)}]_{T,t}^{(i_1\ldots i_k)}=\int\limits_t^{*T}\psi_k(t_k)\ldots\int\limits_t^{*t_2}\psi_1(t_1)d\mathbf{w}_{t_1}^{(i_1)}\ldots d\mathbf{w}_{t_k}^{(i_k)}$$

the following expansion

$$J^*[\psi^{(k)}]_{T,t}^{(i_1\ldots i_k)}=\underset{p_1,\ldots,p_k\to\infty}{\text{l.i.m.}}\sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k}C_{j_k\ldots j_1}\prod_{l=1}^{k}\zeta_{j_l}^{(i_l)}$$

that converges in the mean-square sense is valid, where

$$C_{j_k\ldots j_1}=\int\limits_t^T\psi_k(t_k)\phi_{j_k}(t_k)\ldots\int\limits_t^{t_2}\psi_1(t_1)\phi_{j_1}(t_1)dt_1\ldots dt_k$$

is the Fourier coefficient, l.i.m. *is a limit in the mean-square sense,* $i_1,\ldots,i_k=0,1,\ldots,m,$

$$\zeta_j^{(i)}=\int\limits_t^T\phi_j(\tau)d\mathbf{w}_\tau^{(i)}$$

are independent standard Gaussian random variables for various i *or* j *(in the case when* $i\neq 0$*),* $\mathbf{w}_\tau^{(i)}=\mathbf{f}_\tau^{(i)}$ *for* $i=1,\ldots,m$ *and* $\mathbf{w}_\tau^{(0)}=\tau.$

Further in this section, we generalize Theorems 12, 24 to the case of complete orthonormal systems of functions in the space $L_2([t,T])$ and $\psi_1(\tau),\ \ldots,\ \psi_k(\tau)\in L_2([t,T])$ such that the condition (369) is satisfied.

Let $(\Omega,\mathrm{F},\mathsf{P})$ be a complete probability space and let $f(t,\omega)\stackrel{\mathsf{def}}{=}f_t:[0,T]\times\Omega\rightarrow\mathbb{R}$ be the standard Wiener process defined on the probability space $(\Omega,\mathrm{F},\mathsf{P})$.

Let us consider the family of σ-algebras $\{\mathrm{F}_t,\ t\in[0,T]\}$ defined on the probability space $(\Omega,\mathrm{F},\mathsf{P})$ and connected with the Wiener process f_t in such a way that

1. $\mathrm{F}_s\subset\mathrm{F}_t\subset\mathrm{F}$ for $s<t$.
2. The Wiener process f_t is F_t-measurable for all $t\in[0,T]$.
3. The process $f_{t+\Delta}-f_t$ for all $t\ge 0,\ \Delta>0$ is independent with the events of σ-algebra F_t.

Let $\xi(\tau,\omega)\stackrel{\mathsf{def}}{=}\xi_\tau:[0,T]\times\Omega\rightarrow\mathbb{R}$ be some random process, which is measurable with respect to the pair of variables (τ,ω) and satisfies to the following condition

$$\int\limits_t^T|\xi_\tau|d\tau<\infty\quad\text{w. p. 1}\quad(t\ge 0).$$

Let $\tau_j^{(N)},\ j=0,1,\ldots,N$ be a partition of the interval $[t,T],\ t\ge 0$ such that

$$t=\tau_0^{(N)}<\tau_1^{(N)}<\ldots<\tau_N^{(N)}=T,\qquad\max_{0\le j\le N-1}\left|\tau_{j+1}^{(N)}-\tau_j^{(N)}\right|\rightarrow 0\ \ \text{if}\ \ N\rightarrow\infty.\tag{370}$$

Further, for simplicity, we write τ_j instead of $\tau_j^{(N)}$.

Consider the definition of the Stratonovich stochastic integral, which differs from the definition given in [1] (recall that we use definition [1] above in this article).

The mean-square limit (if it exists)

$$\underset{N\to\infty}{\text{l.i.m.}}\sum_{j=0}^{N-1}\frac{1}{\tau_{j+1}-\tau_j}\int\limits_{\tau_j}^{\tau_{j+1}}\xi_s ds\ \left(f_{\tau_{j+1}}-f_{\tau_j}\right)\stackrel{\mathsf{def}}{=}\int\limits_t^T\xi_\tau\circ df_\tau\tag{371}$$

is called [71] the Stratonovich stochastic integral of the process $\xi_\tau,\ \tau\in[t,T]$, where $\tau_j,\ j=0,1,\ldots,N$ is a partition of the interval $[t,T]$ satisfying the condition (370).

We also denote by

$$\int\limits_t^{\tau} \xi_s \circ df_s$$

the Stratonovich stochastic integral like (371) (if it exists) of $\xi_s \mathbf{1}_{\{s\in[t,\tau]\}}$ for $\tau \in [t,T]$, $t \ge 0$.

It is known [71] (Lemma A.2) that the following iterated Stratonovich stochastic integral

$$J^S[\psi^{(k)}]_{\tau,t}^{(i_1\ldots i_k)} = \int\limits_t^{\tau} \psi_k(t_k)\ldots \int\limits_t^{t_2} \psi_1(t_1)\circ d\mathbf{w}_{t_1}^{(i_1)}\ldots \circ d\mathbf{w}_{t_k}^{(i_k)} \tag{372}$$

exists for the case $i_1 = \ldots = i_k \ne 0$, where $\tau \in [t,T]$, $\psi_1(\tau),\ldots,\psi_k(\tau) \in L_2([t,T])$, $i_1,\ldots,i_k = 0,1,\ldots,m$, $\mathbf{w}_{\tau}^{(i)} = \mathbf{f}_{\tau}^{(i)}$ for $i = 1,\ldots,m$ and $\mathbf{w}_{\tau}^{(0)} = \tau$, $\mathbf{f}_{\tau}^{(i)}$ $(i = 1,\ldots,m)$ are independent standard Wiener processes defined as above in this section.

In [72] (2021) an analogue of Theorem 4 (1997) is proved for the case $i_1 = \ldots = i_k \ne 0$ and $\psi_1(\tau),\ldots,\psi_k(\tau) \in L_2([t,T])$.

Let us denote

$$J[\psi^{(k)}]_{T,t}^{(i_1\ldots i_k)} + \sum_{r=1}^{[k/2]} \frac{1}{2^r} \sum_{(s_r,\ldots,s_1)\in \mathrm{A}_{k,r}} J[\psi^{(k)}]_{T,t}^{s_r,\ldots,s_1} \stackrel{\mathsf{def}}{=} \bar{J}^*[\psi^{(k)}]_{T,t}^{(i_1\ldots i_k)}, \tag{373}$$

where $\psi_1(\tau),\ldots,\psi_k(\tau) \in L_2([t,T])$, $\psi_l(\tau)\psi_{l-1}(\tau) \in L_2([t,T])$ $(l = 2,3,\ldots,k)$, $J[\psi^{(k)}]_{T,t}^{(i_1\ldots i_k)}$ is the iterated Ito stochastic integral (376), $\sum\limits_{\emptyset}$ is supposed to be equal to zero; another notations are the same as in Theorem 4.

Further, by analogy with (51), (54) and using the version of (48) for the case of an arbitrary complete orthonormal system of functions in the space $L_2([t,T])$ (see [12] or [15], Sect. 1.11) instead of (48), we obtain the following generalization of (51) to the case of an arbitrary complete orthonormal system of functions in the space $L_2([t,T])$ and $\psi_1(\tau)$, $\ldots$, $\psi_k(\tau) \in L_2([t,T])$

$$\sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k} C_{j_k\ldots j_1}\prod_{l=1}^{k}\zeta_{j_l}^{(i_l)} = \sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k} C_{j_k\ldots j_1} J'[\phi_{j_1}\ldots\phi_{j_k}]_{T,t}^{(i_1\ldots i_k)} +$$

$$+\sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k} C_{j_k\ldots j_1}\sum_{r=1}^{[k/2]}\sum_{\substack{(\{\{g_1,g_2\},\ldots,\{g_{2r-1},g_{2r}\}\},\{q_1,\ldots,q_{k-2r}\})\\ \{g_1,g_2,\ldots,g_{2r-1},g_{2r},q_1,\ldots,q_{k-2r}\}=\{1,2,\ldots,k\}}}\prod_{s=1}^{r}\mathbf{1}_{\{i_{g_{2s-1}}=\ i_{g_{2s}}\ne 0\}}\times$$

$$\times \mathbf{1}_{\{j_{g_{2s-1}}=\ j_{g_{2s}}\}} J'[\phi_{j_{q_1}}\ldots\phi_{j_{q_{k-2r}}}]_{T,t}^{(i_{q_1}\ldots i_{q_{k-2r}})}\quad \text{w. p. 1}, \tag{374}$$

where $J'[\phi_{j_1}\ldots\phi_{j_k}]_{T,t}^{(i_1\ldots i_k)}$, $J'[\phi_{j_{q_1}}\ldots\phi_{j_{q_{k-2r}}}]_{T,t}^{(i_{q_1}\ldots i_{q_{k-2r}})}$ are multiple Wiener stochastic integrals defined as in [67] (1951). Note that in [67] the case of a scalar Wiener process has been considered.

It should be noted that Theorem 1.16 [12] (Sect. 1.11) and Theorem 2 can be reformulated as follows (also see [33], Sect. 15)

$$J[\psi^{(k)}]_{T,t}^{(i_1\ldots i_k)}=\underset{p_1,\ldots,p_k\to\infty}{\hbox{\vtop{\offinterlineskip\halign{\hfil#\hfil\cr{\rm l.i.m.}\cr}}}}\sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k}C_{j_k\ldots j_1}J'[\phi_{j_1}\ldots\phi_{j_k}]_{T,t}^{(i_1\ldots i_k)}\quad\hbox{w. p. 1,}\tag{375}$$

where $J'[\phi_{j_1}\ldots\phi_{j_k}]_{T,t}^{(i_1\ldots i_k)}$ is the multiple Wiener stochastic integral defined as in [67] (1951) and $J[\psi^{(k)}]_{T,t}^{(i_1\ldots i_k)}$ is the iterated Ito stochastic integral

$$J[\psi^{(k)}]_{T,t}^{(i_1\ldots i_k)}=\int\limits_t^T\psi_k(t_k)\ldots\int\limits_t^{t_2}\psi_1(t_1)d{\bf w}_{t_1}^{(i_1)}\ldots d{\bf w}_{t_k}^{(i_k)};\tag{376}$$

another notations are the same as in Theorem 2.

Passing to the limit $\underset{p_1,\ldots,p_k\to\infty}{\rm l.i.m.}$ in (374) and using the equality (375), we get w. p. 1 the following equality

$$\underset{p_1,\ldots,p_k\to\infty}{\rm l.i.m.}\sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k}C_{j_k\ldots j_1}\zeta_{j_1}^{(i_1)}\ldots\zeta_{j_k}^{(i_k)}=J[\psi^{(k)}]_{T,t}^{(i_1\ldots i_k)}+$$

$$+\sum_{r=1}^{[k/2]}\ \sum_{\stackrel{(\{\{g_1,g_2\},\ldots,\{g_{2r-1},g_{2r}\}\},\{q_1,\ldots,q_{k-2r}\})}{\{g_1,g_2,\ldots,g_{2r-1},g_{2r},q_1,\ldots,q_{k-2r}\}=\{1,2,\ldots,k\}}}\ \prod_{s=1}^r{\bf 1}_{\{i_{g_{2s-1}}=\ i_{g_{2s}}\ne 0\}}\times$$

$$\times\underset{p_1,\ldots,p_k\to\infty}{\rm l.i.m.}\sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k}C_{j_k\ldots j_1}\prod_{s=1}^r{\bf 1}_{\{j_{g_{2s-1}}=\ j_{g_{2s}}\}}J'[\phi_{j_{q_1}}\ldots\phi_{j_{q_{k-2r}}}]_{T,t}^{(i_{q_1}\ldots i_{q_{k-2r}})},\tag{377}$$

where $J'[\phi_{j_{q_1}}\ldots\phi_{j_{q_{k-2r}}}]_{T,t}^{(i_{q_1}\ldots i_{q_{k-2r}})}$ is the multiple Wiener stochastic integral defined as in [67] (1951) and $J[\psi^{(k)}]_{T,t}^{(i_1\ldots i_k)}$ is the iterated Ito stochastic integral (376).

Suppose that $\{\phi_j(x)\}_{j=0}^{\infty}$ is an arbitrary complete orthonormal system of functions in $L_2([t,T])$ and $\Phi_1(\tau),\Phi_2(\tau)\in L_2([t,T])$. Then we have

$$\sum_{j=0}^{\infty}\left|\int\limits_t^s\phi_j(\tau)\Phi_1(\tau)d\tau\int\limits_s^T\phi_j(\tau)\Phi_2(\tau)d\tau\right|\le$$

$$\le\frac{1}{2}\sum_{j=0}^{\infty}\left(\left(\int\limits_t^T{\bf 1}_{\{\tau<s\}}\phi_j(\tau)\Phi_1(\tau)d\tau\right)^2+\left(\int\limits_t^T{\bf 1}_{\{\tau>s\}}\phi_j(\tau)\Phi_2(\tau)d\tau\right)^2\right)=$$

$$=\frac{1}{2}\left(\int\limits_t^s\Phi_1^2(\tau)d\tau+\int\limits_s^T\Phi_2^2(\tau)d\tau\right)\le\frac{1}{2}\left(\|\Phi_1\|_{L_2([t,T])}^2+\|\Phi_2\|_{L_2([t,T])}^2\right)<\infty,\tag{378}$$

i.e. the series

$$\sum_{j=0}^{\infty}\int\limits_t^s \phi_j(\tau)\Phi_1(\tau)d\tau\int\limits_s^T \phi_j(\tau)\Phi_2(\tau)d\tau$$

converges absolutely.

By interpreting the integrals in (66)–(69) as Lebesgue integrals, using Fubini's theorem in (66) and Lebesgue's Dominated Convergence Theorem in (68), we obtain (64) (see (69), (378)) for the case of an arbitrary complete orthonormal system of functions in the space $L_2([t,T])$ and $\psi_1(\tau),\ldots,\psi_k(\tau)\in L_2([t,T])$.

Using the equality (38) for the case of an arbitrary complete orthonormal system of functions in the space $L_2([t,T])$ and $\Phi_1(\tau),\Phi_2(\tau)\in L_2([t,T])$ as well as absolute convergence of the series on the right-hand side of (38) for this case (see [75] or [12], Sect. 2.1.4), we obtain [73] (Sect. 3.5.2, Theorem 3.5.2) the generalization of (72) for the case of an arbitrary complete orthonormal system of functions in the space $L_2([t,T])$ and $\psi_1(\tau),\ldots,\psi_k(\tau)\in L_2([t,T])$.

Repeating the steps of the proof of Theorem 12 below the formula (73) using (373), (377) or steps of the proof of Theorem 24 using (373), (377), we obtain for complete orthonormal systems $\{\phi_j(x)\}_{j=0}^{\infty}$ $(\phi_0(x)=1/\sqrt{T-t})$ in the space $L_2([t,T])$ and $\psi_1(\tau),\ldots,\psi_k(\tau)\in L_2([t,T])$, $\psi_l(\tau)\psi_{l-1}(\tau)\in L_2([t,T])$ $(l=2,3,\ldots,k)$ (for which the condition (369) is satisfied) the following equality

$$\underset{p_1,\ldots,p_k\to\infty}{\text{l.i.m.}}\sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k}C_{j_k\ldots j_1}\prod_{l=1}^{k}\zeta_{j_l}^{(i_l)}=$$

$$=J[\psi^{(k)}]_{T,t}^{(i_1\ldots i_k)}+\sum_{r=1}^{[k/2]}\frac{1}{2^r}\sum_{(s_r,\ldots,s_1)\in \mathrm{A}_{k,r}}J[\psi^{(k)}]_{T,t}^{s_r,\ldots,s_1}=\bar J^*[\psi^{(k)}]_{T,t}^{(i_1\ldots i_k)} \tag{379}$$

w. p. 1, where notations in (379) are the same as in Theorem 4 and $\bar J^*[\psi^{(k)}]_{T,t}^{(i_1\ldots i_k)}$ is defined by (373).

Thus the following two theorems are proved.

Theorem 25 [12], [15], [36]. *Assume that the complete orthonormal system* $\{\phi_j(x)\}_{j=0}^{\infty}$ $(\phi_0(x)=1/\sqrt{T-t})$ *in the space* $L_2([t,T])$ *and* $\psi_1(\tau),\ldots,\psi_k(\tau)\in L_2([t,T])$, $\psi_l(\tau)\psi_{l-1}(\tau)\in L_2([t,T])$ $(l=2,3,\ldots,k)$ *are such that the folowing condition*

$$\lim_{p_1,\ldots,p_k\to\infty}\sum_{j_1=0}^{p_1}\ldots\sum_{j_q=0}^{p_q}\ldots\sum_{j_k=0}^{p_k}\Biggl|_{q\ne g_1,g_2,\ldots,g_{2r-1},g_{2r}}\times$$

$$\times\Biggl(\sum_{j_{g_1}=0}^{\min\{p_{g_1},p_{g_2}\}}\ldots\sum_{j_{g_{2r-1}}=0}^{\min\{p_{g_{2r-1}},p_{g_{2r}}\}}C_{j_k\ldots j_1}\Biggl|_{j_{g_1}=j_{g_2},\ldots,j_{g_{2r-1}}=j_{g_{2r}}}-$$

$$-\frac{1}{2^r}\prod_{l=1}^{r}\mathbf{1}_{\{g_{2l}=g_{2l-1}+1\}}C_{j_k\ldots j_1}\Biggl|_{(j_{g_2}j_{g_1})\curvearrowright(\cdot)\ldots(j_{g_{2r}}j_{g_{2r-1}})\curvearrowright(\cdot),j_{g_1}=j_{g_2},\ldots,j_{g_{2r-1}}=j_{g_{2r}}}\Biggr)^2=0 \tag{380}$$

is satisfied for all $r=1,2,\ldots,[k/2]$. *Then, for the sum* $\bar J^*[\psi^{(k)}]_{T,t}^{(i_1\ldots i_k)}$ *of iterated Ito stochastic integrals defined by* (373) *the following expansion*

(381)
$$\bar{J}^*[\psi^{(k)}]_{T,t}^{(i_1\ldots i_k)} = \underset{p_1,\ldots,p_k\to\infty}{\text{l.i.m.}} \sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k} C_{j_k\ldots j_1}\prod_{l=1}^{k}\zeta_{j_l}^{(i_l)}$$

that converges in the mean-square sense is valid, where

$$C_{j_k\ldots j_1} = \int\limits_t^T \psi_k(t_k)\phi_{j_k}(t_k)\ldots\int\limits_t^{t_2}\psi_1(t_1)\phi_{j_1}(t_1)dt_1\ldots dt_k$$

is the Fourier coefficient, l.i.m. *is a limit in the mean-square sense,* $i_1,\ldots,i_k = 0,1,\ldots,m,$

$$\zeta_j^{(i)} = \int\limits_t^T \phi_j(\tau)d\mathbf{w}_\tau^{(i)}$$

are independent standard Gaussian random variables for various i *or* j *(in the case when* $i \ne 0$*),* $\mathbf{w}_\tau^{(i)} = \mathbf{f}_\tau^{(i)}$ *for* $i = 1,\ldots,m$ *and* $\mathbf{w}_\tau^{(0)} = \tau$*.*

Theorem 26 [12], [36]. *Assume that the complete orthonormal system* $\{\phi_j(x)\}_{j=0}^\infty$ $(\phi_0(x) = 1/\sqrt{T-t})$ *in the space* $L_2([t,T])$ *and* $\psi_1(\tau),\ldots,\psi_k(\tau) \in L_2([t,T])$*,* $\psi_l(\tau)\psi_{l-1}(\tau) \in L_2([t,T])$ $(l = 2,3,\ldots,k)$ *are such that the condition*

$$\lim_{p\to\infty}\sum_{\substack{j_1,\ldots,j_q,\ldots,j_k=0\\ q\ne g_1,g_2,\ldots,g_{2r-1},g_{2r}}}^{p}\left(S_{l_1}S_{l_2}\ldots S_{l_d}\left\{\bar{C}_{j_k\ldots j_q\ldots j_1}^{(p)}\Bigg|_{q\ne g_1,g_2,\ldots,g_{2r-1},g_{2r}}\right\}\right)^2 = 0$$

holds for all possible $g_1,g_2,\ldots,g_{2r-1},g_{2r}$ *(see (30)) and* $l_1,l_2,\ldots,l_d$ *such that* $l_1,l_2,\ldots,l_d \in \{1,2,\ldots,r\}$*,* $l_1 > l_2 > \ldots > l_d$*,* $d = 0,1,2,\ldots,r-1$*, where* $r = 1,2,\ldots,[k/2]$ *and*

$$S_{l_1}S_{l_2}\ldots S_{l_d}\left\{\bar{C}_{j_k\ldots j_q\ldots j_1}^{(p)}\Bigg|_{q\ne g_1,g_2,\ldots,g_{2r-1},g_{2r}}\right\} \stackrel{\text{def}}{=} \bar{C}_{j_k\ldots j_q\ldots j_1}^{(p)}\Bigg|_{q\ne g_1,g_2,\ldots,g_{2r-1},g_{2r}}$$

for $d = 0$*. Then, for the sum* $\bar{J}^*[\psi^{(k)}]_{T,t}^{(i_1\ldots i_k)}$ *of iterated Ito stochastic integrals defined by (373) the following expansion*

$$\bar{J}^*[\psi^{(k)}]_{T,t}^{(i_1\ldots i_k)} = \underset{p\to\infty}{\text{l.i.m.}}\sum_{j_1,\ldots,j_k=0}^{p} C_{j_k\ldots j_1}\prod_{l=1}^{k}\zeta_{j_l}^{(i_l)}$$

that converges in the mean-square sense is valid, where

$$C_{j_k\ldots j_1} = \int\limits_t^T \psi_k(t_k)\phi_{j_k}(t_k)\ldots\int\limits_t^{t_2}\psi_1(t_1)\phi_{j_1}(t_1)dt_1\ldots dt_k$$

is the Fourier coefficient, l.i.m. *is a limit in the mean-square sense,* $i_1,\ldots,i_k = 0,1,\ldots,m,$

$$\zeta_j^{(i)} = \int\limits_t^T \phi_j(\tau)d\mathbf{w}_\tau^{(i)}$$

are independent standard Gaussian random variables for various i or j (in the case when $i \neq 0$), $\mathbf{w}_{\tau}^{(i)} = \mathbf{f}_{\tau}^{(i)}$ for $i = 1, \ldots, m$ and $\mathbf{w}_{\tau}^{(0)} = \tau$.

Note that in Theorems 25, 26 (the case $k = 2$) the condition $\psi_1(\tau)\psi_2(\tau) \in L_2([t,T])$ can be omitted.

Using Theorem 4 together with Proposition 3.1 [72] and the proof of Lemma A.2 [71], we can write $\bar{J}^*[\psi^{(k)}]_{T,t}^{(i_1\ldots i_k)} = J^S[\psi^{(k)}]_{T,t}^{(i_1\ldots i_k)}$ w. p. 1 and reformulate Theorems 25, 26 for $J^S[\psi^{(k)}]_{T,t}^{(i_1\ldots i_k)}$ ($J^S[\psi^{(k)}]_{T,t}^{(i_1\ldots i_k)}$ is defined by (372)).

Let us consider the special case $k = 2$ of Theorem 25 in more detail. In this case, the condition (380) takes the following form (compare with (96))

$$\sum_{j_1=0}^{\infty} C_{j_1 j_1} = \frac{1}{2}\int\limits_t^T \psi_1(t_1)\psi_2(t_1)dt_1. \tag{382}$$

Recall that the equality (382) is valid for the case of an arbitrary complete orthonormal system of functions in $L_2([t,T])$ and $\psi_1(\tau), \psi_2(\tau) \in L_2([t,T])$ (see [75] or [12], Sect. 2.1.4).

From Proposition 3.1 [72] for the case $k = 2$ we obtain

$$\int\limits_t^T \psi_2(t_2)\int\limits_t^{t_2} \psi_1(t_1) \circ d\mathbf{w}_{t_1}^{(i)} \circ d\mathbf{w}_{t_2}^{(i)} = \int\limits_t^T \psi_2(t_2)\int\limits_t^{t_2} \psi_1(t_1) d\mathbf{w}_{t_1}^{(i)} d\mathbf{w}_{t_2}^{(i)} +$$

$$+\frac{1}{2}\int\limits_t^T \psi_1(t_1)\psi_2(t_1)dt_1 \tag{383}$$

w. p. 1, where $\psi_1(\tau), \psi_2(\tau) \in L_2([t,T])$, $i = 1, \ldots, m$,

$$\int\limits_t^T \psi_2(t_2)\int\limits_t^{t_2} \psi_1(t_1) \circ d\mathbf{w}_{t_1}^{(i)} \circ d\mathbf{w}_{t_2}^{(i)}$$

is defined by (371), (372) and

$$\int\limits_t^T \psi_2(t_2)\int\limits_t^{t_2} \psi_1(t_1) d\mathbf{w}_{t_1}^{(i)} d\mathbf{w}_{t_2}^{(i)}$$

is the iterated Ito stochastic integral of the form (1) ($k = 2$).

On the other hand, it is not difficult to show that

$$\int\limits_t^T \psi_2(t_2)\int\limits_t^{t_2} \psi_1(t_1) \circ d\mathbf{w}_{t_1}^{(i)} \circ d\mathbf{w}_{t_2}^{(j)} = \int\limits_t^T \psi_2(t_2)\int\limits_t^{t_2} \psi_1(t_1) d\mathbf{w}_{t_1}^{(i)} d\mathbf{w}_{t_2}^{(j)} \tag{384}$$

w. p. 1, where $\psi_1(\tau), \psi_2(\tau) \in L_2([t,T])$, $i \neq j$ $(i, j = 1, \ldots, m)$, another notations are the same as in (383).

Combining (383) and (384), we get (see (373))

$$\int\limits_t^T \psi_2(t_2)\int\limits_t^{t_2}\psi_1(t_1)\circ d\mathbf{w}_{t_1}^{(i_1)}\circ d\mathbf{w}_{t_2}^{(i_2)}=\int\limits_t^T \psi_2(t_2)\int\limits_t^{t_2}\psi_1(t_1)d\mathbf{w}_{t_1}^{(i_1)}d\mathbf{w}_{t_2}^{(i_2)}+$$

$$+\frac{1}{2}\mathbf{1}_{\{i_1=i_2\}}\int\limits_t^T\psi_1(t_1)\psi_2(t_1)dt_1\ \stackrel{\sf def}{=}\ \bar J^{*}[\psi^{(2)}]_{T,t}^{(i_1 i_2)} \tag{385}$$

w. p. 1, where $\psi_1(\tau),\psi_2(\tau)\in L_2([t,T])$, $i_1,i_2=1,\ldots,m.$

It is easy to see that the condition $\phi_0(x)=1/\sqrt{T-t}$ can be omitted in Theorems 25, 26 for the case $k=2$ (see the proof of Theorem 12).

Summing up the above arguments, we obtain the following generalization of Theorem 5 to the case of an arbitrary complete orthonormal system of functions in $L_2([t,T])$ and $\psi_1(\tau),\psi_2(\tau)\in L_2([t,T])$.

Theorem 27 [12]. *Suppose that $\{\phi_j(x)\}_{j=0}^{\infty}$ is an arbitrary complete orthonormal system of functions in the space $L_2([t,T])$ and $\psi_1(\tau),\psi_2(\tau)\in L_2([t,T])$. Then, for the iterated Stratonovich stochastic integral*

$$J^S[\psi^{(2)}]_{T,t}^{(i_1 i_2)}=\int\limits_t^T\psi_2(t_2)\int\limits_t^{t_2}\psi_1(t_1)\circ d\mathbf{f}_{t_1}^{(i_1)}\circ d\mathbf{f}_{t_2}^{(i_2)}\quad (i_1,i_2=1,\ldots,m)$$

the following expansion

$$J^S[\psi^{(2)}]_{T,t}^{(i_1 i_2)}=\underset{p_1,p_2\to\infty}{\text{l.i.m.}}\sum_{j_1=0}^{p_1}\sum_{j_2=0}^{p_2}C_{j_2 j_1}\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)} \tag{386}$$

that converges in the mean-square sence is valid, where the notations are the same as in Theorems 5, 6 *and $J^S[\psi^{(2)}]_{T,t}^{(i_1 i_2)}$ is defined by* (372).

In this section, it is also appropriate to mention the so-called multiple Stratonovich stochastic integral [71] (also see [68]).

The mean-square limit (if it exists)

$$\underset{N\to\infty}{\text{l.i.m.}}\sum_{l_1=0}^{N-1}\ldots\sum_{l_k=0}^{N-1}\frac{1}{\Delta\tau_{l_1}\ldots\Delta\tau_{l_k}}\int\limits_{[\tau_{l_1},\tau_{l_1+1}]\times\ldots\times[\tau_{l_k},\tau_{l_k+1}]}K(t_1,\ldots,t_k)dt_1\ldots dt_k\ \Delta\mathbf{w}_{\tau_{l_1}}^{(i_1)}\ldots\Delta\mathbf{w}_{\tau_{l_k}}^{(i_k)}\ \stackrel{\sf def}{=}$$

$$\stackrel{\sf def}{=}\ \bar J^S[K]_{T,t}^{(i_1\ldots i_k)} \tag{387}$$

is called [71] the multiple Stratonovich stochastic integral of the function $K(t_1,\ldots,t_k)\in L_2([t,T]^k)$, where $\Delta\mathbf{w}_{\tau_j}^{(i)}=\mathbf{w}_{\tau_{j+1}}^{(i)}-\mathbf{w}_{\tau_j}^{(i)}$ $(i=0,1,\ldots,m)$, $\Delta\tau_j=\tau_{j+1}-\tau_j$, $\{\tau_j\}_{j=0}^{N}$ is a partition of the interval $[t,T]$ satisfying the condition (370), $i_1,\ldots,i_k=0,1,\ldots,m$, $\mathbf{w}_{\tau}^{(i)}=\mathbf{f}_{\tau}^{(i)}$ for $i=1,\ldots,m$ and $\mathbf{w}_{\tau}^{(0)}=\tau$, $\mathbf{f}_{\tau}^{(i)}$ $(i=1,\ldots,m)$ are independent standard Wiener processes defined as above in this section.

Note that in [71] the case $i_1=\ldots=i_k\ne 0$ was considered. We also denote by $\bar J^S[K]_{s,t}^{(i_1\ldots i_k)}$ the multiple Stratonovich stochastic integral (387) (if it exists) of the function $K(t_1,\ldots,t_k)\mathbf{1}_{\{(t_1,\ldots,t_k)\in[t,s]^k\}}$, where $K(t_1,\ldots,t_k)\in L_2([t,T]^k)$, $s\in[t,T]$, $t\ge 0$.

Let the function $K(t_1,\ldots,t_k)$ be chosen as follows

$$K(t_1,\ldots,t_k)=\begin{cases}\psi_1(t_1)\ldots\psi_k(t_k), & t_1\le\ldots\le t_k\\ \\ 0, & \text{otherwise}\end{cases},\qquad (388)$$

where $\psi_1(\tau),\ldots,\psi_k(\tau)\in L_2([t,T])$, $t_1,\ldots,t_k\in[t,T]$ $(k\ge 2)$ and $K(t_1)\equiv\psi_1(t_1)$ for $t_1\in[t,T]$.

We will denote the multiple Stratonovich stochastic integral (387) of the function (388) as follows $\bar{J}^S[\psi^{(k)}]_{T,t}^{(i_1\ldots i_k)}$. It is known [71] (Lemma A.2) that the Stratonovich stochastic integrals $J^S[\psi^{(k)}]_{T,t}^{(i_1\ldots i_k)}$ and $\bar{J}^S[\psi^{(k)}]_{T,t}^{(i_1\ldots i_k)}$ exist for the case $i_1=\ldots=i_k\ne 0$. Moreover, $J^S[\psi^{(k)}]_{T,t}^{(i_1\ldots i_k)}=\bar{J}^S[\psi^{(k)}]_{T,t}^{(i_1\ldots i_k)}$ w. p. 1 for this case [71] (Lemma A.2).

Recall that an expansion similar to (40) was obtained in [69] for the multiple Stratonovich stochastic integral (387) under the condition of convergence of trace series.

Recently, another approach to the expansion of integral (387) has been proposed (assuming that the integral (387) exists), where multiple Fourier–Walsh and Fourier–Haar series ($k\in\mathbb{N}$) have been applied [77]. The convergence was proved with respect to the special subsequence ($p_1=\ldots=p_k=p=2^m$, $m\to\infty$ in a formula similar to (381) [77]).

15. Modification of Condition 3 of Theorem 12 Using Parseval's Equality

Let us make some remarks about the development of the approach based on Theorem 12 and describe the algorithm of the verification of Condition 3 of Theorem 12. First, consider the case $k=2n+1$, $n=3,4,\ldots$ (k is the multiplicity of the iterated Stratonovich stochastic integral (39)). Let Conditions 1 and 2 of Theorem 12 be satisfied. Consider the equality (91). The right-hand side of (91) has the form

$$\sum_{j_{g_1}=0}^{p}\ldots\sum_{j_{g_{2r-1}}=0}^{p}C_{j_k\ldots j_1}\Biggl|_{j_{g_1}=j_{g_2},\ldots,j_{g_{2r-1}}=j_{g_{2r}}}-$$

$$-\frac{1}{2^r}\prod_{l=1}^{r}\mathbf{1}_{\{g_{2l}=g_{2l-1}+1\}}C_{j_k\ldots j_1}\Biggl|_{(j_{g_2}j_{g_1})\curvearrowright(\cdot)\ldots(j_{g_{2r}}j_{g_{2r-1}})\curvearrowright(\cdot),\,j_{g_1}=\,j_{g_2},\ldots,j_{g_{2r-1}}=\,j_{g_{2r}}}.$$

Iterated application of the formulas (179), (180), (193) separately to the values

$$\sum_{j_{g_1}=0}^{p}\ldots\sum_{j_{g_{2r-1}}=0}^{p}C_{j_k\ldots j_1}\Biggl|_{j_{g_1}=j_{g_2},\ldots,j_{g_{2r-1}}=j_{g_{2r}}}$$

and

$$\frac{1}{2^r}\prod_{l=1}^{r}\mathbf{1}_{\{g_{2l}=g_{2l-1}+1\}}C_{j_k\ldots j_1}\Biggl|_{(j_{g_2}j_{g_1})\curvearrowright(\cdot)\ldots(j_{g_{2r}}j_{g_{2r-1}})\curvearrowright(\cdot),\,j_{g_1}=\,j_{g_2},\ldots,j_{g_{2r-1}}=\,j_{g_{2r}}}$$

($g_1,g_2,\ldots,g_{2r-1},g_{2r}$ as in (30), $r=1,2,\ldots,[k/2]$, $2r<k$) gives the following representation (see (92))

$$\sum_{\substack{j_1,\ldots,j_q,\ldots,j_k=0\\ q\ne g_1,g_2,\ldots,g_{2r-1},g_{2r}}}^{p}\left(\sum_{j_{g_1}=0}^{p}\ldots\sum_{j_{g_{2r-1}}=0}^{p}C_{j_k\ldots j_1}\Biggr|_{j_{g_1}=j_{g_2},\ldots,j_{g_{2r-1}}=j_{g_{2r}}}-\right.$$

$$\left.-\frac{1}{2^r}\prod_{l=1}^{r}\mathbf{1}_{\{g_{2l}=g_{2l-1}+1\}}C_{j_k\ldots j_1}\Biggr|_{(j_{g_2}j_{g_1})\curvearrowright(\cdot)\ldots(j_{g_{2r}}j_{g_{2r-1}})\curvearrowright(\cdot),j_{g_1}=\,j_{g_2},\ldots,j_{g_{2r-1}}=\,j_{g_{2r}}}\right)^2\le$$

$$\le\sum_{\substack{j_1,\ldots,j_q,\ldots,j_k=0\\ q\ne g_1,g_2,\ldots,g_{2r-1},g_{2r}}}^{\infty}\left(\sum_{j_{g_1}=0}^{p}\ldots\sum_{j_{g_{2r-1}}=0}^{p}C_{j_k\ldots j_1}\Biggr|_{j_{g_1}=j_{g_2},\ldots,j_{g_{2r-1}}=j_{g_{2r}}}-\right.$$

$$\left.-\frac{1}{2^r}\prod_{l=1}^{r}\mathbf{1}_{\{g_{2l}=g_{2l-1}+1\}}C_{j_k\ldots j_1}\Biggr|_{(j_{g_2}j_{g_1})\curvearrowright(\cdot)\ldots(j_{g_{2r}}j_{g_{2r-1}})\curvearrowright(\cdot),j_{g_1}=\,j_{g_2},\ldots,j_{g_{2r-1}}=\,j_{g_{2r}}}\right)^2=$$

$$=\sum_{\substack{j_1,\ldots,j_q,\ldots,j_k=0\\ q\ne g_1,g_2,\ldots,g_{2r-1},g_{2r}}}^{\infty}\left(\int\limits_{[t,T]^{k-2r}}R_p(t_1,\ldots,t_{g_1-1},t_{g_1+1},\ldots,t_{g_{2r}-1},t_{g_{2r}+1},\ldots,t_k)\times\right.$$

$$\left.\times\prod_{\substack{q=1\\ q\ne g_1,g_2,\ldots,g_{2r-1},g_{2r}}}^{k}\psi_q(t_q)\phi_{j_q}(t_q)\;dt_1\ldots dt_{g_1-1}dt_{g_1+1}\ldots dt_{g_{2r}-1}dt_{g_{2r}+1}\ldots dt_k\right)^2, \tag{389}$$

where

$$R_p(t_1,\ldots,t_{g_1-1},t_{g_1+1},\ldots,t_{g_{2r}-1},t_{g_{2r}+1},\ldots,t_k)=$$

$$=\sum_{d=1}^{4^r}\bar{R}_p^{(d)}(t_1,\ldots,t_{g_1-1},t_{g_1+1},\ldots,t_{g_{2r}-1},t_{g_{2r}+1},\ldots,t_k)-$$

$$-\sum_{d=1}^{2^r}\tilde{R}_p^{(d)}(t_1,\ldots,t_{g_1-1},t_{g_1+1},\ldots,t_{g_{2r}-1},t_{g_{2r}+1},\ldots,t_k)\in L_2([t,T]^{k-2r})$$

and

$$\int\limits_{[t,T]^{k-2r}}R_p(t_1,\ldots,t_{g_1-1},t_{g_1+1},\ldots,t_{g_{2r}-1},t_{g_{2r}+1},\ldots,t_k)\times$$

$$\times\prod_{\substack{q=1\\ q\ne g_1,g_2,\ldots,g_{2r-1},g_{2r}}}^{k}\psi_q(t_q)\phi_{j_q}(t_q)\;dt_1\ldots dt_{g_1-1}dt_{g_1+1}\ldots dt_{g_{2r}-1}dt_{g_{2r}+1}\ldots dt_k$$

is the Fourier coefficient of

$$\hat{R}_p(t_1,\ldots,t_{g_1-1},t_{g_1+1},\ldots,t_{g_{2r}-1},t_{g_{2r}+1},\ldots,t_k)=$$

$$=R_p(t_1,\ldots,t_{g_1-1},t_{g_1+1},\ldots,t_{g_{2r}-1},t_{g_{2r}+1},\ldots,t_k)\prod_{\substack{q=1\\ q\ne g_1,g_2,\ldots,g_{2r-1},g_{2r}}}^{k}\psi_q(t_q).$$

Also note that some of the functions

$$\bar{R}_p^{(d)}(t_1,\ldots,t_{g_1-1},t_{g_1+1},\ldots,t_{g_{2r}-1},t_{g_{2r}+1},\ldots,t_k)$$

and

$$\tilde{R}_p^{(d)}(t_1,\ldots,t_{g_1-1},t_{g_1+1},\ldots,t_{g_{2r}-1},t_{g_{2r}+1},\ldots,t_k)$$

can be identically equal to zero.

Obviously, we could use another representation for the function

(390) $$R_p(t_1,\ldots,t_{g_1-1},t_{g_1+1},\ldots,t_{g_{2r}-1},t_{g_{2r}+1},\ldots,t_k)$$

based on the left-hand side of the equality (91) and (179), (180), (193) (see Sect. 5, 8 for details). In Sect. 8, we considered the function (390) in detail for the case $k\ge 5$, $r=1$.

Parseval's equality gives

$$\sum_{\substack{j_1,\ldots,j_q,\ldots,j_k=0\\ q\ne g_1,g_2,\ldots,g_{2r-1},g_{2r}}}^{\infty}\left(\int\limits_{[t,T]^{k-2r}}R_p(t_1,\ldots,t_{g_1-1},t_{g_1+1},\ldots,t_{g_{2r}-1},t_{g_{2r}+1},\ldots,t_k)\times\right.$$

$$\left.\times\prod_{\substack{q=1\\ q\ne g_1,g_2,\ldots,g_{2r-1},g_{2r}}}^{k}\psi_q(t_q)\phi_{j_q}(t_q)\ dt_1\ldots dt_{g_1-1}dt_{g_1+1}\ldots dt_{g_{2r}-1}dt_{g_{2r}+1}\ldots dt_k\right)^2=$$

$$=\int\limits_{[t,T]^{k-2r}}\left(\hat{R}_p(t_1,\ldots,t_{g_1-1},t_{g_1+1},\ldots,t_{g_{2r}-1},t_{g_{2r}+1},\ldots,t_k)\right)^2\times$$

$$\times dt_1\ldots dt_{g_1-1}dt_{g_1+1}\ldots dt_{g_{2r}-1}dt_{g_{2r}+1}\ldots dt_k=$$

(391) $$=\left\|\hat{R}_p\right\|^2_{L_2([t,T]^{k-2r})}.$$

Combining (389) and (391), we obtain

$$\sum_{\substack{j_1,\ldots,j_q,\ldots,j_k=0\\ q\ne g_1,g_2,\ldots,g_{2r-1},g_{2r}}}^{p}\left(\sum_{j_{g_1}=0}^{p}\ldots\sum_{j_{g_{2r-1}}=0}^{p}C_{j_k\ldots j_1}\Bigg|_{j_{g_1}=j_{g_2},\ldots,j_{g_{2r-1}}=j_{g_{2r}}}-\right.$$

$$\left.-\frac{1}{2^r}\prod_{l=1}^{r}\mathbf{1}_{\{g_{2l}=g_{2l-1}+1\}}C_{j_k\ldots j_1}\Bigg|_{(j_{g_2}j_{g_1})\curvearrowright(\cdot)\ldots(j_{g_{2r}}j_{g_{2r-1}})\curvearrowright(\cdot),j_{g_1}=j_{g_2},\ldots,j_{g_{2r-1}}=j_{g_{2r}}}\right)^2\le$$

$$\le\left\|\hat{R}_p\right\|^2_{L_2([t,T]^{k-2r})}. \tag{392}$$

Assume that we have succeeded in proving the following equality

$$\lim_{p\to\infty}\left\|\hat{R}_p\right\|^2_{L_2([t,T]^{k-2r})}=0. \tag{393}$$

Applying (392) and (393), we get (compare with (92))

$$\lim_{p\to\infty}\sum_{\substack{j_1,\ldots,j_q,\ldots,j_k=0\\ q\ne g_1,g_2,\ldots,g_{2r-1},g_{2r}}}^{p}\left(\sum_{j_{g_1}=0}^{p}\ldots\sum_{j_{g_{2r-1}}=0}^{p}C_{j_k\ldots j_1}\Bigg|_{j_{g_1}=j_{g_2},\ldots,j_{g_{2r-1}}=j_{g_{2r}}}-\right.$$

$$\left.-\frac{1}{2^r}\prod_{l=1}^{r}\mathbf{1}_{\{g_{2l}=g_{2l-1}+1\}}C_{j_k\ldots j_1}\Bigg|_{(j_{g_2}j_{g_1})\curvearrowright(\cdot)\ldots(j_{g_{2r}}j_{g_{2r-1}})\curvearrowright(\cdot),j_{g_1}=j_{g_2},\ldots,j_{g_{2r-1}}=j_{g_{2r}}}\right)^2=0. \tag{394}$$

As noted in Sect. 5, Condition 3 of Theorem 12 can be replaced by a weaker condition (92) (or (394)). Also Condition 3 of Theorem 12 can be replaced by (393). From (394) we obviously obtain

$$\lim_{p\to\infty}\sum_{j_{g_1}=0}^{p}\ldots\sum_{j_{g_{2r-1}}=0}^{p}C_{j_k\ldots j_1}\Bigg|_{j_{g_1}=j_{g_2},\ldots,j_{g_{2r-1}}=j_{g_{2r}}}=$$

$$=\frac{1}{2^r}\prod_{l=1}^{r}\mathbf{1}_{\{g_{2l}=g_{2l-1}+1\}}C_{j_k\ldots j_1}\Bigg|_{(j_{g_2}j_{g_1})\curvearrowright(\cdot)\ldots(j_{g_{2r}}j_{g_{2r-1}})\curvearrowright(\cdot),j_{g_1}=j_{g_2},\ldots,j_{g_{2r-1}}=j_{g_{2r}}}. \tag{395}$$

According to (91), the equality (395) will be satisfied if

$$\lim_{p\to\infty}S_{l_1}S_{l_2}\ldots S_{l_d}\left\{\bar{C}^{(p)}_{j_k\ldots j_q\ldots j_1}\Bigg|_{q\ne g_1,g_2,\ldots,g_{2r-1},g_{2r}}\right\}=0, \tag{396}$$

where $g_1,g_2,\ldots,g_{2r-1},g_{2r}$ as in (30), $l_1,l_2,\ldots,l_d$ such that $l_1,l_2,\ldots,l_d\in\{1,2,\ldots,r\}$, $l_1>l_2>\ldots>l_d$, $d=0,1,2,\ldots,r-1$, $r=1,2,\ldots,[k/2]$,

$$S_{l_1}S_{l_2}\ldots S_{l_d}\left\{\bar C^{(p)}_{j_k\ldots j_q\ldots j_1}\Biggl|_{q\ne g_1,g_2,\ldots,g_{2r-1},g_{2r}}\right\}\stackrel{\rm def}{=}\bar C^{(p)}_{j_k\ldots j_q\ldots j_1}\Biggl|_{q\ne g_1,g_2,\ldots,g_{2r-1},g_{2r}}$$

for $d=0$, where

$$\bar C^{(p)}_{j_k\ldots j_q\ldots j_1}\Biggl|_{q\ne g_1,g_2,\ldots,g_{2r-1},g_{2r}},\quad S_l\left\{\bar C^{(p)}_{j_k\ldots j_q\ldots j_1}\Biggl|_{q\ne g_1,g_2,\ldots,g_{2r-1},g_{2r}}\right\}$$

are defined by (34), (35), $l=1,2,\ldots,r$ (see Sect. 5 for details).

Let us make some remarks about the function (390) for the case $k>5$, $r=2$. In this case, using the left-hand side of the equality (91) and (179), (180), (193), we represent the function (390) as the sum of several functions. In particular, among these functions will be the following functions

$$Q_p(t_1,\ldots,t_{s-1},t_{s+1},\ldots,t_{l-1},t_{l+1},\ldots,t_{q-1},t_{q+1},\ldots,t_{g-1},t_{g+1},\ldots,t_k)=$$

$$=\mathbf{1}_{\{t_1<\ldots<t_{s-1}<t_{s+1}<\ldots<t_{l-1}<t_{l+1}<\ldots<t_{q-1}<t_{q+1}<\ldots<t_{g-1}<t_{g+1}<\ldots<t_k\}}\times$$

$$\times\sum_{j_l=p+1}^{\infty}\int\limits_t^{t_{s+1}}\psi_s(\tau)\phi_{j_l}(\tau)d\tau\int\limits_t^{t_{l-1}}\psi_l(\tau)\phi_{j_l}(\tau)d\tau\times$$

$$\times\sum_{j_q=p+1}^{\infty}\int\limits_t^{t_{q+1}}\psi_q(\tau)\phi_{j_q}(\tau)d\tau\int\limits_t^{t_{g-1}}\psi_g(\tau)\phi_{j_q}(\tau)d\tau, \tag{397}$$

$$\bar Q_p(t_1,\ldots,t_{l-2},t_{l+3},\ldots,t_k)=\mathbf{1}_{\{t_1<\ldots<t_{l-2}<t_{l+3}<\ldots<t_k\}}\times$$

$$\times\sum_{j_l=p+1}^{\infty}\left(\int\limits_t^{t_{l-2}}\psi_{l-1}(\theta)\phi_{j_l}(\theta)\int\limits_t^{\theta}\psi_l(u)\phi_{j_l}(u)dud\theta\right)\times$$

$$\times\sum_{j_q=p+1}^{\infty}\left(\int\limits_t^{t_{l-2}}\psi_{l+1}(\theta)\phi_{j_q}(\theta)\int\limits_t^{\theta}\psi_{l+2}(u)\phi_{j_q}(u)dud\theta\right), \tag{398}$$

$$\tilde Q_p(t_1,\ldots,t_{l-2},t_{l+3},\ldots,t_k)=\mathbf{1}_{\{t_1<\ldots<t_{l-2}<t_{l+3}<\ldots<t_k\}}\times$$

$$\times\sum_{j_l=p+1}^{\infty}\sum_{j_q=p+1}^{\infty}\int\limits_t^{t_{l+3}}\psi_{l+1}(\tau)\phi_{j_q}(\tau)\left(\int\limits_t^{\tau}\psi_{l-1}(\theta)\phi_{j_l}(\theta)\int\limits_t^{\theta}\psi_l(u)\phi_{j_l}(u)dud\theta\right)\times$$

$$\times\int\limits_t^{\tau}\psi_{l+2}(u)\phi_{j_q}(u)dud\tau, \tag{399}$$

$$\hat{Q}_p(t_1,\ldots,t_{l-1},t_{l+2},\ldots,t_{q-1},t_{q+2},\ldots,t_k)=$$

$$=\mathbf{1}_{\{t_1<\ldots<t_{l-1}<t_{l+2}<\ldots<t_{q-1}<t_{q+2}<\ldots<t_k\}}\times$$

$$\times\sum_{j_l=p+1}^{\infty}\sum_{j_{l+1}=p+1}^{\infty}\left(\int\limits_t^{t_{l+2}}\psi_{l+1}(\theta)\phi_{j_{l+1}}(\theta)\int\limits_t^{\theta}\psi_l(u)\phi_{j_l}(u)dud\theta\right)\times$$

$$\times\left(\int\limits_t^{t_{q+2}}\psi_{q+1}(\theta)\phi_{j_{l+1}}(\theta)\int\limits_t^{\theta}\psi_q(u)\phi_{j_l}(u)dud\theta\right). \qquad (400)$$

Note that the pairs (g_1,g_2), (g_3,g_4) for the functions (398) and (399) have the property: $g_2=g_1+1$, $g_4=g_3+1$, $g_3=g_2+1$. At the same time, the pairs (g_1,g_2), (g_3,g_4) for the function (397) have the following property: $g_2>g_1+1$, $g_4>g_3+1$, $g_3\ge g_2+1$. For the function (400), the pairs (g_1,g_2), (g_3,g_4) chosen as follows: $g_2>g_1+1$, $g_4>g_3+1$, $g_4=g_2+1$, $g_3=g_1+1$. Generally speaking, all possible pairs (g_1,g_2), (g_3,g_4) must be considered. We consider the functions (397)–(400) only as an example.

Suppose that $s+1=l-1$, $l+1=q-1$, $q+1=g-1$ in (397). Let us show that (we consider the case of Legendre polynomials; the trigonometric case is simpler and can be considered similarly)

$$\lim_{p\to\infty}\left\|Q_p\right\|^2_{L_2([t,T]^{k-4})}=0, \qquad (401)$$

$$\lim_{p\to\infty}\left\|\bar{Q}_p\right\|^2_{L_2([t,T]^{k-4})}=0, \qquad (402)$$

$$\lim_{p\to\infty}\left\|\tilde{Q}_p\right\|^2_{L_2([t,T]^{k-4})}=0, \qquad (403)$$

$$\lim_{p\to\infty}\left\|\hat{Q}_p\right\|^2_{L_2([t,T]^{k-4})}=0. \qquad (404)$$

First consider the proof of (401). We have $(s+1=l-1,\ l+1=q-1,\ q+1=g-1)$

$$\left(Q_p(t_1,\ldots,t_{l-3},t_{l-1},t_{l+1},t_{l+3},t_{l+5},\ldots,t_k)\right)^2=$$

$$=\mathbf{1}_{\{t_1<\ldots<t_{l-3}<t_{l-1}<t_{l+1}<t_{l+3}<t_{l+5}<\ldots<t_k\}}\times$$

$$\times\left(\sum_{j_l=p+1}^{\infty}\int\limits_t^{t_{l-1}}\psi_{l-2}(\tau)\phi_{j_l}(\tau)d\tau\int\limits_t^{t_{l-1}}\psi_l(\tau)\phi_{j_l}(\tau)d\tau\times\right.$$

$$\left.\times\sum_{j_q=p+1}^{\infty}\int\limits_t^{t_{l+3}}\psi_{l+2}(\tau)\phi_{j_q}(\tau)d\tau\int\limits_t^{t_{l+3}}\psi_{l+4}(\tau)\phi_{j_q}(\tau)d\tau\right)^2. \qquad (405)$$

Using the estimate (129), we obtain

$$\left|\int\limits_t^s \psi(\tau)\phi_j(\tau)d\tau\right| < \frac{K}{j^{1-\varepsilon/2}(1-z^2(s))^{1/4-\varepsilon/4}}, \tag{406}$$

where $j\in\mathbb{N}$, $s\in(t,T)$, $z(s)$ is defined by (100), $\varepsilon\in(0,1)$, constant K does not depend on j, $\{\phi_j(x)\}_{j=0}^{\infty}$ is a complete orthonormal system of Legendre polynomials in the space $L_2([t,T])$, $\psi(\tau)$ is a continuously differentiable nonrandom function on $[t,T]$.

Applying (406) and (132) (we take ε instead of $\varepsilon/2$ in (132)), we get

$$\left(\sum_{j_l=p+1}^{\infty}\int\limits_t^{t_{l-1}}\psi_{l-2}(\tau)\phi_{j_l}(\tau)d\tau\int\limits_t^{t_{l-1}}\psi_l(\tau)\phi_{j_l}(\tau)d\tau\times\right.$$

$$\left.\times\sum_{j_q=p+1}^{\infty}\int\limits_t^{t_{l+3}}\psi_{l+2}(\tau)\phi_{j_q}(\tau)d\tau\int\limits_t^{t_{l+3}}\psi_{l+4}(\tau)\phi_{j_q}(\tau)d\tau\right)^2\le$$

$$\le\frac{K_1}{p^{4(1-\varepsilon)}(1-z^2(t_{l-1}))^{1-\varepsilon}(1-z^2(t_{l+3}))^{1-\varepsilon}}, \tag{407}$$

where $t_{l-1},t_{l+3}\in(t,T)$, constant K_1 is independent of p. Combining (405) and (407), we have (401).

Let us prove (402). The following equality is proved in Sect. 12 [37] (also see Sect. 2.9 [12]) for the case of Legendre polynomials ($n>m$; $n,m\in\mathbb{N}$)

$$\sum_{j=m+1}^{n}C_{jj}(s)=\sum_{j=m+1}^{n}\int\limits_t^s\psi_2(\theta)\phi_j(\theta)\int\limits_t^{\theta}\psi_1(\tau)\phi_j(\tau)d\tau d\theta=$$

$$=\frac{T-t}{4}\int\limits_{-1}^{z(s)}\psi_1(u(x))\psi_2(u(x))\left(P_{n+1}(x)P_n(x)-P_{m+1}(x)P_m(x)\right)dx-$$

$$-\frac{(T-t)^2}{8}\sum_{j=m+1}^{n}\frac{1}{2j+1}\int\limits_{-1}^{z(s)}\left(P_{j+1}(y)-P_{j-1}(y)\right)\psi_1'(u(y))\times$$

$$\times\Biggl(\left(P_{j+1}(z(s))-P_{j-1}(z(s))\right)\psi_2(s)-\left(P_{j+1}(y)-P_{j-1}(y)\right)\psi_2(u(y))-$$

$$\left.-\frac{T-t}{2}\int\limits_y^{z(s)}\left(P_{j+1}(x)-P_{j-1}(x)\right)\psi_2'(u(x))dx\right)dy, \tag{408}$$

where $s\in(t,T)$,

$$C_{jj}(s)=\int\limits_t^s\psi_2(\tau)\phi_j(\tau)\int\limits_t^{\tau}\psi_1(\theta)\phi_j(\theta)d\theta d\tau,$$

$$u(y)=\frac{T-t}{2}y+\frac{T+t}{2},\quad z(s)=\left(s-\frac{T+t}{2}\right)\frac{2}{T-t},$$

and ψ_1', ψ_2' are derivatives of the functions $\psi_1(\tau)$, $\psi_2(\tau)$ with respect to the variable $u(y)$.

Applying the estimate (128) in (408) and taking into account the boundedness of the functions $\psi_1(\tau)$, $\psi_2(\tau)$ and their derivatives, we obtain

$$\left|\sum_{j=m+1}^{n} C_{jj}(s)\right|\le C_1\left(\frac{1}{n^{1-\varepsilon}}+\frac{1}{m^{1-\varepsilon}}\right)\int\limits_{-1}^{z(s)}\frac{dx}{\left(1-x^2\right)^{1/2-\varepsilon/2}}+$$

$$+C_2\sum_{j=m+1}^{n}\frac{1}{j^{2-\varepsilon}}\left(\int\limits_{-1}^{z(s)}\frac{dy}{\left(1-y^2\right)^{1/2-\varepsilon/2}}+\frac{1}{\left(1-z^2(s)\right)^{1/4-\varepsilon/4}}\int\limits_{-1}^{z(s)}\frac{dy}{\left(1-y^2\right)^{1/4-\varepsilon/4}}+\right.$$

$$\left.+\int\limits_{-1}^{z(s)}\frac{1}{\left(1-y^2\right)^{1/4-\varepsilon/4}}\int\limits_{y}^{z(s)}\frac{dx}{\left(1-x^2\right)^{1/4-\varepsilon/4}}dy\right),\tag{409}$$

where $s\in(t,T)$, constants C_1, C_2 do not depend on n and m.

From (409) we have

$$\left|\sum_{j=m+1}^{\infty} C_{jj}(s)\right|\le\frac{K_1}{m^{1-\varepsilon}}+K_2\sum_{j=m+1}^{\infty}\frac{1}{j^{2-\varepsilon}}\left(1+\frac{1}{\left(1-z^2(s)\right)^{1/4-\varepsilon/4}}\right),\tag{410}$$

where $s\in(t,T)$, constants K_1, K_2 do not depend on m.

Applying (132) (we take ε instead of $\varepsilon/2$ in (132)) in (410), we get

$$\left|\sum_{j=m+1}^{\infty} C_{jj}(s)\right|\le\frac{K}{m^{1-\varepsilon}\left(1-z^2(s)\right)^{1/4-\varepsilon/4}},\tag{411}$$

where $s\in(t,T)$, constant K is independent of m.

Using the estimate (411), we obtain (see (398))

$$\left(\bar{Q}_p(t_1,\ldots,t_{l-2},t_{l+3},\ldots,t_k)\right)^2=\mathbf{1}_{\{t_1<\ldots<t_{l-2}<t_{l+3}<\ldots<t_k\}}\times$$

$$\times\left(\sum_{j_l=p+1}^{\infty}\left(\int\limits_t^{t_{l-2}}\psi_{l-1}(\theta)\phi_{j_l}(\theta)\int\limits_t^{\theta}\psi_l(u)\phi_{j_l}(u)dud\theta\right)\times\right.$$

$$\left.\times\sum_{j_q=p+1}^{\infty}\left(\int\limits_t^{t_{l-2}}\psi_{l+1}(\theta)\phi_{j_q}(\theta)\int\limits_t^{\theta}\psi_{l+2}(u)\phi_{j_q}(u)dud\theta\right)\right)^2\le$$

$$\leq \frac{K_1}{p^{4(1-\varepsilon)}(1-z^2(t_{l-2}))^{1-\varepsilon}}, \tag{412}$$

where $t_{l-2} \in (t,T)$, constant K_1 is independent of p. The inequality (412) completes the proof of (402).

Let us prove (403). The following equality is proved in Sect. 12 [37] (also see Sect. 2.9 [12]) for the cases of Legendre polynomials and trigonometric functions

$$\frac{1}{2}\int\limits_t^s \psi_1(t_1)\psi_2(t_1)dt_1 - \sum_{j_1=0}^{p} C_{j_1 j_1}(s) = \sum_{j_1=p+1}^{\infty} C_{j_1 j_1}(s), \tag{413}$$

where $s \in (t,T)$ and

$$C_{jj}(s) = \int\limits_t^s \psi_2(\tau)\phi_j(\tau)\int\limits_t^{\tau} \psi_1(\theta)\phi_j(\theta)d\theta d\tau.$$

Applying (413) in (399), we get

$$\left(\tilde{Q}_p(t_1,\ldots,t_{l-2},t_{l+3},\ldots,t_k)\right)^2 \leq$$

$$\leq \left(\sum_{j_l=p+1}^{\infty}\sum_{j_q=p+1}^{\infty}\int\limits_t^{t_{l+3}} \psi_{l+1}(\tau)\phi_{j_q}(\tau)\left(\int\limits_t^{\tau}\psi_{l-1}(\theta)\phi_{j_l}(\theta)\int\limits_t^{\theta}\psi_l(u)\phi_{j_l}(u)dud\theta\right)\times\right.$$

$$\left.\times\int\limits_t^{\tau}\psi_{l+2}(u)\phi_{j_q}(u)dud\tau\right)^2 =$$

$$= \left(\frac{1}{2}\sum_{j_l=p+1}^{\infty}\int\limits_t^{t_{l+3}}\psi_{l+1}(\tau)\left(\int\limits_t^{\tau}\psi_{l-1}(\theta)\phi_{j_l}(\theta)\int\limits_t^{\theta}\psi_l(u)\phi_{j_l}(u)dud\theta\right)\psi_{l+2}(\tau)d\tau-\right.$$

$$-\sum_{j_q=0}^{p}\int\limits_t^{t_{l+3}}\psi_{l+1}(\tau)\phi_{j_q}(\tau)\sum_{j_l=p+1}^{\infty}\left(\int\limits_t^{\tau}\psi_{l-1}(\theta)\phi_{j_l}(\theta)\int\limits_t^{\theta}\psi_l(u)\phi_{j_l}(u)dud\theta\right)\times$$

$$\left.\times\int\limits_t^{\tau}\psi_{l+2}(u)\phi_{j_q}(u)dud\tau\right)^2 =$$

$$= (a-b)^2 \leq 2(|a|^2+|b|^2). \tag{414}$$

Further, we have

$$|a| \le \frac{1}{2} \int\limits_t^{t_{l+3}} |\psi_{l+1}(\tau)| \left| \sum_{j_l=p+1}^{\infty} \int\limits_t^{\tau} \psi_{l-1}(\theta)\phi_{j_l}(\theta) \int\limits_t^{\theta} \psi_l(u)\phi_{j_l}(u) du d\theta \right| |\psi_{l+2}(\tau)| \, d\tau, \tag{415}$$

$$|b| \le \sum_{j_q=0}^{p} \int\limits_t^{t_{l+3}} |\psi_{l+1}(\tau)\phi_{j_q}(\tau)| \left| \sum_{j_l=p+1}^{\infty} \int\limits_t^{\tau} \psi_{l-1}(\theta)\phi_{j_l}(\theta) \int\limits_t^{\theta} \psi_l(u)\phi_{j_l}(u) du d\theta \right| \times$$

$$\times \left| \int\limits_t^{\tau} \psi_{l+2}(u)\phi_{j_q}(u) du \right| d\tau. \tag{416}$$

Combining (411) and (415), we obtain

$$|a| \le \frac{C}{p^{1-\varepsilon}}, \tag{417}$$

where constant C is independent of p.

Separating in (416) the term with the number $j_q = 0$ and then applying (260), (103), (411), we obtain

$$|b| \le \frac{K}{p^{1-\varepsilon}} \left(\int\limits_t^{t_{l+3}} \frac{d\tau}{\left(1 - z^2(\tau)\right)^{1/2-\varepsilon/4}} + \sum_{j_q=1}^{p} \frac{1}{j_q} \int\limits_t^{t_{l+3}} \frac{d\tau}{\left(1 - z^2(\tau)\right)^{3/4-\varepsilon/4}} \right) \le$$

$$\le \frac{K_1}{p^{1-\varepsilon}} \left(1 + \sum_{j_q=1}^{p} \frac{1}{j_q} \right) \le \frac{K_1}{p^{1-\varepsilon}} \left(2 + \int\limits_1^{p} \frac{dx}{x} \right) =$$

$$= \frac{K_1 \left(2 + lnp\right)}{p^{1-\varepsilon}} \ \to \ 0 \tag{418}$$

if $p \to \infty$. The estimates (414), (417), (418) complete the proof of (403).

Finally, consider the proof of (404). Using the elementary inequality $|ab| \le (a^2 + b^2)/2$ and Parseval's equality, we have

$$\left(\hat{Q}_p(t_1, \ldots, t_{l-1}, t_{l+2}, \ldots, t_{q-1}, t_{q+2}, \ldots, t_k) \right)^2 \le$$

$$\le \left(\sum_{j_l=p+1}^{\infty} \sum_{j_{l+1}=p+1}^{\infty} \left| \int\limits_t^{t_{l+2}} \psi_{l+1}(\theta)\phi_{j_{l+1}}(\theta) \int\limits_t^{\theta} \psi_l(u)\phi_{j_l}(u) du d\theta \right| \times \right.$$

$$\left. \times \left| \int\limits_t^{t_{q+2}} \psi_{q+1}(\theta)\phi_{j_{l+1}}(\theta) \int\limits_t^{\theta} \psi_q(u)\phi_{j_l}(u) du d\theta \right| \right)^2 \le$$

$$\leq \frac{1}{4}\left(\sum_{j_l=p+1}^{\infty}\sum_{j_{l+1}=p+1}^{\infty}\left(\int\limits_t^{t_{l+2}}\psi_{l+1}(\theta)\phi_{j_{l+1}}(\theta)\int\limits_t^{\theta}\psi_l(u)\phi_{j_l}(u)dud\theta\right)^2+\right.$$

$$\left.+\sum_{j_l=p+1}^{\infty}\sum_{j_{l+1}=p+1}^{\infty}\left(\int\limits_t^{t_{q+2}}\psi_{q+1}(\theta)\phi_{j_{l+1}}(\theta)\int\limits_t^{\theta}\psi_q(u)\phi_{j_l}(u)dud\theta\right)^2\right)^2\leq$$

$$\leq \frac{1}{4}\left(\sum_{j_l=p+1}^{\infty}\sum_{j_{l+1}=0}^{\infty}\left(\int\limits_t^{t_{l+2}}\psi_{l+1}(\theta)\phi_{j_{l+1}}(\theta)\int\limits_t^{\theta}\psi_l(u)\phi_{j_l}(u)dud\theta\right)^2+\right.$$

$$\left.+\sum_{j_l=p+1}^{\infty}\sum_{j_{l+1}=0}^{\infty}\left(\int\limits_t^{t_{q+2}}\psi_{q+1}(\theta)\phi_{j_{l+1}}(\theta)\int\limits_t^{\theta}\psi_q(u)\phi_{j_l}(u)dud\theta\right)^2\right)^2\leq$$

$$\leq \frac{1}{4}\left(\sum_{j_l=p+1}^{\infty}\int\limits_t^{t_{l+2}}\psi_{l+1}^2(\theta)\left(\int\limits_t^{\theta}\psi_l(u)\phi_{j_l}(u)du\right)^2d\theta+\right.$$

$$\left.+\sum_{j_l=p+1}^{\infty}\int\limits_t^{t_{q+2}}\psi_{q+1}^2(\theta)\left(\int\limits_t^{\theta}\psi_q(u)\phi_{j_l}(u)du\right)^2d\theta\right)^2. \tag{419}$$

Note that

$$\sum_{j=p+1}^{\infty}\frac{1}{j^2}\leq\int\limits_p^{\infty}\frac{dx}{x^2}=\frac{1}{p}. \tag{420}$$

From (419) and (420), (103) we obtain

$$\left(\hat{Q}_p(t_1,\ldots,t_{l-1},t_{l+2},\ldots,t_{q-1},t_{q+2},\ldots,t_k)\right)^2\leq$$
$$\leq\frac{K}{p^2}\ \to\ 0$$

if $p\to\infty$, where constant K does not depend on p. Thus the equalities (401)–(404) are proved.

Recall that the function (390) (this function is defined using the left-hand side of the equality (91)) for the case $k>5$, $r=2$ is represented as the sum of several functions. Four of them, namely Q_p, $\bar{Q}_p$, $\tilde{Q}_p$, $\hat{Q}_p$ (these functions correspond to the particular case of choosing the pairs (g_1,g_2), (g_3,g_4); generally speaking, all possible pairs (g_1,g_2), (g_3,g_4) must be considered), have been studied above. Absolutely similarly, we can consider the remaining functions (for all possible pairs (g_1,g_2), (g_3,g_4)) whose sum is the function (390) for the case $k>5$, $r=2$. As a result, we will have

$$\lim_{p\to\infty}\left\|\hat{R}_p\right\|^2_{L_2([t,T]^{k-2r})}=0\quad (k>5,\ r=2).$$

After that, we can go to the function (390) for the case $k > 5$, $r = 3$, $2r < k$ (this function is defined using the left-hand side of the equality (91)) and follow the same steps as above. This will lead us to the following equality

$$\lim_{p\to\infty}\left\|\hat{R}_p\right\|^2_{L_2([t,T]^{k-2r})} = 0 \quad (k > 5,\ r = 3,\ 2r < k).$$

Then we can move on to the next step and so on. As a result, we get the equality (393) ($r = 1, 2, \ldots, [k/2]$). Thus the condition (92) is satisfied for the case $k = 2n + 1$, $n = 3, 4, \ldots$ (recall that the condition (92) is weaker than Condition 3 of Theorem 12 and the condition (92) can be used in Theorem 12 instead of Condition 3).

For the case $k = 2n$, $n = 3, 4, \ldots$ we follow the above steps for $r = 1, 2, \ldots, [k/2] - 1$ ($2r \le k - 2$). For $2r = k$ we use the same technique as in the proof of the equalities (141)–(143). Recall that we used (65), (72) and Parseval's equality in the proof of (141)–(143).

The obvious disadvantage of the proposed algorithm is the drastic increase of complexity of the proof when moving from $r = 1$ to $r = 2$, $r = 2$ to $r = 3$ and so on.

The proofs of Theorems 16 and 17 contain a rather simple trick of passing from $r = 1$ to $r = 2$. Unfortunately, this procedure cannot be applied already at the transition from $r = 2$ to $r = 3$.

Note that the case $k = 6$, $r = 3$ was successfully considered in Theorem 22 under the following simplifying assumption: $\psi_1(\tau), \ldots, \psi_6(\tau) \equiv 1$.

Nevertheless, the results obtained in this paper are quite sufficient for practical needs (see Chapters 4 and 5 [12] for details).

EXPANSION OF ITERATED STRATONOVICH STOCHASTIC INTEGRALS OF MULTIPLICITY 2 BASED ON DOUBLE FOURIER–LEGENDRE SERIES SUMMARIZED BY PRINGSHEIM METHOD

DMITRIY F. KUZNETSOV

Abstract. The article is devoted to the expansion of iterated Stratonovich stochastic integrals of second multiplicity into the double series of products of standard Gaussian random variables. The proof of expansion is based on the application of double Fourier–Legendre series and double trigonometric Fourier series summarized by Pringsheim method. The results of the article are generalized to the case of an arbitrary complete orthonormal system of functions in the space $L_2([t,T])$ and $\psi_1(\tau),\psi_2(\tau)\in L_2([t,T])$, where $\psi_1(\tau),\psi_2(\tau)$ are weight functions of the iterated Stratonovich stochastic integral of second multiplicity. The considered expansion can be applied to the numerical integration of Ito stochastic differential equations. Some recent results on the expansion of iterated Stratonovich stochastic integrals of multiplicities 3 to 6 are given.

1. Introduction

Let $(\Omega, \mathrm{F}, \mathsf{P})$ be a complete probability space, let $\{\mathrm{F}_t, t \in [0,T]\}$ be a nondecreasing right-continous family of σ-algebras of F, and let $\mathbf{f}_t$ be a standard m-dimensional Wiener stochastic process, which is F_t-measurable for any $t \in [0,T]$. We assume that the components $\mathbf{f}_t^{(i)}$ $(i = 1, \ldots, m)$ of this process are independent. Consider an Ito stochastic differential equation (SDE) in the integral form

$$\mathbf{x}_t = \mathbf{x}_0 + \int\limits_0^t \mathbf{a}(\mathbf{x}_\tau, \tau) d\tau + \int\limits_0^t B(\mathbf{x}_\tau, \tau) d\mathbf{f}_\tau, \quad \mathbf{x}_0 = \mathbf{x}(0, \omega). \tag{1}$$

Here $\mathbf{x}_t$ is some n-dimensional stochastic process satisfying the equation (1). The nonrandom functions $\mathbf{a} : \mathbb{R}^n \times [0,T] \to \mathbb{R}^n$, $B : \mathbb{R}^n \times [0,T] \to \mathbb{R}^{n \times m}$ guarantee the existence and uniqueness up to stochastic equivalence of a solution of the Ito SDE (1) [1]. The second integral on the right-hand side of (1) is interpreted as an Ito stochastic integral. Let $\mathbf{x}_0$ be an n-dimensional random variable, which is F_0-measurable and $\mathsf{M}\left\{|\mathbf{x}_0|^2\right\} < \infty$ (M denotes a mathematical expectation). We assume that $\mathbf{x}_0$ and $\mathbf{f}_t - \mathbf{f}_0$ are independent when $t > 0$.

It is well known that one of the effective approaches to the numerical integration of Ito SDEs is an approach based on the Taylor–Ito and Taylor–Stratonovich expansions [2]-[5]. Moreover, one of the most important features of such expansions is a presence in them of the so-called iterated Ito and Stratonovich stochastic integrals, which play the key role for solving the problem of numerical integration of Ito SDEs and have the following form

$$J[\psi^{(k)}]_{T,t} = \int\limits_t^T \psi_k(t_k) \ldots \int\limits_t^{t_2} \psi_1(t_1) d\mathbf{w}_{t_1}^{(i_1)} \ldots d\mathbf{w}_{t_k}^{(i_k)}, \tag{2}$$

$$J^*[\psi^{(k)}]_{T,t} = \int\limits_t^{*T} \psi_k(t_k) \ldots \int\limits_t^{*t_2} \psi_1(t_1) d\mathbf{w}_{t_1}^{(i_1)} \ldots d\mathbf{w}_{t_k}^{(i_k)}, \tag{3}$$

where every $\psi_l(\tau)$ $(l = 1, \ldots, k)$ is a nonrandom function at the interval $[t,T]$, $\mathbf{w}_\tau^{(i)} = \mathbf{f}_\tau^{(i)}$ for $i = 1, \ldots, m$ and $\mathbf{w}_\tau^{(0)} = \tau$, $i_1, \ldots, i_k = 0, 1, \ldots, m$,

$$\int \text{ and } \int\limits^{*}$$

denote Ito and Stratonovich stochastic integrals, respectively. In this paper we use the definition of the Stratonovich stochastic integral from [3].

Note that usually in applications the functions $\psi_l(\tau) \equiv 1$ $(l = 1, \ldots, k)$ are equal to 1 or have a binomial form. More precisely, $\psi_l(\tau) \equiv 1$ $(l = 1, \ldots, k)$ and $i_1, \ldots, i_k = 0, 1, \ldots, m$ in [2]-[6]. At the same time $\psi_l(\tau) \equiv (t - \tau)^{q_l}$ $(l = 1, \ldots, k,\ q_1, \ldots, q_k = 0, 1, 2, \ldots)$ and $i_1, \ldots, i_k = 1, \ldots, m$ in [7]-[42].

Effective solution of the problem of combined mean-square approximation for collections of iterated Stratonovich stochastic integrals (3) of second multiplicity composes the subject of this article.

It is well known that the mean-square approximation of iterated Ito and Stratonovich stochastic integrals (2), (3) using multiple integral sums requires significant computational costs [11] since this approach implies the partitioning of the integration interval $[t,T]$ of the iterated stochastic integrals

(2), (3) into parts ($T-t$ is already a sufficiently small value since $T-t$ plays the role of an integration step in numerical methods for solving Ito SDEs).

More efficient approximation methods for the iterated stochastic integrals (2), (3) use Fourier series, and they do not require the interval $[t,T]$ to be subdivided into smaller parts. One such method was proposed in [2] and elaborated in [3], [4]. This method, which received widespread use, is based on the Karhunen–Loeve expansion of the Brownian bridge process [2] in the eigenfunctions of its covariance, which form a complete orthonormal trigonometric basis in the space $L_2([t,T])$.

Note that in [11] (2006) the more general and effective method (the so-called method of generalized multiple Fourier series) for the mean-square approximation of iterated Ito stochastic integrals (2) was proposed. This method is based on the generalized multiple Fourier series that converge in the sense of norm in Hilbert space $L_2([t,T]^k)$, where $[t,T]^k$ is the hypercube $[t,T]\times\ldots\times[t,T]$ (k times) and k is the multiplicity of the iterated Ito stochastic integral. The method of generalized multiple Fourier series was developed in [12]-[41], [43]-[61].

An important feature of the method of generalized multiple Fourier series is that various complete orthonormal systems of functions in the space $L_2(t,T])$ can be used (the method proposed in [2] admits only the trigonometric system of functions). Hence, we can state the problem of comparing the efficiency of using different complete orthonormal systems of functions in the space $L_2(t,T])$ in the context of numerical solution of Ito SDEs. This problem has been solved in [37], [38] (also see [25]-[28]). In particular, in [25]-[28], [37], [38] it was shown that the optimal system of basis functions in the framework of numerical solution of Ito SDEs is the system of Legendre polynomials. This fact is true at least for high-order strong numerical methods with orders of convergence $1.5, 2.0, \ldots$ That is why the part of this article is devoted to the expansions of iterated Stratonovich stochastic integrals with multiplicity 2 based on multiple Fourier–Legendre series.

Usage of Fourier series with respect to the system of Legendre polynomials for approximation of iterated stochastic integrals took place for the first time in [7] (1997), [8] (1998), [9] (also see [10]-[41], [43]-[60]).

The results of [7] (also see [8]-[41], [43]-[59]) convincingly testify that there is a doubtless relation between multiplier factor $1/2$, which is typical for Stratonovich stochastic integral and included into the sum connecting Stratonovich and Ito stochastic integrals, and the fact that in the point of finite discontinuity of piecewise smooth function $f(x)$ its Fourier series converges to the value

$$\frac{f(x+0)+f(x-0)}{2}.$$

In addition, in [7], [8], [16]-[20], [23]-[29], [31], [33], [35], [39], [49]-[51], [54], [58] several theorems on expansion of iterated Stratonovich stochastic integrals were formulated and proved. As shown in these papers, the final formulas for expansions of iterated Stratonovich stochastic integrals are more compact than their analogues for iterated Ito stochastic integrals.

This paper continues the study of the relationships between generalized multiple Fourier series and iterated stochastic integrals. We use the double Fourier–Legendre series and double trigonometric Fourier series (summarized by Pringsheim method) for the proof of Theorem 5.3 [24] or Theorem 2.1 [25] (also see [26], [28]). As shown below the conditions of these theorems can be weakened.

Moreover, the mentioned theorems are generalized to the case of an arbitrary complete orthonormal system of functions in the space $L_2([t,T])$ and $\psi_1(\tau),\psi_2(\tau)\in L_2([t,T])$.

2. Method of Generalized Multiple Fourier Series

Let us consider an approach to the expansion of iterated Ito stochastic integrals [11]-[41], [43]-[61] (the so-called method of generalized multiple Fourier series).

Suppose that $\psi_1(\tau),\ldots,\psi_k(\tau)\in L_2([t,T])$. Define the following function on the hypercube $[t,T]^k$

$$
K(t_1,\ldots,t_k)=\begin{cases}\psi_1(t_1)\ldots\psi_k(t_k) & \text{for}\ \ t_1<\ldots<t_k\\ \\ 0 & \text{otherwise}\end{cases},\qquad t_1,\ldots,t_k\in[t,T],\quad k\ge 2, \tag{4}
$$

and $K(t_1)\equiv\psi_1(t_1),\ t_1\in[t,T]$.

Suppose that $\{\phi_j(x)\}_{j=0}^{\infty}$ is a complete orthonormal system of functions in the space $L_2([t,T])$. The function $K(t_1,\ldots,t_k)$ belongs to the space $L_2([t,T]^k)$. At this situation it is well-known that the generalized multiple Fourier series of $K(t_1,\ldots,t_k)\in L_2([t,T]^k)$ is converging to $K(t_1,\ldots,t_k)$ in the hypercube $[t,T]^k$ in the mean-square sense, i.e.

$$
\lim_{p_1,\ldots,p_k\to\infty}\left\|K(t_1,\ldots,t_k)-\sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k}C_{j_k\ldots j_1}\prod_{l=1}^{k}\phi_{j_l}(t_l)\right\|_{L_2([t,T]^k)}=0,
$$

where

$$
C_{j_k\ldots j_1}=\int\limits_{[t,T]^k}K(t_1,\ldots,t_k)\prod_{l=1}^{k}\phi_{j_l}(t_l)dt_1\ldots dt_k, \tag{5}
$$

$$
\|f\|_{L_2([t,T]^k)}=\left(\int\limits_{[t,T]^k}f^2(t_1,\ldots,t_k)dt_1\ldots dt_k\right)^{1/2}.
$$

Consider the partition $\{\tau_j\}_{j=0}^{N}$ of the interval $[t,T]$ such that

$$
t=\tau_0<\ldots<\tau_N=T,\quad \Delta_N=\max_{0\le j\le N-1}\Delta\tau_j\to 0\ \ \text{if}\ \ N\to\infty,\quad \Delta\tau_j=\tau_{j+1}-\tau_j. \tag{6}
$$

Theorem 1 [11] (2006) (also see [12]-[41], [43]-[61]). *Suppose that every $\psi_l(\tau)$ $(l=1,\ldots,k)$ is a continuous nonrandom function on $[t,T]$ and $\{\phi_j(x)\}_{j=0}^{\infty}$ is a complete orthonormal system of continuous functions in $L_2([t,T])$. Then*

$$
J[\psi^{(k)}]_{T,t}\ =\ \underset{p_1,\ldots,p_k\to\infty}{\text{l.i.m.}}\ \sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k}C_{j_k\ldots j_1}\Biggl(\prod_{l=1}^{k}\zeta_{j_l}^{(i_l)}\ -
$$

$$
-\ \underset{N\to\infty}{\text{l.i.m.}}\sum_{(l_1,\ldots,l_k)\in\mathrm{G}_k}\phi_{j_1}(\tau_{l_1})\Delta\mathbf{w}_{\tau_{l_1}}^{(i_1)}\ldots\phi_{j_k}(\tau_{l_k})\Delta\mathbf{w}_{\tau_{l_k}}^{(i_k)}\Biggr), \tag{7}
$$

where $J[\psi^{(k)}]_{T,t}$ is defined by (2),

$$
\mathrm{G}_k=\mathrm{H}_k\backslash\mathrm{L}_k,\quad \mathrm{H}_k=\bigl\{(l_1,\ldots,l_k):\ l_1,\ldots,l_k=0,\ 1,\ldots,N-1\bigr\},
$$

$$
\mathrm{L}_k=\bigl\{(l_1,\ldots,l_k):\ l_1,\ldots,l_k=0,\ 1,\ldots,N-1;\ l_g\ne l_r\ (g\ne r);\ g,r=1,\ldots,k\bigr\},
$$

l.i.m. *is a limit in the mean-square sense*, $i_1,\ldots,i_k=0,1,\ldots,m$,

$$\zeta_j^{(i)}=\int\limits_t^T\phi_j(s)d\mathbf{w}_s^{(i)} \tag{8}$$

are independent standard Gaussian random variables for various i *or* j *(if* $i\ne 0$*),* $C_{j_k\ldots j_1}$ *is the Fourier coefficient* (5), $\Delta\mathbf{w}_{\tau_j}^{(i)}=\mathbf{w}_{\tau_{j+1}}^{(i)}-\mathbf{w}_{\tau_j}^{(i)}$ $(i=0,1,\ldots,m)$, $\{\tau_j\}_{j=0}^N$ *is a partition of the interval* $[t,T]$, *which satisfies the condition* (6).

Note that the condition of continuity of the functions $\phi_j(x)$ $(j=0,1,\ldots)$ can be weakened (see [11]-[20], [23]-[28]). Another versions and generalizations of Theorem 1 can be found in [12]-[41], [43]-[61].

In order to evaluate the significance of Theorem 1 for practice we will demonstrate its transformed particular cases for $k=1,\ldots,5$ [11]-[41], [43]-[59]

$$J[\psi^{(1)}]_{T,t}=\underset{p_1\to\infty}{\text{l.i.m.}}\sum_{j_1=0}^{p_1}C_{j_1}\zeta_{j_1}^{(i_1)}, \tag{9}$$

$$J[\psi^{(2)}]_{T,t}=\underset{p_1,p_2\to\infty}{\text{l.i.m.}}\sum_{j_1=0}^{p_1}\sum_{j_2=0}^{p_2}C_{j_2j_1}\Biggl(\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}-\mathbf{1}_{\{i_1=i_2\ne0\}}\mathbf{1}_{\{j_1=j_2\}}\Biggr), \tag{10}$$

$$J[\psi^{(3)}]_{T,t}=\underset{p_1,\ldots,p_3\to\infty}{\text{l.i.m.}}\sum_{j_1=0}^{p_1}\sum_{j_2=0}^{p_2}\sum_{j_3=0}^{p_3}C_{j_3j_2j_1}\Biggl(\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}\zeta_{j_3}^{(i_3)}-$$

$$+\mathbf{1}_{\{i_1=i_3\ne 0\}}\mathbf{1}_{\{j_1=j_3\}}\mathbf{1}_{\{i_2=i_5\ne 0\}}\mathbf{1}_{\{j_2=j_5\}}\zeta_{j_4}^{(i_4)}+\mathbf{1}_{\{i_1=i_3\ne 0\}}\mathbf{1}_{\{j_1=j_3\}}\mathbf{1}_{\{i_4=i_5\ne 0\}}\mathbf{1}_{\{j_4=j_5\}}\zeta_{j_2}^{(i_2)}+$$
$$+\mathbf{1}_{\{i_1=i_4\ne 0\}}\mathbf{1}_{\{j_1=j_4\}}\mathbf{1}_{\{i_2=i_3\ne 0\}}\mathbf{1}_{\{j_2=j_3\}}\zeta_{j_5}^{(i_5)}+\mathbf{1}_{\{i_1=i_4\ne 0\}}\mathbf{1}_{\{j_1=j_4\}}\mathbf{1}_{\{i_2=i_5\ne 0\}}\mathbf{1}_{\{j_2=j_5\}}\zeta_{j_3}^{(i_3)}+$$
$$+\mathbf{1}_{\{i_1=i_4\ne 0\}}\mathbf{1}_{\{j_1=j_4\}}\mathbf{1}_{\{i_3=i_5\ne 0\}}\mathbf{1}_{\{j_3=j_5\}}\zeta_{j_2}^{(i_2)}+\mathbf{1}_{\{i_1=i_5\ne 0\}}\mathbf{1}_{\{j_1=j_5\}}\mathbf{1}_{\{i_2=i_3\ne 0\}}\mathbf{1}_{\{j_2=j_3\}}\zeta_{j_4}^{(i_4)}+$$
$$+\mathbf{1}_{\{i_1=i_5\ne 0\}}\mathbf{1}_{\{j_1=j_5\}}\mathbf{1}_{\{i_2=i_4\ne 0\}}\mathbf{1}_{\{j_2=j_4\}}\zeta_{j_3}^{(i_3)}+\mathbf{1}_{\{i_1=i_5\ne 0\}}\mathbf{1}_{\{j_1=j_5\}}\mathbf{1}_{\{i_3=i_4\ne 0\}}\mathbf{1}_{\{j_3=j_4\}}\zeta_{j_2}^{(i_2)}+$$
$$+\mathbf{1}_{\{i_2=i_3\ne 0\}}\mathbf{1}_{\{j_2=j_3\}}\mathbf{1}_{\{i_4=i_5\ne 0\}}\mathbf{1}_{\{j_4=j_5\}}\zeta_{j_1}^{(i_1)}+\mathbf{1}_{\{i_2=i_4\ne 0\}}\mathbf{1}_{\{j_2=j_4\}}\mathbf{1}_{\{i_3=i_5\ne 0\}}\mathbf{1}_{\{j_3=j_5\}}\zeta_{j_1}^{(i_1)}+$$
$$+\mathbf{1}_{\{i_2=i_5\ne 0\}}\mathbf{1}_{\{j_2=j_5\}}\mathbf{1}_{\{i_3=i_4\ne 0\}}\mathbf{1}_{\{j_3=j_4\}}\zeta_{j_1}^{(i_1)}\Biggr), \tag{13}$$

where $\mathbf{1}_A$ is the indicator of the set A.

For further consideration, let us consider the generalization of formulas (9)–(13) for the case of an arbitrary multiplicity k ($k\in\mathbb{N}$) of the iterated Ito stochastic integral $J[\psi^{(k)}]_{T,t}$ defined by (2). In order to do this, let us introduce some notations. Consider the unordered set $\{1,2,\ldots,k\}$ and separate it into two parts: the first part consists of r unordered pairs (sequence order of these pairs is also unimportant) and the second one consists of the remaining $k-2r$ numbers. So, we have

$$(\{\underbrace{\{g_1,g_2\},\ldots,\{g_{2r-1},g_{2r}\}}_{\text{part 1}}\},\{\underbrace{q_1,\ldots,q_{k-2r}}_{\text{part 2}}\}), \tag{14}$$

where

$$\{g_1,g_2,\ldots,g_{2r-1},g_{2r},q_1,\ldots,q_{k-2r}\}=\{1,2,\ldots,k\},$$

braces mean an unordered set, and parentheses mean an ordered set.

We will say that (14) is a partition and consider the sum with respect to all possible partitions

$$\sum_{\substack{(\{\{g_1,g_2\},\ldots,\{g_{2r-1},g_{2r}\}\},\{q_1,\ldots,q_{k-2r}\})\\ \{g_1,g_2,\ldots,g_{2r-1},g_{2r},q_1,\ldots,q_{k-2r}\}=\{1,2,\ldots,k\}}} a_{g_1g_2,\ldots,g_{2r-1}g_{2r},q_1\ldots q_{k-2r}}, \tag{15}$$

where $a_{g_1g_2,\ldots,g_{2r-1}g_{2r},q_1\ldots q_{k-2r}}\in\mathbb{R}$.

Below there are several examples of sums in the form (15)

$$\sum_{\substack{(\{g_1,g_2\})\\ \{g_1,g_2\}=\{1,2\}}} a_{g_1g_2}=a_{12},$$

$$\sum_{\substack{(\{\{g_1,g_2\},\{g_3,g_4\}\})\\ \{g_1,g_2,g_3,g_4\}=\{1,2,3,4\}}} a_{g_1g_2g_3g_4} = a_{1234} + a_{1324} + a_{2314},$$

$$\sum_{\substack{(\{g_1,g_2\},\{q_1,q_2\})\\ \{g_1,g_2,q_1,q_2\}=\{1,2,3,4\}}} a_{g_1g_2,q_1q_2} =$$

$$= a_{12,34} + a_{13,24} + a_{14,23} + a_{23,14} + a_{24,13} + a_{34,12},$$

$$\sum_{\substack{(\{g_1,g_2\},\{q_1,q_2,q_3\})\\ \{g_1,g_2,q_1,q_2,q_3\}=\{1,2,3,4,5\}}} a_{g_1g_2,q_1q_2q_3} =$$

$$= a_{12,345} + a_{13,245} + a_{14,235} + a_{15,234} + a_{23,145} + a_{24,135} +$$

$$+ a_{25,134} + a_{34,125} + a_{35,124} + a_{45,123},$$

$$\sum_{\substack{(\{\{g_1,g_2\},\{g_3,g_4\}\},\{q_1\})\\ \{g_1,g_2,g_3,g_4,q_1\}=\{1,2,3,4,5\}}} a_{g_1g_2,g_3g_4,q_1} =$$

$$= a_{12,34,5} + a_{13,24,5} + a_{14,23,5} + a_{12,35,4} + a_{13,25,4} + a_{15,23,4} +$$

$$+ a_{12,54,3} + a_{15,24,3} + a_{14,25,3} + a_{15,34,2} + a_{13,54,2} + a_{14,53,2} +$$

$$+ a_{52,34,1} + a_{53,24,1} + a_{54,23,1}.$$

Now we can write (7) as

$$J[\psi^{(k)}]_{T,t} = \underset{p_1,\ldots,p_k\to\infty}{\text{l.i.m.}} \sum_{j_1=0}^{p_1} \ldots \sum_{j_k=0}^{p_k} C_{j_k\ldots j_1} \Biggl(\prod_{l=1}^{k} \zeta_{j_l}^{(i_l)} + \sum_{r=1}^{[k/2]} (-1)^r \times$$

$$\times \sum_{\substack{(\{\{g_1,g_2\},\ldots,\{g_{2r-1},g_{2r}\}\},\{q_1,\ldots,q_{k-2r}\})\\ \{g_1,g_2,\ldots,g_{2r-1},g_{2r},q_1,\ldots,q_{k-2r}\}=\{1,2,\ldots,k\}}} \prod_{s=1}^{r} \mathbf{1}_{\{i_{g_{2s-1}}=\ i_{g_{2s}}\neq 0\}} \mathbf{1}_{\{j_{g_{2s-1}}=\ j_{g_{2s}}\}} \prod_{l=1}^{k-2r} \zeta_{j_{q_l}}^{(i_{q_l})} \Biggr), \tag{16}$$

where $[x]$ is an integer part of a real number x, $\prod\limits_{\emptyset} \stackrel{\sf def}{=} 1$, $\sum\limits_{\emptyset} \stackrel{\sf def}{=} 0$; another notations are the same as in Theorem **1**.

In particular, from (16) for $k = 5$ we obtain

$$J[\psi^{(5)}]_{T,t} = \underset{p_1,\ldots,p_5\to\infty}{\text{l.i.m.}} \sum_{j_1=0}^{p_1} \ldots \sum_{j_5=0}^{p_5} C_{j_5\ldots j_1} \Biggl(\prod_{l=1}^{5} \zeta_{j_l}^{(i_l)} -$$

$$
-\sum_{\substack{(\{g_1,g_2\},\{q_1,q_2,q_3\})\\ \{g_1,g_2,q_1,q_2,q_3\}=\{1,2,3,4,5\}}} \mathbf{1}_{\{i_{g_1}=\,i_{g_2}\ne 0\}}\mathbf{1}_{\{j_{g_1}=\,j_{g_2}\}}\prod_{l=1}^{3}\zeta_{j_{q_l}}^{(i_{q_l})}+
$$

$$
+\sum_{\substack{(\{\{g_1,g_2\},\{g_3,g_4\}\},\{q_1\})\\ \{g_1,g_2,g_3,g_4,q_1\}=\{1,2,3,4,5\}}} \mathbf{1}_{\{i_{g_1}=\,i_{g_2}\ne 0\}}\mathbf{1}_{\{j_{g_1}=\,j_{g_2}\}}\mathbf{1}_{\{i_{g_3}=\,i_{g_4}\ne 0\}}\mathbf{1}_{\{j_{g_3}=\,j_{g_4}\}}\zeta_{j_{q_1}}^{(i_{q_1})}\Biggr).
$$

The last equality obviously agrees with (13).

Let us consider the generalization of Theorem 1 for the case of an arbitrary complete orthonormal systems of functions in the space $L_2([t,T])$ and $\psi_1(\tau),\ldots,\psi_k(\tau)\in L_2([t,T])$.

Theorem 2 [25] (Sect. 1.11), [46] (Sect. 15), [61]. *Suppose that* $\psi_1(\tau),\ldots,\psi_k(\tau)\in L_2([t,T])$ *and* $\{\phi_j(x)\}_{j=0}^{\infty}$ *is an arbitrary complete orthonormal system of functions in the space* $L_2([t,T])$. *Then the following expansion*

$$
J[\psi^{(k)}]_{T,t}=\underset{p_1,\ldots,p_k\to\infty}{\text{l.i.m.}}\sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k}C_{j_k\ldots j_1}\Biggl(\prod_{l=1}^{k}\zeta_{j_l}^{(i_l)}+\sum_{r=1}^{[k/2]}(-1)^r\times
$$

$$
\times\sum_{\substack{(\{\{g_1,g_2\},\ldots,\{g_{2r-1},g_{2r}\}\},\{q_1,\ldots,q_{k-2r}\})\\ \{g_1,g_2,\ldots,g_{2r-1},g_{2r},q_1,\ldots,q_{k-2r}\}=\{1,2,\ldots,k\}}}\prod_{s=1}^{r}\mathbf{1}_{\{i_{g_{2s-1}}=\,i_{g_{2s}}\ne 0\}}\mathbf{1}_{\{j_{g_{2s-1}}=\,j_{g_{2s}}\}}\prod_{l=1}^{k-2r}\zeta_{j_{q_l}}^{(i_{q_l})}\Biggr)
$$

converging in the mean-square sense is valid, where $[x]$ *is an integer part of a real number* x, $\prod_{\emptyset}\stackrel{\sf def}{=}1$, $\sum_{\emptyset}\stackrel{\sf def}{=}0$; *another notations are the same as in Theorem* 1.

It should be noted that an analogue of Theorem 2 was considered in [62] using Hermite polynomials. Note that we use another notations [25] (Sect. 1.11), [46] (Sect. 15), [61] in comparison with [62]. Moreover, the proof from [62] is different from the proof given in [25] (Sect. 1.11), [46] (Sect. 15), [61]. The results of [62], as well as the results of [25] (Sect. 1.11), [46] (Sect. 15), [61] are based on our idea [11] (2006) on the expansion of the kernel (4) (or $\Phi(t_1,\ldots,t_k)\in L_2([t,T]^k)$) into a generalized multiple Fourier series (see [11], Chapter 5, Theorem 5.1, pp. 235-245 or [25], Chapter 1 for details).

3. Theorem on Expansion of Iterated Stratonovich Stochastic Integrals of Second Multiplicity. Some Old Results

In a number of works of the author [16]-[20], [23]-[29], [31], [33], [35], [49], [51], [54], [58] Theorems 1, 2 have been adapted for iterated Stratonovich stochastic integrals (3) of multiplicities 2 to 6 (also see the case of multiplicity k ($k\in\mathbb{N}$) in [25] (Sect. 2.10), [29], [33], [47]). For example, we can formulate the following theorem for iterated Stratonovich stochastic integrals of second multiplicity.

Theorem 3 [16]-[20], [23]-[29], [49], [51], [54], [58]. *Suppose that* $\{\phi_j(x)\}_{j=0}^{\infty}$ *is a complete orthonormal system of Legendre polynomials or trigonometric functions in the space* $L_2([t,T])$. *At the same time* $\psi_2(\tau)$ *is a continuously differentiable function on* $[t,T]$ *and* $\psi_1(\tau)$ *is twice continuously differentiable functions on* $[t,T]$. *Then*

$$J^*[\psi^{(2)}]_{T,t} = \underset{p_1,p_2\to\infty}{\text{l.i.m.}} \sum_{j_1=0}^{p_1}\sum_{j_2=0}^{p_2} C_{j_2j_1}\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)} \quad (i_1,i_2=1,\ldots,m), \tag{17}$$

where $J^*[\psi^{(2)}]_{T,t}$ *is defined by* (3); *another notations are the same as in Theorem* 1.

Note that the proof of Theorem 3 is based on the proof of the following equality

$$\frac{1}{2}\int\limits_t^T \psi_1(t_1)\psi_2(t_1)dt_1 = \sum_{j_1=0}^{\infty} C_{j_1j_1}, \tag{18}$$

where $C_{j_1j_1}$ is defined by (5) for $k=2$ and $j_1=j_2$; $\{\phi_j(x)\}_{j=0}^{\infty}$ is a complete orthonormal system of Legendre polynomials or trigonometric functions in the space $L_2([t,T])$.

According to the standard relation between Ito and Stratonovich stochastic integrals, we can write w. p. 1 (with probability 1)

$$J^*[\psi^{(2)}]_{T,t} = J[\psi^{(2)}]_{T,t} + \frac{1}{2}\mathbf{1}_{\{i_1=i_2\neq 0\}}\int\limits_t^T \psi_1(t_1)\psi_2(t_1)dt_1, \tag{19}$$

where we assume that the functions $\psi_1(\tau),\psi_2(\tau)$ are continuous at the interval $[t,T]$. This condition is related to the definition of the Stratonovich stochastic integral that we use [3] (also see Sect. 2.1.1 [25]).

From the other hand according to (10), we obtain

$$J[\psi^{(2)}]_{T,t} = \underset{p_1,p_2\to\infty}{\text{l.i.m.}} \sum_{j_1=0}^{p_1}\sum_{j_2=0}^{p_2} C_{j_2j_1}\left(\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)} - \mathbf{1}_{\{i_1=i_2\neq 0\}}\mathbf{1}_{\{j_1=j_2\}}\right) =$$

$$= \underset{p_1,p_2\to\infty}{\text{l.i.m.}} \sum_{j_1=0}^{p_1}\sum_{j_2=0}^{p_2} C_{j_2j_1}\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)} - \mathbf{1}_{\{i_1=i_2\neq 0\}}\sum_{j_1=0}^{\infty} C_{j_1j_1}. \tag{20}$$

From (18)–(20) we get (17). Note that the existence of the limit on the right-hand side of (18) will be proved below (see Lemma 2 and Theorem 7).

The proof of Theorem 3 [16]-[20], [23]-[29], [31], [33], [35], [49], [51], [54], [58] is based on double (iterated) Fourier–Legendre series and analogous trigonometric Fourier series. This proof uses double integration by parts, which leads to the requirement of double continuous differentiability of the function $\psi_1(\tau)$ at the interval $[t,T]$.

In this article, we formulate and prove the analogue of Theorem 3 (Theorem 6, see below) but under the weakened conditions: the functions $\psi_1(\tau)$, $\psi_2(\tau)$ are assumed to be continuously differentiable only one time at the interval $[t,T]$. At that we will use double Fourier–Legendre series and double trigonometric Fourier series summarized by Pringsheim method for the proof of Theorem 6 (see below).

In Sect. 5 (see Theorem 7), we generalize the equality (18) to the case of an arbitrary complete orthonormal system of functions in the space $L_2([t,T])$ and $\psi_1(\tau),\psi_2(\tau)\in L_2([t,T])$.

4. Proof of the Equality (18). The Case of Legendre Polynomials and Trigonometric Functions as well as Continuously Differentiable Functions $\psi_1(\tau),\ \psi_2(\tau)$

Let $P_j(x)$ $(j=0,1,2,\ldots)$ be the Legendre polynomial. Consider the function $f(x,y)$ defined for $(x,y)\in[-1,1]^2$.

Consider the double Fourier–Legendre series summarized by Pringsheim method and corresponding to the function $f(x,y)$

$$\lim_{n,m\to\infty}\sum_{j=0}^{n}\sum_{i=0}^{m}\frac{\sqrt{(2j+1)(2i+1)}}{2}C_{ij}^{*}P_i(x)P_j(y)\stackrel{\sf def}{=}$$

$$\stackrel{\sf def}{=}\sum_{i,j=0}^{\infty}\frac{\sqrt{(2j+1)(2i+1)}}{2}C_{ij}^{*}P_i(x)P_j(y), \tag{21}$$

where

$$C_{ij}^{*}=\frac{\sqrt{(2j+1)(2i+1)}}{2}\int\limits_{[-1,1]^2}f(x,y)P_i(x)P_j(y)dxdy. \tag{22}$$

Let us consider the generalization for the case of two variables [63] of the theorem on equiconvergence for the Fourier–Legendre series [64].

Theorem 4 [63]. *Let $f(x,y)\in L_2([-1,1]^2)$ and the function*

$$f(x,y)(1-x^2)^{-1/4}(1-y^2)^{-1/4}$$

is integrable on the square $[-1,1]^2$. Moreover, let

$$|f(x,y)-f(u,v)|\le G(y)|x-u|+H(x)|y-v|,$$

where $G(y),H(x)$ are bounded functions on the square $[-1,1]^2$. Then for all $(x,y)\in(-1,1)^2$ the following equality is satisfied

$$\lim_{n,m\to\infty}\Biggl(\sum_{j=0}^{n}\sum_{i=0}^{m}\frac{\sqrt{(2j+1)(2i+1)}}{2}C_{ij}^{*}P_i(x)P_j(y)-$$

$$-(1-x^2)^{-1/4}(1-y^2)^{-1/4}S_{nm}(\arccos x,\arccos y,F)\Biggr)=0, \tag{23}$$

where $S_{nm}(\theta,\varphi,F)$ is a partial sum of the double trigonometric Fourier series of the auxiliary function

$$F(\theta,\varphi)=\sqrt{|\sin\theta|}\sqrt{|\sin\varphi|}f(\cos\theta,\cos\varphi),\quad \theta,\varphi\in[0,\pi],$$

the Fourier coefficient C^*_{ij} *has the form* (22). *At that, the convergence in* (23) *is uniform on the rectangle*

$$[-1+\varepsilon, 1-\varepsilon] \times [-1+\delta, 1-\delta] \quad \textit{for any} \quad \varepsilon, \delta > 0.$$

From Theorem 4, for example, follows that for all $(x, y) \in (-1, 1)^2$ the following equality is fulfilled

$$\lim_{n,m\to\infty}\left(\sum_{j=0}^{n}\sum_{i=0}^{m}\frac{\sqrt{(2j+1)(2i+1)}}{2}C^*_{ij}P_i(x)P_j(y) - f(x,y)\right) = 0 \tag{24}$$

and convergence in (24) is uniform on the rectangle

$$[-1+\varepsilon, 1-\varepsilon] \times [-1+\delta, 1-\delta] \quad \text{for any} \quad \varepsilon, \delta > 0$$

if the corresponding conditions of convergence of the double trigonometric Fourier series of the auxiliary function

$$g(x, y) = f(x, y)(1-x^2)^{1/4}(1-y^2)^{1/4} \tag{25}$$

are satisfied.

Note that Theorem 4 does not imply any conclusions on the behavior of the double Fourier–Legendre series on the boundary of the square $[-1, 1]^2$.

For each $\delta > 0$ *let us call the exact upper edge of the difference* $|f(\mathbf{t}') - f(\mathbf{t}'')|$ *in the set of all points* $\mathbf{t}'$, $\mathbf{t}''$ (*which belong to the domain* D) *as the module of continuity of the function* $f(\mathbf{t})$ ($\mathbf{t} = (t_1, \ldots, t_k)$) *in the* k*-dimentional domain* D ($k \ge 1$) *if the distance* $\rho(\mathbf{t}', \mathbf{t}'')$ *between* $\mathbf{t}$ *and* $\mathbf{t}''$ *satisfies the condition* $\rho(\mathbf{t}', \mathbf{t}'') < \delta$.

We will say that the function of k ($k \ge 1$) *variables* $f(\mathbf{t})$ ($\mathbf{t} = (t_1, \ldots, t_k)$) *belongs to the Hölder class with the parameter* $\alpha \in (0, 1]$ ($f(\mathbf{t}) \in C^{\alpha}(D)$) *in the domain* D *if the module of continuity of the function* $f(\mathbf{t})$ ($\mathbf{t} = (t_1, \ldots, t_k)$) *in the domain* D *has orders* $o(\delta^{\alpha})$ ($\alpha \in (0, 1)$) *and* $O(\delta)$ ($\alpha = 1$).

In 1967, Zhizhiashvili L.V. proved that the rectangular sums of multiple trigonometric Fourier series of the function of k variables in the hypercube $[t, T]^k$ converge uniformly in the hypercube $[t, T]^k$ to this function if it belongs to the class $C^{\alpha}([t, T]^k)$, $\alpha > 0$ (definition of the Holder class with the parameter $\alpha > 0$ can be found in the well-known mathematical analysis tutorials; see, for example, [65]). More precisely, the following theorem is correct.

Theorem 5 [65]. *If the function* $f(x_1, \ldots, x_n)$ *is periodic with period* 2π *with respect to each variable and belongs in* $\mathbb{R}^n$ *to the Holder class* C^{α} *for any* $\alpha > 0$, *then the rectangular partial sums of the multiple trigonometric Fourier series of the function* $f(x_1, \ldots, x_n)$ *converge to this function uniformly in* $\mathbb{R}^n$.

Lemma 1. *Let the function* $f(x, y)$ *satisfies to the following condition*

$$|f(x, y) - f(x_1, y_1)| \le C_1|x - x_1| + C_2|y - y_1|,$$

where $C_1, C_2 < \infty$ *and* (x, y), $(x_1, y_1) \in [-1, 1]^2$. *Then the following inequality is fulfilled*

$$|g(x, y) - g(x_1, y_1)| \le K\rho^{1/4}, \tag{26}$$

where $g(x,y)$ *has the form* (25),

$$\rho=\sqrt{(x-x_1)^2+(y-y_1)^2},$$

(x,y) *and* $(x_1,y_1)\in[-1,1]^2$, $K<\infty$.

Proof. First, we assume that $x\neq x_1$, $y\neq y_1$. In this case we have

$$|g(x,y)-g(x_1,y_1)|=|(1-x^2)^{1/4}(1-y^2)^{1/4}(f(x,y)-f(x_1,y_1))+$$

$$+f(x_1,y_1)((1-x^2)^{1/4}(1-y^2)^{1/4}-(1-x_1^2)^{1/4}(1-y_1^2)^{1/4})|\le C_1|x-x_1|+C_2|y-y_1|+$$

$$+C_3|(1-x^2)^{1/4}(1-y^2)^{1/4}-(1-x_1^2)^{1/4}(1-y_1^2)^{1/4}|,\quad C_3<\infty. \tag{27}$$

Moreover,

$$|(1-x^2)^{1/4}(1-y^2)^{1/4}-(1-x_1^2)^{1/4}(1-y_1^2)^{1/4}|=$$

$$=|(1-x^2)^{1/4}((1-y^2)^{1/4}-(1-y_1^2)^{1/4})+(1-y_1^2)^{1/4}((1-x^2)^{1/4}-(1-x_1^2)^{1/4})|\le$$

$$\le|(1-y^2)^{1/4}-(1-y_1^2)^{1/4}|+|(1-x^2)^{1/4}-(1-x_1^2)^{1/4}|, \tag{28}$$

$$|(1-x^2)^{1/4}-(1-x_1^2)^{1/4}|=$$

$$=|((1-x)^{1/4}-(1-x_1)^{1/4})(1+x)^{1/4}+(1-x_1)^{1/4}((1+x)^{1/4}-(1+x_1)^{1/4})|\le$$

$$\le K_1(|(1-x)^{1/4}-(1-x_1)^{1/4}|+|(1+x)^{1/4}-(1+x_1)^{1/4}|),\quad K_1<\infty. \tag{29}$$

It is not difficult to see that

$$|(1\pm x)^{1/4}-(1\pm x_1)^{1/4}|=$$

$$=\frac{|(1\pm x)-(1\pm x_1)|}{((1\pm x)^{1/2}+(1\pm x_1)^{1/2})((1\pm x)^{1/4}+(1\pm x_1)^{1/4})}=$$

$$=|x_1-x|^{1/4}\frac{|x_1-x|^{1/2}}{(1\pm x)^{1/2}+(1\pm x_1)^{1/2}}\cdot\frac{|x_1-x|^{1/4}}{(1\pm x)^{1/4}+(1\pm x_1)^{1/4}}\le|x_1-x|^{1/4}. \tag{30}$$

The last inequality follows from the obvious inequalities

$$\frac{|x_1-x|^{1/2}}{(1\pm x)^{1/2}+(1\pm x_1)^{1/2}}\le 1,$$

$$\frac{|x_1-x|^{1/4}}{(1\pm x)^{1/4}+(1\pm x_1)^{1/4}}\le 1.$$

From (27)–(30) we obtain

$$|g(x,y)-g(x_1,y_1)|\le C_1|x-x_1|+C_2|y-y_1|+C_4(|x_1-x|^{1/4}+|y_1-y|^{1/4})\le$$

$$\le C_5\rho+C_6\rho^{1/4}\le K\rho^{1/4},$$

where $C_5, C_6, K<\infty$.

The cases $x=x_1, y\ne y_1$ and $x\ne x_1, y=y_1$ can be considered analogously to the case $x\ne x_1, y\ne y_1$. At that, the consideration begins from the inequalities

$$|g(x,y)-g(x_1,y_1)|\le K_2|(1-y^2)^{1/4}f(x,y)-(1-y_1^2)^{1/4}f(x_1,y_1)|$$

$(x=x_1,\ y\ne y_1)$ and

$$|g(x,y)-g(x_1,y_1)|\le K_2|(1-x^2)^{1/4}f(x,y)-(1-x_1^2)^{1/4}f(x_1,y_1)|$$

$(x\ne x_1,\ y=y_1)$, where $K_2<\infty$. Lemma 1 is proved.

Lemma 1 and Theorem 5 imply that rectangular partial sums of the double trigonometric Fourier series of the function $g(x,y)$ (in the case of periodic continuation of the function $g(x,y)$) converge uniformly in the square $[-1,1]^2$ to the function $g(x,y)$. This means that the equality (24) holds.

Theorem 6 [25]-[28], [39], [50]. *Suppose that $\{\phi_j(x)\}_{j=0}^{\infty}$ is a complete orthonormal system of Legendre polynomials or trigonometric functions in the space $L_2([t,T])$. Moreover, $\psi_1(\tau)$, $\psi_2(\tau)$ are continuously differentiable functions on $[t,T]$. Then for the iterated Stratonovich stochastic integral*

$$J^*[\psi^{(2)}]_{T,t}=\int\limits_t^{*T}\psi_2(t_2)\int\limits_t^{*t_2}\psi_1(t_1)d\mathbf{f}_{t_1}^{(i_1)}d\mathbf{f}_{t_2}^{(i_2)}\quad (i_1,i_2=1,\ldots,m)$$

the following expansion

$$J^*[\psi^{(2)}]_{T,t}=\underset{p_1,p_2\to\infty}{\text{l.i.m.}}\sum_{j_1=0}^{p_1}\sum_{j_2=0}^{p_2}C_{j_2j_1}\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)} \tag{31}$$

that converges in the mean-square sence is valid, where the notations are the same as in Theorem 3.

Proof. Let us prove the equality

$$\frac{1}{2}\int\limits_t^T\psi_1(t_1)\psi_2(t_1)dt_1=\sum_{j_1=0}^{\infty}C_{j_1j_1},$$

where $C_{j_1 j_1}$ is defined by the formula (5) for $k=2$ and $j_1=j_2$. At that $\{\phi_j(x)\}_{j=0}^{\infty}$ is a complete orthonormal system of Legendre polynomials or trigonometric functions in the space $L_2([t,T])$.

Consider the auxiliary function

$$K'(t_1,t_2)=\begin{cases}\psi_2(t_1)\psi_1(t_2), & t_1\ge t_2\\ \\ \psi_1(t_1)\psi_2(t_2), & t_1\le t_2\end{cases},\quad t_1,t_2\in[t,T]$$

and prove that

$$|K'(t_1,t_2)-K'(t_1^*,t_2^*)|\le L(|t_1-t_1^*|+|t_2-t_2^*|), \tag{32}$$

where $L<\infty$, and (t_1,t_2), $(t_1,t_2)\in[t,T]^2$.

By the Lagrange formula for the functions $\psi_1(t_1^*)$, $\psi_2(t_1^*)$ at the interval $[\min\{t_1,t_1^*\},\max\{t_1,t_1^*\}]$ and for the functions $\psi_1(t_2^*)$, $\psi_2(t_2^*)$ at the interval $[\min\{t_2,t_2^*\},\max\{t_2,t_2^*\}]$ we obtain

$$|K'(t_1,t_2)-K'(t_1^*,t_2^*)|\le\left|\begin{cases}\psi_2(t_1)\psi_1(t_2), & t_1\ge t_2\\ \\ \psi_1(t_1)\psi_2(t_2), & t_1\le t_2\end{cases}-\begin{cases}\psi_2(t_1)\psi_1(t_2), & t_1^*\ge t_2^*\\ \\ \psi_1(t_1)\psi_2(t_2), & t_1^*\le t_2^*\end{cases}\right|+$$

$$+L_1|t_1-t_1^*|+L_2|t_2-t_2^*|,\quad L_1,L_2<\infty. \tag{33}$$

We have

$$\begin{cases}\psi_2(t_1)\psi_1(t_2), & t_1\ge t_2\\ \\ \psi_1(t_1)\psi_2(t_2), & t_1\le t_2\end{cases}-\begin{cases}\psi_2(t_1)\psi_1(t_2), & t_1^*\ge t_2^*\\ \\ \psi_1(t_1)\psi_2(t_2), & t_1^*\le t_2^*\end{cases}=$$

$$=\begin{cases}0, \quad t_1\ge t_2,\ t_1^*\ge t_2^* \quad\text{or}\quad t_1\le t_2,\ t_1^*\le t_2^*\\ \\ \psi_2(t_1)\psi_1(t_2)-\psi_1(t_1)\psi_2(t_2), \quad t_1\ge t_2,\ t_1^*\le t_2^*.\\ \\ \psi_1(t_1)\psi_2(t_2)-\psi_2(t_1)\psi_1(t_2), \quad t_1\le t_2,\ t_1^*\ge t_2^*\end{cases} \tag{34}$$

By the Lagrange formula for the functions $\psi_1(t_2)$, $\psi_2(t_2)$ at the interval $[\min\{t_1,t_2\},\max\{t_1,t_2\}]$ we get the estimate

$$\left|\begin{cases}\psi_2(t_1)\psi_1(t_2), & t_1\ge t_2\\ \\ \psi_1(t_1)\psi_2(t_2), & t_1\le t_2\end{cases}-\begin{cases}\psi_2(t_1)\psi_1(t_2), & t_1^*\ge t_2^*\\ \\ \psi_1(t_1)\psi_2(t_2), & t_1^*\le t_2^*\end{cases}\right|\le$$

$$\leq L_3|t_2-t_1|\begin{cases}0, & t_1\geq t_2,\ t_1^*\geq t_2^* \quad \text{or} \quad t_1\leq t_2,\ t_1^*\leq t_2^*\\ \\ 1, & t_1\leq t_2,\ t_1^*\geq t_2^* \quad \text{or} \quad t_1\geq t_2,\ t_1^*\leq t_2^*\end{cases},\quad L_3<\infty. \tag{35}$$

Let us show that if $t_1\leq t_2,\ t_1^*\geq t_2^*$ or $t_1\geq t_2,\ t_1^*\leq t_2^*$, then the following inequality is satisfied

$$|t_2-t_1|\leq|t_1^*-t_1|+|t_2^*-t_2|. \tag{36}$$

First, consider the case $t_1\geq t_2,\ t_1^*\leq t_2^*$. For this case

$$t_2+(t_1^*-t_2^*)\leq t_2\leq t_1.$$

Then

$$(t_1^*-t_1)-(t_2^*-t_2)\leq t_2-t_1\leq 0$$

and (36) is satisfied.

For the case $t_1\leq t_2,\ t_1^*\geq t_2^*$ we have

$$t_1+(t_2^*-t_1^*)\leq t_1\leq t_2.$$

Then

$$(t_1-t_1^*)-(t_2-t_2^*)\leq t_1-t_2\leq 0$$

and (36) is also satisfied.

From (35) and (36) we obtain

$$\left|\begin{cases}\psi_2(t_1)\psi_1(t_2), & t_1\geq t_2\\ \\ \psi_1(t_1)\psi_2(t_2), & t_1\leq t_2\end{cases}-\begin{cases}\psi_2(t_1)\psi_1(t_2), & t_1^*\geq t_2^*\\ \\ \psi_1(t_1)\psi_2(t_2), & t_1^*\leq t_2^*\end{cases}\right|\leq$$

$$\leq L_3(|t_1^*-t_1|+|t_2^*-t_2|)\begin{cases}0, & t_1\geq t_2,\ t_1^*\geq t_2^* \quad \text{or} \quad t_1\leq t_2,\ t_1^*\leq t_2^*\\ \\ 1, & t_1\leq t_2,\ t_1^*\geq t_2^* \quad \text{or} \quad t_1\geq t_2,\ t_1^*\leq t_2^*\end{cases}\leq$$

$$\leq L_3(|t_1^*-t_1|+|t_2^*-t_2|)\begin{cases}1, & t_1\geq t_2,\ t_1^*\geq t_2^* \quad \text{or} \quad t_1\leq t_2,\ t_1^*\leq t_2^*\\ \\ 1, & t_1\leq t_2,\ t_1^*\geq t_2^* \quad \text{or} \quad t_1\geq t_2,\ t_1^*\leq t_2^*\end{cases}=$$

$$=L_3(|t_1^*-t_1|+|t_2^*-t_2|). \tag{37}$$

From (33) and (37) we get (32). Let

$$t_1 = \frac{T-t}{2}x + \frac{T+t}{2}, \quad t_2 = \frac{T-t}{2}y + \frac{T+t}{2},$$

where $x, y \in [-1, 1]$. Then

$$K'(t_1, t_2) \equiv K^*(x, y) = \begin{cases} \psi_2\left(h(x)\right)\psi_1\left(h(y)\right), & x \ge y \\ \\ \psi_1\left(h(x)\right)\psi_2\left(h(y)\right), & x \le y \end{cases},$$

where $x, y \in [-1, 1]$ and

$$h(x) = \frac{T-t}{2}x + \frac{T+t}{2}. \tag{38}$$

Inequality (32) can be written in the form

$$|K^*(x,y) - K^*(x^*,y^*)| \le L^*(|x - x^*| + |y - y^*|), \tag{39}$$

where $L^* < \infty$ and (x, y), $(x^*, y^*) \in [-1, 1]^2$.

Thus, the function $K^*(x, y)$ satisfies the conditions of Lemma 1 and hence for the function

$$K^*(x,y)(1-x^2)^{1/4}(1-y^2)^{1/4}$$

the inequality (26) is fulfilled.

Due to the continuous differentiability of the functions $\psi_1\left(h(x)\right)$ and $\psi_2\left(h(x)\right)$ at the interval $[-1, 1]$ we have $K^*(x, y) \in L_2([-1, 1]^2)$. In addition

$$\int\limits_{[-1,1]^2} \frac{K^*(x,y)dxdy}{(1-x^2)^{1/4}(1-y^2)^{1/4}} \le C\left(\int\limits_{-1}^{1}\frac{1}{(1-x^2)^{1/4}}\int\limits_{-1}^{x}\frac{1}{(1-y^2)^{1/4}}dydx + \right.$$

$$\left. + \int\limits_{-1}^{1}\frac{1}{(1-x^2)^{1/4}}\int\limits_{x}^{1}\frac{1}{(1-y^2)^{1/4}}dydx\right) < \infty, \quad C < \infty.$$

Thus, the conditions of Theorem 4 are fulfilled for the function $K^*(x, y)$. Note that the mentioned properties of the function $K^*(x, y)$, $x, y \in [-1, 1]$ also correct for the function $K'(t_1, t_2)$, $t_1, t_2 \in [t, T]$.

Remark 1. *On the basis of* (32) *it can be argued that the function* $K'(t_1, t_2)$ *belongs to the Holder class with parameter* 1 *in* $[t, T]^2$*. Hence by Theorem* 5 *this function can be expanded into the uniformly convergent double trigonometric Fourier series in the square* $[t, T]^2$*, which summarized by Pringsheim method. However, the expansions of iterated stochastic integrals obtained by using the system of Legendre polynomials are essentially simpler than their analogues obtained by using the trigonometric system of functions* (*see Sect.* 7)*.*

Let us expand the function $K'(t_1,t_2)$ into a double Fourier–Legendre series or double trigonometric Fourier series in the square $[t,T]^2$. This series is summable by the method of rectangular sums (Pringsheim method), i.e.

$$K'(t_1,t_2)=\lim_{n_1,n_2\to\infty}\sum_{j_1=0}^{n_1}\sum_{j_2=0}^{n_2}\int\limits_t^T\int\limits_t^T K'(t_1,t_2)\phi_{j_1}(t_1)\phi_{j_2}(t_2)dt_1dt_2\cdot\phi_{j_1}(t_1)\phi_{j_2}(t_2)=$$

$$=\lim_{n_1,n_2\to\infty}\sum_{j_1=0}^{n_1}\sum_{j_2=0}^{n_2}\left(\int\limits_t^T\psi_2(t_2)\phi_{j_2}(t_2)\int\limits_t^{t_2}\psi_1(t_1)\phi_{j_1}(t_1)dt_1dt_2+\right.$$

$$\left.+\int\limits_t^T\psi_1(t_2)\phi_{j_2}(t_2)\int\limits_{t_2}^T\psi_2(t_1)\phi_{j_1}(t_1)dt_1\right)dt_2\phi_{j_1}(t_1)\phi_{j_2}(t_2)=$$

$$=\lim_{n_1,n_2\to\infty}\sum_{j_1=0}^{n_1}\sum_{j_2=0}^{n_2}\left(C_{j_2j_1}+C_{j_1j_2}\right)\phi_{j_1}(t_1)\phi_{j_2}(t_2),\quad (t_1,t_2)\in(t,T)^2. \tag{40}$$

Moreover, the convergence of the series (40) is uniform on the rectangle

$$[t+\varepsilon,T-\varepsilon]\times[t+\delta,T-\delta]\quad\text{for any}\quad\varepsilon,\delta>0\quad(\text{in particular, we can choose }\varepsilon=\delta).$$

In addition, the series (40) converges to $K'(t_1,t_2)$ at any inner point of the square $[t,T]^2$. Note that Theorem 4 does not answer the question of convergence of the series (40) on a boundary of the square $[t,T]^2$. In obtaining (40) we replaced the order of integration in the second iterated integral.

Let us substitute $t_1=t_2$ into (40). After that, let us rewrite the limit on the right-hand side of (40) as two limits. Let us replace j_1 with j_2, j_2 with j_1, n_1 with n_2, and n_2 with n_1 in the second limit. Thus, we get

$$\lim_{n_1,n_2\to\infty}\sum_{j_1=0}^{n_1}\sum_{j_2=0}^{n_2}C_{j_2j_1}\phi_{j_1}(t_1)\phi_{j_2}(t_1)=\frac{1}{2}\psi_1(t_1)\psi_2(t_1),\quad t_1\in(t,T). \tag{41}$$

According to the above reasoning, the equality (41) holds uniformly on the interval $[t+\varepsilon,T-\varepsilon]$ for any $\varepsilon>0$. Additionally, (41) holds at each interior point of the interval $[t,T]$.

Let us fix $\varepsilon>0$ and integrate the equality (41) at the interval $[t+\varepsilon,T-\varepsilon]$. Due to the uniform convergence of the series (41) we can swap the series and the integral

$$\lim_{n_1,n_2\to\infty}\sum_{j_1=0}^{n_1}\sum_{j_2=0}^{n_2}C_{j_2j_1}\int\limits_{t+\varepsilon}^{T-\varepsilon}\phi_{j_1}(t_1)\phi_{j_2}(t_1)dt_1=\frac{1}{2}\int\limits_{t+\varepsilon}^{T-\varepsilon}\psi_1(t_1)\psi_2(t_1)dt_1. \tag{42}$$

Lemma 2. *Under the conditions of Theorem* 6 *the following limit*

$$\lim_{n\to\infty}\sum_{j_1=0}^{n}C_{j_1j_1}$$

exists and is finite, where $C_{j_1j_1}$ *is defined by* (5) *for* $k=2$ *and* $j_1=j_2$, *i.e.*

$$C_{j_1j_1}=\int\limits_t^T\psi_2(t_2)\phi_{j_1}(t_2)\int\limits_t^{t_2}\psi_1(t_1)\phi_{j_1}(t_1)dt_1dt_2.$$

The proof of Lemma 2 will be given further in this section. Using the equality (42) for $n_1=n_2=n$ and Lemma 2, we get

$$\frac{1}{2}\int\limits_{t+\varepsilon}^{T-\varepsilon}\psi_1(t_1)\psi_2(t_1)dt_1=\lim_{n\to\infty}\sum_{j_1,j_2=0}^{n}C_{j_2j_1}\int\limits_{t+\varepsilon}^{T-\varepsilon}\phi_{j_1}(t_1)\phi_{j_2}(t_1)dt_1=$$

$$=\lim_{n\to\infty}\sum_{j_1,j_2=0}^{n}C_{j_2j_1}\left(\int\limits_t^T\phi_{j_1}(t_1)\phi_{j_2}(t_1)dt_1-\int\limits_t^{t+\varepsilon}\phi_{j_1}(t_1)\phi_{j_2}(t_1)dt_1-\right.$$

$$\left.-\int\limits_{T-\varepsilon}^{T}\phi_{j_1}(t_1)\phi_{j_2}(t_1)dt_1\right)=$$

$$=\lim_{n\to\infty}\sum_{j_1,j_2=0}^{n}C_{j_2j_1}\left(\mathbf{1}_{\{j_1=j_2\}}-\Bigl(\phi_{j_1}(\theta)\phi_{j_2}(\theta)+\phi_{j_1}(\lambda)\phi_{j_2}(\lambda)\Bigr)\varepsilon\right)=$$

$$=\lim_{n\to\infty}\sum_{j_1=0}^{n}C_{j_1j_1}-\varepsilon\lim_{n\to\infty}\sum_{j_1,j_2=0}^{n}C_{j_2j_1}\Bigl(\phi_{j_1}(\theta)\phi_{j_2}(\theta)+\phi_{j_1}(\lambda)\phi_{j_2}(\lambda)\Bigr),\tag{43}$$

where $\theta\in[t,t+\varepsilon]$, $\lambda\in[T-\varepsilon,T]$. In obtaining (43) we used the theorem on the mean value for the Riemann integral and orthonormality of the functions $\phi_j(x)$ for $j=0,1,2\ldots$

Applying (43), we obtain

$$\varepsilon\lim_{n\to\infty}\sum_{j_1,j_2=0}^{n}C_{j_2j_1}\Bigl(\phi_{j_1}(\theta)\phi_{j_2}(\theta)+\phi_{j_1}(\lambda)\phi_{j_2}(\lambda)\Bigr)=$$

$$=\lim_{n\to\infty}\sum_{j_1=0}^{n}C_{j_1j_1}-\lim_{n\to\infty}\sum_{j_1,j_2=0}^{n}C_{j_2j_1}\int\limits_{t+\varepsilon}^{T-\varepsilon}\phi_{j_1}(t_1)\phi_{j_2}(t_1)dt_1,$$

where the limits

$$\lim_{n\to\infty}\sum_{j_1=0}^{n}C_{j_1j_1},\quad \lim_{n\to\infty}\sum_{j_1,j_2=0}^{n}C_{j_2j_1}\int\limits_{t+\varepsilon}^{T-\varepsilon}\phi_{j_1}(t_1)\phi_{j_2}(t_1)dt_1$$

exist and are finite (see Lemma 2 and the equality (42)). This means that the limit

$$\varepsilon\lim_{n\to\infty}\sum_{j_1,j_2=0}^{n}C_{j_2j_1}\Bigl(\phi_{j_1}(\theta)\phi_{j_2}(\theta)+\phi_{j_1}(\lambda)\phi_{j_2}(\lambda)\Bigr)$$

also exists and is finite.

Suppose that the following relations

$$\left|\sum_{j_1,j_2=0}^{n} C_{j_2j_1}\phi_{j_2}(T)\phi_{j_1}(T)\right| \le K < \infty, \quad \left|\sum_{j_1,j_2=0}^{n} C_{j_2j_1}\phi_{j_2}(t)\phi_{j_1}(t)\right| \le K < \infty \tag{44}$$

are satisfied (the relations (44) will be proved further in this section); constant K does not depend on n.

Note that

$$\left|\varepsilon \lim_{n\to\infty}\sum_{j_1,j_2=0}^{n} C_{j_2j_1}\Bigl(\phi_{j_1}(\theta)\phi_{j_2}(\theta)+\phi_{j_1}(\lambda)\phi_{j_2}(\lambda)\Bigr)\right| =$$

$$= \lim_{n\to\infty}\varepsilon\left|\sum_{j_1,j_2=0}^{n} C_{j_2j_1}\phi_{j_1}(\theta)\phi_{j_2}(\theta)+\sum_{j_1,j_2=0}^{n} C_{j_2j_1}\phi_{j_1}(\lambda)\phi_{j_2}(\lambda)\right|. \tag{45}$$

Using (41) $(n_1=n_2=n)$ and (44), we obtain

$$\varepsilon\left|\sum_{j_1,j_2=0}^{n} C_{j_2j_1}\phi_{j_1}(\theta)\phi_{j_2}(\theta)+\sum_{j_1,j_2=0}^{n} C_{j_2j_1}\phi_{j_1}(\lambda)\phi_{j_2}(\lambda)\right| \le$$

$$\le \varepsilon\left(\left|\sum_{j_1,j_2=0}^{n} C_{j_2j_1}\phi_{j_1}(\theta)\phi_{j_2}(\theta)\right|+\left|\sum_{j_1,j_2=0}^{n} C_{j_2j_1}\phi_{j_1}(\lambda)\phi_{j_2}(\lambda)\right|\right) \le 2\varepsilon K_1 \ \to\ 0 \tag{46}$$

if $\varepsilon\to +0$, where $\theta\in[t,t+\varepsilon]$, $\lambda\in[T-\varepsilon,T]$, constant K_1 is independent on n.

Performing the passage to the limit $\lim\limits_{\varepsilon\to+0}$ in the equality (43) and taking into account (45), (46), we get

$$\frac{1}{2}\int\limits_t^T \psi_1(t_1)\psi_2(t_1)dt_1 = \sum_{j_1=0}^{\infty} C_{j_1j_1}. \tag{47}$$

Thus, to complete the proof of Theorem 6, it is necessary to prove (44) and Lemma 2. To prove (44) and Lemma 2, as well as for further consideration, we need some well known properties of the Legendre polynomials [64], [67].

The complete orthonormal system of Legendre polynomials in the space $L_2([t,T])$ looks as follows

$$\phi_j(x) = \sqrt{\frac{2j+1}{T-t}}P_j\left(\left(x-\frac{T+t}{2}\right)\frac{2}{T-t}\right), \quad j=0,1,2,\ldots, \tag{48}$$

where $P_j(x)$ is the Legendre polynomial.

It is known that the Legendre polynomial $P_j(x)$ is represented, for example, as

$$P_j(x) = \frac{1}{2^j j!}\frac{d^j}{dx^j}\left(x^2-1\right)^j.$$

At the boundary points of the interval of orthogonality the Legendre polynomials satisfy the following relations

$$P_j(1) = 1, \quad P_j(-1) = (-1)^j,$$

$$P_{j+1}(1) - P_{j-1}(1) = 0, \quad P_{j+1}(-1) - P_{j-1}(-1) = 0,$$

$$P_{j+1}(1) - P_j(1) = 0, \quad P_{j+1}(-1) + P_j(-1) = 0,$$

where $j = 0, 1, 2, \ldots$

Relation of the Legendre polynomial $P_j(x)$ with derivatives of the Legendre polynomials $P_{j+1}(x)$ and $P_{j-1}(x)$ is expressed by the following equality

$$P_j(x) = \frac{1}{2j+1}\left(P^{'}_{j+1}(x) - P^{'}_{j-1}(x)\right), \quad j = 1, 2, \ldots \tag{49}$$

The recurrent relation has the form

$$xP_j(x) = \frac{(j+1)P_{j+1}(x) + jP_{j-1}(x)}{2j+1}, \quad j = 1, 2, \ldots$$

Orthogonality of Legendre polynomial $P_j(x)$ to any polynomial $Q_k(x)$ of lesser degree we write in the following form

$$\int\limits_{-1}^{1} Q_k(x)P_j(x)dx = 0, \quad k = 0, 1, 2, \ldots, j-1.$$

From the property

$$\int\limits_{-1}^{1} P_k(x)P_j(x)dx = \begin{cases} 0 & \text{if } \ k \neq j \\ 2/(2j+1) & \text{if } \ k = j \end{cases}$$

it follows that the orthonormal on the interval $[-1, 1]$ Legendre polynomials determined by the relation

$$P_j^*(x) = \sqrt{\frac{2j+1}{2}}P_j(x), \quad j = 0, 1, 2, \ldots$$

It is well known that there is an estimate

$$|P_j(y)| < \frac{K}{\sqrt{j+1}(1-y^2)^{1/4}}, \quad y \in (-1, 1), \quad j = 1, 2, \ldots, \tag{50}$$

where constant K does not depends on y and j.

Moreover,

$$|P_j(x)| \le 1, \quad x \in [-1, 1], \quad j = 0,\ 1, \ldots \tag{51}$$

The Christoffel–Darboux formula has the form

$$\sum_{j=0}^{n}(2j+1)P_j(x)P_j(y)=(n+1)\frac{P_n(x)P_{n+1}(y)-P_{n+1}(x)P_n(y)}{y-x}. \tag{52}$$

Let us prove (44). From (52) for $x=\pm 1$ we obtain

$$\sum_{j=0}^{n}(2j+1)P_j(y)=(n+1)\frac{P_{n+1}(y)-P_n(y)}{y-1}, \tag{53}$$

$$\sum_{j=0}^{n}(2j+1)(-1)^jP_j(y)=(n+1)(-1)^n\frac{P_{n+1}(y)+P_n(y)}{y+1}. \tag{54}$$

From the other hand (see (49))

$$\sum_{j=0}^{n}(2j+1)P_j(y)=1+\sum_{j=1}^{n}(2j+1)P_j(y)=$$

$$=1+\sum_{j=1}^{n}(P_{j+1}^{'}(y)-P_{j-1}^{'}(y))=1+\left(\sum_{j=1}^{n}(P_{j+1}(y)-P_{j-1}(y))\right)^{'}=$$

$$=1+(P_{n+1}(x)+P_n(x)-x-1)'=(P_n(x)+P_{n+1}(x))' \tag{55}$$

and

$$\sum_{j=0}^{n}(2j+1)(-1)^jP_j(y)=1+\sum_{j=1}^{n}(-1)^j(2j+1)P_j(y)=$$

$$=1+\sum_{j=1}^{n}(-1)^j(P_{j+1}^{'}(y)-P_{j-1}^{'}(y))=1+\left(\sum_{j=1}^{n}(-1)^j(P_{j+1}(y)-P_{j-1}(y))\right)^{'}=$$

$$=1+((-1)^n(P_{n+1}(x)-P_n(x))-x+1)'=(-1)^n(P_{n+1}(x)-P_n(x))'. \tag{56}$$

Applying (53)–(56), we get

$$(n+1)\frac{P_{n+1}(y)-P_n(y)}{y-1}=(P_n(x)+P_{n+1}(x))', \tag{57}$$

$$(n+1)\frac{P_{n+1}(y)+P_n(y)}{y+1}=(P_{n+1}(x)-P_n(x))'. \tag{58}$$

Let us prove the boundedness of the first sum in (44). We have

$$\sum_{j_1,j_2=0}^{n}C_{j_2j_1}\phi_{j_2}(T)\phi_{j_1}(T)=$$

$$= \frac{1}{4}\sum_{j_2=0}^{n}\sum_{j_1=0}^{n}(2j_2+1)(2j_1+1)\int\limits_{-1}^{1}\psi_2(h(y))P_{j_2}(y)\int\limits_{-1}^{y}\psi_1(h(y_1))P_{j_1}(y_1)dy_1dy =$$

$$= \frac{1}{4}\int\limits_{-1}^{1}\psi_2(h(y))\sum_{j_2=0}^{n}(2j_2+1)P_{j_2}(y)\int\limits_{-1}^{y}\psi_1(h(y_1))\sum_{j_1=0}^{n}(2j_1+1)P_{j_1}(y_1)dy_1dy =$$

$$= \frac{1}{4}\int\limits_{-1}^{1}\psi_2(h(y))\left(\int\limits_{-1}^{y}\psi_1(h(y_1))d(P_{n+1}(y_1)+P_n(y_1))\right)d(P_{n+1}(y)+P_n(y)) =$$

$$= \frac{1}{4}\int\limits_{-1}^{1}\psi_1(h(y))\left(\int\limits_{-1}^{y}\psi_1(h(y_1))d(P_{n+1}(y_1)+P_n(y_1))\right)d(P_{n+1}(y)+P_n(y))+$$

$$+\frac{1}{4}\int\limits_{-1}^{1}\Delta(h(y))\left(\int\limits_{-1}^{y}\psi_1(h(y_1))d(P_{n+1}(y_1)+P_n(y_1))\right)d(P_{n+1}(y)+P_n(y)) =$$

$$= \frac{1}{4}I_1 + \frac{1}{4}I_2,$$

where

$$\Delta(h(y)) = \psi_2(h(y)) - \psi_1(h(y)), \quad h(y) = \frac{T-t}{2}y + \frac{T+t}{2}. \tag{59}$$

Further,

$$I_1 = \frac{1}{2}\Biggl(\int\limits_{-1}^{1}\psi_1(h(y))d(P_{n+1}(y)+P_n(y))\Biggr)^2 =$$

$$= \frac{1}{2}\Biggl(2\psi_1(T) - \int\limits_{-1}^{1}(P_{n+1}(y)+P_n(y))\psi_1'(h(y))\frac{T-t}{2}dy\Biggr)^2 < C_1 < \infty,$$

where ψ_1' is a derivative of the function ψ_1 with respect to the variable y, constant C_1 does not depend on n.

By the Lagrange formula we obtain

$$\Delta(h(y)) = \psi_2\biggl(\frac{1}{2}(T-t)(y-1)+T\biggr) - \psi_1\biggl(\frac{1}{2}(T-t)(y-1)+T\biggr) =$$

$$= \psi_2(T) - \psi_1(T) + (y-1)\Bigl(\psi_2'(\xi_y) - \psi_1'(\theta_y)\Bigr)\frac{1}{2}(T-t) =$$

$$= C_1 + \alpha_y(y-1), \tag{60}$$

where $|\alpha_y| < \infty$ and $C_1 = \psi_2(T) - \psi_1(T)$.

Let us substitute (60) into the integral I_2

$$
I_2 = I_3 + I_4,
$$

where

$$
I_3 = \int\limits_{-1}^{1} \alpha_y (y-1) \left(\int\limits_{-1}^{y} \psi_1(h(y_1)) d(P_{n+1}(y_1) + P_n(y_1)) \right) d(P_{n+1}(y) + P_n(y)),
$$

$$
I_4 = C_1 \int\limits_{-1}^{1} \left(\int\limits_{-1}^{y} \psi_1(h(y_1)) d(P_{n+1}(y_1) + P_n(y_1)) \right) d(P_{n+1}(y) + P_n(y)).
$$

Integrating by parts and using (57), we obtain

$$
I_3 = \int\limits_{-1}^{1} \frac{\alpha_y (y-1)(n+1)(P_{n+1}(y) - P_n(y))}{y-1} \Biggl(\psi_1(h(y))(P_{n+1}(y) + P_n(y)) -
$$

$$
- \int\limits_{-1}^{y} (P_{n+1}(y_1) + P_n(y_1)) \psi_1'(h(y_1)) \frac{1}{2}(T-t) dy_1 \Biggr) dy.
$$

Applying the etimate (50) and taking into account the boundedness of α_y and $\psi_1'(h(y_1))$, we have that $|I_3| < \infty$.

Using the integration order replacement in I_4, we get

$$
I_4 = C_1 \int\limits_{-1}^{1} \psi_1(h(y_1)) \left(\int\limits_{y_1}^{1} d(P_{n+1}(y) + P_n(y)) \right) d(P_{n+1}(y_1) + P_n(y_1)) =
$$

$$
= C_1 \int\limits_{-1}^{1} \psi_1(h(y_1)) d(P_{n+1}(y_1) + P_n(y_1)) \int\limits_{-1}^{1} d(P_{n+1}(y) + P_n(y)) -
$$

$$
- C_1 \int\limits_{-1}^{1} \psi_1(h(y_1)) \left(\int\limits_{-1}^{y_1} d(P_{n+1}(y) + P_n(y)) \right) d(P_{n+1}(y_1) + P_n(y_1)) =
$$

$$
= I_5 - I_6.
$$

Consider I_5

$$
I_5 = 2C_1 \int\limits_{-1}^{1} \psi_1(h(y_1)) d(P_{n+1}(y_1) + P_n(y_1)) =
$$

$$
= 2C_1 \left(2\psi_1(T) - \int\limits_{-1}^{1} (P_{n+1}(y_1) + P_n(y_1)) \psi_1'(h(y_1)) \frac{1}{2}(T-t) dy_1 \right).
$$

Applying the estimate (51) and using the boundedness of $\psi_1'(h(y_1))$, we obtain that $|I_5| < \infty$.

Since (see (60))

$$\psi_1(h(y)) = \psi_1\left(\frac{1}{2}(T-t)(y-1)+T\right) =$$

$$= \psi_1(T) + (y-1)\psi_1'(\theta_y)\frac{1}{2}(T-t) = C_2 + \beta_y(y-1),$$

where $|\beta_y| < \infty$ and $C_2 = \psi_1(T)$, then

$$I_6 = C_3\int\limits_{-1}^{1}\left(\int\limits_{-1}^{y_1} d(P_{n+1}(y)+P_n(y))\right)d(P_{n+1}(y_1)+P_n(y_1))+$$

$$+C_1\int\limits_{-1}^{1}\beta_{y_1}(y_1-1)\left(\int\limits_{-1}^{y_1} d(P_{n+1}(y)+P_n(y))\right)d(P_{n+1}(y_1)+P_n(y_1)) =$$

$$= \frac{C_3}{2}\left(\int\limits_{-1}^{1} d(P_{n+1}(y)+P_n(y))\right)^2 +$$

$$+C_1\int\limits_{-1}^{1}\frac{\beta_{y_1}(y_1-1)(n+1)(P_{n+1}(y_1)-P_n(y_1))}{y_1-1}\left(\int\limits_{-1}^{y_1} d(P_{n+1}(y)+P_n(y))\right)dy_1 =$$

$$= 2C_3 + C_1\int\limits_{-1}^{1}\beta_{y_1}(n+1)(P_{n+1}(y_1)-P_n(y_1))(P_{n+1}(y_1)+P_n(y_1))dy_1.$$

Using the estimate (50) and taking into account the bounedness of β_{y_1}, we obtain that $|I_6| < \infty$. Thus, the boundedness of the first sum in (44) is proved.

Let us prove the boundedness of the second sum in (44). We have

$$\sum_{j_1,j_2=0}^{n} C_{j_2j_1}\phi_{j_2}(t)\phi_{j_1}(t) =$$

$$= \frac{1}{4}\sum_{j_2=0}^{n}\sum_{j_1=0}^{n}(2j_2+1)(2j_1+1)(-1)^{j_1+j_2}\int\limits_{-1}^{1}\psi_2(h(y))P_{j_2}(y)\int\limits_{-1}^{y}\psi_1(h(y_1))P_{j_1}(y_1)dy_1dy =$$

$$= \frac{1}{4}\int\limits_{-1}^{1}\psi_2(h(y))\sum_{j_2=0}^{n}(2j_2+1)P_{j_2}(y)(-1)^{j_2}\int\limits_{-1}^{y}\psi_1(h(y_1))\sum_{j_1=0}^{n}(2j_1+1)P_{j_1}(y_1)(-1)^{j_1}dy_1dy =$$

$$= \frac{(-1)^{2n}}{4}\int\limits_{-1}^{1}\psi_2(h(y))\left(\int\limits_{-1}^{y}\psi_1(h(y_1))d(P_{n+1}(y_1)-P_n(y_1))\right)d(P_{n+1}(y)-P_n(y)) =$$

$$= \frac{1}{4}\int\limits_{-1}^{1}\psi_1(h(y))\left(\int\limits_{-1}^{y}\psi_1(h(y_1))d(P_{n+1}(y_1)-P_n(y_1))\right)d(P_{n+1}(y)-P_n(y))+$$

$$+\frac{1}{4}\int\limits_{-1}^{1}\Delta(h(y))\left(\int\limits_{-1}^{y}\psi_1(h(y_1))d(P_{n+1}(y_1)-P_n(y_1))\right)d(P_{n+1}(y)-P_n(y))=$$

$$=\frac{1}{4}J_1+\frac{1}{4}J_2,$$

where $\Delta(h(y))$, $h(y)$ are defined by (59).

Further,

$$J_1=\frac{1}{2}\left(\int\limits_{-1}^{1}\psi_1(h(y))d(P_{n+1}(y)-P_n(y))\right)^2=$$

$$=\frac{1}{2}\left(2(-1)^n\psi_1(t)-\int\limits_{-1}^{1}(P_{n+1}(y)-P_n(y))\psi_1'(h(y))\frac{T-t}{2}dy\right)^2<K_1<\infty, \tag{61}$$

where ψ_1' is a derivative of the function ψ_1 with respect to the variable y, constant K_1 is independent of n.

By the Lagrange formula we obtain

$$\Delta(h(y))=\psi_2\left(\frac{1}{2}(T-t)(y+1)+t\right)-\psi_1\left(\frac{1}{2}(T-t)(y+1)+t\right)=$$

$$=\psi_2(t)-\psi_1(t)+(y+1)\Bigl(\psi_2'(\mu_y)-\psi_1'(\rho_y)\Bigr)\frac{1}{2}(T-t)=$$

$$=K_2+\gamma_y(y+1), \tag{62}$$

where $|\gamma_y|<\infty$ and $K_2=\psi_2(t)-\psi_1(t)$.

Consider J_2

$$J_2=\int\limits_{-1}^{1}\Delta(h(y))d(P_{n+1}(y)-P_n(y))\int\limits_{-1}^{1}\psi_1(h(y_1))d(P_{n+1}(y_1)-P_n(y_1))-$$

$$-\int\limits_{-1}^{1}\Delta(h(y))\left(\int\limits_{y}^{1}\psi_1(h(y_1))d(P_{n+1}(y_1)-P_n(y_1))\right)d(P_{n+1}(y)-P_n(y))=$$

$$=J_3J_4-J_5.$$

The integral J_4 was considered earlier (see J_1 and (61)), i.e. it has already been shown that $|J_4|<\infty$. Analogously, we have that $|J_3|<\infty$.

Let us substitute (62) into the integral J_5

$$J_5=J_6+J_7,$$

where

$$J_6 = \int_{-1}^{1} \gamma_y (y+1) \left(\int_{y}^{1} \psi_1(h(y_1)) d(P_{n+1}(y_1) - P_n(y_1)) \right) d(P_{n+1}(y) - P_n(y)),$$

$$J_7 = K_2 \int_{-1}^{1} \left(\int_{y}^{1} \psi_1(h(y_1)) d(P_{n+1}(y_1) - P_n(y_1)) \right) d(P_{n+1}(y) - P_n(y)).$$

Integrating by parts and using (58), we get

$$J_6 = \int_{-1}^{1} \frac{\gamma_y (y+1)(n+1)(P_{n+1}(y) + P_n(y))}{y+1} \Biggl(-\psi_1(h(y))(P_{n+1}(y) - P_n(y)) -$$

$$- \int_{y}^{1} (P_{n+1}(y_1) - P_n(y_1)) \psi_1'(h(y_1)) \frac{1}{2}(T-t) dy_1 \Biggr) dy.$$

Applying the etimate (50) and taking into account the boundedness of γ_y and $\psi_1'(h(y_1))$, we have that $|J_6| < \infty$.

Using the integration order replacement in J_7, we obtain

$$J_7 = K_2 \int_{-1}^{1} \psi_1(h(y_1)) \left(\int_{-1}^{y_1} d(P_{n+1}(y) - P_n(y)) \right) d(P_{n+1}(y_1) - P_n(y_1)) =$$

$$= K_2 \int_{-1}^{1} \psi_1(h(y_1)) d(P_{n+1}(y_1) - P_n(y_1)) \int_{-1}^{1} d(P_{n+1}(y) - P_n(y)) - K_2 J_8 =$$

$$= K_2 J_4 2(-1)^n - K_2 J_8,$$

where

$$J_8 = \int_{-1}^{1} \psi_1(h(y_1)) \left(\int_{y_1}^{1} d(P_{n+1}(y) - P_n(y)) \right) d(P_{n+1}(y_1) - P_n(y_1)).$$

Since (see (62))

$$\psi_1(h(y)) = \psi_1 \left(\frac{1}{2}(T-t)(y+1) + t \right) =$$

$$= \psi_1(t) + (y+1)\psi_1'(\rho_y) \frac{1}{2}(T-t) = K_3 + \varepsilon_y (y+1), \tag{63}$$

where $|\varepsilon_y| < \infty$ and $K_3 = \psi_1(t)$, then

$$J_8 = K_3 \int_{-1}^{1} \left(\int_{y_1}^{1} d(P_{n+1}(y) - P_n(y)) \right) d(P_{n+1}(y_1) - P_n(y_1)) +$$

$$+\int\limits_{-1}^{1}\varepsilon_y(y+1)\left(\int\limits_{y_1}^{1}d(P_{n+1}(y)-P_n(y))\right)d(P_{n+1}(y_1)-P_n(y_1))=$$

$$=\frac{K_3}{2}\left(\int\limits_{-1}^{1}d(P_{n+1}(y)-P_n(y))\right)^2+$$

$$+\int\limits_{-1}^{1}\frac{\varepsilon_{y_1}(y_1+1)(n+1)(P_{n+1}(y_1)+P_n(y_1))}{y_1+1}(P_n(y_1)-P_{n+1}(y_1))dy=$$

$$=2K_3+\int\limits_{-1}^{1}\varepsilon_{y_1}(n+1)(P_{n+1}(y_1)+P_n(y_1))(P_n(y_1)-P_{n+1}(y_1))dy. \tag{64}$$

When obtaining the equality (64), we used (58). Applying the estimate (50) and taking into account the bounedness of ε_{y_1}, we obtain that $|J_8|<\infty$. Thus, the boundedness of the second sum in (44) is proved. The relations (44) are proved.

Let us prove Lemma 2. We will prove that

$$\sum_{j_1=0}^{n}C_{j_1j_1}$$

is the Cauchy sequence for the cases of Legendre polynomials and trigonometric functions.

Consider the case of Legendre polynomials and fix $n>m$ $(n,m\in\mathbb{N})$. We have

$$\sum_{j_1=m+1}^{n}C_{j_1j_1}=\sum_{j_1=m+1}^{n}\int\limits_t^T\psi_2(s)\phi_{j_1}(s)\int\limits_t^s\psi_1(\tau)\phi_{j_1}(\tau)d\tau ds=$$

$$=\frac{T-t}{4}\sum_{j_1=m+1}^{n}(2j_1+1)\int\limits_{-1}^{1}\psi_2(h(x))P_{j_1}(x)\int\limits_{-1}^{x}\psi_1(h(y))P_{j_1}(y)dydx=$$

$$=\frac{T-t}{4}\sum_{j_1=m+1}^{n}\int\limits_{-1}^{1}\psi_1(h(x))\psi_2(h(x))\left(P_{j_1+1}(x)P_{j_1}(x)-P_{j_1}(x)P_{j_1-1}(x)\right)dx-$$

$$-\frac{(T-t)^2}{8}\sum_{j_1=m+1}^{n}\int\limits_{-1}^{1}\psi_2(h(x))P_{j_1}(x)\int\limits_{-1}^{x}\left(P_{j_1+1}(y)-P_{j_1-1}(y)\right)\psi_1'(h(y))dydx=$$

$$=\frac{T-t}{4}\int\limits_{-1}^{1}\psi_1(h(x))\psi_2(h(x))\sum_{j_1=m+1}^{n}\left(P_{j_1+1}(x)P_{j_1}(x)-P_{j_1}(x)P_{j_1-1}(x)\right)dx-$$

$$
-\frac{(T-t)^2}{8}\sum_{j_1=m+1}^{n}\int\limits_{-1}^{1}\left(P_{j_1+1}(y)-P_{j_1-1}(y)\right)\psi_1'(h(y))\int\limits_{y}^{1}P_{j_1}(x)\psi_2(h(x))dxdy=
$$

$$
=\frac{T-t}{4}\int\limits_{-1}^{1}\psi_1(h(x))\psi_2(h(x))\left(P_{n+1}(x)P_n(x)-P_{m+1}(x)P_m(x)\right)dx+
$$

$$
+\frac{(T-t)^2}{8}\sum_{j_1=m+1}^{n}\frac{1}{2j_1+1}\int\limits_{-1}^{1}\left(P_{j_1+1}(y)-P_{j_1-1}(y)\right)\psi_1'(h(y))\times
$$

$$
\times\Biggl(\left(P_{j_1+1}(y)-P_{j_1-1}(y)\right)\psi_2(h(y))+
$$

$$
+\frac{T-t}{2}\int\limits_{y}^{1}\left(P_{j_1+1}(x)-P_{j_1-1}(x)\right)\psi_2'(h(x))dx\Biggr)dy, \tag{65}
$$

where ψ_1', ψ_2' are derivatives of the functions $\psi_1(\tau)$, $\psi_2(\tau)$ with respect to the variable $h(y)$ (see (38)).

Applying the estimate (50) and taking into account the boundedness of the functions $\psi_1(\tau)$, $\psi_2(\tau)$ and their derivatives, we finally obtain

$$
\left|\sum_{j_1=m+1}^{n}C_{j_1j_1}\right|\le C_1\left(\frac{1}{n}+\frac{1}{m}\right)\int\limits_{-1}^{1}\frac{dx}{\left(1-x^2\right)^{1/2}}+
$$

$$
+C_2\sum_{j_1=m+1}^{n}\frac{1}{j_1^2}\left(\int\limits_{-1}^{1}\frac{dy}{\left(1-y^2\right)^{1/2}}+\int\limits_{-1}^{1}\frac{1}{\left(1-y^2\right)^{1/4}}\int\limits_{y}^{1}\frac{dx}{\left(1-x^2\right)^{1/4}}dy\right)\le
$$

$$
\le C_3\left(\frac{1}{n}+\frac{1}{m}+\sum_{j_1=m+1}^{n}\frac{1}{j_1^2}\right)\to 0 \tag{66}
$$

if $n,m\to\infty$ $(n>m)$, where constants C_1,C_2,C_3 do not depend on n and m.

Consider the trigonometric case. Below in this section we write $\lim\limits_{n,m\to\infty}$ instead of $\lim\limits_{\substack{n,m\to\infty\\ n>m}}$. Fix $n>m$ $(n,m\in\mathbf{N})$. Denote

$$
S_{n,m}\stackrel{\sf def}{=}\sum_{j_1=m+1}^{n}C_{j_1j_1}=\sum_{j_1=m+1}^{n}\int\limits_{t}^{T}\psi_2(t_2)\phi_{j_1}(t_2)\int\limits_{t}^{t_2}\psi_1(t_1)\phi_{j_1}(t_1)dt_1dt_2.
$$

By analogy with (65) we obtain

$$
S_{2n,2m}=\sum_{j_1=2m+1}^{2n}\int\limits_t^T\psi_2(t_2)\phi_{j_1}(t_2)\int\limits_t^{t_2}\psi_1(t_1)\phi_{j_1}(t_1)dt_1dt_2=
$$

$$
=\frac{2}{T-t}\sum_{j_1=m+1}^{n}\Biggl(\int\limits_t^T\psi_2(t_2)\sin\frac{2\pi j_1(t_2-t)}{T-t}\int\limits_t^{t_2}\psi_1(t_1)\sin\frac{2\pi j_1(t_1-t)}{T-t}dt_1dt_2+
$$

$$
+\int\limits_t^T\psi_2(t_2)\cos\frac{2\pi j_1(t_2-t)}{T-t}\int\limits_t^{t_2}\psi_1(t_1)\cos\frac{2\pi j_1(t_1-t)}{T-t}dt_1dt_2\Biggr)=
$$

$$
=\frac{T-t}{2\pi^2}\sum_{j_1=m+1}^{n}\frac{1}{j_1^2}\Biggl(\psi_1(t)\Biggl(\psi_2(t)-\psi_2(T)+\int\limits_t^T\psi_2'(t_2)\cos\frac{2\pi j_1(t_2-t)}{T-t}dt_2\Biggr)-
$$

$$
-\int\limits_t^T\psi_1'(t_1)\cos\frac{2\pi j_1(t_1-t)}{T-t}\Biggl(\psi_2(T)-\psi_2(t_1)\cos\frac{2\pi j_1(t_1-t)}{T-t}-
$$

$$
-\int\limits_{t_1}^T\psi_2'(t_2)\cos\frac{2\pi j_1(t_2-t)}{T-t}dt_2\Biggr)dt_1+
$$

$$
+\int\limits_t^T\psi_1'(t_1)\sin\frac{2\pi j_1(t_1-t)}{T-t}\Biggl(\psi_2(t_1)\sin\frac{2\pi j_1(t_1-t)}{T-t}+
$$

$$
+\int\limits_{t_1}^T\psi_2'(t_2)\sin\frac{2\pi j_1(t_2-t)}{T-t}dt_2\Biggr)dt_1\Biggr), \tag{67}
$$

where $\psi_1'(\tau)$, $\psi_2'(\tau)$ are derivatives of the functions $\psi_1(\tau)$, $\psi_2(\tau)$ with respect to the variable τ.

From (67) we get

$$
|S_{2n,2m}|\le C\sum_{j_1=m+1}^{n}\frac{1}{j_1^2}\to 0 \tag{68}
$$

if $n,m\to\infty$ $(n>m)$, where constant C does not depend on n and m.

Further,

$$
S_{2n-1,2m}=S_{2n,2m}-
$$

$$
-\frac{2}{T-t}\int\limits_t^T\psi_2(t_2)\cos\frac{2\pi n(t_2-t)}{T-t}\int\limits_t^{t_2}\psi_1(t_1)\cos\frac{2\pi n(t_1-t)}{T-t}dt_1dt_2, \tag{69}
$$

$$S_{2n,2m-1} = S_{2n,2m}+$$

$$+\frac{2}{T-t}\int\limits_t^T \psi_2(t_2)\cos\frac{2\pi m(t_2-t)}{T-t}\int\limits_t^{t_2}\psi_1(t_1)\cos\frac{2\pi m(t_1-t)}{T-t}dt_1dt_2, \tag{70}$$

$$S_{2n-1,2m-1} = S_{2n,2m-1}-$$

$$-\frac{2}{T-t}\int\limits_t^T \psi_2(t_2)\cos\frac{2\pi n(t_2-t)}{T-t}\int\limits_t^{t_2}\psi_1(t_1)\cos\frac{2\pi n(t_1-t)}{T-t}dt_1dt_2 =$$

$$= S_{2n,2m} + \frac{2}{T-t}\int\limits_t^T \psi_2(t_2)\cos\frac{2\pi m(t_2-t)}{T-t}\int\limits_t^{t_2}\psi_1(t_1)\cos\frac{2\pi m(t_1-t)}{T-t}dt_1dt_2-$$

$$-\frac{2}{T-t}\int\limits_t^T \psi_2(t_2)\cos\frac{2\pi n(t_2-t)}{T-t}\int\limits_t^{t_2}\psi_1(t_1)\cos\frac{2\pi n(t_1-t)}{T-t}dt_1dt_2. \tag{71}$$

Integrating by parts in (69)–(71), we obtain

$$|S_{2n-1,2m}| \le |S_{2n,2m}| + \frac{C_1}{n}, \tag{72}$$

$$|S_{2n,2m-1}| \le |S_{2n,2m}| + \frac{C_1}{m}, \tag{73}$$

$$|S_{2n-1,2m-1}| \le |S_{2n,2m}| + C_1\left(\frac{1}{m}+\frac{1}{n}\right), \tag{74}$$

where constant C_1 does not depend on n and m.

The relations (68), (72)–(74) imply that

$$\lim_{n,m\to\infty}|S_{2n,2m}| = \lim_{n,m\to\infty}|S_{2n-1,2m}| = \lim_{n,m\to\infty}|S_{2n,2m-1}| = \lim_{n,m\to\infty}|S_{2n-1,2m-1}| = 0. \tag{75}$$

From (75) we get

$$\lim_{n,m\to\infty}|S_{n,m}| = 0. \tag{76}$$

Lemma 2 is proved. Theorem 6 is proved.

5. Proof of the Equality (18). The Case of an Arbitrary Complete Orthonormal System of Functions in the Space $L_2([t,T])$ and $\psi_1(\tau),\psi_2(\tau)\in L_2([t,T])$

Theorem 7. *Suppose that $\{\phi_j(x)\}_{j=0}^{\infty}$ is an arbitrary complete orthonormal system of functions in the space $L_2([t,T])$ and $\psi_1(\tau),\psi_2(\tau)\in L_2([t,T])$. Then the following equality*

$$\sum_{j=0}^{\infty}\int\limits_t^T \psi_2(t_2)\phi_j(t_2)\int\limits_t^{t_2}\psi_1(t_1)\phi_j(t_1)dt_1dt_2=\frac{1}{2}\int\limits_t^T\psi_1(\tau)\psi_2(\tau)d\tau \tag{77}$$

is fulfilled.

Proof. First consider the case $\psi_1(\tau)\equiv\psi_2(\tau)$ or

$$\psi_1(\tau)=\psi_2(\tau)\int\limits_t^{\tau}g(\theta)d\theta, \tag{78}$$

where $\tau\in[t,T]$ and $\psi_1(\tau),\psi_2(\tau),g(\tau)\in L_2([t,T])$.

First suppose that $\{\phi_j(x)\}_{j=0}^{\infty}$ is an arbitrary complete orthonormal system of functions in the space $L_2([t,T])$ such that $\phi_j(x)$ for $j<\infty$ is continuous at the interval $[t,T]$ except may be for the finite number of points of the finite discontinuity. Furthermore, let $\psi_1(\tau)\equiv\psi_2(\tau)$ or the equality (78) is satisfied. Here we suppose that $\psi_1(\tau),\psi_2(\tau),g(\tau)$ are continuous functions at the interval $[t,T]$.

Using the integration order replacement and the Parseval equality, we have (see (78))

$$\sum_{j=0}^{\infty}\int\limits_t^T \psi_2(t_2)\phi_j(t_2)\int\limits_t^{t_2}\psi_1(t_1)\phi_j(t_1)dt_1dt_2=$$

$$=\sum_{j=0}^{\infty}\int\limits_t^T \psi_2(t_2)\phi_j(t_2)\int\limits_t^{t_2}\psi_2(t_1)\phi_j(t_1)\int\limits_t^{t_1}g(\tau)d\tau dt_1dt_2=$$

$$=\sum_{j=0}^{\infty}\int\limits_t^T g(\tau)\int\limits_{\tau}^{T}\psi_2(t_1)\phi_j(t_1)\int\limits_{t_1}^{T}\psi_2(t_2)\phi_j(t_2)dt_2dt_1d\tau=$$

$$=\frac{1}{2}\sum_{j=0}^{\infty}\int\limits_t^T g(\tau)\left(\int\limits_{\tau}^{T}\psi_2(t_1)\phi_j(t_1)dt_1\right)^2d\tau= \tag{79}$$

$$=\frac{1}{2}\int\limits_t^T g(\tau)\sum_{j=0}^{\infty}\left(\int\limits_t^T \mathbf{1}_{\{\tau<t_1\}}\psi_2(t_1)\phi_j(t_1)dt_1\right)^2d\tau= \tag{80}$$

$$=\frac{1}{2}\int\limits_t^T g(\tau)\int\limits_t^T \mathbf{1}_{\{\tau<t_1\}}\psi_2^2(t_1)dt_1d\tau=$$

$$=\frac{1}{2}\int\limits_t^T g(\tau)\int\limits_\tau^T \psi_2^2(t_1)dt_1d\tau=$$

$$=\frac{1}{2}\int\limits_t^T \psi_2^2(t_1)\int\limits_t^{t_1} g(\tau)d\tau dt_1= \tag{81}$$

$$=\frac{1}{2}\int\limits_t^T \psi_1(t_1)\psi_2(t_1)dt_1, \tag{82}$$

where the transition from (79) to (80) is based on the Dini Theorem (using the continuity of the functions $u_q(\tau)$ (see below), the nondecreasing property of the functional sequence

$$u_q(\tau)=\sum_{j=0}^{q}\left(\int\limits_\tau^T \psi_2(t_1)\phi_j(t_1)dt_1\right)^2,$$

and the continuity of the limit function

$$u(\tau)=\int\limits_\tau^T \psi_2^2(t_1)dt_1$$

according to Dini's Theorem, we have the uniform convergence $u_q(\tau)$ to $u(\tau)$ at the interval $[t,T]$).

From the other hand, using the integration order replacement and the generalized Parseval equality as well as (81), we get

$$\sum_{j=0}^{\infty}\int\limits_t^T \psi_1(t_2)\phi_j(t_2)\int\limits_t^{t_2} \psi_2(t_1)\phi_j(t_1)dt_1dt_2=$$

$$=\sum_{j=0}^{\infty}\int\limits_t^T \psi_2(t_2)\phi_j(t_2)\int\limits_t^{t_2} g(\tau)d\tau\int\limits_t^{t_2} \psi_2(t_1)\phi_j(t_1)dt_1dt_2=$$

$$=\sum_{j=0}^{\infty}\int\limits_t^T \psi_2(t_1)\phi_j(t_1)\int\limits_{t_1}^{T} \psi_2(t_2)\phi_j(t_2)\int\limits_t^{t_2} g(\tau)d\tau dt_2dt_1=$$

$$=\sum_{j=0}^{\infty}\int\limits_t^T \psi_2(t_1)\phi_j(t_1)dt_1\int\limits_t^{T} \psi_2(t_2)\phi_j(t_2)\int\limits_t^{t_2} g(\tau)d\tau dt_2-$$

$$-\sum_{j=0}^{\infty}\int\limits_t^T \psi_2(t_1)\phi_j(t_1)\int\limits_t^{t_1} \psi_2(t_2)\phi_j(t_2)\int\limits_t^{t_2} g(\tau)d\tau dt_2dt_1=$$

$$= \int\limits_t^T \psi_2(t_1) \cdot \psi_2(t_1) \int\limits_t^{t_1} g(\tau)d\tau dt_1 - \frac{1}{2} \int\limits_t^T \psi_2^2(t_1) \int\limits_t^{t_1} g(\tau)d\tau dt_1 =$$

$$= \frac{1}{2} \int\limits_t^T \psi_2^2(t_1) \int\limits_t^{t_1} g(\tau)d\tau dt_1 = \frac{1}{2} \int\limits_t^T \psi_1(t_1)\psi_2(t_1)dt_1. \tag{83}$$

In addition, for the case $\psi_1(\tau) \equiv \psi_2(\tau)$, using the Parseval equality, we obtain

$$\sum_{j=0}^{\infty} \int\limits_t^T \psi_1(t_2)\phi_j(t_2) \int\limits_t^{t_2} \psi_1(t_1)\phi_j(t_1)dt_1 dt_2 =$$

$$= \frac{1}{2} \sum_{j=0}^{\infty} \left(\int\limits_t^T \psi_1(t_1)\phi_j(t_1)dt_1 \right)^2 =$$

$$= \frac{1}{2} \int\limits_t^T \psi_1^2(t_1)dt_1. \tag{84}$$

By interpreting the integrals in the above formulas as Lebesgue integrals, using Fubini's theorem and Lebesgue's Dominated Convergence Theorem in the above reasoning, we get the equality (77) for the case of an arbitrary complete orthonormal system of functions in the space $L_2([t,T])$ and $\psi_1(\tau), \psi_2(\tau), g(\tau) \in L_2([t,T])$.

Suppose that

$$\psi_2(\tau) = (\tau - t)^l, \quad g(\tau) = k(\tau - t)^{k-1},$$

where $l = 0, 1, 2, \ldots, k = 1, 2, \ldots$

From (78) we have

$$\psi_1(\tau) = \psi_2(\tau) \int\limits_t^{\tau} g(\theta)d\theta = k(\tau - t)^l \int\limits_t^{\tau} (\theta - t)^{k-1}d\theta = (\tau - t)^{l+k}.$$

Taking into account (82)–(84), we obtain

$$\sum_{j=0}^{\infty} \int\limits_t^T (t_2 - t)^l \phi_j(t_2) \int\limits_t^{t_2} (t_1 - t)^{l+k}\phi_j(t_1)dt_1 dt_2 =$$

$$= \sum_{j=0}^{\infty} \int\limits_t^T (t_2 - t)^{l+k} \phi_j(t_2) \int\limits_t^{t_2} (t_1 - t)^l \phi_j(t_1)dt_1 dt_2 =$$

$$= \frac{1}{2} \int\limits_t^T (\tau - t)^{2l+k} d\tau, \tag{85}$$

where $k, l = 0, 1, 2, \ldots$

The equality similar to (85) was obtained in [68] using other arguments. In addition, the formula similar to (85) was used in [68] to generalize the equality (77) to the case of an arbitrary complete orthonormal system of functions in the space $L_2([t,T])$ and $\psi_1(\tau), \psi_2(\tau) \in L_2([t,T])$. Consider this approach [68] in more detail.

Let us rewrite the equality (85) in the following form

$$\sum_{j=0}^{\infty} \int\limits_t^T (t_2-t)^l \phi_j(t_2) \int\limits_t^{t_2} (t_1-t)^m \phi_j(t_1) dt_1 dt_2 = \frac{1}{2} \int\limits_t^T (\tau-t)^l (\tau-t)^m d\tau, \tag{86}$$

where $l, m = 0, 1, 2, \ldots$

Since the equality (86) is valid for monomials with respect to $\tau - t$ $(\tau \in [t,T])$, it will obviously also be valid for Legendre polynomials that form a complete orthonormal system of functions in the space $L_2([t,T]$ and finite linear combinations of Legendre polynomials.

Let $\psi_1(\tau), \psi_2(\tau) \in L_2([t,T])$ and $\psi_1^{(p)}(\tau), \psi_2^{(q)}(\tau)$ be approximations of the functions $\psi_1(\tau), \psi_2(\tau)$, respectively, which are partial sums of the corresponding Fourier–Legendre series. Then we have (see (86))

$$\sum_{j=0}^{\infty} \int\limits_t^T \psi_2^{(q)}(t_2) \phi_j(t_2) \int\limits_t^{t_2} \psi_1^{(p)}(\tau) \phi_j(t_1) dt_1 dt_2 = \frac{1}{2} \int\limits_t^T \psi_1^{(p)}(\tau) \psi_2^{(q)}(\tau) d\tau, \tag{87}$$

where $p, q \in \mathbb{N}$, the series converges absolutly and its sum does not depend on a basis system $\{\phi_j(x)\}_{j=0}^{\infty}$.

Let us fix q in (87). The right-hand side of (87) for a fixed q defines (as a scalar product in $L_2([t,T])$) a linear bounded (and therefore continuous) functional in $L_2([t,T])$, which is given by the function $\psi_2^{(q)}$. The left-hand side of the equality (87) has the same properties. Let us implement the passage to the limit $\lim\limits_{p\to\infty}$ in (87)

$$\sum_{j=0}^{\infty} \int\limits_t^T \psi_2^{(q)}(t_2) \phi_j(t_2) \int\limits_t^{t_2} \psi_1(\tau) \phi_j(t_1) dt_1 dt_2 = \frac{1}{2} \int\limits_t^T \psi_1(\tau) \psi_2^{(q)}(\tau) d\tau, \tag{88}$$

where $q \in \mathbb{N}$. The equality (88) defines a linear bounded functional in $L_2([t,T])$ given by the function ψ_1. Let us implement the passage to the limit $\lim\limits_{q\to\infty}$ in (88)

$$\sum_{j=0}^{\infty} \int\limits_t^T \psi_2(t_2) \phi_j(t_2) \int\limits_t^{t_2} \psi_1(\tau) \phi_j(t_1) dt_1 dt_2 = \frac{1}{2} \int\limits_t^T \psi_1(\tau) \psi_2(\tau) d\tau,$$

where $\{\phi_j(x)\}_{j=0}^{\infty}$ is an arbitrary complete orthonormal system of functions in the space $L_2([t,T])$ and $\psi_1(\tau), \psi_2(\tau) \in L_2([t,T])$.

Thus we have the following theorem.

Theorem 8 [25]. *Suppose that $\{\phi_j(x)\}_{j=0}^{\infty}$ is an arbitrary complete orthonormal system of functions in the space $L_2([t,T])$ and $\psi_1(\tau), \psi_2(\tau) \in L_2([t,T])$. Then for the iterated Stratonovich stochastic integral*

$$J^*[\psi^{(2)}]_{T,t}=\int\limits_t^{*T}\psi_2(t_2)\int\limits_t^{*t_2}\psi_1(t_1)d\mathbf{f}_{t_1}^{(i_1)}d\mathbf{f}_{t_2}^{(i_2)}\quad (i_1,i_2=1,\ldots,m)$$

the following expansion

$$J^*[\psi^{(2)}]_{T,t}=\underset{p_1,p_2\to\infty}{\text{l.i.m.}}\sum_{j_1=0}^{p_1}\sum_{j_2=0}^{p_2}C_{j_2j_1}\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)} \tag{89}$$

that converges in the mean-square sence is valid, where the notations are the same as in Theorem 3.

6. Some Recent Results on Expansions of Iterated Stratonovich Stochastic Integrals of Multiplicities 3 to 6

Recently, a new approach to the expansion and mean-square approximation of iterated Stratonovich stochastic integrals has been obtained [25] (Sect. 2.10–2.16), [29] (Sect. 13–19), [33] (Sect. 5–11), [47] (Sect. 7–13), [48]. Let us formulate four theorems that were obtained using this approach.

Theorem 9 [25], [29], [33], [47]. *Suppose that* $\{\phi_j(x)\}_{j=0}^{\infty}$ *is a complete orthonormal system of Legendre polynomials or trigonometric functions in the space* $L_2([t,T])$*. Furthermore, let* $\psi_1(\tau),\psi_2(\tau),$ $\psi_3(\tau)$ *are continuously differentiable nonrandom functions on* $[t,T]$*. Then for the iterated Stratonovich stochastic integral of third multiplicity*

$$J^*[\psi^{(3)}]_{T,t}=\int\limits_t^{*T}\psi_3(t_3)\int\limits_t^{*t_3}\psi_2(t_2)\int\limits_t^{*t_2}\psi_1(t_1)d\mathbf{w}_{t_1}^{(i_1)}d\mathbf{w}_{t_2}^{(i_2)}d\mathbf{w}_{t_3}^{(i_3)}\quad (i_1,i_2,i_3=0,1,\ldots,m)$$

the following relations

$$J^*[\psi^{(3)}]_{T,t}=\underset{p\to\infty}{\text{l.i.m.}}\sum_{j_1,j_2,j_3=0}^{p}C_{j_3j_2j_1}\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}\zeta_{j_3}^{(i_3)}, \tag{90}$$

$$\mathsf{M}\left\{\left(J^*[\psi^{(3)}]_{T,t}-\sum_{j_1,j_2,j_3=0}^{p}C_{j_3j_2j_1}\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}\zeta_{j_3}^{(i_3)}\right)^2\right\}\le\frac{C}{p} \tag{91}$$

are fulfilled, where $i_1,i_2,i_3=0,1,\ldots,m$ *in* (90) *and* $i_1,i_2,i_3=1,\ldots,m$ *in* (91)*, constant* C *is independent of* p*,*

$$C_{j_3j_2j_1}=\int\limits_t^T\psi_3(t_3)\phi_{j_3}(t_3)\int\limits_t^{t_3}\psi_2(t_2)\phi_{j_2}(t_2)\int\limits_t^{t_2}\psi_1(t_1)\phi_{j_1}(t_1)dt_1dt_2dt_3$$

and

$$\zeta_j^{(i)} = \int\limits_t^T \phi_j(\tau) d\mathbf{f}_\tau^{(i)}$$

are independent standard Gaussian random variables for various i *or* j *(in the case when* $i \neq 0$*); another notations are the same as in Theorems* 1, 2.

Theorem 10 [25], [29], [33], [47]. *Let* $\{\phi_j(x)\}_{j=0}^{\infty}$ *be a complete orthonormal system of Legendre polynomials or trigonometric functions in the space* $L_2([t,T])$*. Furthermore, let* $\psi_1(\tau), \ldots, \psi_4(\tau)$ *be continuously differentiable nonrandom functions on* $[t,T]$*. Then for the iterated Stratonovich stochastic integral of fourth multiplicity*

$$J^*[\psi^{(4)}]_{T,t} = \int\limits_t^{*T} \psi_4(t_4) \int\limits_t^{*t_4} \psi_3(t_3) \int\limits_t^{*t_3} \psi_2(t_2) \int\limits_t^{*t_2} \psi_1(t_1) d\mathbf{w}_{t_1}^{(i_1)} d\mathbf{w}_{t_2}^{(i_2)} d\mathbf{w}_{t_3}^{(i_3)} d\mathbf{w}_{t_4}^{(i_4)} \tag{92}$$

the following relations

$$J^*[\psi^{(4)}]_{T,t} = \underset{p\to\infty}{\text{l.i.m.}} \sum_{j_1,j_2,j_3,j_4=0}^{p} C_{j_4j_3j_2j_1} \zeta_{j_1}^{(i_1)} \zeta_{j_2}^{(i_2)} \zeta_{j_3}^{(i_3)} \zeta_{j_4}^{(i_4)}, \tag{93}$$

$$\mathsf{M}\left\{\left(J^*[\psi^{(4)}]_{T,t} - \sum_{j_1,j_2,j_3,j_4=0}^{p} C_{j_4j_3j_2j_1} \zeta_{j_1}^{(i_1)} \zeta_{j_2}^{(i_2)} \zeta_{j_3}^{(i_3)} \zeta_{j_4}^{(i_4)}\right)^2\right\} \le \frac{C}{p^{1-\varepsilon}} \tag{94}$$

are fulfilled, where $i_1, \ldots, i_4 = 0, 1, \ldots, m$ *in* (92), (93) *and* $i_1, \ldots, i_4 = 1, \ldots, m$ *in* (94)*, constant* C *does not depend on* p*,* ε *is an arbitrary small positive real number for the case of complete orthonormal system of Legendre polynomials in the space* $L_2([t,T])$ *and* $\varepsilon = 0$ *for the case of complete orthonormal system of trigonometric functions in the space* $L_2([t,T])$*,*

$$C_{j_4j_3j_2j_1} =$$

$$= \int\limits_t^T \psi_4(t_4)\phi_{j_4}(t_4) \int\limits_t^{t_4} \psi_3(t_3)\phi_{j_3}(t_3) \int\limits_t^{t_3} \psi_2(t_2)\phi_{j_2}(t_2) \int\limits_t^{t_2} \psi_1(t_1)\phi_{j_1}(t_1) dt_1 dt_2 dt_3 dt_4;$$

another notations are the same as in Theorem 9.

Theorem 11 [25], [29], [33], [47]. *Assume that* $\{\phi_j(x)\}_{j=0}^{\infty}$ *is a complete orthonormal system of Legendre polynomials or trigonometric functions in the space* $L_2([t,T])$ *and* $\psi_1(\tau), \ldots, \psi_5(\tau)$ *are continuously differentiable nonrandom functions on* $[t,T]$*. Then for the iterated Stratonovich stochastic integral of fifth multiplicity*

$$J^*[\psi^{(5)}]_{T,t} = \int\limits_t^{*T} \psi_5(t_5) \ldots \int\limits_t^{*t_2} \psi_1(t_1) d\mathbf{w}_{t_1}^{(i_1)} \ldots d\mathbf{w}_{t_5}^{(i_5)} \tag{95}$$

the following relations

(96) $$J^*[\psi^{(5)}]_{T,t} = \underset{p\to\infty}{\text{l.i.m.}} \sum_{j_1,\ldots,j_5=0}^{p} C_{j_5\ldots j_1}\zeta_{j_1}^{(i_1)}\ldots\zeta_{j_5}^{(i_5)},$$

(97) $$\mathsf{M}\left\{\left(J^*[\psi^{(5)}]_{T,t} - \sum_{j_1,\ldots,j_5=0}^{p} C_{j_5\ldots j_1}\zeta_{j_1}^{(i_1)}\ldots\zeta_{j_5}^{(i_5)}\right)^2\right\} \le \frac{C}{p^{1-\varepsilon}}$$

are fulfilled, where $i_1,\ldots,i_5 = 0,1,\ldots,m$ *in* (95), (96) *and* $i_1,\ldots,i_5 = 1,\ldots,m$ *in* (97), *constant* C *is independent of* p, ε *is an arbitrary small positive real number for the case of complete orthonormal system of Legendre polynomials in the space* $L_2([t,T])$ *and* $\varepsilon = 0$ *for the case of complete orthonormal system of trigonometric functions in the space* $L_2([t,T])$,

$$C_{j_5\ldots j_1} = \int\limits_t^T \psi_5(t_5)\phi_{j_5}(t_5)\ldots\int\limits_t^{t_2}\psi_1(t_1)\phi_{j_1}(t_1)dt_1\ldots dt_5;$$

another notations are the same as in Theorems 9, 10.

Theorem 12 [25], [29], [33], [47]. *Suppose that* $\{\phi_j(x)\}_{j=0}^{\infty}$ *is a complete orthonormal system of Legendre polynomials or trigonometric functions in the space* $L_2([t,T])$. *Then, for the iterated Stratonovich stochastic integral of sixth multiplicity*

(98) $$J_{T,t}^{*(i_1\ldots i_6)} = \int\limits_t^{*T}\ldots\int\limits_t^{*t_2} d\mathbf{w}_{t_1}^{(i_1)}\ldots d\mathbf{w}_{t_6}^{(i_6)}$$

the following expansion

$$J_{T,t}^{*(i_1\ldots i_6)} = \underset{p\to\infty}{\text{l.i.m.}} \sum_{j_1,\ldots,j_6=0}^{p} C_{j_6\ldots j_1}\zeta_{j_1}^{(i_1)}\ldots\zeta_{j_6}^{(i_6)}$$

that converges in the mean-square sense is valid, where $i_1,\ldots,i_6 = 0,1,\ldots,m$,

$$C_{j_6\ldots j_1} = \int\limits_t^T \phi_{j_6}(t_6)\ldots\int\limits_t^{t_2}\phi_{j_1}(t_1)dt_1\ldots dt_6;$$

another notations are the same as in Theorems 9–11.

7. Expansions of Iterated Stratonovich Stochastic Integrals of First and Second Multiplicity Based on Multiple Fourier–Legendre Series

We will use the following notations for iterated Stratonovich stochastic integrals of first and second multiplicities

(99)
$$I_{(l_1)T,t}^{*(i_1)}=\int\limits_t^{*T}(t-t_1)^{l_1}d\mathbf{f}_{t_1}^{(i_1)},$$

(100)
$$I_{(l_1 l_2)T,t}^{*(i_1 i_2)}=\int\limits_t^{*T}(t-t_2)^{l_2}\int\limits_t^{*t_2}(t-t_1)^{l_1}d\mathbf{f}_{t_1}^{(i_1)}d\mathbf{f}_{t_2}^{(i_2)},$$

where $l_1, l_2 = 0, 1, \ldots;\ i_1, \ldots, i_k = 1, \ldots, m.$

Note that together with the iterated Stratonovich stochastic integrals of higher multiplicities than the second, the stochastic integrals (99) and (100) are included in the so-called unified Taylor–Stratonovich expansion [42] (also see [25]-[26]). This expansion can be used for construction of high-order strong numerical methods for Ito SDEs (definition of a strong numerical method see, for example, in [3]).

Consider the expansions of some stochastic integrals (99) and (100) obtained by using Theorems 6, 8 (see (31) or (89))

$$I_{(0)T,t}^{*(i_1)}=\sqrt{T-t}\zeta_0^{(i_1)},$$

(101)
$$I_{(1)T,t}^{*(i_1)}=-\frac{(T-t)^{3/2}}{2}\left(\zeta_0^{(i_1)}+\frac{1}{\sqrt{3}}\zeta_1^{(i_1)}\right),$$

(102)
$$I_{(2)T,t}^{*(i_1)}=\frac{(T-t)^{5/2}}{3}\left(\zeta_0^{(i_1)}+\frac{\sqrt{3}}{2}\zeta_1^{(i_1)}+\frac{1}{2\sqrt{5}}\zeta_2^{(i_1)}\right),$$

(103)
$$I_{(00)T,t}^{*(i_1 i_2)}=\frac{T-t}{2}\left(\zeta_0^{(i_1)}\zeta_0^{(i_2)}+\sum_{i=1}^{\infty}\frac{1}{\sqrt{4i^2-1}}\left(\zeta_{i-1}^{(i_1)}\zeta_i^{(i_2)}-\zeta_i^{(i_1)}\zeta_{i-1}^{(i_2)}\right)\right),$$

$$I_{(01)T,t}^{*(i_1 i_2)}=-\frac{T-t}{2}I_{(00)T,t}^{*(i_1 i_2)}-\frac{(T-t)^2}{4}\left(\frac{\zeta_0^{(i_1)}\zeta_1^{(i_2)}}{\sqrt{3}}+\right.$$

$$\left.+\sum_{i=0}^{\infty}\left(\frac{(i+2)\zeta_i^{(i_1)}\zeta_{i+2}^{(i_2)}-(i+1)\zeta_{i+2}^{(i_1)}\zeta_i^{(i_2)}}{\sqrt{(2i+1)(2i+5)}(2i+3)}-\frac{\zeta_i^{(i_1)}\zeta_i^{(i_2)}}{(2i-1)(2i+3)}\right)\right),$$

$$I_{(10)T,t}^{*(i_1 i_2)}=-\frac{T-t}{2}I_{(00)T,t}^{*(i_1 i_2)}-\frac{(T-t)^2}{4}\left(\frac{\zeta_0^{(i_2)}\zeta_1^{(i_1)}}{\sqrt{3}}+\right.$$

(104)
$$\left.+\sum_{i=0}^{\infty}\left(\frac{(i+1)\zeta_{i+2}^{(i_2)}\zeta_i^{(i_1)}-(i+2)\zeta_i^{(i_2)}\zeta_{i+2}^{(i_1)}}{\sqrt{(2i+1)(2i+5)}(2i+3)}+\frac{\zeta_i^{(i_1)}\zeta_i^{(i_2)}}{(2i-1)(2i+3)}\right)\right),$$

$$I_{(02)T,t}^{*(i_1 i_2)}=-\frac{(T-t)^2}{4}I_{(00)T,t}^{*(i_1 i_2)}-(T-t)I_{(01)T,t}^{*(i_1 i_2)}+\frac{(T-t)^3}{8}\left(\frac{2\zeta_2^{(i_2)}\zeta_0^{(i_1)}}{3\sqrt{5}}+\right.$$

$$+\frac{1}{3}\zeta_0^{(i_1)}\zeta_0^{(i_2)}+\sum_{i=0}^{\infty}\left(\frac{(i+2)(i+3)\zeta_{i+3}^{(i_2)}\zeta_i^{(i_1)}-(i+1)(i+2)\zeta_i^{(i_2)}\zeta_{i+3}^{(i_1)}}{\sqrt{(2i+1)(2i+7)}(2i+3)(2i+5)}+\right.$$

$$\left.\left.+\frac{(i^2+i-3)\zeta_{i+1}^{(i_2)}\zeta_i^{(i_1)}-(i^2+3i-1)\zeta_i^{(i_2)}\zeta_{i+1}^{(i_1)}}{\sqrt{(2i+1)(2i+3)}(2i-1)(2i+5)}\right)\right),$$

$$I_{(20)T,t}^{*(i_1 i_2)}=-\frac{(T-t)^2}{4}I_{(00)T,t}^{*(i_1 i_2)}-(T-t)I_{(10)T,t}^{*(i_1 i_2)}+\frac{(T-t)^3}{8}\left(\frac{2\zeta_0^{(i_2)}\zeta_2^{(i_1)}}{3\sqrt{5}}+\right.$$

$$+\frac{1}{3}\zeta_0^{(i_1)}\zeta_0^{(i_2)}+\sum_{i=0}^{\infty}\left(\frac{(i+1)(i+2)\zeta_{i+3}^{(i_2)}\zeta_i^{(i_1)}-(i+2)(i+3)\zeta_i^{(i_2)}\zeta_{i+3}^{(i_1)}}{\sqrt{(2i+1)(2i+7)}(2i+3)(2i+5)}+\right.$$

$$\left.\left.+\frac{(i^2+3i-1)\zeta_{i+1}^{(i_2)}\zeta_i^{(i_1)}-(i^2+i-3)\zeta_i^{(i_2)}\zeta_{i+1}^{(i_1)}}{\sqrt{(2i+1)(2i+3)}(2i-1)(2i+5)}\right)\right),$$

$$I_{(11)T,t}^{*(i_1 i_2)}=-\frac{(T-t)^2}{4}I_{(00)T,t}^{*(i_1 i_2)}-\frac{(T-t)}{2}\left(I_{(10)T,t}^{*(i_1 i_2)}+I_{(01)T,t}^{*(i_1 i_2)}\right)+$$

$$+\frac{(T-t)^3}{8}\left(\frac{1}{3}\zeta_1^{(i_1)}\zeta_1^{(i_2)}+\sum_{i=0}^{\infty}\left(\frac{(i+1)(i+3)\left(\zeta_{i+3}^{(i_2)}\zeta_i^{(i_1)}-\zeta_i^{(i_2)}\zeta_{i+3}^{(i_1)}\right)}{\sqrt{(2i+1)(2i+7)}(2i+3)(2i+5)}+\right.\right.$$

$$\left.\left.+\frac{(i+1)^2\left(\zeta_{i+1}^{(i_2)}\zeta_i^{(i_1)}-\zeta_i^{(i_2)}\zeta_{i+1}^{(i_1)}\right)}{\sqrt{(2i+1)(2i+3)}(2i-1)(2i+5)}\right)\right),$$

$$I_{(3)T,t}^{*(i_1)}=-\frac{(T-t)^{7/2}}{4}\left(\zeta_0^{(i_1)}+\frac{3\sqrt{3}}{5}\zeta_1^{(i_1)}+\frac{1}{\sqrt{5}}\zeta_2^{(i_1)}+\frac{1}{5\sqrt{7}}\zeta_3^{(i_1)}\right),$$

where

$$\zeta_j^{(i)}=\int\limits_t^T\phi_j(\tau)d\mathbf{f}_\tau^{(i)}\quad(i=1,\ldots,m)\tag{105}$$

are independent standard Gaussian random variables for various i or j.

Note the simplicity of the formulas (101), (102). For comparison, we present analogs of the formulas (101), (102) obtained in [4] (also see [3]) using the method proposed in [2]

$$I_{(1)T,t}^{(i_1)q} = -\frac{(T-t)^{3/2}}{2}\left(\zeta_0^{(i_1)} - \frac{\sqrt{2}}{\pi}\left(\sum_{r=1}^{q}\frac{1}{r}\zeta_{2r-1}^{(i_1)} + \sqrt{\alpha_q}\xi_q^{(i_1)}\right)\right), \tag{106}$$

$$I_{(2)T,t}^{(i_1)q} = (T-t)^{5/2}\left(\frac{1}{3}\zeta_0^{(i_1)} + \frac{1}{\sqrt{2}\pi^2}\left(\sum_{r=1}^{q}\frac{1}{r^2}\zeta_{2r}^{(i_1)} + \sqrt{\beta_q}\mu_q^{(i_1)}\right) - \right.$$

$$\left. -\frac{1}{\sqrt{2}\pi}\left(\sum_{r=1}^{q}\frac{1}{r}\zeta_{2r-1}^{(i_1)} + \sqrt{\alpha_q}\xi_q^{(i_1)}\right)\right), \tag{107}$$

where $\zeta_j^{(i)}$ is defined by the formula (105), $\phi_j(s)$ is a complete orthonormal system of trigonometric functions in the space $L_2([t,T])$, and $\zeta_0^{(i)},\ \zeta_{2r}^{(i)},\ \zeta_{2r-1}^{(i)},\ \xi_q^{(i)},\ \mu_q^{(i)}$ $(r=1,\ldots,q,\ \ i=1,\ldots,m)$ are independent standard Gaussian random variables, $i_1=1,\ldots,m$,

$$\xi_q^{(i)} = \frac{1}{\sqrt{\alpha_q}}\sum_{r=q+1}^{\infty}\frac{1}{r}\zeta_{2r-1}^{(i)}, \qquad \alpha_q = \frac{\pi^2}{6} - \sum_{r=1}^{q}\frac{1}{r^2},$$

$$\mu_q^{(i)} = \frac{1}{\sqrt{\beta_q}}\sum_{r=q+1}^{\infty}\frac{1}{r^2}\ \zeta_{2r}^{(i)}, \qquad \beta_q = \frac{\pi^4}{90} - \sum_{r=1}^{q}\frac{1}{r^4}.$$

Another example of obvious advantage of the Legendre polynomials over the trigonometric functions (in the framework of the considered problem) is the truncated expansion of the iterated Stratonovich stochastic integral $I_{(10)T,t}^{*(i_1i_2)}$ obtained by Theorems 6, 8 in which instead of the double Fourier–Legendre series is taken the double trigonometric Fourier series

$$I_{(10)T,t}^{*(i_1i_2)q} = -(T-t)^2\left(\frac{1}{6}\zeta_0^{(i_1)}\zeta_0^{(i_2)} - \frac{1}{2\sqrt{2}\pi}\sqrt{\alpha_q}\xi_q^{(i_2)}\zeta_0^{(i_1)} + \right.$$

$$+\frac{1}{2\sqrt{2}\pi^2}\sqrt{\beta_q}\left(\mu_q^{(i_2)}\zeta_0^{(i_1)} - 2\mu_q^{(i_1)}\zeta_0^{(i_2)}\right) +$$

$$+\frac{1}{2\sqrt{2}}\sum_{r=1}^{q}\left(-\frac{1}{\pi r}\zeta_{2r-1}^{(i_2)}\zeta_0^{(i_1)} + \frac{1}{\pi^2 r^2}\left(\zeta_{2r}^{(i_2)}\zeta_0^{(i_1)} - 2\zeta_{2r}^{(i_1)}\zeta_0^{(i_2)}\right)\right) -$$

$$-\frac{1}{2\pi^2}\sum_{\substack{r,l=1\\ r\ne l}}^{q}\frac{1}{r^2-l^2}\left(\zeta_{2r}^{(i_1)}\zeta_{2l}^{(i_2)} + \frac{l}{r}\zeta_{2r-1}^{(i_1)}\zeta_{2l-1}^{(i_2)}\right) +$$

$$+\sum_{r=1}^{q}\left(\frac{1}{4\pi r}\left(\zeta_{2r}^{(i_1)}\zeta_{2r-1}^{(i_2)} - \zeta_{2r-1}^{(i_1)}\zeta_{2r}^{(i_2)}\right) + \right.$$

$$\left.\left. +\frac{1}{8\pi^2 r^2}\left(3\zeta_{2r-1}^{(i_1)}\zeta_{2r-1}^{(i_2)} + \zeta_{2r}^{(i_2)}\zeta_{2r}^{(i_1)}\right)\right)\right), \tag{108}$$

where the meaning of notations included in (106), (7) is saved.

An analogue of the formula (108) (for the case of Legendre polynomials) is (according to (103) and (104)) the following representation

$$I_{(10)T,t}^{*(i_1 i_2)q} = -\frac{T-t}{2} I_{(00)T,t}^{*(i_1 i_2)q} - \frac{(T-t)^2}{4}\left(\frac{\zeta_0^{(i_2)}\zeta_1^{(i_1)}}{\sqrt{3}} + \right.$$

$$\left. + \sum_{i=0}^{q}\left(\frac{(i+1)\zeta_{i+2}^{(i_2)}\zeta_i^{(i_1)} - (i+2)\zeta_i^{(i_2)}\zeta_{i+2}^{(i_1)}}{\sqrt{(2i+1)(2i+5)}(2i+3)} + \frac{\zeta_i^{(i_1)}\zeta_i^{(i_2)}}{(2i-1)(2i+3)}\right)\right), \tag{109}$$

where

$$I_{(00)T,t}^{*(i_1 i_2)q} = \frac{T-t}{2}\left(\zeta_0^{(i_1)}\zeta_0^{(i_2)} + \sum_{i=1}^{q}\frac{1}{\sqrt{4i^2-1}}\left(\zeta_{i-1}^{(i_1)}\zeta_i^{(i_2)} - \zeta_i^{(i_1)}\zeta_{i-1}^{(i_2)}\right)\right),$$

which is obviously substantially simpler than (108).

Here it is necessary to pay a special attention on the fact that the representation (109) includes a single sum with the upper summation limit q while the representation (108) includes the double sum with the same summation limit. In numerical simulation, obviously, the formula (109) is more economical in terms of computational cost than its analogue (108).

There is another feature that should be noted in connection with the formula (108). This formula was first obtained in [4] by the method from [2]. As we noted in Sect. 1, the method [2] of approximation of iterated stochastic integrals is based on the trigonometric series expansion of the Brownian bridge process. So, this method leads to iterated application of the operation of limit transition (in contrast to Theorems 1, 2, 6, and 8–12 in which limit transition is performed only once). This means, generally speaking, that the mean-square convergence of $I_{(10)T,T}^{*(i_1 i_2)q}$ (see (108)) to $I_{(10)T,T}^{*(i_1 i_2)}$ does not follow if $q \to \infty$ for the method [2]. The same applies to some others approximations of iterated Stratonovich stochastic integrals obtained in [4] by the method [2] (see discussion in Sect. 8 for details).

The validity of the formula

$$\lim_{q\to\infty} \mathsf{M}\left\{\left(I_{(10)T,t}^{*(i_1 i_2)} - I_{(10)T,t}^{*(i_1 i_2)q}\right)^2\right\} = 0,$$

where $I_{(10)T,T}^{*(i_1 i_2)q}$ is defined by (108), follows from Theorems 3, 6, and 8.

8. Theorems 1, 2, 6, 8–12 from Point of View of the Wong–Zakai Approximation

The iterated Ito stochastic integrals and solutions of Ito SDEs are complex and important functionals from the independent components $\mathbf{f}_s^{(i)}$, $i = 1,\ldots,m$ of the multidimensional Wiener process $\mathbf{f}_s$, $s \in [0,T]$. Let $\mathbf{f}_s^{(i)p}$, $p \in \mathbb{N}$ be some approximation of $\mathbf{f}_s^{(i)}$, $i = 1,\ldots,m$. Suppose that $\mathbf{f}_s^{(i)p}$ converges to $\mathbf{f}_s^{(i)}$, $i = 1,\ldots,m$ if $p \to \infty$ in some sense and has differentiable sample trajectories.

A natural question arises: if we replace $\mathbf{f}_s^{(i)}$ by $\mathbf{f}_s^{(i)p}$, $i = 1,\ldots,m$ in the functionals mentioned above, will the resulting functionals converge to the original functionals from the components $\mathbf{f}_s^{(i)}$, $i = 1,\ldots,m$ of the multidimentional Wiener process $\mathbf{f}_s$? The answere to this question is negative in the general case. However, in the pioneering works of Wong E. and Zakai M. [69], [70], it was shown that under the special conditions and for some types of approximations of the Wiener process the answere is affirmative with one peculiarity: the convergence takes place to the iterated Stratonovich stochastic integrals and solutions of Stratonovich SDEs and not to iterated Ito stochastic integrals and solutions of Ito SDEs. The piecewise linear approximation as well as the regularization by convolution [69]-[71] relate the mentioned types of approximations of the Wiener process. The above approximation of stochastic integrals and solutions of SDEs is often called the Wong–Zakai approximation.

Let $\mathbf{f}_s$, $s\in[0,T]$ be an m-dimensional standard Wiener process with independent components $\mathbf{f}_s^{(i)}$, $i=1,\ldots,m$. It is well known that the following representation takes place [72], [73]

$$\mathbf{f}_{\tau}^{(i)}-\mathbf{f}_{t}^{(i)}=\sum_{j=0}^{\infty}\int\limits_t^{\tau}\phi_j(s)ds\ \zeta_j^{(i)},\quad \zeta_j^{(i)}=\int\limits_t^{T}\phi_j(s)d\mathbf{f}_s^{(i)}, \tag{110}$$

where $\tau\in[t,T]$, $t\ge 0$, $\{\phi_j(x)\}_{j=0}^{\infty}$ is an arbitrary complete orthonormal system of functions in the space $L_2([t,T])$, and $\zeta_j^{(i)}$ are independent standard Gaussian random variables for various i or j. Moreover, the series (110) converges for any $\tau\in[t,T]$ in the mean-square sense.

Let $\mathbf{f}_{\tau}^{(i)p}-\mathbf{f}_{t}^{(i)p}$ be the mean-square approximation of the process $\mathbf{f}_{\tau}^{(i)}-\mathbf{f}_{t}^{(i)}$, which has the following form

$$\mathbf{f}_{\tau}^{(i)p}-\mathbf{f}_{t}^{(i)p}=\sum_{j=0}^{p}\int\limits_t^{\tau}\phi_j(s)ds\ \zeta_j^{(i)}. \tag{111}$$

From (111) we obtain

$$d\mathbf{f}_{\tau}^{(i)p}=\sum_{j=0}^{p}\phi_j(\tau)\zeta_j^{(i)}d\tau. \tag{112}$$

Consider the following iterated Riemann–Stieltjes integral

$$\int\limits_t^{T}\psi_k(t_k)\ldots\int\limits_t^{t_2}\psi_1(t_1)d\mathbf{w}_{t_1}^{(i_1)p_1}\ldots d\mathbf{w}_{t_k}^{(i_k)p_k}, \tag{113}$$

where $p_1,\ldots,p_k\in\mathbb{N},\ \ i_1,\ldots,i_k=0,1,\ldots,m,$

$$d\mathbf{w}_{\tau}^{(i)p}=\begin{cases}d\mathbf{f}_{\tau}^{(i)p} & \text{for}\quad i=1,\ldots,m\\ \\ d\tau & \text{for}\quad i=0\end{cases}, \tag{114}$$

and $d\mathbf{f}_{\tau}^{(i)p}$ in defined by the relation (112).

Let us substitute (112) into (113)

$$\int\limits_t^{T}\psi_k(t_k)\ldots\int\limits_t^{t_2}\psi_1(t_1)d\mathbf{w}_{t_1}^{(i_1)p_1}\ldots d\mathbf{w}_{t_k}^{(i_k)p_k}=\sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k}C_{j_k\ldots j_1}\prod_{l=1}^{k}\zeta_{j_l}^{(i_l)}, \tag{115}$$

where

$$\zeta_j^{(i)}=\int\limits_t^T \phi_j(s)d\mathbf{w}_s^{(i)}$$

are independent standard Gaussian random variables for various i or j (in the case when $i\neq 0$), $\mathbf{w}_s^{(i)}=\mathbf{f}_s^{(i)}$ for $i=1,\ldots,m$ and $\mathbf{w}_s^{(0)}=s$,

$$C_{j_k\ldots j_1}=\int\limits_t^T \psi_k(t_k)\phi_{j_k}(t_k)\ldots\int\limits_t^{t_2} \psi_1(t_1)\phi_{j_1}(t_1)dt_1\ldots dt_k$$

is the Fourier coefficient.

To best of our knowledge [69]-[71] the approximations of the Wiener process in the Wong–Zakai approximation must satisfy fairly strong restrictions [71] (see Definition 7.1, pp. 480–481). Moreover, approximations of the Wiener process that are similar to (111) were not considered in [69], [70] (also see [71], Theorems 7.1, 7.2). Therefore, the proof of analogs of Theorems 7.1 and 7.2 [71] for approximations of the Wiener process based on its series expansion (110) should be carried out separately. Thus, the mean-square convergence of the right-hand side of (115) to the iterated Stratonovich stochastic integral (3) does not follow from the results of the papers [69], [70] (also see [71], Theorems 7.1, 7.2).

From the other hand, Theorems 1, 2, 6, 8–12 can be considered as the proof of the Wong–Zakai approximation for the iterated Stratonovich stochastic integrals (3) of multiplicities 1–5 and k ($k\in\mathbb{N}$) based on the approximation (111) of the Wiener process. At that, the Riemann–Stieltjes integrals (113) converge (according to Theorems 1, 2, 6, 8–12) to the appropriate Stratonovich stochastic integrals (3). Recall that $\{\phi_j(x)\}_{j=0}^{\infty}$ (see (110), (111), and Theorems 6, 9–12) is a complete orthonormal system of Legendre polynomials or trigonometric functions in the space $L_2([t,T])$.

To illustrate the above reasoning, consider two examples for the case $k=2$, $\psi_1(s)$, $\psi_2(s)\equiv 1$; $i_1,i_2=1,\ldots,m$.

The first example relates to the piecewise linear approximation of the multidimensional Wiener process (these approximations were considered in [69]-[71]).

Let $\mathbf{b}_{\Delta}^{(i)}(t)$, $t\in[0,T]$ be the piecewise linear approximation of the ith component $\mathbf{f}_t^{(i)}$ of the multidimensional standard Wiener process $\mathbf{f}_t$, $t\in[0,T]$ with independent components $\mathbf{f}_t^{(i)}$, $i=1,\ldots,m$, i.e.

$$\mathbf{b}_{\Delta}^{(i)}(t)=\mathbf{f}_{k\Delta}^{(i)}+\frac{t-k\Delta}{\Delta}\Delta\mathbf{f}_{k\Delta}^{(i)},$$

where

$$\Delta\mathbf{f}_{k\Delta}^{(i)}=\mathbf{f}_{(k+1)\Delta}^{(i)}-\mathbf{f}_{k\Delta}^{(i)},\quad t\in[k\Delta,(k+1)\Delta),\quad k=0,1,\ldots,N-1.$$

Note that w. p. 1

$$\frac{d\mathbf{b}_{\Delta}^{(i)}}{dt}(t)=\frac{\Delta\mathbf{f}_{k\Delta}^{(i)}}{\Delta},\quad t\in[k\Delta,(k+1)\Delta),\quad k=0,1,\ldots,N-1. \tag{116}$$

Consider the following iterated Riemann–Stieltjes integral

$$\int\limits_0^T\int\limits_0^s d\mathbf{b}_{\Delta}^{(i_1)}(\tau)d\mathbf{b}_{\Delta}^{(i_2)}(s), \quad i_1,i_2=1,\ldots,m.$$

Using (116) and additive property of the Riemann–Stieltjes integral, we can write w. p. 1

$$\int\limits_0^T\int\limits_0^s d\mathbf{b}_{\Delta}^{(i_1)}(\tau)d\mathbf{b}_{\Delta}^{(i_2)}(s)=\int\limits_0^T\int\limits_0^s \frac{d\mathbf{b}_{\Delta}^{(i_1)}}{d\tau}(\tau)d\tau\frac{d\mathbf{b}_{\Delta}^{(i_2)}}{ds}(s)ds=$$

$$=\sum_{l=0}^{N-1}\int\limits_{l\Delta}^{(l+1)\Delta}\left(\sum_{q=0}^{l-1}\int\limits_{q\Delta}^{(q+1)\Delta}\frac{\Delta\mathbf{f}_{q\Delta}^{(i_1)}}{\Delta}d\tau+\int\limits_{l\Delta}^{s}\frac{\Delta\mathbf{f}_{l\Delta}^{(i_1)}}{\Delta}d\tau\right)\frac{\Delta\mathbf{f}_{l\Delta}^{(i_2)}}{\Delta}ds=$$

$$=\sum_{l=0}^{N-1}\sum_{q=0}^{l-1}\Delta\mathbf{f}_{q\Delta}^{(i_1)}\Delta\mathbf{f}_{l\Delta}^{(i_2)}+\frac{1}{\Delta^2}\sum_{l=0}^{N-1}\Delta\mathbf{f}_{l\Delta}^{(i_1)}\Delta\mathbf{f}_{l\Delta}^{(i_2)}\int\limits_{l\Delta}^{(l+1)\Delta}\int\limits_{l\Delta}^{s}d\tau ds=$$

$$=\sum_{l=0}^{N-1}\sum_{q=0}^{l-1}\Delta\mathbf{f}_{q\Delta}^{(i_1)}\Delta\mathbf{f}_{l\Delta}^{(i_2)}+\frac{1}{2}\sum_{l=0}^{N-1}\Delta\mathbf{f}_{l\Delta}^{(i_1)}\Delta\mathbf{f}_{l\Delta}^{(i_2)}. \tag{117}$$

Using (117) and (19) it is not difficult to show that

$$\underset{N\to\infty}{\text{l.i.m.}}\int\limits_0^T\int\limits_0^s d\mathbf{b}_{\Delta}^{(i_1)}(\tau)d\mathbf{b}_{\Delta}^{(i_2)}(s)=\int\limits_0^T\int\limits_0^s d\mathbf{f}_{\tau}^{(i_1)}d\mathbf{f}_{s}^{(i_2)}+\frac{1}{2}\mathbf{1}_{\{i_1=i_2\}}\int\limits_0^T ds=$$

$$=\int\limits_0^{*T}\int\limits_0^{*s} d\mathbf{f}_{\tau}^{(i_1)}d\mathbf{f}_{s}^{(i_2)}, \tag{118}$$

where $\Delta\to 0$ if $N\to\infty$ $(N\Delta=T)$.

Obviously, (118) agrees with Theorem 7.1 (see [71], p. 486).

The next example relates to the approximation of the Wiener process based on its series expansion (110) for $t=0$, where $\{\phi_j(x)\}_{j=0}^{\infty}$ is a complete orthonormal system of Legendre polynomials or trigonometric functions in the space $L_2([0,T])$.

Consider the following iterated Riemann–Stieltjes integral

$$\int\limits_0^T\int\limits_0^s d\mathbf{f}_{\tau}^{(i_1)p}d\mathbf{f}_{s}^{(i_2)p}, \quad i_1,i_2=1,\ldots,m, \tag{119}$$

where $d\mathbf{f}_{\tau}^{(i)p}$ is defined by the relation (112).

Let us substitute (112) into (119)

$$\int\limits_0^T\int\limits_0^s d\mathbf{f}_\tau^{(i_1)p}d\mathbf{f}_s^{(i_2)p}=\sum_{j_1,j_2=0}^{p}C_{j_2j_1}\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}, \tag{120}$$

where

$$C_{j_2j_1}=\int\limits_0^T\phi_{j_2}(s)\int\limits_0^s\phi_{j_1}(\tau)d\tau ds$$

is the Fourier coefficient; another notations are the same as in (115).

As we noted above, approximations of the Wiener process that are similar to (111) were not considered in [69], [70] (also see Theorems 7.1, 7.2 in [71]). Furthermore, the extension of the results of Theorems 7.1 and 7.2 [71] to the case under consideration is not obvious.

However, the authors of the works [3] (Sect. 5.8, pp. 202–204), [4] (pp. 438-439), [74] (pp. 82-84), [75] (pp. 263-264) use the Wong–Zakai approximation [69]-[71] (without rigorous proof) within the frames of the approach [2] based on the series expansion of the Brownian bridge process.

On the other hand, we can apply the theory built in Chapters 1 and 2 of the monographs [25]-[26]. More precisely, using Theorem 6 from this paper we obtain from (120) the desired result

$$\underset{p\to\infty}{\text{l.i.m.}}\int\limits_0^T\int\limits_0^s d\mathbf{f}_\tau^{(i_1)p}d\mathbf{f}_s^{(i_2)p}=\underset{p\to\infty}{\text{l.i.m.}}\sum_{j_1,j_2=0}^{p}C_{j_2j_1}\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}=$$

$$=\int\limits_0^{*T}\int\limits_0^{*s}d\mathbf{f}_\tau^{(i_1)}d\mathbf{f}_s^{(i_2)}. \tag{121}$$

From the other hand, by Theorems 1, 2 (see (10)) for the case $k=2$ we obtain from (120) the following relation

$$\underset{p\to\infty}{\text{l.i.m.}}\int\limits_0^T\int\limits_0^s d\mathbf{f}_\tau^{(i_1)p}d\mathbf{f}_s^{(i_2)p}=\underset{p\to\infty}{\text{l.i.m.}}\sum_{j_1,j_2=0}^{p}C_{j_2j_1}\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}=$$

$$=\underset{p\to\infty}{\text{l.i.m.}}\sum_{j_1,j_2=0}^{p}C_{j_2j_1}\left(\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}-\mathbf{1}_{\{i_1=i_2\}}\mathbf{1}_{\{j_1=j_2\}}\right)+\mathbf{1}_{\{i_1=i_2\}}\sum_{j_1=0}^{\infty}C_{j_1j_1}=$$

$$=\int\limits_0^T\int\limits_0^s d\mathbf{f}_\tau^{(i_1)}d\mathbf{f}_s^{(i_2)}+\mathbf{1}_{\{i_1=i_2\}}\sum_{j_1=0}^{\infty}C_{j_1j_1}. \tag{122}$$

Since

$$\sum_{j_1=0}^{\infty}C_{j_1j_1}=\frac{1}{2}\sum_{j_1=0}^{\infty}\left(\int\limits_0^T\phi_j(\tau)d\tau\right)^2=$$

$$=\frac{1}{2}\left(\int\limits_0^T\phi_0(\tau)d\tau\right)^2=\frac{1}{2}\int\limits_0^T ds,$$

then from (19) and (122) we obtain (121).

THE HYPOTHESES ON EXPANSION OF ITERATED STRATONOVICH STOCHASTIC INTEGRALS OF ARBITRARY MULTIPLICITY AND THEIR PARTIAL PROOF

DMITRIY F. KUZNETSOV

Abstract. In this article we collected more than ten theorems on expansions of iterated Ito and Stratonovich stochastic integrals, which have been formulated and proved by the author. These theorems open up a new direction for study of iterated Ito and Stratonovich stochastic integrals. The expansions based on multiple Fourier–Legendre series as well as on multiple trigonomectic Fourier series are presented in the article. Some of these theorems are connected with the iterated stochastic integrals of multiplicities 1 to 6. Also we consider two theorems on expansions of iterated Ito stochastic integrals of arbitrary multiplicity k ($k \in \mathbb{N}$) based on generalized multiple Fourier series converging in the sense of norm in Hilbert space $L_2([t,T]^k)$ as well as two theorems on expansions of iterated Stratonovich stochastic integrals of arbitrary multiplicity k ($k \in \mathbb{N}$) based on iterated trigonometric Fourier series converging pointwise. On the base of the presented theorems we formulate 3 hypotheses on expansions of iterated Stratonovich stochastic integrals of arbitrary multiplicity k ($k \in \mathbb{N}$) based on generalized multiple Fourier series converging in the sense of norm in Hilbert space $L_2([t,T]^k)$. The proof of one of these hypotheses (Hypothesis 2) is given under the condition of convergence of trace series. The mentioned iterated Stratonovich stochastic integrals are part of the Taylor–Stratonovich expansion. Moreover, most of the considered expansions of iterated Stratonovich stochastic integrals contain only one operation of the limit transition and substantially simpler than their analogues for iterated Ito stochastic integrals. Therefore, the results of the article can be applied to numerical integration of Ito stochastic differential equations. Also, the results of the article were reformulated in the form of theorems of the Wong–Zakai type for iterated Stratonovich stochastic integrals.

Contents

Mathematics Subject Classification: 60H05, 60H10, 42B05, 42C10.

Keywords: Iterated Ito stochastic integral, Iterated Stratonovich stochastic integral, Ito stochastic differential equation, Generalized multiple Fourier series, Multiple Fourier–Legendre series, Multiple trigonometric Fourier series, Legendre Polynomial, Wong–Zakai approximation, Mean-square convergence, Expansion.

1. Introduction

Let $(\Omega, \mathrm{F}, \mathsf{P})$ be a complete probability space, let $\{\mathrm{F}_t, t \in [0,T]\}$ be a nondecreasing right-continous family of σ-algebras of F, and let $\mathbf{f}_t$ be a standard m-dimensional Wiener stochastic process, which is F_t-measurable for any $t \in [0,T]$. We assume that the components $\mathbf{f}_t^{(i)}$ $(i = 1, \ldots, m)$ of this process are independent. Consider an Ito stochastic differential equation (SDE) in the integral form

$$\mathbf{x}_t = \mathbf{x}_0 + \int\limits_0^t \mathbf{a}(\mathbf{x}_\tau, \tau) d\tau + \int\limits_0^t B(\mathbf{x}_\tau, \tau) d\mathbf{f}_\tau, \quad \mathbf{x}_0 = \mathbf{x}(0, \omega). \tag{1}$$

Here $\mathbf{x}_t$ is some n-dimensional stochastic process satisfying the equation (1). The nonrandom functions $\mathbf{a} : \mathbb{R}^n \times [0,T] \to \mathbb{R}^n$, $B : \mathbb{R}^n \times [0,T] \to \mathbb{R}^{n \times m}$ guarantee the existence and uniqueness up to stochastic equivalence of a solution of the equation (1) [1]. The second integral on the right-hand side of (1) is interpreted as the Ito stochastic integral. Let $\mathbf{x}_0$ be an n-dimensional random variable, which is F_0-measurable and $\mathsf{M}\{|\mathbf{x}_0|^2\} < \infty$ (M denotes a mathematical expectation). We assume that $\mathbf{x}_0$ and $\mathbf{f}_t - \mathbf{f}_0$ are independent when $t > 0$.

It is well known [2]-[5] that Ito SDEs are adequate mathematical models of dynamic systems of various physical nature under the influence of random disturbances. One of the effective approaches to the numerical integration of Ito SDEs is an approach based on the Taylor–Ito and Taylor–Stratonovich expansions [2]-[18]. The most important feature of such expansions is a presence in them of the so-called iterated Ito and Stratonovich stochastic integrals, which play the key role for solving the problem of numerical integration of Ito SDEs and have the following form

$$J[\psi^{(k)}]_{T,t}=\int\limits_t^T\psi_k(t_k)\ldots\int\limits_t^{t_2}\psi_1(t_1)d\mathbf{w}_{t_1}^{(i_1)}\ldots d\mathbf{w}_{t_k}^{(i_k)}, \tag{2}$$

$$J^*[\psi^{(k)}]_{T,t}=\int\limits_t^{*T}\psi_k(t_k)\ldots\int\limits_t^{*t_2}\psi_1(t_1)d\mathbf{w}_{t_1}^{(i_1)}\ldots d\mathbf{w}_{t_k}^{(i_k)}, \tag{3}$$

where $\psi_1(\tau),\ldots,\psi_k(\tau)$ are nonrandom functions on $[t,T]$, $\mathbf{w}_\tau^{(i)}=\mathbf{f}_\tau^{(i)}$ for $i=1,\ldots,m$ and $\mathbf{w}_\tau^{(0)}=\tau$, $i_1,\ldots,i_k=0,1,\ldots,m,$

$$\int \text{ and } \int\limits^{*}$$

denote Ito and Stratonovich stochastic integrals, respectively. In this paper we use the definition of the Stratonovich stochastic integral from [2].

Note that $\psi_l(\tau)\equiv 1$ $(l=1,\ldots,k)$ and $i_1,\ldots,i_k=0,1,\ldots,m$ in [2]-[7]. At the same time $\psi_l(\tau)\equiv(t-\tau)^{q_l}$ $(l=1,\ldots,k,\ q_1,\ldots,q_k=0,1,\ldots)$ and $i_1,\ldots,i_k=1,\ldots,m$ in [8]-[18].

Effective solution of the problem of combined mean-square approximation for collections of iterated Ito and Stratonovich stochastic integrals (2) and (3) composes the subject of the article.

We want to mention in short that there are two main criteria of numerical methods convergence for Ito SDEs [2]-[4]: a strong or mean-square criterion and a weak criterion where the subject of approximation is not the solution of Ito SDE, simply stated, but the distribution of Ito SDE solution.

Using the strong numerical methods, we may build sample pathes of Ito SDEs numerically. These methods require the combined mean-square approximation for collections of iterated Ito and Stratonovich stochastic integrals (2) and (3). The strong numerical methods are used when building new mathematical models on the basis of Ito SDEs and solving various mathematical problems connected with Ito SDEs. Among these problems we mention signal filtering in the background of random noise, stochastic optimal control, stochastic stability, evaluating the parameters of stochastic systems, etc. [2]-[5].

The problem of effective jointly numerical modeling (in accordance to the mean-square convergence criterion) of iterated Ito and Stratonovich stochastic integrals (2) and (3) is difficult from theoretical and computing point of view [2]-[5], [10]-[65].

The only exception is connected with a narrow particular case, when $i_1=\ldots=i_k\neq 0$ and $\psi_1(\tau),\ldots,\psi_k(\tau)\equiv\psi(\tau)$. This case allows the investigation with using of the Ito formula [2]-[4].

Note that even for the mentioned coincidence $(i_1=\ldots=i_k\neq 0)$, but for different functions $\psi_1(\tau),\ldots,\psi_k(\tau)$ the mentioned difficulties persist, and relatively simple families of iterated Ito and Stratonovich stochastic integrals, which can be often met in the applications, cannot be represented effectively in a finite form (within the framework of the mean-square approximation) using the system of standard Gaussian random variables.

Note that for a number of special types of Ito SDEs the problem of approximation of iterated Ito and Stratonovich stochastic integrals may be simplified but cannot be solved. The equations with additive scalar noise, with additive vector noise, with non-additive scalar noise, with a small parameter are related to such types of equations [2]-[4]. For the mentioned types of equations, simplifications are connected to the fact that some members from stochastic Taylor expansions (Taylor–Ito and Taylor–Stratonovich expansions) are equal to zero or we may neglect some members (which include difficult for approximation iterated stochastic integrals) from these expansions due to the presence of a small parameter [2]-[4]. In this article, we consider Ito SDEs with multidimentional and non-additive noise (non-commutative case).

Consider a brief overview of existing methods of the mean-square approximation of iterated Ito and Stratonovich stochastic integrals.

Seems that iterated stochastic integrals may be approximated by multiple integral sums [3], [4], [64]. However, this approach implies the partitioning of the interval of integration $[t,T]$ for iterated stochastic integrals. The length $T-t$ of this interval is already fairly small (because it is a step of integration of numerical methods for Ito SDEs) and does not need to be partitioned. Computational experiments show that the application of numerical simulation for iterated stochastic integrals (in which the interval of integration is partitioned) leads to unacceptably high computational cost and accumulation of computation errors [10].

In [3] (also see [2], [4]) Milstein G.N. proposed to expand the integral (2) of multiplicity 2 ($\psi_1(\tau)$, $\psi_2(\tau)\equiv 1$ and $i_1,i_2=1,\ldots,m$) into the iterated series of products of standard Gaussian random variables by representing the Brownian bridge process as the trigonometric Fourier series with random coefficients (the version of the so-called Karhunen–Loeve expansion for the Brownian bridge process). To obtain the Milstein expansion of (2) or (3), the truncated Fourier expansions of components of the Wiener process $\mathbf{f}_s$ must be iteratively substituted in the single integrals, and the integrals must be calculated, starting from the innermost integral. This is a complicated procedure that does not lead to general expansions of the integrals (2), (3) of arbitrary multiplicity k. For this reason, only expansions of single, double, and triple stochastic integrals were presented in [2] ($k=1,2,3$) and in [3], [4] ($k=1,2$) for the simplest case $\psi_1(\tau),\psi_2(\tau),\psi_3(\tau)\equiv 1$ and $i_1,i_2,i_3=0,1,\ldots,m$. Moreover, the authors of the works [2] (Sect. 5.8, pp. 202–204), [5] (pp. 82-84), [67] (pp. 438-439), [68] (pp. 263-264) use the Wong–Zakai approximation [69], [70], [74] (without rigorous proof) within the frames of the Milstein approach [3] based on the series expansion of the Brownian bridge process. See discussion in Sect. 15 of this paper for details.

Note that in [65] the method of approximation of the double Ito stochastic integral (2) ($\psi_1(\tau)$, $\psi_2(\tau)\equiv 1$ and $i_1,i_2=1,\ldots,m$) based on expansion of the Wiener process using Haar functions and trigonometric functions has been considered. The restrictions of the method [65] as well as the Milstein approach [3] are connected with the iterated application of the operation of limit transition at least starting from the second (in general case) and third multiplicity of iterated stochastic integrals.

It is necessary to note that the Milstein approach [3] excelled in several times or even in several orders the methods of multiple integral sums [3], [4], [64] (we mean here the diminishing of computational costs).

An alternative strong approximation method (see Theorems 1 and 2 below) was proposed for (3) in [15] (Sect. 2.4) (also see [14], [16]-[18], [22]-[25], [36] (1997), [37] (1998), [52]), where $J^*[\psi^{(k)}]_{T,t}$ was represented as the multiple stochastic integral from the certain discontinuous nonrandom function of k variables, and the function was then expressed as the generalized iterated Fourier series in a complete systems of continuous functions that are orthonormal in the space $L_2([t,T])$. As a result, an iterated series expansion of the integral (3) in terms of products of standard Gaussian random variables was obtained in [15] (Sect. 2.4) (also see [14], [16]-[18], [22]-[25], [36] (1997), [37] (1998), [52]) for an arbitrary multiplicity k. Hereinafter, this method is referred to as the method of generalized iterated Fourier series.

It was shown in [15] (also see [14], [16]-[18], [22]-[25], [36] (1997), [37] (1998), [52]) that the method of generalized iterated Fourier series leads to the Milstein expansion [3] of the integral (3) in the case of trigonometric system and to the substantially simpler expansion of the integral (3) in the case of Legendre polynomials system (at least for the case of multiplicity $k=2$ of the integral (3), $i_1\neq i_2$).

Note that the method of generalized iterated Fourier series as well as the Milstein approach [3] leads to iterated application of the operation of limit transition. As mentioned above, this problem appears for triple stochastic integrals ($i_1,i_2,i_3=1,\ldots,m$) or even for some double stochastic integrals in the case, when $\psi_1(\tau)$, $\psi_2(\tau)\not\equiv 1$ ($i_1,i_2=1,\ldots,m$) [10].

The mentioned problem (iterated application of the operation of limit transition) not appears in the method, which is considered for the integrals (2) in Theorems 3, 4 (see below) [10] (2006) [11]-[34], [40]-[49], [51], [53]-[55]. The idea of this method is as follows: the iterated Ito stochastic integral (2) of multiplicity k is represented as the multiple stochastic integral from the certain discontinuous nonrandom function of k variables defined on the hypercube $[t,T]^k$, where $[t,T]$ is the interval of integration of the iterated Ito stochastic integral (2). Then, the indicated nonrandom function is expanded in the hypercube $[t,T]^k$ into the generalized multiple Fourier series converging in the mean-square sense in the space $L_2([t,T]^k)$. After a number of nontrivial transformations we come (see Theorems 3, 4 below) to the mean-square convergening expansion of the iterated Ito stochastic integral (2) into the multiple series of products of standard Gaussian random variables. The coefficients of this series are the coefficients of generalized multiple Fourier series for the mentioned nonrandom function of k variables, which can be calculated using the explicit formula regardless of the multiplicity k of the iterated Ito stochastic integral (2). Hereinafter, this method is referred to as the method of generalized multiple Fourier series.

Thus, we obtain the following useful possibilities of the method of generalized multiple Fourier series.

1. There is the explicit formula (see (13)) for calculation of expansion coefficients of the iterated Ito stochastic integral (2) with any fixed multiplicity k.

2. We have new possibilities for exact calculation of the mean-square error of approximation of the iterated Ito stochastic integral (2) [12]-[18], [26], [44].

3. Since the used multiple Fourier series is generalized in the sense that it is built using various complete orthonormal systems of functions in the space $L_2([t,T])$, then we have new possibilities for approximation — we can use not only the trigonometric functions as in [2]-[4] but the Legendre polynomials as well as the systems of Haar and Rademacher–Walsh functions.

4. As it turned out [10]-[34], [40]-[49], [51], [53]-[55] it is more convenient to work with the Legendre polynomials for approximation of the iterated Ito stochastic integrals (2). Approximations based on the Legendre polynomials essentially simpler than their analogues based on the trigonometric functions. Another advantages of the application of Legendre polynomials in the framework of the mentioned direction are considered in [31], [40] (also see [15]-[18]).

5. The approach based on the Karhunen–Loeve expansion of the Brownian bridge process (also see [65]) leads to iterated application of the operation of limit transition (the operation of limit transition is implemented only once in Theorems 3, 4 (see below)) starting from the second or third multiplicity of the iterated Ito stochastic integrals (2). Multiple series (the operation of limit transition is implemented only once) are more convenient for approximation than the iterated ones (iterated application of the operation of limit transition), since partial sums of multiple series converge for any possible case of convergence to infinity of their upper limits of summation (let us denote them as $p_1,\ldots,p_k$). For example, when $p_1=\ldots=p_k=p\to\infty$. For iterated series, the condition $p_1=\ldots=p_k=p\to\infty$ obviously does not guarantee the convergence of this series. However, in [2] (Sect. 5.8, pp. 202–204), [5] (pp. 82-84), [67] (pp. 438-439), [68] (pp. 263-264) the authors use (without rigorous proof) the condition $p_1=p_2=p_3=p\to\infty$ within the frames of the mentioned approach based on the Karhunen–Loeve expansion of the Brownian bridge process [3] together with the Wong–Zakai approximation [69], [70], [74] (see Sect. 15 for details).

6. As it turned out, the method of generalized multiple Fourier series can be adapted for the iterated Stratonovich stochastic integrals (3) at least for multiplicities 1 to 6 [11]-[18], [23]-[25], [32], [36], [37], [41], [47]-[49], [52], [55]. Expansions of these iterated Stratonovich stochastic integrals turned out to be simpler (see Theorems 6–13, 15–18, 23 below) than the appropriate expansions of the iterated Ito stochastic integrals (2) from Theorems 3, 4.

In this article, we collect more than ten theorems formulated and proved by the author that develop the mentioned direction of investigations. Moreover, on the base of the presented theorems, we formulate 3 hypotheses (Hypotheses 1–3) on expansions of iterated Stratonovich stochastic integrals of arbitrary multiplicity k. The results of the article prove (the cases of Legendre polynomials and trigonometric functions) Hypothesis 1 for $k=1,\ldots,6$, Hypothesis 2 for $k=1,\ldots,5$ and Hypothesis 3 for $k=1,\ldots,3$. Moreover, the proof of Hypotheses 2 and 3 is given for an arbitrary k under the condition of convergence of trace series.

2. Hypotheses on Expansions of Iterated Stratonovich Stochastic Integrals of Arbitrary Multiplicity k

Taking into account Theorems 1–13, 15–18, 23 (see below), let us formulate the following hypotheses on expansions of iterated Stratonovich stochastic integrals of arbitrary multiplicity k.

Hypothesis 1 [11]-[18]. *Assume that $\{\phi_j(x)\}_{j=0}^{\infty}$ is a complete orthonormal system of Legendre polynomials or trigonometric functions in the space $L_2([t,T])$. Then, for the iterated Stratonovich stochastic integral of kth multiplicity*

$$
I_{T,t}^{*(i_1\ldots i_k)}=\int\limits_t^{*T}\ldots\int\limits_t^{*t_2}d\mathbf{w}_{t_1}^{(i_1)}\ldots d\mathbf{w}_{t_k}^{(i_k)} \tag{4}
$$

$$
(i_1,\ldots,i_k=0,1,\ldots,m)
$$

the following expansion

$$
I_{T,t}^{*(i_1\ldots i_k)}=\underset{p\to\infty}{\text{l.i.m.}}\sum_{j_1,\ldots j_k=0}^{p}C_{j_k\ldots j_1}\zeta_{j_1}^{(i_1)}\ldots\zeta_{j_k}^{(i_k)} \tag{5}
$$

converging in the mean-square sense is valid, where the Fourier coefficient $C_{j_k\ldots j_1}$ has the form

$$
C_{j_k\ldots j_1}=\int\limits_t^T\phi_{j_k}(t_k)\ldots\int\limits_t^{t_2}\phi_{j_1}(t_1)dt_1\ldots dt_k,
$$

l.i.m. *is a limit in the mean-square sense,*

$$
\zeta_j^{(i)}=\int\limits_t^T\phi_j(s)d\mathbf{w}_s^{(i)}
$$

are independent standard Gaussian random variables for various i or j (if $i\ne 0$), $\mathbf{w}_\tau^{(i)}=\mathbf{f}_\tau^{(i)}$ are independent standard Wiener processes $(i=1,\ldots,m)$ and $\mathbf{w}_\tau^{(0)}=\tau$.

Hypothesis 1 allows to approximate the iterated Stratonovich stochastic integral $I_{T,t}^{*(i_1\ldots i_k)}$ by the sum

$$
I_{T,t}^{*(i_1\ldots i_k)p}=\sum_{j_1,\ldots j_k=0}^{p}C_{j_k\ldots j_1}\zeta_{j_1}^{(i_1)}\ldots\zeta_{j_k}^{(i_k)}, \tag{6}
$$

where

$$
\lim_{p\to\infty}\mathsf{M}\left\{\left(I_{T,t}^{*(i_1\ldots i_k)}-I_{T,t}^{*(i_1\ldots i_k)p}\right)^2\right\}=0.
$$

The integrals (4) are integrals from the Taylor–Stratonovich expansion [2]. It means that the approximations (6) can be very useful for the numerical integration of Ito SDEs. The expansion (5) contains only one operation of the limit transition and by this reason is convenient for approximation of iterated Stratonovich stochastic integrals. Moreover, the author supposes that the analogue of Hypothesis 1 will be valid for the iterated Stratonovich stochastic integrals (3).

Hypothesis 2 [14]-[18]. *Assume that* $\{\phi_j(x)\}_{j=0}^{\infty}$ *is a complete orthonormal system of Legendre polynomials or trigonometric functions in the space* $L_2([t,T])$*. Moreover, every* $\psi_l(\tau)$ $(l=1,\ldots,k)$ *is an enough smooth nonrandom function on* $[t,T]$*. Then, for the iterated Stratonovich stochastic integral* (3) *of* k*th multiplicity*

$$J^*[\psi^{(k)}]_{T,t}=\int\limits_t^{*T}\psi_k(t_k)\ldots\int\limits_t^{*t_2}\psi_1(t_1)d\mathbf{w}_{t_1}^{(i_1)}\ldots d\mathbf{w}_{t_k}^{(i_k)}$$

$$(i_1,\ldots,i_k=0,1,\ldots,m)$$

the following expansion

$$J^*[\psi^{(k)}]_{T,t}=\underset{p\to\infty}{\text{l.i.m.}}\sum_{j_1,\ldots j_k=0}^{p}C_{j_k\ldots j_1}\zeta_{j_1}^{(i_1)}\ldots\zeta_{j_k}^{(i_k)} \tag{7}$$

converging in the mean-square sense is valid, where the Fourier coefficient $C_{j_k\ldots j_1}$ *has the form*

$$C_{j_k\ldots j_1}=\int\limits_t^T\psi_k(t_k)\phi_{j_k}(t_k)\ldots\int\limits_t^{t_2}\psi_1(t_1)\phi_{j_1}(t_1)dt_1\ldots dt_k,$$

l.i.m. *is a limit in the mean-square sense,*

$$\zeta_j^{(i)}=\int\limits_t^T\phi_j(s)d\mathbf{w}_s^{(i)}$$

are independent standard Gaussian random variables for various i *or* j *(if* $i\neq 0$*),* $\mathbf{w}_{\tau}^{(i)}=\mathbf{f}_{\tau}^{(i)}$ *are independent standard Wiener processes* $(i=1,\ldots,m)$ *and* $\mathbf{w}_{\tau}^{(0)}=\tau$*.*

Hypothesis 2 allows to approximate the iterated Stratonovich stochastic integral $J^*[\psi^{(k)}]_{T,t}$ by the sum

$$J^*[\psi^{(k)}]_{T,t}^p=\sum_{j_1,\ldots j_k=0}^{p}C_{j_k\ldots j_1}\zeta_{j_1}^{(i_1)}\ldots\zeta_{j_k}^{(i_k)}, \tag{8}$$

where

$$\lim_{p\to\infty}\mathsf{M}\left\{\left(J^*[\psi^{(k)}]_{T,t}-J^*[\psi^{(k)}]_{T,t}^p\right)^2\right\}=0.$$

Let us consider the more general statement, then Hypotheses 1 and 2.

Hypothesis 3 [15]-[18]. *Assume that* $\{\phi_j(x)\}_{j=0}^{\infty}$ *is a complete orthonormal system of Legendre polynomials or trigonometric functions in the space* $L_2([t,T])$. *Moreover, every* $\psi_l(\tau)$ $(l=1,\ldots,k)$ *is an enough smooth nonrandom function on* $[t,T]$. *Then, for the iterated Stratonovich stochastic integral* (3) *of* k*th multiplicity*

$$J^*[\psi^{(k)}]_{T,t}=\int\limits_t^{*T}\psi_k(t_k)\ldots\int\limits_t^{*t_2}\psi_1(t_1)d\mathbf{w}_{t_1}^{(i_1)}\ldots d\mathbf{w}_{t_k}^{(i_k)}$$

$$(i_1,\ldots,i_k=0,1,\ldots,m)$$

the following expansion

$$J^*[\psi^{(k)}]_{T,t}=\underset{p_1,\ldots,p_k\to\infty}{\text{l.i.m.}}\sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k}C_{j_k\ldots j_1}\zeta_{j_1}^{(i_1)}\ldots\zeta_{j_k}^{(i_k)} \tag{9}$$

converging in the mean-square sense is valid, where the Fourier coefficient $C_{j_k\ldots j_1}$ *has the form*

$$C_{j_k\ldots j_1}=\int\limits_t^T\psi_k(t_k)\phi_{j_k}(t_k)\ldots\int\limits_t^{t_2}\psi_1(t_1)\phi_{j_1}(t_1)dt_1\ldots dt_k,$$

l.i.m. *is a limit in the mean-square sense,*

$$\zeta_j^{(i)}=\int\limits_t^T\phi_j(s)d\mathbf{w}_s^{(i)}$$

are independent standard Gaussian random variables for various i *or* j (*if* $i\neq 0$), $\mathbf{w}_\tau^{(i)}=\mathbf{f}_\tau^{(i)}$ *are independent standard Wiener processes* $(i=1,\ldots,m)$ *and* $\mathbf{w}_\tau^{(0)}=\tau$.

In the next section, we consider two theorems on expansions of iterated Stratonovich stochastic integrals of arbitrary multiplicity k. Expansions from Theorems 1 and 2 (see below) contain an iterated operation of the limit transition in comparison with Hypotheses 1–3. This feature creates some difficulties when estimating the mean-square approximation error of iterated Stratonovich stochastic integrals. On the other hand, Theorems 1 and 2 contain the same expansion terms of iterated Stratonovich stochastic integrals as in Hypotheses 1–3.

3. Expansions of Iterated Stratonovich Stochastic Integrals of Arbitrary Multiplicity Based on Iterated Fourier Series Converging Pointwise

Let us formulate the following theorem.

Theorem 1 [15] (Sect. 2.4) (also see [14], [16]-[18], [22]-[25], [36] (1997), [37] (1998), [52]). *Suppose that the functions* $\psi_1(\tau),\ldots,\psi_k(\tau)$ *are twice continuously differentiable at the interval* $[t,T]$ *and* $\{\phi_j(x)\}_{j=0}^{\infty}$ *is a complete orthonormal system of trigonometric functions in the space* $L_2([t,T])$. *Then, the iterated Stratonovich stochastic integral*

$$J^*[\psi^{(k)}]_{T,t} = \int\limits_t^{*T} \psi_k(t_k) \ldots \int\limits_t^{*t_2} \psi_1(t_1) d\mathbf{w}_{t_1}^{(i_1)} \ldots d\mathbf{w}_{t_k}^{(i_k)} \quad (i_1, \ldots, i_k = 0, 1, \ldots, m)$$

is expanded into the converging in the mean of degree $2n$ $(n \in \mathbb{N})$ *iterated series*

$$J^*[\psi^{(k)}]_{T,t} = \sum_{j_1=0}^{\infty} \ldots \sum_{j_k=0}^{\infty} C_{j_k \ldots j_1} \zeta_{j_1}^{(i_1)} \ldots \zeta_{j_k}^{(i_k)}, \tag{10}$$

i.e.

$$\lim_{p_1\to\infty} \overline{\lim_{p_2\to\infty}} \ldots \overline{\lim_{p_k\to\infty}} \mathsf{M}\left\{\left(J^*[\psi^{(k)}]_{T,t} - \sum_{j_1=0}^{p_1} \ldots \sum_{j_k=0}^{p_k} C_{j_k \ldots j_1} \zeta_{j_1}^{(i_1)} \ldots \zeta_{j_k}^{(i_k)}\right)^{2n}\right\} = 0,$$

where $\overline{\lim}$ *means* $\limsup$,

$$\zeta_j^{(i)} = \int\limits_t^T \phi_j(s) d\mathbf{w}_s^{(i)}$$

are independent standard Gaussian random variables for various i *or* j *(if* $i \neq 0$*), the Fourier coefficient* $C_{j_k \ldots j_1}$ *has the form*

$$C_{j_k \ldots j_1} = \int\limits_{[t,T]^k} K^*(t_1, \ldots, t_k) \prod_{l=1}^{k} \phi_{j_l}(t_l) dt_1 \ldots dt_k =$$

$$= \int\limits_t^T \psi_k(t_k) \phi_{j_k}(t_k) \ldots \int\limits_t^{t_2} \psi_1(t_1) \phi_{j_1}(t_1) dt_1 \ldots dt_k,$$

where

$$K^*(t_1, \ldots, t_k) = \prod_{l=1}^{k} \psi_l(t_l) \prod_{l=1}^{k-1} \left(\mathbf{1}_{\{t_l < t_{l+1}\}} + \frac{1}{2} \mathbf{1}_{\{t_l = t_{l+1}\}}\right), \quad t_1, \ldots, t_k \in [t, T]$$

for $k \geq 2$ *and* $K^*(t_1) \equiv \psi_1(t_1)$ *for* $t_1 \in [t, T]$*. Here* $\mathbf{1}_A$ *is the indicator of the set* A*.*

Let us consider the following theorem.

Theorem 2 [15] (Sect. 2.4) (also see [14], [16]-[18], [25] (2013), [52]). *Suppose that the functions* $\psi_1(\tau), \ldots, \psi_k(\tau)$ *are twice continuously differentiable at the interval* $[t, T]$ *and* $\{\phi_j(x)\}_{j=0}^{\infty}$ *is a complete orthonormal system of trigonometric functions in the space* $L_2([t, T])$*. Then, the iterated Stratonovich stochastic integral*

$$J^*[\psi^{(k)}]_{T,t} = \int\limits_t^{*T} \psi_k(t_k) \ldots \int\limits_t^{*t_2} \psi_1(t_1) d\mathbf{w}_{t_1}^{(i_1)} \ldots d\mathbf{w}_{t_k}^{(i_k)} \quad (i_1, \ldots, i_k = 0, 1, \ldots, m)$$

is expanded into the converging in the mean of degree $2n$ $(n \in \mathbb{N})$ *iterated series*

$$J^*[\psi^{(k)}]_{T,t}=\sum_{j_k=0}^{\infty}\ldots\sum_{j_1=0}^{\infty}C_{j_k\ldots j_1}\zeta_{j_1}^{(i_1)}\ldots\zeta_{j_k}^{(i_k)}, \tag{11}$$

i.e.

$$\lim_{p_k\to\infty}\overline{\lim_{p_{k-1}\to\infty}}\ldots\overline{\lim_{p_1\to\infty}}\,\mathsf{M}\left\{\left(J^*[\psi^{(k)}]_{T,t}-\sum_{j_k=0}^{p_k}\ldots\sum_{j_1=0}^{p_1}C_{j_k\ldots j_1}\zeta_{j_1}^{(i_1)}\ldots\zeta_{j_k}^{(i_k)}\right)^{2n}\right\}=0;$$

another notations are the same as in Theorem 1.

It is not difficult to see that the members of expansions (7), (10), and (11) are the same. However, as mentioned before, the expansion (7) contains only one operation of the limit transition. At the same time the expansions (10), (11) contain an iterated operation of the limit transiton.

In [15] (Sect. 2.4.1) it is shown that Theorems 1 and 2 will remain valid for the case when $\{\phi_j(x)\}_{j=0}^{\infty}$ is a complete orthonormal system of Legendre polynomials in the space $L_2([t,T])$, $k=2$, and $2n=2$ (the case of mean-square convergence). In this case the function $\psi_2(\tau)$ is continuously differentiable at the interval $[t,T]$ and the function $\psi_1(\tau)$ is twice continuously differentiable at the interval $[t,T]$.

As it tured out, the approach considered in the next section gives the key to the proof of Hypotheses 1–3.

4. Expansion of Iterated Ito Stochastic Integrals of Arbitrary Multiplicity k Based on Generalized Multiple Fourier Series Converging in the Mean

Suppose that every $\psi_l(\tau)$ $(l=1,\ldots,k)$ is a continuous nonrandom function on $[t,T]$ (the case $\psi_1(\tau),\ldots,\psi_k(\tau)\in L_2([t,T])$ will be considered in Theorem 4 (see below)). Define the following function on the hypercube $[t,T]^k$

$$K(t_1,\ldots,t_k)=\begin{cases}\psi_1(t_1)\ldots\psi_k(t_k), & \text{for}\ \ t_1<\ldots<t_k\\ \\ 0, & \text{otherwise}\end{cases},\quad t_1,\ldots,t_k\in[t,T],\quad k\ge 2, \tag{12}$$

and $K(t_1)\equiv\psi_1(t_1)$ for $t_1\in[t,T]$.

Suppose that $\{\phi_j(x)\}_{j=0}^{\infty}$ is a complete orthonormal system of functions in the space $L_2([t,T])$. The function $K(t_1,\ldots,t_k)$ is piecewise continuous in the hypercube $[t,T]^k$. At this situation it is well known that the generalized multiple Fourier series of $K(t_1,\ldots,t_k)\in L_2([t,T]^k)$ is converging to $K(t_1,\ldots,t_k)$ in the hypercube $[t,T]^k$ in the mean-square sense, i.e.

$$\lim_{p_1,\ldots,p_k\to\infty}\left\|K(t_1,\ldots,t_k)-\sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k}C_{j_k\ldots j_1}\prod_{l=1}^{k}\phi_{j_l}(t_l)\right\|_{L_2([t,T]^k)}=0,$$

where

$$C_{j_k\ldots j_1}=\int\limits_{[t,T]^k}K(t_1,\ldots,t_k)\prod_{l=1}^{k}\phi_{j_l}(t_l)dt_1\ldots dt_k \tag{13}$$

is the Fourier coefficient,

$$\|f\|_{L_2([t,T]^k)} = \left(\int\limits_{[t,T]^k} f^2(t_1, \ldots, t_k) dt_1 \ldots dt_k \right)^{1/2}.$$

Consider the partition $\{\tau_j\}_{j=0}^N$ of $[t, T]$ such that

$$t = \tau_0 < \ldots < \tau_N = T, \quad \Delta_N = \max_{0 \le j \le N-1} \Delta\tau_j \to 0 \ \text{ if } \ N \to \infty, \quad \Delta\tau_j = \tau_{j+1} - \tau_j. \tag{14}$$

Theorem 3 [10] (2006), [11]-[34], [40]-[49], [51], [53]-[55]. *Suppose that every $\psi_l(\tau)$ $(l = 1, \ldots, k)$ is a continuous nonrandom function on $[t, T]$ and $\{\phi_j(x)\}_{j=0}^{\infty}$ is a complete orthonormal system of continuous functions in the space $L_2([t, T])$. Then*

$$J[\psi^{(k)}]_{T,t} = \underset{p_1,\ldots,p_k \to \infty}{\text{l.i.m.}} \sum_{j_1=0}^{p_1} \ldots \sum_{j_k=0}^{p_k} C_{j_k \ldots j_1} \left(\prod_{l=1}^{k} \zeta_{j_l}^{(i_l)} - \right.$$

$$\left. - \underset{N \to \infty}{\text{l.i.m.}} \sum_{(l_1,\ldots,l_k) \in \mathrm{G}_k} \phi_{j_1}(\tau_{l_1}) \Delta\mathbf{w}_{\tau_{l_1}}^{(i_1)} \ldots \phi_{j_k}(\tau_{l_k}) \Delta\mathbf{w}_{\tau_{l_k}}^{(i_k)} \right), \tag{15}$$

where $J[\psi^{(k)}]_{T,t}$ is defined by (2),

$$\mathrm{G}_k = \mathrm{H}_k \backslash \mathrm{L}_k, \quad \mathrm{H}_k = \{(l_1, \ldots, l_k): \ l_1, \ldots, l_k = 0, \ 1, \ldots, N-1\},$$

$$\mathrm{L}_k = \{(l_1, \ldots, l_k): \ l_1, \ldots, l_k = 0, \ 1, \ldots, N-1; \ l_g \ne l_r \ (g \ne r); \ g, r = 1, \ldots, k\},$$

l.i.m. *is a limit in the mean-square sense,* $i_1, \ldots, i_k = 0, 1, \ldots, m,$

$$\zeta_j^{(i)} = \int\limits_t^T \phi_j(\tau) d\mathbf{w}_\tau^{(i)}$$

are independent standard Gaussian random variables for various i or j (if $i \ne 0$), $C_{j_k \ldots j_1}$ is the Fourier coefficient (13), $\Delta\mathbf{w}_{\tau_j}^{(i)} = \mathbf{w}_{\tau_{j+1}}^{(i)} - \mathbf{w}_{\tau_j}^{(i)}$ $(i = 0, 1, \ldots, m)$, $\{\tau_j\}_{j=0}^N$ is a partition of the interval $[t, T]$, which satisfies the condition (14).

Let us consider the transformed particular cases of Theorem 3 (see (15)) for $k = 1$–6 [10]-[34], [40]-[49], [51], [53]-[55] (the case $k = 7$ can be found in [11]-[18], [42])

$$J[\psi^{(1)}]_{T,t} = \underset{p_1 \to \infty}{\text{l.i.m.}} \sum_{j_1=0}^{p_1} C_{j_1} \zeta_{j_1}^{(i_1)}, \tag{16}$$

$$J[\psi^{(2)}]_{T,t} = \underset{p_1,p_2 \to \infty}{\text{l.i.m.}} \sum_{j_1=0}^{p_1} \sum_{j_2=0}^{p_2} C_{j_2 j_1} \left(\zeta_{j_1}^{(i_1)} \zeta_{j_2}^{(i_2)} - \mathbf{1}_{\{i_1 = i_2 \ne 0\}} \mathbf{1}_{\{j_1 = j_2\}} \right), \tag{17}$$

$$J[\psi^{(3)}]_{T,t}=\underset{p_1,\ldots,p_3\to\infty}{\text{l.i.m.}}\sum_{j_1=0}^{p_1}\sum_{j_2=0}^{p_2}\sum_{j_3=0}^{p_3}C_{j_3j_2j_1}\Biggl(\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}\zeta_{j_3}^{(i_3)}-$$

$$-\mathbf{1}_{\{i_1=i_2\ne 0\}}\mathbf{1}_{\{j_1=j_2\}}\zeta_{j_3}^{(i_3)}-\mathbf{1}_{\{i_2=i_3\ne 0\}}\mathbf{1}_{\{j_2=j_3\}}\zeta_{j_1}^{(i_1)}-\mathbf{1}_{\{i_1=i_3\ne 0\}}\mathbf{1}_{\{j_1=j_3\}}\zeta_{j_2}^{(i_2)}\Biggr), \tag{18}$$

$$J[\psi^{(4)}]_{T,t}=\underset{p_1,\ldots,p_4\to\infty}{\text{l.i.m.}}\sum_{j_1=0}^{p_1}\ldots\sum_{j_4=0}^{p_4}C_{j_4\ldots j_1}\Biggl(\prod_{l=1}^{4}\zeta_{j_l}^{(i_l)}-$$
$$-\mathbf{1}_{\{i_1=i_2\ne 0\}}\mathbf{1}_{\{j_1=j_2\}}\zeta_{j_3}^{(i_3)}\zeta_{j_4}^{(i_4)}-\mathbf{1}_{\{i_1=i_3\ne 0\}}\mathbf{1}_{\{j_1=j_3\}}\zeta_{j_2}^{(i_2)}\zeta_{j_4}^{(i_4)}-$$
$$-\mathbf{1}_{\{i_1=i_4\ne 0\}}\mathbf{1}_{\{j_1=j_4\}}\zeta_{j_2}^{(i_2)}\zeta_{j_3}^{(i_3)}-\mathbf{1}_{\{i_2=i_3\ne 0\}}\mathbf{1}_{\{j_2=j_3\}}\zeta_{j_1}^{(i_1)}\zeta_{j_4}^{(i_4)}-$$
$$-\mathbf{1}_{\{i_2=i_4\ne 0\}}\mathbf{1}_{\{j_2=j_4\}}\zeta_{j_1}^{(i_1)}\zeta_{j_3}^{(i_3)}-\mathbf{1}_{\{i_3=i_4\ne 0\}}\mathbf{1}_{\{j_3=j_4\}}\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}+$$
$$+\mathbf{1}_{\{i_1=i_2\ne 0\}}\mathbf{1}_{\{j_1=j_2\}}\mathbf{1}_{\{i_3=i_4\ne 0\}}\mathbf{1}_{\{j_3=j_4\}}+\mathbf{1}_{\{i_1=i_3\ne 0\}}\mathbf{1}_{\{j_1=j_3\}}\mathbf{1}_{\{i_2=i_4\ne 0\}}\mathbf{1}_{\{j_2=j_4\}}+$$
$$+\mathbf{1}_{\{i_1=i_4\ne 0\}}\mathbf{1}_{\{j_1=j_4\}}\mathbf{1}_{\{i_2=i_3\ne 0\}}\mathbf{1}_{\{j_2=j_3\}}\Biggr), \tag{19}$$

$$J[\psi^{(5)}]_{T,t}=\underset{p_1,\ldots,p_5\to\infty}{\text{l.i.m.}}\sum_{j_1=0}^{p_1}\ldots\sum_{j_5=0}^{p_5}C_{j_5\ldots j_1}\Biggl(\prod_{l=1}^{5}\zeta_{j_l}^{(i_l)}-$$
$$-\mathbf{1}_{\{i_1=i_2\ne 0\}}\mathbf{1}_{\{j_1=j_2\}}\zeta_{j_3}^{(i_3)}\zeta_{j_4}^{(i_4)}\zeta_{j_5}^{(i_5)}-\mathbf{1}_{\{i_1=i_3\ne 0\}}\mathbf{1}_{\{j_1=j_3\}}\zeta_{j_2}^{(i_2)}\zeta_{j_4}^{(i_4)}\zeta_{j_5}^{(i_5)}-$$
$$-\mathbf{1}_{\{i_1=i_4\ne 0\}}\mathbf{1}_{\{j_1=j_4\}}\zeta_{j_2}^{(i_2)}\zeta_{j_3}^{(i_3)}\zeta_{j_5}^{(i_5)}-\mathbf{1}_{\{i_1=i_5\ne 0\}}\mathbf{1}_{\{j_1=j_5\}}\zeta_{j_2}^{(i_2)}\zeta_{j_3}^{(i_3)}\zeta_{j_4}^{(i_4)}-$$
$$-\mathbf{1}_{\{i_2=i_3\ne 0\}}\mathbf{1}_{\{j_2=j_3\}}\zeta_{j_1}^{(i_1)}\zeta_{j_4}^{(i_4)}\zeta_{j_5}^{(i_5)}-\mathbf{1}_{\{i_2=i_4\ne 0\}}\mathbf{1}_{\{j_2=j_4\}}\zeta_{j_1}^{(i_1)}\zeta_{j_3}^{(i_3)}\zeta_{j_5}^{(i_5)}-$$

$$-\mathbf{1}_{\{i_6=i_5\neq 0\}}\mathbf{1}_{\{j_6=j_5\}}\mathbf{1}_{\{i_1=i_4\neq 0\}}\mathbf{1}_{\{j_1=j_4\}}\mathbf{1}_{\{i_2=i_3\neq 0\}}\mathbf{1}_{\{j_2=j_3\}}-$$
$$-\mathbf{1}_{\{i_6=i_5\neq 0\}}\mathbf{1}_{\{j_6=j_5\}}\mathbf{1}_{\{i_1=i_2\neq 0\}}\mathbf{1}_{\{j_1=j_2\}}\mathbf{1}_{\{i_3=i_4\neq 0\}}\mathbf{1}_{\{j_3=j_4\}}-$$
$$-\mathbf{1}_{\{i_6=i_5\neq 0\}}\mathbf{1}_{\{j_6=j_5\}}\mathbf{1}_{\{i_1=i_3\neq 0\}}\mathbf{1}_{\{j_1=j_3\}}\mathbf{1}_{\{i_2=i_4\neq 0\}}\mathbf{1}_{\{j_2=j_4\}}\Biggr), \tag{21}$$

where $\mathbf{1}_A$ is the indicator of the set A.

It was shown that Theorem 3 is valid for convergence in the mean of degree $2n$ ($n \in \mathbb{N}$) [11]-[25], [42]. Moreover, the convergence with probability 1 (further w. p. 1) is proved in Theorem 3 for iterated Ito stochastic integrals of multiplicity k for the cases of Legendre polynomials and trigonometric functions [42]-[45], [57], [58] (also see [15]-[18]).

As it turned out, Theorem 3 remains valid for some discontinuous complete orthonormal systems of functions in the space $L_2([t,T])$. For example, Theorem 3 is true for the system of Haar functions as well as for the system of Rademacher–Walsh functions [10]-[25], [42].

In [11]-[25], [54] we demonstrate that approach to expansion of iterated Ito stochastic integrals considered in Theorem 3 is essentially general and allows some modifications for other types of iterated stochastic integrals. Versions of Theorem 3 for iterated stochastic integrals with respect to martingale Poisson measures and for iterated stochastic integrals with respect to martingales are obtained in [11]-[25], [54]. The mentioned theorems are sufficiently natural according to general properties of martingales. Another modification of Theorem 3 can be found in [15]-[18], [42], [54], where complete orthonormal with weight $r(x) \geq 0$ systems of functions in the space $L_2([t,T])$ were considered.

A generalization of Theorem 3 (see Theorem 4 below) for the case of an arbitrary complete orthonormal system of functions in the space $L_2([t,T])$ and $\psi_1(\tau),\ldots,\psi_k(\tau) \in L_2([t,T])$ is given in [15] (Sect. 1.11), [42] (Sect. 15), [43]. Moreover, Theorems 3 and 4 allow us to calculate exactly the mean-square approximation error for the iterated Ito stochastic integral (2) of arbitrary multiplicity k (see [14], [15]-[18], [44]). Here we consider an approxination as the expression before passing to the limit in (15) or (24) (see below).

Application of Theorem 3 and Theorem 4 (see below) for the mean-square approximation of iterated stochastic integrals with respect to the infinite-dimensional Q-Wiener process can be found in the monographs [15]-[18] (Chapter 7) and in [33]-[35].

Consider the generalization of formulas (16)–(21) for the case of an arbitrary multiplicity k of the stochastic integral $J[\psi^{(k)}]_{T,t}$ as well as for the case of an arbitrary complete orthonormal systems of functions in the space $L_2([t,T])$ and $\psi_1(\tau),\ldots,\psi_k(\tau) \in L_2([t,T])$. In order to do this, let us consider the unordered set $\{1,2,\ldots,k\}$ and separate it into two parts: the first part consists of r unordered pairs (sequence order of these pairs is also unimportant) and the second one consists of the remaining $k-2r$ numbers. So, we have

$$(\{\underbrace{\{g_1,g_2\},\ldots,\{g_{2r-1},g_{2r}\}}_{\text{part 1}}\},\{\underbrace{q_1,\ldots,q_{k-2r}}_{\text{part 2}}\}), \tag{22}$$

where $\{g_1, g_2, \ldots, g_{2r-1}, g_{2r}, q_1, \ldots, q_{k-2r}\} = \{1, 2, \ldots, k\}$, braces mean an unordered set, and parentheses mean an ordered set.

We will say that (22) is a partition and consider the sum with respect to all possible partitions

$$\sum_{\substack{(\{\{g_1,g_2\},\ldots,\{g_{2r-1},g_{2r}\}\},\{q_1,\ldots,q_{k-2r}\})\\ \{g_1,g_2,\ldots,g_{2r-1},g_{2r},q_1,\ldots,q_{k-2r}\}=\{1,2,\ldots,k\}}} a_{g_1 g_2,\ldots,g_{2r-1}g_{2r},q_1\ldots q_{k-2r}}, \tag{23}$$

where $a_{g_1 g_2,\ldots,g_{2r-1}g_{2r},q_1\ldots q_{k-2r}} \in \mathbb{R}$.

Below there are several examples of sums in the form (23)

$$\sum_{\substack{(\{g_1,g_2\})\\ \{g_1,g_2\}=\{1,2\}}} a_{g_1 g_2} = a_{12},$$

$$\sum_{\substack{(\{\{g_1,g_2\},\{g_3,g_4\}\})\\ \{g_1,g_2,g_3,g_4\}=\{1,2,3,4\}}} a_{g_1 g_2 g_3 g_4} = a_{1234} + a_{1324} + a_{2314},$$

$$\sum_{\substack{(\{g_1,g_2\},\{q_1,q_2\})\\ \{g_1,g_2,q_1,q_2\}=\{1,2,3,4\}}} a_{g_1 g_2,q_1 q_2} = a_{12,34} + a_{13,24} + a_{14,23} + a_{23,14} + a_{24,13} + a_{34,12},$$

$$\sum_{\substack{(\{g_1,g_2\},\{q_1,q_2,q_3\})\\ \{g_1,g_2,q_1,q_2,q_3\}=\{1,2,3,4,5\}}} a_{g_1 g_2,q_1 q_2 q_3} = a_{12,345} + a_{13,245} + a_{14,235} + a_{15,234} + a_{23,145} + a_{24,135} +$$

$$+ a_{25,134} + a_{34,125} + a_{35,124} + a_{45,123},$$

$$\sum_{\substack{(\{\{g_1,g_2\},\{g_3,g_4\}\},\{q_1\})\\ \{g_1,g_2,g_3,g_4,q_1\}=\{1,2,3,4,5\}}} a_{g_1 g_2,g_3 g_4,q_1} = a_{12,34,5} + a_{13,24,5} + a_{14,23,5} + a_{12,35,4} + a_{13,25,4} + a_{15,23,4} +$$

$$+ a_{12,54,3} + a_{15,24,3} + a_{14,25,3} + a_{15,34,2} + a_{13,54,2} + a_{14,53,2} + a_{52,34,1} + a_{53,24,1} + a_{54,23,1}.$$

Now we can generalize Theorem 3.

Theorem 4 [15] (Sect. 1.11), [42] (Sect. 15), [43]. *Suppose that $\psi_1(\tau), \ldots, \psi_k(\tau) \in L_2([t, T])$ and $\{\phi_j(x)\}_{j=0}^{\infty}$ is an arbitrary complete orthonormal system of functions in the space $L_2([t, T])$. Then the following expansion*

$$J[\psi^{(k)}]_{T,t} = \underset{p_1,\ldots,p_k\to\infty}{\text{l.i.m.}} \sum_{j_1=0}^{p_1} \ldots \sum_{j_k=0}^{p_k} C_{j_k\ldots j_1} \Biggl(\prod_{l=1}^{k} \zeta_{j_l}^{(i_l)} + \sum_{r=1}^{[k/2]} (-1)^r \times$$

$$\times \sum_{\substack{(\{\{g_1,g_2\},\ldots,\{g_{2r-1},g_{2r}\}\},\{q_1,\ldots,q_{k-2r}\})\\ \{g_1,g_2,\ldots,g_{2r-1},g_{2r},q_1,\ldots,q_{k-2r}\}=\{1,2,\ldots,k\}}} \prod_{s=1}^{r} \mathbf{1}_{\{i_{g_{2s-1}} =\ i_{g_{2s}} \ne 0\}} \mathbf{1}_{\{j_{g_{2s-1}} =\ j_{g_{2s}}\}} \prod_{l=1}^{k-2r} \zeta_{j_{q_l}}^{(i_{q_l})} \Biggr) \tag{24}$$

that converges in the mean-square sense is valid, where $[x]$ is an integer part of a real number x and $\prod\limits_{\emptyset} \stackrel{\sf def}{=} 1$, $\sum\limits_{\emptyset} \stackrel{\sf def}{=} 0$; another notations are the same as in Theorem 3.

In particular from (24) for $k=5$ we obtain

$$J[\psi^{(5)}]_{T,t}=\underset{p_1,\ldots,p_5\to\infty}{\text{l.i.m.}}\sum_{j_1=0}^{p_1}\ldots\sum_{j_5=0}^{p_5}C_{j_5\ldots j_1}\Biggl(\zeta_{j_1}^{(i_1)}\ldots\zeta_{j_5}^{(i_5)}-$$

$$-\sum_{\substack{(\{g_1,g_2\},\{q_1,q_2,q_3\})\\ \{g_1,g_2,q_1,q_2,q_3\}=\{1,2,3,4,5\}}}\mathbf{1}_{\{i_{g_1}=\ i_{g_2}\ne 0\}}\mathbf{1}_{\{j_{g_1}=\ j_{g_2}\}}\prod_{l=1}^{3}\zeta_{j_{q_l}}^{(i_{q_l})}+$$

$$+\sum_{\substack{(\{\{g_1,g_2\},\{g_3,g_4\}\},\{q_1\})\\ \{g_1,g_2,g_3,g_4,q_1\}=\{1,2,3,4,5\}}}\mathbf{1}_{\{i_{g_1}=\ i_{g_2}\ne 0\}}\mathbf{1}_{\{j_{g_1}=\ j_{g_2}\}}\mathbf{1}_{\{i_{g_3}=\ i_{g_4}\ne 0\}}\mathbf{1}_{\{j_{g_3}=\ j_{g_4}\}}\zeta_{j_{q_1}}^{(i_{q_1})}\Biggr).$$

The last equality obviously agrees with (20).

It should be noted that an analogue of Theorem 4 for multiple Ito stochastic integrals was considered in [66]. Note that we use another notations in comparison with [66]. Moreover, the proof of an analogue of Theorem 4 from [66] is different from the proof given in [15] (Sect. 1.11), [42] (Sect. 15), [43].

5. The Idea of the Proof of Hypotheses 1, 2, and 3

Let us consider the idea of the proof of Hypotheses 1–3. Introduce the following notations

$$J[\psi^{(k)}]_{T,t}^{s_l,\ldots,s_1}\ \stackrel{\text{def}}{=}\ \prod_{p=1}^{l}\mathbf{1}_{\{i_{s_p}=i_{s_p+1}\ne 0\}}\ \times$$

$$\times\int\limits_t^T\psi_k(t_k)\ldots\int\limits_t^{t_{s_l+3}}\psi_{s_l+2}(t_{s_l+2})\int\limits_t^{t_{s_l+2}}\psi_{s_l}(t_{s_l+1})\psi_{s_l+1}(t_{s_l+1})\times$$

$$\times\int\limits_t^{t_{s_l+1}}\psi_{s_l-1}(t_{s_l-1})\ldots\int\limits_t^{t_{s_1+3}}\psi_{s_1+2}(t_{s_1+2})\int\limits_t^{t_{s_1+2}}\psi_{s_1}(t_{s_1+1})\psi_{s_1+1}(t_{s_1+1})\times$$

$$\times\int\limits_t^{t_{s_1+1}}\psi_{s_1-1}(t_{s_1-1})\ldots\int\limits_t^{t_2}\psi_1(t_1)d\mathbf{w}_{t_1}^{(i_1)}\ldots d\mathbf{w}_{t_{s_1-1}}^{(i_{s_1-1})}dt_{s_1+1}d\mathbf{w}_{t_{s_1+2}}^{(i_{s_1+2})}\ldots$$

$$\ldots d\mathbf{w}_{t_{s_l-1}}^{(i_{s_l-1})}dt_{s_l+1}d\mathbf{w}_{t_{s_l+2}}^{(i_{s_l+2})}\ldots d\mathbf{w}_{t_k}^{(i_k)},\tag{25}$$

where $(s_l,\ldots,s_1)\in \mathrm{A}_{k,l}$,

$$\mathrm{A}_{k,l}=\left\{(s_l,\ldots,s_1):\ s_l>s_{l-1}+1,\ldots,s_2>s_1+1;\ s_l,\ldots,s_1=1,\ldots,k-1\right\},\tag{26}$$

$l=1,2,\ldots,[k/2],\ \ i_s=0,1,\ldots,m,\ \ s=1,\ldots,k,\ \ [x]$ is an integer part of a real number $x,\ \ \mathbf{1}_A$ is the indicator of the set A.

Let us formulate the statement on connection between iterated Ito and Stratonovich stochastic integrals (2) and (3) of arbitrary multiplicity k.

Theorem 5 [36] (1997) (also see [10]-[18]). *Suppose that every $\psi_l(\tau)$ $(l=1,\ldots,k)$ is a continuous nonrandom function at the interval $[t,T]$. Then, the following relation between iterated Ito and Stratonovich stochastic integrals (2) and (3) is correct*

$$J^*[\psi^{(k)}]_{T,t}=J[\psi^{(k)}]_{T,t}+\sum_{r=1}^{[k/2]}\frac{1}{2^r}\sum_{(s_r,\ldots,s_1)\in \mathrm{A}_{k,r}}J[\psi^{(k)}]_{T,t}^{s_r,\ldots,s_1}\quad \text{w. p. 1}, \tag{27}$$

where $\sum\limits_{\emptyset}$ is supposed to be equal to zero.

Note that the condition of continuity of the functions $\psi_1(\tau),\ldots,\psi_k(\tau)$ is related to the definition [2] of the Stratonovich stochastic integral that we use.

According to (15), we have

$$\underset{p_1,\ldots,p_k\to\infty}{\text{l.i.m.}}\sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k}C_{j_k\ldots j_1}\prod_{g=1}^{k}\zeta_{j_g}^{(i_g)}=J[\psi^{(k)}]_{T,t}+$$

$$+\underset{p_1,\ldots,p_k\to\infty}{\text{l.i.m.}}\sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k}C_{j_k\ldots j_1}\ \underset{N\to\infty}{\text{l.i.m.}}\sum_{(l_1,\ldots,l_k)\in G_k}\prod_{g=1}^{k}\phi_{j_g}(\tau_{l_g})\Delta\mathbf{w}_{\tau_{l_g}}^{(i_g)}. \tag{28}$$

From (5) and (27) it follows that

$$J^*[\psi^{(k)}]_{T,t}=\underset{p_1,\ldots,p_k\to\infty}{\text{l.i.m.}}\sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k}C_{j_k\ldots j_1}\prod_{g=1}^{k}\zeta_{j_g}^{(i_g)} \tag{29}$$

if

$$\sum_{r=1}^{[k/2]}\frac{1}{2^r}\sum_{(s_r,\ldots,s_1)\in \mathrm{A}_{k,r}}J[\psi^{(k)}]_{T,t}^{s_r,\ldots,s_1}=$$

$$=\underset{p_1,\ldots,p_k\to\infty}{\text{l.i.m.}}\sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k}C_{j_k\ldots j_1}\ \underset{N\to\infty}{\text{l.i.m.}}\sum_{(l_1,\ldots,l_k)\in G_k}\prod_{g=1}^{k}\phi_{j_g}(\tau_{l_g})\Delta\mathbf{w}_{\tau_{l_g}}^{(i_g)}\quad \text{w. p. 1}.$$

In the case $p_1=\ldots=p_k=p$ and $\psi_l(\tau)\equiv 1$ $(l=1,\ldots,k)$ from (29) we obtain the statement of Hypothesis 1 (see (5)).

If $p_1=\ldots=p_k=p$ and every $\psi_l(\tau)$ $(l=1,\ldots,k)$ is an enough smooth nonrandom function on $[t,T]$, then from (29) we obtain the statement of Hypothesis 2 (see (7)).

In the case when every $\psi_l(\tau)$ $(l=1,\ldots,k)$ is an enough smooth nonrandom function on $[t,T]$ from (29) we obtain the statement of Hypothesis 3 (see (9)).

In the following sections we consider some theorems proving Hypothesis 1 for $k=1,\ldots,6$, Hypothesis 2 for $k=1,\ldots,5$ and Hypothesis 3 for $k=1,\ldots,3$. Moreover, the proof of Hypotheses 2 and 3 is given for an arbitrary k under the condition of convergence of trace series. The case $k=1$ obviously directly follows from Theorem 3 (see (16)).

6. Expansions of Iterated Stratonovich Stochastc Integrals of Multiplicity 2–4. Some Old Results

As it turned out, approximations of the iterated Stratonovich stochastic integrals (3) are essentially simpler than the appropriate approximations of the iterated Ito stochastic integrals (2) based on Theorems 3 and 4. For the first time this fact was mentioned in [10] (2006).

According to the standard connection between Ito and Stratonovich stochastic integrals, the iterated Ito and Stratonovich stochastic integrals (2) and (3) of first multiplicity are equal to each other w. p. 1. So, we begin the consideration from the multiplicity $k=2$.

The following theorems adapt Theorems 3, 4 for the integrals (3) of multiplicities 2–4.

Theorem 6 [11]-[18], [23]-[25], [47]. *Suppose that the following conditions are fulfilled*:

1. *The function $\psi_2(\tau)$ is continuously differentiable at the interval $[t,T]$ and the function $\psi_1(\tau)$ is twice continuously differentiable at the interval $[t,T]$.*

2. *$\{\phi_j(x)\}_{j=0}^{\infty}$ is a complete orthonormal system of Legendre polynomials or trigonometric functions in the space $L_2([t,T])$.*

Then, the iterated Stratonovich stochastic integral of second multiplicity

$$J^*[\psi^{(2)}]_{T,t}=\int\limits_t^{*T}\psi_2(t_2)\int\limits_t^{*t_2}\psi_1(t_1)d\mathbf{w}_{t_1}^{(i_1)}d\mathbf{w}_{t_2}^{(i_2)}\quad (i_1,i_2=0,1,\ldots,m)$$

is expanded into the converging in the mean-square sense double series

$$J^*[\psi^{(2)}]_{T,t}=\underset{p_1,p_2\to\infty}{\text{l.i.m.}}\sum_{j_1=0}^{p_1}\sum_{j_2=0}^{p_2}C_{j_2j_1}\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)},$$

where notations are the same as in Theorems 3, 4.

Proving Theorem 6 [11]-[18], [23]-[25], [47], we used Theorem 3 and double integration by parts. This procedure leads to the condition of double continuously differentiability of the function $\psi_1(\tau)$ at the interval $[t,T]$. The mentioned condition can be weakened, but the proof becomes more complicated. As a result, we have the following theorem.

Theorem 7 [15]-[18], [32], [49]. *Suppose that the following conditions are fulfilled*:

1. *Every $\psi_l(\tau)$ $(l=1,2)$ is a continuously differentiable function at the interval $[t,T]$.*

2. *$\{\phi_j(x)\}_{j=0}^{\infty}$ is a complete orthonormal system of Legendre polynomials or trigonometric functions in the space $L_2([t,T])$.*

Then, the iterated Stratonovich stochastic integral of second multiplicity

$$J^*[\psi^{(2)}]_{T,t}=\int\limits_t^{*T}\psi_2(t_2)\int\limits_t^{*t_2}\psi_1(t_1)d\mathbf{w}_{t_1}^{(i_1)}d\mathbf{w}_{t_2}^{(i_2)}\quad (i_1,i_2=0,1,\ldots,m)$$

is expanded into the converging in the mean-square sense double series

$$J^*[\psi^{(2)}]_{T,t}=\underset{p_1,p_2\to\infty}{\text{l.i.m.}}\sum_{j_1=0}^{p_1}\sum_{j_2=0}^{p_2}C_{j_2j_1}\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)},$$

where notations are the same as in Theorems 3, 4.

The proof of Theorem 7 [15]-[18], [32], [49] is based on Theorem 3 and double Fourier–Legendre series as well as double trigonometric Fourier series summarized by Pringsheim method at the square $[t,T]^2$.

Recently, Theorem 7 has been generalized to the case of an arbitrary complete orthonormal system of functions in the space $L_2([t,T])$ and $\psi_1(\tau),\psi_2(\tau)\in L_2([t,T])$ (see [15], Sect. 2.18) or Theorem 42 below.

The following 4 theorems (Theorems 8–11) adapt Theorems 3, 4 for the integrals (3) of multiplicity 3.

Theorem 8 [11]-[18], [23]-[25], [48]. *Suppose that $\{\phi_j(x)\}_{j=0}^{\infty}$ is a complete orthonormal system of Legendre polynomials or trigonometric functions in the space $L_2([t,T])$. Then, for the iterated Stratonovich stochastic integral of third multiplicity*

$$\int\limits_t^{*T}\int\limits_t^{*t_3}\int\limits_t^{*t_2} d\mathbf{f}_{t_1}^{(i_1)}d\mathbf{f}_{t_2}^{(i_2)}d\mathbf{f}_{t_3}^{(i_3)}\quad (i_1,i_2,i_3=1,\ldots,m)$$

the following expansion

$$\int\limits_t^{*T}\int\limits_t^{*t_3}\int\limits_t^{*t_2} d\mathbf{f}_{t_1}^{(i_1)}d\mathbf{f}_{t_2}^{(i_2)}d\mathbf{f}_{t_3}^{(i_3)} = \underset{p_1,p_2,p_3\to\infty}{\text{l.i.m.}}\sum_{j_1=0}^{p_1}\sum_{j_2=0}^{p_2}\sum_{j_3=0}^{p_3} C_{j_3j_2j_1}\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}\zeta_{j_3}^{(i_3)} \stackrel{\text{def}}{=}$$

$$\stackrel{\text{def}}{=}\sum_{j_1,j_2,j_3=0}^{\infty} C_{j_3j_2j_1}\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}\zeta_{j_3}^{(i_3)} \tag{30}$$

that converges in the mean-square sense is valid, where

$$C_{j_3j_2j_1}=\int\limits_t^{T}\phi_{j_3}(t_3)\int\limits_t^{t_3}\phi_{j_2}(t_2)\int\limits_t^{t_2}\phi_{j_1}(t_1)dt_1dt_2dt_3;$$

another notations are the same as in Theorems 3, 4.

Obviously, that Theorem 8 proves Hypothesis 3 for the case $k=3$ and $\psi_l(\tau)\equiv 1$ $(l=1,2,3)$.

Let us consider the generalization of Theorem 8 (the case of Legendre polynomials) for the binomial weight functions.

Theorem 9 [11]-[18], [23]-[25], [48]. *Suppose that $\{\phi_j(x)\}_{j=0}^{\infty}$ is a complete orthonormal system of Legendre polynomials in the space $L_2([t,T])$. Then, for the iterated Stratonovich stochastic integral of third multiplicity*

$$I_{l_1l_2l_3T,t}^{*(i_1i_2i_3)}=\int\limits_t^{*T}(t-t_3)^{l_3}\int\limits_t^{*t_3}(t-t_2)^{l_2}\int\limits_t^{*t_2}(t-t_1)^{l_1}d\mathbf{f}_{t_1}^{(i_1)}d\mathbf{f}_{t_2}^{(i_2)}d\mathbf{f}_{t_3}^{(i_3)}\quad (i_1,i_2,i_3=1,\ldots,m)$$

the following expansion

$$I_{l_1l_2l_3T,t}^{*(i_1i_2i_3)}=\underset{p_1,p_2,p_3\to\infty}{\text{l.i.m.}}\sum_{j_1=0}^{p_1}\sum_{j_2=0}^{p_2}\sum_{j_3=0}^{p_3} C_{j_3j_2j_1}\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}\zeta_{j_3}^{(i_3)} \stackrel{\text{def}}{=}$$

$$\stackrel{\rm def}{=} \sum_{j_1,j_2,j_3=0}^{\infty} C_{j_3j_2j_1}\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}\zeta_{j_3}^{(i_3)} \qquad (31)$$

that converges in the mean-square sense is valid for each of the following cases

1. $i_1 \ne i_2,\ i_2 \ne i_3,\ i_1 \ne i_3$ *and* $l_1, l_2, l_3 = 0, 1, 2, \ldots$
2. $i_1 = i_2 \ne i_3$ *and* $l_1 = l_2 \ne l_3$ *and* $l_1, l_2, l_3 = 0, 1, 2, \ldots$
3. $i_1 \ne i_2 = i_3$ *and* $l_1 \ne l_2 = l_3$ *and* $l_1, l_2, l_3 = 0, 1, 2, \ldots$
4. $i_1, i_2, i_3 = 1, \ldots, m;\ l_1 = l_2 = l_3 = l$ *and* $l = 0, 1, 2, \ldots,$

where

$$C_{j_3j_2j_1} = \int\limits_t^T (t-t_3)^{l_3}\phi_{j_3}(t_3)\int\limits_t^{t_3}(t-t_2)^{l_2}\phi_{j_2}(t_2)\int\limits_t^{t_2}(t-t_1)^{l_1}\phi_{j_1}(t_1)dt_1dt_2dt_3;$$

another notations are the same as in Theorems 3, 4.

We can introduce the weight functions $\psi_l(\tau)$ $(l = 1, 2, 3)$ with some properties of smoothness. However, we consider in this case the more specific method of series summation $(p_1 = p_2 = p_3 = p \to \infty)$.

Theorem 10 [11]-[18], [23]-[25]. *Suppose that* $\{\phi_j(x)\}_{j=0}^{\infty}$ *is a complete orthonormal system of Legendre polynomials or trigonometric functions in the space* $L_2([t,T])$ *and* $\psi_l(\tau)$ $(l = 1, 2, 3)$ *are continuously differentiable functions at the interval* $[t,T]$*. Then, for the iterated Stratonovich stochastic integral of third multiplicity*

$$J^*[\psi^{(3)}]_{T,t} = \int\limits_t^{*T}\psi_3(t_3)\int\limits_t^{*t_3}\psi_2(t_2)\int\limits_t^{*t_2}\psi_1(t_1)d{\bf f}_{t_1}^{(i_1)}d{\bf f}_{t_2}^{(i_2)}d{\bf f}_{t_3}^{(i_3)}\quad (i_1, i_2, i_3 = 1, \ldots, m)$$

the following expansion

$$J^*[\psi^{(3)}]_{T,t} = \underset{p\to\infty}{\rm l.i.m.}\sum_{j_1,j_2,j_3=0}^{p} C_{j_3j_2j_1}\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}\zeta_{j_3}^{(i_3)} \qquad (32)$$

that converges in the mean-square sense is valid for each of the following cases

1. $i_1 \ne i_2,\ i_2 \ne i_3,\ i_1 \ne i_3,$
2. $i_1 = i_2 \ne i_3$ *and* $\psi_1(\tau) \equiv \psi_2(\tau),$
3. $i_1 \ne i_2 = i_3$ *and* $\psi_2(\tau) \equiv \psi_3(\tau),$
4. $i_1, i_2, i_3 = 1, \ldots, m$ *and* $\psi_1(\tau) \equiv \psi_2(\tau) \equiv \psi_3(\tau),$

where

$$C_{j_3j_2j_1} = \int\limits_t^T \psi_3(t_3)\phi_{j_3}(t_3)\int\limits_t^{t_3}\psi_2(t_2)\phi_{j_2}(t_2)\int\limits_t^{t_2}\psi_1(t_1)\phi_{j_1}(t_1)dt_1dt_2dt_3;$$

another notations are the same as in Theorems 3, 4.

We can omit Cases 1–4 in Theorem 10 in the case when the functions $\psi_1(\tau)$ and $\psi_3(\tau)$ are twice continuously differentiable.

Theorem 11 [12]-[18], [25], [47]. *Suppose that* $\{\phi_j(x)\}_{j=0}^{\infty}$ *is a complete orthonormal system of Legendre polynomials or trigonomertic functions in the space* $L_2([t,T])$. *Furthermore, let the function* $\psi_2(\tau)$ *is continuously differentiable at the interval* $[t,T]$ *and the functions* $\psi_1(\tau)$, $\psi_3(\tau)$ *are twice continuously differentiable at the interval* $[t,T]$. *Then, for the iterated Stratonovich stochastic integral of third multiplicity*

$$J^*[\psi^{(3)}]_{T,t}=\int\limits_t^{*T}\psi_3(t_3)\int\limits_t^{*t_3}\psi_2(t_2)\int\limits_t^{*t_2}\psi_1(t_1)d\mathbf{f}_{t_1}^{(i_1)}d\mathbf{f}_{t_2}^{(i_2)}d\mathbf{f}_{t_3}^{(i_3)}\quad (i_1,i_2,i_3=1,\ldots,m)$$

the following expansion

$$J^*[\psi^{(3)}]_{T,t}=\underset{p\to\infty}{\text{l.i.m.}}\sum_{j_1,j_2,j_3=0}^{p}C_{j_3j_2j_1}\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}\zeta_{j_3}^{(i_3)} \tag{33}$$

that converges in the mean-square sense is valid, where

$$C_{j_3j_2j_1}=\int\limits_t^{T}\psi_3(t_3)\phi_{j_3}(t_3)\int\limits_t^{t_3}\psi_2(t_2)\phi_{j_2}(t_2)\int\limits_t^{t_2}\psi_1(t_1)\phi_{j_1}(t_1)dt_1dt_2dt_3;$$

another notations are the same as in Theorems 3, 4.

The following theorem adapts Theorems 3, 4 for the integrals (3) ($\psi_l(\tau)\equiv 1,\ l=1,\ldots,4$) of multiplicity 4.

Theorem 12 [12]-[18], [25], [47]. *Suppose that* $\{\phi_j(x)\}_{j=0}^{\infty}$ *is a complete orthonormal system of Legendre polynomials or trigonometric functions in the space* $L_2([t,T])$. *Then, for the iterated Stratonovich stochastic integral of fourth multiplicity*

$$I_{T,t}^{*(i_1i_2i_3i_4)}=\int\limits_t^{*T}\int\limits_t^{*t_4}\int\limits_t^{*t_3}\int\limits_t^{*t_2}d\mathbf{w}_{t_1}^{(i_1)}d\mathbf{w}_{t_2}^{(i_2)}d\mathbf{w}_{t_3}^{(i_3)}d\mathbf{w}_{t_4}^{(i_4)}\quad (i_1,i_2,i_3,i_4=0,1,\ldots,m)$$

the following expansion

$$I_{T,t}^{*(i_1i_2i_3i_4)}=\underset{p\to\infty}{\text{l.i.m.}}\sum_{j_1,j_2,j_3,j_4=0}^{p}C_{j_4j_3j_2j_1}\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}\zeta_{j_3}^{(i_3)}\zeta_{j_4}^{(i_4)}$$

that converges in the mean-square sense is valid, where

$$C_{j_4j_3j_2j_1}=\int\limits_t^{T}\phi_{j_4}(t_4)\int\limits_t^{t_4}\phi_{j_3}(t_3)\int\limits_t^{t_3}\phi_{j_2}(t_2)\int\limits_t^{t_2}\phi_{j_1}(t_1)dt_1dt_2dt_3dt_4,$$

$\mathbf{w}_{\tau}^{(i)}=\mathbf{f}_{\tau}^{(i)}$ $(i=1,\ldots,m)$ *are independent standard Wiener processes and* $\mathbf{w}_{\tau}^{(0)}=\tau$.

It is obvious that Theorem 12 prove Hypothesis 1 for the case $k=4$.

7. Expansion of Iterated Stratonovich Stochastic Integrals of Arbitrary Multiplicity k ($k \in \mathbb{N}$). Proof of Hypothesis 2 Under the Condition of Convergence of Trace Series

In this section, we prove the expansion of iterated Stratonovich stochastic integrals of arbitrary multiplicity k ($k \in \mathbb{N}$) under the condition of convergence of trace series.

Let us introduce some notations and formulate some auxiliary results.

Consider the unordered set $\{1, 2, \ldots, k\}$ and separate it into two parts: the first part consists of r unordered pairs (sequence order of these pairs is also unimportant) and the second one consists of the remaining $k - 2r$ numbers. So, we have

$$
(\{\underbrace{\{g_1, g_2\}, \ldots, \{g_{2r-1}, g_{2r}\}}_{\text{part 1}}\}, \{\underbrace{q_1, \ldots, q_{k-2r}}_{\text{part 2}}\}), \tag{34}
$$

where

$$
\{g_1, g_2, \ldots, g_{2r-1}, g_{2r}, q_1, \ldots, q_{k-2r}\} = \{1, 2, \ldots, k\},
$$

braces mean an unordered set, and parentheses mean an ordered set.

Recall that the expression (34) is called the partition. Let us consider the sum with respect to all possible partitions

$$
\sum_{\substack{(\{\{g_1,g_2\},\ldots,\{g_{2r-1},g_{2r}\}\},\{q_1,\ldots,q_{k-2r}\}) \\ \{g_1,g_2,\ldots,g_{2r-1},g_{2r},q_1,\ldots,q_{k-2r}\}=\{1,2,\ldots,k\}}} a_{g_1 g_2,\ldots,g_{2r-1} g_{2r},q_1\ldots q_{k-2r}},
$$

where $a_{g_1 g_2,\ldots,g_{2r-1} g_{2r},q_1\ldots q_{k-2r}} \in \mathbb{R}$.

Consider the Fourier coefficient

$$
C_{j_k\ldots j_1} = \int\limits_t^T \psi_k(t_k)\phi_{j_k}(t_k)\ldots \int\limits_t^{t_2} \psi_1(t_1)\phi_{j_1}(t_1)dt_1\ldots dt_k \tag{35}
$$

corresponding to the function (12), where $\{\phi_j(x)\}_{j=0}^{\infty}$ is a complete orthonormal system of functions in the space $L_2([t, T])$. At that we suppose $\phi_0(x) = 1/\sqrt{T-t}$.

Denote

$$
C_{j_k\ldots j_{l+1} j_l j_l j_{l-2}\ldots j_1}\Bigg|_{(j_l j_l)\frown(\cdot)} \stackrel{\sf def}{=}
$$

$$
\stackrel{\sf def}{=} \int\limits_t^T \psi_k(t_k)\phi_{j_k}(t_k)\ldots \int\limits_t^{t_{l+2}} \psi_{l+1}(t_{l+1})\phi_{j_{l+1}}(t_{l+1}) \int\limits_t^{t_{l+1}} \psi_l(t_l)\psi_{l-1}(t_l)\times
$$

$$
\times \int\limits_t^{t_l} \psi_{l-2}(t_{l-2})\phi_{j_{l-2}}(t_{l-2})\ldots \int\limits_t^{t_2} \psi_1(t_1)\phi_{j_1}(t_1)dt_1\ldots dt_{l-2}dt_l t_{l+1}\ldots dt_k = \tag{36}
$$

$$
= \sqrt{T-t}\int\limits_t^T \psi_k(t_k)\phi_{j_k}(t_k)\ldots \int\limits_t^{t_{l+2}} \psi_{l+1}(t_{l+1})\phi_{j_{l+1}}(t_{l+1}) \int\limits_t^{t_{l+1}} \psi_l(t_l)\psi_{l-1}(t_l)\phi_0(t_l)\times
$$

$$\times \int_t^{t_l} \psi_{l-2}(t_{l-2})\phi_{j_{l-2}}(t_{l-2}) \ldots \int_t^{t_2} \psi_1(t_1)\phi_{j_1}(t_1)dt_1 \ldots dt_{l-2}dt_l t_{l+1} \ldots dt_k =$$

$$= \sqrt{T-t}\hat{C}_{j_k \ldots j_{l+1}0j_{l-2}\ldots j_1},$$

i.e. $\sqrt{T-t}\hat{C}_{j_k \ldots j_{l+1}0j_{l-2}\ldots j_1}$ is again the Fourier coefficient of type $C_{j_k \ldots j_1}$ but with a new shorter multi-index $j_k \ldots j_{l+1}0j_{l-2} \ldots j_1$ and new weight functions $\psi_1(\tau), \ldots, \psi_{l-2}(\tau), \sqrt{T-t}\psi_{l-1}(\tau)\psi_l(\tau)$, $\psi_{l+1}(\tau), \ldots, \psi_k(\tau)$ (also we suppose that $\{l, l-1\}$ is one of the pairs $\{g_1, g_2\}, \ldots, \{g_{2r-1}, g_{2r}\}$).

Let

$$C_{j_k \ldots j_{l+1}j_l j_l j_{l-2}\ldots j_1}\Bigg|_{(j_l j_l)\frown j_m} \stackrel{\sf def}{=}$$

$$\stackrel{\sf def}{=} \int_t^T \psi_k(t_k)\phi_{j_k}(t_k) \ldots \int_t^{t_{l+2}} \psi_{l+1}(t_{l+1})\phi_{j_{l+1}}(t_{l+1}) \int_t^{t_{l+1}} \psi_l(t_l)\psi_{l-1}(t_l)\phi_{j_m}(t_l)\times$$

$$\times \int_t^{t_l} \psi_{l-2}(t_{l-2})\phi_{j_{l-2}}(t_{l-2}) \ldots \int_t^{t_2} \psi_1(t_1)\phi_{j_1}(t_1)dt_1 \ldots dt_{l-2}dt_l t_{l+1} \ldots dt_k = \tag{37}$$

$$= \bar{C}_{j_k \ldots j_{l+1}j_m j_{l-2}\ldots j_1},$$

i.e. $\bar{C}_{j_k \ldots j_{l+1}j_m j_{l-2}\ldots j_1}$ is again the Fourier coefficient of type $C_{j_k \ldots j_1}$ but with a new shorter multi-index $j_k \ldots j_{l+1}j_m j_{l-2} \ldots j_1$ and new weight functions $\psi_1(\tau), \ldots, \psi_{l-2}(\tau), \psi_{l-1}(\tau)\psi_l(\tau), \psi_{l+1}(\tau), \ldots$, $\psi_k(\tau)$ (also we suppose that $\{l-1, l\}$ is one of the pairs $\{g_1, g_2\}, \ldots, \{g_{2r-1}, g_{2r}\}$).

Denote

$$\bar{C}^{(p)}_{j_k \ldots j_q \ldots j_1}\Bigg|_{q \ne g_1, g_2, \ldots, g_{2r-1}, g_{2r}} \stackrel{\sf def}{=}$$

$$\stackrel{\sf def}{=} \sum_{j_{g_{2r-1}}=p+1}^{\infty} \sum_{j_{g_{2r-3}}=p+1}^{\infty} \ldots \sum_{j_{g_3}=p+1}^{\infty} \sum_{j_{g_1}=p+1}^{\infty} C_{j_k \ldots j_1}\Bigg|_{j_{g_1}=j_{g_2}, \ldots, j_{g_{2r-1}}=j_{g_{2r}}}. \tag{38}$$

Introduce the following notation

$$S_l \left\{ \bar{C}^{(p)}_{j_k \ldots j_q \ldots j_1}\Bigg|_{q \ne g_1, g_2, \ldots, g_{2r-1}, g_{2r}} \right\} \stackrel{\sf def}{=} \frac{1}{2}\mathbf{1}_{\{g_{2l}=g_{2l-1}+1\}} \sum_{j_{g_{2r-1}}=p+1}^{\infty} \sum_{j_{g_{2r-3}}=p+1}^{\infty} \ldots$$

$$\ldots \sum_{j_{g_{2l+1}}=p+1}^{\infty} \sum_{j_{g_{2l-3}}=p+1}^{\infty} \ldots \sum_{j_{g_3}=p+1}^{\infty} \sum_{j_{g_1}=p+1}^{\infty} C_{j_k \ldots j_1}\Bigg|_{(j_{g_{2l}} j_{g_{2l-1}})\frown(\cdot), j_{g_1}=j_{g_2}, \ldots, j_{g_{2r-1}}=j_{g_{2r}}}. \tag{39}$$

Note that the operation S_l $(l = 1, 2, \ldots, r)$ acts on the value

$$\bar{C}^{(p)}_{j_k\ldots j_q\ldots j_1}\Biggr|_{q\ne g_1,g_2,\ldots,g_{2r-1},g_{2r}} \tag{40}$$

as follows: S_l multiplies (40) by $\mathbf{1}_{\{g_{2l}=g_{2l-1}+1\}}/2$, removes the summation

$$\sum_{j_{g_{2l-1}}=p+1}^{\infty},$$

and replaces

$$C_{j_k\ldots j_1}\Biggr|_{j_{g_1}=j_{g_2},\ldots,j_{g_{2r-1}}=j_{g_{2r}}}$$

with

$$C_{j_k\ldots j_1}\Biggr|_{(j_{g_{2l}}j_{g_{2l-1}})\curvearrowright(\cdot),j_{g_1}=j_{g_2},\ldots,j_{g_{2r-1}}=j_{g_{2r}}}. \tag{41}$$

Note that we write

$$C_{j_k\ldots j_1}\Biggr|_{(j_{g_1}j_{g_2})\curvearrowright(\cdot),j_{g_1}=j_{g_2}}=C_{j_k\ldots j_1}\Biggr|_{(j_{g_1}j_{g_1})\curvearrowright(\cdot),j_{g_1}=j_{g_2}},$$

$$C_{j_k\ldots j_1}\Biggr|_{(j_{g_1}j_{g_2})\curvearrowright j_m,j_{g_1}=j_{g_2}}=C_{j_k\ldots j_1}\Biggr|_{(j_{g_1}j_{g_1})\curvearrowright j_m,j_{g_1}=j_{g_2}},$$

$$C_{j_k\ldots j_1}\Biggr|_{(j_{g_1}j_{g_2})\curvearrowright(\cdot),(j_{g_3}j_{g_4})\curvearrowright(\cdot),j_{g_1}=j_{g_2},j_{g_3}=j_{g_4}}=C_{j_k\ldots j_1}\Biggr|_{(j_{g_1}j_{g_1})\curvearrowright(\cdot)(j_{g_3}j_{g_3})\curvearrowright(\cdot),j_{g_1}=j_{g_2},j_{g_3}=j_{g_4}},\quad\ldots$$

Since (41) is again the Fourier coefficient, then the action of superposition S_lS_m on (41) is obvious. For example, for $r=3$

$$S_3S_2S_1\left\{\bar{C}^{(p)}_{j_k\ldots j_q\ldots j_1}\Biggr|_{q\ne g_1,g_2,\ldots,g_5,g_6}\right\}=$$

$$=\frac{1}{2^3}\prod_{s=1}^{3}\mathbf{1}_{\{g_{2s}=g_{2s-1}+1\}}C_{j_k\ldots j_1}\Biggr|_{(j_{g_2}j_{g_1})\curvearrowright(\cdot)(j_{g_4}j_{g_3})\curvearrowright(\cdot)(j_{g_6}j_{g_5})\curvearrowright(\cdot),j_{g_1}=j_{g_2},j_{g_3}=j_{g_4},j_{g_5}=j_{g_6}},$$

$$S_3S_1\left\{\bar{C}^{(p)}_{j_k\ldots j_q\ldots j_1}\Biggr|_{q\ne g_1,g_2,\ldots,g_5,g_6}\right\}=$$

$$=\frac{1}{2^2}\mathbf{1}_{\{g_6=g_5+1\}}\mathbf{1}_{\{g_2=g_1+1\}}\sum_{j_{g_3}=p+1}^{\infty}C_{j_k\ldots j_1}\Biggr|_{(j_{g_2}j_{g_1})\curvearrowright(\cdot)(j_{g_6}j_{g_5})\curvearrowright(\cdot),j_{g_1}=j_{g_2},j_{g_3}=j_{g_4},j_{g_5}=j_{g_6}},$$

$$S_2\left\{\bar{C}_{j_k\ldots j_q\ldots j_1}^{(p)}\Biggr|_{q\ne g_1,g_2,\ldots,g_5,g_6}\right\}=$$

$$=\frac{1}{2}\mathbf{1}_{\{g_4=g_3+1\}}\sum_{j_{g_1}=p+1}^{\infty}\sum_{j_{g_5}=p+1}^{\infty}C_{j_k\ldots j_1}\Biggr|_{(j_{g_4}j_{g_3})\curvearrowright(\cdot),j_{g_1}=j_{g_2},j_{g_3}=j_{g_4},j_{g_5}=j_{g_6}}.$$

Theorem 13 [15], [46], [47], [55], [62]. *Assume that the continuously differentiable functions* $\psi_l(\tau)$ $(l=1,\ldots,k)$ *and the complete orthonormal system* $\{\phi_j(x)\}_{j=0}^{\infty}$ *of continuous functions* $(\phi_0(x)=1/\sqrt{T-t})$ *in the space* $L_2([t,T])$ *are such that the following conditions are satisfied*:

1. *The equality*

$$\frac{1}{2}\int\limits_t^s\Phi_1(t_1)\Phi_2(t_1)dt_1=\sum_{j_1=0}^{\infty}\int\limits_t^s\Phi_2(t_2)\phi_{j_1}(t_2)\int\limits_t^{t_2}\Phi_1(t_1)\phi_{j_1}(t_1)dt_1dt_2 \tag{42}$$

holds for all $s\in(t,T]$, *where the nonrandom functions* $\Phi_1(\tau)$, $\Phi_2(\tau)$ *are continuously differentiable on* $[t,T]$ *and the series on the right-hand side of* (42) *converges absolutely.*

2. *The estimates*

$$\left|\int\limits_t^s\phi_j(\tau)\Phi_1(\tau)d\tau\right|\le\frac{\Psi_1(s)}{j^{1/2+\alpha}},\qquad\left|\int\limits_s^T\phi_j(\tau)\Phi_2(\tau)d\tau\right|\le\frac{\Psi_1(s)}{j^{1/2+\alpha}},$$

$$\left|\sum_{j=p+1}^{\infty}\int\limits_t^s\Phi_2(\tau)\phi_j(\tau)\int\limits_t^{\tau}\Phi_1(\theta)\phi_j(\theta)d\theta d\tau\right|\le\frac{\Psi_2(s)}{p^{\beta}}$$

hold for all $s\in(t,T)$ *and for some* $\alpha,\beta>0$, *where* $\Phi_1(\tau)$, $\Phi_2(\tau)$ *are continuously differentiable nonrandom functions on* $[t,T]$, $j,p\in\mathbb{N}$, *and*

$$\int\limits_t^T\Psi_1^2(\tau)d\tau<\infty,\qquad\int\limits_t^T\left|\Psi_2(\tau)\right|d\tau<\infty.$$

3. *The condition*

$$\lim_{p\to\infty}\sum_{\substack{j_1,\ldots,j_q,\ldots,j_k=0\\ q\ne g_1,g_2,\ldots,g_{2r-1},g_{2r}}}^{p}\left(S_{l_1}S_{l_2}\ldots S_{l_d}\left\{\bar{C}_{j_k\ldots j_q\ldots j_1}^{(p)}\Biggr|_{q\ne g_1,g_2,\ldots,g_{2r-1},g_{2r}}\right\}\right)^2=0$$

holds for all possible $g_1,g_2,\ldots,g_{2r-1},g_{2r}$ *(see* (34)*) and* $l_1,l_2,\ldots,l_d$ *such that* $l_1,l_2,\ldots,l_d\in\{1,2,\ldots,r\}$, $l_1>l_2>\ldots>l_d$, $d=0,1,2,\ldots,r-1$, *where* $r=1,2,\ldots,[k/2]$ *and*

$$S_{l_1}S_{l_2}\ldots S_{l_d}\left\{\bar{C}_{j_k\ldots j_q\ldots j_1}^{(p)}\Biggr|_{q\ne g_1,g_2,\ldots,g_{2r-1},g_{2r}}\right\}\stackrel{\sf def}{=}\bar{C}_{j_k\ldots j_q\ldots j_1}^{(p)}\Biggr|_{q\ne g_1,g_2,\ldots,g_{2r-1},g_{2r}}$$

for $d=0$.

Then, for the iterated Stratonovich stochastic integral of arbitrary multiplicity k

$$J^*[\psi^{(k)}]_{T,t}^{(i_1\ldots i_k)}=\int\limits_t^{*T}\psi_k(t_k)\ldots\int\limits_t^{*t_2}\psi_1(t_1)d\mathbf{w}_{t_1}^{(i_1)}\ldots d\mathbf{w}_{t_k}^{(i_k)} \tag{43}$$

the following expansion

$$J^*[\psi^{(k)}]_{T,t}^{(i_1\ldots i_k)}=\underset{p\to\infty}{\text{l.i.m.}}\sum_{j_1,\ldots,j_k=0}^{p}C_{j_k\ldots j_1}\prod_{l=1}^{k}\zeta_{j_l}^{(i_l)} \tag{44}$$

that converges in the mean-square sense is valid, where

$$C_{j_k\ldots j_1}=\int\limits_t^{T}\psi_k(t_k)\phi_{j_k}(t_k)\ldots\int\limits_t^{t_2}\psi_1(t_1)\phi_{j_1}(t_1)dt_1\ldots dt_k \tag{45}$$

is the Fourier coefficient, l.i.m. *is a limit in the mean-square sense,* $i_1,\ldots,i_k=0,1,\ldots,m,$

$$\zeta_j^{(i)}=\int\limits_t^{T}\phi_j(s)d\mathbf{w}_s^{(i)}$$

are independent standard Gaussian random variables for various i *or* j *(in the case when* $i\neq 0$*),* $\mathbf{w}_\tau^{(i)}=\mathbf{f}_\tau^{(i)}$ *for* $i=1,\ldots,m$ *and* $\mathbf{w}_\tau^{(0)}=\tau.$

Proof. First note that (42) is fulfilled (see [15], Sect. 2.1.4 or [94]). The proof of Theorem 13 will consist of several steps.

Step 1. Let us find a representation of the quantity

$$\sum_{j_1,\ldots,j_k=0}^{p}C_{j_k\ldots j_1}\prod_{l=1}^{k}\zeta_{j_l}^{(i_l)}$$

that will be convenient for further consideration.

Let us consider the following multiple stochastic integral

$$\underset{N\to\infty}{\text{l.i.m.}}\sum_{\substack{j_1,\ldots,j_k=0\\ j_q\neq j_r;\ q\neq r;\ q,r=1,\ldots,k}}^{N-1}\Phi\left(\tau_{j_1},\ldots,\tau_{j_k}\right)\prod_{l=1}^{k}\Delta\mathbf{w}_{\tau_{j_l}}^{(i_l)}\stackrel{\text{def}}{=}J'[\Phi]_{T,t}^{(i_1\ldots i_k)}, \tag{46}$$

where for simplicity we assume that $\Phi(t_1,\ldots,t_k):\ [t,T]^k\to\mathbb{R}$ is a continuous nonrandom function on $[t,T]^k$. Moreover, $\Delta\mathbf{w}_{\tau_j}^{(i)}=\mathbf{w}_{\tau_{j+1}}^{(i)}-\mathbf{w}_{\tau_j}^{(i)}$ $(i=0,1,\ldots,m)$, $\{\tau_j\}_{j=0}^{N}$ is a partition of $[t,T]$, which satisfies the condition (14), $i_1,\ldots,i_k=0,1,\ldots,m.$

The stochastic integral with respect to the scalar standard Wiener process $(i_1=\ldots=i_k\neq 0)$ and similar to (46) was considered in [85] (1951) and is called the multiple Wiener stochastic integral [85].

Note that the following well known estimate

$$\mathsf{M}\left\{\left(J'[\Phi]_{T,t}^{(i_1\ldots i_k)}\right)^2\right\}\le C_k\int\limits_{[t,T]^k}\Phi^2(t_1,\ldots,t_k)dt_1\ldots dt_k \tag{47}$$

is true for the multiple Wiener stochastic integral, where $J'[\Phi]_{T,t}^{(i_1\ldots i_k)}$ is defined by (46) and C_k is a constant.

From the proof of Theorem 3 (see the proof of Theorem 5.1 in the original paper [10] (2006) in Russian or proof of Theorem 1.1 in the monographs [15]-[18] in English) it follows that (15) can be written as

$$J[\psi^{(k)}]_{T,t}^{(i_1\ldots i_k)} = \underset{p_1,\ldots,p_k\to\infty}{\text{l.i.m.}} \sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k} C_{j_k\ldots j_1} J'[\phi_{j_1}\ldots\phi_{j_k}]_{T,t}^{(i_1\ldots i_k)}, \tag{48}$$

where $J'[\phi_{j_1}\ldots\phi_{j_k}]_{T,t}^{(i_1\ldots i_k)}$ is the multiple Wiener stochatic integral defined by (46) and $J[\psi^{(k)}]_{T,t}^{(i_1\ldots i_k)}$ is the iterated Ito stochastic integral (2), i.e.

$$J[\psi^{(k)}]_{T,t}^{(i_1\ldots i_k)} = \int\limits_t^T \psi_k(t_k)\ldots\int\limits_t^{t_2}\psi_1(t_1)d\mathbf{w}_{t_1}^{(i_1)}\ldots d\mathbf{w}_{t_k}^{(i_k)}. \tag{49}$$

Let us consider the following multiple stochastic integral

$$\underset{N\to\infty}{\text{l.i.m.}} \sum_{j_1,\ldots,j_k=0}^{N-1} \Phi\left(\tau_{j_1},\ldots,\tau_{j_k}\right)\prod_{l=1}^k \Delta\mathbf{w}_{\tau_{j_l}}^{(i_l)} \stackrel{\text{def}}{=} J[\Phi]_{T,t}^{(i_1\ldots i_k)}, \tag{50}$$

where we assume that $\Phi(t_1,\ldots,t_k):\ [t,T]^k\to\mathbb{R}$ is a continuous nonrandom function on $[t,T]^k$. Another notations are the same as in (46).

The stochastic integral with respect to the scalar standard Wiener process ($i_1=\ldots=i_k\neq 0$) and similar to (50) (the function $\Phi(t_1,\ldots,t_k)$ is assumed to be symmetric on the hypercube $[t,T]^k$) has been considered in literature (see, for example, Remark 1.5.7 [86]). The integral (50) is sometimes called the multiple Stratonovich stochastic integral. This is due to the fact that the following rule of the classical integral calculus holds for this integral

$$J[\Phi]_{T,t}^{(i_1\ldots i_k)} = J[\varphi_1]_{T,t}^{(i_1)}\ldots J[\varphi_k]_{T,t}^{(i_k)} \quad \text{w. p. 1},$$

where $\Phi(t_1,\ldots,t_k)=\varphi_1(t_1)\ldots\varphi_k(t_k)$ and

$$J[\varphi_l]_{T,t}^{(i_l)} = \int\limits_t^T \varphi_l(s)d\mathbf{w}_s^{(i_l)} \quad (l=1,\ldots,k).$$

Theorem 14 [15], [18]. *Suppose that $\Phi(t_1,\ldots,t_k):\ [t,T]^k\to\mathbb{R}$ is a continuous nonrandom function on $[t,T]^k$. Furthermore, $\{\phi_j(x)\}_{j=0}^\infty$ is a complete orthonormal system of functions in the space $L_2([t,T])$, each function $\phi_j(x)$ of which for finite j is continuous at the interval $[t,T]$ except may be for the finite number of points of the finite discontinuity as well as $\phi_j(x)$ right-continuous at the interval $[t,T]$. Then the following expansion*

$$J'[\Phi]_{T,t}^{(i_1\ldots i_k)} = \underset{p_1,\ldots,p_k\to\infty}{\text{l.i.m.}} \sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k} C_{j_k\ldots j_1}\Biggl(\prod_{l=1}^k \zeta_{j_l}^{(i_l)} + \sum_{r=1}^{[k/2]}(-1)^r\times$$

$$\times \sum_{\substack{(\{\{g_1,g_2\},\ldots,\{g_{2r-1},g_{2r}\}\},\{q_1,\ldots,q_{k-2r}\})\\ \{g_1,g_2,\ldots,g_{2r-1},g_{2r},q_1,\ldots,q_{k-2r}\}=\{1,2,\ldots,k\}}} \prod_{s=1}^r \mathbf{1}_{\{i_{g_{2s-1}}=\ i_{g_{2s}}\neq 0\}}\mathbf{1}_{\{j_{g_{2s-1}}=\ j_{g_{2s}}\}}\prod_{l=1}^{k-2r}\zeta_{j_{q_l}}^{(i_{q_l})}\Biggr) \tag{51}$$

converging in the mean-square sense is valid, where $J'[\Phi]_{T,t}^{(i_1\ldots i_k)}$ *is the multiple Wiener stochatic integral defined by* (46),

$$C_{j_k\ldots j_1}=\int\limits_{[t,T]^k}\Phi(t_1,\ldots,t_k)\prod_{l=1}^k\phi_{j_l}(t_l)dt_1\ldots dt_k \tag{52}$$

is the Fourier coefficient. Another notations are the same as in Theorems 3, 4.

From (24) and (48) we conclude that

$$J'[\phi_{j_1}\ldots\phi_{j_k}]_{T,t}^{(i_1\ldots i_k)}=\prod_{l=1}^k\zeta_{j_l}^{(i_l)}+$$

$$+\sum_{r=1}^{[k/2]}(-1)^r\sum_{\substack{(\{\{g_1,g_2\},\ldots,\{g_{2r-1},g_{2r}\}\},\{q_1,\ldots,q_{k-2r}\})\\ \{g_1,g_2,\ldots,g_{2r-1},g_{2r},q_1,\ldots,q_{k-2r}\}=\{1,2,\ldots,k\}}}\prod_{s=1}^r\mathbf{1}_{\{i_{g_{2s-1}}=\ i_{g_{2s}}\neq 0\}}\mathbf{1}_{\{j_{g_{2s-1}}=\ j_{g_{2s}}\}}\prod_{l=1}^{k-2r}\zeta_{j_{q_l}}^{(i_{q_l})} \tag{53}$$

w. p. 1, where notations are the same as in Theorem 4 and $J'[\phi_{j_1}\ldots\phi_{j_k}]_{T,t}^{(i_1\ldots i_k)}$ is the multiple Wiener stochastic integral (46). For a more detailed derivation of (53), see [43] (also see [15])).

Using (53), we obtain

$$\prod_{l=1}^k\zeta_{j_l}^{(i_l)}=J'[\phi_{j_1}\ldots\phi_{j_k}]_{T,t}^{(i_1\ldots i_k)}-$$

$$-\sum_{r=1}^{[k/2]}(-1)^r\sum_{\substack{(\{\{g_1,g_2\},\ldots,\{g_{2r-1},g_{2r}\}\},\{q_1,\ldots,q_{k-2r}\})\\ \{g_1,g_2,\ldots,g_{2r-1},g_{2r},q_1,\ldots,q_{k-2r}\}=\{1,2,\ldots,k\}}}\prod_{s=1}^r\mathbf{1}_{\{i_{g_{2s-1}}=\ i_{g_{2s}}\neq 0\}}\mathbf{1}_{\{j_{g_{2s-1}}=\ j_{g_{2s}}\}}\prod_{l=1}^{k-2r}\zeta_{j_{q_l}}^{(i_{q_l})} \tag{54}$$

w. p. 1.

By iteratively applying the formula (54) (also see (17)–(21)), we obtain the following representation of the product

$$\prod_{l=1}^k\zeta_{j_l}^{(i_l)}$$

as the sum of some constant value and multiple Wiener stochastic integrals of multiplicities not exceeding k

$$\prod_{l=1}^k\zeta_{j_l}^{(i_l)}=J'[\phi_{j_1}\ldots\phi_{j_k}]_{T,t}^{(i_1\ldots i_k)}+\sum_{r=1}^{[k/2]}\sum_{\substack{(\{\{g_1,g_2\},\ldots,\{g_{2r-1},g_{2r}\}\},\{q_1,\ldots,q_{k-2r}\})\\ \{g_1,g_2,\ldots,g_{2r-1},g_{2r},q_1,\ldots,q_{k-2r}\}=\{1,2,\ldots,k\}}}\prod_{s=1}^r\mathbf{1}_{\{i_{g_{2s-1}}=\ i_{g_{2s}}\neq 0\}}\times$$

$$\times\mathbf{1}_{\{j_{g_{2s-1}}=\ j_{g_{2s}}\}}J'[\phi_{j_{q_1}}\ldots\phi_{j_{q_{k-2r}}}]_{T,t}^{(i_{q_1}\ldots i_{q_{k-2r}})}\quad\text{w. p. 1}, \tag{55}$$

where $J'[\phi_{j_{q_1}}\ldots\phi_{j_{q_{k-2r}}}]_{T,t}^{(i_{q_1}\ldots i_{q_{k-2r}})}\stackrel{\sf def}{=}1$ for $k=2r$.

Multiplying both sides of the equality (55) by $C_{j_k\ldots j_1}$ and summing over $j_1,\ldots,j_k$, we get w. p. 1

$$\sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k} C_{j_k\ldots j_1}\prod_{l=1}^{k}\zeta_{j_l}^{(i_l)} = \sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k} C_{j_k\ldots j_1} J'[\phi_{j_1}\ldots\phi_{j_k}]_{T,t}^{(i_1\ldots i_k)}+$$

$$+\sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k} C_{j_k\ldots j_1}\sum_{r=1}^{[k/2]}\sum_{\substack{(\{\{g_1,g_2\},\ldots,\{g_{2r-1},g_{2r}\}\},\{q_1,\ldots,q_{k-2r}\})\\ \{g_1,g_2,\ldots,g_{2r-1},g_{2r},q_1,\ldots,q_{k-2r}\}=\{1,2,\ldots,k\}}}\prod_{s=1}^{r}\mathbf{1}_{\{i_{g_{2s-1}}=\ i_{g_{2s}}\neq 0\}}\times$$

$$\times\mathbf{1}_{\{j_{g_{2s-1}}=\ j_{g_{2s}}\}} J'[\phi_{j_{q_1}}\ldots\phi_{j_{q_{k-2r}}}]_{T,t}^{(i_{q_1}\ldots i_{q_{k-2r}})}\quad \text{w. p. 1.} \tag{56}$$

Denote

$$K_{p_1\ldots p_k}(t_1,\ldots,t_k)=\sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k} C_{j_k\ldots j_1}\prod_{l=1}^{k}\phi_{j_l}(t_l), \tag{57}$$

$$K_{p_1\ldots p_k}^{g_1\ldots g_{2r},q_1\ldots q_{k-2r}}(t_{q_1},\ldots,t_{q_{k-2r}})=\sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k} C_{j_k\ldots j_1}\prod_{s=1}^{r}\mathbf{1}_{\{j_{g_{2s-1}}=\ j_{g_{2s}}\}}\prod_{l=1}^{k-2r}\phi_{j_{q_l}}(t_{q_l}), \tag{58}$$

where $C_{j_k\ldots j_1}$ is defined by (45) and $\prod_{\emptyset}\stackrel{\text{def}}{=}1$.

The equality (56) can be written as

$$J[K_{p_1\ldots p_k}]_{T,t}^{(i_1\ldots i_k)}=J'[K_{p_1\ldots p_k}]_{T,t}^{(i_1\ldots i_k)}+$$

$$+\sum_{r=1}^{[k/2]}\sum_{\substack{(\{\{g_1,g_2\},\ldots,\{g_{2r-1},g_{2r}\}\},\{q_1,\ldots,q_{k-2r}\})\\ \{g_1,g_2,\ldots,g_{2r-1},g_{2r},q_1,\ldots,q_{k-2r}\}=\{1,2,\ldots,k\}}}\prod_{s=1}^{r}\mathbf{1}_{\{i_{g_{2s-1}}=\ i_{g_{2s}}\neq 0\}}\ J'[K_{p_1\ldots p_k}^{g_1\ldots g_{2r},q_1\ldots q_{k-2r}}]_{T,t}^{(i_{q_1}\ldots i_{q_{k-2r}})} \tag{59}$$

w. p. 1, where $K_{p_1\ldots p_k}(t_1,\ldots,t_k)$ and $K_{p_1\ldots p_k}^{g_1\ldots g_{2r},q_1\ldots q_{k-2r}}(t_{q_1},\ldots,t_{q_{k-2r}})$ have the form (57), (58), $J[K_{p_1\ldots p_k}]_{T,t}^{(i_1\ldots i_k)}$ is the multiple Stratonovich stochastic integral defined by (50), $J'[K_{p_1\ldots p_k}]_{T,t}^{(i_1\ldots i_k)}$ and $J'[K_{p_1\ldots p_k}^{g_1\ldots g_{2r},q_1\ldots q_{k-2r}}]_{T,t}^{(i_{q_1}\ldots i_{q_{k-2r}})}$ are multiple Wiener stochastic integrals defined by (46).

Passing to the limit $\underset{p_1,\ldots,p_k\to\infty}{\text{l.i.m.}}$ $(p_1=\ldots=p_k=p)$ in (56) or (59), we get w. p. 1 (see (48))

$$\underset{p\to\infty}{\text{l.i.m.}}\sum_{j_1,\ldots,j_k=0}^{p} C_{j_k\ldots j_1}\prod_{l=1}^{k}\zeta_{j_l}^{(i_l)}=J[\psi^{(k)}]_{T,t}^{(i_1\ldots i_k)}+$$

$$+\underset{p\to\infty}{\text{l.i.m.}}\sum_{j_1,\ldots,j_k=0}^{p} C_{j_k\ldots j_1}\sum_{r=1}^{[k/2]}\sum_{\substack{(\{\{g_1,g_2\},\ldots,\{g_{2r-1},g_{2r}\}\},\{q_1,\ldots,q_{k-2r}\})\\ \{g_1,g_2,\ldots,g_{2r-1},g_{2r},q_1,\ldots,q_{k-2r}\}=\{1,2,\ldots,k\}}}\prod_{s=1}^{r}\mathbf{1}_{\{i_{g_{2s-1}}=\ i_{g_{2s}}\neq 0\}}\times$$

$$\times\mathbf{1}_{\{j_{g_{2s-1}}=\ j_{g_{2s}}\}} J'[\phi_{j_{q_1}}\ldots\phi_{j_{q_{k-2r}}}]_{T,t}^{(i_{q_1}\ldots i_{q_{k-2r}})}= \tag{60}$$

$$= J[\psi^{(k)}]_{T,t}^{(i_1\ldots i_k)} + \underset{p\to\infty}{\text{l.i.m.}} \sum_{r=1}^{[k/2]} \sum_{\substack{(\{\{g_1,g_2\},\ldots,\{g_{2r-1},g_{2r}\}\},\{q_1,\ldots,q_{k-2r}\})\\ \{g_1,g_2,\ldots,g_{2r-1},g_{2r},q_1,\ldots,q_{k-2r}\}=\{1,2,\ldots,k\}}} \prod_{s=1}^{r} \mathbf{1}_{\{i_{g_{2s-1}}=\ i_{g_{2s}}\neq 0\}}\times$$

$$\times J'[K_{p\ldots p}^{g_1\ldots g_{2r},q_1\ldots q_{k-2r}}]_{T,t}^{(i_{q_1}\ldots i_{q_{k-2r}})} \tag{61}$$

w. p. 1, where $J[\psi^{(k)}]_{T,t}^{(i_1\ldots i_k)}$ is the iterated Ito stochastic integral (49).

If we prove that w. p. 1

$$\sum_{r=1}^{[k/2]} \frac{1}{2^r} \sum_{(s_r,\ldots,s_1)\in \mathrm{A}_{k,r}} J[\psi^{(k)}]_{T,t}^{s_r,\ldots,s_1} =$$

$$= \underset{p\to\infty}{\text{l.i.m.}} \sum_{j_1,\ldots,j_k=0}^{p} C_{j_k\ldots j_1} \sum_{r=1}^{[k/2]} \sum_{\substack{(\{\{g_1,g_2\},\ldots,\{g_{2r-1},g_{2r}\}\},\{q_1,\ldots,q_{k-2r}\})\\ \{g_1,g_2,\ldots,g_{2r-1},g_{2r},q_1,\ldots,q_{k-2r}\}=\{1,2,\ldots,k\}}} \prod_{s=1}^{r} \mathbf{1}_{\{i_{g_{2s-1}}=\ i_{g_{2s}}\neq 0\}}\times$$

$$\times \mathbf{1}_{\{j_{g_{2s-1}}=\ j_{g_{2s}}\}} J'[\phi_{j_{q_1}}\ldots\phi_{j_{q_{k-2r}}}]_{T,t}^{(i_{q_1}\ldots i_{q_{k-2r}})}, \tag{62}$$

then (see (60), (62), and Theorem 5)

$$\underset{p\to\infty}{\text{l.i.m.}} \sum_{j_1,\ldots,j_k=0}^{p} C_{j_k\ldots j_1} \prod_{l=1}^{k} \zeta_{j_l}^{(i_l)} =$$

$$= J[\psi^{(k)}]_{T,t}^{(i_1\ldots i_k)} + \sum_{r=1}^{[k/2]} \frac{1}{2^r} \sum_{(s_r,\ldots,s_1)\in \mathrm{A}_{k,r}} J[\psi^{(k)}]_{T,t}^{s_r,\ldots,s_1} = J^*[\psi^{(k)}]_{T,t}^{(i_1\ldots i_k)} \tag{63}$$

w. p. 1, where notations in (63) are the same as in Theorem 5. Thus Theorem 13 will be proved.

From (59) we have that the multiple Stratonovich stochastic integral $J[K_{p_1\ldots p_k}]_{T,t}^{(i_1\ldots i_k)}$ of multiplicity k is expressed as a sum of some constant value and multiple Wiener stochastic integrals $J'[K_{p_1\ldots p_k}]_{T,t}^{(i_1\ldots i_k)}$ and $J'[K_{p_1\ldots p_k}^{g_1\ldots g_{2r},q_1\ldots q_{k-2r}}]_{T,t}^{(i_{q_1}\ldots i_{q_{k-2r}})}$ of multiplicities $k,\ k-2,\ k-4,\ \ldots,\ k-2[k/2]$ $(r=1,2,\ldots,[k/2])$.

The formulas (56), (59) can be considered as new representations of the Hu-Meyer formula for the case of a multidimensional Wiener process [87] (also see [86], [88]) and kernel $K_{p_1\ldots p_k}(t_1,\ldots,t_k)$ (see (57)).

Note that the equality (59) can be obtained from (51) if we consider (51) for $\Phi(t_1,\ldots,t_k) = K_{p_1\ldots p_k}(t_1,\ldots,t_k)$ and without passing to the limit $\underset{p_1,\ldots,p_k\to\infty}{\text{l.i.m.}}$

For example, for $k=2,3,4,5,6$ we have from (56) w. p. 1

$$\sum_{j_1=0}^{p_1}\sum_{j_2=0}^{p_2} C_{j_2j_1}\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)} = J'[K_{p_1p_2}]_{T,t}^{(i_1i_2)} + \sum_{j_1=0}^{p_1}\sum_{j_2=0}^{p_2} C_{j_2j_1}\mathbf{1}_{\{i_1=i_2\neq 0\}}\mathbf{1}_{\{j_1=j_2\}}, \tag{64}$$

$$
\sum_{j_1=0}^{p_1}\sum_{j_2=0}^{p_2}\sum_{j_3=0}^{p_3} C_{j_3j_2j_1}\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}\zeta_{j_3}^{(i_3)} = J'[K_{p_1p_2p_3}]_{T,t}^{(i_1i_2i_3)}+
$$
$$
+\sum_{j_1=0}^{p_1}\sum_{j_2=0}^{p_2}\sum_{j_3=0}^{p_3} C_{j_3j_2j_1}\Biggl(\mathbf{1}_{\{i_1=i_2\ne 0\}}\mathbf{1}_{\{j_1=j_2\}}J'[\phi_{j_3}]_{T,t}^{(i_3)}+\mathbf{1}_{\{i_2=i_3\ne 0\}}\mathbf{1}_{\{j_2=j_3\}}J'[\phi_{j_1}]_{T,t}^{(i_1)}+
$$
$$
+\mathbf{1}_{\{i_1=i_3\ne 0\}}\mathbf{1}_{\{j_1=j_3\}}J'[\phi_{j_2}]_{T,t}^{(i_2)}\Biggr), \tag{65}
$$

$$
\sum_{j_1=0}^{p_1}\ldots\sum_{j_4=0}^{p_4} C_{j_4j_3j_2j_1}\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}\zeta_{j_3}^{(i_3)}\zeta_{j_4}^{(i_4)} = J'[K_{p_1p_2p_3p_4}]_{T,t}^{(i_1i_2i_3i_4)}+
$$
$$
+\sum_{j_1=0}^{p_1}\ldots\sum_{j_4=0}^{p_4} C_{j_4j_3j_2j_1}\Biggl(\mathbf{1}_{\{i_1=i_2\ne 0\}}\mathbf{1}_{\{j_1=j_2\}}J'[\phi_{j_3}\phi_{j_4}]_{T,t}^{(i_3i_4)}+
$$
$$
+\mathbf{1}_{\{i_1=i_3\ne 0\}}\mathbf{1}_{\{j_1=j_3\}}J'[\phi_{j_2}\phi_{j_4}]_{T,t}^{(i_2i_4)}+\mathbf{1}_{\{i_1=i_4\ne 0\}}\mathbf{1}_{\{j_1=j_4\}}J'[\phi_{j_2}\phi_{j_3}]_{T,t}^{(i_2i_3)}+
$$
$$
+\mathbf{1}_{\{i_2=i_3\ne 0\}}\mathbf{1}_{\{j_2=j_3\}}J'[\phi_{j_1}\phi_{j_4}]_{T,t}^{(i_1i_4)}+\mathbf{1}_{\{i_2=i_4\ne 0\}}\mathbf{1}_{\{j_2=j_4\}}J'[\phi_{j_1}\phi_{j_3}]_{T,t}^{(i_1i_3)}+
$$
$$
+\mathbf{1}_{\{i_3=i_4\ne 0\}}\mathbf{1}_{\{j_3=j_4\}}J'[\phi_{j_1}\phi_{j_2}]_{T,t}^{(i_1i_2)}+
$$
$$
+\mathbf{1}_{\{i_1=i_2\ne 0\}}\mathbf{1}_{\{j_1=j_2\}}\mathbf{1}_{\{i_3=i_4\ne 0\}}\mathbf{1}_{\{j_3=j_4\}}+\mathbf{1}_{\{i_1=i_3\ne 0\}}\mathbf{1}_{\{j_1=j_3\}}\mathbf{1}_{\{i_2=i_4\ne 0\}}\mathbf{1}_{\{j_2=j_4\}}+
$$
$$
+\mathbf{1}_{\{i_1=i_4\ne 0\}}\mathbf{1}_{\{j_1=j_4\}}\mathbf{1}_{\{i_2=i_3\ne 0\}}\mathbf{1}_{\{j_2=j_3\}}\Biggr), \tag{66}
$$

$$
\sum_{j_1=0}^{p_1}\ldots\sum_{j_5=0}^{p_5} C_{j_5j_4j_3j_2j_1}\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}\zeta_{j_3}^{(i_3)}\zeta_{j_4}^{(i_4)}\zeta_{j_5}^{(i_5)} = J'[K_{p_1p_2p_3p_4p_5}]_{T,t}^{(i_1i_2i_3i_4i_5)}+
$$
$$

$$+\mathbf{1}_{\{i_2=i_3\ne 0\}}\sum_{j_1=0}^{p_1}\sum_{j_4=0}^{p_4}\left(\sum_{j_3=0}^{\min\{p_2,p_3\}} C_{j_4j_3j_3j_1}\right) J'[\phi_{j_1}\phi_{j_4}]_{T,t}^{(i_1i_4)}+$$

$$+\mathbf{1}_{\{i_2=i_4\ne 0\}}\sum_{j_1=0}^{p_1}\sum_{j_3=0}^{p_3}\left(\sum_{j_4=0}^{\min\{p_2,p_4\}} C_{j_4j_3j_4j_1}\right) J'[\phi_{j_1}\phi_{j_3}]_{T,t}^{(i_1i_3)}+$$

$$+\mathbf{1}_{\{i_3=i_4\ne 0\}}\sum_{j_1=0}^{p_1}\sum_{j_2=0}^{p_2}\left(\sum_{j_4=0}^{\min\{p_3,p_4\}} C_{j_4j_4j_2j_1}\right) J'[\phi_{j_1}\phi_{j_2}]_{T,t}^{(i_1i_2)}+$$

$$+\mathbf{1}_{\{i_2=i_3\ne 0\}}\mathbf{1}_{\{i_1=i_4\ne 0\}}\sum_{j_2=0}^{\min\{p_2,p_3\}}\ \sum_{j_4=0}^{\min\{p_1,p_4\}} C_{j_4j_2j_2j_4}+$$

$$+\mathbf{1}_{\{i_2=i_4\ne 0\}}\mathbf{1}_{\{i_1=i_3\ne 0\}}\sum_{j_3=0}^{\min\{p_1,p_3\}}\sum_{j_4=0}^{\min\{p_2,p_4\}} C_{j_4j_3j_4j_3}+$$

$$+\mathbf{1}_{\{i_3=i_4\ne 0\}}\mathbf{1}_{\{i_1=i_2\ne 0\}}\sum_{j_2=0}^{\min\{p_1,p_2\}}\sum_{j_4=0}^{\min\{p_3,p_4\}} C_{j_4j_4j_2j_2}\quad \text{w. p. 1.}$$

Further, we will use the representation (56) for $p_1 = \ldots = p_k = p$, i.e.

$$\sum_{j_1,\ldots,j_k=0}^{p} C_{j_k\ldots j_1}\prod_{l=1}^{k}\zeta_{j_l}^{(i_l)} = \sum_{j_1,\ldots,j_k=0}^{p} C_{j_k\ldots j_1} J'[\phi_{j_1}\ldots\phi_{j_k}]_{T,t}^{(i_1\ldots i_k)}+$$

$$+\sum_{j_1,\ldots,j_k=0}^{p} C_{j_k\ldots j_1}\sum_{r=1}^{[k/2]}\sum_{\substack{(\{\{g_1,g_2\},\ldots,\{g_{2r-1},g_{2r}\}\},\{q_1,\ldots,q_{k-2r}\})\\ \{g_1,g_2,\ldots,g_{2r-1},g_{2r},q_1,\ldots,q_{k-2r}\}=\{1,2,\ldots,k\}}}\prod_{s=1}^{r}\mathbf{1}_{\{i_{g_{2s-1}}=\ i_{g_{2s}}\ne 0\}}\times$$

$$\times\mathbf{1}_{\{j_{g_{2s-1}}=\ j_{g_{2s}}\}} J'[\phi_{j_{q_1}}\ldots\phi_{j_{q_{k-2r}}}]_{T,t}^{(i_{q_1}\ldots i_{q_{k-2r}})}\quad \text{w. p. 1.} \tag{69}$$

Step 2. Let us prove that

$$\sum_{j_l=0}^{\infty} C_{j_k\ldots j_{l+1}j_lj_{l-1}\ldots j_{s+1}j_lj_{s-1}\ldots j_1} = 0 \tag{70}$$

or

$$\sum_{j_l=0}^{p} C_{j_k\ldots j_{l+1}j_lj_{l-1}\ldots j_{s+1}j_lj_{s-1}\ldots j_1} = -\sum_{j_l=p+1}^{\infty} C_{j_k\ldots j_{l+1}j_lj_{l-1}\ldots j_{s+1}j_lj_{s-1}\ldots j_1}, \tag{71}$$

where $l-1\ge s+1$.

Our further proof will not fundamentally depend on the weight functions $\psi_1(\tau),\ldots,\psi_k(\tau)$. Therefore, sometimes in subsequent consideration we assume that $\psi_1(\tau),\ldots,\psi_k(\tau)\equiv 1$.

We have

$$C_{j_k\ldots j_{l+1}j_lj_{l-1}\ldots j_{s+1}j_lj_{s-1}\ldots j_1} =$$

$$=\int\limits_t^T \phi_{j_k}(t_k)\ldots\int\limits_t^{t_{l+2}}\phi_{j_{l+1}}(t_{l+1})\int\limits_t^{t_{l+1}}\phi_{j_l}(t_l)\int\limits_t^{t_l}\phi_{j_{l-1}}(t_{l-1})\ldots$$

$$\ldots\int\limits_t^{t_{s+2}}\phi_{j_{s+1}}(t_{s+1})\int\limits_t^{t_{s+1}}\phi_{j_l}(t_s)\int\limits_t^{t_s}\phi_{j_{s-1}}(t_{s-1})\ldots$$

$$\ldots\int\limits_t^{t_2}\phi_{j_1}(t_1)dt_1\ldots dt_{s-1}dt_sdt_{s+1}\ldots dt_{l-1}dt_ldt_{l+1}\ldots dt_k =$$

$$
=\int\limits_t^T \phi_{j_{s+1}}(t_{s+1})\int\limits_t^{t_{s+1}}\phi_{j_l}(t_s)\int\limits_t^{t_s}\phi_{j_{s-1}}(t_{s-1})\ldots\int\limits_t^{t_2}\phi_{j_1}(t_1)dt_1\ldots dt_{s-1}dt_s\times
$$

$$
\times\left(\int\limits_{t_{s+1}}^T \phi_{j_{s+2}}(t_{s+2})\ldots\int\limits_{t_{l-2}}^T\phi_{j_{l-1}}(t_{l-1})\int\limits_{t_{l-1}}^T\phi_{j_l}(t_l)\int\limits_{t_l}^T\phi_{j_{l+1}}(t_{l+1})\ldots\right.
$$

$$
\left.\ldots\int\limits_{t_{k-1}}^T\phi_{j_k}(t_k)dt_k\ldots dt_{l+1}dt_ldt_{l-1}\ldots dt_{s+2}\right)dt_{s+1}=
$$

$$
=\int\limits_t^T \phi_{j_{s+1}}(t_{s+1})\int\limits_t^{t_{s+1}}\phi_{j_l}(t_s)\underbrace{\int\limits_t^{t_s}\phi_{j_{s-1}}(t_{s-1})\ldots\int\limits_t^{t_2}\phi_{j_1}(t_1)dt_1\ldots dt_{s-1}}_{G_{j_{s-1}\ldots j_1}(t_s)}dt_s\times
$$

$$
\times\int\limits_{t_{s+1}}^T\phi_{j_l}(t_l)\underbrace{\int\limits_{t_l}^T\phi_{j_{l+1}}(t_{l+1})\ldots\int\limits_{t_{k-1}}^T\phi_{j_k}(t_k)dt_k\ldots dt_{l+1}}_{H_{j_k\ldots j_{l+1}}(t_l)}\times
$$

$$
\times\left(\underbrace{\int\limits_{t_{s+1}}^{t_l}\phi_{j_{l-1}}(t_{l-1})\ldots\int\limits_{t_{s+1}}^{t_{s+3}}\phi_{j_{s+2}}(t_{s+2})dt_{s+2}\ldots dt_{l-1}}_{Q_{j_{l-1}\ldots j_{s+2}}(t_l,t_{s+1})}dt_l\right)dt_{s+1}=
$$

$$
=\int\limits_t^T \phi_{j_{s+1}}(t_{s+1})\int\limits_t^{t_{s+1}}\phi_{j_l}(t_s)G_{j_{s-1}\ldots j_1}(t_s)dt_s\times
$$

$$
\times\int\limits_{t_{s+1}}^T\phi_{j_l}(t_l)H_{j_k\ldots j_{l+1}}(t_l)Q_{j_{l-1}\ldots j_{s+2}}(t_l,t_{s+1})dt_ldt_{s+1}. \tag{72}
$$

Using the additive property of the integral, we obtain

$$
Q_{j_{l-1}\ldots j_{s+2}}(t_l,t_{s+1})=
$$

$$
=\int\limits_{t_{s+1}}^{t_l}\phi_{j_{l-1}}(t_{l-1})\ldots\int\limits_{t_{s+1}}^{t_{s+3}}\phi_{j_{s+2}}(t_{s+2})dt_{s+2}\ldots dt_{l-1}=
$$

$$
=\int\limits_{t_{s+1}}^{t_l}\phi_{j_{l-1}}(t_{l-1})\ldots\int\limits_{t_{s+1}}^{t_{s+4}}\phi_{j_{s+3}}(t_{s+3})\int\limits_t^{t_{s+3}}\phi_{j_{s+2}}(t_{s+2})dt_{s+2}dt_{s+3}\ldots dt_{l-1}-
$$

$$-\int\limits_{t_{s+1}}^{t_l}\phi_{j_{l-1}}(t_{l-1})\ldots\int\limits_{t_{s+1}}^{t_{s+4}}\phi_{j_{s+3}}(t_{s+3})dt_{s+3}\ldots dt_{l-1}\int\limits_{t}^{t_{s+1}}\phi_{j_{s+2}}(t_{s+2})dt_{s+2}=$$

$$\ldots$$

(73)
$$=\sum_{m=1}^{d}h^{(m)}_{j_{l-1}\ldots j_{s+2}}(t_l)q^{(m)}_{j_{l-1}\ldots j_{s+2}}(t_{s+1}),\quad d<\infty.$$

Combining (72) and (73), we have

$$\sum_{j_l=0}^{p}C_{j_k\ldots j_{l+1}j_lj_{l-1}\ldots j_{s+1}j_lj_{s-1}\ldots j_1}=$$

$$=\sum_{m=1}^{d}\left(\int\limits_{t}^{T}\phi_{j_{s+1}}(t_{s+1})q^{(m)}_{j_{l-1}\ldots j_{s+2}}(t_{s+1})\sum_{j_l=0}^{p}\int\limits_{t}^{t_{s+1}}\phi_{j_l}(t_s)G_{j_{s-1}\ldots j_1}(t_s)dt_s\times\right.$$

(74)
$$\left.\times\int\limits_{t_{s+1}}^{T}\phi_{j_l}(t_l)H_{j_k\ldots j_{l+1}}(t_l)h^{(m)}_{j_{l-1}\ldots j_{s+2}}(t_l)dt_ldt_{s+1}\right).$$

Using the generalized Parseval equality, we obtain

$$\sum_{j_l=0}^{\infty}\int\limits_{t}^{t_{s+1}}\phi_{j_l}(t_s)G_{j_{s-1}\ldots j_1}(t_s)dt_s\int\limits_{t_{s+1}}^{T}\phi_{j_l}(t_l)H_{j_k\ldots j_{l+1}}(t_l)h^{(m)}_{j_{l-1}\ldots j_{s+2}}(t_l)dt_l=$$

(75)
$$=\int\limits_{t}^{T}\mathbf{1}_{\{\tau<t_{s+1}\}}G_{j_{s-1}\ldots j_1}(\tau)\cdot\mathbf{1}_{\{\tau>t_{s+1}\}}H_{j_k\ldots j_{l+1}}(\tau)h^{(m)}_{j_{l-1}\ldots j_{s+2}}(\tau)d\tau=0.$$

From (74) and (75) we get

$$\sum_{j_l=0}^{p}C_{j_k\ldots j_{l+1}j_lj_{l-1}\ldots j_{s+1}j_lj_{s-1}\ldots j_1}=$$

$$=-\sum_{m=1}^{d}\left(\int\limits_{t}^{T}\phi_{j_{s+1}}(t_{s+1})q^{(m)}_{j_{l-1}\ldots j_{s+2}}(t_{s+1})\sum_{j_l=p+1}^{\infty}\int\limits_{t}^{t_{s+1}}\phi_{j_l}(t_s)G_{j_{s-1}\ldots j_1}(t_s)dt_s\times\right.$$

(76)
$$\left.\times\int\limits_{t_{s+1}}^{T}\phi_{j_l}(t_l)H_{j_k\ldots j_{l+1}}(t_l)h^{(m)}_{j_{l-1}\ldots j_{s+2}}(t_l)dt_ldt_{s+1}\right).$$

Combining Condition 2 of Theorem 13 and (72)–(74), (76), we have

$$\sum_{j_l=0}^{p}C_{j_k\ldots j_{l+1}j_lj_{l-1}\ldots j_{s+1}j_lj_{s-1}\ldots j_1}=$$

$$
=-\sum_{j_l=p+1}^{\infty}\sum_{m=1}^{d}\left(\int\limits_t^T\phi_{j_{s+1}}(t_{s+1})q^{(m)}_{j_{l-1}\ldots j_{s+2}}(t_{s+1})\int\limits_t^{t_{s+1}}\phi_{j_l}(t_s)G_{j_{s-1}\ldots j_1}(t_s)dt_s\times\right.
$$

$$
\left.\times\int\limits_{t_{s+1}}^T\phi_{j_l}(t_l)H_{j_k\ldots j_{l+1}}(t_l)h^{(m)}_{j_{l-1}\ldots j_{s+2}}(t_l)dt_ldt_{s+1}\right)=
$$

$$
=-\sum_{j_l=p+1}^{\infty}\int\limits_t^T\phi_{j_k}(t_k)\ldots\int\limits_t^{t_{l+2}}\phi_{j_{l+1}}(t_{l+1})\int\limits_t^{t_{l+1}}\phi_{j_l}(t_l)\int\limits_t^{t_l}\phi_{j_{l-1}}(t_{l-1})\ldots
$$

$$
\ldots\int\limits_t^{t_{s+2}}\phi_{j_{s+1}}(t_{s+1})\int\limits_t^{t_{s+1}}\phi_{j_l}(t_s)\int\limits_t^{t_s}\phi_{j_{s-1}}(t_{s-1})\ldots
$$

$$
\ldots\int\limits_t^{t_2}\phi_{j_1}(t_1)dt_1\ldots dt_{s-1}dt_sdt_{s+1}\ldots dt_{l-1}dt_ldt_{l+1}\ldots dt_k=
$$

$$
=-\sum_{j_l=p+1}^{\infty}C_{j_k\ldots j_{l+1}j_lj_{l-1}\ldots j_{s+1}j_lj_{s-1}\ldots j_1}. \tag{77}
$$

The equality (77) implies (70), (71).

Step 3. Using Conditions 1 and 2 of Theorem 13, we obtain

$$
\sum_{j_l=0}^{p}C_{j_k\ldots j_{l+1}j_lj_lj_{l-2}\ldots j_1}=
$$

$$
=\int\limits_t^T\psi_k(t_k)\phi_{j_k}(t_k)\ldots\int\limits_t^{t_{l+2}}\psi_{l+1}(t_{l+1})\phi_{j_{l+1}}(t_{l+1})\sum_{j_l=0}^{p}\int\limits_t^{t_{l+1}}\psi_l(t_l)\phi_{j_l}(t_l)\int\limits_t^{t_l}\psi_{l-1}(t_{l-1})\phi_{j_l}(t_{l-1})\times
$$

$$
\times\int\limits_t^{t_{l-1}}\psi_{l-2}(t_{l-2})\phi_{j_{l-2}}(t_{l-2})\ldots\int\limits_t^{t_2}\psi_1(t_1)\phi_{j_1}(t_1)dt_1\ldots dt_{l-2}dt_{l-1}dt_ldt_{l+1}\ldots dt_k=
$$

$$
=\int\limits_t^T\psi_k(t_k)\phi_{j_k}(t_k)\ldots\int\limits_t^{t_{l+2}}\psi_{l+1}(t_{l+1})\phi_{j_{l+1}}(t_{l+1})\sum_{j_l=0}^{\infty}\int\limits_t^{t_{l+1}}\psi_l(t_l)\phi_{j_l}(t_l)\int\limits_t^{t_l}\psi_{l-1}(t_{l-1})\phi_{j_l}(t_{l-1})\times
$$

$$
\times\int\limits_t^{t_{l-1}}\psi_{l-2}(t_{l-2})\phi_{j_{l-2}}(t_{l-2})\ldots\int\limits_t^{t_2}\psi_1(t_1)\phi_{j_1}(t_1)dt_1\ldots dt_{l-2}dt_{l-1}dt_ldt_{l+1}\ldots dt_k-
$$

$$
-\sum_{j_l=p+1}^{\infty}C_{j_k\ldots j_{l+1}j_lj_lj_{l-2}\ldots j_1}=
$$

$$= \frac{1}{2} C_{j_k\ldots j_1}\Biggl|_{(j_l j_l)\curvearrowright(\cdot)} - \sum_{j_l=p+1}^{\infty} C_{j_k\ldots j_{l+1} j_l j_l j_{l-2}\ldots j_1}. \tag{78}$$

Step 4. Passing to the limit $\underset{p\to\infty}{\text{l.i.m.}}$ in (69), we have (see (48))

$$\underset{p\to\infty}{\text{l.i.m.}} \sum_{j_1,\ldots,j_k=0}^{p} C_{j_k\ldots j_1} \zeta_{j_1}^{(i_1)} \ldots \zeta_{j_k}^{(i_k)} = J[\psi^{(k)}]_{T,t}^{(i_1\ldots i_k)} +$$

$$+ \sum_{r=1}^{[k/2]} \sum_{\substack{(\{\{g_1,g_2\},\ldots,\{g_{2r-1},g_{2r}\}\},\{q_1,\ldots,q_{k-2r}\}) \\ \{g_1,g_2,\ldots,g_{2r-1},g_{2r},q_1,\ldots,q_{k-2r}\}=\{1,2,\ldots,k\}}} \prod_{s=1}^{r} \mathbf{1}_{\{i_{g_{2s-1}} = i_{g_{2s}} \ne 0\}} \times$$

$$\times \underset{p\to\infty}{\text{l.i.m.}} \sum_{j_1,\ldots,j_k=0}^{p} C_{j_k\ldots j_1} \prod_{s=1}^{r} \mathbf{1}_{\{j_{g_{2s-1}} = j_{g_{2s}}\}} J'[\phi_{j_{q_1}} \ldots \phi_{j_{q_{k-2r}}}]_{T,t}^{(i_{q_1}\ldots i_{q_{k-2r}})} \quad \text{w. p. 1.} \tag{79}$$

Taking into account (71) and (78), we obtain for $r = 1$

$$\mathbf{1}_{\{i_{g_1} = i_{g_2} \ne 0\}} \underset{p\to\infty}{\text{l.i.m.}} \sum_{j_1,\ldots,j_k=0}^{p} C_{j_k\ldots j_1} \mathbf{1}_{\{j_{g_1} = j_{g_2}\}} J'[\phi_{j_{q_1}} \ldots \phi_{j_{q_{k-2}}}]_{T,t}^{(i_{q_1}\ldots i_{q_{k-2}})} =$$

$$= -\mathbf{1}_{\{i_{g_1} = i_{g_2} \ne 0\}} \underset{p\to\infty}{\text{l.i.m.}} \sum_{j_{g_1}=p+1}^{\infty} \sum_{\substack{j_1,\ldots,j_q,\ldots,j_k=0 \\ q\ne g_1,g_2}}^{p} C_{j_k\ldots j_1}\Biggl|_{j_{g_1} = j_{g_2}} \mathbf{1}_{\{g_2 > g_1+1\}} \times$$

$$\times J'[\phi_{j_{q_1}} \ldots \phi_{j_{q_{k-2}}}]_{T,t}^{(i_{q_1}\ldots i_{q_{k-2}})} +$$

$$+ \mathbf{1}_{\{i_{g_1} = i_{g_2} \ne 0\}} \underset{p\to\infty}{\text{l.i.m.}} \sum_{\substack{j_1,\ldots,j_q,\ldots,j_k=0 \\ q\ne g_1,g_2}}^{p} \frac{1}{2} C_{j_k\ldots j_1}\Biggl|_{(j_{g_2} j_{g_1})\curvearrowright(\cdot),\, j_{g_1} = j_{g_2}} \mathbf{1}_{\{g_2 = g_1+1\}} \times$$

$$\times J'[\phi_{j_{q_1}} \ldots \phi_{j_{q_{k-2}}}]_{T,t}^{(i_{q_1}\ldots i_{q_{k-2}})} -$$

$$- \mathbf{1}_{\{i_{g_1} = i_{g_2} \ne 0\}} \underset{p\to\infty}{\text{l.i.m.}} \sum_{j_{g_1}=p+1}^{\infty} \sum_{\substack{j_1,\ldots,j_q,\ldots,j_k=0 \\ q\ne g_1,g_2}}^{p} C_{j_k\ldots j_1}\Biggl|_{j_{g_1} = j_{g_2}} \mathbf{1}_{\{g_2 = g_1+1\}} \times$$

$$\times J'[\phi_{j_{q_1}} \ldots \phi_{j_{q_{k-2}}}]_{T,t}^{(i_{q_1}\ldots i_{q_{k-2}})} =$$

$$= -\mathbf{1}_{\{i_{g_1} = i_{g_2} \ne 0\}} \underset{p\to\infty}{\text{l.i.m.}} \sum_{j_{g_1}=p+1}^{\infty} \sum_{\substack{j_1,\ldots,j_q,\ldots,j_k=0 \\ q\ne g_1,g_2}}^{p} C_{j_k\ldots j_1}\Biggl|_{j_{g_1} = j_{g_2}} \times$$

$$\times J'[\phi_{j_{q_1}}\ldots\phi_{j_{q_{k-2}}}]_{T,t}^{(i_{q_1}\ldots i_{q_{k-2}})}+$$

$$+\mathbf{1}_{\{i_{g_1}=\ i_{g_2}\ne 0\}}\underset{p\to\infty}{\text{l.i.m.}}\sum_{\substack{j_1,\ldots,j_q,\ldots,j_k=0\\ q\ne g_1,g_2}}^{p}\frac{1}{2}C_{j_k\ldots j_1}\Biggl|_{(j_{g_2}j_{g_1})\curvearrowright(\cdot),j_{g_1}=\ j_{g_2}}\mathbf{1}_{\{g_2=g_1+1\}}\times$$

$$\times J'[\phi_{j_{q_1}}\ldots\phi_{j_{q_{k-2}}}]_{T,t}^{(i_{q_1}\ldots i_{q_{k-2}})}= \tag{80}$$

$$=\frac{1}{2}\mathbf{1}_{\{g_2=g_1+1\}}J[\psi^{(k)}]_{T,t}^{g_1}+\mathbf{1}_{\{i_{g_1}=\ i_{g_2}\ne 0\}}\underset{p\to\infty}{\text{l.i.m.}}\ R_{T,t}^{(p)1,g_1,g_2}\quad \text{w. p. 1}, \tag{81}$$

where $J[\psi^{(k)}]_{T,t}^{g_1}$ $(g_1=1,2,\ldots,k-1)$ is defined by (25),

$$R_{T,t}^{(p)1,g_1,g_2}=-\sum_{\substack{j_1,\ldots,j_q,\ldots,j_k=0\\ q\ne g_1,g_2}}^{p}\bar{C}_{j_k\ldots j_q\ldots j_1}^{(p)}\Biggl|_{q\ne g_1,g_2}J'[\phi_{j_{q_1}}\ldots\phi_{j_{q_{k-2}}}]_{T,t}^{(i_{q_1}\ldots i_{q_{k-2}})}.$$

Let us explain the transition from (80) to (81). We have for $g_2=g_1+1$

$$\mathbf{1}_{\{i_{g_1}=\ i_{g_2}\ne 0\}}\underset{p\to\infty}{\text{l.i.m.}}\sum_{\substack{j_1,\ldots,j_q,\ldots,j_k=0\\ q\ne g_1,g_2}}^{p}\frac{1}{2}C_{j_k\ldots j_1}\Biggl|_{(j_{g_2}j_{g_1})\curvearrowright(\cdot),j_{g_1}=\ j_{g_2}}\times$$

$$\times J'[\phi_{j_{q_1}}\ldots\phi_{j_{q_{k-2}}}]_{T,t}^{(i_{q_1}\ldots i_{q_{k-2}})}=$$

$$=\frac{1}{2}\mathbf{1}_{\{i_{g_1}=\ i_{g_2}\ne 0\}}\underset{p\to\infty}{\text{l.i.m.}}\sum_{\substack{j_1,\ldots,j_q,\ldots,j_k=0\\ q\ne g_1,g_2}}^{p}C_{j_k\ldots j_1}\Biggl|_{(j_{g_2}j_{g_1})\curvearrowright 0,j_{g_1}=\ j_{g_2}}\times$$

$$\times\zeta_0^{(0)}J'[\phi_{j_{q_1}}\ldots\phi_{j_{q_{k-2}}}]_{T,t}^{(i_{q_1}\ldots i_{q_{k-2}})}=$$

$$=\frac{1}{2}\mathbf{1}_{\{i_{g_1}=\ i_{g_2}\ne 0\}}\underset{p\to\infty}{\text{l.i.m.}}\sum_{\substack{j_1,\ldots,j_q,\ldots,j_k=0\\ q\ne g_1,g_2}}^{p}\sum_{j_{m_1}=0}^{p}C_{j_k\ldots j_1}\Biggl|_{(j_{g_2}j_{g_1})\curvearrowright j_{m_1},j_{g_1}=\ j_{g_2}}\times$$

$$\times\zeta_{j_{m_1}}^{(0)}J'[\phi_{j_{q_1}}\ldots\phi_{j_{q_{k-2}}}]_{T,t}^{(i_{q_1}\ldots i_{q_{k-2}})}=$$

$$=\frac{1}{2}\mathbf{1}_{\{i_{g_1}=\ i_{g_2}\ne 0\}}\underset{p\to\infty}{\text{l.i.m.}}\sum_{\substack{j_1,\ldots,j_q,\ldots,j_k=0\\ q\ne g_1,g_2}}^{p}\sum_{j_{m_1}=0}^{p}C_{j_k\ldots j_1}\Biggl|_{(j_{g_2}j_{g_1})\curvearrowright j_{m_1},j_{g_1}=\ j_{g_2}}\times$$

$$\times J'[\phi_{j_{m_1}}\phi_{j_{q_1}}\ldots\phi_{j_{q_{k-2}}}]_{T,t}^{(0i_{q_1}\ldots i_{q_{k-2}})}= \tag{82}$$

$$
= \frac{1}{2} J[\psi^{(k)}]_{T,t}^{g_1} \quad \text{w. p. 1,} \tag{83}
$$

where

$$
C_{j_k \ldots j_1} \Big|_{(j_{g_2} j_{g_1}) \curvearrowright j_{m_1}, j_{g_1} = j_{g_2}, g_2 = g_1 + 1} =
$$

$$
= \int_t^T \psi_k(t_k)\phi_{j_k}(t_k) \ldots \int_t^{t_{g_1+3}} \psi_l(t_{g_1+2})\phi_{j_{g_1+2}}(t_{g_1+2}) \int_t^{t_{g_1+2}} \psi_{g_1+1}(t_{g_1})\psi_{g_1}(t_{g_1})\phi_{j_{m_1}}(t_{g_1}) \times

$$

$$
\phi_0(\tau) = \frac{1}{\sqrt{T-t}}.
$$

The transition from (82) to (83) is based on (48).

By Condition 3 of Theorem 13 we have (also see the property (47) of multiple Wiener stochastic integral)

$$
\lim_{p\to\infty} \mathsf{M}\left\{\left(R_{T,t}^{(p)1,g_1,g_2}\right)^2\right\} \le K \lim_{p\to\infty} \sum_{\substack{j_1,\ldots,j_q,\ldots,j_k=0 \\ q\neq g_1,g_2}}^{p} \left(\bar{C}_{j_k\ldots j_q\ldots j_1}^{(p)}\Big|_{q\neq g_1,g_2}\right)^2 = 0,
$$

where constant K does not depend on p.

Thus

$$
\mathbf{1}_{\{i_{g_1} = i_{g_2} \neq 0\}} \underset{p\to\infty}{\text{l.i.m.}} \sum_{j_1,\ldots,j_k=0}^{p} C_{j_k\ldots j_1} \mathbf{1}_{\{j_{g_1} = j_{g_2}\}} J'[\phi_{j_{q_1}} \ldots \phi_{j_{q_{k-2}}}]_{T,t}^{(i_{q_1}\ldots i_{q_{k-2}})} =
$$

$$
= \frac{1}{2} \mathbf{1}_{\{g_2 = g_1+1\}} J[\psi^{(k)}]_{T,t}^{g_1} \quad \text{w. p. 1.}
$$

Involving into consideration the second pair $\{g_3, g_4\}$ (the first pair is $\{g_1, g_2\}$), we obtain from (80) for $r = 2$

$$
\prod_{s=1}^{2} \mathbf{1}_{\{i_{g_{2s-1}} = i_{g_{2s}} \neq 0\}} \underset{p\to\infty}{\text{l.i.m.}} \sum_{j_1,\ldots,j_k=0}^{p} C_{j_k\ldots j_1} \prod_{s=1}^{2} \mathbf{1}_{\{j_{g_{2s-1}} = j_{g_{2s}}\}} \times
$$

$$
\times J'[\phi_{j_{q_1}} \ldots \phi_{j_{q_{k-4}}}]_{T,t}^{(i_{q_1}\ldots i_{q_{k-4}})} =
$$

$$
=\prod_{s=1}^{2}\mathbf{1}_{\{i_{g_{2s-1}}=~i_{g_{2s}}\ne 0\}}\times
$$

$$
\times\underset{p\to\infty}{\text{l.i.m.}}\sum_{\substack{j_1,\ldots,j_q,\ldots,j_k=0\\ q\ne g_1,g_2,g_3,g_4}}^{p}\Biggl(\frac{1}{4}C_{j_k\ldots j_1}\Biggr|_{(j_{g_2}j_{g_1})\frown(\cdot)(j_{g_4}j_{g_3})\frown(\cdot),j_{g_1}=~j_{g_2},j_{g_3}=~j_{g_4}}\prod_{s=1}^{2}\mathbf{1}_{\{g_{2s}=g_{2s-1}+1\}}-
$$

$$
-\frac{1}{2}\sum_{j_{g_1}=p+1}^{\infty}C_{j_k\ldots j_1}\Biggr|_{(j_{g_4}j_{g_3})\frown(\cdot),j_{g_1}=~j_{g_2},j_{g_3}=~j_{g_4}}\mathbf{1}_{\{g_4=g_3+1\}}-
$$

$$
-\frac{1}{2}\sum_{j_{g_3}=p+1}^{\infty}C_{j_k\ldots j_1}\Biggr|_{(j_{g_2}j_{g_1})\frown(\cdot),j_{g_1}=~j_{g_2},j_{g_3}=~j_{g_4}}\mathbf{1}_{\{g_2=g_1+1\}}+
$$

$$
+\sum_{j_{g_3}=p+1}^{\infty}\sum_{j_{g_1}=p+1}^{\infty}C_{j_k\ldots j_1}\Biggr|_{j_{g_1}=~j_{g_2},j_{g_3}=~j_{g_4}}\Biggr)J'[\phi_{j_{q_1}}\ldots\phi_{j_{q_{k-4}}}]_{T,t}^{(i_{q_1}\ldots i_{q_{k-4}})}= \tag{84}
$$

$$
=\frac{1}{4}\prod_{s=1}^{2}\mathbf{1}_{\{g_{2s}=g_{2s-1}+1\}}J[\psi^{(k)}]_{T,t}^{s_2,s_1}+\prod_{s=1}^{2}\mathbf{1}_{\{i_{g_{2s-1}}=~i_{g_{2s}}\ne 0\}}\underset{p\to\infty}{\text{l.i.m.}}\ R_{T,t}^{(p)2,g_1,g_2,g_3,g_4} \tag{85}
$$

w. p. 1, where $g_3\stackrel{\sf def}{=}s_2$, $g_1\stackrel{\sf def}{=}s_1$, $(s_2,s_1)\in\mathrm{A}_{k,2}$, $J[\psi^{(k)}]_{T,t}^{s_2,s_1}$ is defined by (25) and $\mathrm{A}_{k,2}$ is defined by (26),

$$
R_{T,t}^{(p)2,g_1,g_2,g_3,g_4}=\sum_{\substack{j_1,\ldots,j_q,\ldots,j_k=0\\ q\ne g_1,g_2,g_3,g_4}}^{p}\Biggl(\bar{C}_{j_k\ldots j_q\ldots j_1}^{(p)}\Biggr|_{q\ne g_1,g_2,g_3,g_4}-
$$

$$
-S_1\left\{\bar{C}_{j_k\ldots j_q\ldots j_1}^{(p)}\Biggr|_{q\ne g_1,g_2,g_3,g_4}\right\}-S_2\left\{\bar{C}_{j_k\ldots j_q\ldots j_1}^{(p)}\Biggr|_{q\ne g_1,g_2,g_3,g_4}\right\}\Biggr)\times
$$

$$
\times J'[\phi_{j_{q_1}}\ldots\phi_{j_{q_{k-4}}}]_{T,t}^{(i_{q_1}\ldots i_{q_{k-4}})}.
$$

Let us explain the transition from (84) to (85). We have for $g_2=g_1+1$, $g_4=g_3+1$

$$
\underset{p\to\infty}{\text{l.i.m.}}\sum_{\substack{j_1,\ldots,j_q,\ldots,j_k=0\\ q\ne g_1,g_2,g_3,g_4}}^{p}\frac{1}{4}C_{j_k\ldots j_1}\Biggr|_{(j_{g_2}j_{g_1})\frown(\cdot)(j_{g_4}j_{g_3})\frown(\cdot),j_{g_1}=~j_{g_2},j_{g_3}=~j_{g_4}}\times
$$

$$
\times\prod_{s=1}^{2}\mathbf{1}_{\{i_{g_{2s-1}}=~i_{g_{2s}}\ne 0\}}J'[\phi_{j_{q_1}}\ldots\phi_{j_{q_{k-4}}}]_{T,t}^{(i_{q_1}\ldots i_{q_{k-4}})}=
$$

$$= \frac{1}{4} \underset{p\to\infty}{\text{l.i.m.}} \sum_{\substack{j_1,\ldots,j_q,\ldots,j_k=0\\ q\ne g_1,g_2,g_3,g_4}}^{p} C_{j_k\ldots j_1}\Bigg|_{(j_{g_2}j_{g_1})\curvearrowright 0(j_{g_4}j_{g_3})\curvearrowright 0,j_{g_1}=\ j_{g_2},j_{g_3}=\ j_{g_4}} \times$$

$$\times \prod_{s=1}^{2} \mathbf{1}_{\{i_{g_{2s-1}}=\ i_{g_{2s}}\ne 0\}} \zeta_0^{(0)}\zeta_0^{(0)} J'[\phi_{j_{q_1}}\ldots\phi_{j_{q_{k-4}}}]_{T,t}^{(i_{q_1}\ldots i_{q_{k-4}})} =$$

$$= \frac{1}{4} \underset{p\to\infty}{\text{l.i.m.}} \sum_{\substack{j_1,\ldots,j_q,\ldots,j_k=0\\ q\ne g_1,g_2,g_3,g_4}}^{p} \sum_{j_{m_1},j_{m_3}=0}^{p} C_{j_k\ldots j_1}\Bigg|_{(j_{g_2}j_{g_1})\curvearrowright j_{m_1}(j_{g_4}j_{g_3})\curvearrowright j_{m_3},j_{g_1}=\ j_{g_2},j_{g_3}=\ j_{g_4}} \times$$

$$\times \prod_{s=1}^{2} \mathbf{1}_{\{i_{g_{2s-1}}=\ i_{g_{2s}}\ne 0\}} \zeta_{j_{m_1}}^{(0)}\zeta_{j_{m_3}}^{(0)} J'[\phi_{j_{q_1}}\ldots\phi_{j_{q_{k-4}}}]_{T,t}^{(i_{q_1}\ldots i_{q_{k-4}})} =$$

$$= \frac{1}{4} \underset{p\to\infty}{\text{l.i.m.}} \sum_{\substack{j_1,\ldots,j_q,\ldots,j_k=0\\ q\ne g_1,g_2,g_3,g_4}}^{p} \sum_{j_{m_1},j_{m_3}=0}^{p} C_{j_k\ldots j_1}\Bigg|_{(j_{g_2}j_{g_1})\curvearrowright j_{m_1}(j_{g_4}j_{g_3})\curvearrowright j_{m_3},j_{g_1}=\ j_{g_2},j_{g_3}=\ j_{g_4}} \times$$

$$\times \prod_{s=1}^{2} \mathbf{1}_{\{i_{g_{2s-1}}=\ i_{g_{2s}}\ne 0\}} J'[\phi_{j_{m_1}}\phi_{j_{m_3}}\phi_{j_{q_1}}\ldots\phi_{j_{q_{k-4}}}]_{T,t}^{(00i_{q_1}\ldots i_{q_{k-4}})} = \tag{86}$$

$$= \frac{1}{4} J[\psi^{(k)}]_{T,t}^{s_2,s_1} \quad \text{w. p. 1.} \tag{87}$$

The transition from (86) to (87) is based on (48).

Note that

$$C_{j_k\ldots j_1}\Bigg|_{(j_{g_2}j_{g_1})\curvearrowright j_{m_1},j_{g_1}=\ j_{g_2}} = C_{j_k\ldots j_1}\Bigg|_{(j_{g_1}j_{g_1})\curvearrowright j_{m_1},j_{g_1}=\ j_{g_2}}$$

is the Fourier coefficient, where $g_2 = g_1 + 1$. Therefore, the value

$$C_{j_k\ldots j_1}\Bigg|_{(j_{g_2}j_{g_1})\curvearrowright j_{m_1}(j_{g_4}j_{g_3})\curvearrowright j_{m_3},j_{g_1}=\ j_{g_2},j_{g_3}=\ j_{g_4}} =$$

$$= C_{j_k\ldots j_1}\Bigg|_{(j_{g_1}j_{g_1})\curvearrowright j_{m_1}(j_{g_3}j_{g_3})\curvearrowright j_{m_3},j_{g_1}=\ j_{g_2},j_{g_3}=\ j_{g_4}}$$

is determined recursively using (37) in an obvious way for $g_2 = g_1 + 1$ and $g_4 = g_3 + 1$.

By Condition 3 of Theorem 13 we have (also see the property (47) of multiple Wiener stochastic integral)

$$\lim_{p\to\infty}\mathsf{M}\left\{\left(R_{T,t}^{(p)2,g_1,g_2,g_3,g_4}\right)^2\right\}\le K\lim_{p\to\infty}\sum_{\substack{j_1,\ldots,j_q,\ldots,j_k=0\\ q\ne g_1,g_2,g_3,g_4}}^{p}\left(\left(\bar{C}_{j_k\ldots j_q\ldots j_1}^{(p)}\Biggl|_{q\ne g_1,g_2,g_3,g_4}\right)^2+\right.$$

$$\left.+\left(S_1\left\{\bar{C}_{j_k\ldots j_q\ldots j_1}^{(p)}\Biggl|_{q\ne g_1,g_2,g_3,g_4}\right\}\right)^2+\left(S_2\left\{\bar{C}_{j_k\ldots j_q\ldots j_1}^{(p)}\Biggl|_{q\ne g_1,g_2,g_3,g_4}\right\}\right)^2\right)=0,$$

where constant K is independent of p.

Thus

$$\prod_{s=1}^{2}\mathbf{1}_{\{i_{g_{2s-1}}=\,i_{g_{2s}}\ne 0\}}\underset{p\to\infty}{\text{l.i.m.}}\sum_{j_1,\ldots,j_k=0}^{p}C_{j_k\ldots j_1}\prod_{s=1}^{2}\mathbf{1}_{\{j_{g_{2s-1}}=\,j_{g_{2s}}\}}\times$$

$$\times J'[\phi_{j_{q_1}}\ldots\phi_{j_{q_{k-4}}}]_{T,t}^{(i_{q_1}\ldots i_{q_{k-4}})}=\frac{1}{4}\prod_{s=1}^{2}\mathbf{1}_{\{g_{2s}=g_{2s-1}+1\}}J[\psi^{(k)}]_{T,t}^{s_2,s_1}\quad \text{w. p. 1},$$

where $g_3\overset{\mathsf{def}}{=}s_2,\ g_1\overset{\mathsf{def}}{=}s_1,\ (s_2,s_1)\in\mathrm{A}_{k,2},\ J[\psi^{(k)}]_{T,t}^{s_2,s_1}$ is defined by (25) and $\mathrm{A}_{k,2}$ is defined by (26).

Involving into consideration the third pair $\{g_6,g_5\}$ ($\{g_1,g_2\}$ is the first pair and $\{g_4,g_3\}$ is the second pair), we obtain from (84) for $r=3$

$$\prod_{s=1}^{3}\mathbf{1}_{\{i_{g_{2s-1}}=\,i_{g_{2s}}\ne 0\}}\underset{p\to\infty}{\text{l.i.m.}}\sum_{j_1,\ldots,j_k=0}^{p}C_{j_k\ldots j_1}\prod_{s=1}^{3}\mathbf{1}_{\{j_{g_{2s-1}}=\,j_{g_{2s}}\}}\times$$

$$\times J'[\phi_{j_{q_1}}\ldots\phi_{j_{q_{k-6}}}]_{T,t}^{(i_{q_1}\ldots i_{q_{k-6}})}=\prod_{s=1}^{3}\mathbf{1}_{\{i_{g_{2s-1}}=\,i_{g_{2s}}\ne 0\}}\times$$

$$\times\underset{p\to\infty}{\text{l.i.m.}}\sum_{\substack{j_1,\ldots,j_q,\ldots,j_k=0\\ q\ne g_1,g_2,g_3,g_4,g_5,g_6}}^{p}\left(\frac{1}{2^3}C_{j_k\ldots j_1}\Biggl|_{(j_{g_2}j_{g_1})\curvearrowright(\cdot)(j_{g_4}j_{g_3})\curvearrowright(\cdot)(j_{g_6}j_{g_5})\curvearrowright(\cdot),j_{g_1}=\,j_{g_2},j_{g_3}=\,j_{g_4},j_{g_5}=\,j_{g_6}}\times\right.$$

$$\times\prod_{s=1}^{3}\mathbf{1}_{\{g_{2s}=g_{2s-1}+1\}}-$$

$$-\frac{1}{2^2}\sum_{j_{g_1}=p+1}^{\infty}C_{j_k\ldots j_1}\Biggl|_{(j_{g_4}j_{g_3})\curvearrowright(\cdot)(j_{g_6}j_{g_5})\curvearrowright(\cdot),j_{g_1}=\,j_{g_2},j_{g_3}=\,j_{g_4},j_{g_5}=\,j_{g_6}}\mathbf{1}_{\{g_4=g_3+1\}}\mathbf{1}_{\{g_6=g_5+1\}}-$$

$$-\frac{1}{2^2}\sum_{j_{g_3}=p+1}^{\infty}C_{j_k\ldots j_1}\Biggl|_{(j_{g_2}j_{g_1})\curvearrowright(\cdot)(j_{g_6}j_{g_5})\curvearrowright(\cdot),j_{g_1}=\,j_{g_2},j_{g_3}=\,j_{g_4},j_{g_5}=\,j_{g_6}}\mathbf{1}_{\{g_2=g_1+1\}}\mathbf{1}_{\{g_6=g_5+1\}}-$$

$$-\frac{1}{2^2}\sum_{j_{g_5}=p+1}^{\infty}C_{j_k\ldots j_1}\Biggl|_{(j_{g_2}j_{g_1})\curvearrowright(\cdot)(j_{g_4}j_{g_3})\curvearrowright(\cdot),j_{g_1}=\,j_{g_2},j_{g_3}=\,j_{g_4},j_{g_5}=\,j_{g_6}}\mathbf{1}_{\{g_2=g_1+1\}}\mathbf{1}_{\{g_4=g_3+1\}}+$$

$$\times J'[\phi_{j_{q_1}} \ldots \phi_{j_{q_{k-2r}}}]_{T,t}^{(i_{q_1}\ldots i_{q_{k-2r}})}. \tag{90}$$

Let us explain the transition from (88) to (89). We have for $g_2=g_1+1,\ldots,g_{2r}=g_{2r-1}+1$

$$\underset{p\to\infty}{\text{l.i.m.}} \sum_{\substack{j_1,\ldots,j_q,\ldots,j_k=0\\ q\ne g_1,g_2,\ldots,g_{2r-1},g_{2r}}}^{p} \frac{1}{2^r}C_{j_k\ldots j_1}\biggr|_{(j_{g_2}j_{g_1})\curvearrowright(\cdot)\ldots(j_{g_{2r}}j_{g_{2r-1}})\curvearrowright(\cdot),\,j_{g_1}=~j_{g_2},\ldots,j_{g_{2r-1}}=~j_{g_{2r}}}\times$$

$$\times\prod_{s=1}^{r} \mathbf{1}_{\{i_{g_{2s-1}}=~i_{g_{2s}}\ne 0\}} J'[\phi_{j_{q_1}} \ldots \phi_{j_{q_{k-2r}}}]_{T,t}^{(i_{q_1}\ldots i_{q_{k-2r}})} =$$

$$
=\frac{1}{2^r}\underset{p\to\infty}{\text{l.i.m.}}\sum_{\substack{j_1,\ldots,j_q,\ldots,j_k=0\\ q\ne g_1,g_2,\ldots,g_{2r-1},g_{2r}}}^{p} C_{j_k\ldots j_1}\Biggl|_{(j_{g_2}j_{g_1})\curvearrowright 0\ldots(j_{g_{2r}}j_{g_{2r-1}})\curvearrowright 0,j_{g_1}=j_{g_2},\ldots,j_{g_{2r-1}}=j_{g_{2r}}}\times
$$

$$
\times\prod_{s=1}^{r}\mathbf{1}_{\{i_{g_{2s-1}}=i_{g_{2s}}\ne 0\}}\left(\zeta_0^{(0)}\right)^r J'[\phi_{j_{q_1}}\ldots\phi_{j_{q_{k-2r}}}]_{T,t}^{(i_{q_1}\ldots i_{q_{k-2r}})}=
$$

$$
=\frac{1}{2^r}\underset{p\to\infty}{\text{l.i.m.}}\sum_{\substack{j_1,\ldots,j_q,\ldots,j_k=0\\ q\ne g_1,g_2,\ldots,g_{2r-1},g_{2r}}}^{p}\ \sum_{j_{m_1},j_{m_3}\ldots,j_{m_{2r-1}}=0}^{p}\prod_{s=1}^{r}\mathbf{1}_{\{i_{g_{2s-1}}=i_{g_{2s}}\ne 0\}}\times
$$

$$
\times C_{j_k\ldots j_1}\Biggl|_{(j_{g_2}j_{g_1})\curvearrowright j_{m_1}\ldots(j_{g_{2r}}j_{g_{2r-1}})\curvearrowright j_{m_{2r-1}},j_{g_1}=j_{g_2},\ldots,j_{g_{2r-1}}=j_{g_{2r}}}\times
$$

$$
\times\zeta_{j_{m_1}}^{(0)}\zeta_{j_{m_3}}^{(0)}\ldots\zeta_{j_{m_{2r-1}}}^{(0)}J'[\phi_{j_{q_1}}\ldots\phi_{j_{q_{k-2r}}}]_{T,t}^{(i_{q_1}\ldots i_{q_{k-2r}})}=
$$

$$
=\frac{1}{2^r}\underset{p\to\infty}{\text{l.i.m.}}\sum_{\substack{j_1,\ldots,j_q,\ldots,j_k=0\\ q\ne g_1,g_2,\ldots,g_{2r-1},g_{2r}}}^{p}\ \sum_{j_{m_1},j_{m_3}\ldots,j_{m_{2r-1}}=0}^{p}\prod_{s=1}^{r}\mathbf{1}_{\{i_{g_{2s-1}}=i_{g_{2s}}\ne 0\}}\times
$$

$$
\times C_{j_k\ldots j_1}\Biggl|_{(j_{g_2}j_{g_1})\curvearrowright j_{m_1}\ldots(j_{g_{2r}}j_{g_{2r-1}})\curvearrowright j_{m_{2r-1}},j_{g_1}=j_{g_2},\ldots,j_{g_{2r-1}}=j_{g_{2r}}}\times
$$

$$
\times J'[\phi_{j_{m_1}}\phi_{j_{m_3}}\ldots\phi_{j_{m_{2r-1}}}\phi_{j_{q_1}}\ldots\phi_{j_{q_{k-2r}}}]_{T,t}^{(00\ldots 0i_{q_1}\ldots i_{q_{k-2r}})}= \tag{91}
$$

$$
=\frac{1}{2^r}J[\psi^{(k)}]_{T,t}^{s_r,\ldots,s_1}\quad\text{w. p. 1.} \tag{92}
$$

The transition from (91) to (92) is based on (48).

Note that

$$
C_{j_k\ldots j_1}\Biggl|_{(j_{g_2}j_{g_1})\curvearrowright j_{m_1},j_{g_1}=j_{g_2}}=C_{j_k\ldots j_1}\Biggl|_{(j_{g_1}j_{g_1})\curvearrowright j_{m_1},j_{g_1}=j_{g_2}}
$$

is the Fourier coefficient, where $g_2=g_1+1$. Therefore, the value

$$
C_{j_k\ldots j_1}\Biggl|_{(j_{g_2}j_{g_1})\curvearrowright j_{m_1}\ldots(j_{g_{2d}}j_{g_{2d-1}})\curvearrowright j_{m_{2d-1}},j_{g_1}=j_{g_2},\ldots,j_{g_{2d-1}}=j_{g_{2d}}}=
$$

$$
= C_{j_k\ldots j_1}\Biggl|_{(j_{g_1}j_{g_1})\curvearrowright j_{m_1}\ldots(j_{g_{2d-1}}j_{g_{2d-1}})\curvearrowright j_{m_{2d-1}},j_{g_1}=j_{g_2},\ldots,j_{g_{2d-1}}=j_{g_{2d}}}
$$

is determined recursively using (37) in an obvious way for $g_2 = g_1 + 1, \ldots, g_{2d} = g_{2d-1} + 1$ and $d = 2, \ldots, r$.

By Condition 3 of Theorem 13 we have (also see the property (47) of multiple Wiener stochastic integral)

$$
\lim_{p\to\infty} \mathsf{M}\left\{\left(R_{T,t}^{(p)r,g_1,g_2,\ldots,g_{2r-1},g_{2r}}\right)^2\right\} \le
$$

$$
\le K \lim_{p\to\infty} \sum_{\substack{j_1,\ldots,j_q,\ldots,j_k=0\\ q\ne g_1,g_2,\ldots,g_{2r-1},g_{2r}}}^{p} \left(\left(\bar C_{j_k\ldots j_q\ldots j_1}^{(p)}\Biggl|_{q\ne g_1,g_2,\ldots,g_{2r-1},g_{2r}}\right)^2 + \right.
$$

$$
+ \sum_{l_1=1}^{r}\left(S_{l_1}\left\{\bar C_{j_k\ldots j_q\ldots j_1}^{(p)}\Biggl|_{q\ne g_1,g_2,\ldots,g_{2r-1},g_{2r}}\right\}\right)^2 +
$$

$$
+ \sum_{\substack{l_1,l_2=1\\ l_1>l_2}}^{r}\left(S_{l_1}S_{l_2}\left\{\bar C_{j_k\ldots j_q\ldots j_1}^{(p)}\Biggl|_{q\ne g_1,g_2,\ldots,g_{2r-1},g_{2r}}\right\}\right)^2 +
$$

$$
\ldots
$$

$$
\left. + \sum_{\substack{l_1,l_2,\ldots,l_{r-1}=1\\ l_1>l_2>\ldots>l_{r-1}}}^{r}\left(S_{l_1}S_{l_2}\ldots S_{l_{r-1}}\left\{\bar C_{j_k\ldots j_q\ldots j_1}^{(p)}\Biggl|_{q\ne g_1,g_2,\ldots,g_{2r-1},g_{2r}}\right\}\right)^2\right) = 0,
$$

where constant K does not depend on p.

So we have

$$
\prod_{s=1}^{r}\mathbf{1}_{\{i_{g_{2s-1}}=\,i_{g_{2s}}\ne 0\}}\underset{p\to\infty}{\text{l.i.m.}}\sum_{j_1,\ldots,j_k=0}^{p} C_{j_k\ldots j_1}\prod_{s=1}^{r}\mathbf{1}_{\{j_{g_{2s-1}}=\,j_{g_{2s}}\}}\times
$$

$$
\times J'[\phi_{j_{q_1}}\ldots\phi_{j_{q_{k-2r}}}]_{T,t}^{(i_{q_1}\ldots i_{q_{k-2r}})} =
$$

$$
= \frac{1}{2^r}\prod_{s=1}^{r}\mathbf{1}_{\{g_{2s}=g_{2s-1}+1\}}J[\psi^{(k)}]_{T,t}^{s_r,\ldots,s_1} \quad \text{w. p. 1}, \tag{93}
$$

where $g_{2i-1} \stackrel{\mathsf{def}}{=} s_i$; $i = 1, 2, \ldots, r$; $r = 1, 2, \ldots, [k/2]$, $(s_r, \ldots, s_1) \in \mathrm{A}_{k,r}$, $J[\psi^{(k)}]_{T,t}^{s_r,\ldots,s_1}$ is defined by (25) and $\mathrm{A}_{k,r}$ is defined by (26).

Note that

$$
\sum_{\substack{(\{\{g_1,g_2\},\ldots,\{g_{2r-1},g_{2r}\}\},\{q_1,\ldots,q_{k-2r}\})\\ \{g_1,g_2,\ldots,g_{2r-1},g_{2r},q_1,\ldots,q_{k-2r}\}=\{1,2,\ldots,k\}}}\Biggl.\Biggr|_{g_2=g_1+1,g_3=g_2+1,\ldots,g_{2r}=g_{2r-1}+1} A_{g_1,g_3,\ldots,g_{2r-1}} =
$$

$$
= \sum_{(s_r,\ldots,s_1)\in\mathrm{A}_{k,r}} A_{s_1,s_2,\ldots,s_r}, \tag{94}
$$

where $A_{g_1,g_3,\ldots,g_{2r-1}}$, $A_{s_1,s_2,\ldots,s_r}$ are scalar values, $g_{2i-1}=s_i$; $i=1,2,\ldots,r$; $r=1,2,\ldots,[k/2]$, $\mathrm{A}_{k,r}$ is defined by (26):

$$
\mathrm{A}_{k,r}=\bigl\{(s_r,\ldots,s_1):\ s_r>s_{r-1}+1,\ldots,s_2>s_1+1,\ s_r,\ldots,s_1=1,\ldots,k-1\bigr\}.
$$

Using (79), (93), (94), and Theorem 5, we finally get

$$
\underset{p\to\infty}{\text{l.i.m.}}\sum_{j_1,\ldots,j_k=0}^{p} C_{j_k\ldots j_1}\prod_{l=1}^{k}\zeta_{j_l}^{(i_l)} = \underset{p\to\infty}{\text{l.i.m.}}\sum_{j_1,\ldots,j_k=0}^{p} C_{j_k\ldots j_1}\zeta_{j_1}^{(i_1)}\ldots\zeta_{j_k}^{(i_k)} =
$$

$$
= J[\psi^{(k)}]_{T,t}^{(i_1\ldots i_k)} + \sum_{r=1}^{[k/2]}\frac{1}{2^r}\sum_{(s_r,\ldots,s_1)\in\mathrm{A}_{k,r}} J[\psi^{(k)}]_{T,t}^{s_r,\ldots,s_1} = J^*[\psi^{(k)}]_{T,t}^{(i_1\ldots i_k)} \tag{95}
$$

w. p. 1, where (see (25))

$$
J[\psi^{(k)}]_{T,t}^{s_r,\ldots,s_1} \stackrel{\text{def}}{=} \prod_{p=1}^{r}\mathbf{1}_{\{i_{s_p}=i_{s_p+1}\neq 0\}}\times
$$

$$
\times\int_t^T\psi_k(t_k)\ldots\int_t^{t_{s_r+3}}\psi_{s_r+2}(t_{s_r+2})\int_t^{t_{s_r+2}}\psi_{s_r}(t_{s_r+1})\psi_{s_r+1}(t_{s_r+1})\times
$$

$$
\times\int_t^{t_{s_r+1}}\psi_{s_r-1}(t_{s_r-1})\ldots\int_t^{t_{s_1+3}}\psi_{s_1+2}(t_{s_1+2})\int_t^{t_{s_1+2}}\psi_{s_1}(t_{s_1+1})\psi_{s_1+1}(t_{s_1+1})\times
$$

$$
\times\int_t^{t_{s_1+1}}\psi_{s_1-1}(t_{s_1-1})\ldots\int_t^{t_2}\psi_1(t_1)d\mathbf{w}_{t_1}^{(i_1)}\ldots d\mathbf{w}_{t_{s_1-1}}^{(i_{s_1-1})}dt_{s_1+1}d\mathbf{w}_{t_{s_1+2}}^{(i_{s_1+2})}\ldots
$$

$$
\ldots\ d\mathbf{w}_{t_{s_r-1}}^{(i_{s_r-1})}dt_{s_r+1}d\mathbf{w}_{t_{s_r+2}}^{(i_{s_r+2})}\ldots d\mathbf{w}_{t_k}^{(i_k)}. \tag{96}
$$

Theorem 13 is proved.

Let us make a number of remarks about Theorem 13. An expansion similar to (44) was obtained in [87], where the author used the definition (394) of the Stratonovich stochastic integral, which differs from the definition we use in this article [2]. The proof from [87] is somewhat simpler than the proof proposed in this work. However, the results from [87] were obtained under the condition of convergence of trace series. The verification of this condition for the kernel (12) is a separate problem. In our proof, we essentially use the structure of the Fourier coefficients (45) corresponding to the kernel $K(t_1,\ldots,t_k)$ of the form (12). This circumstance actually made it possible to prove Theorem 13 using not the condition of finiteness of trace series, but using the condition of convergence to zero of explicit expressions for the remainders of the mentioned series. This leaves hope that it is possible to estimate the rate of convergence in Theorem 13 (see Theorems 19–22 below).

Note that under the conditions of Theorem 13 the sequential order of the series (also see (71), (78))

$$\sum_{j_{g_{2r-1}}=p+1}^{\infty}\ \sum_{j_{g_{2r-3}}=p+1}^{\infty}\ldots\sum_{j_{g_3}=p+1}^{\infty}\ \sum_{j_{g_1}=p+1}^{\infty}$$

is not important.

We also note that the first and second conditions of Theorem 13 are satisfied for complete orthonormal systems of Legendre polynomials and trigonometric functions in the space $L_2([t,T])$ (see the proofs of Theorems 16–18 below). Moreover, the equality (42) is true for an arbitrary basis in $L_2([t,T])$ (see [15], Sect. 2.1.4 or [94]). Note that in the proofs of Theorems 6–12, 16–18, 23 the conditions of Theorem 13 are verified for various special cases of iterated Stratonovich stochastic integrals of multiplicities 2–6 with respect to the components of the multidimensional Wiener process.

It should be noted that (see (90))

$$(-1)^r \bar{C}_{j_k\ldots j_q\ldots j_1}^{(p)}\Biggl|_{q\ne g_1,g_2,\ldots,g_{2r-1},g_{2r}}+$$

$$+(-1)^{r-1}\sum_{l_1=1}^{r} S_{l_1}\left\{\bar{C}_{j_k\ldots j_q\ldots j_1}^{(p)}\Biggl|_{q\ne g_1,g_2,\ldots,g_{2r-1},g_{2r}}\right\}+$$

$$+(-1)^{r-2}\sum_{\substack{l_1,l_2=1\\ l_1>l_2}}^{r} S_{l_1}S_{l_2}\left\{\bar{C}_{j_k\ldots j_q\ldots j_1}^{(p)}\Biggl|_{q\ne g_1,g_2,\ldots,g_{2r-1},g_{2r}}\right\}+$$

$$\ldots$$

$$+(-1)^{1}\sum_{\substack{l_1,l_2,\ldots,l_{r-1}=1\\ l_1>l_2>\ldots>l_{r-1}}}^{r} S_{l_1}S_{l_2}\ldots S_{l_{r-1}}\left\{\bar{C}_{j_k\ldots j_q\ldots j_1}^{(p)}\Biggl|_{q\ne g_1,g_2,\ldots,g_{2r-1},g_{2r}}\right\}=$$

$$=\sum_{j_{g_1}=0}^{p}\ldots\sum_{j_{g_{2r-1}}=0}^{p} C_{j_k\ldots j_1}\Biggl|_{j_{g_1}=j_{g_2},\ldots,j_{g_{2r-1}}=j_{g_{2r}}}-$$

$$-\frac{1}{2^r}\prod_{l=1}^{r}\mathbf{1}_{\{g_{2l}=g_{2l-1}+1\}}C_{j_k\ldots j_1}\Biggl|_{(j_{g_2}j_{g_1})\frown(\cdot)\ldots(j_{g_{2r}}j_{g_{2r-1}})\frown(\cdot),\,j_{g_1}=\,j_{g_2},\ldots,j_{g_{2r-1}}=\,j_{g_{2r}}},\qquad (97)$$

where the meaning of the notations used in (90) is preserved.

For example, from (97) for the case $r=2$ we get

$$\sum_{j_{g_3}=p+1}^{\infty}\ \sum_{j_{g_1}=p+1}^{\infty} C_{j_k\ldots j_1}\Biggl|_{j_{g_1}=\,j_{g_2},\,j_{g_3}=\,j_{g_4}}-$$

$$-\frac{1}{2}\mathbf{1}_{\{g_4=g_3+1\}}\sum_{j_{g_1}=p+1}^{\infty}C_{j_k\ldots j_1}\Biggl|_{(j_{g_4}j_{g_3})\frown(\cdot),j_{g_1}=\ j_{g_2},j_{g_3}=\ j_{g_4}}-$$

$$-\frac{1}{2}\mathbf{1}_{\{g_2=g_1+1\}}\sum_{j_{g_3}=p+1}^{\infty}C_{j_k\ldots j_1}\Biggl|_{(j_{g_2}j_{g_1})\frown(\cdot),j_{g_1}=\ j_{g_2},j_{g_3}=\ j_{g_4}}=$$

$$=\sum_{j_{g_1}=0}^{p}\sum_{j_{g_3}=0}^{p}C_{j_k\ldots j_1}\Biggl|_{j_{g_1}=j_{g_2},j_{g_3}=j_{g_4}}-$$

$$-\frac{1}{4}\mathbf{1}_{\{g_2=g_1+1\}}\mathbf{1}_{\{g_4=g_3+1\}}C_{j_k\ldots j_1}\Biggl|_{(j_{g_2}j_{g_1})\frown(\cdot)(j_{g_4}j_{g_3})\frown(\cdot),j_{g_1}=\ j_{g_2},j_{g_3}=\ j_{g_4}}.$$

As a result, Condition 3 of Theorem 13 can be replaced by a weaker condition

$$\lim_{p\to\infty}\sum_{\substack{j_1,\ldots,j_q,\ldots,j_k=0\\ q\ne g_1,g_2,\ldots,g_{2r-1},g_{2r}}}^{p}\left(\sum_{j_{g_1}=0}^{p}\ldots\sum_{j_{g_{2r-1}}=0}^{p}C_{j_k\ldots j_1}\Biggl|_{j_{g_1}=j_{g_2},\ldots,j_{g_{2r-1}}=j_{g_{2r}}}-\right.$$

$$\left.-\frac{1}{2^r}\prod_{l=1}^{r}\mathbf{1}_{\{g_{2l}=g_{2l-1}+1\}}C_{j_k\ldots j_1}\Biggl|_{(j_{g_2}j_{g_1})\frown(\cdot)\ldots(j_{g_{2r}}j_{g_{2r-1}})\frown(\cdot),j_{g_1}=\ j_{g_2},\ldots,j_{g_{2r-1}}=\ j_{g_{2r}}}\right)^2=0, \tag{98}$$

where $r=1,2,\ldots,[k/2]$.

However, Condition 3 of Theorem 13 itself contains a way of proving of the condition (98), which is partially realized in the proof of Theorems 16–18, 23 (see below).

In fact, when proving Theorem 18 (the case $r=3$ is proved in Theorem 23 for $\psi_1(\tau),\ldots,\psi_6(\tau)\equiv 1$), we proved the following equality

$$\lim_{p\to\infty}\sum_{j_{g_1}=0}^{p}\sum_{j_{g_3}=0}^{p}C_{j_k\ldots j_1}\Biggl|_{j_{g_1}=j_{g_2},j_{g_3}=j_{g_4}}=$$

$$=\frac{1}{4}\mathbf{1}_{\{g_2=g_1+1\}}\mathbf{1}_{\{g_4=g_3+1\}}C_{j_k\ldots j_1}\Biggl|_{(j_{g_2}j_{g_1})\frown(\cdot)(j_{g_4}j_{g_3})\frown(\cdot),j_{g_1}=\ j_{g_2},j_{g_3}=\ j_{g_4}}.$$

On the other hand, iterative application of (78) gives

$$\sum_{j_{g_1}=0}^{\infty}\ldots\sum_{j_{g_{2r-1}}=0}^{\infty}C_{j_k\ldots j_1}\Biggl|_{j_{g_1}=j_{g_2},\ldots,j_{g_{2r-1}}=j_{g_{2r}}}=$$

$$=\frac{1}{2^r}\prod_{l=1}^{r}\mathbf{1}_{\{g_{2l}=g_{2l-1}+1\}}C_{j_k\ldots j_1}\Biggl|_{(j_{g_2}j_{g_1})\frown(\cdot)\ldots(j_{g_{2r}}j_{g_{2r-1}})\frown(\cdot),j_{g_1}=\ j_{g_2},\ldots,j_{g_{2r-1}}=\ j_{g_{2r}}},$$

where $r = 1, 2, \ldots, [k/2]$.

Taking into account the modification of Theorem 3 for the case of integration interval $[t, s]$ ($s \in (t, T]$) of iterated Ito stochastic integrals (see Theorem 1.11 in [15], [17] or Theorem 1.24 in [15]), we can formulate an analogue of Theorem 13 for the case of integration interval $[t, s]$ ($s \in (t, T]$) of iterated Stratonovich stochastic integrals of multiplicity k ($k \in \mathbb{N}$).

Denote

$$\bar{C}^{(p)}_{j_k \ldots j_q \ldots j_1}(s)\Bigg|_{q \ne g_1, g_2, \ldots, g_{2r-1}, g_{2r}} \stackrel{\mathsf{def}}{=}$$

$$\stackrel{\mathsf{def}}{=} \sum_{j_{g_{2r-1}}=p+1}^{\infty} \sum_{j_{g_{2r-3}}=p+1}^{\infty} \ldots \sum_{j_{g_3}=p+1}^{\infty} \sum_{j_{g_1}=p+1}^{\infty} C_{j_k \ldots j_1}(s)\Bigg|_{j_{g_1}=j_{g_2}, \ldots, j_{g_{2r-1}}=j_{g_{2r}}}$$

and introduce the following notation

$$S_l \left\{ \bar{C}^{(p)}_{j_k \ldots j_q \ldots j_1}(s)\Bigg|_{q \ne g_1, g_2, \ldots, g_{2r-1}, g_{2r}} \right\} \stackrel{\mathsf{def}}{=} \frac{1}{2} \mathbf{1}_{\{g_{2l}=g_{2l-1}+1\}} \sum_{j_{g_{2r-1}}=p+1}^{\infty} \sum_{j_{g_{2r-3}}=p+1}^{\infty} \ldots$$

$$\ldots \sum_{j_{g_{2l+1}}=p+1}^{\infty} \sum_{j_{g_{2l-3}}=p+1}^{\infty} \ldots \sum_{j_{g_3}=p+1}^{\infty} \sum_{j_{g_1}=p+1}^{\infty} C_{j_k \ldots j_1}(s)\Bigg|_{(j_{g_{2l}} j_{g_{2l-1}}) \frown (\cdot), j_{g_1}=j_{g_2}, \ldots, j_{g_{2r-1}}=j_{g_{2r}}},$$

where $l = 1, 2, \ldots, r$,

$$C_{j_k \ldots j_1}(s)\Bigg|_{(j_{g_{2l}} j_{g_{2l-1}}) \frown (\cdot)}$$

is defined by analogy with (36),

$$C_{j_k \ldots j_1}(s) = \int_t^s \psi_k(t_k) \phi_{j_k}(t_k) \ldots \int_t^{t_2} \psi_1(t_1) \phi_{j_1}(t_1) dt_1 \ldots dt_k. \tag{99}$$

Theorem 15 [15], [47], [55], [62]. *Assume that the continuously differentiable functions* $\psi_l(\tau)$ ($l = 1, \ldots, k$) *and the complete orthonormal system* $\{\phi_j(x)\}_{j=0}^{\infty}$ *of continuous functions* ($\phi_0(x) = 1/\sqrt{T-t}$) *in the space* $L_2([t, T])$ *are such that the following conditions are satisfied*:

1. *The equality*

$$\frac{1}{2} \int_t^s \Phi_1(t_1) \Phi_2(t_1) dt_1 = \sum_{j_1=0}^{\infty} \int_t^s \Phi_2(t_2) \phi_{j_1}(t_2) \int_t^{t_2} \Phi_1(t_1) \phi_{j_1}(t_1) dt_1 dt_2 \tag{100}$$

holds for all $s \in (t, T]$, *where the nonrandom functions* $\Phi_1(\tau)$, $\Phi_2(\tau)$ *are continuously differentiable on* $[t, T]$ *and the series on the right-hand side of* (100) *converges absolutely.*

2. *The estimates*

$$
\left|\int\limits_t^s \phi_j(\tau)\Phi_1(\tau)d\tau\right| \le \frac{\Psi_1(s)}{j^{1/2+\alpha}},\quad \left|\int\limits_\tau^s \phi_j(\theta)\Phi_2(\theta)d\theta\right| \le \frac{\Psi_2(s,\tau)}{j^{1/2+\alpha}},
$$

$$
\left|\sum_{j=p+1}^{\infty}\int\limits_t^s \Phi_2(\tau)\phi_j(\tau)\int\limits_t^\tau \Phi_1(\theta)\phi_j(\theta)d\theta d\tau\right| \le \frac{\Psi_3(s)}{p^\beta}
$$

hold for all s,τ such that $t<\tau<s<T$ and for some $\alpha,\beta>0$, where $\Phi_1(\tau)$, $\Phi_2(\tau)$ are continuously differentiable nonrandom functions on $[t,T]$, $j,p\in\mathbb{N}$, and

$$
\int\limits_t^s |\Psi_1(\tau)\Psi_2(s,\tau)|\,d\tau<\infty,\quad \int\limits_t^s |\Psi_3(\tau)|\,d\tau<\infty
$$

for all $s\in(t,T)$.

3. *The condition*

$$
\lim_{p\to\infty}\sum_{\substack{j_1,\ldots,j_q,\ldots,j_k=0\\ q\ne g_1,g_2,\ldots,g_{2r-1},g_{2r}}}^{p}\left(S_{l_1}S_{l_2}\ldots S_{l_d}\left\{\bar{C}^{(p)}_{j_k\ldots j_q\ldots j_1}(s)\Bigr|_{q\ne g_1,g_2,\ldots,g_{2r-1},g_{2r}}\right\}\right)^2=0
$$

holds for all possible $g_1,g_2,\ldots,g_{2r-1},g_{2r}$ (see (34)) and $l_1,l_2,\ldots,l_d$ such that $l_1,l_2,\ldots,l_d\in\{1,2,\ldots,r\}$, $l_1>l_2>\ldots>l_d$, $d=0,1,2,\ldots,r-1$, where $r=1,2,\ldots,[k/2]$ and

$$
S_{l_1}S_{l_2}\ldots S_{l_d}\left\{\bar{C}^{(p)}_{j_k\ldots j_q\ldots j_1}(s)\Bigr|_{q\ne g_1,g_2,\ldots,g_{2r-1},g_{2r}}\right\}\stackrel{\mathsf{def}}{=}\bar{C}^{(p)}_{j_k\ldots j_q\ldots j_1}(s)\Bigr|_{q\ne g_1,g_2,\ldots,g_{2r-1},g_{2r}}
$$

for $d=0$.

Then, for the iterated Stratonovich stochastic integral of arbitrary multiplicity k

$$
J^*[\psi^{(k)}]_{s,t}^{(i_1\ldots i_k)}=\int\limits_t^{*s}\psi_k(t_k)\ldots\int\limits_t^{*t_2}\psi_1(t_1)d\mathbf{w}_{t_1}^{(i_1)}\ldots d\mathbf{w}_{t_k}^{(i_k)} \tag{101}
$$

the following expansion

$$
J^*[\psi^{(k)}]_{s,t}^{(i_1\ldots i_k)}=\underset{p\to\infty}{\text{l.i.m.}}\sum_{j_1,\ldots,j_k=0}^{p}C_{j_k\ldots j_1}(s)\prod_{l=1}^{k}\zeta_{j_l}^{(i_l)}
$$

that converges in the mean-square sense is valid, where $C_{j_k\ldots j_1}(s)$ is the Fourier coefficient (99), l.i.m. *is a limit in the mean-square sense, $i_1,\ldots,i_k=0,1,\ldots,m$, $s\in(t,T)$,*

$$
\zeta_j^{(i)}=\int\limits_t^T\phi_j(s)d\mathbf{w}_s^{(i)}
$$

are independent standard Gaussian random variables for various i or j (in the case when $i \neq 0$), $\mathbf{w}_\tau^{(i)} = \mathbf{f}_\tau^{(i)}$ for $i = 1, \ldots, m$ and $\mathbf{w}_\tau^{(0)} = \tau$.

The results presented below in this section show that Conditions 1 and 2 of Theorem 13 are satisfied for complete orthonormal systems of Legendre polynomials and trigonometric functions in the space $L_2([t,T])$. Note that Condition 1 of Theorem 13 is fulfilled for an arbitrary complete orthonormal system of functions in the space $L_2([t,T])$ and $\psi_1(\tau), \ldots, \psi_k(\tau) \in L_2([t,T])$ (see recent publications [15] (Sect. 2.1.4) or [94]).

In Sect. 2.1.2 of the monograpths [15]–[18], the following formula is proved

$$\frac{1}{2}\int\limits_t^T \psi_1(t_1)\psi_2(t_1)dt_1 = \sum_{j_1=0}^{\infty} C_{j_1 j_1}, \tag{102}$$

where

$$C_{j_1 j_1} = \int\limits_t^T \psi_2(t_2)\phi_{j_1}(t_2) \int\limits_t^{t_2} \psi_1(t_1)\phi_{j_1}(t_1)dt_1 dt_2,$$

$\{\phi_j(x)\}_{j=0}^{\infty}$ is a complete orthonormal system of Legendre polynomials or trigonometric functions in the space $L_2([t,T])$, the functions $\psi_1(\tau)$, $\psi_2(\tau)$ are continuously differentiable at the interval $[t,T]$.

Moreover (see Sect. 2.1.2 of the monograpths [15]–[18]), the following estimate

$$\left|\sum_{j_1=p+1}^{\infty} C_{j_1 j_1}\right| \le \frac{C}{p}, \tag{103}$$

holds under the above assumptions, where constant C does not depend on p.

The relations (102) and (103) have been modified for the Legendre polynomial system as follows (see Sect. 2.8, 2.13 of the monograpth [17])

$$\frac{1}{2}\int\limits_t^s \psi_1(t_1)\psi_2(t_1)dt_1 = \sum_{j_1=0}^{\infty} C_{j_1 j_1}(s), \tag{104}$$

$$\left|\sum_{j_1=p+1}^{\infty} C_{j_1 j_1}(s)\right| \le \frac{C}{p}\left(\frac{1}{\left(1-z^2(s)\right)^{1/4}} + 1\right), \tag{105}$$

where $s \in (t,T)$ (s is fixed, the case $s = T$ corresponds to (102) and (103)), constant C does not depend p, the functions $\psi_1(\tau)$, $\psi_2(\tau)$ are continuously differentiable at the interval $[t,T]$,

$$C_{j_1 j_1}(s) = \int\limits_t^s \psi_2(t_2)\phi_{j_1}(t_2) \int\limits_t^{t_2} \psi_1(t_1)\phi_{j_1}(t_1)dt_1 dt_2,$$

$$z(s) = \left(s - \frac{T+t}{2}\right)\frac{2}{T-t}. \tag{106}$$

For the trigonometric case, the estimate (105) is replaced by [15], [17]

$$\left|\sum_{j_1=p+1}^{\infty} C_{j_1 j_1}(s)\right| \le \frac{C}{p}, \tag{107}$$

where $s\in[t,T]$, constant C does not depend on p.

Note the well known estimate for the Legendre polynomials

$$|P_j(y)|<\frac{K}{\sqrt{j+1}(1-y^2)^{1/4}},\quad y\in(-1,1),\quad j\in\mathbb{N}, \tag{108}$$

where $P_j(y)$ is the Legendre polynomial, constant K does not depend on y and j.

We also note the following useful estimates for the case of Legendre polynomials ([15]-[18], Chapters 1, 2)

$$\left|\int\limits_t^x \psi(\tau)\phi_j(\tau)d\tau\right|<\frac{C}{j}\left(\frac{1}{(1-(z(x))^2)^{1/4}}+1\right), \tag{109}$$

$$\left|\int\limits_x^T \psi(\tau)\phi_j(\tau)d\tau\right|<\frac{C}{j}\left(\frac{1}{(1-(z(x))^2)^{1/4}}+1\right), \tag{110}$$

$$\left|\int\limits_v^x \psi(\tau)\phi_j(\tau)d\tau\right|<\frac{C}{j}\left(\frac{1}{(1-(z(x))^2)^{1/4}}+\frac{1}{(1-(z(v))^2)^{1/4}}+1\right), \tag{111}$$

where $j\in\mathbb{N}$, $z(x),z(v)\in(-1,1)$, $x,v\in(t,T)$, the function $\psi(\tau)$ is continuously differentiable at the interval $[t,T]$, constant C does not depend on j.

For the case of trigonometric functions we note the following obvious estimates

$$\left|\int\limits_t^x \psi(\tau)\phi_j(\tau)d\tau\right|<\frac{C}{j}, \tag{112}$$

$$\left|\int\limits_x^T \psi(\tau)\phi_j(\tau)d\tau\right|<\frac{C}{j}, \tag{113}$$

$$\left|\int\limits_v^x \psi(\tau)\phi_j(\tau)d\tau\right|<\frac{C}{j}, \tag{114}$$

where $j\in\mathbb{N}$, $x,v\in[t,T]$, the function $\psi(\tau)$ is continuously differentiable at the interval $[t,T]$, constant C does not depend on j.

8. Expansion of Iterated Stratonovich Stochastic Integrals of Multiplicity 3. The Case $p_1=p_2=p_3\to\infty$ and Continuously Differentiable Weight Functions $\psi_1(\tau)$, $\psi_2(\tau)$, $\psi_3(\tau)$ (The Cases of Legendre Polynomials and Trigonometric Functions)

In this section, we present a simple proof of Theorem 11 based on Theorem 13. In this case, the conditions of Theorem 11 will be weakened.

First, consider the following equalities

$$\frac{1}{2}\int\limits_{t_1}^{t_2}\Phi_1(\tau)\Phi_2(\tau)d\tau=\sum_{j=0}^{\infty}\int\limits_{t_1}^{t_2}\Phi_2(\tau)\phi_j(\tau)\int\limits_{t_1}^{\tau}\Phi_1(\theta)\phi_j(\theta)d\theta d\tau, \tag{115}$$

$$\frac{1}{2}\int\limits_{t_1}^{t_2}\Phi_1(\tau)\Phi_2(\tau)d\tau=\sum_{j=0}^{\infty}\int\limits_{t_1}^{t_2}\Phi_1(\theta)\phi_j(\theta)\int\limits_{\theta}^{t_2}\Phi_2(\tau)\phi_j(\tau)d\tau d\theta \tag{116}$$

that will be used further, where $t\le t_1<t_2\le T$, $\Phi_1(\tau),\Phi_2(\tau)\in L_2([t,T])$, $\{\phi_j(x)\}_{j=0}^{\infty}$ is an arbitrary complete orthonormal system of funtions in $L_2([t,T])$. The equality (116) has been proved in [15] (Sect. 2.7.2). Using (116) and Fubini's Theorem, we get (115).

Theorem 16 [15], [47], [55], [62]. *Suppose that $\{\phi_j(x)\}_{j=0}^{\infty}$ is a complete orthonormal system of Legendre polynomials or trigonometric functions in the space $L_2([t,T])$. Furthermore, let $\psi_1(\tau),\psi_2(\tau)$, $\psi_3(\tau)$ are continuously differentiable nonrandom functions on $[t,T]$. Then, for the iterated Stratonovich stochastic integral of third multiplicity*

$$J^*[\psi^{(3)}]_{T,t}=\int\limits_t^{*T}\psi_3(t_3)\int\limits_t^{*t_3}\psi_2(t_2)\int\limits_t^{*t_2}\psi_1(t_1)d\mathbf{w}_{t_1}^{(i_1)}d\mathbf{w}_{t_2}^{(i_2)}d\mathbf{w}_{t_3}^{(i_3)} \tag{117}$$

the following expansion

$$J^*[\psi^{(3)}]_{T,t}=\underset{p\to\infty}{\text{l.i.m.}}\sum_{j_1,j_2,j_3=0}^{p}C_{j_3j_2j_1}\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}\zeta_{j_3}^{(i_3)}$$

that converges in the mean-square sense is valid, where $i_1,i_2,i_3=0,1,\ldots,m$,

$$C_{j_3j_2j_1}=\int\limits_t^{T}\psi_3(t_3)\phi_{j_3}(t_3)\int\limits_t^{t_3}\psi_2(t_2)\phi_{j_2}(t_2)\int\limits_t^{t_2}\psi_1(t_1)\phi_{j_1}(t_1)dt_1dt_2dt_3$$

and

$$\zeta_j^{(i)}=\int\limits_t^{T}\phi_j(s)d\mathbf{w}_s^{(i)}$$

are independent standard Gaussian random variables for various i or j (in the case when $i\ne 0$), $\mathbf{w}_\tau^{(i)}=\mathbf{f}_\tau^{(i)}$ for $i=1,\ldots,m$ and $\mathbf{w}_\tau^{(0)}=\tau$.

Proof. As follows from Sect. 7, Conditions 1 and 2 of Theorem 13 are satisfied for complete orthonormal systems of Legendre polynomials and trigonometric functions in the space $L_2([t,T])$. Let us verify Condition 3 of Theorem 13 for the iterated Stratonovich stochastic integral (117). Thus, we have to check the following conditions

$$\lim_{p\to\infty}\sum_{j_3=0}^{p}\left(\sum_{j_1=p+1}^{\infty}C_{j_3j_1j_1}\right)^2=0, \tag{118}$$

$$\lim_{p\to\infty}\sum_{j_1=0}^{p}\left(\sum_{j_3=p+1}^{\infty}C_{j_3j_3j_1}\right)^2=0, \tag{119}$$

$$\lim_{p\to\infty}\sum_{j_2=0}^{p}\left(\sum_{j_1=p+1}^{\infty}C_{j_1j_2j_1}\right)^2=0. \tag{120}$$

We have

$$\sum_{j_3=0}^{p}\left(\sum_{j_1=p+1}^{\infty}C_{j_3j_1j_1}\right)^2=$$

$$=\sum_{j_3=0}^{p}\left(\sum_{j_1=p+1}^{\infty}\int\limits_t^T\psi_3(t_3)\phi_{j_3}(t_3)\int\limits_t^{t_3}\psi_2(t_2)\phi_{j_1}(t_2)\int\limits_t^{t_2}\psi_1(t_1)\phi_{j_1}(t_1)dt_1dt_2dt_3\right)^2= \tag{121}$$

$$=\sum_{j_3=0}^{p}\left(\int\limits_t^T\psi_3(t_3)\phi_{j_3}(t_3)\sum_{j_1=p+1}^{\infty}\int\limits_t^{t_3}\psi_2(t_2)\phi_{j_1}(t_2)\int\limits_t^{t_2}\psi_1(t_1)\phi_{j_1}(t_1)dt_1dt_2dt_3\right)^2\le \tag{122}$$

$$\le\sum_{j_3=0}^{\infty}\left(\int\limits_t^T\psi_3(t_3)\phi_{j_3}(t_3)\sum_{j_1=p+1}^{\infty}\int\limits_t^{t_3}\psi_2(t_2)\phi_{j_1}(t_2)\int\limits_t^{t_2}\psi_1(t_1)\phi_{j_1}(t_1)dt_1dt_2dt_3\right)^2= \tag{123}$$

$$=\int\limits_t^T\psi_3^2(t_3)\left(\sum_{j_1=p+1}^{\infty}\int\limits_t^{t_3}\psi_2(t_2)\phi_{j_1}(t_2)\int\limits_t^{t_2}\psi_1(t_1)\phi_{j_1}(t_1)dt_1dt_2\right)^2dt_3\le \tag{124}$$

$$\le\frac{K}{p^2}\ \to\ 0 \tag{125}$$

if $p\to\infty$, where constant K does not depend on p.

Note that the transition from (121) to (122) is based on the estimate (105) for the polynomial case and its analogue (107) for the trigonometric case, the transition from (123) to (124) is based on the Parseval equality, and the transition from (124) to (125) is also based on the estimate (105) and its analogue (107) for the trigonometric case.

By analogy with the previous case we have

$$\sum_{j_1=0}^{p}\left(\sum_{j_3=p+1}^{\infty}C_{j_3j_3j_1}\right)^2=$$

$$=\sum_{j_1=0}^{p}\left(\sum_{j_3=p+1}^{\infty}\int\limits_t^T\psi_3(t_3)\phi_{j_3}(t_3)\int\limits_t^{t_3}\psi_2(t_2)\phi_{j_3}(t_2)\int\limits_t^{t_2}\psi_1(t_1)\phi_{j_1}(t_1)dt_1dt_2dt_3\right)^2=$$

$$
= \sum_{j_1=0}^{p} \left(\sum_{j_3=p+1}^{\infty} \int\limits_t^T \psi_1(t_1)\phi_{j_1}(t_1) \int\limits_{t_1}^T \psi_2(t_2)\phi_{j_3}(t_2) \int\limits_{t_2}^T \psi_3(t_3)\phi_{j_3}(t_3) dt_3 dt_2 dt_1 \right)^2 = \tag{126}
$$

$$
= \sum_{j_1=0}^{p} \left(\int\limits_t^T \psi_1(t_1)\phi_{j_1}(t_1) \sum_{j_3=p+1}^{\infty} \int\limits_{t_1}^T \psi_2(t_2)\phi_{j_3}(t_2) \int\limits_{t_2}^T \psi_3(t_3)\phi_{j_3}(t_3) dt_3 dt_2 dt_1 \right)^2 \le \tag{127}
$$

$$
\le \sum_{j_1=0}^{\infty} \left(\int\limits_t^T \psi_1(t_1)\phi_{j_1}(t_1) \sum_{j_3=p+1}^{\infty} \int\limits_{t_1}^T \psi_2(t_2)\phi_{j_3}(t_2) \int\limits_{t_2}^T \psi_3(t_3)\phi_{j_3}(t_3) dt_3 dt_2 dt_1 \right)^2 =
$$

$$
= \int\limits_t^T \psi_1^2(t_1) \left(\sum_{j_3=p+1}^{\infty} \int\limits_{t_1}^T \psi_2(t_2)\phi_{j_3}(t_2) \int\limits_{t_2}^T \psi_1(t_3)\phi_{j_3}(t_3) dt_3 dt_2 \right)^2 dt_1 \le \tag{128}
$$

$$
\le \frac{K}{p^2} \to 0 \tag{129}
$$

if $p \to \infty$, where constant K is independent of p.

The transition from (126) to (127) is based on analogues of the estimates (105), (107) for the value

$$
\left| \sum_{j_3=p+1}^{\infty} \int\limits_{t_1}^T \psi_2(t_2)\phi_{j_3}(t_2) \int\limits_{t_2}^T \psi_3(t_3)\phi_{j_3}(t_3) dt_3 dt_2 \right|
$$

for the polynomial and trigonometric cases, the transition from (128) to (129) is also based on the mentioned analogues of the estimates (105), (107).

Further, we have

$$
\sum_{j_2=0}^{p} \left(\sum_{j_1=p+1}^{\infty} C_{j_1 j_2 j_1} \right)^2 =
$$

$$
= \sum_{j_2=0}^{p} \left(\sum_{j_1=p+1}^{\infty} \int\limits_t^T \psi_3(t_3)\phi_{j_1}(t_3) \int\limits_t^{t_3} \psi_2(t_2)\phi_{j_2}(t_2) \int\limits_t^{t_2} \psi_1(t_1)\phi_{j_1}(t_1) dt_1 dt_2 dt_3 \right)^2 =
$$

$$
= \sum_{j_2=0}^{p} \left(\sum_{j_1=p+1}^{\infty} \int\limits_t^T \psi_2(t_2)\phi_{j_2}(t_2) \int\limits_t^{t_2} \psi_1(t_1)\phi_{j_1}(t_1) dt_1 \int\limits_{t_2}^T \psi_3(t_3)\phi_{j_1}(t_3) dt_3 dt_2 \right)^2 = \tag{130}
$$

$$
= \sum_{j_2=0}^{p} \left(\int\limits_t^T \psi_2(t_2)\phi_{j_2}(t_2) \sum_{j_1=p+1}^{\infty} \int\limits_t^{t_2} \psi_1(t_1)\phi_{j_1}(t_1) dt_1 \int\limits_{t_2}^T \psi_3(t_3)\phi_{j_1}(t_3) dt_3 dt_2 \right)^2 \le \tag{131}
$$

$$\le \sum_{j_2=0}^{\infty}\left(\int\limits_t^T \psi_2(t_2)\phi_{j_2}(t_2)\sum_{j_1=p+1}^{\infty}\int\limits_t^{t_2}\psi_1(t_1)\phi_{j_1}(t_1)dt_1\int\limits_{t_2}^T\psi_3(t_3)\phi_{j_1}(t_3)dt_3dt_2\right)^2 =$$

(132) $$= \int\limits_t^T \psi_2^2(t_2)\left(\sum_{j_1=p+1}^{\infty}\int\limits_t^{t_2}\psi_1(t_1)\phi_{j_1}(t_1)dt_1\int\limits_{t_2}^T\psi_3(t_3)\phi_{j_1}(t_3)dt_3\right)^2 dt_2.$$

The transition from (130) to (131) is based on the estimates (109), (110) and its obvious analogues (112), (113) for the trigonometric case. However, the estimates (109), (110) cannot be used to estimate the right-hand side of (132), since we get the divergent integral. For this reason, we will obtain a new estimate based on the relation [15]-[18]

$$\int\limits_t^x \psi(s)\phi_{j_1}(s)ds = \frac{\sqrt{T-t}\sqrt{2j_1+1}}{2}\int\limits_{-1}^{z(x)} P_{j_1}(y)\psi(u(y))dy =$$

$$= \frac{\sqrt{T-t}}{2\sqrt{2j_1+1}}\Biggl((P_{j_1+1}(z(x)) - P_{j_1-1}(z(x)))\psi(x) -$$

(133) $$-\frac{T-t}{2}\int\limits_{-1}^{z(x)}((P_{j_1+1}(y) - P_{j_1-1}(y))\psi'(u(y))dy\Biggr),$$

where $x \in (t,T)$, $j_1 \ge p+1$, $z(x)$ is defined by (106), $P_j(x)$ is the Legendre polynomial, ψ' is a derivative of the continuously differentiable function $\psi(s)$ with respect to the variable $u(y)$,

$$u(y) = \frac{T-t}{2}y + \frac{T+t}{2}.$$

From (108) and the estimate $|P_j(y)| \le 1$, $y \in [-1,1]$ we obtain

(134) $$|P_j(y)| = |P_j(y)|^{\varepsilon}\cdot|P_j(y)|^{1-\varepsilon} \le |P_j(y)|^{1-\varepsilon} < \frac{C}{j^{1/2-\varepsilon/2}(1-y^2)^{1/4-\varepsilon/4}},$$

where $y \in (-1,1)$, $j \in \mathbb{N}$, and ε is an arbitrary small positive real number.

Combining (133) and (134), we have the following estimate

(135) $$\left|\int\limits_t^s \psi_1(\tau)\phi_{j_1}(\tau)d\tau\right| < \frac{C}{(j_1)^{1-\varepsilon/2}}\left(\frac{1}{(1-z^2(s))^{1/4-\varepsilon/4}}+1\right),$$

where $s \in (t,T)$, $z(s)$ is defined by (106), constant C does not depend on j_1.

Similarly to (135) we obtain

(136) $$\left|\int\limits_s^T \psi_3(\tau)\phi_{j_1}(\tau)d\tau\right| < \frac{C}{(j_1)^{1-\varepsilon/2}}\left(\frac{1}{(1-z^2(s))^{1/4-\varepsilon/4}}+1\right),$$

where $s \in (t,T)$, constant C is independent of j_1.

Combining (109) and (136), we have

$$\left|\int\limits_t^s \psi_1(\tau)\phi_{j_1}(\tau)d\tau \int\limits_s^T \psi_3(\tau)\phi_{j_1}(\tau)d\tau\right| <$$

$$< \frac{L}{(j_1)^{2-\varepsilon/2}}\left(\frac{1}{(1-z^2(s))^{1/4-\varepsilon/4}}+1\right)\left(\frac{1}{(1-z^2(s))^{1/4}}+1\right), \qquad (137)$$

where $s \in (t,T)$, $z(s)$ is defined by (106), constant L does not depend on j_1.

Observe that

$$\sum_{j_1=p+1}^{\infty}\frac{1}{(j_1)^{2-\varepsilon/2}} \le \int\limits_p^{\infty}\frac{dx}{x^{2-\varepsilon/2}} = \frac{1}{(1-\varepsilon/2)p^{1-\varepsilon/2}}. \qquad (138)$$

Applying (137) and (138) to estimate the right-hand side of (132) gives

$$\sum_{j_2=0}^{p}\left(\sum_{j_1=p+1}^{\infty} C_{j_1 j_2 j_1}\right)^2 \le \frac{K}{p^{2-\varepsilon}} \ \to \ 0 \qquad (139)$$

if $p \to \infty$, where ε is an arbitrary small positive real number, constant K is independent of p.

The estimation of the right-hand side of (132) for the trigonometric case is carried out using the estimates (112), (113). At that we obtain the estimate (139) with $\varepsilon = 0$. Theorem 16 is proved.

9. Expansion of Iterated Stratonovich Stochastic Integrals of Multiplicity 4. The Case $p_1 = \ldots = p_4 \to \infty$ and Continuously Differentiable Weight Functions $\psi_1(\tau)$, $\ldots$, $\psi_4(\tau)$ (The Cases of Legendre Polynomials and Trigonometric Functions)

Theorem 17 [15], [47], [55], [62]. *Suppose that $\{\phi_j(x)\}_{j=0}^{\infty}$ is a complete orthonormal system of Legendre polynomials or trigonometric functions in the space $L_2([t,T])$. Furthermore, let $\psi_1(\tau),\ldots,$ $\psi_4(\tau)$ are continuously differentiable nonrandom functions on $[t,T]$. Then, for the iterated Stratonovich stochastic integral of fourth multiplicity*

$$J^*[\psi^{(4)}]_{T,t} = \int\limits_t^{*T}\psi_4(t_4)\int\limits_t^{*t_4}\psi_3(t_3)\int\limits_t^{*t_3}\psi_2(t_2)\int\limits_t^{*t_2}\psi_1(t_1)d\mathbf{w}_{t_1}^{(i_1)}d\mathbf{w}_{t_2}^{(i_2)}d\mathbf{w}_{t_3}^{(i_3)}d\mathbf{w}_{t_4}^{(i_4)} \qquad (140)$$

the following expansion

$$J^*[\psi^{(4)}]_{T,t} = \underset{p\to\infty}{\text{l.i.m.}}\sum_{j_1,j_2,j_3,j_4=0}^{p} C_{j_4 j_3 j_2 j_1}\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}\zeta_{j_3}^{(i_3)}\zeta_{j_4}^{(i_4)}$$

that converges in the mean-square sense is valid, where $i_1, i_2, i_3, i_4 = 0, 1, \ldots, m$,

$$C_{j_4 j_3 j_2 j_1} = \int\limits_t^T \psi_4(t_4)\phi_{j_4}(t_4) \int\limits_t^{t_4} \psi_3(t_3)\phi_{j_3}(t_3) \int\limits_t^{t_3} \psi_2(t_2)\phi_{j_2}(t_2) \int\limits_t^{t_2} \psi_1(t_1)\phi_{j_1}(t_1) dt_1 \times$$

$$\times dt_2 dt_3 dt_4$$

and

$$\zeta_j^{(i)} = \int\limits_t^T \phi_j(s) d\mathbf{w}_s^{(i)}$$

are independent standard Gaussian random variables for various i *or* j (*in the case when* $i \neq 0$), $\mathbf{w}_\tau^{(i)} = \mathbf{f}_\tau^{(i)}$ *for* $i = 1, \ldots, m$ *and* $\mathbf{w}_\tau^{(0)} = \tau$.

Proof. As follows from Sect. 7, Conditions 1 and 2 of Theorem 13 are satisfied for complete orthonormal systems of Legendre polynomials and trigonometric functions in the space $L_2([t,T])$. Let us verify Condition 3 of Theorem 13 for the iterated Stratonovich stochastic integral (140). Thus, we have to check the following conditions

$$\lim_{p\to\infty} \sum_{j_3,j_4=0}^{p} \left(\sum_{j_1=p+1}^{\infty} C_{j_4 j_3 j_1 j_1} \right)^2 = 0, \tag{141}$$

$$\lim_{p\to\infty} \sum_{j_2,j_4=0}^{p} \left(\sum_{j_1=p+1}^{\infty} C_{j_4 j_1 j_2 j_1} \right)^2 = 0, \tag{142}$$

$$\lim_{p\to\infty} \sum_{j_2,j_3=0}^{p} \left(\sum_{j_1=p+1}^{\infty} C_{j_1 j_3 j_2 j_1} \right)^2 = 0, \tag{143}$$

$$\lim_{p\to\infty} \sum_{j_1,j_4=0}^{p} \left(\sum_{j_2=p+1}^{\infty} C_{j_4 j_2 j_2 j_1} \right)^2 = 0, \tag{144}$$

$$\lim_{p\to\infty} \sum_{j_1,j_3=0}^{p} \left(\sum_{j_2=p+1}^{\infty} C_{j_2 j_3 j_2 j_1} \right)^2 = 0, \tag{145}$$

$$\lim_{p\to\infty} \sum_{j_1,j_2=0}^{p} \left(\sum_{j_3=p+1}^{\infty} C_{j_3 j_3 j_2 j_1} \right)^2 = 0, \tag{146}$$

$$\lim_{p\to\infty} \left(\sum_{j_2=p+1}^{\infty} \sum_{j_1=p+1}^{\infty} C_{j_2 j_1 j_2 j_1} \right)^2 = 0, \tag{147}$$

$$\lim_{p\to\infty} \left(\sum_{j_2=p+1}^{\infty} \sum_{j_1=p+1}^{\infty} C_{j_1 j_2 j_2 j_1} \right)^2 = 0, \tag{148}$$

$$\lim_{p\to\infty}\left(\sum_{j_3=p+1}^{\infty}\sum_{j_1=p+1}^{\infty}C_{j_3j_3j_1j_1}\right)^2=0, \tag{149}$$

$$\lim_{p\to\infty}\left(\sum_{j_3=p+1}^{\infty}C_{j_3j_3j_1j_1}\Bigl|_{(j_1j_1)\frown(\cdot)}\right)^2=0, \tag{150}$$

$$\lim_{p\to\infty}\left(\sum_{j_1=p+1}^{\infty}C_{j_3j_3j_1j_1}\Bigl|_{(j_3j_3)\frown(\cdot)}\right)^2=0, \tag{151}$$

$$\lim_{p\to\infty}\left(\sum_{j_1=p+1}^{\infty}C_{j_1j_2j_2j_1}\Bigl|_{(j_2j_2)\frown(\cdot)}\right)^2=0, \tag{152}$$

where we use the notation (36) in (150)–(152).

Applying arguments similar to those we used in the proof of Theorem 16, we obtain for (141)

$$\sum_{j_3,j_4=0}^{p}\left(\sum_{j_1=p+1}^{\infty}C_{j_4j_3j_1j_1}\right)^2=\sum_{j_3,j_4=0}^{p}\left(\sum_{j_1=p+1}^{\infty}\int\limits_t^T\psi_4(t_4)\phi_{j_4}(t_4)\int\limits_t^{t_4}\psi_3(t_3)\phi_{j_3}(t_3)\times\right.$$

$$\left.\times\int\limits_t^{t_3}\psi_2(t_2)\phi_{j_1}(t_2)\int\limits_t^{t_2}\psi_1(t_1)\phi_{j_1}(t_1)dt_1dt_2dt_3dt_4\right)^2= \tag{153}$$

$$=\sum_{j_3,j_4=0}^{p}\left(\int\limits_t^T\psi_4(t_4)\phi_{j_4}(t_4)\int\limits_t^{t_4}\psi_3(t_3)\phi_{j_3}(t_3)\times\right.$$

$$\left.\times\sum_{j_1=p+1}^{\infty}\int\limits_t^{t_3}\psi_2(t_2)\phi_{j_1}(t_2)\int\limits_t^{t_2}\psi_1(t_1)\phi_{j_1}(t_1)dt_1dt_2dt_3dt_4\right)^2\le \tag{154}$$

$$\le\sum_{j_3,j_4=0}^{\infty}\left(\int\limits_t^T\psi_4(t_4)\phi_{j_4}(t_4)\int\limits_t^{t_4}\psi_3(t_3)\phi_{j_3}(t_3)\times\right.$$

$$\left.\times\sum_{j_1=p+1}^{\infty}\int\limits_t^{t_3}\psi_2(t_2)\phi_{j_1}(t_2)\int\limits_t^{t_2}\psi_1(t_1)\phi_{j_1}(t_1)dt_1dt_2dt_3dt_4\right)^2= \tag{155}$$

$$=\int\limits_{[t,T]^2}\mathbf{1}_{\{t_3<t_4\}}\psi_4^2(t_4)\psi_3^2(t_3)\left(\sum_{j_1=p+1}^{\infty}\int\limits_t^{t_3}\psi_2(t_2)\phi_{j_1}(t_2)\int\limits_t^{t_2}\psi_1(t_1)\phi_{j_1}(t_1)dt_1dt_2\right)^2dt_3dt_4\le \tag{156}$$

$$\le\frac{K}{p^2}\ \to\ 0 \tag{157}$$

if $p\to\infty$, where constant K is independent of p.

Note that the transition from (153) to (154) is based on the estimate (105) for the polynomial case and its analogue for the trigonometric case, the transition from (155) to (156) is based on the Parseval equality, and the transition from (156) to (157) is also based on the estimate (105) and its analogue for the trigonometric case.

Further, we have for (142)

$$\sum_{j_2,j_4=0}^{p}\left(\sum_{j_1=p+1}^{\infty}C_{j_4j_1j_2j_1}\right)^2=\sum_{j_2,j_4=0}^{p}\left(\sum_{j_1=p+1}^{\infty}\int\limits_t^T\psi_4(t_4)\phi_{j_4}(t_4)\int\limits_t^{t_4}\psi_3(t_3)\phi_{j_1}(t_3)\times\right.$$

$$\left.\times\int\limits_t^{t_3}\psi_2(t_2)\phi_{j_2}(t_2)\int\limits_t^{t_2}\psi_1(t_1)\phi_{j_1}(t_1)dt_1dt_2dt_3dt_4\right)^2= \tag{158}$$

$$=\sum_{j_2,j_4=0}^{p}\left(\sum_{j_1=p+1}^{\infty}\int\limits_t^T\psi_4(t_4)\phi_{j_4}(t_4)\int\limits_t^{t_4}\psi_2(t_2)\phi_{j_2}(t_2)\times\right.$$

$$\left.\times\int\limits_t^{t_2}\psi_1(t_1)\phi_{j_1}(t_1)dt_1\int\limits_{t_2}^{t_4}\psi_3(t_3)\phi_{j_1}(t_3)dt_3dt_2dt_4\right)^2= \tag{159}$$

$$=\sum_{j_2,j_4=0}^{p}\left(\int\limits_t^T\psi_4(t_4)\phi_{j_4}(t_4)\int\limits_t^{t_4}\psi_2(t_2)\phi_{j_2}(t_2)\times\right.$$

$$\left.\times\sum_{j_1=p+1}^{\infty}\int\limits_t^{t_2}\psi_1(t_1)\phi_{j_1}(t_1)dt_1\int\limits_{t_2}^{t_4}\psi_3(t_3)\phi_{j_1}(t_3)dt_3dt_2dt_4\right)^2\le$$

$$\le\sum_{j_2,j_4=0}^{\infty}\left(\int\limits_t^T\psi_4(t_4)\phi_{j_4}(t_4)\int\limits_t^{t_4}\psi_2(t_2)\phi_{j_2}(t_2)\times\right.$$

$$\left.\times\sum_{j_1=p+1}^{\infty}\int\limits_t^{t_2}\psi_1(t_1)\phi_{j_1}(t_1)dt_1\int\limits_{t_2}^{t_4}\psi_3(t_3)\phi_{j_1}(t_3)dt_3dt_2dt_4\right)^2=$$

$$=\int\limits_{[t,T]^2}\mathbf{1}_{\{t_2<t_4\}}\psi_4^2(t_4)\psi_2^2(t_2)\left(\sum_{j_1=p+1}^{\infty}\int\limits_t^{t_2}\psi_1(t_1)\phi_{j_1}(t_1)dt_1\int\limits_{t_2}^{t_4}\psi_3(t_3)\phi_{j_1}(t_3)dt_3\right)^2dt_2dt_4\le$$

$$\le\frac{K}{p^{2-\varepsilon}}\ \to\ 0 \tag{160}$$

if $p\to\infty$, where ε is an arbitrary small positive real number for the polynomial case and $\varepsilon=0$ for the trigonometric case, constant K does not depend on p.

The relation (160) was obtained by the same method as (157). Note that in obtaining (160) we used the estimates (111), (135) for the polynomial case and (112), (114) for the trigonometric case. We also used the integration order replacement in the iterated Riemann integrals (see (158), (159)).

Repeating the previous steps for (143) and (144), we get

$$\sum_{j_2,j_3=0}^{p}\left(\sum_{j_1=p+1}^{\infty}C_{j_1j_3j_2j_1}\right)^2=\sum_{j_2,j_3=0}^{p}\left(\sum_{j_1=p+1}^{\infty}\int\limits_t^T\psi_4(t_4)\phi_{j_1}(t_4)\int\limits_t^{t_4}\psi_3(t_3)\phi_{j_3}(t_3)\times\right.$$

$$\left.\times\int\limits_t^{t_3}\psi_2(t_2)\phi_{j_2}(t_2)\int\limits_t^{t_2}\psi_1(t_1)\phi_{j_1}(t_1)dt_1dt_2dt_3dt_4\right)^2=$$

$$=\sum_{j_2,j_3=0}^{p}\left(\sum_{j_1=p+1}^{\infty}\int\limits_t^T\psi_3(t_3)\phi_{j_3}(t_3)\int\limits_t^{t_3}\psi_2(t_2)\phi_{j_2}(t_2)\times\right.$$

$$\left.\times\int\limits_t^{t_2}\psi_1(t_1)\phi_{j_1}(t_1)dt_1\int\limits_{t_3}^{T}\psi_4(t_4)\phi_{j_1}(t_4)dt_4dt_2dt_3\right)^2=$$

$$=\sum_{j_2,j_3=0}^{p}\left(\int\limits_t^T\psi_3(t_3)\phi_{j_3}(t_3)\int\limits_t^{t_3}\psi_2(t_2)\phi_{j_2}(t_2)\times\right.$$

$$\left.\times\sum_{j_1=p+1}^{\infty}\int\limits_t^{t_2}\psi_1(t_1)\phi_{j_1}(t_1)dt_1\int\limits_{t_3}^{T}\psi_4(t_4)\phi_{j_1}(t_4)dt_4dt_2dt_3\right)^2\le$$

$$\le\sum_{j_2,j_3=0}^{\infty}\left(\int\limits_t^T\psi_3(t_3)\phi_{j_3}(t_3)\int\limits_t^{t_3}\psi_2(t_2)\phi_{j_2}(t_2)\times\right.$$

$$\left.\times\sum_{j_1=p+1}^{\infty}\int\limits_t^{t_2}\psi_1(t_1)\phi_{j_1}(t_1)dt_1\int\limits_{t_3}^{T}\psi_4(t_4)\phi_{j_1}(t_4)dt_4dt_2dt_3\right)^2=$$

$$=\int\limits_{[t,T]^2}\mathbf{1}_{\{t_2<t_3\}}\psi_3^2(t_3)\psi_2^2(t_2)\left(\sum_{j_1=p+1}^{\infty}\int\limits_t^{t_2}\psi_1(t_1)\phi_{j_1}(t_1)dt_1\int\limits_{t_3}^{T}\psi_4(t_4)\phi_{j_1}(t_4)dt_4\right)^2dt_2dt_3\le$$

$$\le\frac{K}{p^2}\ \to\ 0 \qquad (161)$$

if $p\to\infty$, where constant K does not depend on p;

$$\sum_{j_1,j_4=0}^{p}\left(\sum_{j_2=p+1}^{\infty}C_{j_4j_2j_2j_1}\right)^2=\sum_{j_1,j_4=0}^{p}\left(\sum_{j_2=p+1}^{\infty}\int\limits_t^T\psi_4(t_4)\phi_{j_4}(t_4)\int\limits_t^{t_4}\psi_3(t_3)\phi_{j_2}(t_3)\times\right.$$

$$\left.\times\int\limits_t^{t_3}\psi_2(t_2)\phi_{j_2}(t_2)\int\limits_t^{t_2}\psi_1(t_1)\phi_{j_1}(t_1)dt_1dt_2dt_3dt_4\right)^2=$$

$$=\sum_{j_1,j_4=0}^{p}\left(\sum_{j_2=p+1}^{\infty}\int\limits_t^T\psi_4(t_4)\phi_{j_4}(t_4)\int\limits_t^{t_4}\psi_1(t_1)\phi_{j_1}(t_1)\times\right.$$

$$
\times \int\limits_{t_1}^{t_4} \psi_2(t_2)\phi_{j_2}(t_2) \int\limits_{t_2}^{t_4} \psi_3(t_3)\phi_{j_2}(t_3)dt_3dt_2dt_1dt_4\Biggr)^2 =
$$

$$
= \sum_{j_1,j_4=0}^{p} \Biggl(\int\limits_t^T \psi_4(t_4)\phi_{j_4}(t_4) \int\limits_t^{t_4} \psi_1(t_1)\phi_{j_1}(t_1)\times
$$

$$
\times \sum_{j_2=p+1}^{\infty} \int\limits_{t_1}^{t_4} \psi_2(t_2)\phi_{j_2}(t_2) \int\limits_{t_2}^{t_4} \psi_3(t_3)\phi_{j_2}(t_3)dt_3dt_2dt_1dt_4\Biggr)^2 \le
$$

$$
\le \sum_{j_1,j_4=0}^{\infty} \Biggl(\int\limits_t^T \psi_4(t_4)\phi_{j_4}(t_4) \int\limits_t^{t_4} \psi_1(t_1)\phi_{j_1}(t_1)\times
$$

$$
\times \sum_{j_2=p+1}^{\infty} \int\limits_{t_1}^{t_4} \psi_2(t_2)\phi_{j_2}(t_2) \int\limits_{t_2}^{t_4} \psi_3(t_3)\phi_{j_2}(t_3)dt_3dt_2dt_1dt_4\Biggr)^2 =
$$

$$
= \int\limits_{[t,T]^2} \mathbf{1}_{\{t_1<t_4\}}\psi_4^2(t_4)\psi_1^2(t_1)\left(\sum_{j_2=p+1}^{\infty} \int\limits_{t_1}^{t_4} \psi_2(t_2)\phi_{j_2}(t_2) \int\limits_{t_2}^{t_4} \psi_3(t_3)\phi_{j_2}(t_3)dt_3dt_2\right)^2 dt_1dt_4. \tag{162}
$$

Note that, by virtue of the additivity property of the integral, we have

$$
\sum_{j_2=p+1}^{\infty} \int\limits_{t_1}^{t_4} \psi_2(t_2)\phi_{j_2}(t_2) \int\limits_{t_2}^{t_4} \psi_3(t_3)\phi_{j_2}(t_3)dt_3dt_2 = \tag{163}
$$

$$
= \sum_{j_2=p+1}^{\infty} \int\limits_{t}^{t_4} \psi_3(t_3)\phi_{j_2}(t_3) \int\limits_{t}^{t_3} \psi_2(t_2)\phi_{j_2}(t_2)dt_2dt_3-
$$

$$
- \sum_{j_2=p+1}^{\infty} \int\limits_{t}^{t_1} \psi_3(t_3)\phi_{j_2}(t_3) \int\limits_{t}^{t_3} \psi_2(t_2)\phi_{j_2}(t_2)dt_2dt_3-
$$

$$
- \sum_{j_2=p+1}^{\infty} \int\limits_{t_1}^{t_4} \psi_3(t_3)\phi_{j_2}(t_3)dt_3 \int\limits_{t}^{t_1} \psi_2(t_2)\phi_{j_2}(t_2)dt_2. \tag{164}
$$

However, all three series on the right-hand side of (164) have already been evaluated in (157) and (160). From (162) and (164) we finally obtain

$$
\sum_{j_1,j_4=0}^{p} \left(\sum_{j_2=p+1}^{\infty} C_{j_4j_2j_2j_1}\right)^2 \le \frac{K}{p^{2-\varepsilon}} \ \to \ 0 \tag{165}
$$

if $p \to \infty$, where ε is an arbitrary small positive real number for the polynomial case and $\varepsilon = 0$ for the trigonometric case, constant K does not depend on p.

In complete analogy with (160), we have for (145)

$$
\sum_{j_1,j_3=0}^{p}\left(\sum_{j_2=p+1}^{\infty}C_{j_2j_3j_2j_1}\right)^2=\sum_{j_1,j_3=0}^{p}\left(\sum_{j_2=p+1}^{\infty}\int\limits_t^T\psi_4(t_4)\phi_{j_2}(t_4)\int\limits_t^{t_4}\psi_3(t_3)\phi_{j_3}(t_3)\times\right.
$$

$$
\left.\times\int\limits_t^{t_3}\psi_2(t_2)\phi_{j_2}(t_2)\int\limits_t^{t_2}\psi_1(t_1)\phi_{j_1}(t_1)dt_1dt_2dt_3dt_4\right)^2=
$$

$$
=\sum_{j_1,j_3=0}^{p}\left(\sum_{j_2=p+1}^{\infty}\int\limits_t^T\psi_3(t_3)\phi_{j_3}(t_3)\int\limits_t^{t_3}\psi_2(t_2)\phi_{j_2}(t_2)\times\right.
$$

$$
\left.\times\int\limits_t^{t_2}\psi_1(t_1)\phi_{j_1}(t_1)dt_1dt_2\int\limits_{t_3}^T\psi_4(t_4)\phi_{j_2}(t_4)dt_4dt_3\right)^2=
$$

$$
=\sum_{j_1,j_3=0}^{p}\left(\sum_{j_2=p+1}^{\infty}\int\limits_t^T\psi_3(t_3)\phi_{j_3}(t_3)\int\limits_t^{t_3}\psi_1(t_1)\phi_{j_1}(t_1)\times\right.
$$

$$
\left.\times\int\limits_{t_1}^{t_3}\psi_2(t_2)\phi_{j_2}(t_2)dt_2dt_1\int\limits_{t_3}^T\psi_4(t_4)\phi_{j_2}(t_4)dt_4dt_3\right)^2=
$$

$$
=\sum_{j_1,j_3=0}^{p}\left(\int\limits_t^T\psi_3(t_3)\phi_{j_3}(t_3)\int\limits_t^{t_3}\psi_1(t_1)\phi_{j_1}(t_1)\times\right.
$$

$$
\left.\times\sum_{j_2=p+1}^{\infty}\int\limits_{t_1}^{t_3}\psi_2(t_2)\phi_{j_2}(t_2)dt_2dt_1\int\limits_{t_3}^T\psi_4(t_4)\phi_{j_2}(t_4)dt_4dt_3\right)^2\le
$$

$$
\le\sum_{j_1,j_3=0}^{\infty}\left(\int\limits_t^T\psi_3(t_3)\phi_{j_3}(t_3)\int\limits_t^{t_3}\psi_1(t_1)\phi_{j_1}(t_1)\times\right.
$$

$$
\left.\times\sum_{j_2=p+1}^{\infty}\int\limits_{t_1}^{t_3}\psi_2(t_2)\phi_{j_2}(t_2)dt_2\int\limits_{t_3}^T\psi_4(t_4)\phi_{j_2}(t_4)dt_4dt_1dt_3\right)^2=
$$

$$
=\int\limits_{[t,T]^2}\mathbf{1}_{\{t_1<t_3\}}\psi_3^2(t_3)\psi_1^2(t_1)\left(\sum_{j_2=p+1}^{\infty}\int\limits_{t_1}^{t_3}\psi_2(t_2)\phi_{j_2}(t_2)dt_2\int\limits_{t_3}^T\psi_4(t_4)\phi_{j_2}(t_4)dt_4\right)^2dt_1dt_3\le
$$

$$
\le\frac{K}{p^{2-\varepsilon}}\ \to\ 0 \tag{166}
$$

if $p\to\infty$, where ε is an arbitrary small positive real number for the polynomial case and $\varepsilon=0$ for the trigonometric case, constant K does not depend on p.

We have for (146)

$$\sum_{j_1,j_2=0}^{p}\left(\sum_{j_3=p+1}^{\infty}C_{j_3j_3j_2j_1}\right)^2=\sum_{j_1,j_2=0}^{p}\left(\sum_{j_3=p+1}^{\infty}\int\limits_t^T\psi_4(t_4)\phi_{j_3}(t_4)\int\limits_t^{t_4}\psi_3(t_3)\phi_{j_3}(t_3)\times\right.$$

$$\left.\times\int\limits_t^{t_3}\psi_2(t_2)\phi_{j_2}(t_2)\int\limits_t^{t_2}\psi_1(t_1)\phi_{j_1}(t_1)dt_1dt_2dt_3dt_4\right)^2=$$

$$=\sum_{j_1,j_2=0}^{p}\left(\sum_{j_3=p+1}^{\infty}\int\limits_t^T\psi_1(t_1)\phi_{j_1}(t_1)\int\limits_{t_1}^{T}\psi_2(t_2)\phi_{j_2}(t_2)\times\right.$$

$$\left.\times\int\limits_{t_2}^T\psi_3(t_3)\phi_{j_3}(t_3)\int\limits_{t_3}^{T}\psi_4(t_4)\phi_{j_3}(t_4)dt_4dt_3dt_2dt_1\right)^2=$$

$$=\sum_{j_1,j_2=0}^{p}\left(\int\limits_t^T\psi_1(t_1)\phi_{j_1}(t_1)\int\limits_{t_1}^{T}\psi_2(t_2)\phi_{j_2}(t_2)\times\right.$$

$$\left.\times\sum_{j_3=p+1}^{\infty}\int\limits_{t_2}^T\psi_3(t_3)\phi_{j_3}(t_3)\int\limits_{t_3}^{T}\psi_4(t_4)\phi_{j_3}(t_4)dt_4dt_3dt_2dt_1\right)^2\le$$

$$\le\sum_{j_1,j_2=0}^{\infty}\left(\int\limits_t^T\psi_1(t_1)\phi_{j_1}(t_1)\int\limits_{t_1}^{T}\psi_2(t_2)\phi_{j_2}(t_2)\times\right.$$

$$\left.\times\sum_{j_3=p+1}^{\infty}\int\limits_{t_2}^T\psi_3(t_3)\phi_{j_3}(t_3)\int\limits_{t_3}^{T}\psi_4(t_4)\phi_{j_3}(t_4)dt_4dt_3dt_2dt_1\right)^2=$$

$$=\int\limits_{[t,T]^2}\mathbf{1}_{\{t_1<t_2\}}\psi_1^2(t_1)\psi_2^2(t_2)\left(\sum_{j_3=p+1}^{\infty}\int\limits_{t_2}^T\psi_3(t_3)\phi_{j_3}(t_3)\int\limits_{t_3}^{T}\psi_4(t_4)\phi_{j_3}(t_4)dt_4dt_3\right)^2dt_2dt_1. \tag{167}$$

It is easy to see that the integral (see (167))

$$\int\limits_{t_2}^T\psi_3(t_3)\phi_{j_3}(t_3)\int\limits_{t_3}^{T}\psi_4(t_4)\phi_{j_3}(t_4)dt_4dt_3$$

is similar to the integral from the formula (163) if in the last integral we substitute $t_4=T$. Therefore, by analogy with (165), we obtain

$$\sum_{j_1,j_2=0}^{p}\left(\sum_{j_3=p+1}^{\infty}C_{j_3j_3j_2j_1}\right)^2\le\frac{K}{p^{2-\varepsilon}}\ \to\ 0 \tag{168}$$

if $p\to\infty$, where ε is an arbitrary small positive real number for the polynomial case and $\varepsilon=0$ for the trigonometric case, constant K does not depend on p.

Now consider (147)–(149). We have for (147) (see **Step 2** in the proof of Theorem 13)

$$\left(\sum_{j_2=p+1}^{\infty}\sum_{j_1=p+1}^{\infty} C_{j_2j_1j_2j_1}\right)^2 = \left(\sum_{j_1=0}^{p}\sum_{j_2=p+1}^{\infty} C_{j_2j_1j_2j_1}\right)^2 \le$$

$$\le (p+1)\sum_{j_1=0}^{p}\left(\sum_{j_2=p+1}^{\infty} C_{j_2j_1j_2j_1}\right)^2. \tag{169}$$

Consider (145) and (166). We have

$$\sum_{j_1=0}^{p}\left(\sum_{j_2=p+1}^{\infty} C_{j_2j_1j_2j_1}\right)^2 = \sum_{j_1,j_3=0}^{p}\left(\sum_{j_2=p+1}^{\infty} C_{j_2j_3j_2j_1}\right)^2\Biggl|_{j_1=j_3} \le$$

$$\le \sum_{j_1,j_3=0}^{p}\left(\sum_{j_2=p+1}^{\infty} C_{j_2j_3j_2j_1}\right)^2 \le \frac{K}{p^{2-\varepsilon}}, \tag{170}$$

where ε is an arbitrary small positive real number for the polynomial case and $\varepsilon = 0$ for the trigonometric case, constant K does not depend on p. Combining (169) and (170), we obtain

$$\left(\sum_{j_2=p+1}^{\infty}\sum_{j_1=p+1}^{\infty} C_{j_2j_1j_2j_1}\right)^2 \le \frac{(p+1)K}{p^{2-\varepsilon}} \le \frac{K_1}{p^{1-\varepsilon}} \ \to\ 0$$

if $p\to\infty$, where constant K_1 does not depend on p.

Similarly for (148) we have (see (144), (165))

$$\left(\sum_{j_2=p+1}^{\infty}\sum_{j_1=p+1}^{\infty} C_{j_1j_2j_2j_1}\right)^2 = \left(\sum_{j_1=0}^{p}\sum_{j_2=p+1}^{\infty} C_{j_1j_2j_2j_1}\right)^2 \le$$

$$\le (p+1)\sum_{j_1=0}^{p}\left(\sum_{j_2=p+1}^{\infty} C_{j_1j_2j_2j_1}\right)^2, \tag{171}$$

$$\sum_{j_1=0}^{p}\left(\sum_{j_2=p+1}^{\infty} C_{j_1j_2j_2j_1}\right)^2 = \sum_{j_1,j_4=0}^{p}\left(\sum_{j_2=p+1}^{\infty} C_{j_4j_2j_2j_1}\right)^2\Biggl|_{j_1=j_4} \le$$

$$\le \sum_{j_1,j_4=0}^{p}\left(\sum_{j_2=p+1}^{\infty} C_{j_4j_2j_2j_1}\right)^2 \le \frac{K}{p^{2-\varepsilon}}, \tag{172}$$

where ε is an arbitrary small positive real number for the polynomial case and $\varepsilon = 0$ for the trigonometric case, constant K does not depend on p. Combining (171) and (172), we obtain

$$\left(\sum_{j_2=p+1}^{\infty}\sum_{j_1=p+1}^{\infty} C_{j_1j_2j_2j_1}\right)^2 \le \frac{(p+1)K}{p^{2-\varepsilon}} \le \frac{K_1}{p^{1-\varepsilon}} \ \to\ 0$$

if $p\to\infty$, where constant K_1 does not depend on p.

Consider (149). Using (78), we get

$$\sum_{j_3=p+1}^{\infty}\sum_{j_1=p+1}^{\infty}C_{j_3j_3j_1j_1}=\sum_{j_3=p+1}^{\infty}\sum_{j_1=0}^{\infty}C_{j_3j_3j_1j_1}-\sum_{j_3=p+1}^{\infty}\sum_{j_1=0}^{p}C_{j_3j_3j_1j_1}=$$

$$=\frac{1}{2}\sum_{j_3=p+1}^{\infty}C_{j_3j_3j_1j_1}\Biggl|_{(j_1j_1)\frown(\cdot)}-\sum_{j_3=p+1}^{\infty}\sum_{j_1=0}^{p}C_{j_3j_3j_1j_1},\tag{173}$$

where (see (36))

$$C_{j_3j_3j_1j_1}\Biggl|_{(j_1j_1)\frown(\cdot)}=$$

$$=\int\limits_t^T\psi_4(t_4)\phi_{j_3}(t_4)\int\limits_t^{t_4}\psi_3(t_3)\phi_{j_3}(t_3)\int\limits_t^{t_3}\psi_2(t_2)\psi_1(t_2)dt_2dt_3dt_4.$$

From the estimate (103) for the polynomial and trigonometric cases we get

$$\left|\sum_{j_3=p+1}^{\infty}C_{j_3j_3j_1j_1}\Biggl|_{(j_1j_1)\frown(\cdot)}\right|\le\frac{C}{p},\tag{174}$$

where constant C is independent of p.

Further, we have (see (168))

$$\left(\sum_{j_1=0}^{p}\sum_{j_3=p+1}^{\infty}C_{j_3j_3j_1j_1}\right)^2\le(p+1)\sum_{j_1=0}^{p}\left(\sum_{j_3=p+1}^{\infty}C_{j_3j_3j_1j_1}\right)^2=$$

$$=(p+1)\sum_{j_1,j_2=0}^{p}\left(\sum_{j_3=p+1}^{\infty}C_{j_3j_3j_2j_1}\right)^2\Biggl|_{j_1=j_2}\le$$

$$\le(p+1)\sum_{j_1,j_2=0}^{p}\left(\sum_{j_3=p+1}^{\infty}C_{j_3j_3j_2j_1}\right)^2\le\frac{(p+1)K}{p^{2-\varepsilon}}\le\frac{K_1}{p^{1-\varepsilon}},\tag{175}$$

where constant K_1 does not depend on p.

Combining (173)–(175), we obtain

$$\left(\sum_{j_3=p+1}^{\infty}\sum_{j_1=p+1}^{\infty}C_{j_3j_3j_1j_1}\right)^2\le\frac{K_2}{p^{1-\varepsilon}}\ \to\ 0$$

if $p\to\infty$, where constant K_2 does not depend on p.

Let us prove (150)–(152). It is not difficult to see that the estimate (174) proves (150).

Using the integration order replacement, we have

$$\sum_{j_1=p+1}^{\infty}C_{j_3j_3j_1j_1}\Biggl|_{(j_3j_3)\frown(\cdot)}=$$

$$= \sum_{j_1=p+1}^{\infty} \int_t^T \psi_4(t_4)\psi_3(t_4) \int_t^{t_4} \psi_2(t_2)\phi_{j_1}(t_2) \int_t^{t_2} \psi_1(t_1)\phi_{j_1}(t_1) dt_1 dt_2 dt_4 =$$

$$= \sum_{j_1=p+1}^{\infty} \int_t^T \left(\psi_2(t_2) \int_{t_2}^T \psi_4(t_4)\psi_3(t_4) dt_4 \right) \phi_{j_1}(t_2) \int_t^{t_2} \psi_1(t_1)\phi_{j_1}(t_1) dt_1 dt_2, \tag{176}$$

$$\sum_{j_1=p+1}^{\infty} C_{j_1 j_2 j_2 j_1} \Big|_{(j_2 j_2) \curvearrowright (\cdot)} =$$

$$= \sum_{j_1=p+1}^{\infty} \int_t^T \psi_4(t_4)\phi_{j_1}(t_4) \int_t^{t_4} \psi_3(t_3)\psi_2(t_3) \int_t^{t_3} \psi_1(t_1)\phi_{j_1}(t_1) dt_1 dt_3 dt_4 =$$

$$= \sum_{j_1=p+1}^{\infty} \int_t^T \psi_4(t_4)\phi_{j_1}(t_4) \int_t^{t_4} \psi_1(t_1)\phi_{j_1}(t_1) \int_{t_1}^{t_4} \psi_3(t_3)\psi_2(t_3) dt_3 dt_1 dt_4 =$$

$$= \sum_{j_1=p+1}^{\infty} \int_t^T \psi_4(t_4)\phi_{j_1}(t_4) \int_t^{t_4} \psi_1(t_1)\phi_{j_1}(t_1) \left(\int_t^{t_4} - \int_t^{t_1} \right) \psi_3(t_3)\psi_2(t_3) dt_3 dt_1 dt_4 =$$

$$= \sum_{j_1=p+1}^{\infty} \int_t^T \left(\psi_4(t_4) \int_t^{t_4} \psi_3(t_3)\psi_2(t_3) dt_3 \right) \phi_{j_1}(t_4) \int_t^{t_4} \psi_1(t_1)\phi_{j_1}(t_1) dt_1 dt_4 - \tag{177}$$

$$- \sum_{j_1=p+1}^{\infty} \int_t^T \psi_4(t_4)\phi_{j_1}(t_4) \int_t^{t_4} \left(\psi_1(t_1) \int_t^{t_1} \psi_3(t_3)\psi_2(t_3) dt_3 \right) \phi_{j_1}(t_1) dt_1 dt_4. \tag{178}$$

Applying the estimate (103) (polynomial and trigonometric cases) to the right-hand sides of (176)–(178), we get

$$\left| \sum_{j_3=p+1}^{\infty} C_{j_3 j_3 j_1 j_1} \Big|_{(j_3 j_3) \curvearrowright (\cdot)} \right| \le \frac{C}{p}, \tag{179}$$

$$\left| \sum_{j_1=p+1}^{\infty} C_{j_1 j_2 j_2 j_1} \Big|_{(j_2 j_2) \curvearrowright (\cdot)} \right| \le \frac{C}{p}, \tag{180}$$

where constant C is independent of p. The estimates (179), (180) prove (151), (152).

The relations (141)–(152) are proved. Theorem 17 is proved.

10. Expansion of Iterated Stratonovich Stochastic Integrals of Multiplicity 5. The Case $p_1 = \ldots = p_5 \to \infty$ and Continuously Differentiable Weight Functions $\psi_1(\tau)$, $\ldots$, $\psi_5(\tau)$ (The Cases of Legendre Polynomials and Trigonometric Functions)

Theorem 18 [15], [47], [55], [62]. *Suppose that $\{\phi_j(x)\}_{j=0}^{\infty}$ is a complete orthonormal system of Legendre polynomials or trigonometric functions in the space $L_2([t,T])$. Furthermore, let $\psi_1(\tau),\ldots,$ $\psi_5(\tau)$ are continuously differentiable nonrandom functions on $[t,T]$. Then, for the iterated Stratonovich stochastic integral of fifth multiplicity*

$$J^*[\psi^{(5)}]_{T,t} = \int\limits_t^{*T} \psi_5(t_5)\ldots \int\limits_t^{*t_2} \psi_1(t_1)d\mathbf{w}_{t_1}^{(i_1)}\ldots d\mathbf{w}_{t_5}^{(i_5)} \tag{181}$$

the following expansion

$$J^*[\psi^{(5)}]_{T,t} = \underset{p\to\infty}{\text{l.i.m.}} \sum_{j_1,\ldots,j_5=0}^{p} C_{j_5\ldots j_1}\zeta_{j_1}^{(i_1)}\ldots\zeta_{j_5}^{(i_5)}$$

that converges in the mean-square sense is valid, where $i_1,\ldots,i_5 = 0,1,\ldots,m,$

$$C_{j_5\ldots j_1} = \int\limits_t^T \psi_5(t_5)\phi_{j_5}(t_5)\ldots\int\limits_t^{t_2}\psi_1(t_1)\phi_{j_1}(t_1)dt_1\ldots dt_5$$

and

$$\zeta_j^{(i)} = \int\limits_t^T \phi_j(s)d\mathbf{w}_s^{(i)}$$

are independent standard Gaussian random variables for various i or j (in the case when $i\neq 0$), $\mathbf{w}_\tau^{(i)} = \mathbf{f}_\tau^{(i)}$ for $i=1,\ldots,m$ and $\mathbf{w}_\tau^{(0)}=\tau$.

Proof. Note that in this proof we write k instead of 5 when this is true for an arbitrary k ($k\in\mathbb{N}$). As follows from Sect. 7, Conditions 1 and 2 of Theorem 13 are satisfied for complete orthonormal systems of Legendre polynomials and trigonometric functions in the space $L_2([t,T])$. Let us verify Condition 3 of Theorem 13 for the iterated Stratonovich stochastic integral (181). Thus, we have to check the following conditions

$$\lim_{p\to\infty}\sum_{j_{q_1},j_{q_2},j_{q_3}=0}^{p}\left(\sum_{j_{g_1}=p+1}^{\infty} C_{j_5\ldots j_1}\Bigg|_{j_{g_1}=j_{g_2}}\right)^2 = 0, \tag{182}$$

$$\lim_{p\to\infty}\sum_{j_{q_1}=0}^{p}\left(\sum_{j_{g_1}=p+1}^{\infty}\sum_{j_{g_3}=p+1}^{\infty} C_{j_5\ldots j_1}\Bigg|_{j_{g_1}=j_{g_2},j_{g_3}=j_{g_4}}\right)^2 = 0, \tag{183}$$

$$\lim_{p\to\infty}\sum_{j_{q_1}=0}^{p}\left(\sum_{j_{g_3}=p+1}^{\infty} C_{j_5\ldots j_1}\Bigg|_{(j_{g_2}j_{g_1})\curvearrowright(\cdot),j_{g_1}=j_{g_2},j_{g_3}=j_{g_4},g_2=g_1+1}\right)^2 = 0, \tag{184}$$

where $(\{g_1,g_2\},\{g_3,g_4\},\{q_1\})$ and $(\{g_1,g_2\},\{q_1,q_2,q_3\})$ are partitions of the set $\{1,2,\ldots,5\}$ that is $\{g_1,g_2,g_3,g_4,q_1\}=\{g_1,g_2,q_1,q_2,q_3\}=\{1,2,\ldots,5\}$; braces mean an unordered set, and parentheses mean an ordered set.

Let us find a representation for $C_{j_k\ldots j_1}\Big|_{j_{g_1}=j_{g_2},\ g_2>g_1+1}$ that will be convenient for further consideration.

Using the integration order replacement in the Riemann integrals, we obtain

$$\int\limits_t^T h_k(t_k)\ldots\int\limits_t^{t_{l+2}} h_{l+1}(t_{l+1})\int\limits_t^{t_{l+1}} h_l(t_l)\int\limits_t^{t_l} h_{l-1}(t_{l-1})\ldots\int\limits_t^{t_2} h_1(t_1)dt_1\ldots$$

$$\ldots dt_{l-1}dt_l dt_{l+1}\ldots dt_k=$$

$$=\int\limits_t^T h_k(t_k)\ldots\int\limits_t^{t_{l+2}} h_{l+1}(t_{l+1})\int\limits_t^{t_{l+1}} h_1(t_1)\int\limits_{t_1}^{t_{l+1}} h_2(t_2)\ldots\int\limits_{t_{l-2}}^{t_{l+1}} h_{l-1}(t_{l-1})\int\limits_{t_{l-1}}^{t_{l+1}} h_l(t_l)dt_l\times$$

$$\times dt_{l-1}\ldots dt_2dt_1dt_{l+1}\ldots dt_k=$$

$$=\int\limits_t^T h_k(t_k)\ldots\int\limits_t^{t_{l+2}} h_{l+1}(t_{l+1})\left(\int\limits_t^{t_{l+1}} h_l(t_l)dt_l\right)\int\limits_t^{t_{l+1}} h_1(t_1)\int\limits_{t_1}^{t_{l+1}} h_2(t_2)\ldots\int\limits_{t_{l-2}}^{t_{l+1}} h_{l-1}(t_{l-1})\times$$

$$\times dt_{l-1}\ldots dt_2dt_1dt_{l+1}\ldots dt_k-$$

$$-\int\limits_t^T h_k(t_k)\ldots\int\limits_t^{t_{l+2}} h_{l+1}(t_{l+1})\int\limits_t^{t_{l+1}} h_1(t_1)\int\limits_{t_1}^{t_{l+1}} h_2(t_2)\ldots\int\limits_{t_{l-2}}^{t_{l+1}} h_{l-1}(t_{l-1})\left(\int\limits_t^{t_{l-1}} h_l(t_l)dt_l\right)\times$$

$$\times dt_{l-1}\ldots dt_2dt_1dt_{l+1}\ldots dt_k=$$

$$=\int\limits_t^T h_k(t_k)\ldots\int\limits_t^{t_{l+2}} h_{l+1}(t_{l+1})\left(\int\limits_t^{t_{l+1}} h_l(t_l)dt_l\right)\int\limits_t^{t_{l+1}} h_{l-1}(t_{l-1})\ldots$$

$$\ldots\int\limits_t^{t_2} h_1(t_1)dt_1\ldots dt_{l-1}dt_{l+1}\ldots dt_k-$$

$$-\int\limits_t^T h_k(t_k)\ldots\int\limits_t^{t_{l+2}} h_{l+1}(t_{l+1})\int\limits_t^{t_{l+1}} h_{l-1}(t_{l-1})\left(\int\limits_t^{t_{l-1}} h_l(t_l)dt_l\right)\int\limits_t^{t_{l-1}} h_{l-2}(t_{l-2})\ldots$$

$$\ldots\int\limits_t^{t_2} h_1(t_1)dt_1\ldots dt_{l-2}dt_{l-1}dt_{l+1}\ldots dt_k, \tag{185}$$

where $1<l<k$ and $h_1(\tau),\ldots,h_k(\tau)$ are continuous functions on the interval $[t,T]$. By analogy with (185) we have for $l=k$

$$\int\limits_t^T h_l(t_l)\int\limits_t^{t_l} h_{l-1}(t_{l-1})\ldots\int\limits_t^{t_2} h_1(t_1)dt_1\ldots dt_{l-1}dt_l =$$

$$= \int\limits_t^T h_1(t_1)\int\limits_{t_1}^T h_2(t_2)\ldots\int\limits_{t_{l-2}}^T h_{l-1}(t_{l-1})\int\limits_{t_{l-1}}^T h_l(t_l)dt_l dt_{l-1}\ldots dt_2 dt_1 =$$

$$= \left(\int\limits_t^T h_l(t_l)dt_l\right)\int\limits_t^T h_1(t_1)\int\limits_{t_1}^T h_2(t_2)\ldots\int\limits_{t_{l-2}}^T h_{l-1}(t_{l-1})dt_{l-1}\ldots dt_2 dt_1 -$$

$$-\int\limits_t^T h_1(t_1)\int\limits_{t_1}^T h_2(t_2)\ldots\int\limits_{t_{l-2}}^T h_{l-1}(t_{l-1})\left(\int\limits_t^{t_{l-1}} h_l(t_l)dt_l\right)dt_{l-1}\ldots dt_2 dt_1 =$$

$$= \left(\int\limits_t^T h_l(t_l)dt_l\right)\int\limits_t^T h_{l-1}(t_{l-1})\ldots\int\limits_t^{t_2} h_1(t_1)dt_1\ldots dt_{l-1} -$$

$$-\int\limits_t^T h_{l-1}(t_{l-1})\left(\int\limits_t^{t_{l-1}} h_l(t_l)dt_l\right)\int\limits_t^{t_{l-1}} h_{l-2}(t_{l-2})\ldots\int\limits_t^{t_2} h_1(t_1)dt_1\ldots dt_{l-1}. \tag{186}$$

The formulas (185), (186) will be used further.

Our further proof will not fundamentally depend on the weight functions $\psi_1(\tau),\ldots,\psi_k(\tau)$. Therefore, sometimes in subsequent consideration we assume for simplicity that $\psi_1(\tau),\ldots,\psi_k(\tau)\equiv 1$.

Let us continue the proof. Applying (185) to $C_{j_k\ldots j_{l+1}j_l j_{l-1}\ldots j_{s+1}j_l j_{s-1}\ldots j_1}$ (more precisely to $h_s(t_s)$ $= \psi_s(t_s)\phi_{j_l}(t_s)$), we obtain for $l+1\le k$, $s-1\ge 1$, $l-1\ge s+1$

$$\sum_{j_l=p+1}^{\infty} C_{j_k\ldots j_{l+1}j_l j_{l-1}\ldots j_{s+1}j_l j_{s-1}\ldots j_1} = \tag{187}$$

$$= \sum_{j_l=p+1}^{\infty}\int\limits_t^T \phi_{j_k}(t_k)\ldots\int\limits_t^{t_{l+2}}\phi_{j_{l+1}}(t_{l+1})\int\limits_t^{t_{l+1}}\phi_{j_l}(t_l)\int\limits_t^{t_l}\phi_{j_{l-1}}(t_{l-1})\ldots$$

$$\ldots\int\limits_t^{t_{s+2}}\phi_{j_{s+1}}(t_{s+1})\int\limits_t^{t_{s+1}}\phi_{j_l}(t_s)\int\limits_t^{t_s}\phi_{j_{s-1}}(t_{s-1})\ldots$$

$$\ldots\int\limits_t^{t_2}\phi_{j_1}(t_1)dt_1\ldots dt_{s-1}dt_s dt_{s+1}\ldots dt_{l-1}dt_l dt_{l+1}\ldots dt_k =$$

$$= \sum_{j_l=p+1}^{\infty}\int\limits_t^T \phi_{j_k}(t_k)\ldots\int\limits_t^{t_{l+2}}\phi_{j_{l+1}}(t_{l+1})\int\limits_t^{t_{l+1}}\phi_{j_l}(t_l)\int\limits_t^{t_l}\phi_{j_{l-1}}(t_{l-1})\ldots$$

$$\ldots \int\limits_t^{t_{s+2}} \phi_{j_{s+1}}(t_{s+1}) \left(\int\limits_t^{t_{s+1}} \phi_{j_l}(t_s)dt_s \right) \int\limits_t^{t_{s+1}} \phi_{j_{s-1}}(t_{s-1}) \ldots$$

$$\ldots \int\limits_t^{t_2} \phi_{j_1}(t_1)dt_1 \ldots dt_{s-1}dt_{s+1} \ldots dt_{l-1}dt_l dt_{l+1} \ldots dt_k -$$

$$- \sum_{j_l=p+1}^{\infty} \int\limits_t^T \phi_{j_k}(t_k) \ldots \int\limits_t^{t_{l+2}} \phi_{j_{l+1}}(t_{l+1}) \int\limits_t^{t_{l+1}} \phi_{j_l}(t_l) \int\limits_t^{t_l} \phi_{j_{l-1}}(t_{l-1}) \ldots$$

$$\ldots \int\limits_t^{t_{s+2}} \phi_{j_{s+1}}(t_{s+1}) \int\limits_t^{t_{s+1}} \phi_{j_{s-1}}(t_{s-1}) \left(\int\limits_t^{t_{s-1}} \phi_{j_l}(t_s)dt_s \right) \int\limits_t^{t_{s-1}} \phi_{j_{s-2}}(t_{s-2}) \ldots$$

$$\ldots \int\limits_t^{t_2} \phi_{j_1}(t_1)dt_1 \ldots dt_{s-2}dt_{s-1}dt_{s+1} \ldots dt_{l-1}dt_l dt_{l+1} \ldots dt_k =$$

$$= \sum_{j_l=p+1}^{\infty} A_{j_k \ldots j_{l+1} j_l j_{l-1} \ldots j_{s+1} j_l j_{s-1} \ldots j_1} - \sum_{j_l=p+1}^{\infty} B_{j_k \ldots j_{l+1} j_l j_{l-1} \ldots j_{s+1} j_l j_{s-1} \ldots j_1}.$$

Now we apply the formula (185) to $A_{j_k \ldots j_{l+1} j_l j_{l-1} \ldots j_{s+1} j_l j_{s-1} \ldots j_1}$, $B_{j_k \ldots j_{l+1} j_l j_{l-1} \ldots j_{s+1} j_l j_{s-1} \ldots j_1}$ (more precisely to $h_l(t_l) = \psi_l(t_l)\phi_{j_l}(t_l)$). Then we have for $l+1 \le k$, $s-1 \ge 1$, $l-1 \ge s+1$

$$\sum_{j_l=p+1}^{\infty} C_{j_k \ldots j_{l+1} j_l j_{l-1} \ldots j_{s+1} j_l j_{s-1} \ldots j_1} =$$

$$= \int\limits_{[t,T]^{k-2}} \sum_{d=1}^{4} F_p^{(d)}(t_1, \ldots, t_{s-1}, t_{s+1}, \ldots, t_{l-1}, t_{l+1}, \ldots, t_k) \times$$

$$\times \prod_{\substack{g=1 \\ g \ne l,s}}^{k} \psi_g(t_g)\phi_{j_g}(t_g) dt_1 \ldots dt_{s-1}dt_{s+1} \ldots dt_{l-1}dt_{l+1} \ldots dt_k =$$

$$= \sum_{d=1}^{4} C^{*(d)}_{j_k \ldots j_{l+1} j_{l-1} \ldots j_{s+1} j_{s-1} \ldots j_1} = \sum_{d=1}^{4} C^{*(d)}_{j_k \ldots j_q \ldots j_1}\Bigg|_{q \ne l,s}, \tag{188}$$

where

$$F_p^{(1)}(t_1, \ldots, t_{s-1}, t_{s+1}, \ldots, t_{l-1}, t_{l+1}, \ldots, t_k) =$$

$$= \mathbf{1}_{\{t_1 < \ldots < t_{s-1} < t_{s+1} < \ldots < t_{l-1} < t_{l+1} < \ldots < t_k\}} \sum_{j_l=p+1}^{\infty} \int\limits_t^{t_{s+1}} \psi_s(\tau)\phi_{j_l}(\tau)d\tau \int\limits_t^{t_{l+1}} \psi_l(\tau)\phi_{j_l}(\tau)d\tau, \tag{189}$$

$$F_p^{(2)}(t_1, \ldots, t_{s-1}, t_{s+1}, \ldots, t_{l-1}, t_{l+1}, \ldots, t_k) =$$

$$= \mathbf{1}_{\{t_1<\ldots<t_{s-1}<t_{s+1}<\ldots<t_{l-1}<t_{l+1}<\ldots<t_k\}} \sum_{j_l=p+1}^{\infty} \int\limits_t^{t_{s-1}} \psi_s(\tau)\phi_{j_l}(\tau)d\tau \int\limits_t^{t_{l-1}} \psi_l(\tau)\phi_{j_l}(\tau)d\tau, \tag{190}$$

$$F_p^{(3)}(t_1,\ldots,t_{s-1},t_{s+1},\ldots,t_{l-1},t_{l+1},\ldots,t_k) =$$

$$= -\mathbf{1}_{\{t_1<\ldots<t_{s-1}<t_{s+1}<\ldots<t_{l-1}<t_{l+1}<\ldots<t_k\}} \sum_{j_l=p+1}^{\infty} \int\limits_t^{t_{s-1}} \psi_s(\tau)\phi_{j_l}(\tau)d\tau \int\limits_t^{t_{l+1}} \psi_l(\tau)\phi_{j_l}(\tau)d\tau, \tag{191}$$

$$F_p^{(4)}(t_1,\ldots,t_{s-1},t_{s+1},\ldots,t_{l-1},t_{l+1},\ldots,t_k) =$$

$$= -\mathbf{1}_{\{t_1<\ldots<t_{s-1}<t_{s+1}<\ldots<t_{l-1}<t_{l+1}<\ldots<t_k\}} \sum_{j_l=p+1}^{\infty} \int\limits_t^{t_{s+1}} \psi_s(\tau)\phi_{j_l}(\tau)d\tau \int\limits_t^{t_{l-1}} \psi_l(\tau)\phi_{j_l}(\tau)d\tau. \tag{192}$$

By analogy with (188) we can consider the expressions

$$\sum_{j_l=p+1}^{\infty} C_{j_l j_{k-1}\ldots j_2 j_l}, \tag{193}$$

$$\sum_{j_l=p+1}^{\infty} C_{j_k\ldots j_{l+1} j_l j_{l-1}\ldots j_2 j_l} \quad (l+1\le k), \tag{194}$$

$$\sum_{j_l=p+1}^{\infty} C_{j_l j_{k-1}\ldots j_{s+1} j_l j_{s-1}\ldots j_1} \quad (s-1\ge 1). \tag{195}$$

Then we have for (193)–(195) (see (185), (186))

$$\sum_{j_l=p+1}^{\infty} C_{j_l j_{k-1}\ldots j_2 j_l} = \int\limits_{[t,T]^{k-2}} \sum_{d=1}^{2} G_p^{(d)}(t_2,\ldots,t_{k-1}) \prod_{g=2}^{k-1} \psi_g(t_g)\phi_{j_g}(t_g)dt_2\ldots dt_{k-1}, \tag{196}$$

$$\sum_{j_l=p+1}^{\infty} C_{j_k\ldots j_{l+1} j_l j_{l-1}\ldots j_2 j_l} = \int\limits_{[t,T]^{k-2}} \sum_{d=1}^{2} E_p^{(d)}(t_2,\ldots,t_{l-1},t_{l+1},\ldots,t_k)\times$$

$$\times \prod_{\substack{g=2\\ g\ne l}}^{k} \psi_g(t_g)\phi_{j_g}(t_g)dt_2\ldots dt_{l-1}dt_{l+1}\ldots dt_k, \tag{197}$$

$$\sum_{j_l=p+1}^{\infty} C_{j_l j_{k-1}\ldots j_{s+1} j_l j_{s-1}\ldots j_1} = \int\limits_{[t,T]^{k-2}} \sum_{d=1}^{4} D_p^{(d)}(t_1,\ldots,t_{s-1},t_{s+1},\ldots,t_{k-1})\times$$

$$\times\prod_{\substack{g=1\\ g\ne s}}^{k-1}\psi_g(t_g)\phi_{j_g}(t_g)dt_1\ldots dt_{s-1}dt_{s+1}\ldots dt_{k-1}, \tag{198}$$

where

$$G_p^{(1)}(t_2,\ldots,t_{k-1})=\mathbf{1}_{\{t_2<\ldots<t_{k-1}\}}\sum_{j_l=p+1}^{\infty}\int\limits_t^T\psi_k(\tau)\phi_{j_l}(\tau)d\tau\int\limits_t^{t_2}\psi_1(\tau)\phi_{j_l}(\tau)d\tau,$$

$$G_p^{(2)}(t_2,\ldots,t_{k-1})=-\mathbf{1}_{\{t_2<\ldots<t_{k-1}\}}\sum_{j_l=p+1}^{\infty}\int\limits_t^{t_{k-1}}\psi_k(\tau)\phi_{j_l}(\tau)d\tau\int\limits_t^{t_2}\psi_1(\tau)\phi_{j_l}(\tau)d\tau,$$

$$E_p^{(1)}(t_2,\ldots,t_{l-1},t_{l+1},\ldots,t_k)=$$

$$=\mathbf{1}_{\{t_2<\ldots<t_{l-1}<t_{l+1}<\ldots<t_k\}}\sum_{j_l=p+1}^{\infty}\int\limits_t^{t_{l+1}}\psi_l(\tau)\phi_{j_l}(\tau)d\tau\int\limits_t^{t_2}\psi_1(\tau)\phi_{j_l}(\tau)d\tau,$$

$$E_p^{(2)}(t_2,\ldots,t_{l-1},t_{l+1},\ldots,t_k)=$$

$$=-\mathbf{1}_{\{t_2<\ldots<t_{l-1}<t_{l+1}<\ldots<t_k\}}\sum_{j_l=p+1}^{\infty}\int\limits_t^{t_{l-1}}\psi_l(\tau)\phi_{j_l}(\tau)d\tau\int\limits_t^{t_2}\psi_1(\tau)\phi_{j_l}(\tau)d\tau,$$

$$D_p^{(1)}(t_1,\ldots,t_{s-1},t_{s+1},\ldots,t_{k-1})=$$

$$=\mathbf{1}_{\{t_1<\ldots<t_{s-1}<t_{s+1}<\ldots<t_{k-1}\}}\sum_{j_l=p+1}^{\infty}\int\limits_t^{T}\psi_k(\tau)\phi_{j_l}(\tau)d\tau\int\limits_t^{t_{s+1}}\psi_s(\tau)\phi_{j_l}(\tau)d\tau,$$

$$D_p^{(2)}(t_1,\ldots,t_{s-1},t_{s+1},\ldots,t_{k-1})=$$

$$=-\mathbf{1}_{\{t_1<\ldots<t_{s-1}<t_{s+1}<\ldots<t_{k-1}\}}\sum_{j_l=p+1}^{\infty}\int\limits_t^{T}\psi_k(\tau)\phi_{j_l}(\tau)d\tau\int\limits_t^{t_{s-1}}\psi_s(\tau)\phi_{j_l}(\tau)d\tau,$$

$$D_p^{(3)}(t_1,\ldots,t_{s-1},t_{s+1},\ldots,t_{k-1})=$$

$$=-\mathbf{1}_{\{t_1<\ldots<t_{s-1}<t_{s+1}<\ldots<t_{k-1}\}}\sum_{j_l=p+1}^{\infty}\int\limits_t^{t_{k-1}}\psi_k(\tau)\phi_{j_l}(\tau)d\tau\int\limits_t^{t_{s+1}}\psi_s(\tau)\phi_{j_l}(\tau)d\tau,$$

$$D_p^{(4)}(t_1,\ldots,t_{s-1},t_{s+1},\ldots,t_{k-1})=$$

$$=\mathbf{1}_{\{t_1<\ldots<t_{s-1}<t_{s+1}<\ldots<t_{k-1}\}}\sum_{j_l=p+1}^{\infty}\int\limits_t^{t_{k-1}}\psi_k(\tau)\phi_{j_l}(\tau)d\tau\int\limits_t^{t_{s-1}}\psi_s(\tau)\phi_{j_l}(\tau)d\tau.$$

Now let us consider the value $C_{j_k\ldots j_1}\Big|_{j_{g_1}=j_{g_2},\ g_2=g_1+1}$. To do this, we will make the following transformations

$$\int\limits_t^T h_k(t_k)\ldots \int\limits_t^{t_{l+2}} h_{l+1}(t_{l+1}) \int\limits_t^{t_{l+1}} h_l(t_l) \int\limits_t^{t_l} h_l(t_{l-1}) \int\limits_t^{t_{l-1}} h_{l-2}(t_{l-2})\ldots \int\limits_t^{t_2} h_1(t_1)dt_1\ldots$$

$$\ldots dt_{l-2}dt_{l-1}dt_l dt_{l+1}\ldots dt_k =$$

$$= \int\limits_t^T h_k(t_k)\ldots \int\limits_t^{t_{l+2}} h_{l+1}(t_{l+1}) \int\limits_t^{t_{l+1}} h_1(t_1) \int\limits_{t_1}^{t_{l+1}} h_2(t_2)\ldots \int\limits_{t_{l-3}}^{t_{l+1}} h_{l-2}(t_{l-2})\times$$

$$\times \left(\int\limits_t^{t_{l+1}} - \int\limits_t^{t_{l-2}}\right) h_l(t_{l-1}) \left(\int\limits_t^{t_{l+1}} - \int\limits_t^{t_{l-1}}\right) h_l(t_l)dt_l dt_{l-1}dt_{l-2}\ldots dt_2dt_1dt_{l+1}\ldots dt_k =$$

$$= \int\limits_t^T h_k(t_k)\ldots \int\limits_t^{t_{l+2}} h_{l+1}(t_{l+1}) \left(\int\limits_t^{t_{l+1}} h_l(t_l)dt_l \int\limits_t^{t_{l+1}} h_l(t_{l-1})dt_{l-1}\right) \int\limits_t^{t_{l+1}} h_1(t_1)\times$$

$$+ \int\limits_t^T h_k(t_k) \ldots \int\limits_t^{t_{l+2}} h_{l+1}(t_{l+1}) \int\limits_t^{t_{l+1}} h_{l-2}(t_{l-2}) \left(\int\limits_t^{t_{l-2}} h_l(t_{l-1}) \int\limits_t^{t_{l-1}} h_l(t_l) dt_l dt_{l-1} \right) \times$$

$$\times \int\limits_t^{t_{l-2}} h_{l-3}(t_{l-3}) \ldots \int\limits_t^{t_2} h_1(t_1) dt_1 \ldots dt_{l-3} dt_{l-2} dt_{l+1} \ldots dt_k, \tag{199}$$

where $l+1 \le k$, $l-2 \ge 1$, and $h_1(\tau), \ldots, h_k(\tau)$ are continuous functions on the interval $[t, T]$.

Applying (199) to $C_{j_k \ldots j_{l+1} j_l j_l j_{l-2} \ldots \ldots j_1}$, we obtain for $l+1 \le k$, $l-2 \ge 1$

$$\sum_{j_l=p+1}^{\infty} C_{j_k \ldots j_{l+1} j_l j_l j_{l-2} \ldots \ldots j_1} =$$

$$= \int\limits_{[t,T]^{k-2}} \sum_{d=1}^{4} H_p^{(d)}(t_1, \ldots, t_{l-2}, t_{l+1}, \ldots, t_k) \times$$

$$\times \prod_{\substack{g=1 \\ g \ne l-1, l}}^{k} \psi_g(t_g) \phi_{j_g}(t_g) dt_1 \ldots dt_{l-2} dt_{l+1} \ldots dt_k =$$

$$= \sum_{d=1}^{4} C^{**(d)}_{j_k \ldots j_{l+1} j_{l-2} \ldots j_1} = \sum_{d=1}^{4} C^{**(d)}_{j_k \ldots j_q \ldots j_1} \Bigg|_{q \ne l-1, l}, \tag{200}$$

where

$$H_p^{(1)}(t_1, \ldots, t_{l-2}, t_{l+1}, \ldots, t_k) =$$

$$= \mathbf{1}_{\{t_1 < \ldots < t_{l-2} < t_{l+1} < \ldots < t_k\}} \sum_{j_l=p+1}^{\infty} \int\limits_t^{t_{l+1}} \psi_l(\tau) \phi_{j_l}(\tau) d\tau \int\limits_t^{t_{l+1}} \psi_{l-1}(\tau) \phi_{j_l}(\tau) d\tau, \tag{201}$$

$$H_p^{(2)}(t_1,\ldots,t_{l-2},t_{l+1},\ldots,t_k)=$$

$$=-\mathbf{1}_{\{t_1<\ldots<t_{l-2}<t_{l+1}<\ldots<t_k\}}\sum_{j_l=p+1}^{\infty}\int\limits_t^{t_{l+1}}\psi_l(\tau)\phi_{j_l}(\tau)d\tau\int\limits_t^{t_{l-2}}\psi_{l-1}(\tau)\phi_{j_l}(\tau)d\tau, \tag{202}$$

$$H_p^{(3)}(t_1,\ldots,t_{l-2},t_{l+1},\ldots,t_k)=$$

$$=-\mathbf{1}_{\{t_1<\ldots<t_{l-2}<t_{l+1}<\ldots<t_k\}}\sum_{j_l=p+1}^{\infty}\int\limits_t^{t_{l+1}}\psi_{l-1}(\tau)\phi_{j_l}(\tau)\int\limits_t^{\tau}\psi_l(\theta)\phi_{j_l}(\theta)d\theta d\tau, \tag{203}$$

$$H_p^{(4)}(t_1,\ldots,t_{l-2},t_{l+1},\ldots,t_k)=$$

$$=\mathbf{1}_{\{t_1<\ldots<t_{l-2}<t_{l+1}<\ldots<t_k\}}\sum_{j_l=p+1}^{\infty}\int\limits_t^{t_{l-2}}\psi_{l-1}(\tau)\phi_{j_l}(\tau)\int\limits_t^{\tau}\psi_l(\theta)\phi_{j_l}(\theta)d\theta d\tau. \tag{204}$$

By analogy with (200) we can consider the expressions

$$\sum_{j_l=p+1}^{\infty}C_{j_k\ldots j_{l+1}j_lj_l}, \tag{205}$$

$$\sum_{j_l=p+1}^{\infty}C_{j_lj_lj_{k-2}\ldots j_1}. \tag{206}$$

Then we have for (205), (206) (see (199) and its analogue for $t_{l+1}=T$)

$$\sum_{j_l=p+1}^{\infty}C_{j_k\ldots j_{l+1}j_lj_l}=\int\limits_{[t,T]^{k-2}}L_p(t_3,\ldots,t_k)\prod_{g=3}^{k}\psi_g(t_g)\phi_{j_g}(t_g)dt_3\ldots dt_k, \tag{207}$$

$$\sum_{j_l=p+1}^{\infty}C_{j_lj_lj_{k-2}\ldots j_1}=\int\limits_{[t,T]^{k-2}}\sum_{d=1}^{4}M_p^{(d)}(t_1,\ldots,t_{k-2})\prod_{g=1}^{k-2}\psi_g(t_g)\phi_{j_g}(t_g)dt_1\ldots dt_{k-2}, \tag{208}$$

where

$$L_p(t_3,\ldots,t_k)=\mathbf{1}_{\{t_3<\ldots<t_k\}}\sum_{j_l=p+1}^{\infty}\int\limits_t^{t_3}\psi_2(\tau)\phi_{j_l}(\tau)\int\limits_t^{\tau}\psi_1(\theta)\phi_{j_l}(\theta)d\theta d\tau,$$

$$M_p^{(1)}(t_1,\ldots,t_{k-2})=$$

$$=\mathbf{1}_{\{t_1<\ldots<t_{k-2}\}}\sum_{j_l=p+1}^{\infty}\int\limits_t^{T}\psi_k(\tau)\phi_{j_l}(\tau)d\tau\int\limits_t^{T}\psi_{k-1}(\tau)\phi_{j_l}(\tau)d\tau,$$

$$M_p^{(2)}(t_1,\ldots,t_{k-2})=$$

$$=-\mathbf{1}_{\{t_1<\ldots<t_{k-2}\}}\sum_{j_l=p+1}^{\infty}\int\limits_t^T\psi_k(\tau)\phi_{j_l}(\tau)d\tau\int\limits_t^{t_{k-2}}\psi_{k-1}(\tau)\phi_{j_l}(\tau)d\tau,$$

$$M_p^{(3)}(t_1,\ldots,t_{k-2})=$$

$$=-\mathbf{1}_{\{t_1<\ldots<t_{k-2}\}}\sum_{j_l=p+1}^{\infty}\int\limits_t^T\psi_{k-1}(\tau)\phi_{j_l}(\tau)\int\limits_t^{\tau}\psi_k(\theta)\phi_{j_l}(\theta)d\theta d\tau,$$

$$M_p^{(4)}(t_1,\ldots,t_{k-2})=$$

$$=\mathbf{1}_{\{t_1<\ldots<t_{k-2}\}}\sum_{j_l=p+1}^{\infty}\int\limits_t^{t_{k-2}}\psi_{k-1}(\tau)\phi_{j_l}(\tau)\int\limits_t^{\tau}\psi_k(\theta)\phi_{j_l}(\theta)d\theta d\tau.$$

It is important to note that $C^{*(d)}_{j_k\ldots j_{l+1}j_{l-2}\ldots j_1}$, $C^{**(d)}_{j_k\ldots j_{l+1}j_{l-2}\ldots j_1}$ $(d=1,\ldots,4)$ are Fourier coefficients (see (188), (200)), that is, we can use Parseval's equality in the further proof.

Combining the equalities (188)–(192) (the case $g_2>g_1+1$), using Parseval's equality and applying the estimates for integrals from basis functions that we used in the proof of Theorems 16, 17, we obtain for (188)

$$\sum_{j_{q_1},\ldots,j_{q_{k-2}}=0}^{p}\left(\sum_{j_{g_1}=p+1}^{\infty}C_{j_k\ldots j_1}\Biggl|_{j_{g_1}=j_{g_2},g_2>g_1+1}\right)^2=$$

$$=\sum_{\substack{j_1,\ldots,j_q,\ldots,j_k=0\\ q\ne g_1,g_2}}^{p}\left(\sum_{j_{g_1}=p+1}^{\infty}C_{j_k\ldots j_1}\Biggl|_{j_{g_1}=j_{g_2},g_2>g_1+1}\right)^2=$$

$$=\sum_{\substack{j_1,\ldots,j_q,\ldots,j_k=0\\ q\ne g_1,g_2}}^{p}\left(\sum_{d=1}^{4}C^{*(d)}_{j_k\ldots j_q\ldots j_1}\Biggl|_{q\ne g_1,g_2}\right)^2\le\sum_{\substack{j_1,\ldots,j_q,\ldots,j_k=0\\ q\ne g_1,g_2}}^{\infty}\left(\sum_{d=1}^{4}C^{*(d)}_{j_k\ldots j_q\ldots j_1}\Biggl|_{q\ne g_1,g_2}\right)^2=$$

$$=\sum_{\substack{j_1,\ldots,j_q,\ldots,j_k=0\\ q\ne g_1,g_2}}^{\infty}\left(\int\limits_{[t,T]^{k-2}}\sum_{d=1}^{4}F_p^{(d)}(t_1,\ldots,t_{g_1-1},t_{g_1+1},\ldots,t_{g_2-1},t_{g_2+1},\ldots,t_k)\times\right.$$

$$\left.\times\prod_{\substack{q=1\\ q\ne g_1,g_2}}^{k}\psi_q(t_q)\phi_{j_q}(t_q)dt_1\ldots dt_{g_1-1}dt_{g_1+1}\ldots dt_{g_2-1}dt_{g_2+1}\ldots dt_k\right)^2=$$

$$=\int\limits_{[t,T]^{k-2}}\left(\sum_{d=1}^{4}F_p^{(d)}(t_1,\ldots,t_{g_1-1},t_{g_1+1},\ldots,t_{g_2-1},t_{g_2+1},\ldots,t_k)\prod_{\substack{q=1\\ q\ne g_1,g_2}}^{k}\psi_q(t_q)\right)^2\times$$

$$\times dt_1\ldots dt_{g_1-1}dt_{g_1+1}\ldots dt_{g_2-1}dt_{g_2+1}\ldots dt_k\le$$

$$\leq 4\sum_{d=1}^{4}\int\limits_{[t,T]^{k-2}}\left(F_p^{(d)}(t_1,\ldots,t_{g_1-1},t_{g_1+1},\ldots,t_{g_2-1},t_{g_2+1},\ldots,t_k)\prod_{\substack{q=1\\ q\neq g_1,g_2}}^{k}\psi_q(t_q)\right)^2\times$$

$$\times dt_1\ldots dt_{g_1-1}dt_{g_1+1}\ldots dt_{g_2-1}dt_{g_2+1}\ldots dt_k\leq$$

$$\leq\frac{K}{p^{2-\varepsilon}}\ \to\ 0 \tag{209}$$

if $p\to\infty$, where ε is an arbitrary small positive real number for the polynomial case and $\varepsilon=0$ for the trigonometric case, constant K does not depend on p. The cases (193)–(195) are considered analogously.

Absolutely similarly (see (209)) combining the equalities (200)–(204) (the case $g_2=g_1+1$), using Parseval's equality and applying the estimates for integrals from basis functions that we used in the proof of Theorems 16, 17, we get for (200)

$$\sum_{j_{q_1},\ldots,j_{q_{k-2}}=0}^{p}\left(\sum_{j_{g_1}=p+1}^{\infty}C_{j_k\ldots j_1}\Biggr|_{j_{g_1}=j_{g_2},g_2=g_1+1}\right)^2=$$

$$=\sum_{\substack{j_1,\ldots,j_q,\ldots,j_k=0\\ q\neq g_1,g_2}}^{p}\left(\sum_{j_{g_1}=p+1}^{\infty}C_{j_k\ldots j_1}\Biggr|_{j_{g_1}=j_{g_2},g_2=g_1+1}\right)^2=$$

$$=\sum_{\substack{j_1,\ldots,j_q,\ldots,j_k=0\\ q\neq g_1,g_2}}^{p}\left(\sum_{d=1}^{4}C_{j_k\ldots j_q\ldots j_1}^{**(d)}\Biggr|_{q\neq g_1,g_2}\right)^2\leq\sum_{\substack{j_1,\ldots,j_q,\ldots,j_k=0\\ q\neq g_1,g_2}}^{\infty}\left(\sum_{d=1}^{4}C_{j_k\ldots j_q\ldots j_1}^{**(d)}\Biggr|_{q\neq g_1,g_2}\right)^2=$$

$$=\sum_{\substack{j_1,\ldots,j_q,\ldots,j_k=0\\ q\neq g_1,g_2}}^{\infty}\left(\int\limits_{[t,T]^{k-2}}\sum_{d=1}^{4}H_p^{(d)}(t_1,\ldots,t_{g_1-1},t_{g_1+2},\ldots,t_k)\times\right.$$

$$\left.\times\prod_{\substack{q=1\\ q\neq g_1,g_2}}^{k}\psi_q(t_q)\phi_{j_q}(t_q)dt_1\ldots dt_{g_1-1}dt_{g_1+2}\ldots dt_k\right)^2=$$

$$=\int\limits_{[t,T]^{k-2}}\left(\sum_{d=1}^{4}H_p^{(d)}(t_1,\ldots,t_{g_1-1},t_{g_1+2},\ldots,t_k)\prod_{\substack{q=1\\ q\neq g_1,g_2}}^{k}\psi_q(t_q)\right)^2dt_1\ldots dt_{g_1-1}dt_{g_1+2}\ldots\ldots dt_k\leq$$

$$\leq 4\sum_{d=1}^{4}\int\limits_{[t,T]^{k-2}}\left(H_p^{(d)}(t_1,\ldots,t_{g_1-1},t_{g_1+2},\ldots,t_k)\prod_{\substack{q=1\\ q\neq g_1,g_2}}^{k}\psi_q(t_q)\right)^2dt_1\ldots dt_{g_1-1}dt_{g_1+2}\ldots dt_k\leq$$

$$\leq\frac{K}{p^{2-\varepsilon}}\ \to\ 0 \tag{210}$$

if $p\to\infty$, where ε is an arbitrary small positive real number for the polynomial case and $\varepsilon=0$ for the trigonometric case, constant K does not depend on p. The cases (205), (206) are considered analogously.

From (209), (210) and their analogues for the cases (193)–(195), (205), (206) we obtain

$$\sum_{j_{q_1},\ldots,j_{q_{k-2}}=0}^{p}\left(\sum_{j_{g_1}=p+1}^{\infty}C_{j_k\ldots j_1}\Biggl|_{j_{g_1}=j_{g_2}}\right)^2\le\frac{K}{p^{2-\varepsilon}},\tag{211}$$

where constant K is independent of p. Thus the equality (182) is proved.

Let us prove the equality (183). Consider the following cases

1. $g_2>g_1+1,\ g_4=g_3+1,$ 2. $g_2=g_1+1,\ g_4>g_3+1,$

3. $g_2>g_1+1,\ g_4>g_3+1,$ 4. $g_2=g_1+1,\ g_4=g_3+1.$

The proof for Cases 1–3 will be similar. Consider, for example, Case 2. Using (77), we obtain

$$\sum_{j_{q_1}=0}^{p}\left(\sum_{j_{g_1}=p+1}^{\infty}\sum_{j_{g_3}=p+1}^{\infty}C_{j_5\ldots j_1}\Biggl|_{j_{g_1}=j_{g_2},j_{g_3}=j_{g_4},g_4>g_3+1,g_2=g_1+1}\right)^2=$$

$$=\sum_{j_{q_1}=0}^{p}\left(\sum_{j_{g_1}=p+1}^{\infty}\sum_{j_{g_3}=0}^{p}C_{j_5\ldots j_1}\Biggl|_{j_{g_1}=j_{g_2},j_{g_3}=j_{g_4},g_4>g_3+1,g_2=g_1+1}\right)^2=$$

$$=\sum_{j_{q_1}=0}^{p}\left(\sum_{j_{g_3}=0}^{p}\sum_{j_{g_1}=p+1}^{\infty}C_{j_5\ldots j_1}\Biggl|_{j_{g_1}=j_{g_2},j_{g_3}=j_{g_4},g_4>g_3+1,g_2=g_1+1}\right)^2\le\tag{212}$$

$$\le(p+1)\sum_{j_{q_1}=0}^{p}\sum_{j_{g_3}=0}^{p}\left(\sum_{j_{g_1}=p+1}^{\infty}C_{j_5\ldots j_1}\Biggl|_{j_{g_1}=j_{g_2},j_{g_3}=j_{g_4},g_4>g_3+1,g_2=g_1+1}\right)^2=$$

$$=(p+1)\sum_{j_{q_1}=0}^{p}\sum_{j_{g_3},j_{g_4}=0}^{p}\left(\sum_{j_{g_1}=p+1}^{\infty}C_{j_5\ldots j_1}\Biggl|_{j_{g_1}=j_{g_2},g_4>g_3+1,g_2=g_1+1}\right)^2\Biggl|_{j_{g_3}=j_{g_4}}\le$$

$$\le(p+1)\sum_{j_{q_1}=0}^{p}\sum_{j_{g_3},j_{g_4}=0}^{p}\left(\sum_{j_{g_1}=p+1}^{\infty}C_{j_5\ldots j_1}\Biggl|_{j_{g_1}=j_{g_2},g_4>g_3+1,g_2=g_1+1}\right)^2.\tag{213}$$

It is easy to see that the expression (213) (without the multiplier $p+1$) is a particular case $(g_4>g_3+1,g_2=g_1+1)$ of the left-hand side of (211). Combining (211) and (213), we have

$$\sum_{j_{q_1}=0}^{p}\left(\sum_{j_{g_1}=p+1}^{\infty}\sum_{j_{g_3}=p+1}^{\infty}C_{j_5\ldots j_1}\Biggl|_{j_{g_1}=j_{g_2},j_{g_3}=j_{g_4},g_4>g_3+1,g_2=g_1+1}\right)^2\le$$

$$\le\frac{(p+1)K}{p^{2-\varepsilon}}\le\frac{K_1}{p^{1-\varepsilon}}\ \to\ 0\tag{214}$$

if $p\to\infty$, where constant K_1 does not depend on p.

Consider Case 4 ($g_2=g_1+1,\ g_4=g_3+1$). We have (see (78))

$$
\sum_{j_{q_1}=0}^{p}\left(\sum_{j_{g_1}=p+1}^{\infty}\sum_{j_{g_3}=p+1}^{\infty}C_{j_5\ldots j_1}\Bigg|_{j_{g_1}=j_{g_2},j_{g_3}=j_{g_4}}\right)^2=
$$

$$
=\sum_{j_{q_1}=0}^{p}\left(\sum_{j_{g_1}=p+1}^{\infty}\left(\sum_{j_{g_3}=0}^{\infty}-\sum_{j_{g_3}=0}^{p}\right)C_{j_5\ldots j_1}\Bigg|_{j_{g_1}=j_{g_2},j_{g_3}=j_{g_4}}\right)^2=
$$

$$
=\sum_{j_{q_1}=0}^{p}\left(\frac{1}{2}\sum_{j_{g_1}=p+1}^{\infty}C_{j_5\ldots j_1}\Bigg|_{j_{g_1}=j_{g_2},(j_{g_3}j_{g_3})\frown(\cdot)}-\sum_{j_{g_3}=0}^{p}\sum_{j_{g_1}=p+1}^{\infty}C_{j_5\ldots j_1}\Bigg|_{j_{g_1}=j_{g_2},j_{g_3}=j_{g_4}}\right)^2\le
$$

$$
\le\frac{1}{2}\sum_{j_{q_1}=0}^{p}\left(\sum_{j_{g_1}=p+1}^{\infty}C_{j_5\ldots j_1}\Bigg|_{j_{g_1}=j_{g_2},(j_{g_3}j_{g_3})\frown(\cdot)}\right)^2+ \tag{215}
$$

$$
+2\sum_{j_{q_1}=0}^{p}\left(\sum_{j_{g_3}=0}^{p}\sum_{j_{g_1}=p+1}^{\infty}C_{j_5\ldots j_1}\Bigg|_{j_{g_1}=j_{g_2},j_{g_3}=j_{g_4}}\right)^2. \tag{216}
$$

An expression similar to (216) was estimated (see (212)–(214)). Let us estimate (215). We have

$$
\sum_{j_{q_1}=0}^{p}\left(\sum_{j_{g_1}=p+1}^{\infty}C_{j_5\ldots j_1}\Bigg|_{j_{g_1}=j_{g_2},(j_{g_3}j_{g_3})\frown(\cdot)}\right)^2=
$$

$$
=(T-t)\sum_{j_{q_1}=0}^{p}\left(\sum_{j_{g_1}=p+1}^{\infty}C_{j_5\ldots j_1}\Bigg|_{j_{g_1}=j_{g_2},(j_{g_3}j_{g_3})\frown 0}\right)^2\le
$$

$$
\le(T-t)\sum_{j_{q_1}=0}^{p}\sum_{j_{g_3}=0}^{p}\left(\sum_{j_{g_1}=p+1}^{\infty}C_{j_5\ldots j_1}\Bigg|_{j_{g_1}=j_{g_2},(j_{g_3}j_{g_3})\frown j_{g_3}}\right)^2, \tag{217}
$$

where the notations are the same as in the proof of Theorem 13.

The expression (217) without the multiplier $T-t$ is an expression of type (141)–(146) before passing to the limit $\lim\limits_{p\to\infty}$ (the only difference is the replacement of one of the weight functions $\psi_1(\tau),\ldots,\psi_4(\tau)$ in (141)–(146) by the product $\psi_{l+1}(\tau)\psi_l(\tau)$ ($l=1,\ldots,4$). Therefore, for Case 4 ($g_2=g_1+1,\ g_4=g_3+1$), we obtain the estimate

$$
\sum_{j_{q_1}=0}^{p}\left(\sum_{j_{g_1}=p+1}^{\infty}\sum_{j_{g_3}=p+1}^{\infty}C_{j_5\ldots j_1}\Bigg|_{j_{g_1}=j_{g_2},j_{g_3}=j_{g_4},g_4=g_3+1,g_2=g_1+1}\right)^2\le
$$

$$
\le\frac{K}{p^{1-\varepsilon}}, \tag{218}
$$

where constant K is independent of p.

The estimates (214), (218) prove (183). Let us prove (184). By analogy with (217) we have

$$\sum_{j_{q_1}=0}^{p}\left(\sum_{j_{g_3}=p+1}^{\infty} C_{j_5\ldots j_1}\Bigg|_{(j_{g_2}j_{g_1})\curvearrowright(\cdot),j_{g_1}=j_{g_2},j_{g_3}=j_{g_4},g_2=g_1+1}\right)^2=$$

$$=\sum_{j_{q_1}=0}^{p}\left(\sum_{j_{g_3}=p+1}^{\infty} C_{j_5\ldots j_1}\Bigg|_{(j_{g_1}j_{g_1})\curvearrowright(\cdot),j_{g_3}=j_{g_4},g_2=g_1+1}\right)^2=$$

$$=(T-t)\sum_{j_{q_1}=0}^{p}\left(\sum_{j_{g_3}=p+1}^{\infty} C_{j_5\ldots j_1}\Bigg|_{(j_{g_1}j_{g_1})\curvearrowright 0,j_{g_3}=j_{g_4},g_2=g_1+1}\right)^2\le$$

$$\le(T-t)\sum_{j_{q_1}=0}^{p}\sum_{j_{g_1}=0}^{p}\left(\sum_{j_{g_3}=p+1}^{\infty} C_{j_5\ldots j_1}\Bigg|_{(j_{g_1}j_{g_1})\curvearrowright j_{g_1},j_{g_3}=j_{g_4},g_2=g_1+1}\right)^2. \quad (219)$$

Thus, we obtain the estimate (see (217) and the proof of Theorem 17)

$$\sum_{j_{q_1}=0}^{p}\left(\sum_{j_{g_3}=p+1}^{\infty} C_{j_5\ldots j_1}\Bigg|_{(j_{g_2}j_{g_1})\curvearrowright(\cdot),j_{g_1}=j_{g_2},j_{g_3}=j_{g_4},g_2=g_1+1}\right)^2\le$$

$$\le\frac{K}{p^{2-\varepsilon}}, \quad (220)$$

where ε is an arbitrary small positive real number for the polynomial case and $\varepsilon=0$ for the trigonometric case, constant K does not depend on p.

The estimate (220) proves (184). Theorem 18 is proved.

11. Estimates for the Mean-Square Approximation Error of Expansions of Iterated Stratonovich Stochastic Integrals of Multiplicity k in Theorems 13, 15

In this section, we estimate the mean-square approximation error for iterated Stratonovich stochastic integrals of multiplicity k ($k\in\mathbb{N}$) in Theorems 13, 15.

Theorem 19 [15], [47], [55], [62]. *Suppose that every $\psi_l(\tau)$ ($l=1,\ldots,k$) is a continuously differentiable nonrandom function at the interval $[t,T]$. Furthermore, let $\{\phi_j(x)\}_{j=0}^{\infty}$ is a complete orthonormal system of Legendre polynomials or trigonometric functions in the space $L_2([t,T])$. Then the following estimates*

$$\mathsf{M}\left\{\left(J^*[\psi^{(k)}]_{T,t}^{(i_1\ldots i_k)}-\sum_{j_1,\ldots,j_k=0}^{p} C_{j_k\ldots j_1}\prod_{l=1}^{k}\zeta_{j_l}^{(i_l)}\right)^2\right\}\le$$

$$\leq K_1\left(\frac{1}{p}+\sum_{r=1}^{[k/2]}\sum_{\substack{(\{\{g_1,g_2\},\ldots,\{g_{2r-1},g_{2r}\}\},\{q_1,\ldots,q_{k-2r}\})\\ \{g_1,g_2,\ldots,g_{2r-1},g_{2r},q_1,\ldots,q_{k-2r}\}=\{1,2,\ldots,k\}}} \mathsf{M}\left\{\left(R_{T,t}^{(p)r,g_1,g_2,\ldots,g_{2r-1},g_{2r}}\right)^2\right\}\right), \tag{221}$$

$$\mathsf{M}\left\{\left(J^*[\psi^{(k)}]_{s,t}^{(i_1\ldots i_k)}-\sum_{j_1,\ldots,j_k=0}^{p} C_{j_k\ldots j_1}(s)\prod_{l=1}^{k}\zeta_{j_l}^{(i_l)}\right)^2\right\}\leq$$

$$\leq K_2(s)\left(\frac{1}{p}+\sum_{r=1}^{[k/2]}\sum_{\substack{(\{\{g_1,g_2\},\ldots,\{g_{2r-1},g_{2r}\}\},\{q_1,\ldots,q_{k-2r}\})\\ \{g_1,g_2,\ldots,g_{2r-1},g_{2r},q_1,\ldots,q_{k-2r}\}=\{1,2,\ldots,k\}}} \mathsf{M}\left\{\left(R_{s,t}^{(p)r,g_1,g_2,\ldots,g_{2r-1},g_{2r}}\right)^2\right\}\right) \tag{222}$$

hold, where $s\in(t,T]$ *(*s *is fixed),* $i_1,\ldots,i_k=1,\ldots,m$,

$$R_{s,t}^{(p)r,g_1,g_2,\ldots,g_{2r-1},g_{2r}}=R_{T,t}^{(p)r,g_1,g_2,\ldots,g_{2r-1},g_{2r}}\Biggr|_{T=s},$$

$R_{T,t}^{(p)r,g_1,g_2,\ldots,g_{2r-1},g_{2r}}$ *is defined by* (90), $J^*[\psi^{(k)}]_{T,t}^{(i_1\ldots i_k)}$ *and* $J^*[\psi^{(k)}]_{s,t}^{(i_1\ldots i_k)}$ *are iterated Stratonovich stochastic integrals* (43) *and* (101), $C_{j_k\ldots j_1}$ *and* $C_{j_k\ldots j_1}(s)$ *are Fourier coefficients* (35) *and* (99), *constants* K_1, $K_2(s)$ *are independent of* p; *another notations are the same as in Theorems* 3, 13, 15.

Proof. As follows from Sect. 7 and 8, Conditions 1 and 2 of Theorems 13, 15 are satisfied under the conditions of Theorem 19. Then from the proof of Theorem 13 it follows that the expression (95) before passing to limit $\underset{p\to\infty}{\text{l.i.m.}}$ has the form

$$\sum_{j_1,\ldots,j_k=0}^{p} C_{j_k\ldots j_1}\prod_{l=1}^{k}\zeta_{j_l}^{(i_l)}=J[\psi^{(k)}]_{T,t}^{(i_1\ldots i_k)p}+$$

$$+\sum_{r=1}^{[k/2]}\left(\frac{1}{2^r}\sum_{(s_r,\ldots,s_1)\in\mathrm{A}_{k,r}} I[\psi^{(k)}]_{T,t}^{(i_1\ldots i_{s_1-1}i_{s_1+2}\ldots i_{s_r-1}i_{s_r+2}\ldots i_k)p}+\right.$$

$$\left.+\sum_{\substack{(\{\{g_1,g_2\},\ldots,\{g_{2r-1},g_{2r}\}\},\{q_1,\ldots,q_{k-2r}\})\\ \{g_1,g_2,\ldots,g_{2r-1},g_{2r},q_1,\ldots,q_{k-2r}\}=\{1,2,\ldots,k\}}} R_{T,t}^{(p)r,g_1,g_2,\ldots,g_{2r-1},g_{2r}}\right), \tag{223}$$

where $J[\psi^{(k)}]_{T,t}^{(i_1\ldots i_k)p}$ is the approximation for the iterated Ito stochastic integral (2), which is obtained using Theorem 4, i.e.

$$J[\psi^{(k)}]_{T,t}^{(i_1\ldots i_k)p}=\sum_{j_1,\ldots,j_k=0}^{p} C_{j_k\ldots j_1}\left(\prod_{l=1}^{k}\zeta_{j_l}^{(i_l)}+\sum_{r=1}^{[k/2]}(-1)^r\times\right.$$

$$\left.\times\sum_{\substack{(\{\{g_1,g_2\},\ldots,\{g_{2r-1},g_{2r}\}\},\{q_1,\ldots,q_{k-2r}\})\\ \{g_1,g_2,\ldots,g_{2r-1},g_{2r},q_1,\ldots,q_{k-2r}\}=\{1,2,\ldots,k\}}} \prod_{s=1}^{r}\mathbf{1}_{\{i_{g_{2s-1}}=\,i_{g_{2s}}\neq 0\}}\mathbf{1}_{\{j_{g_{2s-1}}=\,j_{g_{2s}}\}}\prod_{l=1}^{k-2r}\zeta_{j_{q_l}}^{(i_{q_l})}\right), \tag{224}$$

$I[\psi^{(k)}]_{T,t}^{(i_1\ldots i_{s_1-1}i_{s_1+2}\ldots i_{s_r-1}i_{s_r+2}\ldots i_k)p}$ is the approximation obtained using (224) for the iterated Ito stochastic integral $J[\psi^{(k)}]_{T,t}^{s_r,\ldots,s_1}$ (see (96)).

Using (223) and Theorem 5, we have

$$\sum_{j_1,\ldots,j_k=0}^{p} C_{j_k\ldots j_1}\prod_{l=1}^{k}\zeta_{j_l}^{(i_l)} = J[\psi^{(k)}]_{T,t}^{(i_1\ldots i_k)} + \sum_{r=1}^{[k/2]}\frac{1}{2^r}\sum_{(s_r,\ldots,s_1)\in \mathrm{A}_{k,r}} I[\psi^{(k)}]_{T,t}^{(i_1\ldots i_{s_1-1}i_{s_1+2}\ldots i_{s_r-1}i_{s_r+2}\ldots i_k)}+$$

$$+\left(J[\psi^{(k)}]_{T,t}^{(i_1\ldots i_k)p} - J[\psi^{(k)}]_{T,t}^{(i_1\ldots i_k)}\right)+$$

$$+\sum_{r=1}^{[k/2]}\sum_{(s_r,\ldots,s_1)\in \mathrm{A}_{k,r}}\frac{1}{2^r}\left(I[\psi^{(k)}]_{T,t}^{(i_1\ldots i_{s_1-1}i_{s_1+2}\ldots i_{s_r-1}i_{s_r+2}\ldots i_k)p} - I[\psi^{(k)}]_{T,t}^{(i_1\ldots i_{s_1-1}i_{s_1+2}\ldots i_{s_r-1}i_{s_r+2}\ldots i_k)}\right)+$$

$$+\sum_{r=1}^{[k/2]}\sum_{\substack{(\{\{g_1,g_2\},\ldots,\{g_{2r-1},g_{2r}\}\},\{q_1,\ldots,q_{k-2r}\})\\ \{g_1,g_2,\ldots,g_{2r-1},g_{2r},q_1,\ldots,q_{k-2r}\}=\{1,2,\ldots,k\}}} R_{T,t}^{(p)r,g_1,g_2,\ldots,g_{2r-1},g_{2r}} =$$

$$= J^{*}[\psi^{(k)}]_{T,t}^{(i_1\ldots i_k)} + \left(J[\psi^{(k)}]_{T,t}^{(i_1\ldots i_k)p} - J[\psi^{(k)}]_{T,t}^{(i_1\ldots i_k)}\right)+$$

$$+\sum_{r=1}^{[k/2]}\sum_{(s_r,\ldots,s_1)\in \mathrm{A}_{k,r}}\frac{1}{2^r}\left(I[\psi^{(k)}]_{T,t}^{(i_1\ldots i_{s_1-1}i_{s_1+2}\ldots i_{s_r-1}i_{s_r+2}\ldots i_k)p} - I[\psi^{(k)}]_{T,t}^{(i_1\ldots i_{s_1-1}i_{s_1+2}\ldots i_{s_r-1}i_{s_r+2}\ldots i_k)}\right)+$$

$$+\sum_{r=1}^{[k/2]}\sum_{\substack{(\{\{g_1,g_2\},\ldots,\{g_{2r-1},g_{2r}\}\},\{q_1,\ldots,q_{k-2r}\})\\ \{g_1,g_2,\ldots,g_{2r-1},g_{2r},q_1,\ldots,q_{k-2r}\}=\{1,2,\ldots,k\}}} R_{T,t}^{(p)r,g_1,g_2,\ldots,g_{2r-1},g_{2r}} \tag{225}$$

w. p. 1, where we denote $J[\psi^{(k)}]_{T,t}^{s_r,\ldots,s_1}$ as $I[\psi^{(k)}]_{T,t}^{(i_1\ldots i_{s_1-1}i_{s_1+2}\ldots i_{s_r-1}i_{s_r+2}\ldots i_k)}$.

In [15] (Sect. 1.7.2, Remark 1.7) it is shown that under the conditions of Theorem 19 the following estimate

$$\mathsf{M}\left\{\left(J[\psi^{(k)}]_{T,t}^{(i_1\ldots i_k)} - J[\psi^{(k)}]_{T,t}^{(i_1\ldots i_k)p}\right)^2\right\} \le \frac{C}{p}, \tag{226}$$

holds, where $J[\psi^{(k)}]_{T,t}^{(i_1\ldots i_k)}$ is defined by (2), $J[\psi^{(k)}]_{T,t}^{(i_1\ldots i_k)p}$ has the form (224), $i_1,\ldots,i_k = 0,1,\ldots,m$, constant C depends only on k and $T-t$.

Applying (226), we obtain the following estimates

$$\mathsf{M}\left\{\left(J[\psi^{(k)}]_{T,t}^{(i_1\ldots i_k)p} - J[\psi^{(k)}]_{T,t}^{(i_1\ldots i_k)}\right)^2\right\} \le \frac{C}{p}, \tag{227}$$

$$\mathsf{M}\left\{\left(I[\psi^{(k)}]_{T,t}^{(i_1\ldots i_{s_1-1}i_{s_1+2}\ldots i_{s_r-1}i_{s_r+2}\ldots i_k)p}-I[\psi^{(k)}]_{T,t}^{(i_1\ldots i_{s_1-1}i_{s_1+2}\ldots i_{s_r-1}i_{s_r+2}\ldots i_k)}\right)^2\right\}\le$$

$$\le\frac{C}{p}, \tag{228}$$

where constant C does not depend on p.

From (225)–(228) and the elementary inequality

$$(a_1+a_2+\ldots+a_n)^2\le n\left(a_1^2+a_2^2+\ldots+a_n^2\right),\quad n\in\mathbb{N}$$

we obtain (221).

The estimate (222) is obtained similarly to the estimate (221) using Theorems 1.11, 1.24 in [15], Theorem 15 and the estimate [15] (Sect. 1.8.1, Remark 1.12)

$$\mathsf{M}\left\{\left(J[\psi^{(k)}]_{s,t}^{(i_1\ldots i_k)}-J[\psi^{(k)}]_{s,t}^{(i_1\ldots i_k)p}\right)^2\right\}\le\frac{C}{p},$$

where

$$J[\psi^{(k)}]_{s,t}^{(i_1\ldots i_k)}=\int\limits_t^s\psi_k(t_k)\ldots\int\limits_t^{t_2}\psi_1(t_1)d\mathbf{f}_{t_1}^{(i_1)}\ldots d\mathbf{f}_{t_k}^{(i_k)},$$

$$J[\psi^{(k)}]_{s,t}^{(i_1\ldots i_k)p}=\sum_{j_1,\ldots,j_k=0}^{p}C_{j_k\ldots j_1}(s)\Biggl(\prod_{l=1}^{k}\zeta_{j_l}^{(i_l)}+\sum_{r=1}^{[k/2]}(-1)^r\times$$

$$\times\sum_{\substack{(\{\{g_1,g_2\},\ldots,\{g_{2r-1},g_{2r}\}\},\{q_1,\ldots,q_{k-2r}\})\\ \{g_1,g_2,\ldots,g_{2r-1},g_{2r},q_1,\ldots,q_{k-2r}\}=\{1,2,\ldots,k\}}}\prod_{s=1}^{r}\mathbf{1}_{\{i_{g_{2s-1}}=\,i_{g_{2s}}\ne 0\}}\mathbf{1}_{\{j_{g_{2s-1}}=\,j_{g_{2s}}\}}\prod_{l=1}^{k-2r}\zeta_{j_{q_l}}^{(i_{q_l})}\Biggr),$$

where $s\in(t,T]$ (s is fixed), $C_{j_k\ldots j_1}(s)$ is the Fourier coefficient (99), $i_1,\ldots,i_k=0,1,\ldots,m$, constant C depends only on k and $s-t$; another notations are the same as in Theorem 4, 15. Theorem 19 is proved.

12. Rate of the Mean-Square Convergence of Expansions of Iterated Stratonovich Stochastic Integrals of Multiplicities 3–5 in Theorems 16–18

In this section, we consider the rate of convergence of approximations of iterated Stratonovich stochastic integrals in Theorems 16–18. It is easy to see that in Theorems 16–18 the second term in parentheses on the right-hand side of (221) is estimated. Combining these results with Theorem 19, we obtain the following theorems.

Theorem 20 [15], [47], [55], [62]. *Suppose that $\{\phi_j(x)\}_{j=0}^{\infty}$ is a complete orthonormal system of Legendre polynomials or trigonometric functions in the space $L_2([t,T])$. Furthermore, let $\psi_1(\tau),\psi_2(\tau)$, $\psi_3(\tau)$ are continuously differentiable nonrandom functions on $[t,T]$. Then, for the iterated Stratonovich stochastic integral of third multiplicity*

$$J^*[\psi^{(3)}]_{T,t}=\int\limits_t^{*T}\psi_3(t_3)\int\limits_t^{*t_3}\psi_2(t_2)\int\limits_t^{*t_2}\psi_1(t_1)d\mathbf{f}_{t_1}^{(i_1)}d\mathbf{f}_{t_2}^{(i_2)}d\mathbf{f}_{t_3}^{(i_3)}$$

the following estimate

$$\mathsf{M}\left\{\left(J^*[\psi^{(3)}]_{T,t}-\sum_{j_1,j_2,j_3=0}^{p}C_{j_3j_2j_1}\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}\zeta_{j_3}^{(i_3)}\right)^2\right\}\le\frac{C}{p}$$

is fulfilled, where $i_1,i_2,i_3=1,\ldots,m,$ *constant* C *is independent of* p,

$$C_{j_3j_2j_1}=\int\limits_t^T\psi_3(t_3)\phi_{j_3}(t_3)\int\limits_t^{t_3}\psi_2(t_2)\phi_{j_2}(t_2)\int\limits_t^{t_2}\psi_1(t_1)\phi_{j_1}(t_1)dt_1dt_2dt_3$$

and

$$\zeta_j^{(i)}=\int\limits_t^T\phi_j(s)d\mathbf{f}_s^{(i)}$$

are independent standard Gaussian random variables for various i *or* j.

Theorem 21 [15], [47], [55], [62]. *Let* $\{\phi_j(x)\}_{j=0}^{\infty}$ *be a complete orthonormal system of Legendre polynomials or trigonometric functions in the space* $L_2([t,T])$. *Furthermore, let* $\psi_1(\tau),\ldots,\ \psi_4(\tau)$ *be continuously differentiable nonrandom functions on* $[t,T]$. *Then, for the iterated Stratonovich stochastic integral of fourth multiplicity*

$$J^*[\psi^{(4)}]_{T,t}=\int\limits_t^{*T}\psi_4(t_4)\int\limits_t^{*t_4}\psi_3(t_3)\int\limits_t^{*t_3}\psi_2(t_2)\int\limits_t^{*t_2}\psi_1(t_1)d\mathbf{f}_{t_1}^{(i_1)}d\mathbf{f}_{t_2}^{(i_2)}d\mathbf{f}_{t_3}^{(i_3)}d\mathbf{f}_{t_4}^{(i_4)}$$

the following estimate

$$\mathsf{M}\left\{\left(J^*[\psi^{(4)}]_{T,t}-\sum_{j_1,j_2,j_3,j_4=0}^{p}C_{j_4j_3j_2j_1}\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}\zeta_{j_3}^{(i_3)}\zeta_{j_4}^{(i_4)}\right)^2\right\}\le\frac{C}{p^{1-\varepsilon}}$$

holds, where $i_1,i_2,i_3,i_4=1,\ldots,m,$ *constant* C *does not depend on* p, ε *is an arbitrary small positive real number for the case of complete orthonormal system of Legendre polynomials in the space* $L_2([t,T])$ *and* $\varepsilon=0$ *for the case of complete orthonormal system of trigonometric functions in the space* $L_2([t,T])$,

$$C_{j_4j_3j_2j_1}=\int\limits_t^T\psi_4(t_4)\phi_{j_4}(t_4)\int\limits_t^{t_4}\psi_3(t_3)\phi_{j_3}(t_3)\int\limits_t^{t_3}\psi_2(t_2)\phi_{j_2}(t_2)\int\limits_t^{t_2}\psi_1(t_1)\phi_{j_1}(t_1)dt_1\times$$

$$\times dt_2dt_3dt_4;$$

another notations are the same as in Theorem 20.

Theorem 22 [15], [47], [55], [62]. *Assume that* $\{\phi_j(x)\}_{j=0}^{\infty}$ *is a complete orthonormal system of Legendre polynomials or trigonometric functions in the space* $L_2([t,T])$ *and* $\psi_1(\tau),\ldots,\psi_5(\tau)$ *are continuously differentiable nonrandom functions on* $[t,T]$. *Then, for the iterated Stratonovich stochastic integral of fifth multiplicity*

$$J^*[\psi^{(5)}]_{T,t}=\int\limits_t^{*T}\psi_5(t_5)\ldots\int\limits_t^{*t_2}\psi_1(t_1)d\mathbf{f}_{t_1}^{(i_1)}\ldots d\mathbf{f}_{t_5}^{(i_5)}$$

the following estimate

$$\mathsf{M}\left\{\left(J^*[\psi^{(5)}]_{T,t}-\sum_{j_1,\ldots,j_5=0}^{p}C_{j_5\ldots j_1}\zeta_{j_1}^{(i_1)}\ldots\zeta_{j_5}^{(i_5)}\right)^2\right\}\le\frac{C}{p^{1-\varepsilon}}$$

is valid, where $i_1,\ldots,i_5=1,\ldots,m$, *constant* C *is independent of* p, ε *is an arbitrary small positive real number for the case of complete orthonormal system of Legendre polynomials in the space* $L_2([t,T])$ *and* $\varepsilon=0$ *for the case of complete orthonormal system of trigonometric functions in the space* $L_2([t,T])$,

$$C_{j_5\ldots j_1}=\int\limits_t^{T}\psi_5(t_5)\phi_{j_5}(t_5)\ldots\int\limits_t^{t_2}\psi_1(t_1)\phi_{j_1}(t_1)dt_1\ldots dt_5;$$

another notations are the same as in Theorem 20, 21.

13. Expansion of Iterated Stratonovich Stochastic Integrals of Multiplicity 6. The Case $p_1=\ldots=p_6\to\infty$ and $\psi_1(\tau),\ \ldots,\ \psi_6(\tau)\equiv 1$ (The Cases of Legendre Polynomials and Trigonometric Functions)

Theorem 23 [15], [47], [55], [63]. *Suppose that* $\{\phi_j(x)\}_{j=0}^{\infty}$ *is a complete orthonormal system of Legendre polynomials or trigonometric functions in the space* $L_2([t,T])$. *Then, for the iterated Stratonovich stochastic integral of sixth multiplicity*

$$J_{T,t}^{*(i_1\ldots i_6)}=\int\limits_t^{*T}\ldots\int\limits_t^{*t_2}d\mathbf{w}_{t_1}^{(i_1)}\ldots d\mathbf{w}_{t_6}^{(i_6)} \qquad (229)$$

the following expansion

$$J_{T,t}^{*(i_1\ldots i_6)}=\underset{p\to\infty}{\text{l.i.m.}}\sum_{j_1,\ldots,j_6=0}^{p}C_{j_6\ldots j_1}\zeta_{j_1}^{(i_1)}\ldots\zeta_{j_6}^{(i_6)}$$

that converges in the mean-square sense is valid, where $i_1,\ldots,i_6=0,1,\ldots,m$,

$$C_{j_6\ldots j_1}=\int\limits_t^{T}\phi_{j_6}(t_6)\ldots\int\limits_t^{t_2}\phi_{j_1}(t_1)dt_1\ldots dt_6$$

and

$$\zeta_j^{(i)} = \int\limits_t^T \phi_j(s) d\mathbf{w}_s^{(i)}$$

are independent standard Gaussian random variables for various i or j (in the case when $i \neq 0$), $\mathbf{w}_\tau^{(i)} = \mathbf{f}_\tau^{(i)}$ for $i = 1, \ldots, m$ and $\mathbf{w}_\tau^{(0)} = \tau$.

Proof. As noted in Sect. 7, Conditions 1 and 2 of Theorem 13 are satisfied for complete orthonormal systems of Legendre polynomials and trigonometric functions in the space $L_2([t, T])$. Let us verify Condition 3 of Theorem 13 for the iterated Stratonovich stochastic integral (229). Thus, we have to check the following conditions

$$\lim_{p\to\infty} \sum_{j_{q_1}, j_{q_2}, j_{q_3}, j_{q_4}=0}^{p} \left(\sum_{j_{g_1}=p+1}^{\infty} C_{j_6 \ldots j_1}\Bigg|_{j_{g_1}=j_{g_2}} \right)^2 = 0, \tag{230}$$

$$\lim_{p\to\infty} \sum_{j_{q_1}, j_{q_2}=0}^{p} \left(\sum_{j_{g_1}=p+1}^{\infty} \sum_{j_{g_3}=p+1}^{\infty} C_{j_6 \ldots j_1}\Bigg|_{j_{g_1}=j_{g_2}, j_{g_3}=j_{g_4}} \right)^2 = 0, \tag{231}$$

$$\lim_{p\to\infty} \sum_{j_{q_1}, j_{q_2}=0}^{p} \left(\sum_{j_{g_1}=p+1}^{\infty} C_{j_6 \ldots j_1}\Bigg|_{(j_{g_4} j_{g_3})\curvearrowright(\cdot), j_{g_1}=j_{g_2}, j_{g_3}=j_{g_4}, g_4=g_3+1} \right)^2 = 0, \tag{232}$$

$$\lim_{p\to\infty} \left(\sum_{j_{g_1}=p+1}^{\infty} \sum_{j_{g_3}=p+1}^{\infty} \sum_{j_{g_5}=p+1}^{\infty} C_{j_6 \ldots j_1}\Bigg|_{j_{g_1}=j_{g_2}, j_{g_3}=j_{g_4}, j_{g_5}=j_{g_6}} \right)^2 = 0, \tag{233}$$

$$\lim_{p\to\infty} \left(\sum_{j_{g_1}=p+1}^{\infty} \sum_{j_{g_3}=p+1}^{\infty} C_{j_6 \ldots j_1}\Bigg|_{(j_{g_6} j_{g_5})\curvearrowright(\cdot), j_{g_1}=j_{g_2}, j_{g_3}=j_{g_4}, j_{g_5}=j_{g_6}, g_6=g_5+1} \right)^2 = 0, \tag{234}$$

$$\lim_{p\to\infty} \left(\sum_{j_{g_1}=p+1}^{\infty} C_{j_6 \ldots j_1}\Bigg|_{(j_{g_4} j_{g_3})\curvearrowright(\cdot)(j_{g_6} j_{g_5})\curvearrowright(\cdot), j_{g_1}=j_{g_2}, j_{g_3}=j_{g_4}, j_{g_5}=j_{g_6}, g_4=g_3+1, g_6=g_5+1} \right)^2 = 0, \tag{235}$$

where the expressions

$$(\{g_1, g_2\}, \{g_3, g_4\}, \{g_5, g_6\}\}), \quad (\{g_1, g_2\}, \{g_3, g_4\}, \{q_1, q_2\}\}), \quad (\{g_1, g_2\}, \{q_1, q_2, q_3, q_4\})$$

are partitions of the set $\{1, 2, \ldots, 6\}$ that is $\{g_1, g_2, g_3, g_4, g_5, g_6\} = \{g_1, g_2, g_3, g_4, q_1, q_2\} = \{g_1, g_2, q_1, q_2, q_3, q_4\} = \{1, 2, \ldots, 6\}$; braces mean an unordered set, and parentheses mean an ordered set.

The equalities (230), (232) were proved earlier (see the proof of equalities (211), (217)). The relation (235) follows from the estimate (103) for the polynomial case and its analogue for the trigonometric case. It is easy to see that the equalities (231) and (234) are proved in complete analogy with the proof of (183), (217).

Thus, we have to prove the relation (233). The equality (233) is equivalent to the following equalities

$$\lim_{p\to\infty}\sum_{j_1=p+1}^{\infty}\sum_{j_2=p+1}^{\infty}\sum_{j_3=p+1}^{\infty}C_{j_3j_2j_1j_3j_2j_1}=0, \tag{236}$$

$$\lim_{p\to\infty}\sum_{j_1=p+1}^{\infty}\sum_{j_2=p+1}^{\infty}\sum_{j_3=p+1}^{\infty}C_{j_1j_3j_2j_3j_2j_1}=0, \tag{237}$$

$$\lim_{p\to\infty}\sum_{j_1=p+1}^{\infty}\sum_{j_2=p+1}^{\infty}\sum_{j_3=p+1}^{\infty}C_{j_3j_2j_3j_1j_2j_1}=0, \tag{238}$$

$$\lim_{p\to\infty}\sum_{j_1=p+1}^{\infty}\sum_{j_2=p+1}^{\infty}\sum_{j_3=p+1}^{\infty}C_{j_1j_2j_3j_3j_2j_1}=0, \tag{239}$$

$$\lim_{p\to\infty}\sum_{j_1=p+1}^{\infty}\sum_{j_2=p+1}^{\infty}\sum_{j_3=p+1}^{\infty}C_{j_1j_2j_2j_3j_3j_1}=0, \tag{240}$$

$$\lim_{p\to\infty}\sum_{j_1=p+1}^{\infty}\sum_{j_2=p+1}^{\infty}\sum_{j_3=p+1}^{\infty}C_{j_3j_3j_2j_2j_1j_1}=0, \tag{241}$$

$$\lim_{p\to\infty}\sum_{j_1=p+1}^{\infty}\sum_{j_2=p+1}^{\infty}\sum_{j_3=p+1}^{\infty}C_{j_2j_3j_3j_2j_1j_1}=0, \tag{242}$$

$$\lim_{p\to\infty}\sum_{j_1=p+1}^{\infty}\sum_{j_2=p+1}^{\infty}\sum_{j_3=p+1}^{\infty}C_{j_3j_2j_3j_2j_1j_1}=0, \tag{243}$$

$$\lim_{p\to\infty}\sum_{j_1=p+1}^{\infty}\sum_{j_2=p+1}^{\infty}\sum_{j_3=p+1}^{\infty}C_{j_3j_3j_2j_1j_2j_1}=0, \tag{244}$$

$$\lim_{p\to\infty}\sum_{j_1=p+1}^{\infty}\sum_{j_2=p+1}^{\infty}\sum_{j_3=p+1}^{\infty}C_{j_3j_3j_1j_2j_2j_1}=0, \tag{245}$$

$$\lim_{p\to\infty}\sum_{j_1=p+1}^{\infty}\sum_{j_2=p+1}^{\infty}\sum_{j_3=p+1}^{\infty}C_{j_2j_1j_3j_3j_2j_1}=0, \tag{246}$$

$$\lim_{p\to\infty}\sum_{j_1=p+1}^{\infty}\sum_{j_2=p+1}^{\infty}\sum_{j_3=p+1}^{\infty}C_{j_3j_1j_2j_3j_2j_1}=0, \tag{247}$$

$$\lim_{p\to\infty}\sum_{j_1=p+1}^{\infty}\sum_{j_2=p+1}^{\infty}\sum_{j_3=p+1}^{\infty}C_{j_2j_3j_1j_3j_2j_1}=0, \tag{248}$$

$$\lim_{p\to\infty}\sum_{j_1=p+1}^{\infty}\sum_{j_2=p+1}^{\infty}\sum_{j_3=p+1}^{\infty}C_{j_3j_1j_3j_2j_2j_1}=0, \tag{249}$$

$$\lim_{p\to\infty}\sum_{j_1=p+1}^{\infty}\sum_{j_2=p+1}^{\infty}\sum_{j_3=p+1}^{\infty}C_{j_2j_3j_3j_1j_2j_1}=0. \tag{250}$$

Consider in detail the case of Legendre polynomials (the case of trigonometric functions is considered in complete analogy).

First, we prove the following equality for the Fourier coefficients for the case $\psi_1(\tau),\ldots,\psi_6(\tau)\equiv 1$

$$C_{j_6j_5j_4j_3j_2j_1}+C_{j_1j_2j_3j_4j_5j_6}=C_{j_6}C_{j_5j_4j_3j_2j_1}-C_{j_5j_6}C_{j_4j_3j_2j_1}+$$

$$+C_{j_4j_5j_6}C_{j_3j_2j_1}-C_{j_3j_4j_5j_6}C_{j_2j_1}+C_{j_2j_3j_4j_5j_6}C_{j_1}. \tag{251}$$

Using the integration order replacement, we have

$$C_{j_6j_5j_4j_3j_2j_1}=$$

$$=\int\limits_t^T\phi_{j_6}(t_6)\int\limits_t^{t_6}\phi_{j_5}(t_5)\ldots\int\limits_t^{t_2}\phi_{j_1}(t_1)dt_1\ldots dt_5dt_6=$$

$$=\int\limits_t^T\phi_{j_6}(t_6)\int\limits_t^{T}\phi_{j_5}(t_5)\int\limits_t^{t_5}\phi_{j_4}(t_4)\ldots\int\limits_t^{t_2}\phi_{j_1}(t_1)dt_1\ldots dt_4dt_5dt_6-$$

$$-\int\limits_t^T\phi_{j_6}(t_6)\int\limits_{t_6}^{T}\phi_{j_5}(t_5)\int\limits_t^{t_5}\phi_{j_4}(t_4)\ldots\int\limits_t^{t_2}\phi_{j_1}(t_1)dt_1\ldots dt_4dt_5dt_6=$$

$$=C_{j_6}C_{j_5j_4j_3j_2j_1}-$$

$$-\int\limits_t^T\phi_{j_6}(t_6)\int\limits_{t_6}^{T}\phi_{j_5}(t_5)\int\limits_t^{T}\phi_{j_4}(t_4)\int\limits_t^{t_4}\phi_{j_3}(t_3)\ldots\int\limits_t^{t_2}\phi_{j_1}(t_1)dt_1\ldots dt_3dt_4dt_5dt_6+$$

$$+\int\limits_t^T\phi_{j_6}(t_6)\int\limits_{t_6}^{T}\phi_{j_5}(t_5)\int\limits_{t_5}^{T}\phi_{j_4}(t_4)\int\limits_t^{t_4}\phi_{j_3}(t_3)\ldots\int\limits_t^{t_2}\phi_{j_1}(t_1)dt_1\ldots dt_3dt_4dt_5dt_6=$$

$$=C_{j_6}C_{j_5j_4j_3j_2j_1}-$$

$$-\int\limits_t^T\phi_{j_6}(t_6)\int\limits_{t_6}^{T}\phi_{j_5}(t_5)dt_5dt_6\ C_{j_4j_3j_2j_1}+$$

$$+\int\limits_t^T\phi_{j_6}(t_6)\int\limits_{t_6}^{T}\phi_{j_5}(t_5)\int\limits_{t_5}^{T}\phi_{j_4}(t_4)\int\limits_t^{t_4}\phi_{j_3}(t_3)\ldots\int\limits_t^{t_2}\phi_{j_1}(t_1)dt_1\ldots dt_3dt_4dt_5dt_6=$$

$$= C_{j_6}C_{j_5j_4j_3j_2j_1} - C_{j_5j_6}C_{j_4j_3j_2j_1} +$$

$$+\int\limits_t^T \phi_{j_6}(t_6)\int\limits_{t_6}^T \phi_{j_5}(t_5)\int\limits_{t_5}^T \phi_{j_4}(t_4)\int\limits_t^{t_4} \phi_{j_3}(t_3)\ldots\int\limits_t^{t_2} \phi_{j_1}(t_1)dt_1\ldots dt_3dt_4dt_5dt_6 =$$

$$\ldots$$

$$= C_{j_6}C_{j_5j_4j_3j_2j_1} - C_{j_5j_6}C_{j_4j_3j_2j_1} + C_{j_4j_5j_6}C_{j_3j_2j_1} - C_{j_3j_4j_5j_6}C_{j_2j_1} + C_{j_2j_3j_4j_5j_6}C_{j_1} -$$

$$-\int\limits_t^T \phi_{j_6}(t_6)\int\limits_{t_6}^T \phi_{j_5}(t_5)\ldots\int\limits_{t_2}^T \phi_{j_1}(t_1)dt_1\ldots dt_5dt_6 =$$

$$= C_{j_6}C_{j_5j_4j_3j_2j_1} - C_{j_5j_6}C_{j_4j_3j_2j_1} + C_{j_4j_5j_6}C_{j_3j_2j_1} -$$

$$-C_{j_3j_4j_5j_6}C_{j_2j_1} + C_{j_2j_3j_4j_5j_6}C_{j_1} - C_{j_1j_2j_3j_4j_5j_6}. \tag{252}$$

The equality (252) completes the proof of the relation (251).
Let us consider (236). From (71) we obtain

$$\sum_{j_1=p+1}^{\infty}\sum_{j_2=p+1}^{\infty}\sum_{j_3=p+1}^{\infty} C_{j_3j_2j_1j_3j_2j_1} = -\sum_{j_1=0}^{p}\sum_{j_2=0}^{p}\sum_{j_3=0}^{p} C_{j_3j_2j_1j_3j_2j_1}. \tag{253}$$

Applying (251), we get

$$\sum_{j_1,j_2,j_3=0}^{p} C_{j_3j_2j_1j_3j_2j_1} + \sum_{j_1,j_2,j_3=0}^{p} C_{j_1j_2j_3j_1j_2j_3} = 2\sum_{j_1,j_2,j_3=0}^{p} C_{j_3j_2j_1j_3j_2j_1} =$$

$$= \sum_{j_1,j_2,j_3=0}^{p}\Biggl(C_{j_3}C_{j_2j_1j_3j_2j_1} - C_{j_2j_3}C_{j_1j_3j_2j_1} + C_{j_1j_2j_3}C_{j_3j_2j_1} -$$

$$-C_{j_3j_1j_2j_3}C_{j_2j_1} + C_{j_2j_3j_1j_2j_3}C_{j_1}\Biggr). \tag{254}$$

The complete orthonormal system of Legendre polynomials in the space $L_2([t,T])$ looks as follows

$$\phi_j(x) = \sqrt{\frac{2j+1}{T-t}}P_j\left(\left(x - \frac{T+t}{2}\right)\frac{2}{T-t}\right), \quad j = 0, 1, 2, \ldots, \tag{255}$$

where

$$P_j(x) = \frac{1}{2^j j!}\frac{d^j}{dx^j}\left(x^2-1\right)^j$$

is the Legendre polynomial.

Note that

$$C_{j_2 j_1}=\int\limits_t^T \phi_{j_2}(\tau)\int\limits_t^{\tau}\phi_{j_1}(\theta)d\theta d\tau =$$

$$=\frac{T-t}{2}\begin{cases}1/\sqrt{(2j_1+1)(2j_1+3)} & \text{if } j_2=j_1+1,\ j_1=0,1,2,\ldots\\ -1/\sqrt{4j_1^2-1} & \text{if } j_2=j_1-1,\ j_1=1,2,\ldots\\ 1 & \text{if } j_1=j_2=0\\ 0 & \text{otherwise}\end{cases}, \tag{256}$$

$$C_{j_1}=\int\limits_t^T \phi_{j_1}(\tau)d\tau=\begin{cases}\sqrt{T-t} & \text{if } j_1=0\\ 0 & \text{if } j_1\ne 0\end{cases}. \tag{257}$$

Moreover, the generalized Parseval equality gives

$$\lim_{p\to\infty}\sum_{j_1,j_2,j_3=0}^{p} C_{j_1j_2j_3}C_{j_3j_2j_1}=$$

$$=\lim_{p\to\infty}\sum_{j_1,j_2,j_3=0}^{p}\int\limits_t^T \phi_{j_1}(t_3)\int\limits_t^{t_3}\phi_{j_2}(t_2)\int\limits_t^{t_2}\phi_{j_3}(t_1)dt_1dt_2dt_3\times$$

$$\times\int\limits_t^T \phi_{j_3}(t_3)\int\limits_t^{t_3}\phi_{j_2}(t_2)\int\limits_t^{t_2}\phi_{j_1}(t_1)dt_1dt_2dt_3=$$

$$=\lim_{p\to\infty}\sum_{j_1,j_2,j_3=0}^{p}\int\limits_t^T \phi_{j_3}(t_3)\int\limits_{t_3}^{T}\phi_{j_2}(t_2)\int\limits_{t_2}^{T}\phi_{j_1}(t_1)dt_1dt_2dt_3\times$$

$$\times\int\limits_t^T \phi_{j_3}(t_3)\int\limits_t^{t_3}\phi_{j_2}(t_2)\int\limits_t^{t_2}\phi_{j_1}(t_1)dt_1dt_2dt_3=$$

$$=\lim_{p\to\infty}\sum_{j_1,j_2,j_3=0}^{p}\int\limits_{[t,T]^3}\mathbf{1}_{\{t_3<t_2<t_1\}}\prod_{l=1}^{3}\phi_{j_l}(t_l)dt_1dt_2dt_3\times$$

$$\times\int\limits_{[t,T]^3}\mathbf{1}_{\{t_1<t_2<t_3\}}\prod_{l=1}^{3}\phi_{j_l}(t_l)dt_1dt_2dt_3=$$

$$=\int\limits_{[t,T]^3}\mathbf{1}_{\{t_3<t_2<t_1\}}\mathbf{1}_{\{t_1<t_2<t_3\}}dt_1dt_2dt_3=0. \tag{258}$$

Using the above arguments and also (71), (253), and (254), we get

$$-\lim_{p\to\infty}\sum_{j_1=p+1}^{\infty}\sum_{j_2=p+1}^{\infty}\sum_{j_3=p+1}^{\infty}C_{j_3j_2j_1j_3j_2j_1}=\lim_{p\to\infty}\sum_{j_1,j_2,j_3=0}^{p}C_{j_3j_2j_1j_3j_2j_1}=$$

$$=\frac{1}{2}\lim_{p\to\infty}\sum_{j_1,j_2,j_3=0}^{p}\Biggl(C_{j_3}C_{j_2j_1j_3j_2j_1}-C_{j_2j_3}C_{j_1j_3j_2j_1}-$$

$$-C_{j_3j_1j_2j_3}C_{j_2j_1}+C_{j_2j_3j_1j_2j_3}C_{j_1}\Biggr)=$$

$$=\lim_{p\to\infty}\sum_{j_1,j_2,j_3=0}^{p}\Biggl(C_{j_3}C_{j_2j_1j_3j_2j_1}-C_{j_3j_1j_2j_3}C_{j_2j_1}\Biggr)=$$

$$=\sqrt{T-t}\lim_{p\to\infty}\sum_{j_1,j_2=0}^{p}C_{j_2j_10j_2j_1}-\lim_{p\to\infty}\sum_{j_1,j_2,j_3=0}^{p}C_{j_3j_1j_2j_3}C_{j_2j_1}=$$

$$=\sqrt{T-t}\lim_{p\to\infty}\sum_{j_1,j_2=0}^{p}C_{j_2j_10j_2j_1}+\lim_{p\to\infty}\sum_{j_1,j_2=0}^{p}\sum_{j_3=p+1}^{\infty}C_{j_3j_1j_2j_3}C_{j_2j_1}. \tag{259}$$

By analogy with the proof of (147) (see the proof of Theorem 17) we obtain

$$\lim_{p\to\infty}\sum_{j_1,j_2=0}^{p}C_{j_2j_10j_2j_1}=\lim_{p\to\infty}\sum_{j_1=p+1}^{\infty}\sum_{j_2=p+1}^{\infty}C_{j_2j_10j_2j_1}=0, \tag{260}$$

where we used the following representation

$$C_{j_2j_10j_2j_1}=$$

$$=\frac{1}{\sqrt{T-t}}\int\limits_t^T\phi_{j_2}(t_5)\int\limits_t^{t_5}\phi_{j_1}(t_4)\int\limits_t^{t_4}\int\limits_t^{t_3}\phi_{j_2}(t_2)\int\limits_t^{t_2}\phi_{j_1}(t_1)dt_1dt_2dt_3dt_4dt_5=$$

$$=\frac{1}{\sqrt{T-t}}\int\limits_t^T\phi_{j_2}(t_5)\int\limits_t^{t_5}\phi_{j_1}(t_4)\int\limits_t^{t_4}\phi_{j_2}(t_2)\int\limits_t^{t_2}\phi_{j_1}(t_1)dt_1\int\limits_{t_2}^{t_4}dt_3dt_2dt_4dt_5=$$

$$=\frac{1}{\sqrt{T-t}}\int\limits_t^T\phi_{j_2}(t_5)\int\limits_t^{t_5}\phi_{j_1}(t_4)(t_4-t)\int\limits_t^{t_4}\phi_{j_2}(t_2)\int\limits_t^{t_2}\phi_{j_1}(t_1)dt_1dt_2dt_4dt_5+$$

$$+\frac{1}{\sqrt{T-t}}\int\limits_t^T\phi_{j_2}(t_5)\int\limits_t^{t_5}\phi_{j_1}(t_4)\int\limits_t^{t_4}\phi_{j_2}(t_2)(t-t_2)\int\limits_t^{t_2}\phi_{j_1}(t_1)dt_1dt_2dt_4dt_5\stackrel{\text{def}}{=}$$

$$\stackrel{\text{def}}{=}\bar{C}_{j_2j_1j_2j_1}+\tilde{C}_{j_2j_1j_2j_1}.$$

Further, we have (see (256))

$$\lim_{p\to\infty}\sum_{j_1,j_2=0}^{p}\sum_{j_3=p+1}^{\infty}C_{j_3j_1j_2j_3}C_{j_2j_1}=\lim_{p\to\infty}\sum_{j_3=p+1}^{\infty}\Biggl(C_{00}C_{j_300j_3}+$$

$$+\sum_{j_1=1}^{p}C_{j_1-1,j_1}C_{j_3j_1,j_1-1,j_3}+\sum_{j_1=1}^{p-1}C_{j_1+1,j_1}C_{j_3j_1,j_1+1,j_3}+C_{1,0}C_{j_301j_3}\Biggr). \tag{261}$$

Observe that

$$|C_{j_1-1,j_1}|+|C_{j_1+1,j_1}|\le\frac{K}{j_1}\quad (j_1=1,\ldots,p), \tag{262}$$

$$|C_{j_300j_3}|+|C_{j_3j_1,j_1-1,j_3}|+|C_{j_3j_1,j_1+1,j_3}|+|C_{j_301j_3}|\le\frac{K_1}{j_3^2}\quad (j_3\ge p+1), \tag{263}$$

where constants K, K_1 do not depend on j_1, j_3.

The estimate (262) follow from (256). At the same time, the estimate (263) can be obtained using the following reasoning. First note that the integration order replacement gives

$$C_{j_3j_1j_2j_3}=\int\limits_t^T\phi_{j_3}(t_4)\int\limits_t^{t_4}\phi_{j_1}(t_3)\int\limits_t^{t_3}\phi_{j_2}(t_2)\int\limits_t^{t_2}\phi_{j_3}(t_1)dt_1dt_2dt_3dt_4=$$

$$=\int\limits_t^T\phi_{j_1}(t_3)\int\limits_t^{t_3}\phi_{j_2}(t_2)\left(\int\limits_t^{t_2}\phi_{j_3}(t_1)dt_1\right)dt_2\left(\int\limits_{t_3}^{T}\phi_{j_3}(t_4)dt_4\right)dt_3. \tag{264}$$

Consider the well-known estimate for Legendre polynomials

$$|P_j(y)|<\frac{K}{\sqrt{j+1}(1-y^2)^{1/4}},\quad y\in(-1,1),\quad j\in\mathbb{N}, \tag{265}$$

where constant K does not depend on y and j.

The estimate (265) can be rewritten for the function $\phi_j(x)$ (see (255)) in the following form

$$|\phi_j(x)|<\sqrt{\frac{2j+1}{j+1}}\frac{K}{\sqrt{T-t}}\frac{1}{(1-z^2(x))^{1/4}}<\frac{K_1}{\sqrt{T-t}}\frac{1}{(1-z^2(x))^{1/4}}, \tag{266}$$

where $K_1=K\sqrt{2}$, $x\in(t,T)$, $j\in\mathbb{N}$,

$$z(x)=\left(x-\frac{T+t}{2}\right)\frac{2}{T-t}.$$

Note analogues of the estimates (109), (110)

$$\left|\int\limits_t^x \phi_{j_1}(s)ds\right| < \frac{C}{j_1(1-(z(x))^2)^{1/4}}, \quad \left|\int\limits_x^T \phi_{j_1}(s)ds\right| < \frac{C}{j_1(1-(z(x))^2)^{1/4}}, \quad x \in (t,T), \tag{267}$$

where $j_1 > 0$, constant C does not depend on j_1.

Applying the estimates (266) and (267) to (264) gives the estimate (263). Using (261), (262), and (263), we obtain

$$\left|\sum_{j_1,j_2=0}^{p}\sum_{j_3=p+1}^{\infty} C_{j_3j_1j_2j_3}C_{j_2j_1}\right| \le K\sum_{j_3=p+1}^{\infty}\frac{1}{j_3^2}\left(1+\sum_{j_1=1}^{p}\frac{1}{j_1}\right) \le$$

$$\le K\int\limits_p^{\infty}\frac{dx}{x^2}\left(2+\int\limits_1^p\frac{dx}{x}\right) = \frac{K(2+lnp)}{p} \to 0 \tag{268}$$

if $p \to \infty$, where constant K is independent of p. Thus, the equality (236) is proved (see (259), (260), (268)).

The relation (237) is proved in complete analogy with the proof of equality (236). For (237) we have (see (251))

$$\lim_{p\to\infty}\left(\sum_{j_1,j_2,j_3=0}^{p} C_{j_1j_3j_2j_3j_2j_1} + \sum_{j_1,j_2,j_3=0}^{p} C_{j_1j_2j_3j_2j_3j_1}\right) = 2\lim_{p\to\infty}\sum_{j_1,j_2,j_3=0}^{p} C_{j_1j_3j_2j_3j_2j_1} =$$

$$= \lim_{p\to\infty}\sum_{j_1,j_2,j_3=0}^{p}\Bigl(C_{j_1}C_{j_3j_2j_3j_2j_1} - C_{j_3j_1}C_{j_2j_3j_2j_1} + C_{j_2j_3j_1}C_{j_3j_2j_1} -$$

$$-C_{j_3j_2j_3j_1}C_{j_2j_1} + C_{j_2j_3j_2j_3j_1}C_{j_1}\Bigr) =$$

$$= 2\lim_{p\to\infty}\left(\sqrt{T-t}\sum_{j_2,j_3=0}^{p} C_{j_3j_2j_3j_20} - \sum_{j_1,j_2,j_3=0}^{p} C_{j_2j_1}C_{j_3j_2j_3j_1}\right) =$$

$$= -2\lim_{p\to\infty}\sum_{j_1,j_2,j_3=0}^{p} C_{j_2j_1}C_{j_3j_2j_3j_1}.$$

To estimate the Fourier coefficient $C_{j_3j_2j_3j_1}$, we use the following (see the proof of (236) for more details)

$$C_{j_3j_2j_3j_1} = \int\limits_t^T \phi_{j_3}(t_4)\int\limits_t^{t_4}\phi_{j_2}(t_3)\int\limits_t^{t_3}\phi_{j_3}(t_2)\int\limits_t^{t_2}\phi_{j_1}(t_1)dt_1dt_2dt_3dt_4 =$$

$$= \int\limits_t^T \phi_{j_3}(t_4)\int\limits_t^{t_4}\phi_{j_2}(t_3)\int\limits_t^{t_3}\phi_{j_1}(t_1)\int\limits_{t_1}^{t_3}\phi_{j_3}(t_2)dt_2dt_1dt_3dt_4 =$$

$$= \int_t^T \phi_{j_3}(t_4) \int_t^{t_4} \phi_{j_2}(t_3) \left(\int_t^{t_3} \phi_{j_3}(t_2)dt_2 \right) \int_t^{t_3} \phi_{j_1}(t_1)dt_1 dt_3 dt_4 -$$

$$- \int_t^T \phi_{j_3}(t_4) \int_t^{t_4} \phi_{j_2}(t_3) \int_t^{t_3} \phi_{j_1}(t_1) \left(\int_t^{t_1} \phi_{j_3}(t_2)dt_2 \right) dt_1 dt_3 dt_4 =$$

$$= \int_t^T \phi_{j_2}(t_3) \left(\int_t^{t_3} \phi_{j_3}(t_2)dt_2 \right) \int_t^{t_3} \phi_{j_1}(t_1)dt_1 \left(\int_{t_3}^T \phi_{j_3}(t_4)dt_4 \right) dt_3 -$$

$$- \int_t^T \phi_{j_2}(t_3) \int_t^{t_3} \phi_{j_1}(t_1) \left(\int_t^{t_1} \phi_{j_3}(t_2)dt_2 \right) dt_1 \left(\int_{t_3}^T \phi_{j_3}(t_4)dt_4 \right) dt_3.$$

Let us prove (238). From (71) we obtain

$$\sum_{j_1=p+1}^{\infty} \sum_{j_2=p+1}^{\infty} \sum_{j_3=p+1}^{\infty} C_{j_3 j_2 j_3 j_1 j_2 j_1} = - \sum_{j_1=0}^{p} \sum_{j_2=0}^{p} \sum_{j_3=0}^{p} C_{j_3 j_2 j_3 j_1 j_2 j_1}. \tag{269}$$

Applying (251) and (269), we get (we replaced j_3 by j_4)

$$\sum_{j_1,j_2,j_4=0}^{p} C_{j_4 j_2 j_4 j_1 j_2 j_1} + \sum_{j_1,j_2,j_4=0}^{p} C_{j_1 j_2 j_1 j_4 j_2 j_4} = 2 \sum_{j_1,j_2,j_4=0}^{p} C_{j_4 j_2 j_4 j_1 j_2 j_1} =$$

$$= \sum_{j_1,j_2,j_4=0}^{p} \Biggl(C_{j_4} C_{j_2 j_4 j_1 j_2 j_1} - C_{j_2 j_4} C_{j_4 j_1 j_2 j_1} + C_{j_4 j_2 j_4} C_{j_1 j_2 j_1} -$$

$$- C_{j_1 j_4 j_2 j_4} C_{j_2 j_1} + C_{j_2 j_1 j_4 j_2 j_4} C_{j_1} \Biggr) =$$

$$= 2 \sum_{j_1,j_2,j_4=0}^{p} \left(C_{j_2 j_1 j_4 j_2 j_4} C_{j_1} - C_{j_1 j_4 j_2 j_4} C_{j_2 j_1} \right) +$$

$$+ \sum_{j_1,j_2,j_4=0}^{p} C_{j_4 j_2 j_4} C_{j_1 j_2 j_1}. \tag{270}$$

Further, we have (see (71))

$$\lim_{p\to\infty} \sum_{j_1,j_2,j_4=0}^{p} C_{j_4 j_2 j_4} C_{j_1 j_2 j_1} = \lim_{p\to\infty} \sum_{j_2=0}^{p} \left(\sum_{j_1=0}^{p} C_{j_1 j_2 j_1} \right)^2 =$$

$$= \lim_{p\to\infty}\sum_{j_2=0}^{p}\left(\sum_{j_1=p+1}^{\infty}C_{j_1j_2j_1}\right)^2 = 0, \tag{271}$$

where we applied the equality (120).

Furthermore, by analogy with the proof of (236), we have

$$\lim_{p\to\infty}\sum_{j_1,j_2,j_4=0}^{p}\Bigl(C_{j_2j_1j_4j_2j_4}C_{j_1} - C_{j_1j_4j_2j_4}C_{j_2j_1}\Bigr) = 0. \tag{272}$$

To estimate the Fourier coefficient $C_{j_1j_4j_2j_4}$ in (272), we use the following (see the proof of (236) for more details)

$$C_{j_1j_4j_2j_4} = \int\limits_t^T \phi_{j_1}(t_4)\int\limits_t^{t_4}\phi_{j_4}(t_3)\int\limits_t^{t_3}\phi_{j_2}(t_2)\left(\int\limits_t^{t_2}\phi_{j_4}(t_1)dt_1\right)dt_2dt_3dt_4 =$$

$$= \int\limits_t^T \phi_{j_1}(t_4)\int\limits_t^{t_4}\phi_{j_2}(t_2)\left(\int\limits_t^{t_2}\phi_{j_4}(t_1)dt_1\right)\int\limits_{t_2}^{t_4}\phi_{j_4}(t_3)dt_3dt_2dt_4 =$$

$$= \int\limits_t^T \phi_{j_1}(t_4)\left(\int\limits_t^{t_4}\phi_{j_4}(t_3)dt_3\right)\int\limits_t^{t_4}\phi_{j_2}(t_2)\left(\int\limits_t^{t_2}\phi_{j_4}(t_1)dt_1\right)dt_2dt_4 -$$

$$-\int\limits_t^T \phi_{j_1}(t_4)\int\limits_t^{t_4}\phi_{j_2}(t_2)\left(\int\limits_t^{t_2}\phi_{j_4}(t_3)dt_3\right)\left(\int\limits_t^{t_2}\phi_{j_4}(t_1)dt_1\right)dt_2dt_4.$$

The relations (269)–(272) complete the proof of equality (238).

Let us prove (239). Using (71), we get

$$\sum_{j_1=p+1}^{\infty}\sum_{j_2=p+1}^{\infty}\sum_{j_3=p+1}^{\infty}C_{j_1j_2j_3j_3j_2j_1} = \sum_{j_1=0}^{p}\sum_{j_2=0}^{p}\sum_{j_3=p+1}^{\infty}C_{j_1j_2j_3j_3j_2j_1}. \tag{273}$$

Applying (251) and (273), we obtain

$$2\sum_{j_1,j_2=0}^{p}\sum_{j_3=p+1}^{\infty}C_{j_1j_2j_3j_3j_2j_1} =$$

$$= \sum_{j_1,j_2=0}^{p}\sum_{j_3=p+1}^{\infty}\Bigl(C_{j_1}C_{j_2j_3j_3j_2j_1} - C_{j_2j_1}C_{j_3j_3j_2j_1} + \left(C_{j_3j_2j_1}\right)^2 -$$

$$-C_{j_3j_3j_2j_1}C_{j_2j_1} + C_{j_2j_3j_3j_2j_1}C_{j_1}\Bigr) =$$

$$
=2\sum_{j_1,j_2=0}^{p}\sum_{j_3=p+1}^{\infty}\Bigl(C_{j_1}C_{j_2j_3j_3j_2j_1}-C_{j_2j_1}C_{j_3j_3j_2j_1}\Bigr)+
$$

$$
+\sum_{j_1,j_2=0}^{p}\sum_{j_3=p+1}^{\infty}\left(C_{j_3j_2j_1}\right)^2. \tag{274}
$$

In [15] (Sect. 1.7.2) the following estimate

$$
\sum_{j_1=0}^{\infty}\ldots\sum_{j_{s-1}=0}^{\infty}\sum_{j_s=p+1}^{\infty}\sum_{j_{s+1}=0}^{\infty}\ldots\sum_{j_k=0}^{\infty}C_{j_k\ldots j_1}^2\le
$$

$$
\le L_k\sum_{j_s=p+1}^{\infty}\frac{1}{j_s^2}\le L_k\int\limits_p^{\infty}\frac{dx}{x^2}=\frac{L_k}{p} \tag{275}
$$

is proved for the polynomial and trigonometric cases, where $s=1,\ldots,k$, constant L_k depends on k and $T-t$.

Using the estimate (275), we get

$$
\lim_{p\to\infty}\sum_{j_1,j_2=0}^{p}\sum_{j_3=p+1}^{\infty}\left(C_{j_3j_2j_1}\right)^2=0. \tag{276}
$$

By analogy with the proof of (236), we have

$$
\lim_{p\to\infty}\sum_{j_1,j_2=0}^{p}\sum_{j_3=p+1}^{\infty}\Bigl(C_{j_1}C_{j_2j_3j_3j_2j_1}-C_{j_2j_1}C_{j_3j_3j_2j_1}\Bigr)=0, \tag{277}
$$

where we applied the equality (148). To estimate the Fourier coefficient $C_{j_3j_3j_2j_1}$ in (277), we used the following (see the proof of (236) for more details)

$$
C_{j_3j_3j_2j_1}=\int\limits_t^T\phi_{j_3}(t_4)\int\limits_t^{t_4}\phi_{j_3}(t_3)\int\limits_t^{t_3}\phi_{j_2}(t_2)\int\limits_t^{t_2}\phi_{j_1}(t_1)dt_1dt_2dt_3dt_4=
$$

$$
=\int\limits_t^T\phi_{j_1}(t_1)\int\limits_{t_1}^T\phi_{j_2}(t_2)\int\limits_{t_2}^T\phi_{j_3}(t_3)\int\limits_{t_3}^T\phi_{j_3}(t_4)dt_4dt_3dt_2dt_1=
$$

$$
=\frac{1}{2}\int\limits_t^T\phi_{j_1}(t_1)\int\limits_{t_1}^T\phi_{j_2}(t_2)\left(\int\limits_{t_2}^T\phi_{j_3}(t_3)dt_3\right)^2dt_2dt_1. \tag{278}
$$

Combining the equalities (273)–(277), we obtain (239).

Let us prove (240) (we replace j_2 by j_4 and j_3 by j_2 in (240)). As noted in Sect. 7, the sequential order of the series

$$\sum_{j_1=p+1}^{\infty}\sum_{j_2=p+1}^{\infty}\sum_{j_4=p+1}^{\infty}$$

is not important. This follows directly from the formulas (78) and (71).

Applying the mentioned property and (71), we get

$$\sum_{j_1=p+1}^{\infty}\sum_{j_2=p+1}^{\infty}\sum_{j_4=p+1}^{\infty} C_{j_1j_4j_4j_2j_2j_1} = -\sum_{j_1=0}^{p}\sum_{j_2=p+1}^{\infty}\sum_{j_4=p+1}^{\infty} C_{j_1j_4j_4j_2j_2j_1}. \tag{279}$$

Observe that (see the above reasoning)

$$\sum_{j_2=p+1}^{\infty}\sum_{j_4=p+1}^{\infty} C_{j_1j_4j_4j_2j_2j_1} = \sum_{j_4=p+1}^{\infty}\sum_{j_2=p+1}^{\infty} C_{j_1j_4j_4j_2j_2j_1}. \tag{280}$$

Using (251) and (280), we obtain

$$\sum_{j_1=0}^{p}\sum_{j_2=p+1}^{\infty}\sum_{j_4=p+1}^{\infty}\left(C_{j_1j_4j_4j_2j_2j_1}+C_{j_1j_2j_2j_4j_4j_1}\right) = 2\sum_{j_1=0}^{p}\sum_{j_2=p+1}^{\infty}\sum_{j_4=p+1}^{\infty} C_{j_1j_4j_4j_2j_2j_1} =$$

$$= \sum_{j_1=0}^{p}\sum_{j_2=p+1}^{\infty}\sum_{j_4=p+1}^{\infty}\Bigl(C_{j_1}C_{j_4j_4j_2j_2j_1} - C_{j_4j_1}C_{j_4j_2j_2j_1} + C_{j_4j_4j_1}C_{j_2j_2j_1} -$$

$$-C_{j_2j_4j_4j_1}C_{j_2j_1} + C_{j_2j_2j_4j_4j_1}C_{j_1}\Bigr) =$$

$$= \sum_{j_1=0}^{p}\sum_{j_2=p+1}^{\infty}\sum_{j_4=p+1}^{\infty}\left(C_{j_1}C_{j_4j_4j_2j_2j_1} - C_{j_4j_1}C_{j_4j_2j_2j_1} - C_{j_2j_4j_4j_1}C_{j_2j_1} + C_{j_2j_2j_4j_4j_1}C_{j_1}\right) +$$

$$+\sum_{j_1=0}^{p}\left(\sum_{j_2=p+1}^{\infty} C_{j_2j_2j_1}\right)^2. \tag{281}$$

The equality

$$\lim_{p\to\infty}\sum_{j_1=0}^{p}\left(\sum_{j_2=p+1}^{\infty} C_{j_2j_2j_1}\right)^2 = 0 \tag{282}$$

follows from the relation (119).

By analogy with the proof of equality (236) we obtain

$$\lim_{p\to\infty}\sum_{j_1=0}^{p}\sum_{j_2=p+1}^{\infty}\sum_{j_4=p+1}^{\infty}\Bigl(C_{j_1}C_{j_4j_4j_2j_2j_1} - C_{j_4j_1}C_{j_4j_2j_2j_1} -$$

$$-C_{j_2j_4j_4j_1}C_{j_2j_1}+C_{j_2j_2j_4j_4j_1}C_{j_1}\Biggr)=0, \tag{283}$$

where we applied the equality (149). To estimate the Fourier coefficient $C_{j_2j_4j_4j_1}$ in (283), we used the following (see the proof of (236) for more details)

$$C_{j_2j_4j_4j_1}=\int\limits_t^T\phi_{j_2}(t_4)\int\limits_t^{t_4}\phi_{j_4}(t_3)\int\limits_t^{t_3}\phi_{j_4}(t_2)\int\limits_t^{t_2}\phi_{j_1}(t_1)dt_1dt_2dt_3dt_4=$$

$$=\int\limits_t^T\phi_{j_2}(t_4)\int\limits_t^{t_4}\phi_{j_1}(t_1)\int\limits_{t_1}^{t_4}\phi_{j_4}(t_2)\int\limits_{t_2}^{t_4}\phi_{j_4}(t_3)dt_3dt_2dt_1dt_4=$$

$$=\frac{1}{2}\int\limits_t^T\phi_{j_2}(t_4)\int\limits_t^{t_4}\phi_{j_1}(t_1)\left(\int\limits_{t_1}^{t_4}\phi_{j_4}(t_2)dt_2\right)^2dt_1dt_4=$$

$$=\frac{1}{2}\int\limits_t^T\phi_{j_2}(t_4)\left(\int\limits_t^{t_4}\phi_{j_4}(t_2)dt_2\right)^2\int\limits_t^{t_4}\phi_{j_1}(t_1)dt_1dt_4+$$

$$+\frac{1}{2}\int\limits_t^T\phi_{j_2}(t_4)\int\limits_t^{t_4}\phi_{j_1}(t_1)\left(\int\limits_t^{t_1}\phi_{j_4}(t_2)dt_2\right)^2dt_1dt_4-$$

$$-\int\limits_t^T\phi_{j_2}(t_4)\left(\int\limits_t^{t_4}\phi_{j_4}(t_2)dt_2\right)\int\limits_t^{t_4}\phi_{j_1}(t_1)\left(\int\limits_t^{t_1}\phi_{j_4}(t_2)dt_2\right)dt_1dt_4.$$

The relation (240) follows from (279), (281)–(283).

Consider (241). Using the integration order replacement, we obtain

$$C_{j_3j_3j_2j_2j_1j_1}=$$

$$=\frac{1}{2}\int\limits_t^T\phi_{j_3}(t_6)\int\limits_t^{t_6}\phi_{j_3}(t_5)\int\limits_t^{t_5}\phi_{j_2}(t_4)\int\limits_t^{t_4}\phi_{j_2}(t_3)\left(\int\limits_t^{t_3}\phi_{j_1}(t_1)dt_1\right)^2dt_3dt_4dt_5dt_6=$$

$$=\frac{1}{2}\int\limits_t^T\phi_{j_2}(t_3)\left(\int\limits_t^{t_3}\phi_{j_1}(t_1)dt_1\right)^2\int\limits_{t_3}^T\phi_{j_2}(t_4)\int\limits_{t_4}^T\phi_{j_3}(t_5)\int\limits_{t_5}^T\phi_{j_3}(t_6)dt_6dt_5dt_4dt_3=$$

$$=\frac{1}{4}\int\limits_t^T\phi_{j_2}(t_3)\left(\int\limits_t^{t_3}\phi_{j_1}(t_1)dt_1\right)^2\int\limits_{t_3}^T\phi_{j_2}(t_4)\left(\int\limits_{t_4}^T\phi_{j_3}(t_5)dt_5\right)^2dt_4dt_3. \tag{284}$$

Applying the estimates (267) to (284) gives the following estimate

$$|C_{j_3j_3j_2j_2j_1j_1}| \le \frac{K}{j_1^2 j_3^2} \quad (j_1, j_3 > 0,\ j_2 \ge 0), \tag{285}$$

where constant K does not depend on j_1, j_2, j_3.

Further, we get (see (78))

$$\sum_{j_1=p+1}^{\infty}\sum_{j_2=p+1}^{\infty}\sum_{j_3=p+1}^{\infty} C_{j_3j_3j_2j_2j_1j_1} = \sum_{j_1=p+1}^{\infty}\sum_{j_3=p+1}^{\infty}\sum_{j_2=p+1}^{\infty} C_{j_3j_3j_2j_2j_1j_1} =$$

$$= \frac{1}{2}\sum_{j_1=p+1}^{\infty}\sum_{j_3=p+1}^{\infty} C_{j_3j_3j_2j_2j_1j_1}\Biggr|_{(j_2j_2)\curvearrowright(\cdot)} - \sum_{j_2=0}^{p}\sum_{j_1=p+1}^{\infty}\sum_{j_3=p+1}^{\infty} C_{j_3j_3j_2j_2j_1j_1}, \tag{286}$$

where

$$C_{j_3j_3j_2j_2j_1j_1}\Biggr|_{(j_2j_2)\curvearrowright(\cdot)} =$$

$$= \int\limits_t^T \phi_{j_3}(t_6)\int\limits_t^{t_6}\phi_{j_3}(t_5)\int\limits_t^{t_5}\int\limits_t^{t_4}\phi_{j_1}(t_2)\int\limits_t^{t_2}\phi_{j_1}(t_1)dt_1dt_2dt_4dt_5dt_6 =$$

$$= \int\limits_t^T \phi_{j_3}(t_6)\int\limits_t^{t_6}\phi_{j_3}(t_5)\int\limits_t^{t_5}\phi_{j_1}(t_2)\int\limits_t^{t_2}\phi_{j_1}(t_1)dt_1\int\limits_{t_2}^{t_5}dt_4dt_2dt_5dt_6 =$$

$$= \int\limits_t^T \phi_{j_3}(t_6)\int\limits_t^{t_6}\phi_{j_3}(t_5)(t_5-t)\int\limits_t^{t_5}\phi_{j_1}(t_2)\int\limits_t^{t_2}\phi_{j_1}(t_1)dt_1dt_2dt_5dt_6+$$

$$+ \int\limits_t^T \phi_{j_3}(t_6)\int\limits_t^{t_6}\phi_{j_3}(t_5)\int\limits_t^{t_5}\phi_{j_1}(t_2)(t-t_2)\int\limits_t^{t_2}\phi_{j_1}(t_1)dt_1dt_2dt_5dt_6 \stackrel{\text{def}}{=}$$

$$\stackrel{\text{def}}{=} C'_{j_3j_3j_1j_1} + C''_{j_3j_3j_1j_1}. \tag{287}$$

Let us substitute (287) into (286)

$$\sum_{j_1=p+1}^{\infty}\sum_{j_2=p+1}^{\infty}\sum_{j_3=p+1}^{\infty} C_{j_3j_3j_2j_2j_1j_1} = \frac{1}{2}\sum_{j_1=p+1}^{\infty}\sum_{j_3=p+1}^{\infty} C'_{j_3j_3j_1j_1}+$$

$$+\frac{1}{2}\sum_{j_1=p+1}^{\infty}\sum_{j_3=p+1}^{\infty} C''_{j_3j_3j_1j_1} - \sum_{j_2=0}^{p}\sum_{j_1=p+1}^{\infty}\sum_{j_3=p+1}^{\infty} C_{j_3j_3j_2j_2j_1j_1}. \tag{288}$$

The relation (149) implies that

$$
\lim_{p\to\infty}\sum_{j_1=p+1}^{\infty}\sum_{j_3=p+1}^{\infty} C'_{j_3j_3j_1j_1}=0,\quad \lim_{p\to\infty}\sum_{j_1=p+1}^{\infty}\sum_{j_3=p+1}^{\infty} C''_{j_3j_3j_1j_1}=0. \tag{289}
$$

From the estimate (285) we get

$$
\left|\sum_{j_2=0}^{p}\sum_{j_1=p+1}^{\infty}\sum_{j_3=p+1}^{\infty} C_{j_3j_3j_2j_2j_1j_1}\right| \le K(p+1)\sum_{j_1=p+1}^{\infty}\frac{1}{j_1^2}\sum_{j_3=p+1}^{\infty}\frac{1}{j_3^2}\le
$$

$$
\le K(p+1)\left(\int\limits_{p}^{\infty}\frac{dx}{x^2}\right)^2\le \frac{K(p+1)}{p^2}\ \to\ 0 \tag{290}
$$

if $p\to\infty$, where constant K is independent of p.

The relations (288)–(290) complete the proof of (241).

Let us prove (242). Using the integration order replacement, we get

$$
C_{j_2j_3j_3j_2j_1j_1}=
$$

$$
=\frac{1}{2}\int\limits_t^T\phi_{j_2}(t_6)\int\limits_t^{t_6}\phi_{j_3}(t_5)\int\limits_t^{t_5}\phi_{j_3}(t_4)\int\limits_t^{t_4}\phi_{j_2}(t_3)\left(\int\limits_t^{t_3}\phi_{j_1}(t_1)dt_1\right)^2 dt_3dt_4dt_5dt_6=
$$

$$
=\frac{1}{2}\int\limits_t^T\phi_{j_2}(t_3)\left(\int\limits_t^{t_3}\phi_{j_1}(t_1)dt_1\right)^2\int\limits_{t_3}^T\phi_{j_3}(t_4)\int\limits_{t_4}^T\phi_{j_3}(t_5)\int\limits_{t_5}^T\phi_{j_2}(t_6)dt_6dt_5dt_4dt_3=
$$

$$
=\frac{1}{2}\int\limits_t^T\phi_{j_2}(t_3)\left(\int\limits_t^{t_3}\phi_{j_1}(t_1)dt_1\right)^2\int\limits_{t_3}^T\phi_{j_3}(t_5)\int\limits_{t_5}^T\phi_{j_2}(t_6)dt_6\int\limits_{t_3}^{t_5}\phi_{j_3}(t_4)dt_4dt_5dt_3=
$$

$$
=\frac{1}{2}\int\limits_t^T\phi_{j_2}(t_3)\left(\int\limits_t^{t_3}\phi_{j_1}(t_1)dt_1\right)^2\int\limits_{t_3}^T\phi_{j_3}(t_5)\left(\int\limits_{t_5}^T\phi_{j_2}(t_6)dt_6\right)\left(\int\limits_{t}^{t_5}\phi_{j_3}(t_4)dt_4\right)dt_5dt_3-
$$

$$
-\frac{1}{2}\int\limits_t^T\phi_{j_2}(t_3)\left(\int\limits_t^{t_3}\phi_{j_1}(t_1)dt_1\right)^2\left(\int\limits_t^{t_3}\phi_{j_3}(t_4)dt_4\right)\int\limits_{t_3}^T\phi_{j_3}(t_5)\left(\int\limits_{t_5}^T\phi_{j_2}(t_6)dt_6\right)dt_5dt_3. \tag{291}
$$

Applying (71) and (78), we obtain

$$
-\sum_{j_1=p+1}^{\infty}\sum_{j_2=p+1}^{\infty}\sum_{j_3=p+1}^{\infty}C_{j_2j_3j_3j_2j_1j_1}=-\sum_{j_1=p+1}^{\infty}\sum_{j_3=p+1}^{\infty}\sum_{j_2=p+1}^{\infty}C_{j_2j_3j_3j_2j_1j_1}=
$$

$$=\sum_{j_2=0}^{p}\sum_{j_1=p+1}^{\infty}\sum_{j_3=p+1}^{\infty}C_{j_2j_3j_3j_2j_1j_1}=$$

$$=\frac{1}{2}\sum_{j_2=0}^{p}\sum_{j_1=p+1}^{\infty}C_{j_2j_3j_3j_2j_1j_1}\Bigr|_{(j_3j_3)\frown(\cdot)}-\sum_{j_2=0}^{p}\sum_{j_3=0}^{p}\sum_{j_1=p+1}^{\infty}C_{j_2j_3j_3j_2j_1j_1}=$$

$$=\frac{1}{2}\sum_{j_2=0}^{p}\sum_{j_1=p+1}^{\infty}C_{j_2j_3j_3j_2j_1j_1}\Bigr|_{(j_3j_3)\frown(\cdot)}-\sum_{j_1=p+1}^{\infty}C_{0000j_1j_1}-$$

$$-\sum_{j_3=1}^{p}\sum_{j_1=p+1}^{\infty}C_{0j_3j_30j_1j_1}-\sum_{j_2=1}^{p}\sum_{j_1=p+1}^{\infty}C_{j_200j_2j_1j_1}-$$

$$-\sum_{j_2=1}^{p}\sum_{j_3=1}^{p}\sum_{j_1=p+1}^{\infty}C_{j_2j_3j_3j_2j_1j_1}. \quad (292)$$

The equality

$$\lim_{p\to\infty}\frac{1}{2}\sum_{j_2=0}^{p}\sum_{j_1=p+1}^{\infty}C_{j_2j_3j_3j_2j_1j_1}\Bigr|_{(j_3j_3)\frown(\cdot)}=0 \quad (293)$$

follows from the inequality similar to (175) (see the proof of Theorem 17), where we used the following representation

$$C_{j_2j_3j_3j_2j_1j_1}\Bigr|_{(j_3j_3)\frown(\cdot)}=$$

$$=\int_t^T\phi_{j_2}(t_6)\int_t^{t_6}\int_t^{t_4}\phi_{j_2}(t_3)\int_t^{t_3}\phi_{j_1}(t_2)\int_t^{t_2}\phi_{j_1}(t_1)dt_1dt_2dt_3dt_4dt_6=$$

$$=\int_t^T\phi_{j_2}(t_6)\int_t^{t_6}\phi_{j_2}(t_3)\int_t^{t_3}\phi_{j_1}(t_2)\int_t^{t_2}\phi_{j_1}(t_1)dt_1dt_2\int_{t_3}^{t_6}dt_4dt_3dt_6=$$

$$+\int_t^T\phi_{j_2}(t_6)(t_6-t)\int_t^{t_6}\phi_{j_2}(t_3)\int_t^{t_3}\phi_{j_1}(t_2)\int_t^{t_2}\phi_{j_1}(t_1)dt_1dt_2dt_3dt_6+$$

$$+\int_t^T\phi_{j_2}(t_6)\int_t^{t_6}\phi_{j_2}(t_3)(t-t_3)\int_t^{t_3}\phi_{j_1}(t_2)\int_t^{t_2}\phi_{j_1}(t_1)dt_1dt_2dt_3dt_6\stackrel{\text{def}}{=}$$

$$\stackrel{\text{def}}{=}C^{*}_{j_2j_2j_1j_1}+C^{**}_{j_2j_2j_1j_1}. \quad (294)$$

Applying the estimates (267) and (135) ($\varepsilon=1/2$) to (291) gives the following estimates

$$|C_{j_2j_3j_3j_2j_1j_1}| \le \frac{K}{j_1^2 j_2 j_3^{3/4}} \quad (j_1, j_2, j_3 > 0), \tag{295}$$

$$|C_{j_200j_2j_1j_1}| \le \frac{K}{j_1^2 j_2} \quad (j_1, j_2 > 0), \tag{296}$$

$$|C_{0j_3j_30j_1j_1}| \le \frac{K}{j_1^2 j_3} \quad (j_1, j_3 > 0), \tag{297}$$

$$|C_{0000j_1j_1}| \le \frac{K}{j_1^2} \quad (j_1 > 0). \tag{298}$$

Using the estimate (295), we have

$$\left|\sum_{j_2=1}^{p}\sum_{j_3=1}^{p}\sum_{j_1=p+1}^{\infty} C_{j_2j_3j_3j_2j_1j_1}\right| \le K \sum_{j_1=p+1}^{\infty}\frac{1}{j_1^2}\sum_{j_2=1}^{p}\frac{1}{j_2}\sum_{j_3=1}^{p}\frac{1}{j_3^{3/4}} \le$$

$$\le K \int\limits_p^{\infty}\frac{dx}{x^2}\left(1+\int\limits_1^p\frac{dx}{x}\right)\left(1+\int\limits_1^p\frac{dx}{x^{3/4}}\right) \le K_1\frac{1+lnp}{p^{3/4}} \to 0 \tag{299}$$

if $p \to \infty$, where constants K, K_1 do not depend on p.

Similarly we get (see (296)–(298))

$$\left|\sum_{j_1=p+1}^{\infty} C_{0000j_1j_1}\right| + \left|\sum_{j_3=1}^{p}\sum_{j_1=p+1}^{\infty} C_{0j_3j_30j_1j_1}\right| + \left|\sum_{j_2=1}^{p}\sum_{j_1=p+1}^{\infty} C_{j_200j_2j_1j_1}\right| \to 0 \tag{300}$$

if $p \to \infty$.

The relations (292), (293), (299), (300) prove (242).

Consider (243). Using the integration order replacement, we get

$$C_{j_3j_2j_3j_2j_1j_1} =$$

$$= \frac{1}{2}\int\limits_t^T \phi_{j_3}(t_6)\int\limits_t^{t_6}\phi_{j_2}(t_5)\int\limits_t^{t_5}\phi_{j_3}(t_4)\int\limits_t^{t_4}\phi_{j_2}(t_3)\left(\int\limits_t^{t_3}\phi_{j_1}(t_1)dt_1\right)^2 dt_3dt_4dt_5dt_6 =$$

$$= \frac{1}{2}\int\limits_t^T \phi_{j_2}(t_3)\left(\int\limits_t^{t_3}\phi_{j_1}(t_1)dt_1\right)^2\int\limits_{t_3}^{T}\phi_{j_3}(t_4)\int\limits_{t_4}^{T}\phi_{j_2}(t_5)\int\limits_{t_5}^{T}\phi_{j_3}(t_6)dt_6dt_5dt_4dt_3 =$$

$$= \frac{1}{2}\int\limits_t^T \phi_{j_2}(t_3)\left(\int\limits_t^{t_3}\phi_{j_1}(t_1)dt_1\right)^2\int\limits_{t_3}^{T}\phi_{j_2}(t_5)\int\limits_{t_5}^{T}\phi_{j_3}(t_6)dt_6\int\limits_{t_3}^{t_5}\phi_{j_3}(t_4)dt_4dt_5dt_3 =$$

$$= \frac{1}{2}\int\limits_t^T \phi_{j_2}(t_3)\left(\int\limits_t^{t_3}\phi_{j_1}(t_1)dt_1\right)^2\int\limits_{t_3}^T\phi_{j_2}(t_5)\left(\int\limits_t^{t_5}\phi_{j_3}(t_4)dt_4\right)\left(\int\limits_{t_5}^T\phi_{j_3}(t_6)dt_6\right)dt_5dt_3-$$

$$-\frac{1}{2}\int\limits_t^T \phi_{j_2}(t_3)\left(\int\limits_t^{t_3}\phi_{j_1}(t_1)dt_1\right)^2\left(\int\limits_t^{t_3}\phi_{j_3}(t_4)dt_4\right)\int\limits_{t_3}^T\phi_{j_2}(t_5)\left(\int\limits_{t_5}^T\phi_{j_3}(t_6)dt_6\right)dt_5dt_3. \tag{301}$$

Applying (71), we obtain

$$\sum_{j_1=p+1}^{\infty}\sum_{j_2=p+1}^{\infty}\sum_{j_3=p+1}^{\infty}C_{j_3j_2j_3j_2j_1j_1}=\sum_{j_1=p+1}^{\infty}\sum_{j_3=p+1}^{\infty}\sum_{j_2=p+1}^{\infty}C_{j_3j_2j_3j_2j_1j_1}=$$

$$=-\sum_{j_2=0}^{p}\sum_{j_1=p+1}^{\infty}\sum_{j_3=p+1}^{\infty}C_{j_3j_2j_3j_2j_1j_1}. \tag{302}$$

Further proof of the equality (243) is based on the relations (301), (302) and is similar to the proof of the formula (242).

Let us prove (244). Applying the integration order replacement, we obtain

$$C_{j_3j_3j_2j_1j_2j_1}=$$

$$=\int\limits_t^T\phi_{j_3}(t_6)\int\limits_t^{t_6}\phi_{j_3}(t_5)\int\limits_t^{t_5}\phi_{j_2}(t_4)\int\limits_t^{t_4}\phi_{j_1}(t_3)\int\limits_t^{t_3}\phi_{j_2}(t_2)\int\limits_t^{t_2}\phi_{j_1}(t_1)dt_1dt_2dt_3dt_4dt_5dt_6=$$

$$=\int\limits_t^T\phi_{j_1}(t_1)\int\limits_{t_1}^T\phi_{j_2}(t_2)\int\limits_{t_2}^T\phi_{j_1}(t_3)\int\limits_{t_3}^T\phi_{j_2}(t_4)\int\limits_{t_4}^T\phi_{j_3}(t_5)\int\limits_{t_5}^T\phi_{j_3}(t_6)dt_6dt_5dt_4dt_3dt_2dt_1=$$

$$=\frac{1}{2}\int\limits_t^T\phi_{j_1}(t_1)\int\limits_{t_1}^T\phi_{j_2}(t_2)\int\limits_{t_2}^T\phi_{j_1}(t_3)\int\limits_{t_3}^T\phi_{j_2}(t_4)\left(\int\limits_{t_4}^T\phi_{j_3}(t_5)dt_5\right)^2dt_4dt_3dt_2dt_1=$$

$$=\frac{1}{2}\int\limits_t^T\phi_{j_2}(t_4)\left(\int\limits_{t_4}^T\phi_{j_3}(t_5)dt_5\right)^2\int\limits_t^{t_4}\phi_{j_1}(t_3)\int\limits_t^{t_3}\phi_{j_2}(t_2)\int\limits_t^{t_2}\phi_{j_1}(t_1)dt_1dt_2dt_3dt_4=$$

$$=\frac{1}{2}\int\limits_t^T\phi_{j_2}(t_4)\left(\int\limits_{t_4}^T\phi_{j_3}(t_5)dt_5\right)^2\int\limits_t^{t_4}\phi_{j_2}(t_2)\int\limits_t^{t_2}\phi_{j_1}(t_1)dt_1\int\limits_{t_2}^{t_4}\phi_{j_1}(t_3)dt_3dt_2dt_4=$$

$$=\frac{1}{2}\int\limits_t^T\phi_{j_2}(t_4)\left(\int\limits_{t_4}^T\phi_{j_3}(t_5)dt_5\right)^2\left(\int\limits_t^{t_4}\phi_{j_1}(t_3)dt_3\right)\int\limits_t^{t_4}\phi_{j_2}(t_2)\left(\int\limits_t^{t_2}\phi_{j_1}(t_1)dt_1\right)dt_2dt_4-$$

$$
-\frac{1}{2}\int\limits_t^T\phi_{j_2}(t_4)\left(\int\limits_{t_4}^T\phi_{j_3}(t_5)dt_5\right)^2\int\limits_t^{t_4}\phi_{j_2}(t_2)\left(\int\limits_t^{t_2}\phi_{j_1}(t_1)dt_1\right)^2 dt_2dt_4. \qquad (303)
$$

Using (71), we get

$$
\sum_{j_1=p+1}^{\infty}\sum_{j_2=p+1}^{\infty}\sum_{j_3=p+1}^{\infty}C_{j_3j_3j_2j_1j_2j_1}=\sum_{j_1=p+1}^{\infty}\sum_{j_3=p+1}^{\infty}\sum_{j_2=p+1}^{\infty}C_{j_3j_3j_2j_1j_2j_1}=
$$

$$
=-\sum_{j_2=0}^{p}\sum_{j_1=p+1}^{\infty}\sum_{j_3=p+1}^{\infty}C_{j_3j_3j_2j_1j_2j_1}. \qquad (304)
$$

Further proof of the equality (244) is based on the relations (303), (304) and is similar to the proof of the relations (242), (243).

Consider (245). Using the integration order replacement, we have

$$
C_{j_3j_3j_1j_2j_2j_1}=
$$

$$
=\int\limits_t^T\phi_{j_3}(t_6)\int\limits_t^{t_6}\phi_{j_3}(t_5)\int\limits_t^{t_5}\phi_{j_1}(t_4)\int\limits_t^{t_4}\phi_{j_2}(t_3)\int\limits_t^{t_3}\phi_{j_2}(t_2)\int\limits_t^{t_2}\phi_{j_1}(t_1)dt_1dt_2dt_3dt_4dt_5dt_6=
$$

$$
=\int\limits_t^T\phi_{j_1}(t_1)\int\limits_{t_1}^T\phi_{j_2}(t_2)\int\limits_{t_2}^T\phi_{j_2}(t_3)\int\limits_{t_3}^T\phi_{j_1}(t_4)\int\limits_{t_4}^T\phi_{j_3}(t_5)\int\limits_{t_5}^T\phi_{j_3}(t_6)dt_6dt_5dt_4dt_3dt_2dt_1=
$$

$$
=\frac{1}{2}\int\limits_t^T\phi_{j_1}(t_1)\int\limits_{t_1}^T\phi_{j_2}(t_2)\int\limits_{t_2}^T\phi_{j_2}(t_3)\int\limits_{t_3}^T\phi_{j_1}(t_4)\left(\int\limits_{t_4}^T\phi_{j_3}(t_5)dt_5\right)^2dt_4dt_3dt_2dt_1=
$$

$$
=\frac{1}{2}\int\limits_t^T\phi_{j_1}(t_4)\left(\int\limits_{t_4}^T\phi_{j_3}(t_5)dt_5\right)^2\int\limits_t^{t_4}\phi_{j_2}(t_3)\int\limits_t^{t_3}\phi_{j_2}(t_2)\int\limits_t^{t_2}\phi_{j_1}(t_1)dt_1dt_2dt_3dt_4=
$$

$$
=\frac{1}{2}\int\limits_t^T\phi_{j_1}(t_4)\left(\int\limits_{t_4}^T\phi_{j_3}(t_5)dt_5\right)^2\int\limits_t^{t_4}\phi_{j_2}(t_2)\int\limits_t^{t_2}\phi_{j_1}(t_1)dt_1\int\limits_{t_2}^{t_4}\phi_{j_2}(t_3)dt_3dt_2dt_4=
$$

$$
=\frac{1}{2}\int\limits_t^T\phi_{j_1}(t_4)\left(\int\limits_{t_4}^T\phi_{j_3}(t_5)dt_5\right)^2\left(\int\limits_t^{t_4}\phi_{j_2}(t_3)dt_3\right)\int\limits_t^{t_4}\phi_{j_2}(t_2)\left(\int\limits_t^{t_2}\phi_{j_1}(t_1)dt_1\right)dt_2dt_4-
$$

$$
-\frac{1}{2}\int\limits_t^T\phi_{j_1}(t_4)\left(\int\limits_{t_4}^T\phi_{j_3}(t_5)dt_5\right)^2\int\limits_t^{t_4}\phi_{j_2}(t_2)\left(\int\limits_t^{t_2}\phi_{j_1}(t_1)dt_1\right)\left(\int\limits_t^{t_2}\phi_{j_2}(t_3)dt_3\right)dt_2dt_4. \qquad (305)
$$

Applying (71) and (78), we obtain

$$-\sum_{j_1=p+1}^{\infty}\sum_{j_2=p+1}^{\infty}\sum_{j_3=p+1}^{\infty}C_{j_3j_3j_1j_2j_2j_1}=-\sum_{j_2=p+1}^{\infty}\sum_{j_3=p+1}^{\infty}\sum_{j_1=p+1}^{\infty}C_{j_2j_3j_1j_2j_2j_1}=$$

$$=\sum_{j_1=0}^{p}\sum_{j_2=p+1}^{\infty}\sum_{j_3=p+1}^{\infty}C_{j_2j_3j_1j_2j_2j_1}=\sum_{j_1=0}^{p}\sum_{j_3=p+1}^{\infty}\sum_{j_2=p+1}^{\infty}C_{j_2j_3j_1j_2j_2j_1}=$$

$$=\frac{1}{2}\sum_{j_1=0}^{p}\sum_{j_3=p+1}^{\infty}C_{j_3j_3j_1j_2j_2j_1}\Biggl|_{(j_2j_2)\curvearrowright(\cdot)}-\sum_{j_1=0}^{p}\sum_{j_2=0}^{p}\sum_{j_3=p+1}^{\infty}C_{j_3j_3j_1j_2j_2j_1}. \tag{306}$$

The equality

$$\lim_{p\to\infty}\frac{1}{2}\sum_{j_1=0}^{p}\sum_{j_3=p+1}^{\infty}C_{j_3j_3j_1j_2j_2j_1}\Biggl|_{(j_2j_2)\curvearrowright(\cdot)}=0 \tag{307}$$

follows from the inequality (175), where we proceed similarly to the proof of equality (293) (see (294)).

The relation

$$\lim_{p\to\infty}\sum_{j_1=0}^{p}\sum_{j_2=0}^{p}\sum_{j_3=p+1}^{\infty}C_{j_3j_3j_1j_2j_2j_1}=0 \tag{308}$$

is proved on the basis of (305) and similarly with the proof of (242). The equalities (306)–(308) prove (245).

Let us prove (246). Using (71) and (78), we get

$$\sum_{j_1=p+1}^{\infty}\sum_{j_2=p+1}^{\infty}\sum_{j_3=p+1}^{\infty}C_{j_2j_1j_3j_3j_2j_1}=\sum_{j_3=p+1}^{\infty}\sum_{j_1,j_2=0}^{p}C_{j_2j_1j_3j_3j_2j_1}=$$

$$=\frac{1}{2}\sum_{j_1,j_2=0}^{p}C_{j_2j_1j_3j_3j_2j_1}\Biggl|_{(j_3j_3)\curvearrowright(\cdot)}-\sum_{j_1,j_2,j_3=0}^{p}C_{j_2j_1j_3j_3j_2j_1}. \tag{309}$$

Using the equality (147) we have

$$\lim_{p\to\infty}\frac{1}{2}\sum_{j_1,j_2=0}^{p}C_{j_2j_1j_3j_3j_2j_1}\Biggl|_{(j_3j_3)\curvearrowright(\cdot)}=0, \tag{310}$$

where we proceed similarly to the proof of equality (293) (see (294)).

Further, we will prove the following relation

$$\lim_{p\to\infty}\sum_{j_1,j_2,j_3=0}^{p}C_{j_2j_1j_3j_3j_2j_1}=0 \tag{311}$$

using the equality (251). From (251) we have

$$\sum_{j_1,j_2,j_3=0}^{p} C_{j_2j_1j_3j_3j_2j_1} = \frac{1}{2}\sum_{j_1,j_2,j_3=0}^{p}\Biggl(C_{j_2j_1j_3j_3j_2j_1} + C_{j_1j_2j_3j_3j_1j_2}\Biggr) =$$

$$= \frac{1}{2}\sum_{j_1,j_2,j_3=0}^{p}\Biggl(C_{j_2}C_{j_1j_3j_3j_2j_1} - C_{j_1j_2}C_{j_3j_3j_2j_1} + C_{j_3j_1j_2}C_{j_3j_2j_1} -$$

$$-C_{j_3j_3j_1j_2}C_{j_2j_1} + C_{j_2j_3j_3j_1j_2}C_{j_1}\Biggr) =$$

$$= \sum_{j_1,j_2,j_3=0}^{p}\Biggl(C_{j_2j_3j_3j_1j_2}C_{j_1} - C_{j_3j_3j_1j_2}C_{j_2j_1}\Biggr) +$$

$$+\frac{1}{2}\sum_{j_1,j_2,j_3=0}^{p} C_{j_3j_1j_2}C_{j_3j_2j_1}. \tag{312}$$

The generalized Parseval equality gives (by analogy with (258))

$$\lim_{p\to\infty}\frac{1}{2}\sum_{j_1,j_2,j_3=0}^{p} C_{j_3j_1j_2}C_{j_3j_2j_1} = 0. \tag{313}$$

Let us prove the following equality

$$\lim_{p\to\infty}\sum_{j_1,j_2,j_3=0}^{p}\Biggl(C_{j_2j_3j_3j_1j_2}C_{j_1} - C_{j_3j_3j_1j_2}C_{j_2j_1}\Biggr) = 0. \tag{314}$$

The relation

$$\lim_{p\to\infty}\sum_{j_1,j_2,j_3=0}^{p} C_{j_2j_3j_3j_1j_2}C_{j_1} = 0 \tag{315}$$

is proved by the same methods as in the proof of equality (236) and also using Theorem 17 and (78).

Further, we have (see (78))

$$\sum_{j_3=0}^{p} C_{j_3j_3j_1j_2} = \frac{1}{2}C_{j_3j_3j_1j_2}\Biggl|_{(j_3j_3)\curvearrowright(\cdot)} - \sum_{j_3=p+1}^{\infty} C_{j_3j_3j_1j_2}. \tag{316}$$

Moreover,

$$C_{j_3j_3j_1j_2}\Biggl|_{(j_3j_3)\curvearrowright(\cdot)} = \int_t^T\int_t^{t_3}\phi_{j_1}(t_2)\int_t^{t_2}\phi_{j_2}(t_1)dt_1dt_2dt_3 =$$

$$= \int_t^T\phi_{j_1}(t_2)\int_t^{t_2}\phi_{j_2}(t_1)dt_1\int_{t_2}^{T}dt_3dt_2 = \int_t^T(T-t_2)\phi_{j_1}(t_2)\int_t^{t_2}\phi_{j_2}(t_1)dt_1dt_2 =$$

$$= \int\limits_t^T \phi_{j_2}(t_1) \int\limits_{t_1}^T (T-t_2)\phi_{j_1}(t_2)dt_2dt_1 = \int\limits_t^T \phi_{j_2}(t_2) \int\limits_{t_2}^T (T-t_1)\phi_{j_1}(t_1)dt_1dt_2 =$$

$$= \int\limits_{[t,T]^2} (T-t_1)\mathbf{1}_{\{t_2<t_1\}}\phi_{j_1}(t_1)\phi_{j_2}(t_2)dt_1dt_2 \stackrel{\text{def}}{=} \tilde{C}_{j_2j_1}. \qquad (317)$$

Using (316), (317), and the generalized Parseval equality, we obtain

$$\lim_{p\to\infty}\sum_{j_1,j_2,j_3=0}^{p} C_{j_3j_3j_1j_2}C_{j_2j_1} = \frac{1}{2}\lim_{p\to\infty}\sum_{j_1,j_2=0}^{p} C_{j_2j_1}\tilde{C}_{j_2j_1} -$$

$$-\lim_{p\to\infty}\sum_{j_1,j_2=0}^{p}\sum_{j_3=p+1}^{\infty} C_{j_3j_3j_1j_2}C_{j_2j_1} = -\lim_{p\to\infty}\sum_{j_1,j_2=0}^{p}\sum_{j_3=p+1}^{\infty} C_{j_3j_3j_1j_2}C_{j_2j_1}. \qquad (318)$$

We have (see (278))

$$C_{j_3j_3j_1j_2} = \frac{1}{2}\int\limits_t^T \phi_{j_2}(t_1)\int\limits_{t_1}^T \phi_{j_1}(t_2)\left(\int\limits_{t_2}^T \phi_{j_3}(t_3)dt_3\right)^2 dt_2dt_1. \qquad (319)$$

By analogy with (268) and also using (319), we get

$$\lim_{p\to\infty}\sum_{j_1,j_2=0}^{p}\sum_{j_3=p+1}^{\infty} C_{j_3j_3j_1j_2}C_{j_2j_1} = 0. \qquad (320)$$

Combining (318) and (320), we obtain

$$\lim_{p\to\infty}\sum_{j_1,j_2,j_3=0}^{p} C_{j_3j_3j_1j_2}C_{j_2j_1} = 0. \qquad (321)$$

The relation (314) follows from (315) and (321). From (312)–(314) we get (311). The equalities (309)–(311) complete the proof of (246).

For the proof of (247)–(250) we will use a new idea. More precisely, we will consider the sums of expressions (247)–(250) with the expressions already studied throughout this proof.

Let us begin from (247). Applying the integration order replacement, we obtain

$$C_{j_3j_1j_2j_3j_2j_1} + C_{j_3j_1j_2j_3j_1j_2} =$$

$$= \int\limits_t^T \phi_{j_3}(t_6)\int\limits_t^{t_6} \phi_{j_1}(t_5)\int\limits_t^{t_5} \phi_{j_2}(t_4)\int\limits_t^{t_4} \phi_{j_3}(t_3)\left(\int\limits_t^{t_3} \phi_{j_2}(t_2)dt_2\right)\left(\int\limits_t^{t_3} \phi_{j_1}(t_1)dt_1\right)dt_3dt_4dt_5dt_6 =$$

$$=\int_t^T \phi_{j_3}(t_6)\int_t^{t_6}\phi_{j_1}(t_5)\int_t^{t_5}\phi_{j_3}(t_3)\left(\int_t^{t_3}\phi_{j_2}(t_2)dt_2\right)\left(\int_t^{t_3}\phi_{j_1}(t_1)dt_1\right)\int_{t_3}^{t_5}\phi_{j_2}(t_4)dt_4dt_3dt_5dt_6 =$$

$$=\int_t^T \phi_{j_3}(t_6)\int_t^{t_6}\phi_{j_1}(t_5)\left(\int_t^{t_5}\phi_{j_2}(t_4)dt_4\right)\int_t^{t_5}\phi_{j_3}(t_3)\left(\int_t^{t_3}\phi_{j_2}(t_2)dt_2\right)\left(\int_t^{t_3}\phi_{j_1}(t_1)dt_1\right)dt_3dt_5dt_6-$$

$$-\int_t^T \phi_{j_3}(t_6)\int_t^{t_6}\phi_{j_1}(t_5)\int_t^{t_5}\phi_{j_3}(t_3)\left(\int_t^{t_3}\phi_{j_2}(t_2)dt_2\right)^2\left(\int_t^{t_3}\phi_{j_1}(t_1)dt_1\right)dt_3dt_5dt_6 =$$

$$=\int_t^T \phi_{j_1}(t_5)\left(\int_t^{t_5}\phi_{j_2}(t_4)dt_4\right)\int_t^{t_5}\phi_{j_3}(t_3)\left(\int_t^{t_3}\phi_{j_2}(t_2)dt_2\right)\left(\int_t^{t_3}\phi_{j_1}(t_1)dt_1\right)dt_3\left(\int_{t_5}^{T}\phi_{j_3}(t_6)dt_6\right)dt_5-$$

$$-\int_t^T \phi_{j_1}(t_5)\int_t^{t_5}\phi_{j_3}(t_3)\left(\int_t^{t_3}\phi_{j_2}(t_2)dt_2\right)^2\left(\int_t^{t_3}\phi_{j_1}(t_1)dt_1\right)dt_3\left(\int_{t_5}^{T}\phi_{j_3}(t_6)dt_6\right)dt_5. \qquad (322)$$

Using (71), we get

$$\sum_{j_1=p+1}^{\infty}\sum_{j_2=p+1}^{\infty}\sum_{j_3=p+1}^{\infty}\Bigl(C_{j_3j_1j_2j_3j_2j_1}+C_{j_3j_1j_2j_3j_1j_2}\Bigr)=$$

$$=\sum_{j_1=0}^{p}\sum_{j_3=0}^{p}\sum_{j_2=p+1}^{\infty}\Bigl(C_{j_3j_1j_2j_3j_2j_1}+C_{j_3j_1j_2j_3j_1j_2}\Bigr). \qquad (323)$$

Further, by analogy with the proof of equality (242) and using (322), we obtain

$$\lim_{p\to\infty}\sum_{j_1=0}^{p}\sum_{j_3=0}^{p}\sum_{j_2=p+1}^{\infty}\Bigl(C_{j_3j_1j_2j_3j_2j_1}+C_{j_3j_1j_2j_3j_1j_2}\Bigr)=0. \qquad (324)$$

From (323) and (324) we get

$$\lim_{p\to\infty}\sum_{j_1=p+1}^{\infty}\sum_{j_2=p+1}^{\infty}\sum_{j_3=p+1}^{\infty}\Bigl(C_{j_3j_1j_2j_3j_2j_1}+C_{j_3j_1j_2j_3j_1j_2}\Bigr)=0. \qquad (325)$$

Moreover (see (236)),

$$\lim_{p\to\infty}\sum_{j_1=p+1}^{\infty}\sum_{j_2=p+1}^{\infty}\sum_{j_3=p+1}^{\infty}C_{j_3j_1j_2j_3j_1j_2}=0. \qquad (326)$$

Combining (325) and (326), we have

$$\lim_{p\to\infty}\sum_{j_1=p+1}^{\infty}\sum_{j_2=p+1}^{\infty}\sum_{j_3=p+1}^{\infty}C_{j_3j_1j_2j_3j_2j_1}=0.$$

The equality (247) is proved.

Consider (248). Using the integration order replacement, we have

$$C_{j_2j_3j_1j_3j_2j_1}+C_{j_2j_3j_1j_3j_1j_2}=$$

$$=\int\limits_t^T\phi_{j_2}(t_6)\int\limits_t^{t_6}\phi_{j_3}(t_5)\int\limits_t^{t_5}\phi_{j_1}(t_4)\int\limits_t^{t_4}\phi_{j_3}(t_3)\left(\int\limits_t^{t_3}\phi_{j_2}(t_2)dt_2\right)\left(\int\limits_t^{t_3}\phi_{j_1}(t_1)dt_1\right)dt_3dt_4dt_5dt_6=$$

$$=\int\limits_t^T\phi_{j_2}(t_6)\int\limits_t^{t_6}\phi_{j_3}(t_5)\int\limits_t^{t_5}\phi_{j_3}(t_3)\left(\int\limits_t^{t_3}\phi_{j_2}(t_2)dt_2\right)\left(\int\limits_t^{t_3}\phi_{j_1}(t_1)dt_1\right)\int\limits_{t_3}^{t_5}\phi_{j_1}(t_4)dt_4dt_3dt_5dt_6=$$

$$=\int\limits_t^T\phi_{j_2}(t_6)\int\limits_t^{t_6}\phi_{j_3}(t_5)\left(\int\limits_t^{t_5}\phi_{j_1}(t_4)dt_4\right)\int\limits_t^{t_5}\phi_{j_3}(t_3)\left(\int\limits_t^{t_3}\phi_{j_2}(t_2)dt_2\right)\left(\int\limits_t^{t_3}\phi_{j_1}(t_1)dt_1\right)dt_3dt_5dt_6-$$

$$-\int\limits_t^T\phi_{j_2}(t_6)\int\limits_t^{t_6}\phi_{j_3}(t_5)\int\limits_t^{t_5}\phi_{j_3}(t_3)\left(\int\limits_t^{t_3}\phi_{j_2}(t_2)dt_2\right)\left(\int\limits_t^{t_3}\phi_{j_1}(t_1)dt_1\right)^2dt_3dt_5dt_6=$$

$$=\int\limits_t^T\phi_{j_3}(t_5)\left(\int\limits_t^{t_5}\phi_{j_1}(t_4)dt_4\right)\int\limits_t^{t_5}\phi_{j_3}(t_3)\left(\int\limits_t^{t_3}\phi_{j_2}(t_2)dt_2\right)\left(\int\limits_t^{t_3}\phi_{j_1}(t_1)dt_1\right)dt_3\left(\int\limits_{t_5}^{T}\phi_{j_2}(t_6)dt_6\right)dt_5-$$

$$-\int\limits_t^T\phi_{j_3}(t_5)\int\limits_t^{t_5}\phi_{j_3}(t_3)\left(\int\limits_t^{t_3}\phi_{j_2}(t_2)dt_2\right)\left(\int\limits_t^{t_3}\phi_{j_1}(t_1)dt_1\right)^2dt_3\left(\int\limits_{t_5}^{T}\phi_{j_2}(t_6)dt_6\right)dt_5. \qquad (327)$$

Using (71), we obtain

$$-\sum_{j_1=p+1}^{\infty}\sum_{j_2=p+1}^{\infty}\sum_{j_3=p+1}^{\infty}\left(C_{j_2j_3j_1j_3j_2j_1}+C_{j_2j_3j_1j_3j_1j_2}\right)=$$

$$=\sum_{j_3=0}^{p}\sum_{j_1=p+1}^{\infty}\sum_{j_2=p+1}^{\infty}\left(C_{j_2j_3j_1j_3j_2j_1}+C_{j_2j_3j_1j_3j_1j_2}\right). \qquad (328)$$

By analogy with the proof of (242) and applying (327), we get

$$
\lim_{p\to\infty}\sum_{j_3=0}^{p}\sum_{j_1=p+1}^{\infty}\sum_{j_2=p+1}^{\infty}\Biggl(C_{j_2j_3j_1j_3j_2j_1}+C_{j_2j_3j_1j_3j_1j_2}\Biggr)=0. \qquad (329)
$$

From (328) and (329) we have

$$
\lim_{p\to\infty}\sum_{j_1=p+1}^{\infty}\sum_{j_2=p+1}^{\infty}\sum_{j_3=p+1}^{\infty}\Biggl(C_{j_2j_3j_1j_3j_2j_1}+C_{j_2j_3j_1j_3j_1j_2}\Biggr)=0. \qquad (330)
$$

Moreover (see (237)),

$$
\lim_{p\to\infty}\sum_{j_1=p+1}^{\infty}\sum_{j_2=p+1}^{\infty}\sum_{j_3=p+1}^{\infty}C_{j_2j_3j_1j_3j_1j_2}=0. \qquad (331)
$$

Combining (330) and (331), we finally obtain

$$
\lim_{p\to\infty}\sum_{j_1=p+1}^{\infty}\sum_{j_2=p+1}^{\infty}\sum_{j_3=p+1}^{\infty}C_{j_2j_3j_1j_3j_2j_1}=0.
$$

The equality (248) is proved.

Now consider (249). Using the integration order replacement, we obtain

$$
C_{j_3j_1j_3j_2j_2j_1}+C_{j_3j_1j_3j_2j_1j_2}=
$$

$$
=\int\limits_t^T\phi_{j_3}(t_6)\int\limits_t^{t_6}\phi_{j_1}(t_5)\int\limits_t^{t_5}\phi_{j_3}(t_4)\int\limits_t^{t_4}\phi_{j_2}(t_3)\left(\int\limits_t^{t_3}\phi_{j_2}(t_2)dt_2\right)\left(\int\limits_t^{t_3}\phi_{j_1}(t_1)dt_1\right)dt_3dt_4dt_5dt_6=
$$

$$
=\int\limits_t^T\phi_{j_3}(t_6)\int\limits_t^{t_6}\phi_{j_1}(t_5)\int\limits_t^{t_5}\phi_{j_2}(t_3)\left(\int\limits_t^{t_3}\phi_{j_2}(t_2)dt_2\right)\left(\int\limits_t^{t_3}\phi_{j_1}(t_1)dt_1\right)\int\limits_{t_3}^{t_5}\phi_{j_3}(t_4)dt_4dt_3dt_5dt_6=
$$

$$
=\int\limits_t^T\phi_{j_3}(t_6)\int\limits_t^{t_6}\phi_{j_1}(t_5)\left(\int\limits_t^{t_5}\phi_{j_3}(t_4)dt_4\right)\int\limits_t^{t_5}\phi_{j_2}(t_3)\left(\int\limits_t^{t_3}\phi_{j_2}(t_2)dt_2\right)\left(\int\limits_t^{t_3}\phi_{j_1}(t_1)dt_1\right)dt_3dt_5dt_6-
$$

$$
-\int\limits_t^T\phi_{j_3}(t_6)\int\limits_t^{t_6}\phi_{j_1}(t_5)\int\limits_t^{t_5}\phi_{j_2}(t_3)\left(\int\limits_t^{t_3}\phi_{j_2}(t_2)dt_2\right)\left(\int\limits_t^{t_3}\phi_{j_1}(t_1)dt_1\right)\left(\int\limits_t^{t_3}\phi_{j_3}(t_4)dt_4\right)dt_3dt_5dt_6=
$$

$$
=\int\limits_t^T\phi_{j_1}(t_5)\left(\int\limits_t^{t_5}\phi_{j_3}(t_4)dt_4\right)\int\limits_t^{t_5}\phi_{j_2}(t_3)\left(\int\limits_t^{t_3}\phi_{j_2}(t_2)dt_2\right)\left(\int\limits_t^{t_3}\phi_{j_1}(t_1)dt_1\right)dt_3\left(\int\limits_{t_5}^{T}\phi_{j_3}(t_6)dt_6\right)dt_5-
$$

(332)
$$
-\int\limits_t^T \phi_{j_1}(t_5)\int\limits_t^{t_5}\phi_{j_2}(t_3)\left(\int\limits_t^{t_3}\phi_{j_2}(t_2)dt_2\right)\left(\int\limits_t^{t_3}\phi_{j_1}(t_1)dt_1\right)\left(\int\limits_t^{t_3}\phi_{j_3}(t_4)dt_4\right)dt_3\left(\int\limits_{t_5}^{T}\phi_{j_3}(t_6)dt_6\right)dt_5.
$$

Applying (71) and (78), we obtain

$$
\sum_{j_1=p+1}^{\infty}\sum_{j_2=p+1}^{\infty}\sum_{j_3=p+1}^{\infty}\left(C_{j_3j_1j_3j_2j_2j_1}+C_{j_3j_1j_3j_2j_1j_2}\right)=
$$

$$
=-\sum_{j_1=0}^{p}\sum_{j_3=p+1}^{\infty}\sum_{j_2=p+1}^{\infty}\left(C_{j_3j_1j_3j_2j_2j_1}+C_{j_3j_1j_3j_2j_1j_2}\right)=
$$

$$
=\sum_{j_1=0}^{p}\sum_{j_2=0}^{p}\sum_{j_3=p+1}^{\infty}\left(C_{j_3j_1j_3j_2j_2j_1}+C_{j_3j_1j_3j_2j_1j_2}\right)-
$$

(333)
$$
-\frac{1}{2}\sum_{j_1=0}^{p}\sum_{j_3=p+1}^{\infty}C_{j_3j_1j_3j_2j_2j_1}\Biggl|_{(j_2j_2)\curvearrowright(\cdot)}.
$$

The equality

(334)
$$
\lim_{p\to\infty}\frac{1}{2}\sum_{j_1=0}^{p}\sum_{j_3=p+1}^{\infty}C_{j_3j_1j_3j_2j_2j_1}\Biggl|_{(j_2j_2)\curvearrowright(\cdot)}=0
$$

follows from the equality (147), where we proceed similarly to the proof of equality (293) (see (294)).

By analogy with the proof of (242) and applying (332), we get

(335)
$$
\lim_{p\to\infty}\sum_{j_1=0}^{p}\sum_{j_2=0}^{p}\sum_{j_3=p+1}^{\infty}\left(C_{j_3j_1j_3j_2j_2j_1}+C_{j_3j_1j_3j_2j_1j_2}\right)=0.
$$

From (333)–(335) we have

(336)
$$
\lim_{p\to\infty}\sum_{j_1=p+1}^{\infty}\sum_{j_2=p+1}^{\infty}\sum_{j_3=p+1}^{\infty}\left(C_{j_3j_1j_3j_2j_2j_1}+C_{j_3j_1j_3j_2j_1j_2}\right)=0.
$$

Moreover (see (238)),

(337)
$$
\lim_{p\to\infty}\sum_{j_1=p+1}^{\infty}\sum_{j_2=p+1}^{\infty}\sum_{j_3=p+1}^{\infty}C_{j_3j_1j_3j_2j_1j_2}=0.
$$

Combining (336) and (337), we finally obtain

$$
\lim_{p\to\infty}\sum_{j_1=p+1}^{\infty}\sum_{j_2=p+1}^{\infty}\sum_{j_3=p+1}^{\infty}C_{j_3j_1j_3j_2j_2j_1}=0.
$$

The equality (249) is proved.

Finally consider (250). Using the integration order replacement, we have

$$C_{j_2j_3j_3j_1j_2j_1}+C_{j_2j_3j_3j_1j_1j_2}=$$

$$=\int\limits_t^T\phi_{j_2}(t_6)\int\limits_t^{t_6}\phi_{j_3}(t_5)\int\limits_t^{t_5}\phi_{j_3}(t_4)\int\limits_t^{t_4}\phi_{j_1}(t_3)\left(\int\limits_t^{t_3}\phi_{j_2}(t_2)dt_2\right)\left(\int\limits_t^{t_3}\phi_{j_1}(t_1)dt_1\right)dt_3dt_4dt_5dt_6=$$

$$=\int\limits_t^T\phi_{j_2}(t_6)\int\limits_t^{t_6}\phi_{j_3}(t_5)\int\limits_t^{t_5}\phi_{j_1}(t_3)\left(\int\limits_t^{t_3}\phi_{j_2}(t_2)dt_2\right)\left(\int\limits_t^{t_3}\phi_{j_1}(t_1)dt_1\right)\int\limits_{t_3}^{t_5}\phi_{j_3}(t_4)dt_4dt_3dt_5dt_6=$$

$$=\int\limits_t^T\phi_{j_2}(t_6)\int\limits_t^{t_6}\phi_{j_3}(t_5)\left(\int\limits_t^{t_5}\phi_{j_3}(t_4)dt_4\right)\int\limits_t^{t_5}\phi_{j_1}(t_3)\left(\int\limits_t^{t_3}\phi_{j_2}(t_2)dt_2\right)\left(\int\limits_t^{t_3}\phi_{j_1}(t_1)dt_1\right)dt_3dt_5dt_6-$$

$$-\int\limits_t^T\phi_{j_2}(t_6)\int\limits_t^{t_6}\phi_{j_3}(t_5)\int\limits_t^{t_5}\phi_{j_1}(t_3)\left(\int\limits_t^{t_3}\phi_{j_2}(t_2)dt_2\right)\left(\int\limits_t^{t_3}\phi_{j_1}(t_1)dt_1\right)\left(\int\limits_t^{t_3}\phi_{j_3}(t_4)dt_4\right)dt_3dt_5dt_6=$$

$$=\int\limits_t^T\phi_{j_3}(t_5)\left(\int\limits_t^{t_5}\phi_{j_3}(t_4)dt_4\right)\int\limits_t^{t_5}\phi_{j_1}(t_3)\left(\int\limits_t^{t_3}\phi_{j_2}(t_2)dt_2\right)\left(\int\limits_t^{t_3}\phi_{j_1}(t_1)dt_1\right)dt_3\left(\int\limits_{t_5}^{T}\phi_{j_2}(t_6)dt_6\right)dt_5-$$

(338)

$$-\int\limits_t^T\phi_{j_3}(t_5)\int\limits_t^{t_5}\phi_{j_1}(t_3)\left(\int\limits_t^{t_3}\phi_{j_2}(t_2)dt_2\right)\left(\int\limits_t^{t_3}\phi_{j_1}(t_1)dt_1\right)\left(\int\limits_t^{t_3}\phi_{j_3}(t_4)dt_4\right)dt_3\left(\int\limits_{t_5}^{T}\phi_{j_2}(t_6)dt_6\right)dt_5.$$

Using (71) and (78), we get

$$\sum_{j_1=p+1}^{\infty}\sum_{j_2=p+1}^{\infty}\sum_{j_3=p+1}^{\infty}\left(C_{j_2j_3j_3j_1j_2j_1}+C_{j_2j_3j_3j_1j_1j_2}\right)=$$

$$=\frac{1}{2}\sum_{j_1=p+1}^{\infty}\sum_{j_2=p+1}^{\infty}\left(C_{j_2j_3j_3j_1j_2j_1}\Biggl|_{(j_3j_3)\curvearrowright(\cdot)}+C_{j_2j_3j_3j_1j_1j_2}\Biggl|_{(j_3j_3)\curvearrowright(\cdot)}\right)-$$

$$-\sum_{j_3=0}^{p}\sum_{j_1=p+1}^{\infty}\sum_{j_2=p+1}^{\infty}\left(C_{j_2j_3j_3j_1j_2j_1}+C_{j_2j_3j_3j_1j_1j_2}\right)=$$

$$=\frac{1}{2}\sum_{j_1=p+1}^{\infty}\sum_{j_2=p+1}^{\infty}\left(C_{j_2j_3j_3j_1j_2j_1}\Biggl|_{(j_3j_3)\curvearrowright(\cdot)}+C_{j_2j_3j_3j_1j_1j_2}\Biggl|_{(j_3j_3)\curvearrowright(\cdot)}\right)+$$

$$+\sum_{j_1=0}^{p}\sum_{j_3=0}^{p}\sum_{j_2=p+1}^{\infty}\left(C_{j_2j_3j_3j_1j_2j_1}+C_{j_2j_3j_3j_1j_1j_2}\right)-$$

$$-\frac{1}{2}\sum_{j_3=0}^{p}\sum_{j_2=p+1}^{\infty}C_{j_2j_3j_3j_1j_1j_2}\Bigg|_{(j_1j_1)\curvearrowright(\cdot)}. \tag{339}$$

The equalities

$$\lim_{p\to\infty}\frac{1}{2}\sum_{j_1=p+1}^{\infty}\sum_{j_2=p+1}^{\infty}\left(C_{j_2j_3j_3j_1j_2j_1}\Bigg|_{(j_3j_3)\curvearrowright(\cdot)}+C_{j_2j_3j_3j_1j_1j_2}\Bigg|_{(j_3j_3)\curvearrowright(\cdot)}\right)=0, \tag{340}$$

$$\lim_{p\to\infty}\frac{1}{2}\sum_{j_3=0}^{p}\sum_{j_2=p+1}^{\infty}C_{j_2j_3j_3j_1j_1j_2}\Bigg|_{(j_1j_1)\curvearrowright(\cdot)}=$$

$$=\lim_{p\to\infty}\frac{1}{4}\sum_{j_2=p+1}^{\infty}C_{j_2j_3j_3j_1j_1j_2}\Bigg|_{(j_1j_1)\curvearrowright(\cdot)(j_3j_3)\curvearrowright(\cdot)}-$$

$$-\lim_{p\to\infty}\frac{1}{2}\sum_{j_3=p+1}^{\infty}\sum_{j_2=p+1}^{\infty}C_{j_2j_3j_3j_1j_1j_2}\Bigg|_{(j_1j_1)\curvearrowright(\cdot)}=0 \tag{341}$$

follows from the equalities (147), (148), where we used the same technique as in (294). When proving (341), we also applied (78) and (103).

By analogy with the proof of (242) and applying (338), we obtain

$$\lim_{p\to\infty}\sum_{j_1=0}^{p}\sum_{j_3=0}^{p}\sum_{j_2=p+1}^{\infty}\left(C_{j_2j_3j_3j_1j_2j_1}+C_{j_2j_3j_3j_1j_1j_2}\right)=0. \tag{342}$$

From (339)–(342) we have

$$\lim_{p\to\infty}\sum_{j_1=p+1}^{\infty}\sum_{j_2=p+1}^{\infty}\sum_{j_3=p+1}^{\infty}\left(C_{j_2j_3j_3j_1j_2j_1}+C_{j_2j_3j_3j_1j_1j_2}\right)=0. \tag{343}$$

Furthermore (see (240)),

$$\lim_{p\to\infty}\sum_{j_1=p+1}^{\infty}\sum_{j_2=p+1}^{\infty}\sum_{j_3=p+1}^{\infty}C_{j_2j_3j_3j_1j_1j_2}=0. \tag{344}$$

Combining (343) and (344), we finally obtain

$$\lim_{p\to\infty}\sum_{j_1=p+1}^{\infty}\sum_{j_2=p+1}^{\infty}\sum_{j_3=p+1}^{\infty}C_{j_2j_3j_3j_1j_2j_1}=0.$$

The equality (250) is proved. Theorem 23 is proved.

14. Generalization of Theorem 16. The Case p_1, p_2, $p_3 \to \infty$ and Continuously Differetiable Weight Functions (The Cases of Legendre Polynomials and Trigonometric Functions). Proof of Hypothesis 3 for the Case $k = 3$

This section is devoted to the following theorem.

Theorem 24 [15], [47], [55]. *Suppose that $\{\phi_j(x)\}_{j=0}^{\infty}$ is a complete orthonormal system of Legendre polynomials or trigonometric functions in the space $L_2([t,T])$. Furthermore, let $\psi_1(\tau), \psi_2(\tau), \psi_3(\tau)$ are continuously differentiable nonrandom functions on $[t,T]$. Then, for the iterated Stratonovich stochastic integral of third multiplicity*

$$J^*[\psi^{(3)}]_{T,t}^{(i_1 i_2 i_3)} = \int\limits_t^{*T} \psi_3(t_3) \int\limits_t^{*t_3} \psi_2(t_2) \int\limits_t^{*t_2} \psi_1(t_1) d\mathbf{w}_{t_1}^{(i_1)} d\mathbf{w}_{t_2}^{(i_2)} d\mathbf{w}_{t_3}^{(i_3)}$$

the following expansion

$$J^*[\psi^{(3)}]_{T,t}^{(i_1 i_2 i_3)} = \underset{p_1,p_2,p_3\to\infty}{\text{l.i.m.}} \sum_{j_1=0}^{p_1} \sum_{j_2=0}^{p_2} \sum_{j_3=0}^{p_3} C_{j_3 j_2 j_1} \zeta_{j_1}^{(i_1)} \zeta_{j_2}^{(i_2)} \zeta_{j_3}^{(i_3)} \tag{345}$$

that converges in the mean-square sense is valid, where $i_1, i_2, i_3 = 0, 1, \ldots, m$,

$$C_{j_3 j_2 j_1} = \int\limits_t^T \psi_3(t_3)\phi_{j_3}(t_3) \int\limits_t^{t_3} \psi_2(t_2)\phi_{j_2}(t_2) \int\limits_t^{t_2} \psi_1(t_1)\phi_{j_1}(t_1) dt_1 dt_2 dt_3$$

and

$$\zeta_j^{(i)} = \int\limits_t^T \phi_j(s) d\mathbf{w}_s^{(i)}$$

are independent standard Gaussian random variables for various i or j (in the case when $i \neq 0$), $\mathbf{w}_\tau^{(i)} = \mathbf{f}_\tau^{(i)}$ for $i = 1, \ldots, m$ and $\mathbf{w}_\tau^{(0)} = \tau$.

Proof. Let us consider the case of Legendre polynomials (the trigonometric case is simpler and can be considered similarly). Applying (65), we obtain

$$\sum_{j_1=0}^{p_1} \sum_{j_2=0}^{p_2} \sum_{j_3=0}^{p_3} C_{j_3 j_2 j_1} \zeta_{j_1}^{(i_1)} \zeta_{j_2}^{(i_2)} \zeta_{j_3}^{(i_3)} = J'[K_{p_1 p_2 p_3}]_{T,t}^{(i_1 i_2 i_3)} +$$

$$+\mathbf{1}_{\{i_1=i_2\neq 0\}} \sum_{j_3=0}^{p_3} \sum_{j_1=0}^{\min\{p_1,p_2\}} C_{j_3 j_1 j_1} J'[\phi_{j_3}]_{T,t}^{(i_3)} +$$

$$+\mathbf{1}_{\{i_2=i_3\neq 0\}} \sum_{j_1=0}^{p_1} \sum_{j_3=0}^{\min\{p_2,p_3\}} C_{j_3 j_3 j_1} J'[\phi_{j_1}]_{T,t}^{(i_1)} +$$

$$+\mathbf{1}_{\{i_1=i_3\neq 0\}}\sum_{j_2=0}^{p_2}\sum_{j_1=0}^{\min\{p_1,p_3\}} C_{j_1j_2j_1}J'[\phi_{j_2}]_{T,t}^{(i_2)} \tag{346}$$

w. p. 1, where notations are the same as in (65).

Using Theorem 5 (see (27) for the case $k=3$), Theorem 3 (see (48)) as well as (83) (see the derivation of (83)) and (78), we get

$$J^*[\psi^{(3)}]_{T,t}^{(i_1i_2i_3)} = J[\psi^{(3)}]_{T,t}^{(i_1i_2i_3)} + \frac{1}{2}\mathbf{1}_{\{i_1=i_2\neq 0\}}\int\limits_t^T \psi_3(t_3)\int\limits_t^{t_3}\psi_2(t_2)\psi_1(t_2)dt_2 d\mathbf{w}_{t_3}^{(i_3)}+$$

$$+\frac{1}{2}\mathbf{1}_{\{i_2=i_3\neq 0\}}\int\limits_t^T \psi_3(t_3)\psi_2(t_3)\int\limits_t^{t_3}\psi_1(t_1)d\mathbf{w}_{t_1}^{(i_1)}dt_3 =$$

$$= J[\psi^{(3)}]_{T,t}^{(i_1i_2i_3)} + \frac{1}{2}J[\psi^{(3)}]_{T,t}^{1} + \frac{1}{2}J[\psi^{(3)}]_{T,t}^{2} =$$

$$= \underset{p_1,p_2,p_3\to\infty}{\text{l.i.m.}}\ J'[K_{p_1p_2p_3}]_{T,t}^{(i_1i_2i_3)}+$$

$$+\mathbf{1}_{\{i_1=i_2\neq 0\}}\underset{p_3\to\infty}{\text{l.i.m.}}\ \frac{1}{2}\sum_{j_3=0}^{p_3} C_{j_3j_2j_1}\Bigg|_{(j_2j_1)\curvearrowright(\cdot),\, j_1=j_2} J'[\phi_{j_3}]_{T,t}^{(i_3)}+$$

$$+\mathbf{1}_{\{i_2=i_3\neq 0\}}\underset{p_1\to\infty}{\text{l.i.m.}}\ \frac{1}{2}\sum_{j_1=0}^{p_1} C_{j_3j_2j_1}\Bigg|_{(j_3j_2)\curvearrowright(\cdot),\, j_2=j_3} J'[\phi_{j_1}]_{T,t}^{(i_1)} =$$

$$= \underset{p_1,p_2,p_3\to\infty}{\text{l.i.m.}}\ J'[K_{p_1p_2p_3}]_{T,t}^{(i_1i_2i_3)}+$$

$$+\mathbf{1}_{\{i_1=i_2\neq 0\}}\underset{p_3\to\infty}{\text{l.i.m.}}\ \sum_{j_3=0}^{p_3}\sum_{j_1=0}^{\infty} C_{j_3j_1j_1}J'[\phi_{j_3}]_{T,t}^{(i_3)}+$$

$$+\mathbf{1}_{\{i_2=i_3\neq 0\}}\underset{p_1\to\infty}{\text{l.i.m.}}\ \sum_{j_1=0}^{p_1}\sum_{j_3=0}^{\infty} C_{j_3j_3j_1}J'[\phi_{j_1}]_{T,t}^{(i_1)} \tag{347}$$

w. p. 1.

Using (346), (347) and the elementary inequality

$$(a+b+c+d)^2 \le 4\left(a^2+b^2+c^2+d^2\right),$$

we obtain

$$
\mathsf{M}\left\{\left(J^*[\psi^{(3)}]_{T,t}^{(i_1 i_2 i_3)}-\sum_{j_1=0}^{p_1}\sum_{j_2=0}^{p_2}\sum_{j_3=0}^{p_3}C_{j_3 j_2 j_1}\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}\zeta_{j_3}^{(i_3)}\right)^2\right\}\le
$$

$$
\le 4\mathsf{M}\left\{\left(J[\psi^{(3)}]_{T,t}^{(i_1 i_2 i_3)}-J'[K_{p_1 p_2 p_3}]_{T,t}^{(i_1 i_2 i_3)}\right)^2\right\}+
$$

$$
+4\cdot\mathbf{1}_{\{i_1=i_2\ne 0\}}\times
$$

$$
\times\mathsf{M}\left\{\left(\underset{p_3\to\infty}{\text{l.i.m.}}\ \sum_{j_3=0}^{p_3}\sum_{j_1=0}^{\infty}C_{j_3 j_1 j_1}J'[\phi_{j_3}]_{T,t}^{(i_3)}-\sum_{j_3=0}^{p_3}\sum_{j_1=0}^{\min\{p_1,p_2\}}C_{j_3 j_1 j_1}J'[\phi_{j_3}]_{T,t}^{(i_3)}\right)^2\right\}+
$$

$$
+4\cdot\mathbf{1}_{\{i_2=i_3\ne 0\}}\times
$$

$$
\times\mathsf{M}\left\{\left(\underset{p_1\to\infty}{\text{l.i.m.}}\ \sum_{j_1=0}^{p_1}\sum_{j_3=0}^{\infty}C_{j_3 j_3 j_1}J'[\phi_{j_1}]_{T,t}^{(i_1)}-\sum_{j_1=0}^{p_1}\sum_{j_3=0}^{\min\{p_2,p_3\}}C_{j_3 j_3 j_1}J'[\phi_{j_1}]_{T,t}^{(i_1)}\right)^2\right\}+
$$

$$
+4\cdot\mathbf{1}_{\{i_1=i_3\ne 0\}}\mathsf{M}\left\{\left(\sum_{j_2=0}^{p_2}\sum_{j_1=0}^{\min\{p_1,p_3\}}C_{j_1 j_2 j_1}J'[\phi_{j_2}]_{T,t}^{(i_2)}\right)^2\right\}=
$$

$$
=4A_{p_1p_2p_3}+4\cdot\mathbf{1}_{\{i_1=i_2\ne 0\}}B_{p_1p_2p_3}+4\cdot\mathbf{1}_{\{i_2=i_3\ne 0\}}C_{p_1p_2p_3}+4\cdot\mathbf{1}_{\{i_1=i_3\ne 0\}}D_{p_1p_2p_3}. \tag{348}
$$

Theorem 3 gives (see (48))

$$
\lim_{p_1,p_2,p_3\to\infty}A_{p_1p_2p_3}=0. \tag{349}
$$

Further, in complete analogy with (139) and using (71), we obtain

$$
D_{p_1p_2p_3}=\sum_{j_2=0}^{p_2}\left(\sum_{j_1=0}^{\min\{p_1,p_3\}}C_{j_1 j_2 j_1}\right)^2=\sum_{j_2=0}^{p_2}\left(\sum_{j_1=\min\{p_1,p_3\}+1}^{\infty}C_{j_1 j_2 j_1}\right)^2\le
$$

$$
\le\sum_{j_2=0}^{\infty}\left(\sum_{j_1=\min\{p_1,p_3\}+1}^{\infty}C_{j_1 j_2 j_1}\right)^2\le\frac{K}{\left(\min\{p_1,p_3\}\right)^{2-\varepsilon}}\ \to\ 0 \tag{350}
$$

if $p_1,p_2,p_3\to\infty$, where ε is an arbitrary small positive real number, constant K is independent of p.

We have

$$B_{p_1p_2p_3}=\mathsf{M}\left\{\left(\left(\underset{p_3\to\infty}{\text{l.i.m.}}\ \sum_{j_3=0}^{p_3}\sum_{j_1=0}^{\infty}C_{j_3j_1j_1}J'[\phi_{j_3}]_{T,t}^{(i_3)}-\sum_{j_3=0}^{p_3}\sum_{j_1=0}^{\infty}C_{j_3j_1j_1}J'[\phi_{j_3}]_{T,t}^{(i_3)}\right)+\right.\right.$$

$$\left.\left.+\left(\sum_{j_3=0}^{p_3}\sum_{j_1=0}^{\infty}C_{j_3j_1j_1}J'[\phi_{j_3}]_{T,t}^{(i_3)}-\sum_{j_3=0}^{p_3}\sum_{j_1=0}^{\min\{p_1,p_2\}}C_{j_3j_1j_1}J'[\phi_{j_3}]_{T,t}^{(i_3)}\right)\right)^2\right\}\le$$

(351)
$$\le 2E_{p_3}+2F_{p_1p_2p_3},$$

where

$$E_{p_3}=\mathsf{M}\left\{\left(\underset{p_3\to\infty}{\text{l.i.m.}}\ \sum_{j_3=0}^{p_3}\sum_{j_1=0}^{\infty}C_{j_3j_1j_1}J'[\phi_{j_3}]_{T,t}^{(i_3)}-\sum_{j_3=0}^{p_3}\sum_{j_1=0}^{\infty}C_{j_3j_1j_1}J'[\phi_{j_3}]_{T,t}^{(i_3)}\right)^2\right\},$$

$$F_{p_1p_2p_3}=\mathsf{M}\left\{\left(\sum_{j_3=0}^{p_3}\sum_{j_1=0}^{\infty}C_{j_3j_1j_1}J'[\phi_{j_3}]_{T,t}^{(i_3)}-\sum_{j_3=0}^{p_3}\sum_{j_1=0}^{\min\{p_1,p_2\}}C_{j_3j_1j_1}J'[\phi_{j_3}]_{T,t}^{(i_3)}\right)^2\right\}=$$

$$=\mathsf{M}\left\{\left(\sum_{j_3=0}^{p_3}\sum_{j_1=\min\{p_1,p_2\}+1}^{\infty}C_{j_3j_1j_1}J'[\phi_{j_3}]_{T,t}^{(i_3)}\right)^2\right\}=$$

(352)
$$=\sum_{j_3=0}^{p_3}\left(\sum_{j_1=\min\{p_1,p_2\}+1}^{\infty}C_{j_3j_1j_1}\right)^2.$$

By analogy with (125) we get

$$\sum_{j_3=0}^{p_3}\left(\sum_{j_1=\min\{p_1,p_2\}+1}^{\infty}C_{j_3j_1j_1}\right)^2\le\sum_{j_3=0}^{\infty}\left(\sum_{j_1=\min\{p_1,p_2\}+1}^{\infty}C_{j_3j_1j_1}\right)^2\le$$

(353)
$$\le\frac{K}{\left(\min\{p_1,p_2\}\right)^2}\ \to\ 0$$

if $p_1,p_2,p_3\to\infty$, where constant K does not depend on p.

Moreover,

(354)
$$\lim_{p_3\to\infty}E_{p_3}=\lim_{p_1,p_2,p_3\to\infty}E_{p_3}=0.$$

Combining (351)–(354), we obtain

(355)
$$\lim_{p_1,p_2,p_3\to\infty}B_{p_1p_2p_3}=0.$$

Consider $C_{p_1p_2p_3}$. We have

$$C_{p_1p_2p_3}=\mathsf{M}\left\{\left(\left(\underset{p_1\to\infty}{\text{l.i.m.}}\sum_{j_1=0}^{p_1}\sum_{j_3=0}^{\infty}C_{j_3j_3j_1}J'[\phi_{j_1}]_{T,t}^{(i_1)}-\sum_{j_1=0}^{p_1}\sum_{j_3=0}^{\infty}C_{j_3j_3j_1}J'[\phi_{j_1}]_{T,t}^{(i_1)}\right)+\right.\right.$$

$$\left.\left.+\left(\sum_{j_1=0}^{p_1}\sum_{j_3=0}^{\infty}C_{j_3j_3j_1}J'[\phi_{j_1}]_{T,t}^{(i_1)}-\sum_{j_1=0}^{p_1}\sum_{j_3=0}^{\min\{p_2,p_3\}}C_{j_3j_3j_1}J'[\phi_{j_1}]_{T,t}^{(i_1)}\right)\right)^2\right\}\le$$

$$\le 2G_{p_1}+2H_{p_1p_2p_3}, \tag{356}$$

where

$$G_{p_1}=\mathsf{M}\left\{\left(\underset{p_1\to\infty}{\text{l.i.m.}}\sum_{j_1=0}^{p_1}\sum_{j_3=0}^{\infty}C_{j_3j_3j_1}J'[\phi_{j_1}]_{T,t}^{(i_1)}-\sum_{j_1=0}^{p_1}\sum_{j_3=0}^{\infty}C_{j_3j_3j_1}J'[\phi_{j_1}]_{T,t}^{(i_1)}\right)^2\right\},$$

$$H_{p_1p_2p_3}=\mathsf{M}\left\{\left(\sum_{j_1=0}^{p_1}\sum_{j_3=0}^{\infty}C_{j_3j_3j_1}J'[\phi_{j_1}]_{T,t}^{(i_1)}-\sum_{j_1=0}^{p_1}\sum_{j_3=0}^{\min\{p_2,p_3\}}C_{j_3j_3j_1}J'[\phi_{j_1}]_{T,t}^{(i_1)}\right)^2\right\}=$$

$$=\mathsf{M}\left\{\left(\sum_{j_1=0}^{p_1}\sum_{j_3=\min\{p_2,p_3\}+1}^{\infty}C_{j_3j_3j_1}J'[\phi_{j_1}]_{T,t}^{(i_1)}\right)^2\right\}=$$

$$=\sum_{j_1=0}^{p_1}\left(\sum_{j_3=\min\{p_2,p_3\}+1}^{\infty}C_{j_3j_3j_1}\right)^2. \tag{357}$$

By analogy with (129) we get

$$\sum_{j_1=0}^{p_1}\left(\sum_{j_3=\min\{p_2,p_3\}+1}^{\infty}C_{j_3j_3j_1}\right)^2\le\sum_{j_1=0}^{\infty}\left(\sum_{j_3=\min\{p_2,p_3\}+1}^{\infty}C_{j_3j_3j_1}\right)^2\le$$

$$\le\frac{K}{\left(\min\{p_2,p_3\}\right)^2}\ \to\ 0 \tag{358}$$

if $p_1,p_2,p_3\to\infty$, where constant K does not depend on p.

Moreover,

$$\lim_{p_1\to\infty}G_{p_1}=\lim_{p_1,p_2,p_3\to\infty}G_{p_1}=0. \tag{359}$$

Combining (356)–(359), we obtain

$$\lim_{p_1,p_2,p_3\to\infty} C_{p_1p_2p_3} = 0. \tag{360}$$

The relations (348)–(350), (355), (360) complete the proof of Theorem 24. Theorem 24 is proved.

15. Hypotheses 1–3 from the Point of View of the Wong–Zakai Approximation

The iterated Ito stochastic integrals and solutions of Ito SDEs are complex and important functionals from the independent components $\mathbf{f}_\tau^{(i)}$, $i=1,\ldots,m$ of the multidimensional Wiener process $\mathbf{f}_\tau$. Let $\mathbf{f}_\tau^{(i)p}$ $(p\in\mathbb{N})$ be some approximation of $\mathbf{f}_\tau^{(i)}$, $i=1,\ldots,m$. Suppose that $\mathbf{f}_\tau^{(i)p}$ converges to $\mathbf{f}_\tau^{(i)}$, $i=1,\ldots,m$ in some sense and has differentiable sample trajectories.

A natural question arises: if we replace $\mathbf{f}_\tau^{(i)}$ by $\mathbf{f}_\tau^{(i)p}$, $i=1,\ldots,m$ in the functionals mentioned above, will the resulting functionals converge to the original functionals from the components $\mathbf{f}_\tau^{(i)}$, $i=1,\ldots,m$ of the multidimentional Wiener process $\mathbf{f}_\tau$?

The answere to this question is negative in the general case. However, in the pioneering works of Wong E. and Zakai M. [69], [70] (also see [71]-[79]), it was shown that under the special conditions and for some types of approximations of the Wiener process the answere is affirmative with one peculiarity: the convergence takes place to the iterated Stratonovich stochastic integrals and solutions of Stratonovich SDEs and not to the iterated Ito stochastic integrals and solutions of Ito SDEs.

The piecewise linear approximation as well as the regularization by convolution [69]-[79]) relate the mentioned types of approximations of the Wiener process. The above approximation of stochastic integrals and solutions of SDEs is often called the Wong–Zakai approximation.

Let $\mathbf{f}_s$, $s\in[0,T]$ be an m-dimensional standard Wiener process with independent components $\mathbf{f}_s^{(i)}$, $i=1,\ldots,m$. It is well known that the following representation takes place [80], [81]

$$\mathbf{f}_\tau^{(i)}-\mathbf{f}_t^{(i)}=\sum_{j=0}^{\infty}\int\limits_t^{\tau}\phi_j(s)ds\ \zeta_j^{(i)},\quad \zeta_j^{(i)}=\int\limits_t^{T}\phi_j(s)d\mathbf{f}_s^{(i)}, \tag{361}$$

where $\tau\in[t,T]$, $t\geq 0$, $\{\phi_j(x)\}_{j=0}^{\infty}$ is an arbitrary complete orthonormal system of functions in the space $L_2([t,T])$, and $\zeta_j^{(i)}$ are independent standard Gaussian random variables for various i or j. Moreover, the series (361) converges for any $\tau\in[t,T]$ in the mean-square sense.

Let $\mathbf{f}_\tau^{(i)p}-\mathbf{f}_t^{(i)p}$ be the mean-square approximation of the process $\mathbf{f}_\tau^{(i)}-\mathbf{f}_t^{(i)}$, which has the following form

$$\mathbf{f}_\tau^{(i)p}-\mathbf{f}_t^{(i)p}=\sum_{j=0}^{p}\int\limits_t^{\tau}\phi_j(s)ds\ \zeta_j^{(i)}. \tag{362}$$

From (362) we obtain

$$d\mathbf{f}_\tau^{(i)p}=\sum_{j=0}^{p}\phi_j(\tau)\zeta_j^{(i)}d\tau. \tag{363}$$

Consider the following iterated Riemann–Stieltjes integral

$$\int\limits_t^T \psi_k(t_k)\ldots \int\limits_t^{t_2} \psi_1(t_1)d\mathbf{w}_{t_1}^{(i_1)p_1}\ldots d\mathbf{w}_{t_k}^{(i_k)p_k}, \tag{364}$$

where $p_1,\ldots,p_k\in\mathbb{N}$, $i_1,\ldots,i_k=0,1,\ldots,m$ and

$$d\mathbf{w}_{\tau}^{(i)p}=\begin{cases} d\mathbf{f}_{\tau}^{(i)p} & \text{for}\quad i=1,2,\ldots,m\\ \\ d\tau & \text{for}\quad i=0\end{cases},\qquad p\in\mathbb{N}. \tag{365}$$

Let us substitute (363) into (364)

$$\int\limits_t^T \psi_k(t_k)\ldots \int\limits_t^{t_2} \psi_1(t_1)d\mathbf{w}_{t_1}^{(i_1)p_1}\ldots d\mathbf{w}_{t_k}^{(i_k)p_k}=\sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k} C_{j_k\ldots j_1}\prod_{l=1}^k \zeta_{j_l}^{(i_l)}, \tag{366}$$

where $\zeta_j^{(i)}$ are independent standard Gaussian random variables for various i or j (if $i\ne 0$),

$$C_{j_k\ldots j_1}=\int\limits_t^T \psi_k(t_k)\phi_{j_k}(t_k)\ldots \int\limits_t^{t_2} \psi_1(t_1)\phi_{j_1}(t_1)dt_1\ldots dt_k$$

is the Fourier coefficient.

To best of our knowledge [69], [70], [74] the approximations of the Wiener process in the Wong–Zakai approximation must satisfy fairly strong restrictions [74] (see Definition 7.1 on Pages 480–481). At least the proof of an analogue of Theorem 7.2 (see [74], Page 497) for approximations of the Wiener process based on its series expansion (361) should be carried out separately. Thus, the mean-square convergence of the right-hand side of (366) to the iterated Stratonovich stochastic integral (3) does not follow from the results of the papers [69], [70] (also see [74], Theorems 7.1, 7.2).

From the other hand, Theorems 3, 4, 6–12, 16–18, 23, 24 from this paper (see proofs of Theorems 3, 4, 6–12 in Chapters 1 and 2 of the monographs [15]-[18]) can be considered as the proof of the Wong–Zakai approximation for the iterated Stratonovich stochastic integrals (3) of multiplicities 1 to 6 (or of multiplicity k under the condition of convergence of trace series (Theorem 13)) based on the approximation (362) of the Wiener process in the form of its series expansion. At that, the Riemann–Stieltjes integrals (364) converge (according to Theorems 6–13, 16–18, 23, 24) to the mentioned Stratonovich stochastic integrals (3). Recall that $\{\phi_j(x)\}_{j=0}^{\infty}$ (see (361), (362), and Theorems 6–12, 16–18, 23, 24) is a complete orthonormal system of Legendre polynomials or trigonometric functions in the space $L_2([t,T])$.

To illustrate the above reasoning, consider two examples for the case $k=2$, $\psi_1(\tau)$, $\psi_2(\tau)\equiv 1$, $i_1,i_2=1,\ldots,m$.

The first example relates to the piecewise linear approximation of the multidimensional Wiener process (these approximations were considered in [69], [70], [74]).

Let $\mathbf{b}_{\Delta}^{(i)}(t)$, $t\in[0,T]$ be the piecewise linear approximation of the ith component $\mathbf{f}_t^{(i)}$ of the multidimensional standard Wiener process $\mathbf{f}_t$, $t\in[0,T]$ with independent components $\mathbf{f}_t^{(i)}$, $i=1,\ldots,m$, i.e.

$$\mathbf{b}_{\Delta}^{(i)}(t)=\mathbf{f}_{k\Delta}^{(i)}+\frac{t-k\Delta}{\Delta}\Delta\mathbf{f}_{k\Delta}^{(i)},$$

where

$$\Delta\mathbf{f}_{k\Delta}^{(i)} = \mathbf{f}_{(k+1)\Delta}^{(i)} - \mathbf{f}_{k\Delta}^{(i)}, \quad t \in [k\Delta, (k+1)\Delta), \quad k = 0, 1, 2, \ldots, N-1.$$

Consider the following iterated Riemann–Stieltjes integral

$$\int_0^T \int_0^s d\mathbf{b}_\Delta^{(i_1)}(\tau) d\mathbf{b}_\Delta^{(i_2)}(s), \quad i_1, i_2 = 1, \ldots, m.$$

We can write w. p. 1

$$\int_0^T \int_0^s d\mathbf{b}_\Delta^{(i_1)}(\tau) d\mathbf{b}_\Delta^{(i_2)}(s) = \int_0^T \int_0^s \frac{\partial \mathbf{b}_\Delta^{(i_1)}}{\partial \tau}(\tau) d\tau \frac{\partial \mathbf{b}_\Delta^{(i_2)}}{\partial s}(s) ds =$$

$$= \sum_{l=0}^{N-1} \int_{l\Delta}^{(l+1)\Delta} \left(\sum_{q=0}^{l-1} \int_{q\Delta}^{(q+1)\Delta} \frac{\Delta\mathbf{f}_{q\Delta}^{(i_1)}}{\Delta} d\tau + \int_{l\Delta}^{s} \frac{\Delta\mathbf{f}_{l\Delta}^{(i_1)}}{\Delta} d\tau \right) \frac{\Delta\mathbf{f}_{l\Delta}^{(i_2)}}{\Delta} ds =$$

$$= \sum_{l=0}^{N-1} \sum_{q=0}^{l-1} \Delta\mathbf{f}_{q\Delta}^{(i_1)} \Delta\mathbf{f}_{l\Delta}^{(i_2)} + \frac{1}{\Delta^2} \sum_{l=0}^{N-1} \Delta\mathbf{f}_{l\Delta}^{(i_1)} \Delta\mathbf{f}_{l\Delta}^{(i_2)} \int_{l\Delta}^{(l+1)\Delta} \int_{l\Delta}^{s} d\tau ds =$$

$$= \sum_{l=0}^{N-1} \sum_{q=0}^{l-1} \Delta\mathbf{f}_{q\Delta}^{(i_1)} \Delta\mathbf{f}_{l\Delta}^{(i_2)} + \frac{1}{2} \sum_{l=0}^{N-1} \Delta\mathbf{f}_{l\Delta}^{(i_1)} \Delta\mathbf{f}_{l\Delta}^{(i_2)}. \tag{367}$$

Using (367), it is not difficult to show that

$$\underset{N\to\infty}{\text{l.i.m.}} \int_0^T \int_0^s d\mathbf{b}_\Delta^{(i_1)}(\tau) d\mathbf{b}_\Delta^{(i_2)}(s) = \int_0^T \int_0^s d\mathbf{f}_\tau^{(i_1)} d\mathbf{f}_s^{(i_2)} + \frac{1}{2} \mathbf{1}_{\{i_1 = i_2\}} \int_0^T ds =$$

$$= \int_0^{*T} \int_0^{*s} d\mathbf{f}_\tau^{(i_1)} d\mathbf{f}_s^{(i_2)}, \tag{368}$$

where $\Delta \to 0$ if $N \to \infty$ ($N\Delta = T$).

Obviously, (368) agrees with Theorem 7.1 (see [74], Page 486).

The next example relates to the approximation (362) of the Wiener process based on its series expansion (361), where $t = 0$ and $\{\phi_j(x)\}_{j=0}^{\infty}$ is a complete orthonormal system of Legendre polynomials or trigonometric functions in the space $L_2([0, T])$.

Consider the following iterated Riemann–Stieltjes integral

$$\int_0^T \int_0^s d\mathbf{f}_\tau^{(i_1)p} d\mathbf{f}_s^{(i_2)p}, \quad i_1, i_2 = 1, 2, \ldots, m, \tag{369}$$

where $d\mathbf{f}_\tau^{(i)p}$ is defined by the relation (363).

Let us substitute (363) into (369)

$$\int_0^T\int_0^s d\mathbf{f}_\tau^{(i_1)p}d\mathbf{f}_s^{(i_2)p}=\sum_{j_1,j_2=0}^{p}C_{j_2j_1}\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}, \tag{370}$$

where

$$C_{j_2j_1}=\int_0^T\phi_{j_2}(s)\int_0^s\phi_{j_1}(\tau)d\tau ds$$

is the Fourier coefficient; another notations are the same as in (366).

As we noted above, approximations of the Wiener process that are similar to (362) were not considered in [69], [70] (also see Theorems 7.1, 7.2 in [74]). Furthermore, transferring of the results of Theorems 7.1 and 7.2 [74] to the case under consideration is not obvious.

On the other hand, we can apply the theory built in Chapters 1 and 2 of the monographs [15]-[18]. More precisely, using Theorems 6 and 7, we obtain from (370) the desired result

$$\underset{p\to\infty}{\text{l.i.m.}}\int_0^T\int_0^s d\mathbf{f}_\tau^{(i_1)p}d\mathbf{f}_s^{(i_2)p}=\underset{p\to\infty}{\text{l.i.m.}}\sum_{j_1,j_2=0}^{p}C_{j_2j_1}\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}=$$

$$=\int_0^{*T}\int_0^{*s}d\mathbf{f}_\tau^{(i_1)}d\mathbf{f}_s^{(i_2)}. \tag{371}$$

From the other hand, by Theorems 3, 4 (see (17)) for the case $k=2$ we obtain from (370) the following relation

$$\underset{p\to\infty}{\text{l.i.m.}}\int_0^T\int_0^s d\mathbf{f}_\tau^{(i_1)p}d\mathbf{f}_s^{(i_2)p}=\underset{p\to\infty}{\text{l.i.m.}}\sum_{j_1,j_2=0}^{p}C_{j_2j_1}\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}=$$

$$=\underset{p\to\infty}{\text{l.i.m.}}\sum_{j_1,j_2=0}^{p}C_{j_2j_1}\left(\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}-\mathbf{1}_{\{i_1=i_2\}}\mathbf{1}_{\{j_1=j_2\}}\right)+\mathbf{1}_{\{i_1=i_2\}}\sum_{j_1=0}^{\infty}C_{j_1j_1}=$$

$$=\int_0^T\int_0^s d\mathbf{f}_\tau^{(i_1)}d\mathbf{f}_s^{(i_2)}+\mathbf{1}_{\{i_1=i_2\}}\sum_{j_1=0}^{\infty}C_{j_1j_1}. \tag{372}$$

Since

$$\sum_{j_1=0}^{\infty}C_{j_1j_1}=\frac{1}{2}\sum_{j_1=0}^{\infty}\left(\int_0^T\phi_j(\tau)d\tau\right)^2=\frac{1}{2}\left(\int_0^T\phi_0(\tau)d\tau\right)^2=\frac{1}{2}\int_0^T ds,$$

then from Theorem 5 ($k=2$) and (372) we obtain (371).

16. Wong–Zakai Type Theorems for Iterated Stratonovich Stochastic Integrals. The Case of Approximation of the Multidimensional Wiener Process Based on its Series Expansion Using Legendre Polynomials and Trigonometric Functions

As we mentioned above, there exists a lot of publications on the subject of Wong–Zakai approximation of stochastic integrals and SDEs [69]-[79]. However, these works did not consider the approximation of iterated stochastic integrals and systems of SDEs for the case of approximation of the multidimensional Wiener process based on its series expansions. Usually, as an approximation of the Wiener process in the theorems of the Wong–Zakai type, the authors [69]-[79] choose a piecewise linear approximation or an approximation based on the regularization by convolution.

The Wong–Zakai approximation is widely used to approximate stochastic integrals and SDEs. In particular, the Wong–Zakai approximation can be used to approximate the iterated Stratonovich stochastic integrals in the context of numerical integration of Ito SDEs in the framework of the approach based on the Taylor–Stratonovich expansion [2]-[62], [67], [68]. It should be noted that the authors of the works [2] (Sect. 5.8, pp. 202–204), [5] (pp. 82-84), [67] (pp. 438-439), [68] (pp. 263-264) mention the Wong–Zakai approximation [69]-[71], [74] within the frames of approximation of iterated Stratonovich stochastic integrals based on the Karhunen–Loeve expansion of the Brownian bridge process. However, in these works there is no rigorous proof of convergence for approximations of the mentioned stochastic integrals of miltiplicity 3 and higher.

From the other hand, the theory constructed in Chapters 1 and 2 of the monographs [15]-[18] can be considered as the proof of the Wong–Zakai approximation for iterated Stratonovich stochastic integrals of multiplicities 1 to 6 based on the Wiener process series expansion using Legendre polynomials and trigonometric functions.

The subject of this section is to reformulate the results of Chapter 2 of the monograph [15] (also see [16]–[18]) in the form of theorems on convergence of iterated Riemann–Stiltjes integrals to iterated Stratonovich stochastic integrals.

Let us reformulate Theorems 1, 2, 7–13, 16–18, 23, 24 of this paper as theorems on the convergence of iterated Riemann–Stiltjes integrals (364) to the iterated Stratonovich stochastic integrals (3).

Theorem 25. *Suppose that the following conditions are fulfilled*:

1. *Every* $\psi_l(\tau)$ $(l=1,2)$ *is a continuously differentiable function at the interval* $[t,T]$.

2. $\{\phi_j(x)\}_{j=0}^{\infty}$ *is a complete orthonormal system of Legendre polynomials or trigonometric functions in the space* $L_2([t,T])$.

Then, for the iterated Stratonovich stochastic integral of second multiplicity

$$J^*[\psi^{(2)}]_{T,t}=\int\limits_t^{*T}\psi_2(t_2)\int\limits_t^{*t_2}\psi_1(t_1)d\mathbf{w}_{t_1}^{(i_1)}d\mathbf{w}_{t_2}^{(i_2)}\quad (i_1,i_2=0,1,\ldots,m)$$

the following equality

$$J^*[\psi^{(2)}]_{T,t}=\underset{p_1,p_2\to\infty}{\text{l.i.m.}}\int\limits_t^{T}\psi_2(t_2)\int\limits_t^{t_2}\psi_1(t_1)d\mathbf{w}_{t_1}^{(i_1)p_1}d\mathbf{w}_{t_2}^{(i_2)p_2}\tag{373}$$

is valid, where here and further l.i.m. *is a limit in the mean-square sense.*

Theorem 26. *Suppose that* $\{\phi_j(x)\}_{j=0}^{\infty}$ *is a complete orthonormal system of Legendre polynomials or trigonometric functions in the space* $L_2([t,T])$. *Then, for the iterated Stratonovich stochastic integral of third multiplicity*

$$\int\limits_t^{*T}\int\limits_t^{*t_3}\int\limits_t^{*t_2} d{\bf f}_{t_1}^{(i_1)}d{\bf f}_{t_2}^{(i_2)}d{\bf f}_{t_3}^{(i_3)}\quad (i_1,i_2,i_3=1,\ldots,m)$$

the following formula

$$\int\limits_t^{*T}\int\limits_t^{*t_3}\int\limits_t^{*t_2} d{\bf f}_{t_1}^{(i_1)}d{\bf f}_{t_2}^{(i_2)}d{\bf f}_{t_3}^{(i_3)} = \underset{p_1,p_2,p_3\to\infty}{\text{l.i.m.}} \int\limits_t^{T}\int\limits_t^{t_3}\int\limits_t^{t_2} d{\bf f}_{t_1}^{(i_1)p_1}d{\bf f}_{t_2}^{(i_2)p_2}d{\bf f}_{t_3}^{(i_3)p_3}$$

is valid.

Theorem 27. *Suppose that $\{\phi_j(x)\}_{j=0}^{\infty}$ is a complete orthonormal system of Legendre polynomials in the space $L_2([t,T])$. Then, for the iterated Stratonovich stochastic integral of third multiplicity*

$$I_{l_1l_2l_3T,t}^{*(i_1i_2i_3)}=\int\limits_t^{*T}(t-t_3)^{l_3}\int\limits_t^{*t_3}(t-t_2)^{l_2}\int\limits_t^{*t_2}(t-t_1)^{l_1}d{\bf f}_{t_1}^{(i_1)}d{\bf f}_{t_2}^{(i_2)}d{\bf f}_{t_3}^{(i_3)}\quad (i_1,i_2,i_3=1,\ldots,m)$$

the following equality

$$I_{l_1l_2l_3T,t}^{*(i_1i_2i_3)}=\underset{p_1,p_2,p_3\to\infty}{\text{l.i.m.}}\int\limits_t^{T}(t-t_3)^{l_3}\int\limits_t^{t_3}(t-t_2)^{l_2}\int\limits_t^{t_2}(t-t_1)^{l_1}d{\bf f}_{t_1}^{(i_1)p_1}d{\bf f}_{t_2}^{(i_2)p_2}d{\bf f}_{t_3}^{(i_3)p_3}$$

holds for each of the following cases

1. $i_1\ne i_2,\ i_2\ne i_3,\ i_1\ne i_3$ *and* $l_1,l_2,l_3=0,1,2,\ldots$
2. $i_1=i_2\ne i_3$ *and* $l_1=l_2\ne l_3$ *and* $l_1,l_2,l_3=0,1,2,\ldots$
3. $i_1\ne i_2=i_3$ *and* $l_1\ne l_2=l_3$ *and* $l_1,l_2,l_3=0,1,2,\ldots$
4. $i_1,i_2,i_3=1,\ldots,m;\ l_1=l_2=l_3=l$ *and* $l=0,1,2,\ldots$

Theorem 28. *Suppose that $\{\phi_j(x)\}_{j=0}^{\infty}$ is a complete orthonormal system of Legendre polynomials or trigonometric functions in the space $L_2([t,T])$ and $\psi_l(\tau)$ $(l=1,2,3)$ are continuously differentiable functions at the interval $[t,T]$. Then, for the iterated Stratonovich stochastic integral of third multiplicity*

$$J^*[\psi^{(3)}]_{T,t}=\int\limits_t^{*T}\psi_3(t_3)\int\limits_t^{*t_3}\psi_2(t_2)\int\limits_t^{*t_2}\psi_1(t_1)d{\bf f}_{t_1}^{(i_1)}d{\bf f}_{t_2}^{(i_2)}d{\bf f}_{t_3}^{(i_3)}\quad (i_1,i_2,i_3=1,\ldots,m)$$

the following formula

$$J^*[\psi^{(3)}]_{T,t}=\underset{p\to\infty}{\text{l.i.m.}}\int\limits_t^{T}\psi_3(t_3)\int\limits_t^{t_3}\psi_2(t_2)\int\limits_t^{t_2}\psi_1(t_1)d{\bf f}_{t_1}^{(i_1)p}d{\bf f}_{t_2}^{(i_2)p}d{\bf f}_{t_3}^{(i_3)p}$$

holds for each of the following cases:

1. $i_1\ne i_2,\ i_2\ne i_3,\ i_1\ne i_3$,
2. $i_1=i_2\ne i_3$ *and* $\psi_1(\tau)\equiv\psi_2(\tau)$,
3. $i_1\ne i_2=i_3$ *and* $\psi_2(\tau)\equiv\psi_3(\tau)$,
4. $i_1,i_2,i_3=1,\ldots,m$ *and* $\psi_1(\tau)\equiv\psi_2(\tau)\equiv\psi_3(\tau)$.

Theorem 29. *Suppose that $\{\phi_j(x)\}_{j=0}^{\infty}$ is a complete orthonormal system of Legendre polynomials or trigonomertic functions in the space $L_2([t,T])$. Furthermore, let the function $\psi_2(\tau)$ is continuously differentiable at the interval $[t,T]$ and the functions $\psi_1(\tau)$, $\psi_3(\tau)$ are twice continuously differentiable at the interval $[t,T]$. Then, for the iterated Stratonovich stochastic integral of third multiplicity*

$$J^*[\psi^{(3)}]_{T,t}=\int\limits_t^{*T}\psi_3(t_3)\int\limits_t^{*t_3}\psi_2(t_2)\int\limits_t^{*t_2}\psi_1(t_1)d\mathbf{f}_{t_1}^{(i_1)}d\mathbf{f}_{t_2}^{(i_2)}d\mathbf{f}_{t_3}^{(i_3)}\quad (i_1,i_2,i_3=1,\ldots,m)$$

the following formula

$$J^*[\psi^{(3)}]_{T,t}=\underset{p\to\infty}{\text{l.i.m.}}\int\limits_t^{T}\psi_3(t_3)\int\limits_t^{t_3}\psi_2(t_2)\int\limits_t^{t_2}\psi_1(t_1)d\mathbf{f}_{t_1}^{(i_1)p}d\mathbf{f}_{t_2}^{(i_2)p}d\mathbf{f}_{t_3}^{(i_3)p}$$

is valid.

Theorem 30. *Suppose that $\{\phi_j(x)\}_{j=0}^{\infty}$ is a complete orthonormal system of Legendre polynomials or trigonometric functions in the space $L_2([t,T])$. Then, for the iterated Stratonovich stochastic integral of fourth multiplicity*

$$I_{T,t}^{*(i_1i_2i_3i_4)}=\int\limits_t^{*T}\int\limits_t^{*t_4}\int\limits_t^{*t_3}\int\limits_t^{*t_2}d\mathbf{w}_{t_1}^{(i_1)}d\mathbf{w}_{t_2}^{(i_2)}d\mathbf{w}_{t_3}^{(i_3)}d\mathbf{w}_{t_4}^{(i_4)}\quad (i_1,i_2,i_3,i_4=0,1,\ldots,m)$$

the following equality

$$I_{T,t}^{*(i_1i_2i_3i_4)}=\underset{p\to\infty}{\text{l.i.m.}}\int\limits_t^{T}\int\limits_t^{t_4}\int\limits_t^{t_3}\int\limits_t^{t_2}d\mathbf{w}_{t_1}^{(i_1)p}d\mathbf{w}_{t_2}^{(i_2)p}d\mathbf{w}_{t_3}^{(i_3)p}d\mathbf{w}_{t_4}^{(i_4)p}$$

holds, where $\mathbf{w}_{\tau}^{(i)}=\mathbf{f}_{\tau}^{(i)}$ $(i=1,\ldots,m)$ are independent standard Wiener processes and $\mathbf{w}_{\tau}^{(0)}=\tau$.

Theorem 31. *Suppose that $\psi_1(\tau),\ldots,\psi_k(\tau)$ are twice continuously differentiable functions at the interval $[t,T]$ and $\{\phi_j(x)\}_{j=0}^{\infty}$ is a complete orthonormal system of trigonometric functions in the space $L_2([t,T])$. Then, for the iterated Stratonovich stochastic integral*

$$J^*[\psi^{(k)}]_{T,t}=\int\limits_t^{*T}\psi_k(t_k)\ldots\int\limits_t^{*t_2}\psi_1(t_1)d\mathbf{w}_{t_1}^{(i_1)}\ldots d\mathbf{w}_{t_k}^{(i_k)}\quad (i_1,\ldots,i_k=0,1,\ldots,m)$$

the following relation

$$\lim_{p_1\to\infty}\overline{\lim_{p_2\to\infty}}\ldots\overline{\lim_{p_k\to\infty}}\mathsf{M}\left\{\left(J^*[\psi^{(k)}]_{T,t}-J^*[\psi^{(k)}]_{T,t}^{p_1,\ldots,p_k}\right)^{2n}\right\}=0$$

is valid, where

$$J^*[\psi^{(k)}]_{T,t}^{p_1,\ldots,p_k}=\int\limits_t^{T}\psi_k(t_k)\ldots\int\limits_t^{t_2}\psi_1(t_1)d\mathbf{w}_{t_1}^{(i_1)p_1}\ldots d\mathbf{w}_{t_k}^{(i_k)p_k},$$

$n\in\mathbb{N}$, and $\overline{\lim}$ means $\limsup$.

Theorem 32. *Suppose that $\psi_1(\tau),\ldots,\psi_k(\tau)$ are twice continuously differentiable functions at the interval $[t,T]$ and $\{\phi_j(x)\}_{j=0}^{\infty}$ is a complete orthonormal system of trigonometric functions in the space $L_2([t,T])$. Then, for the iterated Stratonovich stochastic integral*

$$J^*[\psi^{(k)}]_{T,t}=\int\limits_t^{*T}\psi_k(t_k)\ldots\int\limits_t^{*t_2}\psi_1(t_1)d\mathbf{w}_{t_1}^{(i_1)}\ldots d\mathbf{w}_{t_k}^{(i_k)}\quad (i_1,\ldots,i_k=0,1,\ldots,m)$$

the following equality

$$\lim_{p_k\to\infty}\overline{\lim_{p_{k-1}\to\infty}}\ldots\overline{\lim_{p_1\to\infty}}\,\mathsf{M}\left\{\left(J^*[\psi^{(k)}]_{T,t}-J^*[\psi^{(k)}]_{T,t}^{p_1,\ldots,p_k}\right)^{2n}\right\}=0$$

is valid, where

$$J^*[\psi^{(k)}]_{T,t}^{p_1,\ldots,p_k}=\int\limits_t^{T}\psi_k(t_k)\ldots\int\limits_t^{t_2}\psi_1(t_1)d\mathbf{w}_{t_1}^{(i_1)p_1}\ldots d\mathbf{w}_{t_k}^{(i_k)p_k},$$

$n\in\mathbb{N}$, *and* $\overline{\lim}$ *means* $\limsup$.

Theorem 33. *Assume that the continuously differentiable functions $\psi_l(\tau)$ $(l=1,\ldots,k)$ and the complete orthonormal system $\{\phi_j(x)\}_{j=0}^{\infty}$ of continuous functions $(\phi_0(x)=1/\sqrt{T-t})$ in the space $L_2([t,T])$ are such that the following conditions are satisfied*:

1. *The equality*

$$\frac{1}{2}\int\limits_t^{s}\Phi_1(t_1)\Phi_2(t_1)dt_1=\sum_{j_1=0}^{\infty}\int\limits_t^{s}\Phi_2(t_2)\phi_{j_1}(t_2)\int\limits_t^{t_2}\Phi_1(t_1)\phi_{j_1}(t_1)dt_1dt_2 \qquad (374)$$

holds for all $s\in(t,T]$, where the nonrandom functions $\Phi_1(\tau)$, $\Phi_2(\tau)$ are continuously differentiable on $[t,T]$ and the series on the right-hand side of (374) converges absolutely.

2. *The estimates*

$$\left|\int\limits_t^{s}\phi_j(\tau)\Phi_1(\tau)d\tau\right|\le\frac{\Psi_1(s)}{j^{1/2+\alpha}},\qquad \left|\int\limits_s^{T}\phi_j(\tau)\Phi_2(\tau)d\tau\right|\le\frac{\Psi_1(s)}{j^{1/2+\alpha}},$$

$$\left|\sum_{j=p+1}^{\infty}\int\limits_t^{s}\Phi_2(\tau)\phi_j(\tau)\int\limits_t^{\tau}\Phi_1(\theta)\phi_j(\theta)d\theta d\tau\right|\le\frac{\Psi_2(s)}{p^{\beta}}$$

hold for all $s\in(t,T)$ and for some $\alpha,\beta>0$, where $\Phi_1(\tau)$, $\Phi_2(\tau)$ are continuously differentiable nonrandom functions on $[t,T]$, $j,p\in\mathbb{N}$, and

$$\int\limits_t^{T}\Psi_1^2(\tau)d\tau<\infty,\qquad \int\limits_t^{T}\left|\Psi_2(\tau)\right|d\tau<\infty.$$

3. *The condition*

$$
\lim_{p\to\infty} \sum_{\substack{j_1,\ldots,j_q,\ldots,j_k=0\\ q\ne g_1,g_2,\ldots,g_{2r-1},g_{2r}}}^{p} \left(S_{l_1} S_{l_2} \ldots S_{l_d} \left\{ \bar{C}^{(p)}_{j_k\ldots j_q\ldots j_1} \Biggl|_{q\ne g_1,g_2,\ldots,g_{2r-1},g_{2r}} \right\} \right)^2 = 0
$$

holds for all possible $g_1, g_2, \ldots, g_{2r-1}, g_{2r}$ *(see* (34)*) and* $l_1, l_2, \ldots, l_d$ *such that* $l_1, l_2, \ldots, l_d \in \{1, 2, \ldots, r\}$, $l_1 > l_2 > \ldots > l_d$, $d = 0, 1, 2, \ldots, r-1$, *where* $r = 1, 2, \ldots, [k/2]$ *and*

$$
S_{l_1} S_{l_2} \ldots S_{l_d} \left\{ \bar{C}^{(p)}_{j_k\ldots j_q\ldots j_1} \Biggl|_{q\ne g_1,g_2,\ldots,g_{2r-1},g_{2r}} \right\} \stackrel{\mathsf{def}}{=} \bar{C}^{(p)}_{j_k\ldots j_q\ldots j_1} \Biggl|_{q\ne g_1,g_2,\ldots,g_{2r-1},g_{2r}}
$$

for $d = 0$.

Then, for the iterated Stratonovich stochastic integral of arbitrary multiplicity k

$$
J^*[\psi^{(k)}]^{(i_1\ldots i_k)}_{T,t} = \int\limits_t^{*T} \psi_k(t_k) \ldots \int\limits_t^{*t_2} \psi_1(t_1) d\mathbf{w}^{(i_1)}_{t_1} \ldots d\mathbf{w}^{(i_k)}_{t_k},
$$

where $i_1, \ldots, i_k = 0, 1, \ldots, m$, *the following formula*

$$
J^*[\psi^{(k)}]^{(i_1\ldots i_k)}_{T,t} = \underset{p\to\infty}{\text{l.i.m.}} \int\limits_t^{T} \psi_k(t_k) \ldots \int\limits_t^{t_2} \psi_1(t_1) d\mathbf{w}^{(i_1)p}_{t_1} \ldots d\mathbf{w}^{(i_k)p}_{t_k}
$$

is valid.

Theorem 34. *Suppose that* $\{\phi_j(x)\}_{j=0}^{\infty}$ *is a complete orthonormal system of Legendre polynomials or trigonometric functions in the space* $L_2([t,T])$. *Furthermore, let* $\psi_1(\tau), \psi_2(\tau), \psi_3(\tau)$ *are continuously differentiable nonrandom functions on* $[t,T]$. *Then, for the iterated Stratonovich stochastic integral of third multiplicity*

$$

is valid.

Theorem 36. *Suppose that* $\{\phi_j(x)\}_{j=0}^{\infty}$ *is a complete orthonormal system of Legendre polynomials or trigonometric functions in the space* $L_2([t,T])$. *Furthermore, let* $\psi_1(\tau),\ldots,\psi_5(\tau)$ *are continuously differentiable nonrandom functions on* $[t,T]$. *Then, for the iterated Stratonovich stochastic integral of fifth multiplicity*

$$J^*[\psi^{(5)}]_{T,t}=\int\limits_t^{*T}\psi_5(t_5)\ldots\int\limits_t^{*t_2}\psi_1(t_1)d\mathbf{w}_{t_1}^{(i_1)}\ldots d\mathbf{w}_{t_5}^{(i_5)},$$

where $i_1,\ldots,i_5=0,1,\ldots,m$, *the following equality*

$$J^*[\psi^{(5)}]_{T,t}=\underset{p\to\infty}{\text{l.i.m.}}\int\limits_t^T\psi_5(t_5)\ldots\int\limits_t^{t_2}\psi_1(t_1)d\mathbf{w}_{t_1}^{(i_1)p}\ldots d\mathbf{w}_{t_5}^{(i_5)p}$$

holds.

Theorem 37. *Suppose that* $\{\phi_j(x)\}_{j=0}^{\infty}$ *is a complete orthonormal system of Legendre polynomials or trigonometric functions in the space* $L_2([t,T])$. *Then, for the iterated Stratonovich stochastic integral of sixth multiplicity*

$$J_{T,t}^{*(i_1\ldots i_6)}=\int\limits_t^{*T}\int\limits_t^{*t_6}\int\limits_t^{*t_5}\int\limits_t^{*t_4}\int\limits_t^{*t_3}\int\limits_t^{*t_2}d\mathbf{w}_{t_1}^{(i_1)}d\mathbf{w}_{t_2}^{(i_2)}d\mathbf{w}_{t_3}^{(i_3)}d\mathbf{w}_{t_4}^{(i_4)}d\mathbf{w}_{t_5}^{(i_5)}d\mathbf{w}_{t_6}^{(i_6)}$$

where $i_1,\ldots,i_6=0,1,\ldots,m$, *the following formula*

$$J_{T,t}^{*(i_1\ldots i_6)}=\underset{p\to\infty}{\text{l.i.m.}}\int\limits_t^T\int\limits_t^{t_6}\int\limits_t^{t_5}\int\limits_t^{t_4}\int\limits_t^{t_3}\int\limits_t^{t_2}d\mathbf{w}_{t_1}^{(i_1)p}d\mathbf{w}_{t_2}^{(i_2)p}d\mathbf{w}_{t_3}^{(i_3)p}d\mathbf{w}_{t_4}^{(i_4)p}d\mathbf{w}_{t_5}^{(i_5)p}d\mathbf{w}_{t_6}^{(i_6)p}$$

is valid.

Theorem 38. *Suppose that* $\{\phi_j(x)\}_{j=0}^{\infty}$ *is a complete orthonormal system of Legendre polynomials or trigonometric functions in the space* $L_2([t,T])$. *Furthermore, let* $\psi_1(s),\psi_2(s),\psi_3(s)$ *are continuously differentiable nonrandom functions on* $[t,T]$. *Then, for the iterated Stratonovich stochastic integral of third multiplicity*

$$J^*[\psi^{(3)}]_{T,t}=\int\limits_t^{*T}\psi_3(t_3)\int\limits_t^{*t_3}\psi_2(t_2)\int\limits_t^{*t_2}\psi_1(t_1)d\mathbf{w}_{t_1}^{(i_1)}d\mathbf{w}_{t_2}^{(i_2)}d\mathbf{w}_{t_3}^{(i_3)},$$

where $i_1,i_2,i_3=0,1,\ldots,m$, *the following formula*

$$J^*[\psi^{(3)}]_{T,t} = \underset{p_1,p_2,p_3\to\infty}{\text{l.i.m.}} \int\limits_t^T \psi_3(t_3) \int\limits_t^{t_3} \psi_2(t_2) \int\limits_t^{t_2} \psi_1(t_1) d\mathbf{w}_{t_1}^{(i_1)p_1} d\mathbf{w}_{t_2}^{(i_2)p_2} d\mathbf{w}_{t_3}^{(i_3)p_3}$$

is valid.

Let us reformulate Hypotheses 1–3 in terms of the convergence of iterated Riemann–Stiltjes integrals to iterated Stratonovich stochastic integrals.

Hypothesis 4. *Assume that $\{\phi_j(x)\}_{j=0}^{\infty}$ is a complete orthonormal system of Legendre polynomials or trigonometric functions in the space $L_2([t,T])$. Then, for the iterated Stratonovich stochastic integral of kth multiplicity*

$$\int\limits_t^{*T} \ldots \int\limits_t^{*t_2} d\mathbf{w}_{t_1}^{(i_1)} \ldots d\mathbf{w}_{t_k}^{(i_k)} \quad (i_1,\ldots,i_k = 0,1,\ldots,m)$$

the following formula

$$\int\limits_t^{*T} \ldots \int\limits_t^{*t_2} d\mathbf{w}_{t_1}^{(i_1)} \ldots d\mathbf{w}_{t_k}^{(i_k)} = \underset{p\to\infty}{\text{l.i.m.}} \int\limits_t^{T} \ldots \int\limits_t^{t_2} d\mathbf{w}_{t_1}^{(i_1)p} \ldots d\mathbf{w}_{t_k}^{(i_k)p}$$

is valid, where l.i.m. *is a limit in the mean-square sense, $\mathbf{w}_\tau^{(i)} = \mathbf{f}_\tau^{(i)}$ are independent standard Wiener processes $(i = 1,\ldots,m)$ and $\mathbf{w}_\tau^{(0)} = \tau$.*

Hypothesis 5. *Assume that $\{\phi_j(x)\}_{j=0}^{\infty}$ is a complete orthonormal system of Legendre polynomials or trigonometric functions in the space $L_2([t,T])$. Moreover, every $\psi_l(\tau)$ $(l = 1,\ldots,k)$ is an enough smooth nonrandom function on $[t,T]$. Then, for the iterated Stratonovich stochastic integral (3) of kth multiplicity*

$$J^*[\psi^{(k)}]_{T,t} = \int\limits_t^{*T} \psi_k(t_k) \ldots \int\limits_t^{*t_2} \psi_1(t_1) d\mathbf{w}_{t_1}^{(i_1)} \ldots d\mathbf{w}_{t_k}^{(i_k)} \quad (i_1,\ldots,i_k = 0,1,\ldots,m)$$

the following relation

$$J^*[\psi^{(k)}]_{T,t} = \underset{p\to\infty}{\text{l.i.m.}} \int\limits_t^{T} \psi_k(t_k) \ldots \int\limits_t^{t_2} \psi_1(t_1) d\mathbf{w}_{t_1}^{(i_1)p} \ldots d\mathbf{w}_{t_k}^{(i_k)p}$$

holds, where l.i.m. *is a limit in the mean-square sense, $\mathbf{w}_\tau^{(i)} = \mathbf{f}_\tau^{(i)}$ are independent standard Wiener processes $(i = 1,2,\ldots,m)$ and $\mathbf{w}_\tau^{(0)} = \tau$.*

Hypothesis 6. *Assume that $\{\phi_j(x)\}_{j=0}^{\infty}$ is a complete orthonormal system of Legendre polynomials or trigonometric functions in the space $L_2([t,T])$. Moreover, every $\psi_l(\tau)$ $(l = 1,\ldots,k)$ is an enough smooth nonrandom function on $[t,T]$. Then, for the iterated Stratonovich stochastic integral (3) of kth multiplicity*

$$J^*[\psi^{(k)}]_{T,t}=\int\limits_t^{*T}\psi_k(t_k)\ldots\int\limits_t^{*t_2}\psi_1(t_1)d\mathbf{w}_{t_1}^{(i_1)}\ldots d\mathbf{w}_{t_k}^{(i_k)}\quad(i_1,\ldots,i_k=0,1,\ldots,m)$$

the following equality

$$J^*[\psi^{(k)}]_{T,t}=\underset{p_1,\ldots,p_k\to\infty}{\text{l.i.m.}}\int\limits_t^{T}\psi_k(t_k)\ldots\int\limits_t^{t_2}\psi_1(t_1)d\mathbf{w}_{t_1}^{(i_1)p_1}\ldots d\mathbf{w}_{t_k}^{(i_k)p_k}$$

holds, where l.i.m. *is a limit in the mean-square sense,* $\mathbf{w}_\tau^{(i)}=\mathbf{f}_\tau^{(i)}$ *are independent standard Wiener processes* $(i=1,2,\ldots,m)$ *and* $\mathbf{w}_\tau^{(0)}=\tau$.

17. Generalization of Theorem 13 for Complete Orthonormal Systems of Functions in $L_2([t,T])$ and $\psi_1(\tau),\ \ldots,\ \psi_k(\tau)\in L_2([t,T])$ such that the Condition (376) is Satisfied

First, note that (see the proof of Thorem 13 and (92))

$$\underset{p\to\infty}{\text{l.i.m.}}\sum_{j_1,\ldots,j_k=0}^{p}C_{j_k\ldots j_1}\prod_{s=1}^{r}\mathbf{1}_{\{j_{g_{2s-1}}=\ j_{g_{2s}}\}}\prod_{s=1}^{r}\mathbf{1}_{\{i_{g_{2s-1}}=\ i_{g_{2s}}\neq 0\}}J'[\phi_{j_{q_1}}\ \ldots\phi_{j_{q_{k-2r}}}]_{T,t}^{(i_{q_1}\ldots i_{q_{k-2r}})}=$$

$$\times\prod_{s=1}^{r}\mathbf{1}_{\{i_{g_{2s-1}}=\ i_{g_{2s}}\ne 0\}}\prod_{s=1}^{r}\mathbf{1}_{\{g_{2s}=g_{2s-1}+1\}}J'[\phi_{j_{q_1}}\ldots\phi_{j_{q_{k-2r}}}]_{T,t}^{(i_{q_1}\ldots i_{q_{k-2r}})}=$$

$$=\underset{p\to\infty}{\text{l.i.m.}}\sum_{\substack{j_1,\ldots,j_q,\ldots,j_k=0\\ q\ne g_1,g_2,\ldots,g_{2r-1},g_{2r}}}^{p}\Biggl(\sum_{j_{g_1},j_{g_3},\ldots,j_{g_{2r-1}}=0}^{p}C_{j_k\ldots j_1}\Biggl|_{j_{g_1}=\ j_{g_2},\ldots,j_{g_{2r-1}}=\ j_{g_{2r}}}-$$

$$-\frac{1}{2^r}\prod_{l=1}^{r}\mathbf{1}_{\{g_{2l}=g_{2l-1}+1\}}C_{j_k\ldots j_1}\Biggl|_{(j_{g_2}j_{g_1})\curvearrowright(\cdot)\ldots(j_{g_{2r}}j_{g_{2r-1}})\curvearrowright(\cdot),j_{g_1}=\ j_{g_2},\ldots,j_{g_{2r-1}}=\ j_{g_{2r}}}\Biggr)\times$$

$$\times\prod_{s=1}^{r}\mathbf{1}_{\{i_{g_{2s-1}}=\ i_{g_{2s}}\ne 0\}}J'[\phi_{j_{q_1}}\ldots\phi_{j_{q_{k-2r}}}]_{T,t}^{(i_{q_1}\ldots i_{q_{k-2r}})}+$$

$$+\frac{1}{2^r}\prod_{s=1}^{r}\mathbf{1}_{\{g_{2s}=g_{2s-1}+1\}}J[\psi^{(k)}]_{T,t}^{s_r,\ldots,s_1}\quad\text{w. p. 1.}\tag{375}$$

Using (375) and the condition (98), we obtain (93). This means that we get (95). Thus the expansion (44) is proved.

Analyzing the proof of Theorems 13 and conditions of Theorem 5 as well as taking into account the above arguments, it is easy to see that the following theorem is true.

Theorem 39 [15], [55]. *Assume that the continuous functions $\psi_1(\tau),\ldots,\psi_k(\tau)$ at the interval $[t,T]$ and the complete orthonormal system $\{\phi_j(x)\}_{j=0}^{\infty}$ of functions ($\phi_0(x)=1/\sqrt{T-t}$) in the space $L_2([t,T])$ are such that the following condition*

$$\lim_{p_1,\ldots,p_k\to\infty}\sum_{j_1=0}^{p_1}\ldots\sum_{j_q=0}^{p_q}\ldots\sum_{j_k=0}^{p_k}\Biggl|_{q\ne g_1,g_2,\ldots,g_{2r-1},g_{2r}}\times$$

$$\times\Biggl(\sum_{j_{g_1}=0}^{\min\{p_{g_1},p_{g_2}\}}\ldots\sum_{j_{g_{2r-1}}=0}^{\min\{p_{g_{2r-1}},p_{g_{2r}}\}}C_{j_k\ldots j_1}\Biggl|_{j_{g_1}=j_{g_2},\ldots,j_{g_{2r-1}}=j_{g_{2r}}}-$$

$$-\frac{1}{2^r}\prod_{l=1}^{r}\mathbf{1}_{\{g_{2l}=g_{2l-1}+1\}}C_{j_k\ldots j_1}\Biggl|_{(j_{g_2}j_{g_1})\curvearrowright(\cdot)\ldots(j_{g_{2r}}j_{g_{2r-1}})\curvearrowright(\cdot),j_{g_1}=\ j_{g_2},\ldots,j_{g_{2r-1}}=\ j_{g_{2r}}}\Biggr)^2=0\tag{376}$$

is satisfied for all $r=1,2,\ldots,[k/2]$. Then, for the iterated Stratonovich stochastic integral of arbitrary multiplicity k

$$J^*[\psi^{(k)}]_{T,t}^{(i_1\ldots i_k)}=\int\limits_t^{*T}\psi_k(t_k)\ldots\int\limits_t^{*t_2}\psi_1(t_1)d\mathbf{w}_{t_1}^{(i_1)}\ldots d\mathbf{w}_{t_k}^{(i_k)}$$

the following expansion

$$J^*[\psi^{(k)}]_{T,t}^{(i_1\ldots i_k)}=\underset{p_1,\ldots,p_k\to\infty}{\text{l.i.m.}}\sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k}C_{j_k\ldots j_1}\prod_{l=1}^{k}\zeta_{j_l}^{(i_l)}$$

that converges in the mean-square sense is valid, where

$$C_{j_k\ldots j_1}=\int\limits_t^{T}\psi_k(t_k)\phi_{j_k}(t_k)\ldots\int\limits_t^{t_2}\psi_1(t_1)\phi_{j_1}(t_1)dt_1\ldots dt_k$$

is the Fourier coefficient, l.i.m. *is a limit in the mean-square sense,* $i_1,\ldots,i_k=0,1,\ldots,m,$

$$\zeta_j^{(i)}=\int\limits_t^T\phi_j(\tau)d\mathbf{w}_\tau^{(i)}$$

are independent standard Gaussian random variables for various i or j (in the case when $i\neq 0$), $\mathbf{w}_\tau^{(i)}=\mathbf{f}_\tau^{(i)}$ for $i=1,\ldots,m$ and $\mathbf{w}_\tau^{(0)}=\tau$.

Further in this section, we generalize Theorems 13, 39 to the case of complete orthonormal systems of functions in the space $L_2([t,T])$ and $\psi_1(\tau),\ \ldots,\ \psi_k(\tau)\in L_2([t,T])$ such that the condition (376) is satisfied.

Let $(\Omega,\mathrm{F},\mathsf{P})$ be a complete probability space and let $f(t,\omega)\stackrel{\mathsf{def}}{=}f_t:[0,T]\times\Omega\to\mathbb{R}$ be the standard Wiener process defined on the probability space $(\Omega,\mathrm{F},\mathsf{P})$.

Let us consider the family of σ-algebras $\{\mathrm{F}_t,\ t\in[0,T]\}$ defined on the probability space $(\Omega,\mathrm{F},\mathsf{P})$ and connected with the Wiener process f_t in such a way that

1. $\mathrm{F}_s\subset\mathrm{F}_t\subset\mathrm{F}$ for $s<t$.
2. The Wiener process f_t is F_t-measurable for all $t\in[0,T]$.
3. The process $f_{t+\Delta}-f_t$ for all $t\ge 0$, $\Delta>0$ is independent with the events of σ-algebra F_t.

Let $\xi(\tau,\omega)\stackrel{\mathsf{def}}{=}\xi_\tau:[0,T]\times\Omega\to\mathbb{R}$ be some random process, which is measurable with respect to the pair of variables (τ,ω) and satisfies to the following condition

$$\int\limits_t^T|\xi_\tau|d\tau<\infty\quad\text{w. p. 1}\quad(t\ge 0).$$

Let $\tau_j^{(N)}$, $j=0,1,\ldots,N$ be a partition of the interval $[t,T]$, $t\ge 0$ such that

$$t=\tau_0^{(N)}<\tau_1^{(N)}<\ldots<\tau_N^{(N)}=T,\qquad\max_{0\le j\le N-1}\left|\tau_{j+1}^{(N)}-\tau_j^{(N)}\right|\to 0\ \ \text{if}\ \ N\to\infty.\tag{377}$$

Further, for simplicity, we write τ_j instead of $\tau_j^{(N)}$.

Consider the definition of the Stratonovich stochastic integral, which differs from the definition given in [2] (recall that we use definition [2] above in this article).

The mean-square limit (if it exists)

$$\underset{N\to\infty}{\text{l.i.m.}}\sum_{j=0}^{N-1}\frac{1}{\tau_{j+1}-\tau_j}\int\limits_{\tau_j}^{\tau_{j+1}}\xi_s ds\ \left(f_{\tau_{j+1}}-f_{\tau_j}\right)\stackrel{\sf def}{=}\int\limits_t^T\xi_\tau\circ df_\tau \tag{378}$$

is called [90] the Stratonovich stochastic integral of the process ξ_τ, $\tau\in[t,T]$, where τ_j, $j=0,1,\ldots,N$ is a partition of the interval $[t,T]$ satisfying the condition (377).

We also denote by

$$\int\limits_t^\tau\xi_s\circ df_s$$

the Stratonovich stochastic integral like (378) (if it exists) of $\xi_s\mathbf{1}_{\{s\in[t,\tau]\}}$ for $\tau\in[t,T]$, $t\ge 0$.

It is known [90] (Lemma A.2) that the following iterated Stratonovich stochastic integral

$$J^S[\psi^{(k)}]_{\tau,t}^{(i_1\ldots i_k)}=\int\limits_t^\tau\psi_k(t_k)\ldots\int\limits_t^{t_2}\psi_1(t_1)\circ d\mathbf{w}_{t_1}^{(i_1)}\ldots\circ d\mathbf{w}_{t_k}^{(i_k)} \tag{379}$$

exists for the case $i_1=\ldots=i_k\ne 0$, where $\tau\in[t,T]$, $\psi_1(\tau),\ldots,\psi_k(\tau)\in L_2([t,T])$, $i_1,\ldots,i_k=0,1,\ldots,m$, $\mathbf{w}_\tau^{(i)}=\mathbf{f}_\tau^{(i)}$ for $i=1,\ldots,m$ and $\mathbf{w}_\tau^{(0)}=\tau$, $\mathbf{f}_\tau^{(i)}$ $(i=1,\ldots,m)$ are independent standard Wiener processes defined as above in this section.

In [91] (2021) an analogue of Theorem 5 (1997) is proved for the case $i_1=\ldots=i_k\ne 0$ and $\psi_1(\tau),\ldots,\psi_k(\tau)\in L_2([t,T])$.

Let us denote

$$J[\psi^{(k)}]_{T,t}^{(i_1\ldots i_k)}+\sum_{r=1}^{[k/2]}\frac{1}{2^r}\sum_{(s_r,\ldots,s_1)\in\mathrm{A}_{k,r}}J[\psi^{(k)}]_{T,t}^{s_r,\ldots,s_1}\stackrel{\sf def}{=}\bar{J}^*[\psi^{(k)}]_{T,t}^{(i_1\ldots i_k)}, \tag{380}$$

where $\psi_1(\tau),\ldots,\psi_k(\tau)\in L_2([t,T])$, $\psi_l(\tau)\psi_{l-1}(\tau)\in L_2([t,T])$ $(l=2,3,\ldots,k)$, $J[\psi^{(k)}]_{T,t}^{(i_1\ldots i_k)}$ is the iterated Ito stochastic integral (383), $\sum\limits_{\emptyset}$ is supposed to be equal to zero; another notations are the same as in Theorem 5.

Further, by analogy with (56), (59) and using the version of (53) for the case of an arbitrary complete orthonormal system $\{\phi_j(x)\}_{j=0}^\infty$ in $L_2([t,T])$ (see [15] or [18], Sect. 1.11) instead of (53), we obtain the following generalization of (56) to the case of an arbitrary complete orthonormal system $\{\phi_j(x)\}_{j=0}^\infty$ in $L_2([t,T])$ and $\psi_1(\tau),\ \ldots,\ \psi_k(\tau)\in L_2([t,T])$

$$\sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k}C_{j_k\ldots j_1}\prod_{l=1}^k\zeta_{j_l}^{(i_l)}=\sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k}C_{j_k\ldots j_1}J'[\phi_{j_1}\ldots\phi_{j_k}]_{T,t}^{(i_1\ldots i_k)}+$$

$$+\sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k}C_{j_k\ldots j_1}\sum_{r=1}^{[k/2]}\sum_{\substack{(\{\{g_1,g_2\},\ldots,\{g_{2r-1},g_{2r}\}\},\{q_1,\ldots,q_{k-2r}\})\\ \{g_1,g_2,\ldots,g_{2r-1},g_{2r},q_1,\ldots,q_{k-2r}\}=\{1,2,\ldots,k\}}}\prod_{s=1}^r\mathbf{1}_{\{i_{g_{2s-1}}=\,i_{g_{2s}}\ne 0\}}\times$$

$$\times\mathbf{1}_{\{j_{g_{2s-1}}=\,j_{g_{2s}}\}}J'[\phi_{j_{q_1}}\ldots\phi_{j_{q_{k-2r}}}]_{T,t}^{(i_{q_1}\ldots i_{q_{k-2r}})}\quad\text{w. p. 1}, \tag{381}$$

where $J'[\phi_{j_1}\ldots\phi_{j_k}]_{T,t}^{(i_1\ldots i_k)}$, $J'[\phi_{j_{q_1}}\ldots\phi_{j_{q_{k-2r}}}]_{T,t}^{(i_{q_1}\ldots i_{q_{k-2r}})}$ are multiple Wiener stochastic integrals defined as in [85] (1951). Note that in [85] the case of a scalar Wiener process has been considered.

It should be noted that Theorem 1.16 [15] (Sect. 1.11) and Theorem 4 can be reformulated as follows (also see [42], Sect. 15)

$$J[\psi^{(k)}]_{T,t}^{(i_1\ldots i_k)}=\underset{p_1,\ldots,p_k\to\infty}{\text{l.i.m.}}\sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k}C_{j_k\ldots j_1}J'[\phi_{j_1}\ldots\phi_{j_k}]_{T,t}^{(i_1\ldots i_k)}\quad \text{w. p. 1,} \tag{382}$$

where $\{\phi_j(x)\}_{j=0}^{\infty}$ is an arbitrary complete orthonormal system in $L_2([t,T])$, $\psi_1(\tau),\ \ldots,\ \psi_k(\tau)\in L_2([t,T])$, $J'[\phi_{j_1}\ldots\phi_{j_k}]_{T,t}^{(i_1\ldots i_k)}$ is the multiple Wiener stochastic integral defined as in [85] (1951) and $J[\psi^{(k)}]_{T,t}^{(i_1\ldots i_k)}$ is the iterated Ito stochastic integral

$$J[\psi^{(k)}]_{T,t}^{(i_1\ldots i_k)}=\int\limits_t^T\psi_k(t_k)\ldots\int\limits_t^{t_2}\psi_1(t_1)d\mathbf{w}_{t_1}^{(i_1)}\ldots d\mathbf{w}_{t_k}^{(i_k)}; \tag{383}$$

another notations are the same as in Theorem 4.

Passing to the limit $\underset{p_1,\ldots,p_k\to\infty}{\text{l.i.m.}}$ in (381) and using the equality (382), we get w. p. 1

$$\underset{p_1,\ldots,p_k\to\infty}{\text{l.i.m.}}\sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k}C_{j_k\ldots j_1}\zeta_{j_1}^{(i_1)}\ldots\zeta_{j_k}^{(i_k)}=J[\psi^{(k)}]_{T,t}^{(i_1\ldots i_k)}+$$

$$+\sum_{r=1}^{[k/2]}\sum_{\substack{(\{\{g_1,g_2\},\ldots,\{g_{2r-1},g_{2r}\}\},\{q_1,\ldots,q_{k-2r}\})\\ \{g_1,g_2,\ldots,g_{2r-1},g_{2r},q_1,\ldots,q_{k-2r}\}=\{1,2,\ldots,k\}}}\prod_{s=1}^{r}\mathbf{1}_{\{i_{g_{2s-1}}=\ i_{g_{2s}}\neq 0\}}\times$$

$$\times\underset{p_1,\ldots,p_k\to\infty}{\text{l.i.m.}}\sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k}C_{j_k\ldots j_1}\prod_{s=1}^{r}\mathbf{1}_{\{j_{g_{2s-1}}=\ j_{g_{2s}}\}}J'[\phi_{j_{q_1}}\ldots\phi_{j_{q_{k-2r}}}]_{T,t}^{(i_{q_1}\ldots i_{q_{k-2r}})}, \tag{384}$$

where $J'[\phi_{j_{q_1}}\ldots\phi_{j_{q_{k-2r}}}]_{T,t}^{(i_{q_1}\ldots i_{q_{k-2r}})}$ is the multiple Wiener stochastic integral defined as in [85] (1951) and $J[\psi^{(k)}]_{T,t}^{(i_1\ldots i_k)}$ is the iterated Ito stochastic integral (383).

Suppose that $\{\phi_j(x)\}_{j=0}^{\infty}$ is an arbitrary complete orthonormal system of functions in $L_2([t,T])$ and $\Phi_1(\tau),\Phi_2(\tau)\in L_2([t,T])$. Then we have

$$\sum_{j=0}^{\infty}\left|\int\limits_t^s\phi_j(\tau)\Phi_1(\tau)d\tau\int\limits_s^T\phi_j(\tau)\Phi_2(\tau)d\tau\right|\le$$

$$\le\frac{1}{2}\sum_{j=0}^{\infty}\left(\left(\int\limits_t^T\mathbf{1}_{\{\tau<s\}}\phi_j(\tau)\Phi_1(\tau)d\tau\right)^2+\left(\int\limits_t^T\mathbf{1}_{\{\tau>s\}}\phi_j(\tau)\Phi_2(\tau)d\tau\right)^2\right)=$$

$$=\frac{1}{2}\left(\int\limits_t^s\Phi_1^2(\tau)d\tau+\int\limits_s^T\Phi_2^2(\tau)d\tau\right)\le\frac{1}{2}\left(\|\Phi_1\|_{L_2([t,T])}^2+\|\Phi_2\|_{L_2([t,T])}^2\right)<\infty, \tag{385}$$

i.e. the series

$$\sum_{j=0}^{\infty}\int\limits_t^s\phi_j(\tau)\Phi_1(\tau)d\tau\int\limits_s^T\phi_j(\tau)\Phi_2(\tau)d\tau$$

converges absolutely.

By interpreting the integrals in (72)–(75) as Lebesgue integrals, using Fubini's theorem in (72) and Lebesgue's Dominated Convergence Theorem in (74), we obtain (70) (see (75), (385)) for the case of an arbitrary complete orthonormal system of functions in the space $L_2([t,T])$ and $\psi_1(\tau),\ldots,\psi_k(\tau)\in L_2([t,T])$.

Using the equality (104) for the case of an arbitrary complete orthonormal system of functions in the space $L_2([t,T])$ and $\psi_1(\tau),\psi_2(\tau)\in L_2([t,T])$ as well as absolute convergence of the series on the right-hand side of (104) for this case (see [15], Sect. 2.1.4 or [94]), we obtain [92] (Sect. 3.5.2, Theorem 3.5.2) the generalization of (78) for the case of an arbitrary complete orthonormal system of functions in the space $L_2([t,T])$ and $\psi_1(\tau),\ldots,\psi_k(\tau)\in L_2([t,T])$.

Repeating the steps of the proof of Theorem 13 below the formula (79) using (380), (384) or steps of the proof of Theorem 39 using (380), (384), we obtain for complete orthonormal systems $\{\phi_j(x)\}_{j=0}^{\infty}$ ($\phi_0(x)=1/\sqrt{T-t}$) in the space $L_2([t,T])$ and $\psi_1(\tau),\ldots,\psi_k(\tau)\in L_2([t,T])$, $\psi_l(\tau)\psi_{l-1}(\tau)\in L_2([t,T])$ ($l=2,3,\ldots,k$) (for which the condition (376) is satisfied) the following equality

$$\underset{p_1,\ldots,p_k\to\infty}{\text{l.i.m.}}\sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k}C_{j_k\ldots j_1}\prod_{l=1}^{k}\zeta_{j_l}^{(i_l)}=$$

$$=J[\psi^{(k)}]_{T,t}^{(i_1\ldots i_k)}+\sum_{r=1}^{[k/2]}\frac{1}{2^r}\sum_{(s_r,\ldots,s_1)\in\mathrm{A}_{k,r}}J[\psi^{(k)}]_{T,t}^{s_r,\ldots,s_1}=\bar{J}^*[\psi^{(k)}]_{T,t}^{(i_1\ldots i_k)}\tag{386}$$

w. p. 1, where notations in (386) are the same as in Theorem 5 and $\bar{J}^*[\psi^{(k)}]_{T,t}^{(i_1\ldots i_k)}$ is defined by (380).

Thus the following two theorems are proved.

Theorem 40 [15], [46], [55]. *Assume that the complete orthonormal system* $\{\phi_j(x)\}_{j=0}^{\infty}$ ($\phi_0(x)=1/\sqrt{T-t}$) *in the space* $L_2([t,T])$ *and* $\psi_1(\tau),\ldots,\psi_k(\tau)\in L_2([t,T])$, $\psi_l(\tau)\psi_{l-1}(\tau)\in L_2([t,T])$ ($l=2,3,\ldots,k$) *are such that the folowing condition*

$$\lim_{p_1,\ldots,p_k\to\infty}\sum_{j_1=0}^{p_1}\ldots\sum_{j_q=0}^{p_q}\ldots\sum_{j_k=0}^{p_k}\Biggl|_{q\ne g_1,g_2,\ldots,g_{2r-1},g_{2r}}\times$$

$$\times\Biggl(\sum_{j_{g_1}=0}^{\min\{p_{g_1},p_{g_2}\}}\ldots\sum_{j_{g_{2r-1}}=0}^{\min\{p_{g_{2r-1}},p_{g_{2r}}\}}C_{j_k\ldots j_1}\Biggl|_{j_{g_1}=j_{g_2},\ldots,j_{g_{2r-1}}=j_{g_{2r}}}-$$

$$-\frac{1}{2^r}\prod_{l=1}^{r}\mathbf{1}_{\{g_{2l}=g_{2l-1}+1\}}C_{j_k\ldots j_1}\Biggl|_{(j_{g_2}j_{g_1})\curvearrowleft(\cdot)\ldots(j_{g_{2r}}j_{g_{2r-1}})\curvearrowleft(\cdot),j_{g_1}=\,j_{g_2},\ldots,j_{g_{2r-1}}=\,j_{g_{2r}}}\Biggr)^2=0\tag{387}$$

is satisfied for all $r=1,2,\ldots,[k/2]$. *Then, for the sum* $\bar{J}^*[\psi^{(k)}]_{T,t}^{(i_1\ldots i_k)}$ *of iterated Ito stochastic integrals defined by* (380) *the following expansion*

$$\bar{J}^*[\psi^{(k)}]_{T,t}^{(i_1\ldots i_k)} = \underset{p_1,\ldots,p_k\to\infty}{\text{l.i.m.}} \sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k} C_{j_k\ldots j_1}\prod_{l=1}^{k}\zeta_{j_l}^{(i_l)} \tag{388}$$

that converges in the mean-square sense is valid, where

$$C_{j_k\ldots j_1} = \int_t^T \psi_k(t_k)\phi_{j_k}(t_k)\ldots\int_t^{t_2}\psi_1(t_1)\phi_{j_1}(t_1)dt_1\ldots dt_k$$

is the Fourier coefficient, l.i.m. *is a limit in the mean-square sense,* $i_1,\ldots,i_k = 0,1,\ldots,m,$

$$\zeta_j^{(i)} = \int_t^T \phi_j(\tau)d\mathbf{w}_\tau^{(i)}$$

are independent standard Gaussian random variables for various i *or* j *(in the case when* $i \neq 0$*),* $\mathbf{w}_\tau^{(i)} = \mathbf{f}_\tau^{(i)}$ *for* $i = 1,\ldots,m$ *and* $\mathbf{w}_\tau^{(0)} = \tau$.

Theorem 41 [15], [55]. *Assume that the complete orthonormal system* $\{\phi_j(x)\}_{j=0}^{\infty}$ $(\phi_0(x) = 1/\sqrt{T-t})$ *in the space* $L_2([t,T])$ *and* $\psi_1(\tau),\ldots,\psi_k(\tau) \in L_2([t,T])$, $\psi_l(\tau)\psi_{l-1}(\tau) \in L_2([t,T])$ $(l = 2,3,\ldots,k)$ *are such that the condition*

$$\lim_{p\to\infty}\sum_{\substack{j_1,\ldots,j_q,\ldots,j_k=0\\ q\neq g_1,g_2,\ldots,g_{2r-1},g_{2r}}}^{p}\left(S_{l_1}S_{l_2}\ldots S_{l_d}\left\{\bar{C}_{j_k\ldots j_q\ldots j_1}^{(p)}\Bigg|_{q\neq g_1,g_2,\ldots,g_{2r-1},g_{2r}}\right\}\right)^2 = 0$$

holds for all possible $g_1,g_2,\ldots,g_{2r-1},g_{2r}$ *(see* (34)*) and* $l_1,l_2,\ldots,l_d$ *such that* $l_1,l_2,\ldots,l_d \in \{1,2,\ldots,r\}$, $l_1 > l_2 > \ldots > l_d$, $d = 0,1,2,\ldots,r-1$, *where* $r = 1,2,\ldots,[k/2]$ *and*

$$S_{l_1}S_{l_2}\ldots S_{l_d}\left\{\bar{C}_{j_k\ldots j_q\ldots j_1}^{(p)}\Bigg|_{q\neq g_1,g_2,\ldots,g_{2r-1},g_{2r}}\right\} \stackrel{\text{def}}{=} \bar{C}_{j_k\ldots j_q\ldots j_1}^{(p)}\Bigg|_{q\neq g_1,g_2,\ldots,g_{2r-1},g_{2r}}$$

for $d = 0$.

Then, for the sum $\bar{J}^*[\psi^{(k)}]_{T,t}^{(i_1\ldots i_k)}$ *of iterated Ito stochastic integrals defined by* (380) *the following expansion*

$$\bar{J}^*[\psi^{(k)}]_{T,t}^{(i_1\ldots i_k)} = \underset{p\to\infty}{\text{l.i.m.}}\sum_{j_1,\ldots,j_k=0}^{p} C_{j_k\ldots j_1}\prod_{l=1}^{k}\zeta_{j_l}^{(i_l)}$$

that converges in the mean-square sense is valid, where

$$C_{j_k\ldots j_1} = \int_t^T \psi_k(t_k)\phi_{j_k}(t_k)\ldots\int_t^{t_2}\psi_1(t_1)\phi_{j_1}(t_1)dt_1\ldots dt_k$$

is the Fourier coefficient, l.i.m. *is a limit in the mean-square sense,* $i_1,\ldots,i_k = 0,1,\ldots,m,$

$$\zeta_j^{(i)} = \int_t^T \phi_j(\tau)d\mathbf{w}_\tau^{(i)}$$

are independent standard Gaussian random variables for various i or j (in the case when $i \ne 0$), $\mathbf{w}_\tau^{(i)} = \mathbf{f}_\tau^{(i)}$ *for* $i = 1, \ldots, m$ *and* $\mathbf{w}_\tau^{(0)} = \tau$.

Note that in Theorems 40, 41 (the case $k = 2$) the condition $\psi_1(\tau)\psi_2(\tau) \in L_2([t, T])$ can be omitted.

Using Theorem 5 together with Proposition 3.1 [91] and the proof of Lemma A.2 [90], we can write $\bar{J}^*[\psi^{(k)}]_{T,t}^{(i_1 \ldots i_k)} = J^S[\psi^{(k)}]_{T,t}^{(i_1 \ldots i_k)}$ w. p. 1 and reformulate Theorems 40, 41 for $J^S[\psi^{(k)}]_{T,t}^{(i_1 \ldots i_k)}$ ($J^S[\psi^{(k)}]_{T,t}^{(i_1 \ldots i_k)}$ is defined by (379)).

Let us consider the special case $k = 2$ of Theorem 40 in more detail. In this case, the condition (387) takes the following form (compare with (102))

$$\sum_{j_1=0}^{\infty} C_{j_1 j_1} = \frac{1}{2} \int_t^T \psi_1(t_1)\psi_2(t_1) dt_1. \tag{389}$$

As follows from [15] (Sect. 2.1.4), the equality (389) is valid for the case of an arbitrary complete orthonormal system of functions in $L_2([t, T])$ and $\psi_1(\tau), \psi_2(\tau) \in L_2([t, T])$.

From Proposition 3.1 [91] for the case $k = 2$ we obtain

$$\int_t^T \psi_2(t_2) \int_t^{t_2} \psi_1(t_1) \circ d\mathbf{w}_{t_1}^{(i)} \circ d\mathbf{w}_{t_2}^{(i)} = \int_t^T \psi_2(t_2) \int_t^{t_2} \psi_1(t_1) d\mathbf{w}_{t_1}^{(i)} d\mathbf{w}_{t_2}^{(i)} +$$

$$+\frac{1}{2} \int_t^T \psi_1(t_1)\psi_2(t_1) dt_1 \tag{390}$$

w. p. 1, where $\psi_1(\tau), \psi_2(\tau) \in L_2([t, T])$, $i = 1, \ldots, m$,

$$\int_t^T \psi_2(t_2) \int_t^{t_2} \psi_1(t_1) \circ d\mathbf{w}_{t_1}^{(i)} \circ d\mathbf{w}_{t_2}^{(i)}$$

is defined by (378), (379) and

$$\int_t^T \psi_2(t_2) \int_t^{t_2} \psi_1(t_1) d\mathbf{w}_{t_1}^{(i)} d\mathbf{w}_{t_2}^{(i)}$$

is the iterated Ito stochastic integral of the form (2) ($k = 2$).

On the other hand, it is not difficult to show that

$$\int_t^T \psi_2(t_2) \int_t^{t_2} \psi_1(t_1) \circ d\mathbf{w}_{t_1}^{(i)} \circ d\mathbf{w}_{t_2}^{(j)} = \int_t^T \psi_2(t_2) \int_t^{t_2} \psi_1(t_1) d\mathbf{w}_{t_1}^{(i)} d\mathbf{w}_{t_2}^{(j)} \tag{391}$$

w. p. 1, where $\psi_1(\tau), \psi_2(\tau) \in L_2([t, T])$, $i \ne j$ ($i, j = 1, \ldots, m$), another notations are the same as in (390).

Combining (390) and (391), we get (see (380))

$$\int_t^T \psi_2(t_2) \int_t^{t_2} \psi_1(t_1) \circ d\mathbf{w}_{t_1}^{(i_1)} \circ d\mathbf{w}_{t_2}^{(i_2)} = \int_t^T \psi_2(t_2) \int_t^{t_2} \psi_1(t_1) d\mathbf{w}_{t_1}^{(i_1)} d\mathbf{w}_{t_2}^{(i_2)} +$$

$$+\frac{1}{2}\mathbf{1}_{\{i_1=i_2\}} \int_t^T \psi_1(t_1)\psi_2(t_1)dt_1 \stackrel{\text{def}}{=} \bar{J}^*[\psi^{(2)}]_{T,t}^{(i_1 i_2)} \tag{392}$$

w. p. 1, where $\psi_1(\tau), \psi_2(\tau) \in L_2([t,T])$, $i_1, i_2 = 1, \ldots, m.$

It is easy to see that the condition $\phi_0(x) = 1/\sqrt{T-t}$ can be omitted in Theorems 40, 41 for the case $k = 2$ (see the proof of Theorem 13).

Summing up the above arguments, we obtain the following generalization of Theorem 7 to the case of an arbitrary complete orthonormal system of functions in $L_2([t,T])$ and $\psi_1(\tau), \psi_2(\tau) \in L_2([t,T])$.

Theorem 42 [15]. *Suppose that $\{\phi_j(x)\}_{j=0}^{\infty}$ is an arbitrary complete orthonormal system of functions in the space $L_2([t,T])$ and $\psi_1(\tau), \psi_2(\tau) \in L_2([t,T])$. Then, for the iterated Stratonovich stochastic integral*

$$J^S[\psi^{(2)}]_{T,t}^{(i_1 i_2)} = \int_t^T \psi_2(t_2) \int_t^{t_2} \psi_1(t_1) \circ d\mathbf{f}_{t_1}^{(i_1)} \circ d\mathbf{f}_{t_2}^{(i_2)} \quad (i_1, i_2 = 1, \ldots, m)$$

the following expansion

$$J^S[\psi^{(2)}]_{T,t}^{(i_1 i_2)} = \underset{p_1,p_2\to\infty}{\text{l.i.m.}} \sum_{j_1=0}^{p_1} \sum_{j_2=0}^{p_2} C_{j_2 j_1} \zeta_{j_1}^{(i_1)} \zeta_{j_2}^{(i_2)} \tag{393}$$

that converges in the mean-square sence is valid, where the notations are the same as in Theorems 6, 7 *and $J^S[\psi^{(2)}]_{T,t}^{(i_1 i_2)}$ is defined by* (379).

In this section, it is also appropriate to mention the so-called multiple Stratonovich stochastic integral [90] (also see [86]).

The mean-square limit (if it exists)

$$\underset{N\to\infty}{\text{l.i.m.}} \sum_{l_1=0}^{N-1} \ldots \sum_{l_k=0}^{N-1} \frac{1}{\Delta\tau_{l_1} \ldots \Delta\tau_{l_k}} \int\limits_{[\tau_{l_1},\tau_{l_1+1}]\times\ldots\times[\tau_{l_k},\tau_{l_k+1}]} K(t_1,\ldots,t_k)dt_1\ldots dt_k \ \Delta\mathbf{w}_{\tau_{l_1}}^{(i_1)} \ldots \Delta\mathbf{w}_{\tau_{l_k}}^{(i_k)} \stackrel{\text{def}}{=}$$

$$\stackrel{\text{def}}{=} \bar{J}^S[K]_{T,t}^{(i_1\ldots i_k)} \tag{394}$$

is called [90] the multiple Stratonovich stochastic integral of the function $K(t_1,\ldots,t_k) \in L_2([t,T]^k)$, where $\Delta\mathbf{w}_{\tau_j}^{(i)} = \mathbf{w}_{\tau_{j+1}}^{(i)} - \mathbf{w}_{\tau_j}^{(i)}$ $(i = 0, 1, \ldots, m)$, $\Delta\tau_j = \tau_{j+1} - \tau_j$, $\{\tau_j\}_{j=0}^N$ is a partition of the interval $[t,T]$ satisfying the condition (377), $i_1,\ldots,i_k = 0,1,\ldots,m$, $\mathbf{w}_\tau^{(i)} = \mathbf{f}_\tau^{(i)}$ for $i = 1,\ldots,m$ and $\mathbf{w}_\tau^{(0)} = \tau$, $\mathbf{f}_\tau^{(i)}$ $(i = 1,\ldots,m)$ are independent standard Wiener processes defined as above in this section.

Note that in [90] the case $i_1 = \ldots = i_k \neq 0$ was considered. We also denote by $\bar{J}^S[K]_{s,t}^{(i_1\ldots i_k)}$ the multiple Stratonovich stochastic integral (394) (if it exists) of the function $K(t_1,\ldots,t_k)\mathbf{1}_{\{(t_1,\ldots,t_k)\in[t,s]^k\}}$, where $K(t_1,\ldots,t_k) \in L_2([t,T]^k)$, $s \in [t,T]$, $t \geq 0$.

Let the function $K(t_1,\ldots,t_k)$ be chosen as follows

$$K(t_1,\ldots,t_k)=\begin{cases}\psi_1(t_1)\ldots\psi_k(t_k), & t_1\le\ldots\le t_k\\ \\ 0, & \text{otherwise}\end{cases}, \tag{395}$$

where $\psi_1(\tau),\ldots,\psi_k(\tau)\in L_2([t,T])$, $t_1,\ldots,t_k\in[t,T]$ $(k\ge 2)$ and $K(t_1)\equiv\psi_1(t_1)$ for $t_1\in[t,T]$.

We will denote the multiple Stratonovich stochastic integral (394) of the function (395) as follows $\bar{J}^S[\psi^{(k)}]_{T,t}^{(i_1\ldots i_k)}$. It is known [90] (Lemma A.2) that the Stratonovich stochastic integrals $J^S[\psi^{(k)}]_{T,t}^{(i_1\ldots i_k)}$ and $\bar{J}^S[\psi^{(k)}]_{T,t}^{(i_1\ldots i_k)}$ exist for the case $i_1=\ldots=i_k\ne 0$. Moreover,

$$J^S[\psi^{(k)}]_{T,t}^{(i_1\ldots i_k)}=\bar{J}^S[\psi^{(k)}]_{T,t}^{(i_1\ldots i_k)}\quad \text{w. p. 1}$$

for this case [90] (Lemma A.2).

Recall that an expansion similar to (44) was obtained in [87] for the multiple Stratonovich stochastic integral (394) under the condition of convergence of trace series.

Recently, another approach to the expansion of integral (394) has been proposed (assuming that the integral (394) exists), where multiple Fourier–Walsh and Fourier–Haar series ($k\in\mathbb{N}$) have been applied [96]. The convergence was proved with respect to the special subsequence ($p_1=\ldots=p_k=p=2^m$, $m\to\infty$ in a formula similar to (388) [96]).

18. Modification of Condition 3 of Theorem 13 Using Parseval's Equality

Let us make some remarks about the development of the approach based on Theorem 13 and describe the algorithm of the verification of Condition 3 of Theorem 13. First, consider the case $k=2n+1$, $n=3,4,\ldots$ (k is the multiplicity of the iterated Stratonovich stochastic integral (43)). Let Conditions 1 and 2 of Theorem 13 be satisfied. Consider the equality (97). The right-hand side of (97) has the form

$$\sum_{j_{g_1}=0}^{p}\ldots\sum_{j_{g_{2r-1}}=0}^{p}C_{j_k\ldots j_1}\Biggl.\Biggr|_{j_{g_1}=j_{g_2},\ldots,j_{g_{2r-1}}=j_{g_{2r}}}-$$

$$-\frac{1}{2^r}\prod_{l=1}^{r}\mathbf{1}_{\{g_{2l}=g_{2l-1}+1\}}C_{j_k\ldots j_1}\Biggl.\Biggr|_{(j_{g_2}j_{g_1})\curvearrowright(\cdot)\ldots(j_{g_{2r}}j_{g_{2r-1}})\curvearrowright(\cdot),j_{g_1}=\,j_{g_2},\ldots,j_{g_{2r-1}}=\,j_{g_{2r}}}.$$

Iterated application of the formulas (185), (186), (199) separately to the values

$$\sum_{j_{g_1}=0}^{p}\ldots\sum_{j_{g_{2r-1}}=0}^{p}C_{j_k\ldots j_1}\Biggl.\Biggr|_{j_{g_1}=j_{g_2},\ldots,j_{g_{2r-1}}=j_{g_{2r}}}$$

and

$$\frac{1}{2^r}\prod_{l=1}^{r}\mathbf{1}_{\{g_{2l}=g_{2l-1}+1\}}C_{j_k\ldots j_1}\Biggl.\Biggr|_{(j_{g_2}j_{g_1})\curvearrowright(\cdot)\ldots(j_{g_{2r}}j_{g_{2r-1}})\curvearrowright(\cdot),j_{g_1}=\,j_{g_2},\ldots,j_{g_{2r-1}}=\,j_{g_{2r}}}$$

$(g_1, g_2, \ldots, g_{2r-1}, g_{2r}$ as in (34), $r = 1, 2, \ldots, [k/2]$, $2r < k$) gives the following representation (see (98))

$$\sum_{\substack{j_1,\ldots,j_q,\ldots,j_k=0\\ q\ne g_1,g_2,\ldots,g_{2r-1},g_{2r}}}^{p}\left(\sum_{j_{g_1}=0}^{p}\ldots\sum_{j_{g_{2r-1}}=0}^{p} C_{j_k\ldots j_1}\Bigg|_{j_{g_1}=j_{g_2},\ldots,j_{g_{2r-1}}=j_{g_{2r}}}-\right.$$

$$\left.-\frac{1}{2^r}\prod_{l=1}^{r}\mathbf{1}_{\{g_{2l}=g_{2l-1}+1\}}C_{j_k\ldots j_1}\Bigg|_{(j_{g_2}j_{g_1})\curvearrowright(\cdot)\ldots(j_{g_{2r}}j_{g_{2r-1}})\curvearrowright(\cdot),\,j_{g_1}=\,j_{g_2},\ldots,j_{g_{2r-1}}=\,j_{g_{2r}}}\right)^2\le$$

$$\le\sum_{\substack{j_1,\ldots,j_q,\ldots,j_k=0\\ q\ne g_1,g_2,\ldots,g_{2r-1},g_{2r}}}^{\infty}\left(\sum_{j_{g_1}=0}^{p}\ldots\sum_{j_{g_{2r-1}}=0}^{p} C_{j_k\ldots j_1}\Bigg|_{j_{g_1}=j_{g_2},\ldots,j_{g_{2r-1}}=j_{g_{2r}}}-\right.$$

$$\left.-\frac{1}{2^r}\prod_{l=1}^{r}\mathbf{1}_{\{g_{2l}=g_{2l-1}+1\}}C_{j_k\ldots j_1}\Bigg|_{(j_{g_2}j_{g_1})\curvearrowright(\cdot)\ldots(j_{g_{2r}}j_{g_{2r-1}})\curvearrowright(\cdot),\,j_{g_1}=\,j_{g_2},\ldots,j_{g_{2r-1}}=\,j_{g_{2r}}}\right)^2=$$

$$=\sum_{\substack{j_1,\ldots,j_q,\ldots,j_k=0\\ q\ne g_1,g_2,\ldots,g_{2r-1},g_{2r}}}^{\infty}\left(\int\limits_{[t,T]^{k-2r}} R_p(t_1,\ldots,t_{g_1-1},t_{g_1+1},\ldots,t_{g_{2r}-1},t_{g_{2r}+1},\ldots,t_k)\times\right.$$

$$\left.\times\prod_{\substack{q=1\\ q\ne g_1,g_2,\ldots,g_{2r-1},g_{2r}}}^{k}\psi_q(t_q)\phi_{j_q}(t_q)\,dt_1\ldots dt_{g_1-1}dt_{g_1+1}\ldots dt_{g_{2r}-1}dt_{g_{2r}+1}\ldots dt_k\right)^2, \tag{396}$$

where

$$R_p(t_1,\ldots,t_{g_1-1},t_{g_1+1},\ldots,t_{g_{2r}-1},t_{g_{2r}+1},\ldots,t_k)=$$

$$=\sum_{d=1}^{4^r}\bar{R}_p^{(d)}(t_1,\ldots,t_{g_1-1},t_{g_1+1},\ldots,t_{g_{2r}-1},t_{g_{2r}+1},\ldots,t_k)-$$

$$-\sum_{d=1}^{2^r}\tilde{R}_p^{(d)}(t_1,\ldots,t_{g_1-1},t_{g_1+1},\ldots,t_{g_{2r}-1},t_{g_{2r}+1},\ldots,t_k)\in L_2([t,T]^{k-2r})$$

and

$$\int\limits_{[t,T]^{k-2r}} R_p(t_1,\ldots,t_{g_1-1},t_{g_1+1},\ldots,t_{g_{2r}-1},t_{g_{2r}+1},\ldots,t_k)\times$$

$$\times\prod_{\substack{q=1\\ q\ne g_1,g_2,\ldots,g_{2r-1},g_{2r}}}^{k}\psi_q(t_q)\phi_{j_q}(t_q)\,dt_1\ldots dt_{g_1-1}dt_{g_1+1}\ldots dt_{g_{2r}-1}dt_{g_{2r}+1}\ldots dt_k$$

is the Fourier coefficient of

$$\hat{R}_p(t_1,\ldots,t_{g_1-1},t_{g_1+1},\ldots,t_{g_{2r}-1},t_{g_{2r}+1},\ldots,t_k)=$$

$$=R_p(t_1,\ldots,t_{g_1-1},t_{g_1+1},\ldots,t_{g_{2r}-1},t_{g_{2r}+1},\ldots,t_k)\prod_{\substack{q=1\\ q\ne g_1,g_2,\ldots,g_{2r-1},g_{2r}}}^{k}\psi_q(t_q).$$

Also note that some of the functions

$$\bar{R}_p^{(d)}(t_1,\ldots,t_{g_1-1},t_{g_1+1},\ldots,t_{g_{2r}-1},t_{g_{2r}+1},\ldots,t_k)$$

and

$$\tilde{R}_p^{(d)}(t_1,\ldots,t_{g_1-1},t_{g_1+1},\ldots,t_{g_{2r}-1},t_{g_{2r}+1},\ldots,t_k)$$

can be identically equal to zero.

Obviously, we could use another representation for the function

$$R_p(t_1,\ldots,t_{g_1-1},t_{g_1+1},\ldots,t_{g_{2r}-1},t_{g_{2r}+1},\ldots,t_k) \tag{397}$$

based on the left-hand side of the equality (97) and (185), (186), (199) (see Sect. 7, 10 for details). In Sect. 10, we considered the function (397) in detail for the case $k\ge 5$, $r=1$.

Parseval's equality gives

$$\sum_{\substack{j_1,\ldots,j_q,\ldots,j_k=0\\ q\ne g_1,g_2,\ldots,g_{2r-1},g_{2r}}}^{\infty}\left(\int\limits_{[t,T]^{k-2r}}R_p(t_1,\ldots,t_{g_1-1},t_{g_1+1},\ldots,t_{g_{2r}-1},t_{g_{2r}+1},\ldots,t_k)\times\right.$$

$$\left.\times\prod_{\substack{q=1\\ q\ne g_1,g_2,\ldots,g_{2r-1},g_{2r}}}^{k}\psi_q(t_q)\phi_{j_q}(t_q)\ dt_1\ldots dt_{g_1-1}dt_{g_1+1}\ldots dt_{g_{2r}-1}dt_{g_{2r}+1}\ldots dt_k\right)^2=$$

$$=\int\limits_{[t,T]^{k-2r}}\left(\hat{R}_p(t_1,\ldots,t_{g_1-1},t_{g_1+1},\ldots,t_{g_{2r}-1},t_{g_{2r}+1},\ldots,t_k)\right)^2\times$$

$$\times dt_1\ldots dt_{g_1-1}dt_{g_1+1}\ldots dt_{g_{2r}-1}dt_{g_{2r}+1}\ldots dt_k=$$

$$=\left\|\hat{R}_p\right\|^2_{L_2([t,T]^{k-2r})}. \tag{398}$$

Combining (396) and (398), we obtain

$$\sum_{\substack{j_1,\ldots,j_q,\ldots,j_k=0\\ q\ne g_1,g_2,\ldots,g_{2r-1},g_{2r}}}^{p}\left(\sum_{j_{g_1}=0}^{p}\ldots\sum_{j_{g_{2r-1}}=0}^{p}C_{j_k\ldots j_1}\Bigg|_{j_{g_1}=j_{g_2},\ldots,j_{g_{2r-1}}=j_{g_{2r}}}-\right.$$

$$\left.-\frac{1}{2^r}\prod_{l=1}^{r}\mathbf{1}_{\{g_{2l}=g_{2l-1}+1\}}C_{j_k\ldots j_1}\Bigg|_{(j_{g_2}j_{g_1})\frown(\cdot)\ldots(j_{g_{2r}}j_{g_{2r-1}})\frown(\cdot),j_{g_1}=\,j_{g_2},\ldots,j_{g_{2r-1}}=\,j_{g_{2r}}}\right)^2\le$$

$$\le\left\|\hat{R}_p\right\|^2_{L_2([t,T]^{k-2r})}. \tag{399}$$

Assume that we have succeeded in proving the following equality

$$\lim_{p\to\infty}\left\|\hat{R}_p\right\|^2_{L_2([t,T]^{k-2r})}=0. \tag{400}$$

Applying (399) and (400), we get (compare with (98))

$$\lim_{p\to\infty}\sum_{\substack{j_1,\ldots,j_q,\ldots,j_k=0\\ q\ne g_1,g_2,\ldots,g_{2r-1},g_{2r}}}^{p}\left(\sum_{j_{g_1}=0}^{p}\ldots\sum_{j_{g_{2r-1}}=0}^{p}C_{j_k\ldots j_1}\Bigg|_{j_{g_1}=j_{g_2},\ldots,j_{g_{2r-1}}=j_{g_{2r}}}-\right.$$

$$\left.-\frac{1}{2^r}\prod_{l=1}^{r}\mathbf{1}_{\{g_{2l}=g_{2l-1}+1\}}C_{j_k\ldots j_1}\Bigg|_{(j_{g_2}j_{g_1})\frown(\cdot)\ldots(j_{g_{2r}}j_{g_{2r-1}})\frown(\cdot),j_{g_1}=\,j_{g_2},\ldots,j_{g_{2r-1}}=\,j_{g_{2r}}}\right)^2=0. \tag{401}$$

As noted in Sect. 7, Condition 3 of Theorem 13 can be replaced by a weaker condition (98) (or (401)). Also Condition 3 of Theorem 13 can be replaced by (400). From (401) we obviously obtain

$$\lim_{p\to\infty}\sum_{j_{g_1}=0}^{p}\ldots\sum_{j_{g_{2r-1}}=0}^{p}C_{j_k\ldots j_1}\Bigg|_{j_{g_1}=j_{g_2},\ldots,j_{g_{2r-1}}=j_{g_{2r}}}=$$

$$=\frac{1}{2^r}\prod_{l=1}^{r}\mathbf{1}_{\{g_{2l}=g_{2l-1}+1\}}C_{j_k\ldots j_1}\Bigg|_{(j_{g_2}j_{g_1})\frown(\cdot)\ldots(j_{g_{2r}}j_{g_{2r-1}})\frown(\cdot),j_{g_1}=\,j_{g_2},\ldots,j_{g_{2r-1}}=\,j_{g_{2r}}}. \tag{402}$$

According to (97), the equality (402) will be satisfied if

$$\lim_{p\to\infty}S_{l_1}S_{l_2}\ldots S_{l_d}\left\{\bar{C}^{(p)}_{j_k\ldots j_q\ldots j_1}\Bigg|_{q\ne g_1,g_2,\ldots,g_{2r-1},g_{2r}}\right\}=0, \tag{403}$$

where $g_1,g_2,\ldots,g_{2r-1},g_{2r}$ as in (34), $l_1,l_2,\ldots,l_d$ such that $l_1,l_2,\ldots,l_d\in\{1,2,\ldots,r\}$, $l_1>l_2>\ldots>l_d$, $d=0,1,2,\ldots,r-1$, $r=1,2,\ldots,[k/2]$,

$$S_{l_1}S_{l_2}\ldots S_{l_d}\left\{\bar C^{(p)}_{j_k\ldots j_q\ldots j_1}\Biggl|_{q\ne g_1,g_2,\ldots,g_{2r-1},g_{2r}}\right\}\stackrel{\sf def}{=}\bar C^{(p)}_{j_k\ldots j_q\ldots j_1}\Biggl|_{q\ne g_1,g_2,\ldots,g_{2r-1},g_{2r}}$$

for $d=0$, where

$$\bar C^{(p)}_{j_k\ldots j_q\ldots j_1}\Biggl|_{q\ne g_1,g_2,\ldots,g_{2r-1},g_{2r}},\quad S_l\left\{\bar C^{(p)}_{j_k\ldots j_q\ldots j_1}\Biggl|_{q\ne g_1,g_2,\ldots,g_{2r-1},g_{2r}}\right\}$$

are defined by (38), (39), $l=1,2,\ldots,r$ (see Sect. 7 for details).

Let us make some remarks about the function (397) for the case $k>5$, $r=2$. In this case, using the left-hand side of the equality (97) and (185), (186), (199), we represent the function (397) as the sum of several functions. In particular, among these functions will be the following functions

$$Q_p(t_1,\ldots,t_{s-1},t_{s+1},\ldots,t_{l-1},t_{l+1},\ldots,t_{q-1},t_{q+1},\ldots,t_{g-1},t_{g+1},\ldots,t_k)=$$

$$=\mathbf{1}_{\{t_1<\ldots<t_{s-1}<t_{s+1}<\ldots<t_{l-1}<t_{l+1}<\ldots<t_{q-1}<t_{q+1}<\ldots<t_{g-1}<t_{g+1}<\ldots<t_k\}}\times$$

$$\times\sum_{j_l=p+1}^{\infty}\int\limits_t^{t_{s+1}}\psi_s(\tau)\phi_{j_l}(\tau)d\tau\int\limits_t^{t_{l-1}}\psi_l(\tau)\phi_{j_l}(\tau)d\tau\times$$

$$\times\sum_{j_q=p+1}^{\infty}\int\limits_t^{t_{q+1}}\psi_q(\tau)\phi_{j_q}(\tau)d\tau\int\limits_t^{t_{g-1}}\psi_g(\tau)\phi_{j_q}(\tau)d\tau, \tag{404}$$

$$\bar Q_p(t_1,\ldots,t_{l-2},t_{l+3},\ldots,t_k)=\mathbf{1}_{\{t_1<\ldots<t_{l-2}<t_{l+3}<\ldots<t_k\}}\times$$

$$\times\sum_{j_l=p+1}^{\infty}\left(\int\limits_t^{t_{l-2}}\psi_{l-1}(\theta)\phi_{j_l}(\theta)\int\limits_t^{\theta}\psi_l(u)\phi_{j_l}(u)dud\theta\right)\times$$

$$\times\sum_{j_q=p+1}^{\infty}\left(\int\limits_t^{t_{l-2}}\psi_{l+1}(\theta)\phi_{j_q}(\theta)\int\limits_t^{\theta}\psi_{l+2}(u)\phi_{j_q}(u)dud\theta\right), \tag{405}$$

$$\tilde Q_p(t_1,\ldots,t_{l-2},t_{l+3},\ldots,t_k)=\mathbf{1}_{\{t_1<\ldots<t_{l-2}<t_{l+3}<\ldots<t_k\}}\times$$

$$\times\sum_{j_l=p+1}^{\infty}\sum_{j_q=p+1}^{\infty}\int\limits_t^{t_{l+3}}\psi_{l+1}(\tau)\phi_{j_q}(\tau)\left(\int\limits_t^{\tau}\psi_{l-1}(\theta)\phi_{j_l}(\theta)\int\limits_t^{\theta}\psi_l(u)\phi_{j_l}(u)dud\theta\right)\times$$

$$\times\int\limits_t^{\tau}\psi_{l+2}(u)\phi_{j_q}(u)dud\tau, \tag{406}$$

$$\hat{Q}_p(t_1,\ldots,t_{l-1},t_{l+2},\ldots,t_{q-1},t_{q+2},\ldots,t_k)=$$

$$=\mathbf{1}_{\{t_1<\ldots<t_{l-1}<t_{l+2}<\ldots<t_{q-1}<t_{q+2}<\ldots<t_k\}}\times$$

$$\times\sum_{j_l=p+1}^{\infty}\sum_{j_{l+1}=p+1}^{\infty}\left(\int\limits_t^{t_{l+2}}\psi_{l+1}(\theta)\phi_{j_{l+1}}(\theta)\int\limits_t^{\theta}\psi_l(u)\phi_{j_l}(u)dud\theta\right)\times$$

$$\times\left(\int\limits_t^{t_{q+2}}\psi_{q+1}(\theta)\phi_{j_{l+1}}(\theta)\int\limits_t^{\theta}\psi_q(u)\phi_{j_l}(u)dud\theta\right). \tag{407}$$

Note that the pairs (g_1,g_2), (g_3,g_4) for the functions (405) and (406) have the property: $g_2=g_1+1$, $g_4=g_3+1$, $g_3=g_2+1$. At the same time, the pairs (g_1,g_2), (g_3,g_4) for the function (404) have the following property: $g_2>g_1+1$, $g_4>g_3+1$, $g_3\ge g_2+1$. For the function (407), the pairs (g_1,g_2), (g_3,g_4) chosen as follows: $g_2>g_1+1$, $g_4>g_3+1$, $g_4=g_2+1$, $g_3=g_1+1$. Generally speaking, all possible pairs (g_1,g_2), (g_3,g_4) must be considered. We consider the functions (404)–(407) only as an example.

Suppose that $s+1=l-1$, $l+1=q-1$, $q+1=g-1$ in (404). Let us show that (we consider the case of Legendre polynomials; the trigonometric case is simpler and can be considered similarly)

$$\lim_{p\to\infty}\left\|Q_p\right\|^2_{L_2([t,T]^{k-4})}=0, \tag{408}$$

$$\lim_{p\to\infty}\left\|\bar{Q}_p\right\|^2_{L_2([t,T]^{k-4})}=0, \tag{409}$$

$$\lim_{p\to\infty}\left\|\tilde{Q}_p\right\|^2_{L_2([t,T]^{k-4})}=0, \tag{410}$$

$$\lim_{p\to\infty}\left\|\hat{Q}_p\right\|^2_{L_2([t,T]^{k-4})}=0. \tag{411}$$

First consider the proof of (408). We have ($s+1=l-1$, $l+1=q-1$, $q+1=g-1$)

$$\left(Q_p(t_1,\ldots,t_{l-3},t_{l-1},t_{l+1},t_{l+3},t_{l+5},\ldots,t_k)\right)^2=$$

$$=\mathbf{1}_{\{t_1<\ldots<t_{l-3}<t_{l-1}<t_{l+1}<t_{l+3}<t_{l+5}<\ldots<t_k\}}\times$$

$$\times\left(\sum_{j_l=p+1}^{\infty}\int\limits_t^{t_{l-1}}\psi_{l-2}(\tau)\phi_{j_l}(\tau)d\tau\int\limits_t^{t_{l-1}}\psi_l(\tau)\phi_{j_l}(\tau)d\tau\times\right.$$

$$\left.\times\sum_{j_q=p+1}^{\infty}\int\limits_t^{t_{l+3}}\psi_{l+2}(\tau)\phi_{j_q}(\tau)d\tau\int\limits_t^{t_{l+3}}\psi_{l+4}(\tau)\phi_{j_q}(\tau)d\tau\right)^2. \tag{412}$$

Using the estimate (135), we obtain

$$\left|\int\limits_t^s \psi(\tau)\phi_j(\tau)d\tau\right| < \frac{K}{j^{1-\varepsilon/2}(1-z^2(s))^{1/4-\varepsilon/4}}, \tag{413}$$

where $j \in \mathbb{N}$, $s \in (t,T)$, $z(s)$ is defined by (106), $\varepsilon \in (0,1)$, constant K does not depend on j, $\{\phi_j(x)\}_{j=0}^{\infty}$ is a complete orthonormal system of Legendre polynomials in the space $L_2([t,T])$, $\psi(\tau)$ is a continuously differentiable nonrandom function on $[t,T]$.

Applying (413) and (138) (we take ε instead of $\varepsilon/2$ in (138)), we get

$$\left(\sum_{j_l=p+1}^{\infty}\int\limits_t^{t_{l-1}}\psi_{l-2}(\tau)\phi_{j_l}(\tau)d\tau\int\limits_t^{t_{l-1}}\psi_l(\tau)\phi_{j_l}(\tau)d\tau\times\right.$$

$$\left.\times\sum_{j_q=p+1}^{\infty}\int\limits_t^{t_{l+3}}\psi_{l+2}(\tau)\phi_{j_q}(\tau)d\tau\int\limits_t^{t_{l+3}}\psi_{l+4}(\tau)\phi_{j_q}(\tau)d\tau\right)^2 \le$$

$$\le \frac{K_1}{p^{4(1-\varepsilon)}(1-z^2(t_{l-1}))^{1-\varepsilon}(1-z^2(t_{l+3}))^{1-\varepsilon}}, \tag{414}$$

where $t_{l-1}, t_{l+3} \in (t,T)$, constant K_1 is independent of p. Combining (412) and (414), we have (408).

Let us prove (409). The following equality is proved in Sect. 12 [47] (also see Sect. 2.9 [15]) for the case of Legendre polynomials ($n > m$; $n, m \in \mathbb{N}$)

$$\sum_{j=m+1}^{n} C_{jj}(s) = \sum_{j=m+1}^{n}\int\limits_t^s \psi_2(\theta)\phi_j(\theta)\int\limits_t^{\theta}\psi_1(\tau)\phi_j(\tau)d\tau d\theta =$$

$$= \frac{T-t}{4}\int\limits_{-1}^{z(s)}\psi_1(u(x))\psi_2(u(x))\left(P_{n+1}(x)P_n(x) - P_{m+1}(x)P_m(x)\right)dx -$$

$$-\frac{(T-t)^2}{8}\sum_{j=m+1}^{n}\frac{1}{2j+1}\int\limits_{-1}^{z(s)}\left(P_{j+1}(y) - P_{j-1}(y)\right)\psi_1'(u(y))\times$$

$$\times\Biggl(\left(P_{j+1}(z(s)) - P_{j-1}(z(s))\right)\psi_2(s) - \left(P_{j+1}(y) - P_{j-1}(y)\right)\psi_2(u(y)) -$$

$$-\frac{T-t}{2}\int\limits_y^{z(s)}\left(P_{j+1}(x) - P_{j-1}(x)\right)\psi_2'(u(x))dx\Biggr)dy, \tag{415}$$

where $s \in (t,T)$,

$$C_{jj}(s) = \int\limits_t^s \psi_2(\tau)\phi_j(\tau)\int\limits_t^{\tau}\psi_1(\theta)\phi_j(\theta)d\theta d\tau,$$

$$u(y)=\frac{T-t}{2}y+\frac{T+t}{2},\quad z(s)=\left(s-\frac{T+t}{2}\right)\frac{2}{T-t},$$

and ψ_1', ψ_2' are derivatives of the functions $\psi_1(\tau)$, $\psi_2(\tau)$ with respect to the variable $u(y)$.

Applying the estimate (134) in (415) and taking into account the boundedness of the functions $\psi_1(\tau)$, $\psi_2(\tau)$ and their derivatives, we obtain

$$\left|\sum_{j=m+1}^{n}C_{jj}(s)\right|\le C_1\left(\frac{1}{n^{1-\varepsilon}}+\frac{1}{m^{1-\varepsilon}}\right)\int\limits_{-1}^{z(s)}\frac{dx}{\left(1-x^2\right)^{1/2-\varepsilon/2}}+$$

$$+C_2\sum_{j=m+1}^{n}\frac{1}{j^{2-\varepsilon}}\left(\int\limits_{-1}^{z(s)}\frac{dy}{\left(1-y^2\right)^{1/2-\varepsilon/2}}+\frac{1}{\left(1-z^2(s)\right)^{1/4-\varepsilon/4}}\int\limits_{-1}^{z(s)}\frac{dy}{\left(1-y^2\right)^{1/4-\varepsilon/4}}+\right.$$

$$\left.+\int\limits_{-1}^{z(s)}\frac{1}{\left(1-y^2\right)^{1/4-\varepsilon/4}}\int\limits_{y}^{z(s)}\frac{dx}{\left(1-x^2\right)^{1/4-\varepsilon/4}}dy\right),\tag{416}$$

where $s\in(t,T)$, constants C_1,C_2 do not depend on n and m.

From (416) we have

$$\left|\sum_{j=m+1}^{\infty}C_{jj}(s)\right|\le\frac{K_1}{m^{1-\varepsilon}}+K_2\sum_{j=m+1}^{\infty}\frac{1}{j^{2-\varepsilon}}\left(1+\frac{1}{\left(1-z^2(s)\right)^{1/4-\varepsilon/4}}\right),\tag{417}$$

where $s\in(t,T)$, constants K_1,K_2 do not depend on m.

Applying (138) (we take ε instead of $\varepsilon/2$ in (138)) in (417), we get

$$\left|\sum_{j=m+1}^{\infty}C_{jj}(s)\right|\le\frac{K}{m^{1-\varepsilon}\left(1-z^2(s)\right)^{1/4-\varepsilon/4}},\tag{418}$$

where $s\in(t,T)$, constant K is independent of m.

Using the estimate (418), we obtain (see (405))

$$\left(\bar{Q}_p(t_1,\ldots,t_{l-2},t_{l+3},\ldots,t_k)\right)^2=\mathbf{1}_{\{t_1<\ldots<t_{l-2}<t_{l+3}<\ldots<t_k\}}\times$$

$$\times\left(\sum_{j_l=p+1}^{\infty}\left(\int\limits_t^{t_{l-2}}\psi_{l-1}(\theta)\phi_{j_l}(\theta)\int\limits_t^{\theta}\psi_l(u)\phi_{j_l}(u)dud\theta\right)\times\right.$$

$$\left.\times\sum_{j_q=p+1}^{\infty}\left(\int\limits_t^{t_{l-2}}\psi_{l+1}(\theta)\phi_{j_q}(\theta)\int\limits_t^{\theta}\psi_{l+2}(u)\phi_{j_q}(u)dud\theta\right)\right)^2\le$$

$$
\le \frac{K_1}{p^{4(1-\varepsilon)}(1-z^2(t_{l-2}))^{1-\varepsilon}}, \tag{419}
$$

where $t_{l-2} \in (t,T)$, constant K_1 is independent of p. The inequality (419) completes the proof of (409).

Let us prove (410). Using (115), we obtain the following equality for the cases of Legendre polynomials and trigonometric functions

$$
\frac{1}{2}\int\limits_t^s \psi_1(t_1)\psi_2(t_1)dt_1 - \sum_{j_1=0}^{p} C_{j_1j_1}(s) = \sum_{j_1=p+1}^{\infty} C_{j_1j_1}(s), \tag{420}
$$

where $s \in (t,T)$ and

$$
C_{jj}(s) = \int\limits_t^s \psi_2(\tau)\phi_j(\tau)\int\limits_t^{\tau} \psi_1(\theta)\phi_j(\theta)d\theta d\tau.
$$

Applying (420) in (406), we get

$$
\left(\tilde{Q}_p(t_1,\ldots,t_{l-2},t_{l+3},\ldots,t_k)\right)^2 \le
$$

$$
\le \left(\sum_{j_l=p+1}^{\infty}\sum_{j_q=p+1}^{\infty}\int\limits_t^{t_{l+3}} \psi_{l+1}(\tau)\phi_{j_q}(\tau)\left(\int\limits_t^{\tau}\psi_{l-1}(\theta)\phi_{j_l}(\theta)\int\limits_t^{\theta}\psi_l(u)\phi_{j_l}(u)dud\theta\right)\times\right.
$$

$$
\left.\times\int\limits_t^{\tau}\psi_{l+2}(u)\phi_{j_q}(u)dud\tau\right)^2 =
$$

$$
= \left(\frac{1}{2}\sum_{j_l=p+1}^{\infty}\int\limits_t^{t_{l+3}}\psi_{l+1}(\tau)\left(\int\limits_t^{\tau}\psi_{l-1}(\theta)\phi_{j_l}(\theta)\int\limits_t^{\theta}\psi_l(u)\phi_{j_l}(u)dud\theta\right)\psi_{l+2}(\tau)d\tau-\right.
$$

$$
-\sum_{j_q=0}^{p}\int\limits_t^{t_{l+3}}\psi_{l+1}(\tau)\phi_{j_q}(\tau)\sum_{j_l=p+1}^{\infty}\left(\int\limits_t^{\tau}\psi_{l-1}(\theta)\phi_{j_l}(\theta)\int\limits_t^{\theta}\psi_l(u)\phi_{j_l}(u)dud\theta\right)\times
$$

$$
\left.\times\int\limits_t^{\tau}\psi_{l+2}(u)\phi_{j_q}(u)dud\tau\right)^2 =
$$

$$
= (a-b)^2 \le 2(|a|^2+|b|^2). \tag{421}
$$

Further, we have

$$|a| \le \frac{1}{2}\int\limits_t^{t_{l+3}} \left|\psi_{l+1}(\tau)\right| \left|\sum_{j_l=p+1}^{\infty}\int\limits_t^{\tau}\psi_{l-1}(\theta)\phi_{j_l}(\theta)\int\limits_t^{\theta}\psi_l(u)\phi_{j_l}(u)dud\theta\right| \left|\psi_{l+2}(\tau)\right| d\tau, \tag{422}$$

$$|b| \le \sum_{j_q=0}^{p}\int\limits_t^{t_{l+3}} \left|\psi_{l+1}(\tau)\phi_{j_q}(\tau)\right| \left|\sum_{j_l=p+1}^{\infty}\int\limits_t^{\tau}\psi_{l-1}(\theta)\phi_{j_l}(\theta)\int\limits_t^{\theta}\psi_l(u)\phi_{j_l}(u)dud\theta\right| \times$$

$$\times \left|\int\limits_t^{\tau}\psi_{l+2}(u)\phi_{j_q}(u)du\right| d\tau. \tag{423}$$

Combining (418) and (422), we obtain

$$|a| \le \frac{C}{p^{1-\varepsilon}}, \tag{424}$$

where constant C is independent of p.

Separating in (423) the term with the number $j_q = 0$ and then applying (266), (109), (418), we obtain

$$|b| \le \frac{K}{p^{1-\varepsilon}}\left(\int\limits_t^{t_{l+3}}\frac{d\tau}{\left(1-z^2(\tau)\right)^{1/2-\varepsilon/4}} + \sum_{j_q=1}^{p}\frac{1}{j_q}\int\limits_t^{t_{l+3}}\frac{d\tau}{\left(1-z^2(\tau)\right)^{3/4-\varepsilon/4}}\right) \le$$

$$\le \frac{K_1}{p^{1-\varepsilon}}\left(1 + \sum_{j_q=1}^{p}\frac{1}{j_q}\right) \le \frac{K_1}{p^{1-\varepsilon}}\left(2 + \int\limits_1^{p}\frac{dx}{x}\right) =$$

$$= \frac{K_1\left(2 + lnp\right)}{p^{1-\varepsilon}} \ \to\ 0 \tag{425}$$

if $p \to \infty$. The estimates (421), (424), (425) complete the proof of (410).

Finally, consider the proof of (411). Using the elementary inequality $|ab| \le (a^2+b^2)/2$ and Parseval's equality, we have

$$\left(\hat{Q}_p(t_1,\ldots,t_{l-1},t_{l+2},\ldots,t_{q-1},t_{q+2},\ldots,t_k)\right)^2 \le$$

$$\le \left(\sum_{j_l=p+1}^{\infty}\sum_{j_{l+1}=p+1}^{\infty}\left|\int\limits_t^{t_{l+2}}\psi_{l+1}(\theta)\phi_{j_{l+1}}(\theta)\int\limits_t^{\theta}\psi_l(u)\phi_{j_l}(u)dud\theta\right| \times\right.$$

$$\left.\times \left|\int\limits_t^{t_{q+2}}\psi_{q+1}(\theta)\phi_{j_{l+1}}(\theta)\int\limits_t^{\theta}\psi_q(u)\phi_{j_l}(u)dud\theta\right|\right)^2 \le$$

$$\le \frac{1}{4}\left(\sum_{j_l=p+1}^{\infty}\sum_{j_{l+1}=p+1}^{\infty}\left(\int\limits_t^{t_{l+2}}\psi_{l+1}(\theta)\phi_{j_{l+1}}(\theta)\int\limits_t^{\theta}\psi_l(u)\phi_{j_l}(u)dud\theta\right)^2+\right.$$

$$\left.+\sum_{j_l=p+1}^{\infty}\sum_{j_{l+1}=p+1}^{\infty}\left(\int\limits_t^{t_{q+2}}\psi_{q+1}(\theta)\phi_{j_{l+1}}(\theta)\int\limits_t^{\theta}\psi_q(u)\phi_{j_l}(u)dud\theta\right)^2\right)^2\le$$

$$\le \frac{1}{4}\left(\sum_{j_l=p+1}^{\infty}\sum_{j_{l+1}=0}^{\infty}\left(\int\limits_t^{t_{l+2}}\psi_{l+1}(\theta)\phi_{j_{l+1}}(\theta)\int\limits_t^{\theta}\psi_l(u)\phi_{j_l}(u)dud\theta\right)^2+\right.$$

$$\left.+\sum_{j_l=p+1}^{\infty}\sum_{j_{l+1}=0}^{\infty}\left(\int\limits_t^{t_{q+2}}\psi_{q+1}(\theta)\phi_{j_{l+1}}(\theta)\int\limits_t^{\theta}\psi_q(u)\phi_{j_l}(u)dud\theta\right)^2\right)^2\le$$

$$\le \frac{1}{4}\left(\sum_{j_l=p+1}^{\infty}\int\limits_t^{t_{l+2}}\psi_{l+1}^2(\theta)\left(\int\limits_t^{\theta}\psi_l(u)\phi_{j_l}(u)du\right)^2 d\theta+\right.$$

$$\left.+\sum_{j_l=p+1}^{\infty}\int\limits_t^{t_{q+2}}\psi_{q+1}^2(\theta)\left(\int\limits_t^{\theta}\psi_q(u)\phi_{j_l}(u)du\right)^2 d\theta\right)^2. \qquad (426)$$

Note that

$$\sum_{j=p+1}^{\infty}\frac{1}{j^2}\le\int\limits_p^{\infty}\frac{dx}{x^2}=\frac{1}{p}. \qquad (427)$$

From (426) and (427), (109) we obtain

$$\left(\hat{Q}_p(t_1,\ldots,t_{l-1},t_{l+2},\ldots,t_{q-1},t_{q+2},\ldots,t_k)\right)^2\le$$
$$\le\frac{K}{p^2}\ \to\ 0$$

if $p\to\infty$, where constant K does not depend on p. Thus the equalities (408)–(411) are proved.

Recall that the function (397) (this function is defined using the left-hand side of the equality (97)) for the case $k>5,\ r=2$ is represented as the sum of several functions. Four of them, namely Q_p, $\bar{Q}_p$, $\tilde{Q}_p$, $\hat{Q}_p$ (these functions correspond to the particular case of choosing the pairs (g_1,g_2), (g_3,g_4); generally speaking, all possible pairs (g_1,g_2), (g_3,g_4) must be considered), have been studied above. Absolutely similarly, we can consider the remaining functions (for all possible pairs (g_1,g_2), (g_3,g_4)) whose sum is the function (397) for the case $k>5$, $r=2$. As a result, we will have

$$\lim_{p\to\infty}\left\|\hat{R}_p\right\|^2_{L_2([t,T]^{k-2r})}=0\quad (k>5,\ r=2).$$

After that, we can go to the function (397) for the case $k > 5$, $r = 3$, $2r < k$ (this function is defined using the left-hand side of the equality (97)) and follow the same steps as above. This will lead us to the following equality

$$\lim_{p\to\infty}\left\|\hat{R}_p\right\|^2_{L_2([t,T]^{k-2r})} = 0 \quad (k > 5,\ r = 3,\ 2r < k).$$

Then we can move on to the next step and so on. As a result, we get the equality (400) ($r = 1, 2, \ldots, [k/2]$). Thus the condition (98) is satisfied for the case $k = 2n + 1$, $n = 3, 4, \ldots$ (recall that the condition (98) is weaker than Condition 3 of Theorem 13 and the condition (98) can be used in Theorem 13 instead of Condition 3).

For the case $k = 2n$, $n = 3, 4, \ldots$ we follow the above steps for $r = 1, 2, \ldots, [k/2] - 1$ ($2r \le k - 2$). For $2r = k$ we use the same technique as in the proof of the equalities (147)–(149). Recall that we used (71), (78) and Parseval's equality in the proof of (147)–(149).

The obvious disadvantage of the proposed algorithm is the drastic increase of complexity of the proof when moving from $r = 1$ to $r = 2$, $r = 2$ to $r = 3$ and so on.

The proofs of Theorems 17 and 18 contain a rather simple trick of passing from $r = 1$ to $r = 2$. Unfortunately, this procedure cannot be applied already at the transition from $r = 2$ to $r = 3$.

Note that the case $k = 6$, $r = 3$ was successfully considered in Theorem 23 under the following simplifying assumption: $\psi_1(\tau), \ldots, \psi_6(\tau) \equiv 1$.

Nevertheless, the results obtained in this paper are quite sufficient for practical needs (see Chapters 4 and 5 [15] for details).

Expansions of Specific Iterated Ito and Stratonovich Stochastic Integrals From the Taylor–Ito and Taylor–Stratonovich Expansions

MEAN-SQUARE APPROXIMATION OF ITERATED ITO AND STRATONOVICH STOCHASTIC INTEGRALS OF MULTIPLICITIES 1 TO 6 FROM THE TAYLOR–ITO AND TAYLOR–STRATONOVICH EXPANSIONS USING LEGENDRE POLYNOMIALS

DMITRIY F. KUZNETSOV

Abstract. The article is devoted to the practical material on expansions and mean-square approximations of specific iterated Ito and Stratonovich stochastic integrals of multiplicities 1 to 6 with respect to components of the multidimensional Wiener process on the base of the method of generalized multiple Fourier series. More precisely, we used the multiple Fourier–Legendre series converging in the sense of norm in the space $L_2([t,T]^k)$ $(k=1,\ldots,6)$ for approximation of iterated Ito and Stratonovich stochastic integrals. The considered iterated Ito and Stratonovich stochastic integrals are part of the stochastic Taylor expansions (Taylor–Ito and Taylor–Stratonovich expansions). Therefore, the results of the article can be useful for the construction of high-order strong numerical methods for Ito stochastic differential equations. Expansions of iterated Ito and Stratonovich stochastic integrals of multiplicities 1 to 6 using Legendre polynomials are derived. The convergence with probability 1 of the mentioned method of generalized multiple Fourier series is proved for iterated Ito stochastic integrals of arbitrary multiplicity k $(k \in \mathbb{N})$ for the cases of multiple Fourier–Legendre series and multiple trigonometric Fourier series.

1. Introduction

Let $(\Omega, \mathrm{F}, \mathsf{P})$ be a complete probability space, let $\{\mathrm{F}_t, t \in [0,T]\}$ be a nondecreasing right-continous family of σ-algebras of F, and let $\mathbf{f}_t$ be a standard m-dimensional Wiener stochastic process, which is F_t-measurable for any $t \in [0,T]$. We assume that the components $\mathbf{f}_t^{(i)}$ $(i = 1,\ldots,m)$ of this process are independent. Consider an Ito stochastic differential equation (SDE) in the integral form

$$\mathbf{x}_t = \mathbf{x}_0 + \int\limits_0^t \mathbf{a}(\mathbf{x}_\tau,\tau)d\tau + \int\limits_0^t B(\mathbf{x}_\tau,\tau)d\mathbf{f}_\tau, \quad \mathbf{x}_0 = \mathbf{x}(0,\omega). \tag{1}$$

Here $\mathbf{x}_t$ is some n-dimensional stochastic process satisfying to the equation (1). The nonrandom functions $\mathbf{a} : \mathbb{R}^n \times [0,T] \to \mathbb{R}^n$, $B : \mathbb{R}^n \times [0,T] \to \mathbb{R}^{n\times m}$ guarantee the existence and uniqueness up to stochastic equivalence of a solution of (1) [1]. The second integral on the right-hand side of (1) is interpreted as an Ito stochastic integral. Let $\mathbf{x}_0$ be an n-dimensional random variable, which is F_0-measurable and $\mathsf{M}\{|\mathbf{x}_0|^2\} < \infty$ (M denotes a mathematical expectation). We assume that $\mathbf{x}_0$ and $\mathbf{f}_t - \mathbf{f}_0$ are independent when $t > 0$.

It is well known that one of the effective approaches to the numerical integration of Ito SDEs is an approach based on the Taylor–Ito and Taylor–Stratonovich expansions [2]-[4]. The most important feature of such expansions is a presence in them of the so-called iterated Ito and Stratonovich stochastic integrals, which play the key role for solving the problem of numerical integration of Ito SDEs and have the following form

$$J[\psi^{(k)}]_{T,t} = \int\limits_t^T \psi_k(t_k)\ldots\int\limits_t^{t_2} \psi_1(t_1)d\mathbf{w}_{t_1}^{(i_1)}\ldots d\mathbf{w}_{t_k}^{(i_k)}, \tag{2}$$

$$J^*[\psi^{(k)}]_{T,t} = \int\limits_t^{*T} \psi_k(t_k) \ldots \int\limits_t^{*t_2} \psi_1(t_1) d\mathbf{w}_{t_1}^{(i_1)} \ldots d\mathbf{w}_{t_k}^{(i_k)}, \tag{3}$$

where $\psi_1(\tau), \ldots, \psi_k(\tau)$ are nonrandom functions on $[t,T]$, $\mathbf{w}_\tau^{(i)} = \mathbf{f}_\tau^{(i)}$ for $i = 1, \ldots, m$ and $\mathbf{w}_\tau^{(0)} = \tau$,

$$\int \ \text{and} \ \int\limits^{*}$$

denote Ito and Stratonovich stochastic integrals, respectively; $i_1, \ldots, i_k = 0, 1, \ldots, m$.

Note that $\psi_l(\tau) \equiv 1$ $(l = 1, \ldots, k)$ and $i_1, \ldots, i_k = 0, 1, \ldots, m$ in [2]-[4]. At the same time $\psi_l(\tau) \equiv (t-\tau)^{q_l}$ $(l = 1, \ldots, k;\ q_1, \ldots, q_k = 0, 1, 2, \ldots)$ and $i_1, \ldots, i_k = 1, \ldots, m$ in [5]-[36].

Effective solution of the problem of mean-square approximation for collections of iterated Ito and Stratonovich stochastic integrals (2) and (3) composes the subject of this article.

2. Theorems on Expansions of Iterated Ito and Stratonovich Stochastic Itegrals

Let us consider the effective approach to expansion of the iterated Ito stochastic integrals (2) [8] (2006), [9]-[35] (the so-called method of generalized multiple Fourier series). Sometimes these stochastic integrals are referred to in the literature as multiple stochastic integrals (see, for example, [2]).

The idea of this method is as follows: the iterated Ito stochastic integral (2) of multiplicity k is represented as the multiple stochastic integral from the certain discontinuous nonrandom function of k variables defined on the hypercube $[t,T]^k$, where $[t,T]$ is the interval of integration of the iterated Ito stochastic integral. Then, the indicated nonrandom function is expanded in the hypercube $[t,T]^k$ into the generalized multiple Fourier series converging in the mean-square sense in the space $L_2([t,T]^k)$. After a number of nontrivial transformations we come (see Theorems 1, 2 below) to the mean-square convergening expansion of the iterated Ito stochastic integral into the multiple series of products of standard Gaussian random variables. The coefficients of this series are the coefficients of generalized multiple Fourier series for the mentioned nonrandom function of k variables, which can be calculated using the explicit formula regardless of the multiplicity k of the iterated Ito stochastic integral (2).

Suppose that every $\psi_l(\tau)$ $(l = 1, \ldots, k)$ is a continuous nonrandom function on $[t,T]$ (the case $\psi_1(\tau), \ldots, \psi_k(\tau) \in L_2([t,T])$ will be considered in Theorem 2).

Define the following function on the hypercube $[t,T]^k$

$$K(t_1, \ldots, t_k) = \begin{cases} \psi_1(t_1) \ldots \psi_k(t_k) & \text{for} \ \ t_1 < \ldots < t_k \\ \\ 0 & \text{otherwise} \end{cases}, \quad t_1, \ldots, t_k \in [t,T], \quad k \ge 2, \tag{4}$$

and $K(t_1) \equiv \psi_1(t_1)$ for $t_1 \in [t,T]$.

Suppose that $\{\phi_j(x)\}_{j=0}^{\infty}$ is a complete orthonormal system of functions in the space $L_2([t,T])$.

The function $K(t_1, \ldots, t_k)$ is piecewise continuous in the hypercube $[t,T]^k$. At this situation it is well known that the generalized multiple Fourier series of $K(t_1, \ldots, t_k) \in L_2([t,T]^k)$ is converging to $K(t_1, \ldots, t_k)$ in the hypercube $[t,T]^k$ in the mean-square sense, i.e.

$$\lim_{p_1,\ldots,p_k\to\infty}\left\|K(t_1,\ldots,t_k)-\sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k}C_{j_k\ldots j_1}\prod_{l=1}^{k}\phi_{j_l}(t_l)\right\|_{L_2([t,T]^k)}=0,$$

where

$$C_{j_k\ldots j_1}=\int\limits_{[t,T]^k}K(t_1,\ldots,t_k)\prod_{l=1}^{k}\phi_{j_l}(t_l)dt_1\ldots dt_k \tag{5}$$

is the Fourier coefficient,

$$\|f\|_{L_2([t,T]^k)}=\left(\int\limits_{[t,T]^k}f^2(t_1,\ldots,t_k)dt_1\ldots dt_k\right)^{1/2}.$$

Consider the partition $\{\tau_j\}_{j=0}^{N}$ of the interval $[t,T]$ such that

$$t=\tau_0<\ldots<\tau_N=T,\quad \Delta_N=\max_{0\le j\le N-1}\Delta\tau_j\to 0\ \text{ if }\ N\to\infty,\quad \Delta\tau_j=\tau_{j+1}-\tau_j. \tag{6}$$

Theorem 1 [8] (2006), [9]-[35], [37]-[48]. *Suppose that every $\psi_l(\tau)$ $(l=1,\ldots,k)$ is a continuous nonrandom function on $[t,T]$ and $\{\phi_j(x)\}_{j=0}^{\infty}$ is a complete orthonormal system of continuous functions in the space $L_2([t,T])$. Then*

$$J[\psi^{(k)}]_{T,t}\ =\ \underset{p_1,\ldots,p_k\to\infty}{\text{l.i.m.}}\ \sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k}C_{j_k\ldots j_1}\Biggl(\prod_{l=1}^{k}\zeta_{j_l}^{(i_l)}\ -$$

$$-\ \underset{N\to\infty}{\text{l.i.m.}}\sum_{(l_1,\ldots,l_k)\in\mathrm{G}_k}\phi_{j_1}(\tau_{l_1})\Delta\mathbf{w}_{\tau_{l_1}}^{(i_1)}\ldots\phi_{j_k}(\tau_{l_k})\Delta\mathbf{w}_{\tau_{l_k}}^{(i_k)}\Biggr), \tag{7}$$

where $J[\psi^{(k)}]_{T,t}$ is defined by (2),

$$\mathrm{G}_k=\mathrm{H}_k\backslash\mathrm{L}_k,\quad \mathrm{H}_k=\{(l_1,\ldots,l_k):\ l_1,\ldots,l_k=0,\ 1,\ldots,N-1\},$$

$$\mathrm{L}_k=\{(l_1,\ldots,l_k):\ l_1,\ldots,l_k=0,\ 1,\ldots,N-1;\ l_g\ne l_r\ (g\ne r);\ g,r=1,\ldots,k\},$$

l.i.m. *is a limit in the mean-square sense, $i_1,\ldots,i_k=0,1,\ldots,m$,*

$$\zeta_j^{(i)}=\int\limits_t^T\phi_j(s)d\mathbf{w}_s^{(i)} \tag{8}$$

are independent standard Gaussian random variables for various i or j (if $i\ne 0$), $C_{j_k\ldots j_1}$ is the Fourier coefficient (5), $\Delta\mathbf{w}_{\tau_j}^{(i)}=\mathbf{w}_{\tau_{j+1}}^{(i)}-\mathbf{w}_{\tau_j}^{(i)}$ $(i=0,1,\ldots,m)$, $\{\tau_j\}_{j=0}^{N}$ is a partition of the interval $[t,T]$, which satisfies the condition (6).

It was shown that Theorem 1 is valid for convergence in the mean of degree $2n$ ($n \in \mathbb{N}$) [11]-[25] and for convergence with probablity 1 (w. p. 1) [22]-[25], [27], [42]. Moreover, the complete orthonormal systems of Haar and Rademacher–Walsh functions in $L_2([t,T])$ can also be applied in Theorem 1 [8]-[25]. The generalization of Theorem 1 for complete orthonormal with weigth $r(t_1)\ldots r(t_k) \ge 0$ systems of functions in the space $L_2([t,T]^k)$ can be found in [21]-[25], [31], [37]. Another modification of Theorem 1 and Theorem 2 (see below) is connected with the approximation of iterated stochastic integrals with respect to the infinite-dimensional Q-Wiener process [22]-[24] (Chapter 7), [34], [38]-[40].

In order to evaluate the significance of Theorem 1 for practice we will demonstrate its transformed particular cases for $k = 1,\ldots,6$ [8]-[35]

$$
J[\psi^{(1)}]_{T,t} = \underset{p_1\to\infty}{\text{l.i.m.}} \sum_{j_1=0}^{p_1} C_{j_1}\zeta_{j_1}^{(i_1)}, \tag{9}

-\mathbf{1}_{\{i_6=i_4\ne 0\}}\mathbf{1}_{\{j_6=j_4\}}\mathbf{1}_{\{i_1=i_2\ne 0\}}\mathbf{1}_{\{j_1=j_2\}}\mathbf{1}_{\{i_3=i_5\ne 0\}}\mathbf{1}_{\{j_3=j_5\}}-\\
-\mathbf{1}_{\{i_6=i_5\ne 0\}}\mathbf{1}_{\{j_6=j_5\}}\mathbf{1}_{\{i_1=i_4\ne 0\}}\mathbf{1}_{\{j_1=j_4\}}\mathbf{1}_{\{i_2=i_3\ne 0\}}\mathbf{1}_{\{j_2=j_3\}}-\\
-\mathbf{1}_{\{i_6=i_5\ne 0\}}\mathbf{1}_{\{j_6=j_5\}}\mathbf{1}_{\{i_1=i_2\ne 0\}}\mathbf{1}_{\{j_1=j_2\}}\mathbf{1}_{\{i_3=i_4\ne 0\}}\mathbf{1}_{\{j_3=j_4\}}-
\end{gathered}
$$

$$
-\mathbf{1}_{\{i_6=i_5\ne 0\}}\mathbf{1}_{\{j_6=j_5\}}\mathbf{1}_{\{i_1=i_3\ne 0\}}\mathbf{1}_{\{j_1=j_3\}}\mathbf{1}_{\{i_2=i_4\ne 0\}}\mathbf{1}_{\{j_2=j_4\}}\Bigg), \tag{14}
$$

where $\mathbf{1}_A$ is the indicator of the set A.

Thus, we obtain the following useful possibilities of the method of generalized multiple Fourier series.

1. There is an explicit formula (see (5)) for calculation of expansion coefficients of the iterated Ito stochastic integral with any fixed multiplicity k.

2. We have new possibilities for exact calculation of the mean-square approximation error for iterated Ito stochastic integrals (see Theorem 3 below).

3. Since the used multiple Fourier series is a generalized in the sense that it is built using various complete orthonormal systems of functions in the space $L_2([t,T])$, we have new possibilities for approximation — we can use not only the trigonometric functions as in [2]-[4] but the Legendre polynomials.

4. As it turned out (see below), it is more convenient to work with Legendre polynomials for constructing approximations of iterated stochastic integrals. We can choose different numbers q (see Sect. 4) for approximations of different iterated Ito stochastic integrals. This is impossible for approximations based on the approach from [2]-[4]. Approximations based on Legendre polynomials are much simpler than approximations based on trigonometric functions (see (52), (53), (114), (118) below).

5. The approach from [2]-[4], [49]-[51] leads to iterated series (iterated application of the operation of limit transition) in contrast with multiple series from Theorem 1 (operation of limit transition is implemented only once) starting at least from the second or third multiplicity of iterated stochastic integrals. Multiple series are more convenient for approximation than the iterated ones, since partial sums of multiple series converge for any possible case of convergence to infinity of their upper limits of summation (let us denote them as $p_1,\ldots,p_k$). For example, when $p_1=\ldots=p_k=p\to\infty$. For iterated series, the condition $p_1=\ldots=p_k=p\to\infty$ obviously does not guarantee the convergence of this series. However, in [2] (Sect. 5.8, pp. 202–204), [49] (pp. 82-84), [50] (pp. 438-439), [51] (pp. 263-264) the authors use (without rigorous proof) the condition $p_1=p_2=p_3=p\to\infty$ within the frames of the mentioned approach [2]-[4], [49]-[51] based on the Karhunen–Loeve expansion of the Brownian bridge process [3] together with the Wong–Zakai approximation [54]-[56] (see discussion in Sect. 8 for detail).

6. In a number of works of the author [12]-[24], [26], [30] Theorem 1 has been adapted for the iterated Stratonovich stochastic integrals (3) of multiplicities 1 to 6.

For further consideration, let us consider the generalization of formulas (9)–(14) for the case of an arbitrary multiplicity k ($k\in\mathbb{N}$) of the iterated Ito stochastic integral $J[\psi^{(k)}]_{T,t}$ defined by (2). In order to do this, let us introduce some notations. Consider the unordered set $\{1,2,\ldots,k\}$ and separate it into two parts: the first part consists of r unordered pairs (sequence order of these pairs is also unimportant) and the second one consists of the remaining $k-2r$ numbers. So, we have

$$(\{\underbrace{\{g_1,g_2\},\ldots,\{g_{2r-1},g_{2r}\}}_{\text{part 1}}\},\{\underbrace{q_1,\ldots,q_{k-2r}}_{\text{part 2}}\}), \tag{15}$$

where

$$\{g_1,g_2,\ldots,g_{2r-1},g_{2r},q_1,\ldots,q_{k-2r}\}=\{1,2,\ldots,k\},$$

braces mean an unordered set, and parentheses mean an ordered set.

We will say that (15) is a partition and consider the sum with respect to all possible partitions

$$\sum_{\substack{(\{\{g_1,g_2\},\ldots,\{g_{2r-1},g_{2r}\}\},\{q_1,\ldots,q_{k-2r}\})\\ \{g_1,g_2,\ldots,g_{2r-1},g_{2r},q_1,\ldots,q_{k-2r}\}=\{1,2,\ldots,k\}}} a_{g_1g_2,\ldots,g_{2r-1}g_{2r},q_1\ldots q_{k-2r}}. \tag{16}$$

Below there are several examples of sums in the form (16)

$$\sum_{\substack{(\{g_1,g_2\})\\ \{g_1,g_2\}=\{1,2\}}} a_{g_1g_2}=a_{12},$$

$$\sum_{\substack{(\{\{g_1,g_2\},\{g_3,g_4\}\})\\ \{g_1,g_2,g_3,g_4\}=\{1,2,3,4\}}} a_{g_1g_2g_3g_4}=a_{1234}+a_{1324}+a_{2314},$$

$$\sum_{\substack{(\{g_1,g_2\},\{q_1,q_2\})\\ \{g_1,g_2,q_1,q_2\}=\{1,2,3,4\}}} a_{g_1g_2,q_1q_2} =$$

$$= a_{12,34} + a_{13,24} + a_{14,23} + a_{23,14} + a_{24,13} + a_{34,12},$$

$$\sum_{\substack{(\{g_1,g_2\},\{q_1,q_2,q_3\})\\ \{g_1,g_2,q_1,q_2,q_3\}=\{1,2,3,4,5\}}} a_{g_1g_2,q_1q_2q_3} =$$

$$= a_{12,345} + a_{13,245} + a_{14,235} + a_{15,234} + a_{23,145} + a_{24,135} +$$
$$+ a_{25,134} + a_{34,125} + a_{35,124} + a_{45,123},$$

$$\sum_{\substack{(\{\{g_1,g_2\},\{g_3,g_4\}\},\{q_1\})\\ \{g_1,g_2,g_3,g_4,q_1\}=\{1,2,3,4,5\}}} a_{g_1g_2,g_3g_4,q_1} =$$

$$= a_{12,34,5} + a_{13,24,5} + a_{14,23,5} + a_{12,35,4} + a_{13,25,4} + a_{15,23,4} +$$
$$+ a_{12,54,3} + a_{15,24,3} + a_{14,25,3} + a_{15,34,2} + a_{13,54,2} + a_{14,53,2} +$$
$$+ a_{52,34,1} + a_{53,24,1} + a_{54,23,1}.$$

Now we can write (7) as

$$J[\psi^{(k)}]_{T,t} = \underset{p_1,\ldots,p_k\to\infty}{\text{l.i.m.}} \sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k} C_{j_k\ldots j_1}\Biggl(\prod_{l=1}^{k}\zeta_{j_l}^{(i_l)} + \sum_{r=1}^{[k/2]}(-1)^r\times$$

$$\times \sum_{\substack{(\{\{g_1,g_2\},\ldots,\{g_{2r-1},g_{2r}\}\},\{q_1,\ldots,q_{k-2r}\})\\ \{g_1,g_2,\ldots,g_{2r-1},g_{2r},q_1,\ldots,q_{k-2r}\}=\{1,2,\ldots,k\}}} \prod_{s=1}^{r}\mathbf{1}_{\{i_{g_{2s-1}}=\,i_{g_{2s}}\ne 0\}}\mathbf{1}_{\{j_{g_{2s-1}}=\,j_{g_{2s}}\}}\prod_{l=1}^{k-2r}\zeta_{j_{q_l}}^{(i_{q_l})}\Biggr), \tag{17}$$

where $[x]$ is an integer part of a real number x; another notations are the same as in Theorem **1**.

In particular, from (17) for $k=5$ we obtain

$$J[\psi^{(5)}]_{T,t} = \underset{p_1,\ldots,p_5\to\infty}{\text{l.i.m.}} \sum_{j_1=0}^{p_1}\ldots\sum_{j_5=0}^{p_5} C_{j_5\ldots j_1}\Biggl(\prod_{l=1}^{5}\zeta_{j_l}^{(i_l)} -$$

$$- \sum_{\substack{(\{g_1,g_2\},\{q_1,q_2,q_3\})\\ \{g_1,g_2,q_1,q_2,q_3\}=\{1,2,3,4,5\}}} \mathbf{1}_{\{i_{g_1}=\,i_{g_2}\ne 0\}}\mathbf{1}_{\{j_{g_1}=\,j_{g_2}\}}\prod_{l=1}^{3}\zeta_{j_{q_l}}^{(i_{q_l})} +$$

$$+ \sum_{\substack{(\{\{g_1,g_2\},\{g_3,g_4\}\},\{q_1\})\\ \{g_1,g_2,g_3,g_4,q_1\}=\{1,2,3,4,5\}}} \mathbf{1}_{\{i_{g_1}=\,i_{g_2}\ne 0\}}\mathbf{1}_{\{j_{g_1}=\,j_{g_2}\}}\mathbf{1}_{\{i_{g_3}=\,i_{g_4}\ne 0\}}\mathbf{1}_{\{j_{g_3}=\,j_{g_4}\}}\zeta_{j_{q_1}}^{(i_{q_1})}\Biggr).$$

The last equality obviously agrees with (13).

Let us consider the generalization of Theorem 1 for the case of an arbitrary complete orthonormal systems of functions in the space $L_2([t,T])$ and $\psi_1(\tau),\ldots,\psi_k(\tau)\in L_2([t,T])$.

Theorem 2 [22] (Sect. 1.11), [25] (Sect. 15). *Suppose that* $\psi_1(\tau),\ldots,\psi_k(\tau)\in L_2([t,T])$ *and* $\{\phi_j(x)\}_{j=0}^{\infty}$ *is an arbitrary complete orthonormal system of functions in the space* $L_2([t,T])$. *Then the following expansion*

$$J[\psi^{(k)}]_{T,t}=\underset{p_1,\ldots,p_k\to\infty}{\text{l.i.m.}}\sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k}C_{j_k\ldots j_1}\Biggl(\prod_{l=1}^{k}\zeta_{j_l}^{(i_l)}+\sum_{r=1}^{[k/2]}(-1)^r\times$$

$$\times\sum_{\substack{(\{\{g_1,g_2\},\ldots,\{g_{2r-1},g_{2r}\}\},\{q_1,\ldots,q_{k-2r}\})\\ \{g_1,g_2,\ldots,g_{2r-1},g_{2r},q_1,\ldots,q_{k-2r}\}=\{1,2,\ldots,k\}}}\prod_{s=1}^{r}\mathbf{1}_{\{i_{g_{2s-1}}=\,i_{g_{2s}}\neq 0\}}\mathbf{1}_{\{j_{g_{2s-1}}=\,j_{g_{2s}}\}}\prod_{l=1}^{k-2r}\zeta_{j_{q_l}}^{(i_{q_l})}\Biggr) \tag{18}$$

converging in the mean-square sense is valid, where $[x]$ *is an integer part of a real number* x; *another notations are the same as in Theorem* 1.

It should be noted that an analogue of Theorem 2 was considered in [52]. Note that we use another notations [22] (Sect. 1.11), [25] (Sect. 15) in comparison with [52]. Moreover, the proof of an analogue of Theorem 2 from [52] is somewhat different from the proof given in [22] (Sect. 1.11), [25] (Sect. 15).

As noted above, in a number of works of the author [12]-[24], [26], [30] Theorem 1 has been adapted for the iterated Stratonovich stochastic integrals (3) of multiplicities 1 to 6. Let us first present some old results as the following theorem.

Theorem 3 [12]-[24], [26], [30]. *Suppose that* $\{\phi_j(x)\}_{j=0}^{\infty}$ *is a complete orthonormal system of Legendre polynomials or trigonometric functions in the space* $L_2([t,T])$. *At the same time* $\psi_2(\tau)$ *is a continuously differentiable function on* $[t,T]$ *and* $\psi_1(\tau),\psi_3(\tau)$ *are twice continuously differentiable functions on* $[t,T]$. *Then*

$$J^*[\psi^{(2)}]_{T,t}=\underset{p_1,p_2\to\infty}{\text{l.i.m.}}\sum_{j_1=0}^{p_1}\sum_{j_2=0}^{p_2}C_{j_2j_1}\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}\quad(i_1,i_2=1,\ldots,m), \tag{19}$$

$$J^*[\psi^{(3)}]_{T,t}=\underset{p_1,p_2,p_3\to\infty}{\text{l.i.m.}}\sum_{j_1=0}^{p_1}\sum_{j_2=0}^{p_2}\sum_{j_3=0}^{p_3}C_{j_3j_2j_1}\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}\zeta_{j_3}^{(i_3)}\quad(i_1,i_2,i_3=0,1,\ldots,m), \tag{20}$$

$$J^*[\psi^{(3)}]_{T,t}=\underset{p\to\infty}{\text{l.i.m.}}\sum_{j_1,j_2,j_3=0}^{p}C_{j_3j_2j_1}\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}\zeta_{j_3}^{(i_3)}\quad(i_1,i_2,i_3=1,\ldots,m), \tag{21}$$

$$J^*[\psi^{(4)}]_{T,t}=\underset{p\to\infty}{\text{l.i.m.}}\sum_{j_1,j_2,j_3,j_4=0}^{p}C_{j_4j_3j_2j_1}\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}\zeta_{j_3}^{(i_3)}\zeta_{j_4}^{(i_4)}\quad(i_1,i_2,i_3,i_4=0,1,\ldots,m), \tag{22}$$

where $J^*[\psi^{(k)}]_{T,t}$ *is defined by* (3) *and* $\psi_l(\tau)\equiv 1$ $(l=1,\ldots,4)$ *in* (20), (22); *another notations are the same as in Theorems* 1, 2.

Recently, a new approach to the expansion and mean-square approximation of iterated Stratonovich stochastic integrals has been obtained [22] (Sect. 2.10–2.16), [26] (Sect. 13–19), [30] (Sect. 5–11), [41] (Sect. 7–13). Let us formulate four theorems that were obtained using this approach.

Theorem 4 [22], [26], [30], [41]. *Suppose that* $\{\phi_j(x)\}_{j=0}^{\infty}$ *is a complete orthonormal system of Legendre polynomials or trigonometric functions in the space* $L_2([t,T])$*. Furthermore, let* $\psi_1(\tau), \psi_2(\tau)$*,* $\psi_3(\tau)$ *are continuously differentiable nonrandom functions on* $[t,T]$*. Then, for the iterated Stratonovich stochastic integral of third multiplicity*

$$J^*[\psi^{(3)}]_{T,t} = \int\limits_t^{*T} \psi_3(t_3) \int\limits_t^{*t_3} \psi_2(t_2) \int\limits_t^{*t_2} \psi_1(t_1) d\mathbf{w}_{t_1}^{(i_1)} d\mathbf{w}_{t_2}^{(i_2)} d\mathbf{w}_{t_3}^{(i_3)} \quad (i_1, i_2, i_3 = 0, 1, \ldots, m)$$

the following relations

$$J^*[\psi^{(3)}]_{T,t} = \underset{p\to\infty}{\text{l.i.m.}} \sum_{j_1,j_2,j_3=0}^{p} C_{j_3j_2j_1} \zeta_{j_1}^{(i_1)} \zeta_{j_2}^{(i_2)} \zeta_{j_3}^{(i_3)}, \tag{23}$$

$$\mathsf{M}\left\{\left(J^*[\psi^{(3)}]_{T,t} - \sum_{j_1,j_2,j_3=0}^{p} C_{j_3j_2j_1} \zeta_{j_1}^{(i_1)} \zeta_{j_2}^{(i_2)} \zeta_{j_3}^{(i_3)}\right)^2\right\} \le \frac{C}{p} \tag{24}$$

are fulfilled, where $i_1, i_2, i_3 = 0, 1, \ldots, m$ *in* (23) *and* $i_1, i_2, i_3 = 1, \ldots, m$ *in* (24)*, constant* C *is independent of* p*,*

$$C_{j_3j_2j_1} = \int\limits_t^T \psi_3(t_3)\phi_{j_3}(t_3) \int\limits_t^{t_3} \psi_2(t_2)\phi_{j_2}(t_2) \int\limits_t^{t_2} \psi_1(t_1)\phi_{j_1}(t_1) dt_1 dt_2 dt_3$$

and

$$\zeta_j^{(i)} = \int\limits_t^T \phi_j(\tau) d\mathbf{f}_\tau^{(i)}$$

are independent standard Gaussian random variables for various i *or* j *(in the case when* $i \ne 0$*); another notations are the same as in Theorems* 1, 2.

Theorem 5 [22], [26], [30], [41]. *Let* $\{\phi_j(x)\}_{j=0}^{\infty}$ *be a complete orthonormal system of Legendre polynomials or trigonometric functions in the space* $L_2([t,T])$*. Furthermore, let* $\psi_1(\tau), \ldots, \psi_4(\tau)$ *be continuously differentiable nonrandom functions on* $[t,T]$*. Then, for the iterated Stratonovich stochastic integral of fourth multiplicity*

$$J^*[\psi^{(4)}]_{T,t} = \int\limits_t^{*T} \psi_4(t_4) \int\limits_t^{*t_4} \psi_3(t_3) \int\limits_t^{*t_3} \psi_2(t_2) \int\limits_t^{*t_2} \psi_1(t_1) d\mathbf{w}_{t_1}^{(i_1)} d\mathbf{w}_{t_2}^{(i_2)} d\mathbf{w}_{t_3}^{(i_3)} d\mathbf{w}_{t_4}^{(i_4)} \tag{25}$$

the following relations

$$J^*[\psi^{(4)}]_{T,t} = \underset{p\to\infty}{\text{l.i.m.}} \sum_{j_1,j_2,j_3,j_4=0}^{p} C_{j_4j_3j_2j_1} \zeta_{j_1}^{(i_1)} \zeta_{j_2}^{(i_2)} \zeta_{j_3}^{(i_3)} \zeta_{j_4}^{(i_4)}, \tag{26}$$

$$\mathsf{M}\left\{\left(J^*[\psi^{(4)}]_{T,t}-\sum_{j_1,j_2,j_3,j_4=0}^{p}C_{j_4j_3j_2j_1}\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}\zeta_{j_3}^{(i_3)}\zeta_{j_4}^{(i_4)}\right)^2\right\}\le\frac{C}{p^{1-\varepsilon}} \tag{27}$$

are fulfilled, where $i_1,\ldots,i_4=0,1,\ldots,m$ *in* (25), (26) *and* $i_1,\ldots,i_4=1,\ldots,m$ *in* (27), *constant* C *does not depend on* p, ε *is an arbitrary small positive real number for the case of complete orthonormal system of Legendre polynomials in the space* $L_2([t,T])$ *and* $\varepsilon=0$ *for the case of complete orthonormal system of trigonometric functions in the space* $L_2([t,T])$,

$$C_{j_4j_3j_2j_1}=$$

$$=\int\limits_t^T\psi_4(t_4)\phi_{j_4}(t_4)\int\limits_t^{t_4}\psi_3(t_3)\phi_{j_3}(t_3)\int\limits_t^{t_3}\psi_2(t_2)\phi_{j_2}(t_2)\int\limits_t^{t_2}\psi_1(t_1)\phi_{j_1}(t_1)dt_1dt_2dt_3dt_4;$$

another notations are the same as in Theorem 4.

Theorem 6 [22], [26], [30], [41]. *Assume that* $\{\phi_j(x)\}_{j=0}^{\infty}$ *is a complete orthonormal system of Legendre polynomials or trigonometric functions in the space* $L_2([t,T])$ *and* $\psi_1(\tau),\ldots,\psi_5(\tau)$ *are continuously differentiable nonrandom functions on* $[t,T]$. *Then, for the iterated Stratonovich stochastic integral of fifth multiplicity*

$$J^*[\psi^{(5)}]_{T,t}=\int\limits_t^{*T}\psi_5(t_5)\ldots\int\limits_t^{*t_2}\psi_1(t_1)d\mathbf{w}_{t_1}^{(i_1)}\ldots d\mathbf{w}_{t_5}^{(i_5)} \tag{28}$$

the following relations

$$J^*[\psi^{(5)}]_{T,t}=\underset{p\to\infty}{\text{l.i.m.}}\sum_{j_1,\ldots,j_5=0}^{p}C_{j_5\ldots j_1}\zeta_{j_1}^{(i_1)}\ldots\zeta_{j_5}^{(i_5)}, \tag{29}$$

$$\mathsf{M}\left\{\left(J^*[\psi^{(5)}]_{T,t}-\sum_{j_1,\ldots,j_5=0}^{p}C_{j_5\ldots j_1}\zeta_{j_1}^{(i_1)}\ldots\zeta_{j_5}^{(i_5)}\right)^2\right\}\le\frac{C}{p^{1-\varepsilon}} \tag{30}$$

are fulfilled, where $i_1,\ldots,i_5=0,1,\ldots,m$ *in* (28), (29) *and* $i_1,\ldots,i_5=1,\ldots,m$ *in* (30), *constant* C *is independent of* p, ε *is an arbitrary small positive real number for the case of complete orthonormal system of Legendre polynomials in the space* $L_2([t,T])$ *and* $\varepsilon=0$ *for the case of complete orthonormal system of trigonometric functions in the space* $L_2([t,T])$,

$$C_{j_5\ldots j_1}=\int\limits_t^T\psi_5(t_5)\phi_{j_5}(t_5)\ldots\int\limits_t^{t_2}\psi_1(t_1)\phi_{j_1}(t_1)dt_1\ldots dt_5;$$

another notations are the same as in Theorems 4, 5.

Theorem 7 [22], [26], [30], [41]. *Suppose that* $\{\phi_j(x)\}_{j=0}^{\infty}$ *is a complete orthonormal system of Legendre polynomials or trigonometric functions in the space* $L_2([t,T])$. *Then, for the iterated Stratonovich stochastic integral of sixth multiplicity*

$$J_{T,t}^{*(i_1\ldots i_6)} = \int\limits_t^{*T} \ldots \int\limits_t^{*t_2} d\mathbf{w}_{t_1}^{(i_1)} \ldots d\mathbf{w}_{t_6}^{(i_6)} \tag{31}$$

the following expansion

$$J_{T,t}^{*(i_1\ldots i_6)} = \underset{p\to\infty}{\text{l.i.m.}} \sum_{j_1,\ldots,j_6=0}^{p} C_{j_6\ldots j_1}\zeta_{j_1}^{(i_1)}\ldots\zeta_{j_6}^{(i_6)}$$

that converges in the mean-square sense is valid, where $i_1,\ldots,i_6 = 0,1,\ldots,m$,

$$C_{j_6\ldots j_1} = \int\limits_t^{T} \phi_{j_6}(t_6)\ldots\int\limits_t^{t_2}\phi_{j_1}(t_1)dt_1\ldots dt_6;$$

another notations are the same as in Theorems 4–6.

As we mentioned above, Theorems 1 and 2 allow us to accurately calculate the mean-square approximation error for iterated Ito stochastic integrals (see Theorem 8 below).

Assume that $J[\psi^{(k)}]_{T,t}^{p_1\ldots p_k}$ is the approximation of (2), which is the expression on the right-hand side of (18) before passing to the limit

$$J[\psi^{(k)}]_{T,t}^{p_1\ldots p_k} = \sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k} C_{j_k\ldots j_1}\Biggl(\prod_{l=1}^{k}\zeta_{j_l}^{(i_l)} + \sum_{r=1}^{[k/2]}(-1)^r\times$$

$$\times \sum_{\substack{(\{\{g_1,g_2\},\ldots,\{g_{2r-1},g_{2r}\}\},\{q_1,\ldots,q_{k-2r}\})\\ \{g_1,g_2,\ldots,g_{2r-1},g_{2r},q_1,\ldots,q_{k-2r}\}=\{1,2,\ldots,k\}}} \prod_{s=1}^{r}\mathbf{1}_{\{i_{g_{2s-1}}=\,i_{g_{2s}}\neq 0\}}\mathbf{1}_{\{j_{g_{2s-1}}=\,j_{g_{2s}}\}}\prod_{l=1}^{k-2r}\zeta_{j_{q_l}}^{(i_{q_l})}\Biggr),$$

where $[x]$ is an integer part of a real number x; another notations are the same as in Theorems 1, 2.

Let us denote

$$E_k^{p_1,\ldots,p_k} \stackrel{\text{def}}{=} \mathsf{M}\left\{\left(J[\psi^{(k)}]_{T,t} - J[\psi^{(k)}]_{T,t}^{p_1,\ldots,p_k}\right)^2\right\},$$

$$E_k^{p} \stackrel{\text{def}}{=} E_k^{p_1,\ldots,p_k} \ \ \text{if} \ \ p_1=\ldots=p_k=p,$$

$$I_k \stackrel{\text{def}}{=} \|K\|_{L_2([t,T]^k)}^2 = \int\limits_{[t,T]^k} K^2(t_1,\ldots,t_k)dt_1\ldots dt_k.$$

In [17]-[25], [31] it was shown that

$$E_k^{p_1,\ldots,p_k} \le k!\left(I_k - \sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k} C_{j_k\ldots j_1}^2\right) \tag{32}$$

if $i_1,\ldots,i_k = 1,\ldots,m$ and $0 < T-t < \infty$ or $i_1,\ldots,i_k = 0,1,\ldots,m$ and $0 < T-t < 1$.

Moreover, in [10]-[25] the following estimate is obtained

$$\mathsf{M}\left\{\left(J[\psi^{(k)}]_{T,t} - J[\psi^{(k)}]_{T,t}^{p_1,\ldots,p_k}\right)^{2n}\right\} \le$$

$$\le (k!)^{2n}(n(2n-1))^{n(k-1)}(2n-1)!!\left(I_k - \sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k} C_{j_k\ldots j_1}^2\right)^n, \tag{33}$$

where $n \in \mathbb{N}$.

The value E_k^p can be calculated exactly.

Theorem 8 [22] (Sect. 1.12), [31] (Sect. 6). *Suppose that* $\{\phi_j(x)\}_{j=0}^{\infty}$ *is an arbitrary complete orthonormal system of functions in the space* $L_2([t,T])$ *and* $\psi_1(\tau),\ldots,\psi_k(\tau) \in L_2([t,T])$, $i_1,\ldots,i_k = 1,\ldots,m$. *Then*

$$E_k^p = I_k -$$

$$-\sum_{j_1,\ldots,j_k=0}^{p} C_{j_k\ldots j_1}\mathsf{M}\left\{J[\psi^{(k)}]_{T,t}\sum_{(j_1,\ldots,j_k)}\int\limits_t^T \phi_{j_k}(t_k)\ldots\int\limits_t^{t_2}\phi_{j_1}(t_1)d\mathbf{f}_{t_1}^{(i_1)}\ldots d\mathbf{f}_{t_k}^{(i_k)}\right\}, \tag{34}$$

where $i_1,\ldots,i_k = 1,\ldots,m$; *expression*

$$\sum_{(j_1,\ldots,j_k)}$$

means the sum with respect to all possible permutations $(j_1,\ldots,j_k)$. *At the same time if* j_r *swapped with* j_q *in the permutation* $(j_1,\ldots,j_k)$, *then* i_r *swapped with* i_q *in the permutation* $(i_1,\ldots,i_k)$; *another notations are the same as in Theorems* 1, 2.

Note that

$$\mathsf{M}\left\{J[\psi^{(k)}]_{T,t}\int\limits_t^T \phi_{j_k}(t_k)\ldots\int\limits_t^{t_2}\phi_{j_1}(t_1)d\mathbf{f}_{t_1}^{(i_1)}\ldots d\mathbf{f}_{t_k}^{(i_k)}\right\} = C_{j_k\ldots j_1}.$$

Then from Theorem 8 for pairwise different $i_1,\ldots,i_k$ and for $i_1 = \ldots = i_k$ we obtain

$$E_k^p = I_k - \sum_{j_1,\ldots,j_k=0}^{p} C_{j_k\ldots j_1}^2,$$

$$E_k^p = I_k - \sum_{j_1,\ldots,j_k=0}^{p} C_{j_k\ldots j_1}\left(\sum_{(j_1,\ldots,j_k)} C_{j_k\ldots j_1}\right).$$

Consider some examples of the application of Theorem 8 ($i_1,\ldots,i_5 = 1,\ldots,m$)

$$E_2^p = I_2 - \sum_{j_1,j_2=0}^{p} C_{j_2j_1}^2 - \sum_{j_1,j_2=0}^{p} C_{j_2j_1}C_{j_1j_2} \quad (i_1 = i_2),$$

$$E_3^p = I_3 - \sum_{j_3,j_2,j_1=0}^{p} C_{j_3j_2j_1}^2 - \sum_{j_3,j_2,j_1=0}^{p} C_{j_3j_1j_2}C_{j_3j_2j_1} \quad (i_1 = i_2 \ne i_3),$$

$$E_3^p = I_3 - \sum_{j_3,j_2,j_1=0}^{p} C_{j_3j_2j_1}^2 - \sum_{j_3,j_2,j_1=0}^{p} C_{j_2j_3j_1}C_{j_3j_2j_1} \quad (i_1 \ne i_2 = i_3),$$

$$E_3^p = I_3 - \sum_{j_3,j_2,j_1=0}^{p} C_{j_3j_2j_1}^2 - \sum_{j_3,j_2,j_1=0}^{p} C_{j_3j_2j_1}C_{j_1j_2j_3} \quad (i_1 = i_3 \ne i_2),$$

$$E_4^p = I_4 - \sum_{j_1,\ldots,j_4=0}^{p} C_{j_4\ldots j_1}\left(\sum_{(j_1,j_2)} C_{j_4\ldots j_1}\right) \quad (i_1 = i_2 \ne i_3, i_4;\ i_3 \ne i_4), \tag{35}$$

$$E_5^p = I_5 - \sum_{j_1,\ldots,j_5=0}^{p} C_{j_5\ldots j_1}\left(\sum_{(j_1,j_3,j_4,j_5)} C_{j_5\ldots j_1}\right) \quad (i_1 = i_3 = i_4 = i_5 \ne i_2).$$

3. Expansions and Approximations of Specific Iterated Ito and Stratonovich Stochastic Integrals of Multiplicities 1 to 6 Using Legendre Polynomials

In this section, we provide considerable practical material (based on Theorems 1–7) on expansions and approximations of iterated Ito and Stratonovich stochastic integrals of the following form

$$I_{(l_1\ldots l_k)T,t}^{(i_1\ldots i_k)}=\int\limits_t^T(t-t_k)^{l_k}\ldots\int\limits_t^{t_2}(t-t_1)^{l_1}d\mathbf{f}_{t_1}^{(i_1)}\ldots d\mathbf{f}_{t_k}^{(i_k)},\tag{48}$$

$$I_{(l_1\ldots l_k)T,t}^{*(i_1\ldots i_k)}=\int\limits_t^{*T}(t-t_k)^{l_k}\ldots\int\limits_t^{*t_2}(t-t_1)^{l_1}d\mathbf{f}_{t_1}^{(i_1)}\ldots d\mathbf{f}_{t_k}^{(i_k)},\tag{49}$$

where $i_1,\ldots,i_k=1,\ldots,m,\ \ l_1,\ldots,l_k=0,1,\ldots$

The complete orthonormal system of Legendre polynomials in the space $L_2([t,T])$ looks as follows

$$\phi_j(x)=\sqrt{\frac{2j+1}{T-t}}P_j\left(\left(x-\frac{T+t}{2}\right)\frac{2}{T-t}\right),\quad j=0,1,2,\ldots,\tag{50}$$

where $P_j(x)$ is the Legendre polynomial. It is well known that the polynomials $P_j(x)$ can be represented, for example, in the form

$$P_j(x)=\frac{1}{2^j j!}\frac{d^j}{dx^j}\left(x^2-1\right)^j.$$

Consider some well known properties of the polynomials $P_j(x)$

$$P_j(1)=1,\quad P_{j+1}(-1)=-P_j(-1),\quad j=0,1,2,\ldots,$$

$$\frac{dP_{j+1}(x)}{dx}-\frac{dP_{j-1}(x)}{dx}=(2j+1)P_j(x),$$

$$xP_j(x)=\frac{(j+1)P_{j+1}(x)+jP_{j-1}(x)}{2j+1},\quad j=1,2,\ldots,$$

$$\int\limits_{-1}^{1}x^kP_j(x)dx=0,\quad k=0,1,2,\ldots,j-1,$$

$$\int\limits_{-1}^{1}P_k(x)P_j(x)dx=\begin{cases}0 & \text{if}\ \ k\ne j\\ 2/(2j+1) & \text{if}\ \ k=j\end{cases},$$

$$P_n(x)P_m(x)=\sum_{k=0}^{m}K_{m,n,k}P_{n+m-2k}(x),$$

where

$$K_{m,n,k}=\frac{a_{m-k}a_ka_{n-k}}{a_{m+n-k}}\cdot\frac{2n+2m-4k+1}{2n+2m-2k+1},\quad a_k=\frac{(2k-1)!!}{k!},\quad m\le n.$$

Using the above properties, system of functions (50) and Theorems 1–7, we obtain the following expansions of iterated Ito and Stratonovich stochastic integrals (48) and (49) based on multiple Fourier–Legendre series

$$I_{(0)T,t}^{(i_1)}=\sqrt{T-t}\zeta_0^{(i_1)}, \tag{51}$$

$$I_{(1)T,t}^{(i_1)}=-\frac{(T-t)^{3/2}}{2}\left(\zeta_0^{(i_1)}+\frac{1}{\sqrt{3}}\zeta_1^{(i_1)}\right), \tag{52}$$

$$I_{(2)T,t}^{(i_1)}=\frac{(T-t)^{5/2}}{3}\left(\zeta_0^{(i_1)}+\frac{\sqrt{3}}{2}\zeta_1^{(i_1)}+\frac{1}{2\sqrt{5}}\zeta_2^{(i_1)}\right), \tag{53}$$

$$I_{(00)T,t}^{*(i_1i_2)}=\frac{T-t}{2}\left(\zeta_0^{(i_1)}\zeta_0^{(i_2)}+\sum_{i=1}^{\infty}\frac{1}{\sqrt{4i^2-1}}\left(\zeta_{i-1}^{(i_1)}\zeta_i^{(i_2)}-\zeta_i^{(i_1)}\zeta_{i-1}^{(i_2)}\right)\right), \tag{54}$$

$$I_{(00)T,t}^{(i_1i_2)}=\frac{T-t}{2}\left(\zeta_0^{(i_1)}\zeta_0^{(i_2)}+\sum_{i=1}^{\infty}\frac{1}{\sqrt{4i^2-1}}\left(\zeta_{i-1}^{(i_1)}\zeta_i^{(i_2)}-\zeta_i^{(i_1)}\zeta_{i-1}^{(i_2)}\right)-\mathbf{1}_{\{i_1=i_2\}}\right),$$

$$I_{(01)T,t}^{*(i_1i_2)}=-\frac{T-t}{2}I_{(00)T,t}^{*(i_1i_2)}-\frac{(T-t)^2}{4}\left(\frac{1}{\sqrt{3}}\zeta_0^{(i_1)}\zeta_1^{(i_2)}+\right.$$

$$\left.+\sum_{i=0}^{\infty}\left(\frac{(i+2)\zeta_i^{(i_1)}\zeta_{i+2}^{(i_2)}-(i+1)\zeta_{i+2}^{(i_1)}\zeta_i^{(i_2)}}{\sqrt{(2i+1)(2i+5)}(2i+3)}-\frac{\zeta_i^{(i_1)}\zeta_i^{(i_2)}}{(2i-1)(2i+3)}\right)\right), \tag{55}$$

$$I_{(10)T,t}^{*(i_1i_2)}=-\frac{T-t}{2}I_{(00)T,t}^{*(i_1i_2)}-\frac{(T-t)^2}{4}\left(\frac{1}{\sqrt{3}}\zeta_0^{(i_2)}\zeta_1^{(i_1)}+\right.$$

$$\left.+\sum_{i=0}^{\infty}\left(\frac{(i+1)\zeta_{i+2}^{(i_2)}\zeta_i^{(i_1)}-(i+2)\zeta_i^{(i_2)}\zeta_{i+2}^{(i_1)}}{\sqrt{(2i+1)(2i+5)}(2i+3)}+\frac{\zeta_i^{(i_1)}\zeta_i^{(i_2)}}{(2i-1)(2i+3)}\right)\right), \tag{56}$$

or

$$I_{(01)T,t}^{*(i_1i_2)}=\underset{p\to\infty}{\text{l.i.m.}}\sum_{j_1,j_2=0}^{p}C_{j_2j_1}^{01}\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)},$$

$$I_{(10)T,t}^{*(i_1i_2)}=\underset{p\to\infty}{\text{l.i.m.}}\sum_{j_1,j_2=0}^{p}C_{j_2j_1}^{10}\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)},$$

where

$$C_{j_2j_1}^{01}=\frac{\sqrt{(2j_1+1)(2j_2+1)}}{8}(T-t)^2\bar{C}_{j_2j_1}^{01},$$

$$C_{j_2j_1}^{10}=\frac{\sqrt{(2j_1+1)(2j_2+1)}}{8}(T-t)^2\bar{C}_{j_2j_1}^{10},$$

$$\bar{C}_{j_2j_1}^{01}=-\int\limits_{-1}^{1}(1+y)P_{j_2}(y)\int\limits_{-1}^{y}P_{j_1}(x)dxdy,$$

$$\bar{C}_{j_2j_1}^{10}=-\int\limits_{-1}^{1}P_{j_2}(y)\int\limits_{-1}^{y}(1+x)P_{j_1}(x)dxdy;$$

$$I_{(10)T,t}^{(i_1i_2)}=I_{(10)T,t}^{*(i_1i_2)}+\frac{1}{4}\mathbf{1}_{\{i_1=i_2\}}(T-t)^2\quad \text{w. p. 1},$$

$$I_{(01)T,t}^{(i_1i_2)}=I_{(01)T,t}^{*(i_1i_2)}+\frac{1}{4}\mathbf{1}_{\{i_1=i_2\}}(T-t)^2\quad \text{w. p. 1},$$

$$I_{(01)T,t}^{(i_1i_2)}=-\frac{T-t}{2}I_{(00)T,t}^{(i_1i_2)}-\frac{(T-t)^2}{4}\Biggl(\frac{1}{\sqrt{3}}\zeta_0^{(i_1)}\zeta_1^{(i_2)}+$$

$$+\sum_{i=0}^{\infty}\Biggl(\frac{(i+2)\zeta_i^{(i_1)}\zeta_{i+2}^{(i_2)}-(i+1)\zeta_{i+2}^{(i_1)}\zeta_i^{(i_2)}}{\sqrt{(2i+1)(2i+5)}(2i+3)}-\frac{\zeta_i^{(i_1)}\zeta_i^{(i_2)}}{(2i-1)(2i+3)}\Biggr)\Biggr),$$

$$I_{(10)T,t}^{(i_1i_2)}=-\frac{T-t}{2}I_{(00)T,t}^{(i_1i_2)}-\frac{(T-t)^2}{4}\Biggl(\frac{1}{\sqrt{3}}\zeta_0^{(i_2)}\zeta_1^{(i_1)}+$$

It should be noted that instead of the expansion (57) we may to consider the following expansion, which is derived by direct calculation

$$I_{(000)T,t}^{*(i_1i_2i_3)}=-\frac{1}{T-t}\left(I_{(0)T,t}^{(i_3)}I_{(10)T,t}^{*(i_2i_1)}+I_{(0)T,t}^{(i_1)}I_{(10)T,t}^{*(i_2i_3)}\right)+\frac{1}{2}I_{(0)T,t}^{(i_3)}\left(I_{(00)T,t}^{*(i_1i_2)}-I_{(00)T,t}^{*(i_2i_1)}\right)-$$

(80) $$-(T-t)^{3/2}\left(\frac{1}{6}\zeta_0^{(i_1)}\zeta_0^{(i_3)}\left(\zeta_0^{(i_2)}+\sqrt{3}\zeta_1^{(i_2)}-\frac{1}{\sqrt{5}}\zeta_2^{(i_2)}\right)+\frac{1}{4}D_{T,t}^{(i_1i_2i_3)}\right),$$

where

$$D_{T,t}^{(i_1i_2i_3)}=\sum_{\substack{i=1,\ j=0,\ k=i\\ 2i\ge k+i-j\ge -2;\ k+i-j\ -\text{even}}}^{\infty}N_{ijk}K_{i+1,k+1,\frac{k+i-j}{2}+1}\zeta_i^{(i_1)}\zeta_j^{(i_2)}\zeta_k^{(i_3)}+$$

$$+\sum_{\substack{i=1,\ j=0,\ 1\le k\le i-1\\ 2k\ge k+i-j\ge -2;\ k+i-j\ -\text{even}}}^{\infty}N_{ijk}K_{k+1,i+1,\frac{k+i-j}{2}+1}\zeta_i^{(i_1)}\zeta_j^{(i_2)}\zeta_k^{(i_3)}-$$

$$-\sum_{\substack{i=1,\ j=0,\ k=i+2\\ 2i+2\ge k+i-j\ge 0;\ k+i-j\ -\text{even}}}^{\infty}N_{ijk}K_{i+1,k-1,\frac{k+i-j}{2}}\zeta_i^{(i_1)}\zeta_j^{(i_2)}\zeta_k^{(i_3)}-$$

$$-\sum_{\substack{i=1,\ j=0,\ 1\le k\le i+1\\ 2k-2\ge k+i-j\ge 0;\ k+i-j\ -\text{even}}}^{\infty}N_{ijk}K_{k-1,i+1,\frac{k+i-j}{2}}\zeta_i^{(i_1)}\zeta_j^{(i_2)}\zeta_k^{(i_3)}-$$

$$-\sum_{\substack{i=1,\ j=0,\ k=i-2,k\ge 1\\ 2i-2\ge k+i-j\ge 0;\ k+i-j\ -\text{even}}}^{\infty}N_{ijk}K_{i-1,k+1,\frac{k+i-j}{2}}\zeta_i^{(i_1)}\zeta_j^{(i_2)}\zeta_k^{(i_3)}-$$

$$-\sum_{\substack{i=1,\ j=0,\ 1\le k\le i-3\\ 2k+2\ge k+i-j\ge 0;\ k+i-j\ -\text{even}}}^{\infty}N_{ijk}K_{k+1,i-1,\frac{k+i-j}{2}}\zeta_i^{(i_1)}\zeta_j^{(i_2)}\zeta_k^{(i_3)}+$$

$$+\sum_{\substack{i=1,\ j=0,\ k=i\\ 2i\ge k+i-j\ge 2;\ k+i-j\ -\text{even}}}^{\infty}N_{ijk}K_{i-1,k-1,\frac{k+i-j}{2}-1}\zeta_i^{(i_1)}\zeta_j^{(i_2)}\zeta_k^{(i_3)}+$$

$$+\sum_{\substack{i=1,\ j=0\ 1\le k\le i-1\\ 2k\ge k+i-j\ge 2;\ k+i-j\ -\text{even}}}^{\infty}N_{ijk}K_{k-1,i-1,\frac{k+i-j}{2}-1}\zeta_i^{(i_1)}\zeta_j^{(i_2)}\zeta_k^{(i_3)},$$

where

$$N_{ijk}=\sqrt{\frac{1}{(2k+1)(2j+1)(2i+1)}}\ ,$$

$$K_{m,n,k}=\frac{a_{m-k}a_ka_{n-k}}{a_{m+n-k}}\cdot\frac{2n+2m-4k+1}{2n+2m-2k+1},\quad a_k=\frac{(2k-1)!!}{k!},\quad m\le n.$$

However, as we will see further, the expansion (58) is more convenient for practical implementation then (80).

Also note the following relation between iterated Ito and Stratonovich stochastic integrals

$$I_{(0000)T,t}^{(i_1 i_2 i_3 i_4)} = I_{(0000)T,t}^{*(i_1 i_2 i_3 i_4)} + \frac{1}{2}\mathbf{1}_{\{i_1=i_2\}} I_{(10)T,t}^{*(i_3 i_4)} - \frac{1}{2}\mathbf{1}_{\{i_2=i_3\}}\left(I_{(10)T,t}^{*(i_1 i_4)} - I_{(01)T,t}^{*(i_1 i_4)}\right) -$$

$$-\frac{1}{2}\mathbf{1}_{\{i_3=i_4\}}\left((T-t)I_{(00)T,t}^{*(i_1 i_2)} + I_{(01)T,t}^{*(i_1 i_2)}\right) + \frac{1}{8}(T-t)^2\mathbf{1}_{\{i_1=i_2\}}\mathbf{1}_{\{i_3=i_4\}} \quad \text{w. p. 1.}$$

Let

$$I_{(l_1\ldots l_k)T,t}^{(i_1\ldots i_k)q}, \quad I_{(l_1\ldots l_k)T,t}^{*(i_1\ldots i_k)q}$$

be approximations of the iterated Ito and Stratonovich stochastic integrals

$$I_{(l_1\ldots l_k)T,t}^{(i_1\ldots i_k)}, \quad I_{(l_1\ldots l_k)T,t}^{*(i_1\ldots i_k)}$$

defined by (48), (49), i.e. we replace ∞ with q in the expansions of these stochastic integrals. For example, $I_{(00)T,t}^{*(i_1 i_2)q}$ be the approximation of the iterated Stratonovich stochastic integral $I_{(00)T,t}^{*(i_1 i_2)}$ obtained from (54) by replacing ∞ with q, etc.

It is easy to prove that

$$\mathsf{M}\left\{\left(I_{(00)T,t}^{*(i_1 i_2)} - I_{(00)T,t}^{*(i_1 i_2)q}\right)^2\right\} = \frac{(T-t)^2}{2}\left(\frac{1}{2} - \sum_{i=1}^{q}\frac{1}{4i^2-1}\right) \quad (i_1 \neq i_2). \tag{81}$$

Moreover, using Theorem 8, we obtain for $i_1 \neq i_2$

$$\mathsf{M}\left\{\left(I_{(10)T,t}^{*(i_1 i_2)} - I_{(10)T,t}^{*(i_1 i_2)q}\right)^2\right\} = \mathsf{M}\left\{\left(I_{(01)T,t}^{*(i_1 i_2)} - I_{(01)T,t}^{*(i_1 i_2)q}\right)^2\right\} =$$

$$= \frac{(T-t)^4}{16}\left(\frac{5}{9} - 2\sum_{i=2}^{q}\frac{1}{4i^2-1} - \sum_{i=1}^{q}\frac{1}{(2i-1)^2(2i+3)^2} -\right.$$

$$\left. - \sum_{i=0}^{q}\frac{(i+2)^2+(i+1)^2}{(2i+1)(2i+5)(2i+3)^2}\right). \tag{82}$$

For the case $i_1 = i_2$, using Theorem 8, we have

$$\mathsf{M}\left\{\left(I_{(10)T,t}^{(i_1 i_1)} - I_{(10)T,t}^{(i_1 i_1)q}\right)^2\right\} = \mathsf{M}\left\{\left(I_{(01)T,t}^{(i_1 i_1)} - I_{(01)T,t}^{(i_1 i_1)q}\right)^2\right\} =$$

$$= \frac{(T-t)^4}{16}\left(\frac{1}{9} - \sum_{i=0}^{q}\frac{1}{(2i+1)(2i+5)(2i+3)^2} - 2\sum_{i=1}^{q}\frac{1}{(2i-1)^2(2i+3)^2}\right). \tag{83}$$

In Tables 1–3 we have calculations according to the formulas (81)–(83) for various values of q. In the given tables ε means the right-hand sides of these formulas.

Let us consider (55), (56) for $i_1 = i_2$

Table 1. Confirmation of the formula (81)

$2\varepsilon/(T-t)^2$	0.1667	0.0238	0.0025	$2.4988\cdot 10^{-4}$	$2.4999\cdot 10^{-5}$
q	1	10	100	1000	10000

Table 2. Confirmation of the formula (82)

$16\varepsilon/(T-t)^4$	0.3797	0.0581	0.0062	$6.2450\cdot 10^{-4}$	$6.2495\cdot 10^{-5}$
q	1	10	100	1000	10000

Table 3. Confirmation of the formula (83)

$16\varepsilon/(T-t)^4$	0.0070	$4.3551\cdot 10^{-5}$	$6.0076\cdot 10^{-8}$	$6.2251\cdot 10^{-11}$	$6.3178\cdot 10^{-14}$
q	1	10	100	1000	10000

$$I_{(01)T,t}^{*(i_1 i_1)}=-\frac{(T-t)^2}{4}\left(\left(\zeta_0^{(i_1)}\right)^2+\frac{1}{\sqrt{3}}\zeta_0^{(i_1)}\zeta_1^{(i_1)}+\right.$$

$$\left.+\sum_{i=0}^{\infty}\left(\frac{1}{\sqrt{(2i+1)(2i+5)}(2i+3)}\zeta_i^{(i_1)}\zeta_{i+2}^{(i_1)}-\frac{1}{(2i-1)(2i+3)}\left(\zeta_i^{(i_1)}\right)^2\right)\right), \tag{84}$$

$$I_{(10)T,t}^{*(i_1 i_1)}=-\frac{(T-t)^2}{4}\left(\left(\zeta_0^{(i_1)}\right)^2+\frac{1}{\sqrt{3}}\zeta_0^{(i_1)}\zeta_1^{(i_1)}+\right.$$

$$\left.+\sum_{i=0}^{\infty}\left(-\frac{1}{\sqrt{(2i+1)(2i+5)}(2i+3)}\zeta_i^{(i_1)}\zeta_{i+2}^{(i_1)}+\frac{1}{(2i-1)(2i+3)}\left(\zeta_i^{(i_1)}\right)^2\right)\right). \tag{85}$$

From (84), (85), considering (51) and (52), we obtain

$$I_{(10)T,t}^{*(i_1 i_1)}+I_{(01)T,t}^{*(i_1 i_1)}=-\frac{(T-t)^2}{2}\left(\left(\zeta_0^{(i_1)}\right)^2+\frac{1}{\sqrt{3}}\zeta_0^{(i_1)}\zeta_1^{(i_1)}\right)=I_{(0)T,t}^{(i_1)}I_{(1)T,t}^{(i_1)}\quad \text{w. p. 1.} \tag{86}$$

Obtaining (86), we supposed that the formulas (55), (56) are valid w. p. 1. The complete proof of this fact will be given in Sect. 5, 6.

Applying the Ito formula and standard relations between iterated Ito and Stratonovich stochastic integrals, it is easy to get the equality (86).

Furthermore, using the Ito formula, we obtain

$$I_{(11)T,t}^{*(i_1 i_1)}=\frac{\left(I_{(1)T,t}^{(i_1)}\right)^2}{2}\quad \text{w. p. 1.} \tag{87}$$

In addition, applying the Ito formula, we have

$$I_{(20)T,t}^{(i_1 i_1)} + I_{(02)T,t}^{(i_1 i_1)} = I_{(0)T,t}^{(i_1)} I_{(2)T,t}^{(i_1)} - \frac{(T-t)^3}{3} \quad \text{w. p. 1.} \tag{88}$$

From (88), considering the formulas (65), (66), we get

$$I_{(20)T,t}^{*(i_1 i_1)} + I_{(02)T,t}^{*(i_1 i_1)} = I_{(0)T,t}^{(i_1)} I_{(2)T,t}^{(i_1)} \quad \text{w. p. 1.} \tag{89}$$

Let us check whether the formulas (87), (89) follow from (62)–(64), if we suppose $i_1 = i_2$ in the last ones. From (62)–(64) for $i_1 = i_2$ we obtain

$$I_{(20)T,t}^{*(i_1 i_1)} + I_{(02)T,t}^{*(i_1 i_1)} = -\frac{(T-t)^2}{2} I_{(00)T,t}^{*(i_1 i_1)} - (T-t)\left(I_{(10)T,t}^{*(i_1 i_1)} + I_{(01)T,t}^{*(i_1 i_1)}\right) +$$

$$+ \frac{(T-t)^3}{4}\left(\frac{1}{3}\left(\zeta_0^{(i_1)}\right)^2 + \frac{2}{3\sqrt{5}}\zeta_2^{(i_1)}\zeta_0^{(i_1)}\right), \tag{90}$$

$$I_{(11)T,t}^{*(i_1 i_1)} = -\frac{(T-t)^2}{4} I_{(00)T,t}^{*(i_1 i_1)} - \frac{T-t}{2}\left(I_{(10)T,t}^{*(i_1 i_1)} + I_{(01)T,t}^{*(i_1 i_1)}\right) + \frac{(T-t)^3}{24}\left(\zeta_1^{(i_1)}\right)^2. \tag{91}$$

It is easy to see that from (90) and (91), considering (86) and (51)–(54), we actually obtain the equalities (87) and (89), and it indirectly confirm the correctness of the formulas (62)–(64).

Obtaining (87), (89), we supposed that the formulas (62)–(64) are valid w. p. 1. The complete proof of this fact will be given in Sect. 5, 6.

On the basis of the presented expansions of iterated stochastic integrals we can see that increasing of multiplicities of these integrals or degree indexes of their weight functions leads to noticeable complication of formulas for mentioned expansions.

However, increasing of mentioned parameters leads to increasing of orders of smallness with respect to $T-t$ in the mean-square sense for iterated stochastic integrals that leads to a sharp decrease of member quantities in expansions of iterated stochastic integrals, which are required for achieving the acceptable accuracy of approximation. In this context, let us consider the approach to the approximation of iterated stochastic integrals, which provides a possibility to obtain the mean-square approximations of the required accuracy without using the complex expansions like (80).

Let us consider the following approximation of iterated Ito stochastic integral $I_{(000)T,t}^{(i_1 i_2 i_3)}$ using (58)

$$I_{(000)T,t}^{(i_1 i_2 i_3)q_1} = \sum_{j_1,j_2,j_3=0}^{q_1} C_{j_3 j_2 j_1}\Biggl(\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}\zeta_{j_3}^{(i_3)} - \mathbf{1}_{\{i_1=i_2\}}\mathbf{1}_{\{j_1=j_2\}}\zeta_{j_3}^{(i_3)} -$$

$$-\mathbf{1}_{\{i_2=i_3\}}\mathbf{1}_{\{j_2=j_3\}}\zeta_{j_1}^{(i_1)} - \mathbf{1}_{\{i_1=i_3\}}\mathbf{1}_{\{j_1=j_3\}}\zeta_{j_2}^{(i_2)}\Biggr), \tag{92}$$

where $C_{j_3 j_2 j_1}$ is defined by (60), (61).

In particular, from (92) for $i_1 \neq i_2$, $i_2 \neq i_3$, $i_1 \neq i_3$ we obtain

$$I_{(000)T,t}^{(i_1 i_2 i_3)q_1} = \sum_{j_1,j_2,j_3=0}^{q_1} C_{j_3 j_2 j_1}\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}\zeta_{j_3}^{(i_3)}. \tag{93}$$

Furthermore, using Theorem 8 for $k=3$, we get

$$\mathsf{M}\left\{\left(I_{(000)T,t}^{(i_1i_2i_3)}-I_{(000)T,t}^{(i_1i_2i_3)q_1}\right)^2\right\}=$$

$$=\frac{(T-t)^3}{6}-\sum_{j_1,j_2,j_3=0}^{q_1}C_{j_3j_2j_1}^2\quad(i_1\ne i_2, i_1\ne i_3, i_2\ne i_3),\tag{94}$$

$$\mathsf{M}\left\{\left(I_{(000)T,t}^{(i_1i_2i_3)}-I_{(000)T,t}^{(i_1i_2i_3)q_1}\right)^2\right\}=$$

$$=\frac{(T-t)^3}{6}-\sum_{j_1,j_2,j_3=0}^{q_1}C_{j_3j_2j_1}^2-\sum_{j_1,j_2,j_3=0}^{q_1}C_{j_2j_3j_1}C_{j_3j_2j_1}\quad(i_1\ne i_2=i_3),\tag{95}$$

$$\mathsf{M}\left\{\left(I_{(000)T,t}^{(i_1i_2i_3)}-I_{(000)T,t}^{(i_1i_2i_3)q_1}\right)^2\right\}=$$

$$=\frac{(T-t)^3}{6}-\sum_{j_1,j_2,j_3=0}^{q_1}C_{j_3j_2j_1}^2-\sum_{j_1,j_2,j_3=0}^{q_1}C_{j_3j_2j_1}C_{j_1j_2j_3}\quad(i_1=i_3\ne i_2),\tag{96}$$

$$\mathsf{M}\left\{\left(I_{(000)T,t}^{(i_1i_2i_3)}-I_{(000)T,t}^{(i_1i_2i_3)q_1}\right)^2\right\}=$$

$$=\frac{(T-t)^3}{6}-\sum_{j_1,j_2,j_3=0}^{q_1}C_{j_3j_2j_1}^2-\sum_{j_1,j_2,j_3=0}^{q_1}C_{j_3j_1j_2}C_{j_3j_2j_1}\quad(i_1=i_2\ne i_3).\tag{97}$$

From the other hand, from (32) for $k=3$ we obtain

$$\mathsf{M}\left\{\left(I_{(000)T,t}^{(i_1i_2i_3)}-I_{(000)T,t}^{(i_1i_2i_3)q_1}\right)^2\right\}\le 6\left(\frac{(T-t)^3}{6}-\sum_{j_1,j_2,j_3=0}^{q_1}C_{j_3j_2j_1}^2\right),\tag{98}$$

where $i_1,i_2,i_3=1,\ldots,m$.

We may act similarly with more complicated iterated stochastic integrals. For example, for approximation of the stochastic integral $I_{(0000)T,t}^{(i_1i_2i_3i_4)}$ we can write (see (72))

$$I_{(0000)T,t}^{(i_1i_2i_3i_4)q_2}=\sum_{j_1,j_2,j_3,j_4=0}^{q_2}C_{j_4j_3j_2j_1}\Biggl(\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}\zeta_{j_3}^{(i_3)}\zeta_{j_4}^{(i_4)}-$$
$$-\mathbf{1}_{\{i_1=i_2\}}\mathbf{1}_{\{j_1=j_2\}}\zeta_{j_3}^{(i_3)}\zeta_{j_4}^{(i_4)}-\mathbf{1}_{\{i_1=i_3\}}\mathbf{1}_{\{j_1=j_3\}}\zeta_{j_2}^{(i_2)}\zeta_{j_4}^{(i_4)}-$$
$$-\mathbf{1}_{\{i_1=i_4\}}\mathbf{1}_{\{j_1=j_4\}}\zeta_{j_2}^{(i_2)}\zeta_{j_3}^{(i_3)}-\mathbf{1}_{\{i_2=i_3\}}\mathbf{1}_{\{j_2=j_3\}}\zeta_{j_1}^{(i_1)}\zeta_{j_4}^{(i_4)}-$$
$$-\mathbf{1}_{\{i_2=i_4\}}\mathbf{1}_{\{j_2=j_4\}}\zeta_{j_1}^{(i_1)}\zeta_{j_3}^{(i_3)}-\mathbf{1}_{\{i_3=i_4\}}\mathbf{1}_{\{j_3=j_4\}}\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}+$$
$$+\mathbf{1}_{\{i_1=i_2\}}\mathbf{1}_{\{j_1=j_2\}}\mathbf{1}_{\{i_3=i_4\}}\mathbf{1}_{\{j_3=j_4\}}+\mathbf{1}_{\{i_1=i_3\}}\mathbf{1}_{\{j_1=j_3\}}\mathbf{1}_{\{i_2=i_4\}}\mathbf{1}_{\{j_2=j_4\}}+$$
$$+\mathbf{1}_{\{i_1=i_4\}}\mathbf{1}_{\{j_1=j_4\}}\mathbf{1}_{\{i_2=i_3\}}\mathbf{1}_{\{j_2=j_3\}}\Biggr),\tag{99}$$

where $C_{j_4 j_3 j_2 j_1}$ is defined by (74), (75).

Moreover, according to (32) for $k = 4$, we get

$$
\mathsf{M}\left\{\left(I_{(0000)T,t}^{(i_1 i_2 i_3 i_4)} - I_{(0000)T,t}^{(i_1 i_2 i_3 i_4)q_2}\right)^2\right\} \le 24\left(\frac{(T-t)^4}{24} - \sum_{j_1,j_2,j_3,j_4=0}^{q_2} C_{j_4 j_3 j_2 j_1}^2\right),
$$

where $i_1, i_2, i_3, i_4 = 1, \ldots, m$.

For pairwise different $i_1, i_2, i_3, i_4 = 1, \ldots, m$ from Theorem 8 we obtain

$$
\mathsf{M}\left\{\left(I_{(0000)T,t}^{(i_1 i_2 i_3 i_4)} - I_{(0000)T,t}^{(i_1 i_2 i_3 i_4)q_2}\right)^2\right\} = \frac{(T-t)^4}{24} - \sum_{j_1,j_2,j_3,j_4=0}^{q_2} C_{j_4 j_3 j_2 j_1}^2. \tag{100}
$$

Using Theorem 8, we can calculate exactly the left-hand side of (100) for any possible combinations of i_1, i_2, i_3, i_4. These relations were obtained in [22]-[24], [31]. For example,

$$
\mathsf{M}\left\{\left(I_{(0000)T,t}^{(i_1 i_2 i_3 i_4)} - I_{(0000)T,t}^{(i_1 i_2 i_3 i_4)q_2}\right)^2\right\} =
$$

$$
= \frac{(T-t)^4}{24} - \sum_{j_1,j_2,j_3,j_4=0}^{q_2} C_{j_4 j_3 j_2 j_1}\left(\sum_{(j_1,j_2)}\left(\sum_{(j_3,j_4)} C_{j_4 j_3 j_2 j_1}\right)\right) \quad (i_1 = i_2 \ne i_3 = i_4),
$$

$$
\mathsf{M}\left\{\left(I_{(0000)T,t}^{(i_1 i_2 i_3 i_4)} - I_{(0000)T,t}^{(i_1 i_2 i_3 i_4)q_2}\right)^2\right\} =
$$

$$
= \frac{(T-t)^4}{24} - \sum_{j_1,\ldots,j_4=0}^{q_2} C_{j_4\ldots j_1}\left(\sum_{(j_1,j_2,j_3)} C_{j_4\ldots j_1}\right) \quad (i_1 = i_2 = i_3 \ne i_4),
$$

where

$$
\sum_{(j_1,j_2)}
$$

means the sum with respect to permutations (j_1, j_2).

Assume that $q_1 = 6$. In Tables 4–10 we have the exact values of coefficients $\bar{C}_{j_3 j_2 j_1}$, $j_1, j_2, j_3 = 0, 1, \ldots, 6$. Note that in [43], [44] the database with 270,000 exactly calculated Fourier–Legendre coefficients was described.

Calculating the value (94) for $q_1 = 6$, $i_1 \ne i_2$, $i_1 \ne i_3$, $i_3 \ne i_2$, we obtain the following approximate equality

$$
\mathsf{M}\left\{\left(I_{(000)T,t}^{(i_1 i_2 i_3)} - I_{(000)T,t}^{(i_1 i_2 i_3)q_1}\right)^2\right\} \approx 0.01956(T-t)^3.
$$

Let us choose, for example, $q_2 = 2$. In Tables 11–19 we have the exact values of coefficients $\bar{C}_{j_4 j_3 j_2 j_1}$ $(j_1, j_2, j_3, j_4 = 0, 1, 2)$. In the case of pairwise different i_1, i_2, i_3, i_4 we have from (100) the following approximate equality

$$
\mathsf{M}\left\{\left(I_{(0000)T,t}^{(i_1 i_2 i_3 i_4)} - I_{(0000)T,t}^{(i_1 i_2 i_3 i_4)q_2}\right)^2\right\} \approx 0.0236084(T-t)^4. \tag{101}
$$

Let us consider the following four approximations of iterated Ito stochastic integrals (see (76)–(79))

$$I_{(001)T,t}^{(i_1 i_2 i_3)q_3} = \sum_{j_1,j_2,j_3=0}^{q_3} C_{j_3 j_2 j_1}^{001} \Biggl(\zeta_{j_1}^{(i_1)} \zeta_{j_2}^{(i_2)} \zeta_{j_3}^{(i_3)} - \mathbf{1}_{\{i_1=i_2\}} \mathbf{1}_{\{j_1=j_2\}} \zeta_{j_3}^{(i_3)} -$$

$$- \mathbf{1}_{\{i_2=i_3\}} \mathbf{1}_{\{j_2=j_3\}} \zeta_{j_1}^{(i_1)} - \mathbf{1}_{\{i_1=i_3\}} \mathbf{1}_{\{j_1=j_3\}} \zeta_{j_2}^{(i_2)} \Biggr), \tag{102}$$

$$I_{(010)T,t}^{(i_1 i_2 i_3)q_3} = \sum_{j_1,j_2,j_3=0}^{q_3} C_{j_3 j_2 j_1}^{010} \Biggl(\zeta_{j_1}^{(i_1)} \zeta_{j_2}^{(i_2)} \zeta_{j_3}^{(i_3)} - \mathbf{1}_{\{i_1=i_2\}} \mathbf{1}_{\{j_1=j_2\}} \zeta_{j_3}^{(i_3)} -$$

$$- \mathbf{1}_{\{i_2=i_3\}} \mathbf{1}_{\{j_2=j_3\}} \zeta_{j_1}^{(i_1)} - \mathbf{1}_{\{i_1=i_3\}} \mathbf{1}_{\{j_1=j_3\}} \zeta_{j_2}^{(i_2)} \Biggr), \tag{103}$$

$$I_{(100)T,t}^{(i_1 i_2 i_3)q_3} = \sum_{j_1,j_2,j_3=0}^{q_3} C_{j_3 j_2 j_1}^{100} \Biggl(\zeta_{j_1}^{(i_1)} \zeta_{j_2}^{(i_2)} \zeta_{j_3}^{(i_3)} - \mathbf{1}_{\{i_1=i_2\}} \mathbf{1}_{\{j_1=j_2\}} \zeta_{j_3}^{(i_3)} -$$

$$- \mathbf{1}_{\{i_2=i_3\}} \mathbf{1}_{\{j_2=j_3\}} \zeta_{j_1}^{(i_1)} - \mathbf{1}_{\{i_1=i_3\}} \mathbf{1}_{\{j_1=j_3\}} \zeta_{j_2}^{(i_2)} \Biggr), \tag{104}$$

$$I_{(00000)T,t}^{(i_1 i_2 i_3 i_4 i_5)q_4} = \sum_{j_1,j_2,j_3,j_4,j_5=0}^{q_4} C_{j_5 j_4 j_3 j_2 j_1} \Biggl(\prod_{l=1}^{5} \zeta_{j_l}^{(i_l)} -$$

$$- \mathbf{1}_{\{i_1=i_2\}} \mathbf{1}_{\{j_1=j_2\}} \zeta_{j_3}^{(i_3)} \zeta_{j_4}^{(i_4)} \zeta_{j_5}^{(i_5)} - \mathbf{1}_{\{i_1=i_3\}} \mathbf{1}_{\{j_1=j_3\}} \zeta_{j_2}^{(i_2)} \zeta_{j_4}^{(i_4)} \zeta_{j_5}^{(i_5)} -$$

$$- \mathbf{1}_{\{i_1=i_4\}} \mathbf{1}_{\{j_1=j_4\}} \zeta_{j_2}^{(i_2)} \zeta_{j_3}^{(i_3)} \zeta_{j_5}^{(i_5)} - \mathbf{1}_{\{i_1=i_5\}} \mathbf{1}_{\{j_1=j_5\}} \zeta_{j_2}^{(i_2)} \zeta_{j_3}^{(i_3)} \zeta_{j_4}^{(i_4)} -$$

Clearly, expansions for iterated Stratonovich stochastic integrals (see above) are simpler than expansions for iterated Ito stochastic integrals (see Theorems 1, 2, and (9)–(14)). However, the

calculation of the mean-square approximation error for iterated Stratonovich stochastic integrals turns out to be much more difficult than for iterated Ito stochastic integrals. Below we consider how we can estimate or calculate exactly (for some particular cases) the mean-square approximation error for iterated Stratonovich stochastic integrals.

As we mentioned above, on the basis of the presented approximations of iterated Stratonovich stochastic integrals we can see that increasing of multiplicities of these integrals leads to increasing of orders of smallness with respect to $T-t$ in the mean-square sense for iterated Stratonovich stochastic integrals ($T-t \ll 1$ since the length of integration interval $[t,T]$ for iterated Stratonovich stochastic integrals plays the role of integration step for the numerical methods for Ito SDEs, i.e. $T-t$ is already fairly small). This leads to a sharp decrease of member quantities in the approximations of iterated Stratonovich stochastic integrals, which are required for achieving the acceptable accuracy of approximation.

From (81) ($i_1 \ne i_2$) we obtain

$$\mathsf{M}\left\{\left(I_{(00)T,t}^{*(i_1 i_2)} - I_{(00)T,t}^{*(i_1 i_2)q}\right)^2\right\} = \frac{(T-t)^2}{2}\sum_{i=q+1}^{\infty}\frac{1}{4i^2-1} \le$$

$$\le \frac{(T-t)^2}{2}\int\limits_q^{\infty}\frac{1}{4x^2-1}dx = -\frac{(T-t)^2}{8}\ln\left|1-\frac{2}{2q+1}\right| \le C_1\frac{(T-t)^2}{q}, \qquad (106)$$

where C_1 is a constant.

It is easy to notice that for a sufficiently small $T-t$ (recall that $T-t \ll 1$ since it is a step of integration for numerical schemes for Ito SDEs) there exists a constant C_2 such that

$$\mathsf{M}\left\{\left(I_{(l_1\ldots l_k)T,t}^{*(i_1\ldots i_k)}-I_{(l_1\ldots l_k)T,t}^{*(i_1\ldots i_k)q}\right)^2\right\} \le C_2\mathsf{M}\left\{\left(I_{(00)T,t}^{*(i_1i_2)}-I_{(00)T,t}^{*(i_1i_2)q}\right)^2\right\}, \tag{107}$$

where $I_{(l_1\ldots l_k)T,t}^{*(i_1\ldots i_k)q}$ is an approximation of the iterated Stratonovich stochastic integral $I_{(l_1\ldots l_k)T,t}^{*(i_1\ldots i_k)}$.

From (106) and (107) we finally obtain

$$\mathsf{M}\left\{\left(I_{(l_1\ldots l_k)T,t}^{*(i_1\ldots i_k)}-I_{(l_1\ldots l_k)T,t}^{*(i_1\ldots i_k)q}\right)^2\right\} \le C\frac{(T-t)^2}{q}, \tag{108}$$

where constant C is independent of $T-t$.

The same idea can be found in [2] in the framework of the method of approximation of iterated Stratonovich stochastic integrals based on the trigonometric expansion of the Brownian bridge process [3]. Note that, in contrast to the estimate (108), the constant C in Theorems 4–6 does not depend on p.

We can get more information about the numbers q (these numbers are different for different iterated Stratonovich stochastic integrals) using the another approach. Since for pairwise different $i_1,\ldots,i_k=1,\ldots,m$

$$J^*[\psi^{(k)}]_{T,t}=J[\psi^{(k)}]_{T,t} \quad \text{w. p. 1},$$

where $J[\psi^{(k)}]_{T,t}$, $J^*[\psi^{(k)}]_{T,t}$ are defined by (2) and (3) correspondingly, then for pairwise different $i_1,\ldots,i_6=1,\ldots,m$ from Theorem 8 we obtain

$$\mathsf{M}\left\{\left(I_{(01)T,t}^{*(i_1i_2)}-I_{(01)T,t}^{*(i_1i_2)q}\right)^2\right\}=\frac{(T-t)^4}{4}-\sum_{j_1,j_2=0}^{q}\left(C_{j_2j_1}^{01}\right)^2,$$

$$\mathsf{M}\left\{\left(I_{(10)T,t}^{*(i_1i_2)}-I_{(10)T,t}^{*(i_1i_2)q}\right)^2\right\}=\frac{(T-t)^4}{12}-\sum_{j_1,j_2=0}^{q}\left(C_{j_2j_1}^{10}\right)^2,$$

$$\mathsf{M}\left\{\left(I_{(000)T,t}^{*(i_1i_2i_3)}-I_{(000)T,t}^{*(i_1i_2i_3)q}\right)^2\right\}=\frac{(T-t)^3}{6}-\sum_{j_3,j_2,j_1=0}^{q}C_{j_3j_2j_1}^2,$$

$$\mathsf{M}\left\{\left(I_{(0000)T,t}^{*(i_1i_2i_3i_4)}-I_{(0000)T,t}^{*(i_1i_2i_3i_4)q}\right)^2\right\}=\frac{(T-t)^4}{24}-\sum_{j_1,j_2,j_3,j_4=0}^{q}C_{j_4j_3j_2j_1}^2,$$

$$\mathsf{M}\left\{\left(I_{(100)T,t}^{*(i_1i_2i_3)}-I_{(100)T,t}^{*(i_1i_2i_3)q}\right)^2\right\}=\frac{(T-t)^5}{60}-\sum_{j_1,j_2,j_3=0}^{q}\left(C_{j_3j_2j_1}^{100}\right)^2,$$

$$\mathsf{M}\left\{\left(I_{(010))T,t}^{*(i_1i_2i_3)}-I_{(010)T,t}^{*(i_1i_2i_3)q}\right)^2\right\}=\frac{(T-t)^5}{20}-\sum_{j_1,j_2,j_3=0}^{q}\left(C_{j_3j_2j_1}^{010}\right)^2,$$

$$\mathsf{M}\left\{\left(I_{(001)T,t}^{*(i_1i_2i_3)}-I_{(001)T,t}^{*(i_1i_2i_3)q}\right)^2\right\}=\frac{(T-t)^5}{10}-\sum_{j_1,j_2,j_3=0}^{q}\left(C_{j_3j_2j_1}^{001}\right)^2,$$

$$\mathsf{M}\left\{\left(I_{(00000)T,t}^{*(i_1i_2i_3i_4i_5)}-I_{(00000)T,t}^{*(i_1i_2i_3i_4i_5)q}\right)^2\right\}=\frac{(T-t)^5}{120}-\sum_{j_1,j_2,j_3,j_4,j_5=0}^{q}C_{j_5i_4i_3i_2j_1}^2,$$

4. Legendre Polynomials of Trigonometry?

This section is devoted to the comparative analysis of the efficiency of application of Legendre polynomials and trigonometric functions to the mean-square approximation of iterated Ito and Stratonovich stochastic integrals.

Using Theorems 1, 2, 8 and the complete orthonormal system of trigonometric functions in the space $L_2([t,T])$, we obtain for $i_1\ne i_2$ $(i_1,i_2=1,\ldots,m)$

(109)
$$I_{(00)T,t}^{(i_1i_2)}=\frac{1}{2}(T-t)\Biggl(\zeta_0^{(i_1)}\zeta_0^{(i_2)}+\frac{1}{\pi}\sum_{r=1}^{\infty}\frac{1}{r}\left(\zeta_{2r}^{(i_1)}\zeta_{2r-1}^{(i_2)}-\zeta_{2r-1}^{(i_1)}\zeta_{2r}^{(i_2)}\ +\sqrt{2}\left(\zeta_{2r-1}^{(i_1)}\zeta_0^{(i_2)}-\zeta_0^{(i_1)}\zeta_{2r-1}^{(i_2)}\right)\right)\Biggr),$$

$$\mathsf{M}\left\{\left(I_{(00)T,t}^{(i_1i_2)}-I_{(00)T,t}^{(i_1i_2)q}\right)^2\right\}=\frac{3(T-t)^2}{2\pi^2}\Biggl(\frac{\pi^2}{6}-\sum_{r=1}^{q}\frac{1}{r^2}\Biggr), \tag{110}$$

(111)
$$I_{(00)T,t}^{(i_1i_2)q}=\frac{1}{2}(T-t)\Biggl(\zeta_0^{(i_1)}\zeta_0^{(i_2)}+\frac{1}{\pi}\sum_{r=1}^{q}\frac{1}{r}\left(\zeta_{2r}^{(i_1)}\zeta_{2r-1}^{(i_2)}-\zeta_{2r-1}^{(i_1)}\zeta_{2r}^{(i_2)}\ +\sqrt{2}\left(\zeta_{2r-1}^{(i_1)}\zeta_0^{(i_2)}-\zeta_0^{(i_1)}\zeta_{2r-1}^{(i_2)}\right)\right)\Biggr),$$

where
$$\zeta_j^{(i)}=\int\limits_t^T\phi_j(s)d\mathbf{f}_s^{(i)}$$

are independent standard Gaussian random variables for various i or j,

$$\phi_j(s)=\frac{1}{\sqrt{T-t}}\begin{cases}1 & \text{for } j=0\\ \sqrt{2}\sin(2\pi r(s-t)/(T-t)) & \text{for } j=2r-1\\ \sqrt{2}\cos(2\pi r(s-t)/(T-t)) & \text{for } j=2r\end{cases},$$

where $r=1,2,\ldots$; another notations are the same as in Theorems 1, 2.

The expansion (109) was first derived by Milstein G.N. in [3] on the base of the Karhunen–Loeve expansion of the Brownian bridge process.

However, this approach has an obvious drawback. Indeed, we have too complex formulas (in comparison with (52), (53)) for the following stochastic integrals with Gaussian distribution

$$I_{(1)T,t}^{(i_1)}=-\frac{(T-t)^{3/2}}{2}\Biggl(\zeta_0^{(i_1)}-\frac{\sqrt{2}}{\pi}\sum_{r=1}^{\infty}\frac{1}{r}\zeta_{2r-1}^{(i_1)}\Biggr), \tag{112}$$

$$I_{(2)T,t}^{(i_1)}=(T-t)^{5/2}\Biggl(\frac{1}{3}\zeta_0^{(i_1)}+\frac{1}{\sqrt{2}\pi^2}\sum_{r=1}^{\infty}\frac{1}{r^2}\zeta_{2r}^{(i_1)}-\frac{1}{\sqrt{2}\pi}\sum_{r=1}^{\infty}\frac{1}{r}\zeta_{2r-1}^{(i_1)}\Biggr), \tag{113}$$

where $i_1=1,\ldots,m$.

In [3] Milstein G.N. proposed the following mean-square approximations on the base of the expansions (109), (112)

$$I_{(1)T,t}^{(i_1)q}=-\frac{(T-t)^{3/2}}{2}\Biggl(\zeta_0^{(i_1)}-\frac{\sqrt{2}}{\pi}\Biggl(\sum_{r=1}^{q}\frac{1}{r}\zeta_{2r-1}^{(i_1)}+\sqrt{\alpha_q}\xi_q^{(i_1)}\Biggr)\Biggr), \tag{114}$$

$$I_{(00)T,t}^{(i_1 i_2)q} = \frac{1}{2}(T-t)\Biggl(\zeta_0^{(i_1)}\zeta_0^{(i_2)} + \frac{1}{\pi}\sum_{r=1}^{q}\frac{1}{r}\left(\zeta_{2r}^{(i_1)}\zeta_{2r-1}^{(i_2)} - \zeta_{2r-1}^{(i_1)}\zeta_{2r}^{(i_2)} + \right.$$

$$\left. + \sqrt{2}\left(\zeta_{2r-1}^{(i_1)}\zeta_0^{(i_2)} - \zeta_0^{(i_1)}\zeta_{2r-1}^{(i_2)}\right)\right) + \frac{\sqrt{2}}{\pi}\sqrt{\alpha_q}\left(\xi_q^{(i_1)}\zeta_0^{(i_2)} - \zeta_0^{(i_1)}\xi_q^{(i_2)}\right)\Biggr), \tag{115}$$

where

$$\xi_q^{(i)} = \frac{1}{\sqrt{\alpha_q}}\sum_{r=q+1}^{\infty}\frac{1}{r}\,\zeta_{2r-1}^{(i)}, \quad \alpha_q = \frac{\pi^2}{6} - \sum_{r=1}^{q}\frac{1}{r^2}, \tag{116}$$

where $\zeta_0^{(i)}$, $\zeta_{2r}^{(i)}$, $\zeta_{2r-1}^{(i)}$, $\xi_q^{(i)}$ $(r = 1, \ldots, q;\ i = 1, \ldots, m)$ are independent standard Gaussian random variables.

Obviously, for the approximations (114) and (115) we obtain

$$\mathsf{M}\left\{\left(I_{(1)T,t}^{(i_1)} - I_{(1)T,t}^{(i_1)q}\right)^2\right\} = 0,$$

$$\mathsf{M}\left\{\left(I_{(00)T,t}^{(i_1 i_2)} - I_{(00)T,t}^{(i_1 i_2)q}\right)^2\right\} = \frac{(T-t)^2}{2\pi^2}\left(\frac{\pi^2}{6} - \sum_{r=1}^{q}\frac{1}{r^2}\right). \tag{117}$$

This idea has been developed in [2]. For example, the approximation $I_{(2)T,t}^{(i_1)q}$, which corresponds to (114), (115), has the form [2]

$$I_{(2)T,t}^{(i_1)q} = (T-t)^{5/2}\left(\frac{1}{3}\zeta_0^{(i_1)} + \frac{1}{\sqrt{2}\pi^2}\left(\sum_{r=1}^{q}\frac{1}{r^2}\zeta_{2r}^{(i_1)} + \sqrt{\beta_q}\mu_q^{(i_1)}\right) - \frac{1}{\sqrt{2}\pi}\left(\sum_{r=1}^{q}\frac{1}{r}\zeta_{2r-1}^{(i_1)} + \sqrt{\alpha_q}\xi_q^{(i_1)}\right)\right), \tag{118}$$

$$\mathsf{M}\left\{\left(I_{(2)T,t}^{(i_1)} - I_{(2)T,t}^{(i_1)q}\right)^2\right\} = 0,$$

where $\xi_q^{(i)}$, α_q have the form (116) and

$$\mu_q^{(i)} = \frac{1}{\sqrt{\beta_q}}\sum_{r=q+1}^{\infty}\frac{1}{r^2}\,\zeta_{2r}^{(i)}, \quad \beta_q = \frac{\pi^4}{90} - \sum_{r=1}^{q}\frac{1}{r^4}, \tag{119}$$

where $\zeta_0^{(i)}$, $\zeta_{2r}^{(i)}$, $\zeta_{2r-1}^{(i)}$, $\xi_q^{(i)}$, $\mu_q^{(i)}$ $(r = 1, \ldots, q;\ i = 1, \ldots, m)$ are independent standard Gaussian random variables.

Nevetheless, the expansions (114), (118) are too complex for the numerical modeling of two Gaussian random variables $I_{(1)T,t}^{(i_1)}$, $I_{(2)T,t}^{(i_1)}$.

Further, we will see that the using of random variables $\xi_q^{(i)}$ and $\mu_q^{(i)}$ will drastically complicate the approximation of the stochastic integral $I_{(000)T,t}^{(i_1 i_2 i_3)}$; $i_1, i_2, i_3 = 1, \ldots, m$. This is due to the fact that for this approach the number q is fixed for all stochastic integrals included into the considered collection [2]. However, it is clear that due to the smallness of $T-t$, the number q for $I_{(000)T,t}^{(i_1 i_2 i_3)}$ could be taken significantly less than in the formula (115) (see for comparison the case of Legendre polynomials). This feature is also valid for the formulas (114), (118).

To obtain the expansion for (3) on the base of the approach from [3] the truncated trigonometric expansions of components of the multidimensional Wiener process $\mathbf{f}_s$ must be iteratively substituted in the single integrals, and the integrals must be calculated, starting from the innermost integral. This is a complicated procedure that obviously does not lead to a general expansion of (3) valid for an arbitrary multiplicity k. For this reason, only expansions of simplest single, double, and triple integrals (3) were obtained (see [2], [3], [49]-[51]).

At that, in [3] the case $\psi_1(s), \psi_2(s) \equiv 1$ and $i_1, i_2 = 0, 1, \ldots, m$ is considered. In [2], [49]-[51] the attempt to consider the case $\psi_1(s), \psi_2(s), \psi_3(s) \equiv 1$ and $i_1, i_2, i_3 = 0, 1, \ldots, m$ is realized.

Note that the mean-square convergence of $J^{*(i_1 i_2 i_3)q}_{(111)T,t}$ to $J^{*(i_1 i_2 i_3)}_{(111)T,t}$ if $q \to \infty$ was not proved rigorously in [2] (Sect. 5.8, pp. 202–204), [49] (pp. 82-84), [50] (pp. 438-439), [51] (pp. 263-264) within the frames of the Milstein approach [3] together with the Wong–Zakai approximation [54]-[56] (see discussion in Sect. 8 for detail).

Consider the approximation $I^{(i_1 i_2)q}_{(00)T,t}$ of the iterated stochastic integral $I^{(i_1 i_2)}_{(00)T,t}$ obtained from (54) by replacing ∞ with q

$$(120) \qquad I^{(i_1 i_2)q}_{(00)T,t} = \frac{T-t}{2}\left(\zeta_0^{(i_1)}\zeta_0^{(i_2)} + \sum_{i=1}^{q}\frac{1}{\sqrt{4i^2-1}}\left(\zeta_{i-1}^{(i_1)}\zeta_i^{(i_2)} - \zeta_i^{(i_1)}\zeta_{i-1}^{(i_2)}\right)\right) \quad (i_1 \ne i_2).$$

Let us compare computational costs for the approximations (115), (120). It is not difficult to show that [5]-[24]

$$(121) \qquad \mathsf{M}\left\{\left(I^{(i_1 i_2)}_{(00)T,t} - I^{(i_1 i_2)q}_{(00)T,t}\right)^2\right\} = \frac{(T-t)^2}{2}\left(\frac{1}{2} - \sum_{i=1}^{q}\frac{1}{4i^2-1}\right).$$

Let us compare (120) with (115) and (121) with (117). Consider minimal natural numbers $q_{\rm trig}$ and $q_{\rm pol}$, which satisfy to (see Table 37)

$$\frac{(T-t)^2}{2}\left(\frac{1}{2} - \sum_{i=1}^{q_{\rm pol}}\frac{1}{4i^2-1}\right) \le (T-t)^3, \qquad \frac{(T-t)^2}{2\pi^2}\left(\frac{\pi^2}{6} - \sum_{r=1}^{q_{\rm trig}}\frac{1}{r^2}\right) \le (T-t)^3.$$

Thus, we have

$$\frac{q_{\rm pol}}{q_{\rm trig}} \approx 1.67, \quad 2.22, \quad 2.43, \quad 2.36, \quad 2.41, \quad 2.43, \quad 2.45, \quad 2.45.$$

From the other hand, the formula (115) includes $(4q+4)m$ independent standard Gaussian random variables. At the same time the folmula (120) includes only $(2q+2)m$ independent standard Gaussian random variables. Moreover, the formula (120) is simpler than the formula (115). Thus, in this case we can talk about approximately equal computational costs for the formulas (115) and (120).

There is one important feature. As we mentioned above, further we will see that the using of random variables $\xi_q^{(i)}$ and $\mu_q^{(i)}$ will drastically complicate the approximation of the stochastic integral $I^{(i_1 i_2 i_3)}_{(000)T,t}$; $i_1, i_2, i_3 = 1, \ldots, m$. This is due to the fact that the number q is fixed for all stochastic integrals, which included into the considered collection (the case of trigonometric functions). However, it is clear that due to the smallness of $T-t$, the number q for $I^{(i_1 i_2 i_3)}_{(000)T,t}$ could be chosen significantly less than in the formula (115). This feature is also valid for the formulas (114), (118). However, for the case of Legendre polynomials we can choose different numbers q for different stochastic integrals (see Sect. 3).

TABLE 37. Numbers $q_{\rm trig}$, $q_{\rm pol}$

$T-t$	2^{-5}	2^{-6}	2^{-7}	2^{-8}	2^{-9}	2^{-10}	2^{-11}	2^{-12}
$q_{\rm trig}$	3	4	7	14	27	53	105	209
$q^*_{\rm trig}$	6	11	20	40	79	157	312	624
$q_{\rm pol}$	5	9	17	33	65	129	257	513

From the other hand, if we will not use the random variables $\xi_q^{(i)}$ and $\mu_q^{(i)}$, then the mean-square error of approximation of the stochastic integral $I_{(00)T,t}^{(i_1i_2)}$ will be three times larger (see (110)). Moreover, in this case the stochastic integrals $I_{(1)T,t}^{(i_1)}$, $I_{(2)T,t}^{(i_1)}$ (with Gaussian distribution) will be approximated worse.

Consider minimal natural numbers $q^*_{\rm trig}$, which satisfy the condition (see Table 37)

$$\frac{3(T-t)^2}{2\pi^2}\left(\frac{\pi^2}{6}-\sum_{r=1}^{q^*_{\rm trig}}\frac{1}{r^2}\right)\le (T-t)^3.$$

In this situation we can talk about the advantage of Ledendre polynomials ($q^*_{\rm trig}>q_{pol}$ and (111) is more complex than (120)).

Using Theorems 1, 2 for the system of trigonometric functions, we have ($i_1\ne i_2,\ i_1\ne i_3,\ i_2\ne i_3$) [8]-[24] (also see [5], [6])

$$I_{(000)T,t}^{(i_1i_2i_3)q}=(T-t)^{3/2}\Biggl(\frac{1}{6}\zeta_0^{(i_1)}\zeta_0^{(i_2)}\zeta_0^{(i_3)}+\frac{\sqrt{\alpha_q}}{2\sqrt{2}\pi}\left(\xi_q^{(i_1)}\zeta_0^{(i_2)}\zeta_0^{(i_3)}-\xi_q^{(i_3)}\zeta_0^{(i_2)}\zeta_0^{(i_1)}\right)+$$
$$+\frac{1}{2\sqrt{2}\pi^2}\sqrt{\beta_q}\left(\mu_q^{(i_1)}\zeta_0^{(i_2)}\zeta_0^{(i_3)}-2\mu_q^{(i_2)}\zeta_0^{(i_1)}\zeta_0^{(i_3)}+\mu_q^{(i_3)}\zeta_0^{(i_1)}\zeta_0^{(i_2)}\right)+$$
$$+\frac{1}{2\sqrt{2}}\sum_{r=1}^{q}\Biggl(\frac{1}{\pi r}\left(\zeta_{2r-1}^{(i_1)}\zeta_0^{(i_2)}\zeta_0^{(i_3)}-\zeta_{2r-1}^{(i_3)}\zeta_0^{(i_2)}\zeta_0^{(i_1)}\right)+$$
$$+\frac{1}{\pi^2r^2}\left(\zeta_{2r}^{(i_1)}\zeta_0^{(i_2)}\zeta_0^{(i_3)}-2\zeta_{2r}^{(i_2)}\zeta_0^{(i_3)}\zeta_0^{(i_1)}+\zeta_{2r}^{(i_3)}\zeta_0^{(i_2)}\zeta_0^{(i_1)}\right)\Biggr)+$$
$$+\sum_{r=1}^{q}\Biggl(\frac{1}{4\pi r}\left(\zeta_{2r}^{(i_1)}\zeta_{2r-1}^{(i_2)}\zeta_0^{(i_3)}-\zeta_{2r-1}^{(i_1)}\zeta_{2r}^{(i_2)}\zeta_0^{(i_3)}-\zeta_{2r-1}^{(i_2)}\zeta_{2r}^{(i_3)}\zeta_0^{(i_1)}+\zeta_{2r-1}^{(i_3)}\zeta_{2r}^{(i_2)}\zeta_0^{(i_1)}\right)+$$
$$+\frac{1}{8\pi^2r^2}\Bigl(3\zeta_{2r-1}^{(i_1)}\zeta_{2r-1}^{(i_2)}\zeta_0^{(i_3)}+\zeta_{2r}^{(i_1)}\zeta_{2r}^{(i_2)}\zeta_0^{(i_3)}-6\zeta_{2r-1}^{(i_1)}\zeta_{2r-1}^{(i_3)}\zeta_0^{(i_2)}+$$
$$+3\zeta_{2r-1}^{(i_2)}\zeta_{2r-1}^{(i_3)}\zeta_0^{(i_1)}-2\zeta_{2r}^{(i_1)}\zeta_{2r}^{(i_3)}\zeta_0^{(i_2)}+\zeta_{2r}^{(i_3)}\zeta_{2r}^{(i_2)}\zeta_0^{(i_1)}\Bigr)\Biggr)+D_{T,t}^{(i_1i_2i_3)q}\Biggr), \tag{122}$$

where

$$D_{T,t}^{(i_1i_2i_3)q}=\frac{1}{2\pi^2}\sum_{\substack{r,l=1\\ r\ne l}}^{q}\Biggl(\frac{1}{r^2-l^2}\Biggl(\zeta_{2r}^{(i_1)}\zeta_{2l}^{(i_2)}\zeta_0^{(i_3)}-\zeta_{2r}^{(i_2)}\zeta_0^{(i_1)}\zeta_{2l}^{(i_3)}+$$
$$+\frac{r}{l}\zeta_{2r-1}^{(i_1)}\zeta_{2l-1}^{(i_2)}\zeta_0^{(i_3)}-\frac{l}{r}\zeta_0^{(i_1)}\zeta_{2r-1}^{(i_2)}\zeta_{2l-1}^{(i_3)}\Biggr)-\frac{1}{rl}\zeta_{2r-1}^{(i_1)}\zeta_0^{(i_2)}\zeta_{2l-1}^{(i_3)}\Biggr)+$$

Table 38. Confirmation of the formula (123)

$\varepsilon/(T-t)^3$	0.0459	0.0072	$7.5722\cdot 10^{-4}$	$7.5973\cdot 10^{-5}$	$7.5990\cdot 10^{-6}$

$$

$$
+\frac{1}{l(l-m)}\left(-\zeta_{2(l-m)}^{(i_1)}\zeta_{2m}^{(i_2)}\zeta_{2l}^{(i_3)}+\zeta_{2(l-m)-1}^{(i_1)}\zeta_{2m-1}^{(i_2)}\zeta_{2l}^{(i_3)}-\right.
$$

$$
\left.\left.\left.-\zeta_{2(l-m)-1}^{(i_1)}\zeta_{2m}^{(i_2)}\zeta_{2l-1}^{(i_3)}-\zeta_{2(l-m)}^{(i_1)}\zeta_{2m-1}^{(i_2)}\zeta_{2l-1}^{(i_3)}\right)\right)\right),
$$

where $\zeta_0^{(i)}$, $\zeta_{2r}^{(i)}$, $\zeta_{2r-1}^{(i)}$, $\xi_q^{(i)}$, $\mu_q^{(i)}$ $(r=1,\ldots,q;\ i=1,\ldots,m)$ are independent standard Gaussian random variables (see (116), (119)).

The mean-square error of approximation (122) $(i_1\ne i_2,\ i_1\ne i_3,\ i_2\ne i_3)$ has the following form [8]-[24] (also see [5], [6])

$$
\mathsf{M}\left\{\left(I_{(000)T,t}^{(i_1i_2i_3)}-I_{(000)T,t}^{(i_1i_2i_3)q}\right)^2\right\}=(T-t)^3\left(\frac{4}{45}-\frac{1}{4\pi^2}\sum_{r=1}^{q}\frac{1}{r^2}-\right.
$$

(123)
$$
\left.-\frac{55}{32\pi^4}\sum_{r=1}^{q}\frac{1}{r^4}-\frac{1}{4\pi^4}\sum_{\substack{r,l=1\\ r\ne l}}^{q}\frac{5l^4+4r^4-3r^2l^2}{r^2l^2\left(r^2-l^2\right)^2}\right).
$$

In Table 38 we can see the numerical confirmation of the formula (123) (ε is the right-hand side of (123)).

As we mentioned above, the Milstein expansion [3] (i.e. expansion based on the Karhunen–Loeve expansion of the Brownian bridge process) for iterated stochastic integrals leads to iterated application of the operation of limit transition. The analogue of (122) for iterated Stratonovich stochastic integrals has been derived in [2], [49]-[51] on the base of the Milstein expansion together with the Wong–Zakai approximation [54]-[56] (without rigorous proof). It means that the authors in [2] (Sect. 5.8, pp. 202–204), [49] (pp. 82-84), [50] (pp. 438-439), [51] (pp. 263-264) formally could not use the double sum with the upper limit q in the analogue of (122). From the other hand the correctness of (122) follows directly from Theorems 1, 2. Note that (122) has been obtained reasonably for the first time in [8]. The version of (122) without using the random variables $\xi_q^{(i)}$ and $\mu_q^{(i)}$ can be found in [5] (1997).

The mean-square error (123) has been obtained for the first time in [8] on the base of the simplified variant of Theorem 8 (the case of pairwise different $i_1,\ldots,i_k$).

As we noted above, the number q must be the same in (114), (115), (122). This is the main drawback of this approach, because really the number q in (122) can be chosen essentially smaller than in (115).

Note that in (122) we can replace $I_{(000)T,t}^{(i_1i_2i_3)q}$ on $I_{(000)T,t}^{*(i_1i_2i_3)q}$ and (122) then will be valid for any $i_1,i_2,i_3=1,\ldots,m$ (see Theorem 3).

Let us compare the efficiency of application of Legendre polynomials and trigonometric functions for approximation of the iterated stochastic integrals $I_{(00)T,t}^{(i_1i_2)}$, $I_{(000)T,t}^{(i_1i_2i_3)}$ $(i_1\ne i_2,\ i_1\ne i_3,\ i_2\ne i_3)$.

Consider the following conditions $(i_1\ne i_2,\ i_1\ne i_3,\ i_2\ne i_3)$

$$\frac{(T-t)^2}{2}\left(\frac{1}{2}-\sum_{i=1}^{q}\frac{1}{4i^2-1}\right)\le (T-t)^4, \tag{124}$$

$$(T-t)^3\left(\frac{1}{6}-\sum_{j_1,j_2,j_3=0}^{q_1}\frac{\left(C_{j_3j_2j_1}\right)^2}{(T-t)^3}\right)\le (T-t)^4, \tag{125}$$

$$\frac{(T-t)^2}{2\pi^2}\left(\frac{\pi^2}{6}-\sum_{r=1}^{p}\frac{1}{r^2}\right)\le (T-t)^4, \tag{126}$$

$$(T-t)^3\left(\frac{4}{45}-\frac{1}{4\pi^2}\sum_{r=1}^{p_1}\frac{1}{r^2}-\frac{55}{32\pi^4}\sum_{r=1}^{p_1}\frac{1}{r^4}-\frac{1}{4\pi^4}\sum_{\substack{r,l=1\\ r\ne l}}^{p_1}\frac{5l^4+4r^4-3r^2l^2}{r^2l^2\left(r^2-l^2\right)^2}\right)\le (T-t)^4, \tag{127}$$

where $C_{j_3j_2j_1}$ is defined by (60).

In Tables 39 and 40 we can see minimal numbers q, q_1, p, p_1, which satisfy the conditions (124)–(127). As we mentioned above, the numbers q, q_1 are different. At that $q_1\ll q$ (the case of Legendre polynomials). Moreover, we cannot take different numbers p, p_1 for the case of trigonometric functions. Thus, we must choose $q=p$ in (114), (115), (122). This leads to huge computational costs (see very complex formula (122)). From the other hand, we can choose different numbers q in (114), (115), (122). At that we must exclude random variables $\xi_q^{(i)}$, $\mu_q^{(i)}$ from (114), (115), (122). At this situation we have

$$\frac{3(T-t)^2}{2\pi^2}\left(\frac{\pi^2}{6}-\sum_{r=1}^{p^*}\frac{1}{r^2}\right)\le (T-t)^4, \tag{128}$$

$$(T-t)^3\left(\frac{5}{36}-\frac{1}{2\pi^2}\sum_{r=1}^{p_1^*}\frac{1}{r^2}-\frac{79}{32\pi^4}\sum_{r=1}^{p_1^*}\frac{1}{r^4}-\frac{1}{4\pi^4}\sum_{\substack{r,l=1\\ r\ne l}}^{p_1^*}\frac{5l^4+4r^4-3r^2l^2}{r^2l^2\left(r^2-l^2\right)^2}\right)\le (T-t)^4, \tag{129}$$

where the left-hand sides of (128), (129) correspond to (115), (122) but without $\xi_q^{(i)}$, $\mu_q^{(i)}$. In Table 40 we can see minimal numbers p^*, p_1^*, which satisfy the conditions (128), (129). Moreover,

$$\mathsf{M}\left\{\left(I_{(1)T,t}^{(i_1)}-I_{(1)T,t}^{(i_1)q}\right)^2\right\}=\frac{(T-t)^3}{2\pi^2}\left(\frac{\pi^2}{6}-\sum_{r=1}^{q}\frac{1}{r^2}\right), \tag{130}$$

Table 39. Numbers q, q_1

$T-t$	0.08222	0.05020	0.02310	0.01956
q	19	51	235	328
q_1	1	2	5	6

Table 40. Numbers p, p_1, p^*, p_1^*

$T-t$	0.08222	0.05020	0.02310	0.01956
p	8	21	96	133
p_1	1	1	3	4
p^*	23	61	286	398
p_1^*	1	2	4	5

Table 41. Confirmation of the formula (129)

$\varepsilon/(T-t)^3$	0.0629	0.0097	0.0010	$1.0129\cdot 10^{-4}$	$1.0132\cdot 10^{-5}$
q	1	10	100	1000	10000

where

$$I_{(1)T,t}^{(i_1)q}=-\frac{(T-t)^{3/2}}{2}\left(\zeta_0^{(i_1)}-\frac{\sqrt{2}}{\pi}\sum_{r=1}^{q}\frac{1}{r}\zeta_{2r-1}^{(i_1)}\right).$$

It is not difficult to see that numbers $q_{\rm trig}$ in Table 37 correspond to minimal numbers $q_{\rm trig}$, which satisfy the condition

$$\frac{(T-t)^3}{2\pi^2}\left(\frac{\pi^2}{6}-\sum_{r=1}^{q_{\rm trig}}\frac{1}{r^2}\right)\le (T-t)^4.$$

From the other hand, the right-hand side of (52) includes only 2 random variables. In this situation we again can talk about the advantage of Ledendre polynomials.

In Table 41 we can see the numerical confirmation of (129) (ε is the left-hand side of (129)).

Let us compare computational costs for the approximation $I_{(10)T,t}^{*(i_1i_2)q}$ obtained from (56) by replacing ∞ with q (the case of Legendre olynomials) and for the approximation $I_{(10)T,t}^{*(i_1i_2)q}$ obtained by Theorem 3 (the case of trigonometric functions)

$$I_{(10)T,t}^{*(i_1i_2)q}=-(T-t)^2\Biggl(\frac{1}{6}\zeta_0^{(i_1)}\zeta_0^{(i_2)}-\frac{1}{2\sqrt{2}\pi}\sqrt{\alpha_q}\xi_q^{(i_2)}\zeta_0^{(i_1)}+$$

$$+\frac{1}{2\sqrt{2}\pi^2}\sqrt{\beta_q}\left(\mu_q^{(i_2)}\zeta_0^{(i_1)}-2\mu_q^{(i_1)}\zeta_0^{(i_2)}\right)+$$

$$+\frac{1}{2\sqrt{2}}\sum_{r=1}^{q}\left(-\frac{1}{\pi r}\zeta_{2r-1}^{(i_2)}\zeta_0^{(i_1)}+\frac{1}{\pi^2r^2}\left(\zeta_{2r}^{(i_2)}\zeta_0^{(i_1)}-2\zeta_{2r}^{(i_1)}\zeta_0^{(i_2)}\right)\right)-$$

TABLE 42. Confirmation of the formulas (132)

$4\varepsilon/(T-t)^4$	0.0540	0.0082	$8.4261\cdot 10^{-4}$	$8.4429\cdot 10^{-5}$	$8.4435\cdot 10^{-6}$
q	1	10	100	1000	10000

$$-\frac{1}{2\pi^2}\sum_{\substack{r,l=1\\r\neq l}}^{q}\frac{1}{r^2-l^2}\left(\zeta_{2r}^{(i_1)}\zeta_{2l}^{(i_2)}+\frac{l}{r}\zeta_{2r-1}^{(i_1)}\zeta_{2l-1}^{(i_2)}\right)+$$

$$+\sum_{r=1}^{q}\left(\frac{1}{4\pi r}\left(\zeta_{2r}^{(i_1)}\zeta_{2r-1}^{(i_2)}-\zeta_{2r-1}^{(i_1)}\zeta_{2r}^{(i_2)}\right)+\right.$$

$$\left.+\frac{1}{8\pi^2 r^2}\left(3\zeta_{2r-1}^{(i_1)}\zeta_{2r-1}^{(i_2)}+\zeta_{2r}^{(i_2)}\zeta_{2r}^{(i_1)}\right)\right)\Biggr). \tag{131}$$

For the formula (131) ($i_1\neq i_2$) from Theorem 8 we obtain [8]-[24]

$$\mathsf{M}\left\{\left(I_{(01)T,t}^{(i_1i_2)}-I_{(01)T,t}^{(i_1i_2)q}\right)^2\right\}=\frac{(T-t)^4}{4}\left(\frac{1}{9}-\frac{1}{2\pi^2}\sum_{r=1}^{q}\frac{1}{r^2}-\right.$$

$$\left.-\frac{5}{8\pi^4}\sum_{r=1}^{q}\frac{1}{r^4}-\frac{1}{\pi^4}\sum_{\substack{k,l=1\\k\neq l}}^{q}\frac{k^2+l^2}{l^2\left(l^2-k^2\right)^2}\right). \tag{132}$$

In Table 42 we can see the numerical confirmation of (132) (ε is the right-hand side of (132)).

Let us compare the complexity of approximation based on the formula (56) with the complexity of approximation (131). The formula (131) includes the double sum

$$\frac{1}{2\pi^2}\sum_{\substack{r,l=1\\r\neq l}}^{q}\frac{1}{r^2-l^2}\left(\zeta_{2r}^{(i_1)}\zeta_{2l}^{(i_2)}+\frac{l}{r}\zeta_{2r-1}^{(i_1)}\zeta_{2l-1}^{(i_2)}\right).$$

Thus, the approximation (131) is more complex than the approximation based on the formula (56) even if we take identical numbers q in these approximations. As we noted above, the number q in (131) must be equal to the number q from the formula (115), so it is much larger than the number q from the approximation based on the formula (56). As s result, we have an obvious advantage of the Legendre polynomials in computational costs in the considered case. As we mentioned above, if we will not use the random variables $\xi_q^{(i)}$ and $\mu_q^{(i)}$, then the number q in (131) can be chosen smaller, but the mean-square error of approximation of the stochastic integral $I_{(00)T,t}^{(i_1i_2)}$ will be three times larger (see (110)). Moreover, in this case the stochastic integrals $I_{(1)T,t}^{(i_1)}$, $I_{(2)T,t}^{(i_1)}$ (with Gaussian distribution) will be approximated worse. In this situation we can again talk about the advantage of Ledendre polynomials.

Summing up the results of this section, we obtain to the following conclusions.

(I) We can talk about the approximately equal computational costs for the formulas (115) and (120). This means that computational costs for the implementation of Milstein scheme (explicit one-step strong numerical method with the order of accuracy 1.0 for Ito SDEs) for the case of Legendre polynomials and for the case of trigonometric functions are approximately the same.

(II) If we will not use the random variables $\xi_q^{(i)}$ (see (115)), then the mean-square error of approximation of the stochastic integral $I_{(00)T,t}^{(i_1 i_2)}$ will be three times larger (see (110)). In this situation we can talk about the advantage of Ledendre polynomials within the frames of the Milstein scheme for Ito SDEs. Moreover, in this case the stochastic integrals $I_{(1)T,t}^{(i_1)}$, $I_{(2)T,t}^{(i_1)}$ (with Gaussian distribution) will be approximated worse.

(III) If we talk about an explicit one-step strong Taylor–Ito scheme of the order of accuracy $\gamma = 1.5$ for Ito SDEs, then the numbers q, q_1 (see (92), (120)) are different. At that $q_1 \ll q$ (the case of Legendre polynomials). The number q must be the same in (114), (115), (122) (the case of trigonometric functions). This leads to huge computational costs (see very complex formula (122)). From the other hand, we can choose different numbers q in (114), (115), (122). At that we must exclude the random variables $\xi_q^{(i)}$, $\mu_q^{(i)}$ from (114), (115), (122). This leads to another problems which we discussed above (see Conclusion (II)).

(IV) In addition, the author of this article supposes that the effect described in Conclusion (III) will be more impressive when analyzing more complex families of iterated Ito and Stratonovich stochastic integrals (when $\gamma = 2.0,\ 2.5,\ 3.0,\ \ldots$). This supposition is based on the fact that the polynomial system of functions has the significant advantage (in comparison with the trigonometric system of functions) for approximation of iterated stochastic integrals for which not all weight functions are equal to 1.

5. Convergence With Probability 1 of Expansions of Iterated Stochastic Integrals of Multiplicities 1 and 2

Let us address now to the convergence with probability 1. Note that proving Theorem 1 [22] (Theorem 1.1, Sect. 1.1.3) or Theorem 2 [22] (Theorem 1.16, Sect. 1.11) we obtained the following representation

$$J[\psi^{(k)}]_{T,t} = \sum_{j_1=0}^{p_1} \ldots \sum_{j_k=0}^{p_k} C_{j_k \ldots j_1} \Biggl(\prod_{l=1}^{k} \zeta_{j_l}^{(i_l)} + \sum_{r=1}^{[k/2]} (-1)^r \times$$

$$\times \sum_{\substack{(\{\{g_1,g_2\},\ldots,\{g_{2r-1},g_{2r}\}\},\{q_1,\ldots,q_{k-2r}\}) \\ \{g_1,g_2,\ldots,g_{2r-1},g_{2r},q_1,\ldots,q_{k-2r}\}=\{1,2,\ldots,k\}}} \prod_{s=1}^{r} \mathbf{1}_{\{i_{g_{2s-1}}=\ i_{g_{2s}}\neq 0\}} \mathbf{1}_{\{j_{g_{2s-1}}=\ j_{g_{2s}}\}} \prod_{l=1}^{k-2r} \zeta_{j_{q_l}}^{(i_{q_l})} \Biggr) + R_{T,t}^{p_1,\ldots,p_k}$$

w. p. 1, where

$$R_{T,t}^{p_1,\ldots,p_k} = \sum_{(t_1,\ldots,t_k)} \int_t^T \ldots \int_t^{t_2} R_{p_1,\ldots,p_k}(t_1,\ldots,t_k) d\mathbf{w}_{t_1}^{(i_1)} \ldots d\mathbf{w}_{t_k}^{(i_k)}, \tag{133}$$

$$R_{p_1,\ldots,p_k}(t_1,\ldots,t_k) = K(t_1,\ldots,t_k) - \sum_{j_1=0}^{p_1} \ldots \sum_{j_k=0}^{p_k} C_{j_k \ldots j_1} \prod_{l=1}^{k} \phi_{j_l}(t_l),$$

where permutations $(t_1,\ldots,t_k)$ when summing in (133) are performed only in the values $d\mathbf{w}_{t_1}^{(i_1)} \ldots d\mathbf{w}_{t_k}^{(i_k)}$. At the same time the indexes near upper limits of integration in the iterated stochastic integrals are changed correspondently and if t_r swapped with t_q in the permutation $(t_1,\ldots,t_k)$, then i_r swapped with i_q in the permutation $(i_1,\ldots,i_k)$. Another notations are the same as in Theorems 1, 2.

Let us consider in detail the following expansion of iterated Ito stochastic integral

$$I_{(00)T,t}^{(i_1 i_2)}=\frac{T-t}{2}\left(\zeta_0^{(i_1)}\zeta_0^{(i_2)}+\sum_{i=1}^{\infty}\frac{1}{\sqrt{4i^2-1}}\left(\zeta_{i-1}^{(i_1)}\zeta_i^{(i_2)}-\zeta_i^{(i_1)}\zeta_{i-1}^{(i_2)}\right)-\mathbf{1}_{\{i_1=i_2\}}\right). \tag{134}$$

If $i_1=i_2$, then from (134) we obtain the following equality

$$I_{(00)T,t}^{(i_1 i_1)}=\frac{1}{2}(T-t)\left(\left(\zeta_0^{(i_1)}\right)^2-1\right),$$

which is correct w. p. 1 and can be obtained using the Ito formula.

Let us consider the case $i_1\ne i_2$. In this case

$$I_{(00)T,t}^{*(i_1 i_2)}=I_{(00)T,t}^{(i_1 i_2)}\quad \text{w. p. 1.}$$

First, note the well-known fact.

Lemma 1. *If for the sequence of random variables ξ_p and for some $\alpha>0$ the number series*

$$\sum_{p=1}^{\infty}\mathsf{M}\left\{|\xi_p|^{\alpha}\right\}$$

converges, then the sequence ξ_p converges to zero w. p. 1.

In our specific case ($i_1\ne i_2$)

$$I_{(00)T,t}^{(i_1 i_2)}=I_{(00)T,t}^{(i_1 i_2)p}+\xi_p,\quad \xi_p=\frac{T-t}{2}\sum_{i=p+1}^{\infty}\frac{1}{\sqrt{4i^2-1}}\left(\zeta_{i-1}^{(i_1)}\zeta_i^{(i_2)}-\zeta_i^{(i_1)}\zeta_{i-1}^{(i_2)}\right),$$

$$I_{(00)T,t}^{(i_1 i_2)p}=\frac{T-t}{2}\left(\zeta_0^{(i_1)}\zeta_0^{(i_2)}+\sum_{i=1}^{p}\frac{1}{\sqrt{4i^2-1}}\left(\zeta_{i-1}^{(i_1)}\zeta_i^{(i_2)}-\zeta_i^{(i_1)}\zeta_{i-1}^{(i_2)}\right)\right). \tag{135}$$

Let

$$R_{T,t}^{p_1,p_2}\stackrel{\mathsf{def}}{=}R_{T,t}^{p},\quad R_{p_1p_2}(t_1,t_2)\stackrel{\mathsf{def}}{=}R_p(t_1,t_2)\quad \text{for}\quad p_1=p_2=p.$$

Then

$$\xi_p=R_{T,t}^p=\int_t^T\int_t^{t_2}R_p(t_1,t_2)d\mathbf{f}_{t_1}^{(i_1)}d\mathbf{f}_{t_2}^{(i_2)}+\int_t^T\int_t^{t_1}R_p(t_1,t_2)d\mathbf{f}_{t_2}^{(i_2)}d\mathbf{f}_{t_1}^{(i_1)},$$

$$\mathsf{M}\{|\xi_p|^2\}=\int_t^T\int_t^{t_2}\left(R_p(t_1,t_2)\right)^2dt_1dt_2+\int_t^T\int_t^{t_1}\left(R_p(t_1,t_2)\right)^2dt_2dt_1=\int_{[t,T]^2}\left(R_p(t_1,t_2)\right)^2dt_1dt_2, \tag{136}$$

$$\mathsf{M}\left\{|\xi_p|^2\right\}=\frac{(T-t)^2}{2}\sum_{i=p+1}^{\infty}\frac{1}{4i^2-1}, \tag{137}$$

$$R_p(t_1,t_2)=K(t_1,t_2)-\sum_{j_1,j_2=0}^{p}C_{j_2j_1}\phi_{j_1}(t_1)\phi_{j_2}(t_2),$$

(138) $$\sum_{i=p+1}^{\infty}\frac{1}{4i^2-1}\le\int\limits_{p}^{\infty}\frac{1}{4x^2-1}dx=-\frac{1}{4}\ln\left|1-\frac{2}{2p+1}\right|\le\frac{C}{p},$$

where constant C does not depend on p.

Therefore, taking $\alpha=2$ in Lemma 1, we cannot prove the convergence of ξ_p to zero w. p. 1, since the series

$$\sum_{p=1}^{\infty}\mathsf{M}\left\{|\xi_p|^2\right\}$$

will be majorized by the divergent Dirichlet series with the index 1. Let us take $\alpha=4$ and estimate the value $\mathsf{M}\left\{|\xi_p|^4\right\}$.

According to (33), we can write

(139) $$\mathsf{M}\left\{\left(R_{T,t}^{p_1,\ldots,p_k}\right)^{2n}\right\}\le C_{n,k}\left(\int\limits_{[t,T]^k}R^2_{p_1\ldots p_k}(t_1,\ldots,t_k)dt_1\ldots dt_k\right)^n,$$

where $C_{n.k}=(k!)^{2n}(n(2n-1))^{n(k-1)}(2n-1)!!$

From (139) for $k=2$, $n=2$ and (136)–(138) we obtain

(140) $$\mathsf{M}\left\{|\xi_p|^4\right\}\le K\left(\int\limits_{[t,T]^2}R_p^2(t_1,t_2)dt_1dt_2\right)^2\le\frac{K_1}{p^2}$$

and

(141) $$\sum_{p=1}^{\infty}\mathsf{M}\left\{|\xi_p|^4\right\}\le K_1\sum_{p=1}^{\infty}\frac{1}{p^2}<\infty,$$

where constants K, K_1 do not depend on p.

Since the series in (141) converges, then according to Lemma 1 we obtain that $\xi_p\to 0$ when $p\to\infty$ w. p. 1. Then

$$I_{(00)T,t}^{(i_1i_2)p}\to I_{(00)T,t}^{(i_1i_2)}\ \ \text{when}\ \ p\to\infty\ \ \text{w. p. 1.}$$

Let us consider the stochastic integrals $I_{(01)T,t}^{*(i_1i_2)}$, $I_{(10)T,t}^{*(i_1i_2)}$ whose expansions look as (55), (56).

Consider the case $i_1\ne i_2$. In this case

$$I_{(01)T,t}^{*(i_1i_2)}=I_{(01)T,t}^{(i_1i_2)},\quad I_{(10)T,t}^{*(i_1i_2)}=I_{(10)T,t}^{(i_1i_2)},\quad I_{(00)T,t}^{*(i_1i_2)}=I_{(00)T,t}^{(i_1i_2)}\quad\text{w. p. 1,}$$

and

$$I_{(01)T,t}^{(i_1 i_2)} = -\frac{T-t}{2} I_{(00)T,t}^{(i_1 i_2)p} - \frac{(T-t)^2}{4}\left(\frac{1}{\sqrt{3}}\zeta_0^{(i_1)}\zeta_1^{(i_2)} + \right.$$

$$\left. + \sum_{i=0}^{p}\left(\frac{(i+2)\zeta_i^{(i_1)}\zeta_{i+2}^{(i_2)} - (i+1)\zeta_{i+2}^{(i_1)}\zeta_i^{(i_2)}}{\sqrt{(2i+1)(2i+5)}(2i+3)} - \frac{\zeta_i^{(i_1)}\zeta_i^{(i_2)}}{(2i-1)(2i+3)}\right)\right) + \xi_p^{(01)},$$

$$I_{(10)T,t}^{(i_1 i_2)} = -\frac{T-t}{2} I_{(00)T,t}^{(i_1 i_2)p} - \frac{(T-t)^2}{4}\left(\frac{1}{\sqrt{3}}\zeta_0^{(i_2)}\zeta_1^{(i_1)} + \right.$$

$$\left. + \sum_{i=0}^{p}\left(\frac{(i+1)\zeta_{i+2}^{(i_2)}\zeta_i^{(i_1)} - (i+2)\zeta_i^{(i_2)}\zeta_{i+2}^{(i_1)}}{\sqrt{(2i+1)(2i+5)}(2i+3)} + \frac{\zeta_i^{(i_1)}\zeta_i^{(i_2)}}{(2i-1)(2i+3)}\right)\right) + \xi_p^{(10)},$$

where

$$\xi_p^{(01)} = -\frac{(T-t)^2}{4}\left(\sum_{i=p+1}^{\infty}\frac{1}{\sqrt{4i^2-1}}\left(\zeta_{i-1}^{(i_1)}\zeta_i^{(i_2)} - \zeta_i^{(i_1)}\zeta_{i-1}^{(i_2)}\right) + \right.$$

$$\left. + \sum_{i=p+1}^{\infty}\left(\frac{(i+2)\zeta_i^{(i_1)}\zeta_{i+2}^{(i_2)} - (i+1)\zeta_{i+2}^{(i_1)}\zeta_i^{(i_2)}}{\sqrt{(2i+1)(2i+5)}(2i+3)} - \frac{\zeta_i^{(i_1)}\zeta_i^{(i_2)}}{(2i-1)(2i+3)}\right)\right),$$

$$\xi_p^{(10)} = -\frac{(T-t)^2}{4}\left(\sum_{i=p+1}^{\infty}\frac{1}{\sqrt{4i^2-1}}\left(\zeta_{i-1}^{(i_1)}\zeta_i^{(i_2)} - \zeta_i^{(i_1)}\zeta_{i-1}^{(i_2)}\right) + \right.$$

$$\left. + \sum_{i=p+1}^{\infty}\left(\frac{(i+1)\zeta_i^{(i_1)}\zeta_{i+2}^{(i_2)} - (i+2)\zeta_{i+2}^{(i_1)}\zeta_i^{(i_2)}}{\sqrt{(2i+1)(2i+5)}(2i+3)} - \frac{\zeta_i^{(i_1)}\zeta_i^{(i_2)}}{(2i-1)(2i+3)}\right)\right).$$

Then

$$\mathsf{M}\left\{\left|\xi_p^{(01)}\right|^2\right\} = \int\limits_{[t,T]^2}\left(R_p^{(01)}(t_1,t_2)\right)^2 dt_1 dt_2 = \frac{(T-t)^4}{16}\times$$

$$\times \sum_{i=p+1}^{\infty}\left(\frac{2}{4i^2-1} + \frac{(i+2)^2+(i+1)^2}{(2i+1)(2i+5)(2i+3)^2} + \frac{1}{(2i-1)^2(2i+3)^2}\right) \le C\sum_{i=p+1}^{\infty}\frac{1}{i^2} \le \frac{K}{p}, \tag{142}$$

where constants C, K do not depend on p.

Analogously, we obtain

$$\mathsf{M}\left\{\left|\xi_p^{(10)}\right|^2\right\} = \int\limits_{[t,T]^2}\left(R_p^{(10)}(t_1,t_2)\right)^2 dt_1 dt_2 \le \frac{K}{p}, \tag{143}$$

where constant K does not depend on p.

According (139) when $k=2$, $n=2$ and (142), (143), we obtain

$$
\mathsf{M}\left\{\left|\xi_p^{(01)}\right|^4\right\} \le K\left(\int\limits_{[t,T]^2}\left(R_p^{(01)}(t_1,t_2)\right)^2 dt_1dt_2\right)^2 \le \frac{K_1}{p^2},
$$

$$
\mathsf{M}\left\{\left|\xi_p^{(10)}\right|^4\right\} \le K\left(\int\limits_{[t,T]^2}\left(R_p^{(10)}(t_1,t_2)\right)^2 dt_1dt_2\right)^2 \le \frac{K_1}{p^2},
$$

and

$$
\sum_{p=1}^{\infty}\mathsf{M}\left\{\left|\xi_p^{(01)}\right|^4\right\} \le K_1\sum_{p=1}^{\infty}\frac{1}{p^2}<\infty, \quad \sum_{p=1}^{\infty}\mathsf{M}\left\{\left|\xi_p^{(10)}\right|^4\right\} \le K_1\sum_{p=1}^{\infty}\frac{1}{p^2}<\infty, \tag{144}
$$

where constant K_1 does not depend on p.

From (144) and Lemma 1 we obtain that $\xi_p^{(01)},\ \xi_p^{(10)} \to 0$ when $p\to\infty$ w. p. 1. Then

$$
I_{(01)T,t}^{(i_1i_2)p} \to I_{(01)T,t}^{(i_1i_2)}, \quad I_{(10)T,t}^{(i_1i_2)p} \to I_{(10)T,t}^{(i_1i_2)} \quad \text{when} \quad p\to\infty \quad \text{w. p. 1},
$$

where $i_1\ne i_2$.

Let us consider the case $i_1=i_2$

$$
I_{(01)T,t}^{(i_1i_1)} = -\frac{(T-t)^2}{4}\left(\left(\zeta_0^{(i_1)}\right)^2 - 1 + \frac{1}{\sqrt{3}}\zeta_0^{(i_1)}\zeta_1^{(i_1)} + \right.
$$

$$
\left. + \sum_{i=0}^{p}\left(\frac{1}{\sqrt{(2i+1)(2i+5)}(2i+3)}\zeta_i^{(i_1)}\zeta_{i+2}^{(i_1)} - \frac{1}{(2i-1)(2i+3)}\left(\zeta_i^{(i_1)}\right)^2\right)\right) + \mu_p^{(01)},
$$

$$
I_{(10)T,t}^{(i_1i_1)} = -\frac{(T-t)^2}{4}\left(\left(\zeta_0^{(i_1)}\right)^2 - 1 + \frac{1}{\sqrt{3}}\zeta_0^{(i_1)}\zeta_1^{(i_1)} + \right.
$$

$$
\left. + \sum_{i=0}^{p}\left(-\frac{1}{\sqrt{(2i+1)(2i+5)}(2i+3)}\zeta_i^{(i_1)}\zeta_{i+2}^{(i_1)} + \frac{1}{(2i-1)(2i+3)}\left(\zeta_i^{(i_1)}\right)^2\right)\right) + \mu_p^{(10)},
$$

where

$$
\mu_p^{(01)} = -\frac{(T-t)^2}{4}\sum_{i=p+1}^{\infty}\left(\frac{1}{\sqrt{(2i+1)(2i+5)}(2i+3)}\zeta_i^{(i_1)}\zeta_{i+2}^{(i_1)} - \frac{1}{(2i-1)(2i+3)}\left(\zeta_i^{(i_1)}\right)^2\right),
$$

$$
\mu_p^{(10)} = -\frac{(T-t)^2}{4}\sum_{i=p+1}^{\infty}\left(-\frac{1}{\sqrt{(2i+1)(2i+5)}(2i+3)}\zeta_i^{(i_1)}\zeta_{i+2}^{(i_1)} + \frac{1}{(2i-1)(2i+3)}\left(\zeta_i^{(i_1)}\right)^2\right).
$$

Then

$$\mathsf{M}\left\{\left(\mu_p^{(01)}\right)^2\right\} = \mathsf{M}\left\{\left(\mu_p^{(10)}\right)^2\right\} = \frac{(T-t)^4}{16}\times$$

$$\times\left(\sum_{i=p+1}^{\infty}\frac{1}{(2i+1)(2i+5)(2i+3)^2} + \sum_{i=p+1}^{\infty}\frac{2}{(2i-1)^2(2i+3)^2} + \left(\sum_{i=p+1}^{\infty}\frac{1}{(2i-1)(2i+3)}\right)^2\right) \le \frac{K}{p^2}$$

and

$$\sum_{p=1}^{\infty}\mathsf{M}\left\{\left|\mu_p^{(01)}\right|^2\right\} \le K\sum_{p=1}^{\infty}\frac{1}{p^2} < \infty, \quad \sum_{p=1}^{\infty}\mathsf{M}\left\{\left|\mu_p^{(10)}\right|^2\right\} \le K\sum_{p=1}^{\infty}\frac{1}{p^2} < \infty, \tag{145}$$

where constant K does not depend on p.

According Lemma 1 and (145), we obtain that $\mu_p^{(01)},\ \mu_p^{(10)} \to 0$ when $p\to\infty$ w. p. 1. Then

$$I_{(01)T,t}^{(i_1i_1)p} \to I_{(01)T,t}^{(i_1i_1)}, \quad I_{(10)T,t}^{(i_1i_1)p} \to I_{(10)T,t}^{(i_1i_1)} \quad \text{when} \quad p\to\infty \quad \text{w. p. 1.}$$

Analogously, we obtain

$$I_{(02)T,t}^{(i_1i_2)p} \to I_{(02)T,t}^{(i_1i_2)}, \quad I_{(11)T,t}^{(i_1i_2)p} \to I_{(11)T,t}^{(i_1i_2)}, \quad I_{(20)T,t}^{(i_1i_2)p} \to I_{(20)T,t}^{(i_1i_2)} \quad \text{when} \quad p\to\infty \quad \text{w. p. 1,}$$

where $i_1, i_2 = 1,\ldots,m$. This result based on the following truncated expansions of the stochastic integrals $I_{(02)T,t}^{(i_1i_2)}$, $I_{(20)T,t}^{(i_1i_2)}$, $I_{(11)T,t}^{(i_1i_2)}$ (see (68)–(70))

$$I_{(02)T,t}^{(i_1i_2)p} = -\frac{(T-t)^2}{4}I_{(00)T,t}^{(i_1i_2)p} - (T-t)I_{(01)T,t}^{(i_1i_2)p} + \frac{(T-t)^3}{8}\left[\frac{2}{3\sqrt{5}}\zeta_2^{(i_2)}\zeta_0^{(i_1)} + \right.$$

$$+\frac{1}{3}\zeta_0^{(i_1)}\zeta_0^{(i_2)} + \sum_{i=0}^{p}\left(\frac{(i+2)(i+3)\zeta_{i+3}^{(i_2)}\zeta_i^{(i_1)} - (i+1)(i+2)\zeta_i^{(i_2)}\zeta_{i+3}^{(i_1)}}{\sqrt{(2i+1)(2i+7)}(2i+3)(2i+5)} + \right.$$

$$\left.\left. + \frac{(i^2+i-3)\zeta_{i+1}^{(i_2)}\zeta_i^{(i_1)} - (i^2+3i-1)\zeta_i^{(i_2)}\zeta_{i+1}^{(i_1)}}{\sqrt{(2i+1)(2i+3)}(2i-1)(2i+5)}\right)\right] -$$

$$-\frac{1}{24}\mathbf{1}_{\{i_1=i_2\}}(T-t)^3,$$

$$I_{(20)T,t}^{(i_1i_2)p} = -\frac{(T-t)^2}{4}I_{(00)T,t}^{(i_1i_2)p} - (T-t)I_{(10)T,t}^{(i_1i_2)p} + \frac{(T-t)^3}{8}\left[\frac{2}{3\sqrt{5}}\zeta_0^{(i_2)}\zeta_2^{(i_1)} + \right.$$

$$+\frac{1}{3}\zeta_0^{(i_1)}\zeta_0^{(i_2)} + \sum_{i=0}^{p}\left(\frac{(i+1)(i+2)\zeta_{i+3}^{(i_2)}\zeta_i^{(i_1)} - (i+2)(i+3)\zeta_i^{(i_2)}\zeta_{i+3}^{(i_1)}}{\sqrt{(2i+1)(2i+7)}(2i+3)(2i+5)} + \right.$$

$$\left.\left. + \frac{(i^2+3i-1)\zeta_{i+1}^{(i_2)}\zeta_i^{(i_1)} - (i^2+i-3)\zeta_i^{(i_2)}\zeta_{i+1}^{(i_1)}}{\sqrt{(2i+1)(2i+3)}(2i-1)(2i+5)}\right)\right] -$$

$$-\frac{1}{24}\mathbf{1}_{\{i_1=i_2\}}(T-t)^3,$$

$$I_{(11)T,t}^{(i_1 i_2)p} = -\frac{(T-t)^2}{4} I_{(00)T,t}^{(i_1 i_2)p} - \frac{T-t}{2}\left(I_{(10)T,t}^{(i_1 i_2)p} + I_{(01)T,t}^{(i_1 i_2)p}\right) +$$

$$+\frac{(T-t)^3}{8}\left[\frac{1}{3}\zeta_1^{(i_1)}\zeta_1^{(i_2)} + \sum_{i=0}^{p}\left(\frac{(i+1)(i+3)\left(\zeta_{i+3}^{(i_2)}\zeta_i^{(i_1)} - \zeta_i^{(i_2)}\zeta_{i+3}^{(i_1)}\right)}{\sqrt{(2i+1)(2i+7)}(2i+3)(2i+5)} + \right.\right.$$

$$\left.\left. + \frac{(i+1)^2\left(\zeta_{i+1}^{(i_2)}\zeta_i^{(i_1)} - \zeta_i^{(i_2)}\zeta_{i+1}^{(i_1)}\right)}{\sqrt{(2i+1)(2i+3)}(2i-1)(2i+5)}\right)\right] -$$

$$-\frac{1}{24}\mathbf{1}_{\{i_1=i_2\}}(T-t)^3.$$

The expansions (51)–(53), (71) for the stochastic integrals $I_{(0)T,t}^{(i_1)}$, $I_{(1)T,t}^{(i_1)}$, $I_{(2)T,t}^{(i_1)}$, $I_{(3)T,t}^{(i_1)}$ are initially correct w. p. 1 (they include 1, 2, 3, and 4 members of expansion, correspondently).

Apparently, using the proposed scheme we can prove convergence w. p. 1 for other iterated stochastic integrals. In the next section, we consider the more general and effective approach.

6. Convergence With Probability 1 of Expansion of Iterated Ito Stochastic Integrals in Theorem 1 for the Case of Multiplicity k ($k \in \mathbb{N}$)

This section is written on the base of Sect. 6 from [31] and Sect. 9 from [25] (also see [22]-[24] (Chapter 1)). Remind that in a lot of author's publications [8]-[41] the convergence in Theorem 1 has been considered in different probabilistic senses. For example, the mean-square convergence [8] (2006) (also see [9]-[41]) and convergence in the mean of degree $2n$ ($n \in \mathbb{N}$) [10] (2007) (also see [11]-[17], [20]-[25]) have been proved. On the examples of specific iterated Ito stochastic integrals of mutiplicities 1 and 2 the convergence with probability 1 has been considered in the previous section (also see [10] (2007), [11]-[17], [20]-[25], [27]). However, these examples are narrow particular cases of the iterated Ito stochastic integrals (2).

In this section, we formulate and prove the theorem [22]-[25], [31], [42] on convergence with probability 1 of the expansions of iterated Ito stochastic integrals from Theorem 1.

Let us remind the well-known fact from the mathematical analysis, which is connected to existence of iterated limits.

Proposition 1. *Let* $\left\{x_{n,m}\right\}_{n,m=1}^{\infty}$ *be a double sequence and let there exists the limit*

$$\lim_{n,m\to\infty} x_{n,m} = a < \infty.$$

Moreover, let there exist the limits

$$\lim_{n\to\infty} x_{n,m} < \infty \quad \text{for any} \quad m, \qquad \lim_{m\to\infty} x_{n,m} < \infty \quad \text{for any} \quad n.$$

Then there exist the iterated limits

$$\lim_{n\to\infty}\lim_{m\to\infty} x_{n,m}, \qquad \lim_{m\to\infty}\lim_{n\to\infty} x_{n,m}$$

and moreover,

$$\lim_{n\to\infty}\lim_{m\to\infty} x_{n,m} = \lim_{m\to\infty}\lim_{n\to\infty} x_{n,m} = a.$$

Theorem 9 [22]-[25], [31], [42]. *Let $\psi_l(\tau)$ $(l=1,\ldots,k)$ are continuously differentiable nonrandom functions on the interval $[t,T]$ and $\{\phi_j(x)\}_{j=0}^{\infty}$ is a complete orthonormal system of Legendre polynomials or trigonometric functions in the space $L_2([t,T])$. Then*

$$J[\psi^{(k)}]_{T,t}^{p,\ldots,p} \ \to \ J[\psi^{(k)}]_{T,t} \quad if \quad p\to\infty$$

w. p. 1, where $J[\psi^{(k)}]_{T,t}^{p,\ldots,p}$ is the expression on the right-hand side of (7) before passing to the limit $\underset{p_1,\ldots,p_k\to\infty}{\text{l.i.m.}}$ for the case $p_1=\ldots=p_k=p$, i.e. (see Theorem 1)

$$J[\psi^{(k)}]_{T,t}^{p,\ldots,p}=\sum_{j_1=0}^{p}\ldots\sum_{j_k=0}^{p}C_{j_k\ldots j_1}\Biggl(\prod_{l=1}^{k}\zeta_{j_l}^{(i_l)}\ -$$

$$-\ \underset{N\to\infty}{\text{l.i.m.}}\sum_{(l_1,\ldots,l_k)\in\mathrm{G}_k}\phi_{j_1}(\tau_{l_1})\Delta\mathbf{w}_{\tau_{l_1}}^{(i_1)}\ldots\phi_{j_k}(\tau_{l_k})\Delta\mathbf{w}_{\tau_{l_k}}^{(i_k)}\Biggr),$$

where $i_1,\ldots,i_k=1,\ldots,m$.

Proof. Let us consider the Parseval equality

$$\int\limits_{[t,T]^k}K^2(t_1,\ldots,t_k)dt_1\ldots dt_k=\lim_{p_1,\ldots,p_k\to\infty}\sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k}C_{j_k\ldots j_1}^2, \tag{146}$$

where

$$K(t_1,\ldots,t_k)=\begin{cases}\psi_1(t_1)\ldots\psi_k(t_k), & t_1<\ldots<t_k\\ \\ 0, & \text{otherwise}\end{cases}\ =\ \prod_{l=1}^{k}\psi_l(t_l)\ \prod_{l=1}^{k-1}\mathbf{1}_{\{t_l<t_{l+1}\}}, \tag{147}$$

where $t_1,\ldots,t_k\in[t,T]$ for $k\ge 2$ and $K(t_1)\equiv\psi_1(t_1)$ for $t_1\in[t,T]$, $\mathbf{1}_A$ denotes the indicator of the set A,

$$C_{j_k\ldots j_1}=\int\limits_{[t,T]^k}K(t_1,\ldots,t_k)\prod_{l=1}^{k}\phi_{j_l}(t_l)dt_1\ldots dt_k \tag{148}$$

is the Fourier coefficient.

Using (147), we obtain

$$C_{j_k\ldots j_1}=\int\limits_t^T\phi_{j_k}(t_k)\psi_k(t_k)\ldots\int\limits_t^{t_2}\phi_{j_1}(t_1)\psi_1(t_1)dt_1\ldots dt_k.$$

Further, we denote

$$\lim_{p_1,\ldots,p_k\to\infty}\sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k}C_{j_k\ldots j_1}^2\ \stackrel{\mathsf{def}}{=}\ \sum_{j_1,\ldots,j_k=0}^{\infty}C_{j_k\ldots j_1}^2.$$

If $p_1 = \ldots = p_k = p$, then we also write

$$\lim_{p\to\infty}\sum_{j_1=0}^{p}\ldots\sum_{j_k=0}^{p} C^2_{j_k\ldots j_1} \stackrel{\sf def}{=} \sum_{j_1,\ldots,j_k=0}^{\infty} C^2_{j_k\ldots j_1}.$$

From the other hand, for iterated limits we write

$$\lim_{p_1\to\infty}\ldots\lim_{p_k\to\infty}\sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k} C^2_{j_k\ldots j_1} \stackrel{\sf def}{=} \sum_{j_1=0}^{\infty}\ldots\sum_{j_k=0}^{\infty} C^2_{j_k\ldots j_1},$$

$$\lim_{p_1\to\infty}\lim_{p_2,\ldots,p_k\to\infty}\sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k} C^2_{j_k\ldots j_1} \stackrel{\sf def}{=} \sum_{j_1=0}^{\infty}\sum_{j_2,\ldots,j_k=0}^{\infty} C^2_{j_k\ldots j_1}$$

and so on.

Let us consider the following lemma.

Lemma 2. *The following equalities are fulfilled*

$$\sum_{j_1,\ldots,j_k=0}^{\infty} C^2_{j_k\ldots j_1} = \sum_{j_1=0}^{\infty}\ldots\sum_{j_k=0}^{\infty} C^2_{j_k\ldots j_1} =$$

$$= \sum_{j_k=0}^{\infty}\ldots\sum_{j_1=0}^{\infty} C^2_{j_k\ldots j_1} = \sum_{j_{q_1}=0}^{\infty}\ldots\sum_{j_{q_k}=0}^{\infty} C^2_{j_k\ldots j_1} \qquad (149)$$

for any permutation $(q_1,\ldots,q_k)$ *such that* $\{q_1,\ldots,q_k\} = \{1,\ldots,k\}$.

Proof. Let us consider the value

$$\sum_{j_{q_l}=0}^{p}\ldots\sum_{j_{q_k}=0}^{p} C^2_{j_k\ldots j_1} \qquad (150)$$

for any permutation $(q_l,\ldots,q_k)$, where $l = 1,2,\ldots,k$, $\{q_1,\ldots,q_k\} = \{1,\ldots,k\}$.

Obviously, (150) is the non-decreasing sequence with respect to p. Moreover,

$$\sum_{j_{q_l}=0}^{p}\ldots\sum_{j_{q_k}=0}^{p} C^2_{j_k\ldots j_1} \le \sum_{j_{q_1}=0}^{p}\sum_{j_{q_2}=0}^{p}\ldots\sum_{j_{q_k}=0}^{p} C^2_{j_k\ldots j_1} \le$$

$$\le \sum_{j_1,\ldots,j_k=0}^{\infty} C^2_{j_k\ldots j_1} < \infty.$$

Then the following limit

$$\lim_{p\to\infty}\sum_{j_{q_l}=0}^{p}\ldots\sum_{j_{q_k}=0}^{p} C^2_{j_k\ldots j_1} = \sum_{j_{q_l},\ldots,j_{q_k}=0}^{\infty} C^2_{j_k\ldots j_1}$$

exists.

Let $p_l,\ldots,p_k$ simultaneously tend to infinity. Then $g,r\to\infty$, where $g=\min\{p_l,\ldots,p_k\}$ and $r=\max\{p_l,\ldots,p_k\}$. Moreover,

$$\sum_{j_{q_l}=0}^{g}\ldots\sum_{j_{q_k}=0}^{g}C_{j_k\ldots j_1}^2\le\sum_{j_{q_l}=0}^{p_l}\ldots\sum_{j_{q_k}=0}^{p_k}C_{j_k\ldots j_1}^2\le\sum_{j_{q_l}=0}^{r}\ldots\sum_{j_{q_k}=0}^{r}C_{j_k\ldots j_1}^2.$$

This means that the existence of the limit

$$\lim_{p\to\infty}\sum_{j_{q_l}=0}^{p}\ldots\sum_{j_{q_k}=0}^{p}C_{j_k\ldots j_1}^2 \tag{151}$$

implies the existence of the limit

$$\lim_{p_l,\ldots,p_k\to\infty}\sum_{j_{q_l}=0}^{p_l}\ldots\sum_{j_{q_k}=0}^{p_k}C_{j_k\ldots j_1}^2 \tag{152}$$

and equality of the limits (151) and (152).

Taking into account the above reasoning, we have

$$\lim_{p,q\to\infty}\sum_{j_{q_l}=0}^{q}\sum_{j_{q_{l+1}}=0}^{p}\ldots\sum_{j_{q_k}=0}^{p}C_{j_k\ldots j_1}^2=\lim_{p\to\infty}\sum_{j_{q_l}=0}^{p}\ldots\sum_{j_{q_k}=0}^{p}C_{j_k\ldots j_1}^2=$$

$$=\lim_{p_l,\ldots,p_k\to\infty}\sum_{j_{q_l}=0}^{p_l}\ldots\sum_{j_{q_k}=0}^{p_k}C_{j_k\ldots j_1}^2. \tag{153}$$

Since the limit

$$\sum_{j_1,\ldots,j_k=0}^{\infty}C_{j_k\ldots j_1}^2$$

exists (see the Parseval equality (146)), then from Proposition 1 we have

$$\sum_{j_{q_1}=0}^{\infty}\sum_{j_{q_2},\ldots,j_{q_k}=0}^{\infty}C_{j_k\ldots j_1}^2=\lim_{q\to\infty}\lim_{p\to\infty}\sum_{j_{q_1}=0}^{q}\sum_{j_{q_2}=0}^{p}\ldots\sum_{j_{q_k}=0}^{p}C_{j_k\ldots j_1}^2=$$

$$=\lim_{q,p\to\infty}\sum_{j_{q_1}=0}^{q}\sum_{j_{q_2}=0}^{p}\ldots\sum_{j_{q_k}=0}^{p}C_{j_k\ldots j_1}^2=\sum_{j_1,\ldots,j_k=0}^{\infty}C_{j_k\ldots j_1}^2. \tag{154}$$

Using (153) and Proposition 1, we get

$$\sum_{j_{q_2}=0}^{\infty}\sum_{j_{q_3},\ldots,j_{q_k}=0}^{\infty}C_{j_k\ldots j_1}^2=\lim_{q\to\infty}\lim_{p\to\infty}\sum_{j_{q_2}=0}^{q}\sum_{j_{q_3}=0}^{p}\ldots\sum_{j_{q_k}=0}^{p}C_{j_k\ldots j_1}^2=$$

$$= \lim_{q,p\to\infty} \sum_{j_{q_2}=0}^{q} \sum_{j_{q_3}=0}^{p} \ldots \sum_{j_{q_k}=0}^{p} C^2_{j_k\ldots j_1} = \sum_{j_{q_2},\ldots,j_{q_k}=0}^{\infty} C^2_{j_k\ldots j_1}. \tag{155}$$

Combining (155) and (154), we obtain

$$\sum_{j_{q_1}=0}^{\infty} \sum_{j_{q_2}=0}^{\infty} \sum_{j_{q_3},\ldots,j_{q_k}=0}^{\infty} C^2_{j_k\ldots j_1} = \sum_{j_1,\ldots,j_k=0}^{\infty} C^2_{j_k\ldots j_1}.$$

Repeating the previous steps, we complete the proof of Lemma 2.

Further, let us show that for $s = 1, \ldots, k$

$$\sum_{j_1=0}^{\infty} \ldots \sum_{j_{s-1}=0}^{\infty} \sum_{j_s=p+1}^{\infty} \sum_{j_{s+1}=0}^{\infty} \ldots \sum_{j_k=0}^{\infty} C^2_{j_k\ldots j_1} =$$

$$= \sum_{j_s=p+1}^{\infty} \sum_{j_{s-1}=0}^{\infty} \ldots \sum_{j_1=0}^{\infty} \sum_{j_{s+1}=0}^{\infty} \ldots \sum_{j_k=0}^{\infty} C^2_{j_k\ldots j_1}. \tag{156}$$

Using the arguments which we used when proving Lemma 2, we obtain

$$\lim_{n\to\infty} \sum_{j_1=0}^{n} \ldots \sum_{j_{s-1}=0}^{n} \sum_{j_s=0}^{p} \sum_{j_{s+1}=0}^{n} \ldots \sum_{j_k=0}^{n} C^2_{j_k\ldots j_1} =$$

$$= \sum_{j_s=0}^{p} \sum_{j_1,\ldots,j_{s-1},j_{s+1},\ldots,j_k=0}^{\infty} C^2_{j_k\ldots j_1} = \sum_{j_s=0}^{p} \sum_{j_{q_1}=0}^{\infty} \ldots \sum_{j_{q_{k-1}}=0}^{\infty} C^2_{j_k\ldots j_1} \tag{157}$$

for any permutation $(q_1, \ldots, q_{k-1})$ such that $\{q_1, \ldots, q_{k-1}\} = \{1, \ldots, s-1, s+1, \ldots, k\}$, where p is a fixed natural number.

Obviously, we have

$$\sum_{j_s=0}^{p} \sum_{j_{q_1}=0}^{\infty} \ldots \sum_{j_{q_{k-1}}=0}^{\infty} C^2_{j_k\ldots j_1} = \sum_{j_{q_1}=0}^{\infty} \ldots \sum_{j_s=0}^{p} \ldots \sum_{j_{q_{k-1}}=0}^{\infty} C^2_{j_k\ldots j_1} = \ldots =$$

$$= \sum_{j_{q_1}=0}^{\infty} \ldots \sum_{j_{q_{k-1}}=0}^{\infty} \sum_{j_s=0}^{p} C^2_{j_k\ldots j_1}. \tag{158}$$

Using (157), (158), and Lemma 2, we get

$$\sum_{j_1=0}^{\infty} \ldots \sum_{j_{s-1}=0}^{\infty} \sum_{j_s=p+1}^{\infty} \sum_{j_{s+1}=0}^{\infty} \ldots \sum_{j_k=0}^{\infty} C^2_{j_k\ldots j_1} = \sum_{j_1=0}^{\infty} \ldots \sum_{j_{s-1}=0}^{\infty} \sum_{j_s=0}^{\infty} \sum_{j_{s+1}=0}^{\infty} \ldots \sum_{j_k=0}^{\infty} C^2_{j_k\ldots j_1} -$$

$$
-\sum_{j_1=0}^{\infty}\ldots\sum_{j_{s-1}=0}^{\infty}\sum_{j_s=0}^{p}\sum_{j_{s+1}=0}^{\infty}\ldots\sum_{j_k=0}^{\infty}C_{j_k\ldots j_1}^2=
$$

$$
=\sum_{j_s=0}^{\infty}\sum_{j_{s-1}=0}^{\infty}\ldots\sum_{j_1=0}^{\infty}\sum_{j_{s+1}=0}^{\infty}\ldots\sum_{j_k=0}^{\infty}C_{j_k\ldots j_1}^2-\sum_{j_s=0}^{p}\sum_{j_{s-1}=0}^{\infty}\ldots\sum_{j_1=0}^{\infty}\sum_{j_{s+1}=0}^{\infty}\ldots\sum_{j_k=0}^{\infty}C_{j_k\ldots j_1}^2=
$$

$$
=\sum_{j_s=p+1}^{\infty}\sum_{j_{s-1}=0}^{\infty}\ldots\sum_{j_1=0}^{\infty}\sum_{j_{s+1}=0}^{\infty}\ldots\sum_{j_k=0}^{\infty}C_{j_k\ldots j_1}^2.
$$

The equality (156) is proved.
Using the Parseval equality and Lemma 2, we obtain

$$
\int\limits_{[t,T]^k}K^2(t_1,\ldots,t_k)dt_1\ldots dt_k-\sum_{j_1=0}^{p}\ldots\sum_{j_k=0}^{p}C_{j_k\ldots j_1}^2=
$$

$$
=\sum_{j_1,\ldots,j_k=0}^{\infty}C_{j_k\ldots j_1}^2-\sum_{j_1=0}^{p}\ldots\sum_{j_k=0}^{p}C_{j_k\ldots j_1}^2=
$$

$$
=\sum_{j_1=0}^{\infty}\ldots\sum_{j_k=0}^{\infty}C_{j_k\ldots j_1}^2-\sum_{j_1=0}^{p}\ldots\sum_{j_k=0}^{p}C_{j_k\ldots j_1}^2=
$$

$$
=\sum_{j_1=0}^{p}\sum_{j_2=0}^{\infty}\ldots\sum_{j_k=0}^{\infty}C_{j_k\ldots j_1}^2+\sum_{j_1=p+1}^{\infty}\sum_{j_2=0}^{\infty}\ldots\sum_{j_k=0}^{\infty}C_{j_k\ldots j_1}^2-\sum_{j_1=0}^{p}\ldots\sum_{j_k=0}^{p}C_{j_k\ldots j_1}^2=
$$

$$
=\sum_{j_1=0}^{p}\sum_{j_2=0}^{p}\sum_{j_3=0}^{\infty}\ldots\sum_{j_k=0}^{\infty}C_{j_k\ldots j_1}^2+\sum_{j_1=0}^{p}\sum_{j_2=p+1}^{\infty}\sum_{j_3=0}^{\infty}\ldots\sum_{j_k=0}^{\infty}+
$$

$$
+\sum_{j_1=p+1}^{\infty}\sum_{j_2=0}^{\infty}\ldots\sum_{j_k=0}^{\infty}C_{j_k\ldots j_1}^2-\sum_{j_1=0}^{p}\ldots\sum_{j_k=0}^{p}C_{j_k\ldots j_1}^2=\ldots=
$$

$$
=\sum_{j_1=p+1}^{\infty}\sum_{j_2=0}^{\infty}\ldots\sum_{j_k=0}^{\infty}C_{j_k\ldots j_1}^2+\sum_{j_1=0}^{p}\sum_{j_2=p+1}^{\infty}\sum_{j_2=0}^{\infty}\ldots\sum_{j_k=0}^{\infty}C_{j_k\ldots j_1}^2+
$$

$$
+\sum_{j_1=0}^{p}\sum_{j_2=0}^{p}\sum_{j_3=p+1}^{\infty}\sum_{j_4=0}^{\infty}\ldots\sum_{j_k=0}^{\infty}C_{j_k\ldots j_1}^2+\ldots+\sum_{j_1=0}^{p}\ldots\sum_{j_{k-1}=0}^{p}\sum_{j_k=p+1}^{\infty}C_{j_k\ldots j_1}^2\le
$$

$$\leq \sum_{j_1=p+1}^{\infty}\sum_{j_2=0}^{\infty}\ldots\sum_{j_k=0}^{\infty} C_{j_k\ldots j_1}^2 + \sum_{j_1=0}^{\infty}\sum_{j_2=p+1}^{\infty}\sum_{j_2=0}^{\infty}\ldots\sum_{j_k=0}^{\infty} C_{j_k\ldots j_1}^2 +$$

$$+\sum_{j_1=0}^{\infty}\sum_{j_2=0}^{\infty}\sum_{j_3=p+1}^{\infty}\sum_{j_4=0}^{\infty}\ldots\sum_{j_k=0}^{\infty} C_{j_k\ldots j_1}^2 + \ldots + \sum_{j_1=0}^{\infty}\ldots\sum_{j_{k-1}=0}^{\infty}\sum_{j_k=p+1}^{\infty} C_{j_k\ldots j_1}^2 =$$

$$= \sum_{s=1}^{k}\left(\sum_{j_1=0}^{\infty}\ldots\sum_{j_{s-1}=0}^{\infty}\sum_{j_s=p+1}^{\infty}\sum_{j_{s+1}=0}^{\infty}\ldots\sum_{j_k=0}^{\infty} C_{j_k\ldots j_1}^2\right). \tag{159}$$

Note that deriving (159), we used the following

$$\sum_{j_1=0}^{p}\ldots\sum_{j_{s-1}=0}^{p}\sum_{j_s=p+1}^{\infty}\sum_{j_{s+1}=0}^{\infty}\ldots\sum_{j_k=0}^{\infty} C_{j_k\ldots j_1}^2 \leq$$

$$\leq \sum_{j_1=0}^{m_1}\ldots\sum_{j_{s-1}=0}^{m_{s-1}}\sum_{j_s=p+1}^{\infty}\sum_{j_{s+1}=0}^{\infty}\ldots\sum_{j_k=0}^{\infty} C_{j_k\ldots j_1}^2 \leq$$

$$\leq \lim_{m_{s-1}\to\infty}\sum_{j_1=0}^{m_1}\ldots\sum_{j_{s-1}=0}^{m_{s-1}}\sum_{j_s=p+1}^{\infty}\sum_{j_{s+1}=0}^{\infty}\ldots\sum_{j_k=0}^{\infty} C_{j_k\ldots j_1}^2 =$$

$$= \sum_{j_1=0}^{m_1}\ldots\sum_{j_{s-2}=0}^{m_{s-2}}\sum_{j_{s-1}=0}^{\infty}\sum_{j_s=p+1}^{\infty}\sum_{j_{s+1}=0}^{\infty}\ldots\sum_{j_k=0}^{\infty} C_{j_k\ldots j_1}^2 \leq$$

$$\leq \ldots \leq$$

$$\leq \sum_{j_1=0}^{\infty}\ldots\sum_{j_{s-1}=0}^{\infty}\sum_{j_s=p+1}^{\infty}\sum_{j_{s+1}=0}^{\infty}\ldots\sum_{j_k=0}^{\infty} C_{j_k\ldots j_1}^2,$$

where $m_1,\ldots,m_{s-1} > p$.

Denote

$$C_{j_s\ldots j_1}(\tau) = \int\limits_t^{\tau}\phi_{j_s}(t_s)\psi_s(t_s)\ldots\int\limits_t^{t_2}\phi_{j_1}(t_1)\psi_1(t_1)dt_1\ldots dt_s,$$

where $s = 1,\ldots,k-1$.

Let us remind the Dini Theorem, which we will use further.

Theorem (Dini). *Let the functional sequence $u_n(x)$ be non-decreasing at each point of the interval $[a,b]$. In addition, all the functions $u_n(x)$ of this sequence and the limit function $u(x)$ are continuous on the interval $[a,b]$. Then the convergence $u_n(x)$ to $u(x)$ is uniform on the interval $[a,b]$.*

For $s < k$ due to the Parseval equality, Dini Theorem and (156) we obtain

$$\sum_{j_1=0}^{\infty}\ldots\sum_{j_{s-1}=0}^{\infty}\sum_{j_s=p+1}^{\infty}\sum_{j_{s+1}=0}^{\infty}\ldots\sum_{j_k=0}^{\infty}C_{j_k\ldots j_1}^2 =$$

$$\stackrel{(156)}{=}\quad \sum_{j_s=p+1}^{\infty}\sum_{j_{s-1}=0}^{\infty}\ldots\sum_{j_1=0}^{\infty}\sum_{j_{s+1}=0}^{\infty}\ldots\sum_{j_k=0}^{\infty}C_{j_k\ldots j_1}^2 =$$

$$\stackrel{\text{(Parseval Eq.)}}{=}\quad \sum_{j_s=p+1}^{\infty}\sum_{j_{s-1}=0}^{\infty}\ldots\sum_{j_1=0}^{\infty}\sum_{j_{s+1}=0}^{\infty}\ldots\sum_{j_{k-1}=0}^{\infty}\int\limits_t^T\psi_k^2(t_k)\left(C_{j_{k-1}\ldots j_1}(t_k)\right)^2 dt_k =$$

$$\stackrel{\text{(Dini Th.)}}{=}\quad \sum_{j_s=p+1}^{\infty}\sum_{j_{s-1}=0}^{\infty}\ldots\sum_{j_1=0}^{\infty}\sum_{j_{s+1}=0}^{\infty}\ldots\sum_{j_{k-2}=0}^{\infty}\int\limits_t^T\psi_k^2(t_k)\sum_{j_{k-1}=0}^{\infty}\left(C_{j_{k-1}\ldots j_1}(t_k)\right)^2 dt_k =$$

$$\stackrel{\text{(Parseval Eq.)}}{=}\quad \sum_{j_s=p+1}^{\infty}\sum_{j_{s-1}=0}^{\infty}\ldots\sum_{j_1=0}^{\infty}\sum_{j_{s+1}=0}^{\infty}\ldots\sum_{j_{k-2}=0}^{\infty}\int\limits_t^T\psi_k^2(t_k)\int\limits_t^{t_k}\psi_{k-1}^2(t_{k-1})\left(C_{j_{k-2}\ldots j_1}(t_{k-1})\right)^2\times$$

$$\times dt_{k-1}dt_k \le$$

$$\le C\sum_{j_s=p+1}^{\infty}\sum_{j_{s-1}=0}^{\infty}\ldots\sum_{j_1=0}^{\infty}\sum_{j_{s+1}=0}^{\infty}\ldots\sum_{j_{k-2}=0}^{\infty}\int\limits_t^T\left(C_{j_{k-2}\ldots j_1}(\tau)\right)^2 d\tau =$$

$$\stackrel{\text{(Dini Th.)}}{=}\quad C\sum_{j_s=p+1}^{\infty}\sum_{j_{s-1}=0}^{\infty}\ldots\sum_{j_1=0}^{\infty}\sum_{j_{s+1}=0}^{\infty}\ldots\sum_{j_{k-3}=0}^{\infty}\int\limits_t^T\sum_{j_{k-2}=0}^{\infty}\left(C_{j_{k-2}\ldots j_1}(\tau)\right)^2 d\tau =$$

$$\stackrel{\text{(Parseval Eq.)}}{=}\quad C\sum_{j_s=p+1}^{\infty}\sum_{j_{s-1}=0}^{\infty}\ldots\sum_{j_1=0}^{\infty}\sum_{j_{s+1}=0}^{\infty}\ldots\sum_{j_{k-3}=0}^{\infty}\int\limits_t^T\int\limits_t^{\tau}\psi_{k-2}^2(\theta)\left(C_{j_{k-3}\ldots j_1}(\theta)\right)^2 d\theta d\tau \le$$

$$\le K\sum_{j_s=p+1}^{\infty}\sum_{j_{s-1}=0}^{\infty}\ldots\sum_{j_1=0}^{\infty}\sum_{j_{s+1}=0}^{\infty}\ldots\sum_{j_{k-3}=0}^{\infty}\int\limits_t^T\left(C_{j_{k-3}\ldots j_1}(\tau)\right)^2 d\tau \le$$

$$\le\ldots\le$$

$$\le C_k\sum_{j_s=p+1}^{\infty}\sum_{j_{s-1}=0}^{\infty}\ldots\sum_{j_1=0}^{\infty}\int\limits_t^T\left(C_{j_s\ldots j_1}(\tau)\right)^2 d\tau =$$

(160) $$\stackrel{\text{(Dini Th.)}}{=} \quad C_k \sum_{j_s=p+1}^{\infty} \sum_{j_{s-1}=0}^{\infty} \ldots \sum_{j_2=0}^{\infty} \int\limits_t^T \sum_{j_1=0}^{\infty} \left(C_{j_s\ldots j_1}(\tau)\right)^2 d\tau,$$

where constants C, K depend on $T-t$ and constant C_k depends on k and $T-t$.

Let us explane more precisely how we obtain (160). For any function $g(s) \in L_2([t,T])$ we have the following Parseval equality

$$\sum_{j=0}^{\infty} \left(\int\limits_t^{\tau} \phi_j(s)g(s)ds\right)^2 = \sum_{j=0}^{\infty} \left(\int\limits_t^{T} \mathbf{1}_{\{s<\tau\}}\phi_j(s)g(s)ds\right)^2 =$$

(161) $$= \int\limits_t^T \left(\mathbf{1}_{\{s<\tau\}}\right)^2 g^2(s)ds = \int\limits_t^{\tau} g^2(s)ds.$$

The equality (161) has been applied repeatedly when we obtaining (160).

Using the replacement of the integrating order in Riemann integrals, we have

$$C_{j_s\ldots j_1}(\tau) = \int\limits_t^{\tau} \phi_{j_s}(t_s)\psi_s(t_s)\ldots \int\limits_t^{t_2} \phi_{j_1}(t_1)\psi_1(t_1)dt_1\ldots dt_s =$$

$$= \int\limits_t^{\tau} \phi_{j_1}(t_1)\psi_1(t_1) \int\limits_{t_1}^{\tau} \phi_{j_2}(t_2)\psi_2(t_2)\ldots \int\limits_{t_{s-1}}^{\tau} \phi_{j_s}(t_s)\psi_s(t_s)dt_s\ldots dt_2dt_1 \stackrel{\text{def}}{=}$$

$$\stackrel{\text{def}}{=} \tilde{C}_{j_s\ldots j_1}(\tau).$$

For $l=1,\ldots,s$ we will use the following notation

$$\tilde{C}_{j_s\ldots j_l}(\tau,\theta) = \int\limits_{\theta}^{\tau} \phi_{j_l}(t_l)\psi_l(t_l) \int\limits_{t_l}^{\tau} \phi_{j_{l+1}}(t_{l+1})\psi_{l+1}(t_{l+1})\ldots \int\limits_{t_{s-1}}^{\tau} \phi_{j_s}(t_s)\psi_s(t_s)dt_s\ldots dt_{l+1}dt_l.$$

Using the Parseval equality and Dini Theorem, from (160) we obtain

$$\sum_{j_1=0}^{\infty}\ldots \sum_{j_{s-1}=0}^{\infty} \sum_{j_s=p+1}^{\infty} \sum_{j_{s+1}=0}^{\infty} \ldots \sum_{j_k=0}^{\infty} C^2_{j_k\ldots j_1} \le$$

$$\le C_k \sum_{j_s=p+1}^{\infty} \sum_{j_{s-1}=0}^{\infty} \ldots \sum_{j_2=0}^{\infty} \int\limits_t^T \sum_{j_1=0}^{\infty} \left(C_{j_s\ldots j_1}(\tau)\right)^2 d\tau =$$

$$
= C_k \sum_{j_s=p+1}^{\infty} \sum_{j_{s-1}=0}^{\infty} \ldots \sum_{j_2=0}^{\infty} \int\limits_t^T \sum_{j_1=0}^{\infty} \left(\tilde{C}_{j_s\ldots j_1}(\tau)\right)^2 d\tau =
$$

$$
\stackrel{\text{(Parseval Eq.)}}{=} C_k \sum_{j_s=p+1}^{\infty} \sum_{j_{s-1}=0}^{\infty} \ldots \sum_{j_2=0}^{\infty} \int\limits_t^T \int\limits_t^{\tau} \psi_1^2(t_1) \left(\tilde{C}_{j_s\ldots j_2}(\tau,t_1)\right)^2 dt_1 d\tau = \tag{162}
$$

$$
\stackrel{\text{(Dini Th.)}}{=} C_k \sum_{j_s=p+1}^{\infty} \sum_{j_{s-1}=0}^{\infty} \ldots \sum_{j_3=0}^{\infty} \int\limits_t^T \int\limits_t^{\tau} \psi_1^2(t_1) \sum_{j_2=0}^{\infty} \left(\tilde{C}_{j_s\ldots j_2}(\tau,t_1)\right)^2 dt_1 d\tau = \tag{163}
$$

$$
\stackrel{\text{(Parseval Eq.)}}{=} C_k \sum_{j_s=p+1}^{\infty} \sum_{j_{s-1}=0}^{\infty} \ldots \sum_{j_3=0}^{\infty} \int\limits_t^T \int\limits_t^{\tau} \psi_1^2(t_1) \int\limits_{t_1}^{\tau} \psi_2^2(t_2) \left(\tilde{C}_{j_s\ldots j_3}(\tau,t_2)\right)^2 dt_2 dt_1 d\tau \le
$$

$$
\le C_k \sum_{j_s=p+1}^{\infty} \sum_{j_{s-1}=0}^{\infty} \ldots \sum_{j_3=0}^{\infty} \int\limits_t^T \int\limits_t^{\tau} \psi_1^2(t_1) \int\limits_{t}^{\tau} \psi_2^2(t_2) \left(\tilde{C}_{j_s\ldots j_3}(\tau,t_2)\right)^2 dt_2 dt_1 d\tau \le
$$

$$
\le C_k^{'} \sum_{j_s=p+1}^{\infty} \sum_{j_{s-1}=0}^{\infty} \ldots \sum_{j_3=0}^{\infty} \int\limits_t^T \int\limits_t^{\tau} \psi_2^2(t_2) \left(\tilde{C}_{j_s\ldots j_3}(\tau,t_2)\right)^2 dt_2 d\tau \le
$$

$$
\le \ldots \le
$$

$$
\le C_k^{''} \sum_{j_s=p+1}^{\infty} \int\limits_t^T \int\limits_t^{\tau} \psi_{s-1}^2(t_{s-1}) \left(\tilde{C}_{j_s}(\tau,t_{s-1})\right)^2 dt_{s-1} d\tau \le
$$

$$
\le \tilde{C}_k \sum_{j_s=p+1}^{\infty} \int\limits_t^T \int\limits_t^{\tau} \left(\int\limits_u^{\tau} \phi_{j_s}(\theta)\psi_s(\theta)d\theta \right)^2 du d\tau, \tag{164}
$$

where constants $C_k^{'}$, $C_k^{''}$, $\tilde{C}_k$ depend on k and $T-t$.

Let us explane more precisely how we obtain (164). For any function $g(s) \in L_2([t,T])$ we have the following Parseval equality

$$
\sum_{j=0}^{\infty} \left(\int\limits_{\theta}^{\tau} \phi_j(s)g(s)ds \right)^2 = \sum_{j=0}^{\infty} \left(\int\limits_t^T \mathbf{1}_{\{\theta<s<\tau\}} \phi_j(s)g(s)ds \right)^2 =
$$

$$
=\int\limits_t^T\left(\mathbf{1}_{\{\theta<s<\tau\}}\right)^2 g^2(s)ds=\int\limits_\theta^\tau g^2(s)ds. \tag{165}
$$

The equality (165) has been applied repeatedly when we obtaining (164).

Let us explane more precisely the passing from (162) to (163) (the same steps have been used when we deriving (164)).

We have

$$
\int\limits_t^T\int\limits_t^\tau \psi_1^2(t_1)\sum_{j_2=0}^{\infty}\left(\tilde C_{j_s\ldots j_2}(\tau,t_1)\right)^2 dt_1d\tau-\sum_{j_2=0}^{n}\int\limits_t^T\int\limits_t^\tau \psi_1^2(t_1)\left(\tilde C_{j_s\ldots j_2}(\tau,t_1)\right)^2 dt_1d\tau=
$$

$$
=\int\limits_t^T\int\limits_t^\tau \psi_1^2(t_1)\sum_{j_2=n+1}^{\infty}\left(\tilde C_{j_s\ldots j_2}(\tau,t_1)\right)^2 dt_1d\tau=
$$

$$
=\lim_{N\to\infty}\sum_{j=0}^{N-1}\int\limits_t^{\tau_j}\psi_1^2(t_1)\sum_{j_2=n+1}^{\infty}\left(\tilde C_{j_s\ldots j_2}(\tau_j,t_1)\right)^2 dt_1\Delta\tau_j, \tag{166}
$$

where $\{\tau_j\}_{j=0}^N$ is the partition of the interval $[t,T]$, which satisfies the condition (6).

Since the non-decreasing functional sequence $u_n(\tau_j,t_1)$ and its limit function $u(\tau_j,t_1)$ are continuous on the interval $[t,\tau_j]\subseteq[t,T]$ with respect to t_1, where

$$
u_n(\tau_j,t_1)=\sum_{j_2=0}^{n}\left(\tilde C_{j_s\ldots j_2}(\tau_j,t_1)\right)^2,
$$

$$
u(\tau_j,t_1)=\sum_{j_2=0}^{\infty}\left(\tilde C_{j_s\ldots j_2}(\tau_j,t_1)\right)^2=\int\limits_{t_1}^{\tau_j}\psi_2^2(t_2)\left(\tilde C_{j_s\ldots j_3}(\tau_j,t_2)\right)^2 dt_2,
$$

then by Dini Theorem we have the uniform convergence of $u_n(\tau_j,t_1)$ to $u(\tau_j,t_1)$ at the interval $[t,\tau_j]\subseteq[t,T]$ with respect to t_1. As a result, we obtain

$$
\sum_{j_2=n+1}^{\infty}\left(\tilde C_{j_s\ldots j_2}(\tau_j,t_1)\right)^2<\varepsilon,\quad t_1\in[t,\tau_j] \tag{167}
$$

for $n>N(\varepsilon)$ ($N(\varepsilon)$ exists for any $\varepsilon>0$ and it does not depend on t_1).

From (166) and (167) we obtain

$$
\lim_{N\to\infty}\sum_{j=0}^{N-1}\int\limits_t^{\tau_j}\psi_1^2(t_1)\sum_{j_2=n+1}^{\infty}\left(\tilde C_{j_s\ldots j_2}(\tau_j,t_1)\right)^2 dt_1\Delta\tau_j\le\varepsilon\lim_{N\to\infty}\sum_{j=0}^{N-1}\int\limits_t^{\tau_j}\psi_1^2(t_1)dt_1\Delta\tau_j=
$$

$$
= \varepsilon \int\limits_t^T \int\limits_t^{\tau} \psi_1^2(t_1) dt_1 d\tau. \tag{168}
$$

Using (168), we get

$$
\lim_{n\to\infty} \int\limits_t^T \int\limits_t^{\tau} \psi_1^2(t_1) \sum_{j_2=n+1}^{\infty} \left(\tilde{C}_{j_s\ldots j_2}(\tau, t_1)\right)^2 dt_1 d\tau = 0.
$$

This fact completes the proof of passing from (162) to (163).

Let us estimate the integral

$$
\int\limits_u^{\tau} \phi_{j_s}(\theta)\psi_s(\theta) d\theta \tag{169}
$$

from (164) for the case when $\{\phi_j(s)\}_{j=0}^{\infty}$ is a complete orthonormal system of Legendre polynomials or trigonometric functions in the space $L_2([t, T])$.

Note that the estimates for the integral

$$
\int\limits_t^{\tau} \phi_j(\theta)\psi(\theta) d\theta, \quad j \ge p+1, \tag{170}
$$

where $\psi(\theta)$ is a continuously differentiable function on the interval $[t, T]$, have been obtained in [26], [32]. The same estimates can also be found in early publications [13]-[17], [20], [21] and in the monographs [22]-[24].

Let us estimate the integral (169) using the approach from [26], [32].

First, consider the case of Legendre polynomials. Then $\phi_j(s)$ looks as follows

$$
\phi_j(\theta) = \sqrt{\frac{2j+1}{T-t}} P_j\left(\left(\theta - \frac{T+t}{2}\right)\frac{2}{T-t}\right), \quad j \ge 0, \tag{171}
$$

where $P_j(x)$ $(j = 0, 1, 2\ldots)$ is the Legendre polynomial.

Further, we have

$$
\int\limits_v^x \phi_j(\theta)\psi(\theta) d\theta = \frac{\sqrt{T-t}\sqrt{2j+1}}{2} \int\limits_{z(v)}^{z(x)} P_j(y)\psi(u(y)) dy =
$$

$$
= \frac{\sqrt{T-t}}{2\sqrt{2j+1}} \Biggl((P_{j+1}(z(x)) - P_{j-1}(z(x)))\psi(x) - (P_{j+1}(z(v)) - P_{j-1}(z(v)))\psi(v) -
$$

$$
- \frac{T-t}{2} \int\limits_{z(v)}^{z(x)} ((P_{j+1}(y) - P_{j-1}(y))\psi'(u(y)) dy \Biggr), \tag{172}
$$

where $x, v \in (t, T)$, $j \ge p+1$, $u(y)$ and $z(x)$ are defined by the following relations

$$u(y) = \frac{T-t}{2}y + \frac{T+t}{2}, \quad z(x) = \left(x - \frac{T+t}{2}\right)\frac{2}{T-t},$$

and ψ' is a derivative of the function $\psi(\theta)$ with respect to the variable $u(y)$.

Note that in (172) we used the following well known property of the Legendre polynomials

$$\frac{dP_{j+1}}{dx}(x) - \frac{dP_{j-1}}{dx}(x) = (2j+1)P_j(x), \quad j = 1, 2, \ldots$$

From (172) and the well known estimate for the Legendre polynomials

$$|P_j(y)| < \frac{K}{\sqrt{j+1}(1-y^2)^{1/4}}, \quad y \in (-1, 1), \quad j \in \mathbb{N}, \tag{173}$$

where constant K does not depend on y and j, it follows that

$$\left|\int\limits_v^x \phi_j(\theta)\psi(\theta)d\theta\right| < \frac{C}{j}\left(\frac{1}{(1-(z(x))^2)^{1/4}} + \frac{1}{(1-(z(v))^2)^{1/4}} + C_1\right), \tag{174}$$

where $j \in \mathbb{N}$, $z(x), z(v) \in (-1, 1)$, $x, v \in (t, T)$, constants C, C_1 do not depend on j.

From (174) we obtain

$$\left(\int\limits_v^x \phi_j(\theta)\psi(\theta)d\theta\right)^2 < \frac{C_2}{j^2}\left(\frac{1}{(1-(z(x))^2)^{1/2}} + \frac{1}{(1-(z(v))^2)^{1/2}} + C_3\right), \tag{175}$$

where $j \in \mathbb{N}$, constants C_2, C_3 do not depend on j.

Let us apply (175) for estimating of the right-hand side of (164). We have

$$\int\limits_t^T \int\limits_t^\tau \left(\int\limits_u^\tau \phi_{j_s}(\theta)\psi_s(\theta)d\theta\right)^2 du d\tau \le$$

$$\le \frac{K_1}{j_s^2}\left(\int\limits_{-1}^1 \frac{dy}{(1-y^2)^{1/2}} + \int\limits_{-1}^1\int\limits_{-1}^x \frac{dy}{(1-y^2)^{1/2}}dx + K_2\right) \le$$

$$\le \frac{K_3}{j_s^2}, \tag{176}$$

where $j_s \in \mathbb{N}$, constants K_1, K_2, K_3 are independent of j_s.

Now, consider the trigonometric case. The complete orthonormal system of trigonometric functions in the space $L_2([t, T])$ has the following form

$$\phi_j(\theta)=\frac{1}{\sqrt{T-t}}\begin{cases}1, & j=0\\ \sqrt{2}\sin\left(2\pi r(\theta-t)/(T-t)\right), & j=2r-1,\\ \sqrt{2}\cos\left(2\pi r(\theta-t)/(T-t)\right), & j=2r\end{cases} \tag{177}$$

where $r=1,2,\ldots$

Using the system of functions (177), we have

$$\int\limits_v^x \phi_{2r-1}(\theta)\psi(\theta)d\theta=\sqrt{\frac{2}{T-t}}\int\limits_v^x \sin\frac{2\pi r(\theta-t)}{T-t}\psi(\theta)d\theta=$$

$$=-\sqrt{\frac{T-t}{2}}\frac{1}{\pi r}\left(\psi(x)\cos\frac{2\pi r(x-t)}{T-t}-\psi(v)\cos\frac{2\pi r(v-t)}{T-t}-\right.$$

$$\left.-\int\limits_v^x \cos\frac{2\pi r(\theta-t)}{T-t}\psi'(\theta)d\theta\right), \tag{178}$$

$$\int\limits_v^x \phi_{2r}(\theta)\psi(\theta)d\theta=\sqrt{\frac{2}{T-t}}\int\limits_v^x \cos\frac{2\pi r(\theta-t)}{T-t}\psi(\theta)d\theta=$$

$$=\sqrt{\frac{T-t}{2}}\frac{1}{\pi r}\left(\psi(x)\sin\frac{2\pi r(x-t)}{T-t}-\psi(v)\sin\frac{2\pi r(v-t)}{T-t}-\right.$$

$$\left.-\int\limits_v^x \sin\frac{2\pi r(\theta-t)}{T-t}\psi'(\theta)d\theta\right), \tag{179}$$

where $\psi'(\theta)$ is a derivative of the function $\psi(\theta)$ with respect to the variable θ.

Combining (178) and (179), we obtain for the trigonometric case

$$\left(\int\limits_v^x \phi_j(\theta)\psi(\theta)d\theta\right)^2\le\frac{C_4}{j^2}, \tag{180}$$

where $j\in\mathbb{N}$, constant C_4 is independent of j.

From (180) we finally have

$$\int\limits_t^T\int\limits_t^\tau\left(\int\limits_u^\tau \phi_{j_s}(\theta)\psi_s(\theta)d\theta\right)^2 dud\tau\le\frac{K_4}{j_s^2}, \tag{181}$$

where $j_s\in\mathbb{N}$, constant K_4 is independent of j_s.

Combibing (164), (176), and (181), we obtain

$$\sum_{j_1=0}^{\infty}\ldots\sum_{j_{s-1}=0}^{\infty}\sum_{j_s=p+1}^{\infty}\sum_{j_{s+1}=0}^{\infty}\ldots\sum_{j_k=0}^{\infty}C_{j_k\ldots j_1}^2\le$$

$$\le L_k\sum_{j_s=p+1}^{\infty}\frac{1}{j_s^2}\le\frac{L_k}{p}, \tag{182}$$

where constant L_k depends on k and $T-t$.

Obviously, the case $s=k$ can be considered absolutely analogously to the case $s<k$. Then from (159) and (182) we obtain

$$\int\limits_{[t,T]^k}K^2(t_1,\ldots,t_k)dt_1\ldots dt_k-\sum_{j_1=0}^{p}\ldots\sum_{j_k=0}^{p}C_{j_k\ldots j_1}^2\le\frac{G_k}{p}, \tag{183}$$

where constant G_k depends on k and $T-t$.

For the further consideration we will use the estimate (33). Using (183) and the estimate (33) for the case $p_1=\ldots=p_k=p$ and $n=2$, we get

$$\mathsf{M}\left\{\left(J[\psi^{(k)}]_{T,t}-J[\psi^{(k)}]_{T,t}^{p,\ldots,p}\right)^4\right\}\le$$

$$\le C_{2,k}\left(\int\limits_{[t,T]^k}K^2(t_1,\ldots,t_k)dt_1\ldots dt_k-\sum_{j_1=0}^{p}\ldots\sum_{j_k=0}^{p}C_{j_k\ldots j_1}^2\right)^2\le\frac{H_{2,k}}{p^2}, \tag{184}$$

where

$$C_{n,k}=(k!)^{2n}(n(2n-1))^{n(k-1)}(2n-1)!!$$

and $H_{2,k}=G_k^2C_{2,k}$.

Let us consider Lemma 1 and put

$$\xi_p=\left|J[\psi^{(k)}]_{T,t}-J[\psi^{(k)}]_{T,t}^{p,\ldots,p}\right|$$

and $\alpha=4$.

Then from (184) we obtain

$$\sum_{p=1}^{\infty}\mathsf{M}\left\{\left(J[\psi^{(k)}]_{T,t}-J[\psi^{(k)}]_{T,t}^{p,\ldots,p}\right)^4\right\}\le$$

$$\le H_{2,k}\sum_{p=1}^{\infty}\frac{1}{p^2}<\infty. \tag{185}$$

Using Lemma 1, from (185) we have

$$J[\psi^{(k)}]_{T,t}^{p,\ldots,p} \ \to \ J[\psi^{(k)}]_{T,t} \quad \text{if} \quad p\to\infty$$

w. p. 1, where (see Theorem 1)

$$J[\psi^{(k)}]_{T,t}^{p,\ldots,p} = \sum_{j_1=0}^{p}\ldots\sum_{j_k=0}^{p} C_{j_k\ldots j_1}\left(\prod_{l=1}^{k}\zeta_{j_l}^{(i_l)} - \right.$$

$$\left. - \underset{N\to\infty}{\text{l.i.m.}} \sum_{(l_1,\ldots,l_k)\in \mathrm{G}_k} \phi_{j_1}(\tau_{l_1})\Delta\mathbf{w}_{\tau_{l_1}}^{(i_1)}\ldots\phi_{j_k}(\tau_{l_k})\Delta\mathbf{w}_{\tau_{l_k}}^{(i_k)}\right), \tag{186}$$

where $i_1,\ldots,i_k=1,\ldots,m$ in (186). Theorem 9 is proved.

Taking into account (32) and (183), we obtain the following inequality

$$\mathsf{M}\left\{\left(J[\psi^{(k)}]_{T,t} - J[\psi^{(k)}]_{T,t}^{p,\ldots,p}\right)^2\right\} \le \frac{k! P_k (T-t)^k}{p}, \tag{187}$$

where constant P_k depends only on k.

The estimates (33) and (183) imply the following inequality

$$\mathsf{M}\left\{\left(J[\psi^{(k)}]_{T,t} - J[\psi^{(k)}]_{T,t}^{p,\ldots,p}\right)^{2n}\right\} \le$$

$$\le (k!)^{2n}(n(2n-1))^{n(k-1)}(2n-1)!!\ \frac{(P_k)^n\,(T-t)^{nk}}{p^n}, \tag{188}$$

where $n\in\mathbb{N}$ and constant P_k depends only on k.

Consider the question on the rate of convergence w. p. 1 in Theorem 9. Using the inequality (188), we obtain

$$\left(\mathsf{M}\left\{\left(J[\psi^{(k)}]_{T,t} - J[\psi^{(k)}]_{T,t}^{p,\ldots,p}\right)^{2n}\right\}\right)^{1/2n} \le \frac{Q_{n,k}}{\sqrt{p}}, \tag{189}$$

where $n\in\mathbb{N}$ and

$$Q_{n,k} = k!\ (n(2n-1))^{(k-1)/2}\,((2n-1)!!)^{1/2n}\ \sqrt{P_k}\ (T-t)^{k/2}.$$

According to the Lyapunov inequality and (189), we have

$$\left(\mathsf{M}\left\{\left(J[\psi^{(k)}]_{T,t} - J[\psi^{(k)}]_{T,t}^{p,\ldots,p}\right)^{n}\right\}\right)^{1/n} \le \frac{Q_{n,k}}{\sqrt{p}} \tag{190}$$

for all $n\in\mathbb{N}$. Following [53] (Lemma 2.1), we get

$$\left|J[\psi^{(k)}]_{T,t}-J[\psi^{(k)}]_{T,t}^{p,\ldots,p}\right|=\frac{p^{1/2-\varepsilon}}{p^{1/2-\varepsilon}}\left|J[\psi^{(k)}]_{T,t}-J[\psi^{(k)}]_{T,t}^{p,\ldots,p}\right|\le$$

$$\le\frac{1}{p^{1/2-\varepsilon}}\sup_{p\in\mathbb{N}}\left(p^{1/2-\varepsilon}\left|J[\psi^{(k)}]_{T,t}-J[\psi^{(k)}]_{T,t}^{p,\ldots,p}\right|\right)=\frac{\eta_{\varepsilon}}{p^{1/2-\varepsilon}} \tag{191}$$

w. p. 1, where

$$\eta_{\varepsilon}=\sup_{p\in\mathbb{N}}\left(p^{1/2-\varepsilon}\left|J[\psi^{(k)}]_{T,t}-J[\psi^{(k)}]_{T,t}^{p,\ldots,p}\right|\right)$$

and $\varepsilon>0$ is fixed.

For $q>1/\varepsilon$, $q\in\mathbb{N}$ we obtain [53] (see (190))

$$\mathsf{M}\left\{|\eta_{\varepsilon}|^q\right\}=\mathsf{M}\left\{\left(\sup_{p\in\mathbb{N}}\left(p^{1/2-\varepsilon}\left|J[\psi^{(k)}]_{T,t}-J[\psi^{(k)}]_{T,t}^{p,\ldots,p}\right|\right)\right)^q\right\}=$$

$$=\mathsf{M}\left\{\sup_{p\in\mathbb{N}}\left(p^{(1/2-\varepsilon)q}\left|J[\psi^{(k)}]_{T,t}-J[\psi^{(k)}]_{T,t}^{p,\ldots,p}\right|^q\right)\right\}\le$$

$$\le\mathsf{M}\left\{\sum_{p=1}^{\infty}p^{(1/2-\varepsilon)q}\left|J[\psi^{(k)}]_{T,t}-J[\psi^{(k)}]_{T,t}^{p,\ldots,p}\right|^q\right\}=$$

$$=\sum_{p=1}^{\infty}p^{(1/2-\varepsilon)q}\mathsf{M}\left\{\left|J[\psi^{(k)}]_{T,t}-J[\psi^{(k)}]_{T,t}^{p,\ldots,p}\right|^q\right\}\le$$

$$\le\sum_{p=1}^{\infty}p^{(1/2-\varepsilon)q}\frac{(Q_{q,k})^q}{p^{q/2}}=(Q_{q,k})^q\sum_{p=1}^{\infty}\frac{1}{p^{\varepsilon q}}<\infty. \tag{192}$$

From (191) we have that for all $\varepsilon>0$ there exists a random variable η_{ε} such that the inequality (191) is fulfilled w. p. 1 for all $p\in\mathbb{N}$. Moreover, from the Lyapunov inequality and (192) we obtain $\mathsf{M}\left\{|\eta_{\varepsilon}|^q\right\}<\infty$ for all $q\ge 1$.

7. About the Structure of Functions $K(t_1,\ldots,t_k)$ Used in Applications

The systems of iterated stochastic integrals (2), (3), (48), (49) are part of the stochastic Taylor–Ito and Taylor–Stratonovich expansions (classical [2], [3] and unified [8]-[17], [20]-[24]).

The function $K(t_1,\ldots,t_k)$ from Theorems 1, 2 for the family (48) looks as follows

$$K(t_1,\ldots,t_k)=(t-t_k)^{l_k}\ldots(t-t_1)^{l_1}\ \mathbf{1}_{\{t_1<\ldots<t_k\}},\quad t_1,\ldots,t_k\in[t,T], \tag{193}$$

where $\mathbf{1}_A$ is the indicator of the set A.

In particular, for the stochastic integrals

$$I_{(1)T,t}^{(i_1)},\ I_{(2)T,t}^{(i_1)},\ I_{(00)T,t}^{(i_1 i_2)},\ I_{(000)T,t}^{(i_1 i_2 i_3)},\ I_{(01)T,t}^{(i_1 i_2)},\ I_{(10)T,t}^{(i_1 i_2)},\ I_{(0000)T,t}^{(i_1 i_2 i_3 i_4)},$$

$$I_{(20)T,t}^{(i_1 i_2)},\ I_{(11)T,t}^{(i_1 i_2)},\ I_{(02)T,t}^{(i_1 i_2)}\quad (i_1,\ldots,i_4=1,\ldots,m)$$

the functions $K(t_1,\ldots,t_k)$ (see (193)) correspondently look as follows

$$K_1(t_1)=t-t_1,\quad K_2(t_1)=(t-t_1)^2,\quad K_{00}(t_1,t_2)=\mathbf{1}_{\{t_1<t_2\}}, \tag{194}$$

$$K_{000}(t_1,t_2,t_3)=\mathbf{1}_{\{t_1<t_2<t_3\}},\quad K_{01}(t_1,t_2)=(t-t_2)\mathbf{1}_{\{t_1<t_2\}}, \tag{195}$$

$$K_{10}(t_1,t_2)=(t-t_1)\mathbf{1}_{\{t_1<t_2\}},\quad K_{0000}(t_1,t_2)=\mathbf{1}_{\{t_1<t_2<t_3<t_4\}}, \tag{196}$$

$$K_{20}(t_1,t_2)=(t-t_1)^2\mathbf{1}_{\{t_1<t_2\}},\quad K_{11}(t_1,t_2)=(t-t_1)(t-t_2)\mathbf{1}_{\{t_1<t_2\}}, \tag{197}$$

$$K_{02}(t_1,t_2)=(t-t_2)^2\mathbf{1}_{\{t_1<t_2\}}, \tag{198}$$

where $t_1,\ldots,t_4\in[t,T]$.

It is obviously that the most simple expansion for the polynomial of a finite degree into the Fourier series using the complete orthonormal system of functions in the space $L_2([t,T])$ will be its Fourier–Legendre expansion (finite sum). The polynomial functions are included in the functions (194)–(198) as their components if $l_1^2+\ldots+l_k^2>0$. So, it is logical to expect that the most simple expansions for the functions (194)–(198) into multiple Fourier series will be their Fourier–Legendre expansions when $l_1^2+\ldots+l_k^2>0$.

Note that the given assumption is confirmed completely (compare the formulas (52), (56) with the formulas (114), (131) correspondently). So, the usage of Legendre polynomials in the considered scientific field is an obvious step forward.

8. Theorems 1–7 from Point of View of the Wong–Zakai Approximation

The iterated Ito stochastic integrals and solutions of Ito SDEs are complex and important functionals from the independent components $\mathbf{f}_s^{(i)}$, $i=1,\ldots,m$ of the multidimensional Wiener process $\mathbf{f}_s$, $s\in[0,T]$. Let $\mathbf{f}_s^{(i)p}$, $p\in\mathbb{N}$ be some approximation of $\mathbf{f}_s^{(i)}$, $i=1,\ldots,m$. Suppose that $\mathbf{f}_s^{(i)p}$ converges to $\mathbf{f}_s^{(i)}$, $i=1,\ldots,m$ if $p\to\infty$ in some sense and has differentiable sample trajectories.

A natural question arises: if we replace $\mathbf{f}_s^{(i)}$ by $\mathbf{f}_s^{(i)p}$, $i=1,\ldots,m$ in the functionals mentioned above, will the resulting functionals converge to the original functionals from the components $\mathbf{f}_s^{(i)}$, $i=1,\ldots,m$ of the multidimentional Wiener process $\mathbf{f}_s$? The answere to this question is negative in the general case. However, in the pioneering works of Wong E. and Zakai M. [54], [55], it was shown that under the special conditions and for some types of approximations of the Wiener process the answere is affirmative with one peculiarity: the convergence takes place to the iterated Stratonovich stochastic integrals and solutions of Stratonovich SDEs and not to iterated Ito stochastic integrals and solutions of Ito SDEs. The piecewise linear approximation as well as the regularization by convolution [54]-[56] relate the mentioned types of approximations of the Wiener process. The above approximation of stochastic integrals and solutions of SDEs is often called the Wong–Zakai approximation.

Let $\mathbf{f}_s$, $s\in[0,T]$ be an m-dimensional standard Wiener process with independent components $\mathbf{f}_s^{(i)}$, $i=1,\ldots,m$. It is well known that the following representation takes place [57], [58]

$$\mathbf{f}_\tau^{(i)}-\mathbf{f}_t^{(i)}=\sum_{j=0}^{\infty}\int\limits_t^{\tau}\phi_j(s)ds\ \zeta_j^{(i)},\quad \zeta_j^{(i)}=\int\limits_t^{T}\phi_j(s)d\mathbf{f}_s^{(i)}, \tag{199}$$

where $\tau\in[t,T]$, $t\ge 0$, $\{\phi_j(x)\}_{j=0}^{\infty}$ is an arbitrary complete orthonormal system of functions in the space $L_2([t,T])$, and $\zeta_j^{(i)}$ are independent standard Gaussian random variables for various i or j. Moreover, the series (199) converges for any $\tau\in[t,T]$ in the mean-square sense.

Let $\mathbf{f}_\tau^{(i)p}-\mathbf{f}_t^{(i)p}$ be the mean-square approximation of the process $\mathbf{f}_\tau^{(i)}-\mathbf{f}_t^{(i)}$, which has the following form

$$\mathbf{f}_\tau^{(i)p}-\mathbf{f}_t^{(i)p}=\sum_{j=0}^{p}\int\limits_t^{\tau}\phi_j(s)ds\ \zeta_j^{(i)}. \tag{200}$$

From (200) we obtain

$$d\mathbf{f}_\tau^{(i)p}=\sum_{j=0}^{p}\phi_j(\tau)\zeta_j^{(i)}d\tau. \tag{201}$$

Consider the following iterated Riemann–Stieltjes integral

$$\int\limits_t^{T}\psi_k(t_k)\ldots\int\limits_t^{t_2}\psi_1(t_1)d\mathbf{w}_{t_1}^{(i_1)p_1}\ldots d\mathbf{w}_{t_k}^{(i_k)p_k}, \tag{202}$$

where $i_1,\ldots,i_k=0,1,\ldots,m,\ \ p_1,\ldots,p_k\in\mathbb{N}$,

$$d\mathbf{w}_\tau^{(i)p}=\begin{cases}d\mathbf{f}_\tau^{(i)p} & \text{for}\quad i=1,\ldots,m\\ \\ d\tau & \text{for}\quad i=0\end{cases}, \tag{203}$$

and $d\mathbf{f}_\tau^{(i)p}$ in defined by the relation (201).

Let us substitute (201) into (202)

$$\int\limits_t^{T}\psi_k(t_k)\ldots\int\limits_t^{t_2}\psi_1(t_1)d\mathbf{w}_{t_1}^{(i_1)p_1}\ldots d\mathbf{w}_{t_k}^{(i_k)p_k}=\sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k}C_{j_k\ldots j_1}\prod_{l=1}^{k}\zeta_{j_l}^{(i_l)}, \tag{204}$$

where

$$\zeta_j^{(i)}=\int\limits_t^T \phi_j(s)d\mathbf{w}_s^{(i)}$$

are independent standard Gaussian random variables for various i or j (in the case when $i\neq 0$), $\mathbf{w}_s^{(i)}=\mathbf{f}_s^{(i)}$ for $i=1,\ldots,m$ and $\mathbf{w}_s^{(0)}=s$,

$$C_{j_k\ldots j_1}=\int\limits_t^T \psi_k(t_k)\phi_{j_k}(t_k)\ldots\int\limits_t^{t_2}\psi_1(t_1)\phi_{j_1}(t_1)dt_1\ldots dt_k$$

is the Fourier coefficient.

To best of our knowledge [54]-[56] the approximations of the Wiener process in the Wong–Zakai approximation must satisfy fairly strong restrictions [56] (see Definition 7.1, pp. 480–481). Moreover, approximations of the Wiener process that are similar to (200) were not considered in [54], [55] (also see [56], Theorems 7.1, 7.2). Therefore, the proof of analogs of Theorems 7.1 and 7.2 [56] for approximations of the Wiener process based on its series expansion (199) should be carried out separately. Thus, the mean-square convergence of the right-hand side of (204) to the iterated Stratonovich stochastic integral (3) does not follow from the results of the papers [54], [55] (also see [56], Theorems 7.1, 7.2).

From the other hand, Theorems 1–7 from this paper can be considered as the proof of the Wong–Zakai approximation for the iterated Stratonovich stochastic integrals (3) of multiplicities 1 to 6 based on the the Riemann–Stieltjes integrals (202) and approximation (200) of the Wiener process. At that, the Riemann–Stieltjes integrals (202) converge (according to Theorems 1–7) to the appropriate Stratonovich stochastic integrals (3). Recall that $\{\phi_j(x)\}_{j=0}^{\infty}$ (see (199), (200), and Theorems 3–7) is a complete orthonormal system of Legendre polynomials or trigonometric functions in the space $L_2([t,T])$.

To illustrate the above reasoning, consider two examples for the case $k=2$, $\psi_1(s)$, $\psi_2(s)\equiv 1$; $i_1,i_2=1,\ldots,m$.

The first example relates to the piecewise linear approximation of the multidimensional Wiener process (these approximations were considered in [54]-[56]).

Let $\mathbf{b}_{\Delta}^{(i)}(t)$, $t\in[0,T]$ be the piecewise linear approximation of the ith component $\mathbf{f}_t^{(i)}$ of the multidimensional standard Wiener process $\mathbf{f}_t$, $t\in[0,T]$ with independent components $\mathbf{f}_t^{(i)}$, $i=1,\ldots,m$, i.e.

$$\mathbf{b}_{\Delta}^{(i)}(t)=\mathbf{f}_{k\Delta}^{(i)}+\frac{t-k\Delta}{\Delta}\Delta\mathbf{f}_{k\Delta}^{(i)},$$

where

$$\Delta\mathbf{f}_{k\Delta}^{(i)}=\mathbf{f}_{(k+1)\Delta}^{(i)}-\mathbf{f}_{k\Delta}^{(i)},\quad t\in[k\Delta,(k+1)\Delta),\quad k=0,1,\ldots,N-1.$$

Note that w. p. 1

$$\frac{d\mathbf{b}_{\Delta}^{(i)}}{dt}(t)=\frac{\Delta\mathbf{f}_{k\Delta}^{(i)}}{\Delta},\quad t\in[k\Delta,(k+1)\Delta),\quad k=0,1,\ldots,N-1. \tag{205}$$

Consider the following iterated Riemann–Stieltjes integral

$$\int_0^T\int_0^s d\mathbf{b}_{\Delta}^{(i_1)}(\tau)d\mathbf{b}_{\Delta}^{(i_2)}(s),\quad i_1,i_2=1,\ldots,m.$$

Using (205) and additive property of Riemann–Stieltjes integrals, we can write w. p. 1

$$\int_0^T\int_0^s d\mathbf{b}_{\Delta}^{(i_1)}(\tau)d\mathbf{b}_{\Delta}^{(i_2)}(s)=\int_0^T\int_0^s \frac{d\mathbf{b}_{\Delta}^{(i_1)}}{d\tau}(\tau)d\tau\frac{d\mathbf{b}_{\Delta}^{(i_2)}}{ds}(s)ds=$$

$$=\sum_{l=0}^{N-1}\int_{l\Delta}^{(l+1)\Delta}\left(\sum_{q=0}^{l-1}\int_{q\Delta}^{(q+1)\Delta}\frac{\Delta\mathbf{f}_{q\Delta}^{(i_1)}}{\Delta}d\tau+\int_{l\Delta}^{s}\frac{\Delta\mathbf{f}_{l\Delta}^{(i_1)}}{\Delta}d\tau\right)\frac{\Delta\mathbf{f}_{l\Delta}^{(i_2)}}{\Delta}ds=$$

$$=\sum_{l=0}^{N-1}\sum_{q=0}^{l-1}\Delta\mathbf{f}_{q\Delta}^{(i_1)}\Delta\mathbf{f}_{l\Delta}^{(i_2)}+\frac{1}{\Delta^2}\sum_{l=0}^{N-1}\Delta\mathbf{f}_{l\Delta}^{(i_1)}\Delta\mathbf{f}_{l\Delta}^{(i_2)}\int_{l\Delta}^{(l+1)\Delta}\int_{l\Delta}^{s}d\tau ds=$$

$$=\sum_{l=0}^{N-1}\sum_{q=0}^{l-1}\Delta\mathbf{f}_{q\Delta}^{(i_1)}\Delta\mathbf{f}_{l\Delta}^{(i_2)}+\frac{1}{2}\sum_{l=0}^{N-1}\Delta\mathbf{f}_{l\Delta}^{(i_1)}\Delta\mathbf{f}_{l\Delta}^{(i_2)}. \tag{206}$$

Using (206) and the standard relation between Stratonovich and Ito stochastic integrals, it is not difficult to show that

$$\underset{N\to\infty}{\text{l.i.m.}}\int_0^T\int_0^s d\mathbf{b}_{\Delta}^{(i_1)}(\tau)d\mathbf{b}_{\Delta}^{(i_2)}(s)=\int_0^T\int_0^s d\mathbf{f}_{\tau}^{(i_1)}d\mathbf{f}_{s}^{(i_2)}+\frac{1}{2}\mathbf{1}_{\{i_1=i_2\}}\int_0^T ds=$$

$$=\int_0^{*T}\int_0^{*s} d\mathbf{f}_{\tau}^{(i_1)}d\mathbf{f}_{s}^{(i_2)}, \tag{207}$$

where $\Delta\to 0$ if $N\to\infty$ $(N\Delta=T)$.

Obviously, (207) agrees with Theorem 7.1 (see [56], p. 486).

The next example relates to the approximation of the Wiener process based on its series expansion (199) for $t=0$, where $\{\phi_j(x)\}_{j=0}^{\infty}$ is a complete orthonormal system of Legendre polynomials or trigonometric functions in the space $L_2([0,T])$.

Consider the following iterated Riemann–Stieltjes integral

$$\int_0^T\int_0^s d\mathbf{f}_{\tau}^{(i_1)p}d\mathbf{f}_{s}^{(i_2)p},\quad i_1,i_2=1,\ldots,m, \tag{208}$$

where $d\mathbf{f}_\tau^{(i)p}$ is defined by the relation (201).

Let us substitute (201) into (208)

$$\int\limits_0^T \int\limits_0^s d\mathbf{f}_\tau^{(i_1)p} d\mathbf{f}_s^{(i_2)p} = \sum_{j_1,j_2=0}^{p} C_{j_2 j_1} \zeta_{j_1}^{(i_1)} \zeta_{j_2}^{(i_2)}, \tag{209}$$

where

$$C_{j_2 j_1} = \int\limits_0^T \phi_{j_2}(s) \int\limits_0^s \phi_{j_1}(\tau) d\tau ds$$

is the Fourier coefficient; another notations are the same as in (204).

As we noted above, approximations of the Wiener process that are similar to (200) were not considered in [54], [55] (also see Theorems 7.1, 7.2 in [56]). Furthermore, the extension of the results of Theorems 7.1 and 7.2 [56] to the case under consideration is not obvious.

On the other hand, we can apply the theory built in Chapters 1 and 2 of the monographs [22]-[24]. More precisely, using Theorem 3 for the case $k = 2$, we obtain from (209) the desired result

$$\underset{p\to\infty}{\text{l.i.m.}} \int\limits_0^T \int\limits_0^s d\mathbf{f}_\tau^{(i_1)p} d\mathbf{f}_s^{(i_2)p} = \underset{p\to\infty}{\text{l.i.m.}} \sum_{j_1,j_2=0}^{p} C_{j_2 j_1} \zeta_{j_1}^{(i_1)} \zeta_{j_2}^{(i_2)} =$$

$$= \int\limits_0^{*T} \int\limits_0^{*s} d\mathbf{f}_\tau^{(i_1)} d\mathbf{f}_s^{(i_2)}. \tag{210}$$

From the other hand, by Theorem 1 (see (10)) for the case $k = 2$ we obtain from (209) the following relation

$$\underset{p\to\infty}{\text{l.i.m.}} \int\limits_0^T \int\limits_0^s d\mathbf{f}_\tau^{(i_1)p} d\mathbf{f}_s^{(i_2)p} = \underset{p\to\infty}{\text{l.i.m.}} \sum_{j_1,j_2=0}^{p} C_{j_2 j_1} \zeta_{j_1}^{(i_1)} \zeta_{j_2}^{(i_2)} =$$

$$= \underset{p\to\infty}{\text{l.i.m.}} \sum_{j_1,j_2=0}^{p} C_{j_2 j_1} \left(\zeta_{j_1}^{(i_1)} \zeta_{j_2}^{(i_2)} - \mathbf{1}_{\{i_1=i_2\}} \mathbf{1}_{\{j_1=j_2\}} \right) + \mathbf{1}_{\{i_1=i_2\}} \sum_{j_1=0}^{\infty} C_{j_1 j_1} =$$

$$= \int\limits_0^T \int\limits_0^s d\mathbf{f}_\tau^{(i_1)} d\mathbf{f}_s^{(i_2)} + \mathbf{1}_{\{i_1=i_2\}} \sum_{j_1=0}^{\infty} C_{j_1 j_1}. \tag{211}$$

Since

$$\sum_{j_1=0}^{\infty} C_{j_1 j_1} = \frac{1}{2} \sum_{j_1=0}^{\infty} \left(\int\limits_0^T \phi_j(\tau) d\tau \right)^2 = \frac{1}{2} \left(\int\limits_0^T \phi_0(\tau) d\tau \right)^2 = \frac{1}{2} \int\limits_0^T ds,$$

then from (211) and the standard relation between Stratonovich and Ito stochastic integrals we obtain (210).

9. Exact Calculation of the Mean-Square Approximation Errors for Iterated Stratonovich Stochastic Integrals $I_{(0)T,t}^{*(i_1)}$, $I_{(1)T,t}^{*(i_1)}$, $I_{(00)T,t}^{*(i_1 i_2)}$, $I_{(000)T,t}^{*(i_1 i_2 i_3)}$, $I_{(0000)T,t}^{*(i_1 i_2 i_3 i_4)}$

First, consider the question on the exact calculation of the mean-square approximation errors for the following iterated Stratonovich stochastic integrals

$$I_{(0)T,t}^{*(i_1)},\quad I_{(1)T,t}^{*(i_1)},\quad I_{(00)T,t}^{*(i_1 i_2)},\quad I_{(000)T,t}^{*(i_1 i_2 i_3)}\quad (i_1,i_2,i_3=1,\ldots,m) \tag{212}$$

defined by (49).

We assume that the stochastic integrals (212) are approximated using Theorems 1, 3 and the Legendre polynomial system. Since $I_{(0)T,t}^{(i_1)}=I_{(0)T,t}^{*(i_1)}$, $I_{(1)T,t}^{(i_1)}=I_{(1)T,t}^{*(i_1)}$ w. p. 1 (see (48)), then we can use (51), (52) to approximate the stochastic integrals $I_{(0)T,t}^{*(i_1)}$, $I_{(1)T,t}^{*(i_1)}$. In this case, we will have zero mean-square approximation errors.

To approximate the iterated Stratonovich stochastic integral $I_{(00)T,t}^{*(i_1 i_2)}$ we can use the formula (see (54))

$$I_{(00)T,t}^{*(i_1 i_2)q}=\frac{T-t}{2}\left(\zeta_0^{(i_1)}\zeta_0^{(i_2)}+\sum_{i=1}^{q}\frac{1}{\sqrt{4i^2-1}}\left(\zeta_{i-1}^{(i_1)}\zeta_i^{(i_2)}-\zeta_i^{(i_1)}\zeta_{i-1}^{(i_2)}\right)\right). \tag{213}$$

The mean-square approximation error for (213) will be determined by the formula (81) $(i_1\ne i_2)$. For the case $i_1=i_2$ we can use the well known equality

$$I_{(00)T,t}^{*(i_1 i_1)}=\frac{T-t}{2}\left(\zeta_0^{(i_1)}\right)^2\quad \text{w. p. 1.}$$

Consider now the iterated Stratonovich stochastic integral $I_{(000)T,t}^{*(i_1 i_2 i_3)}$ of multiplicity 3 $(i_1,i_2,i_3=1,\ldots,m)$. For the case of pairwise different i_1,i_2,i_3 we have the following relation

$$I_{(000)T,t}^{*(i_1 i_2 i_3)}=I_{(000)T,t}^{(i_1 i_2 i_3)}\quad \text{w. p. 1.}$$

Thus, in this case we can use the formulas (93) and (94). For the case $i_1=i_2=i_3$, to approximate the stochastic integral $I_{(000)T,t}^{*(i_1 i_1 i_1)}$, we use the formula (59).

Thus, it remains to consider the following three cases

$$i_1=i_2\ne i_3, \tag{214}$$

$$i_1\ne i_2=i_3, \tag{215}$$

$$i_1=i_3\ne i_2. \tag{216}$$

Taking into account the standard relations between Ito and Stratonovich stochastic integrals and Theorem 1 (the case $k=3$) together with Theorem 3, we obtain

$$\mathsf{M}\left\{\left(I_{(000)T,t}^{*(i_1 i_2 i_3)}-I_{(000)T,t}^{*(i_1 i_2 i_3)q}\right)^2\right\}=$$

$$= \mathsf{M}\left\{\left(I_{(000)T,t}^{(i_1 i_2 i_3)} + \frac{1}{2}\mathbf{1}_{\{i_1=i_2\}}\int\limits_t^T\int\limits_t^{\tau} ds d\mathbf{f}_{\tau}^{(i_3)} + \frac{1}{2}\mathbf{1}_{\{i_2=i_3\}}\int\limits_t^T\int\limits_t^{\tau} d\mathbf{f}_{s}^{(i_1)} d\tau - I_{(000)T,t}^{*(i_1 i_2 i_3)q}\right)^2\right\} =$$

$$= \mathsf{M}\left\{\left(I_{(000)T,t}^{(i_1 i_2 i_3)} - I_{(000)T,t}^{(i_1 i_2 i_3)q} + I_{(000)T,t}^{(i_1 i_2 i_3)q} + \mathbf{1}_{\{i_1=i_2\}}\frac{1}{2}\int\limits_t^T\int\limits_t^{\tau} ds d\mathbf{f}_{\tau}^{(i_3)} + \right.\right.$$

$$\left.\left. +\mathbf{1}_{\{i_2=i_3\}}\frac{1}{2}\int\limits_t^T\int\limits_t^{\tau} d\mathbf{f}_{s}^{(i_1)} d\tau - I_{(000)T,t}^{*(i_1 i_2 i_3)q}\right)^2\right\}, \tag{217}$$

where the approximations $I_{(000)T,t}^{*(i_1 i_2 i_3)q}$, $I_{(000)T,t}^{(i_1 i_2 i_3)q}$ are defined by the relations (see (57), (58))

$$I_{(000)T,t}^{(i_1 i_2 i_3)q} = \sum_{j_1,j_2,j_3=0}^{q} C_{j_3 j_2 j_1}\left(\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}\zeta_{j_3}^{(i_3)} - \mathbf{1}_{\{i_1=i_2\}}\mathbf{1}_{\{j_1=j_2\}}\zeta_{j_3}^{(i_3)} - \right.$$

$$\left. -\mathbf{1}_{\{i_2=i_3\}}\mathbf{1}_{\{j_2=j_3\}}\zeta_{j_1}^{(i_1)} - \mathbf{1}_{\{i_1=i_3\}}\mathbf{1}_{\{j_1=j_3\}}\zeta_{j_2}^{(i_2)}\right), \tag{218}$$

$$I_{(000)T,t}^{*(i_1 i_2 i_3)q} = \sum_{j_1,j_2,j_3=0}^{q} C_{j_3 j_2 j_1}\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}\zeta_{j_3}^{(i_3)}. \tag{219}$$

Substituting (218) and (219) into (217) yields

$$\mathsf{M}\left\{\left(I_{(000)T,t}^{*(i_1 i_2 i_3)} - I_{(000)T,t}^{*(i_1 i_2 i_3)q}\right)^2\right\} =$$

$$= \mathsf{M}\left\{\left(I_{(000)T,t}^{(i_1 i_2 i_3)} - I_{(000)T,t}^{(i_1 i_2 i_3)q} + \mathbf{1}_{\{i_1=i_2\}}\left(\frac{1}{2}\int\limits_t^T\int\limits_t^{\tau} ds d\mathbf{f}_{\tau}^{(i_3)} - \sum_{j_1,j_3=0}^{q} C_{j_3 j_1 j_1}\zeta_{j_3}^{(i_3)}\right) + \right.\right.$$

$$\left.\left. +\mathbf{1}_{\{i_2=i_3\}}\left(\frac{1}{2}\int\limits_t^T\int\limits_t^{\tau} d\mathbf{f}_{s}^{(i_1)} d\tau - \sum_{j_1,j_3=0}^{q} C_{j_3 j_3 j_1}\zeta_{j_1}^{(i_1)}\right) - \mathbf{1}_{\{i_1=i_3\}}\sum_{j_1,j_2=0}^{q} C_{j_1 j_2 j_1}\zeta_{j_2}^{(i_2)}\right)^2\right\}. \tag{220}$$

Consider the case (214). From (220) we obtain

$$\mathsf{M}\left\{\left(I_{(000)T,t}^{*(i_1 i_2 i_3)} - I_{(000)T,t}^{*(i_1 i_2 i_3)q}\right)^2\right\} =$$

$$= \mathsf{M}\left\{\left(I_{(000)T,t}^{(i_1 i_2 i_3)} - I_{(000)T,t}^{(i_1 i_2 i_3)q} + \frac{1}{2}\int\limits_t^T\int\limits_t^{\tau} ds d\mathbf{f}_{\tau}^{(i_3)} - \sum_{j_1,j_3=0}^{q} C_{j_3 j_1 j_1}\zeta_{j_3}^{(i_3)}\right)^2\right\}. \tag{221}$$

According to the results of Sect. 3 in [31] (also see Sect. 1.2.2 in [22]-[24]), the quantity

$$I_{(000)T,t}^{(i_1 i_2 i_3)} - I_{(000)T,t}^{(i_1 i_2 i_3)q}$$

includes only iterated Ito stochastic integrals of multiplicity 3. At the same time, the quantity

$$\frac{1}{2}\int_t^T\int_t^\tau ds d\mathbf{f}_\tau^{(i_3)} - \sum_{j_1,j_3=0}^{q} C_{j_3 j_1 j_1}\zeta_{j_3}^{(i_3)}$$

contains only iterated Ito stochastic integrals of multiplicity 1. This means that from (221) we get

$$\mathsf{M}\left\{\left(I_{(000)T,t}^{*(i_1 i_2 i_3)} - I_{(000)T,t}^{*(i_1 i_2 i_3)q}\right)^2\right\} = \mathsf{M}\left\{\left(I_{(000)T,t}^{(i_1 i_2 i_3)} - I_{(000)T,t}^{(i_1 i_2 i_3)q}\right)^2\right\} +$$

$$+\mathsf{M}\left\{\left(\frac{1}{2}\int_t^T(\tau-t)d\mathbf{f}_\tau^{(i_3)} - \sum_{j_1,j_3=0}^{q} C_{j_3 j_1 j_1}\zeta_{j_3}^{(i_3)}\right)^2\right\}. \tag{222}$$

We have

$$\mathsf{M}\left\{\left(\frac{1}{2}\int_t^T(\tau-t)d\mathbf{f}_\tau^{(i_3)} - \sum_{j_1,j_3=0}^{q} C_{j_3 j_1 j_1}\zeta_{j_3}^{(i_3)}\right)^2\right\} = \frac{1}{4}\int_t^T(\tau-t)^2 d\tau -$$

$$-\sum_{j_1,j_3=0}^{q} C_{j_3 j_1 j_1}\int_t^T(\tau-t)\phi_{j_3}(\tau)d\tau + \sum_{j_3=0}^{q}\left(\sum_{j_1=0}^{q} C_{j_3 j_1 j_1}\right)^2, \tag{223}$$

where $\phi_{j_3}(\tau)$ is the Legendre polynomial defined by (50).

According to the properties of Legendre polynomials, we obtain

$$\int_t^T(\tau-t)\phi_{j_3}(\tau)d\tau = \frac{(T-t)^{3/2}}{2}\begin{cases}1, & j_3=0\\ 1/\sqrt{3}, & j_3=1.\\ 0, & j_3\ge 2\end{cases} \tag{224}$$

Combining (222)–(224) and (97), we get

$$\mathsf{M}\left\{\left(I_{(000)T,t}^{*(i_1 i_2 i_3)} - I_{(000)T,t}^{*(i_1 i_2 i_3)q}\right)^2\right\} = \frac{(T-t)^3}{4} - \sum_{j_1,j_2,j_3=0}^{q} C_{j_3 j_2 j_1}^2 - \sum_{j_1,j_2,j_3=0}^{q} C_{j_3 j_1 j_2}C_{j_3 j_2 j_1} -$$

$$-\frac{(T-t)^{3/2}}{2}\sum_{j_1=0}^{q}\left(C_{0 j_1 j_1} + \frac{1}{\sqrt{3}}C_{1 j_1 j_1}\right) + \sum_{j_3=0}^{q}\left(\sum_{j_1=0}^{q} C_{j_3 j_1 j_1}\right)^2, \tag{225}$$

where $i_1 = i_2 \ne i_3$.

Consider the case (215). From (220) we obtain

$$
{\sf M}\left\{\left(I_{(000)T,t}^{*(i_1 i_2 i_3)} - I_{(000)T,t}^{*(i_1 i_2 i_3)q}\right)^2\right\} =
$$

$$
= {\sf M}\left\{\left(I_{(000)T,t}^{(i_1 i_2 i_3)} - I_{(000)T,t}^{(i_1 i_2 i_3)q} + \frac{1}{2}\int\limits_t^T\int\limits_t^{\tau} d{\bf f}_s^{(i_1)}d\tau - \sum_{j_1,j_3=0}^{q} C_{j_3 j_3 j_1}\zeta_{j_1}^{(i_1)}\right)^2\right\} =
$$

$$
= {\sf M}\left\{\left(I_{(000)T,t}^{(i_1 i_2 i_3)} - I_{(000)T,t}^{(i_1 i_2 i_3)q} + \frac{1}{2}\int\limits_t^T (T-s)d{\bf f}_s^{(i_1)} - \sum_{j_1,j_3=0}^{q} C_{j_3 j_3 j_1}\zeta_{j_1}^{(i_1)}\right)^2\right\} =
$$

$$
= {\sf M}\left\{\left(I_{(000)T,t}^{(i_1 i_2 i_3)} - I_{(000)T,t}^{(i_1 i_2 i_3)q}\right)^2\right\} +
$$

$$
+{\sf M}\left\{\left(\frac{1}{2}\int\limits_t^T (T-s)d{\bf f}_s^{(i_1)} - \sum_{j_1,j_3=0}^{q} C_{j_3 j_3 j_1}\zeta_{j_1}^{(i_1)}\right)^2\right\} =
$$

$$
= {\sf M}\left\{\left(I_{(000)T,t}^{(i_1 i_2 i_3)} - I_{(000)T,t}^{(i_1 i_2 i_3)q}\right)^2\right\} +
$$

$$
+\frac{1}{4}\int\limits_t^T (T-s)^2 ds - \sum_{j_1,j_3=0}^{q} C_{j_3 j_3 j_1}\int\limits_t^T (T-s)\phi_{j_1}(s)ds + \sum_{j_1=0}^{q}\left(\sum_{j_3=0}^{q} C_{j_3 j_3 j_1}\right)^2, \tag{226}
$$

where $\phi_{j_1}(\tau)$ is the Legendre polynomial defined by (50).

Moreover,

$$
\int\limits_t^T (T-s)\phi_{j_1}(s)ds = \frac{(T-t)^{3/2}}{2}\begin{cases} 1, & j_1 = 0\\ -1/\sqrt{3}, & j_1 = 1.\\ 0, & j_1 \ge 2\end{cases} \tag{227}
$$

Combining (226)–(227) and (95), we get

$$
{\sf M}\left\{\left(I_{(000)T,t}^{*(i_1 i_2 i_3)} - I_{(000)T,t}^{*(i_1 i_2 i_3)q}\right)^2\right\} = \frac{(T-t)^3}{4} - \sum_{j_1,j_2,j_3=0}^{q} C_{j_3 j_2 j_1}^2 - \sum_{j_1,j_2,j_3=0}^{q} C_{j_2 j_3 j_1}C_{j_3 j_2 j_1} -
$$

$$
-\frac{(T-t)^{3/2}}{2}\sum_{j_3=0}^{q}\left(C_{j_3 j_3 0} - \frac{1}{\sqrt{3}}C_{j_3 j_3 1}\right) + \sum_{j_1=0}^{q}\left(\sum_{j_3=0}^{q} C_{j_3 j_3 j_1}\right)^2, \tag{228}
$$

where $i_1 \ne i_2 = i_3$.

Consider the case (216). From (220) we obtain

$$\mathsf{M}\left\{\left(I_{(000)T,t}^{*(i_1i_2i_3)}-I_{(000)T,t}^{*(i_1i_2i_3)q}\right)^2\right\}=$$

$$=\mathsf{M}\left\{\left(I_{(000)T,t}^{(i_1i_2i_3)}-I_{(000)T,t}^{(i_1i_2i_3)q}-\sum_{j_1,j_2=0}^{q}C_{j_1j_2j_1}\zeta_{j_2}^{(i_2)}\right)^2\right\}=$$

$$=\mathsf{M}\left\{\left(I_{(000)T,t}^{(i_1i_2i_3)}-I_{(000)T,t}^{(i_1i_2i_3)q}\right)^2\right\}+\mathsf{M}\left\{\left(\sum_{j_1,j_2=0}^{q}C_{j_1j_2j_1}\zeta_{j_2}^{(i_2)}\right)^2\right\}=$$

(229)
$$=\mathsf{M}\left\{\left(I_{(000)T,t}^{(i_1i_2i_3)}-I_{(000)T,t}^{(i_1i_2i_3)q}\right)^2\right\}+\sum_{j_2=0}^{q}\left(\sum_{j_1=0}^{q}C_{j_1j_2j_1}\right)^2.$$

Combining (229) and (96), we have

$$\mathsf{M}\left\{\left(I_{(000)T,t}^{*(i_1i_2i_3)}-I_{(000)T,t}^{*(i_1i_2i_3)q}\right)^2\right\}=\frac{(T-t)^3}{6}-\sum_{j_1,j_2,j_3=0}^{q}C_{j_3j_2j_1}^2-\sum_{j_1,j_2,j_3=0}^{q}C_{j_3j_2j_1}C_{j_1j_2j_3}+$$

(230)
$$+\sum_{j_2=0}^{q}\left(\sum_{j_1=0}^{q}C_{j_1j_2j_1}\right)^2,$$

where $i_1=i_3\ne i_2$.

Thus, the exact calculaton of the mean-square approximation error for the iterated Stratonovich stochastic integral $I_{(000)T,t}^{*(i_1i_2i_3)}$ $(i_1,i_2,i_3=1,\ldots,m)$ is given by the formulas (94), (225), (228), and (230).

Consider now the iterated Stratonovich stochastic integral $I_{(0000)T,t}^{*(i_1i_2i_3i_4)}$ of multiplicity 4 $(i_1,i_2,i_3,i_4=1,\ldots,m)$. For $i_1=i_2=i_3=i_4$ we can use the formula (73). For the case of pairwise different i_1,i_2,i_3,i_4 we have the following relation

$$I_{(0000)T,t}^{*(i_1i_2i_3i_4)}=I_{(0000)T,t}^{(i_1i_2i_3i_4)}\quad \text{w. p. 1.}$$

Then in this case we can use the formulas (99) (for pairwise different i_1,i_2,i_3,i_4) and (100) to approximate the stochastic integral $I_{(0000)T,t}^{*(i_1i_1i_1i_1)}$.

Thus, it remains to consider the following 13 cases

(231) $$i_1=i_2\ne i_3,i_4;\ i_3\ne i_4,$$

(232) $$i_1=i_3\ne i_2,i_4;\ i_2\ne i_4,$$

(233) $$i_1=i_4\ne i_2,i_3;\ i_2\ne i_3,$$

(234) $$i_2=i_3\ne i_1,i_4;\ i_1\ne i_4,$$

(235) $$i_2=i_4\ne i_1,i_3;\ i_1\ne i_3,$$

$$i_3 = i_4 \neq i_1, i_2;\ i_1 \neq i_2, \tag{236}$$

$$i_1 = i_2 = i_3 \neq i_4, \tag{237}$$

$$i_2 = i_3 = i_4 \neq i_1, \tag{238}$$

$$i_1 = i_2 = i_4 \neq i_3, \tag{239}$$

$$i_1 = i_3 = i_4 \neq i_2, \tag{240}$$

$$i_1 = i_2 \neq i_3 = i_4, \tag{241}$$

$$i_1 = i_3 \neq i_2 = i_4, \tag{242}$$

$$i_1 = i_4 \neq i_2 = i_3. \tag{243}$$

By analogy with (220) and using the standard relation between Stratonovich and Ito stochastic integrals (49), (48) of multiplicity 4 as well as (99), we obtain

$$
\begin{aligned}
&\mathsf{M}\left\{\left(I_{(0000)T,t}^{*(i_1 i_2 i_3 i_4)} - I_{(0000)T,t}^{*(i_1 i_2 i_3 i_4)q}\right)^2\right\} = \\
&= \mathsf{M}\left\{\left(I_{(0000)T,t}^{(i_1 i_2 i_3 i_4)} + \frac{1}{2}\mathbf{1}_{\{i_1=i_2\neq 0\}}\int\limits_t^T\int\limits_t^{t_4}\int\limits_t^{t_3} dt_1 d\mathbf{w}_{t_3}^{(i_3)} d\mathbf{w}_{t_4}^{(i_4)} + \right.\right.\\
&+\frac{1}{2}\mathbf{1}_{\{i_2=i_3\neq 0\}}\int\limits_t^T\int\limits_t^{t_4}\int\limits_t^{t_2} d\mathbf{w}_{t_1}^{(i_1)} dt_2 d\mathbf{w}_{t_4}^{(i_4)} + \frac{1}{2}\mathbf{1}_{\{i_3=i_4\neq 0\}}\int\limits_t^T\int\limits_t^{t_3}\int\limits_t^{t_2} d\mathbf{w}_{t_1}^{(i_1)} d\mathbf{w}_{t_2}^{(i_2)} dt_3 + \\
&+\frac{1}{4}\mathbf{1}_{\{i_1=i_2\neq 0\}}\mathbf{1}_{\{i_3=i_4\neq 0\}}\int\limits_t^T\int\limits_t^{t_2} dt_1 dt_2 - I_{(0000)T,t}^{(i_1 i_2 i_3 i_4)q} - \\
&-\mathbf{1}_{\{i_1=i_2\neq 0\}}\sum_{j_4,j_3=0}^{q}\sum_{j_1=0}^{q} C_{j_4 j_3 j_1 j_1}\zeta_{j_3}^{(i_3)}\zeta_{j_4}^{(i_4)} - \mathbf{1}_{\{i_1=i_3\neq 0\}}\sum_{j_4,j_2=0}^{q}\sum_{j_1=0}^{q} C_{j_4 j_1 j_2 j_1}\zeta_{j_2}^{(i_2)}\zeta_{j_4}^{(i_4)} - \\
&-\mathbf{1}_{\{i_1=i_4\neq 0\}}\sum_{j_3,j_2=0}^{q}\sum_{j_1=0}^{q} C_{j_1 j_3 j_2 j_1}\zeta_{j_2}^{(i_2)}\zeta_{j_3}^{(i_3)} - \mathbf{1}_{\{i_2=i_3\neq 0\}}\sum_{j_4,j_1=0}^{q}\sum_{j_2=0}^{q} C_{j_4 j_2 j_2 j_1}\zeta_{j_1}^{(i_1)}\zeta_{j_4}^{(i_4)} - \\
&-\mathbf{1}_{\{i_2=i_4\neq 0\}}\sum_{j_3,j_1=0}^{q}\sum_{j_2=0}^{q} C_{j_2 j_3 j_2 j_1}\zeta_{j_1}^{(i_1)}\zeta_{j_3}^{(i_3)} - \mathbf{1}_{\{i_3=i_4\neq 0\}}\sum_{j_2,j_1=0}^{q}\sum_{j_3=0}^{q} C_{j_3 j_3 j_2 j_1}\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)} + \\
&+\mathbf{1}_{\{i_1=i_2\neq 0\}}\mathbf{1}_{\{i_3=i_4\neq 0\}}\sum_{j_3,j_1=0}^{q} C_{j_3 j_3 j_1 j_1} + \mathbf{1}_{\{i_1=i_3\neq 0\}}\mathbf{1}_{\{i_2=i_4\neq 0\}}\sum_{j_2,j_1=0}^{q} C_{j_2 j_1 j_2 j_1} + \\
&\left.\left.+\mathbf{1}_{\{i_1=i_4\neq 0\}}\mathbf{1}_{\{i_2=i_3\neq 0\}}\sum_{j_2,j_1=0}^{q} C_{j_1 j_2 j_2 j_1}\right)^2\right\},
\end{aligned}
\tag{244}
$$

where $I_{(0000)T,t}^{(i_1 i_2 i_3 i_4)q}$ is defined by (99).

Consider the case (231). From (244) we get

$$\mathsf{M}\left\{\left(I^{*(i_1i_2i_3i_4)}_{(0000)T,t}-I^{*(i_1i_2i_3i_4)q}_{(0000)T,t}\right)^2\right\}=$$

(245)
$$=\mathsf{M}\left\{\left(I^{(i_1i_2i_3i_4)}_{(0000)T,t}-I^{(i_1i_2i_3i_4)q}_{(0000)T,t}+\frac{1}{2}\int\limits_t^T\int\limits_t^{t_4}\int\limits_t^{t_3}dt_1d\mathbf{w}^{(i_3)}_{t_3}d\mathbf{w}^{(i_4)}_{t_4}-\sum_{j_4,j_3=0}^{q}\sum_{j_1=0}^{q}C_{j_4j_3j_1j_1}\zeta^{(i_3)}_{j_3}\zeta^{(i_4)}_{j_4}\right)^2\right\}.$$

Note that

$$\zeta^{(i_3)}_{j_3}\zeta^{(i_4)}_{j_4}=\int\limits_t^T\phi_{j_4}(t_4)\int\limits_t^{t_4}\phi_{j_3}(t_3)d\mathbf{w}^{(i_3)}_{t_3}d\mathbf{w}^{(i_4)}_{t_4}+\int\limits_t^T\phi_{j_3}(t_3)\int\limits_t^{t_3}\phi_{j_4}(t_4)d\mathbf{w}^{(i_4)}_{t_4}d\mathbf{w}^{(i_3)}_{t_3}\qquad(246)$$

w. p. 1, where $i_3\ne i_4$.

According to the results of Sect. 3 in [31] (also see Sect. 1.2.2 in [22]-[24]), the quantity

$$I^{(i_1i_2i_3i_4)}_{(0000)T,t}-I^{(i_1i_2i_3i_4)q}_{(0000)T,t}$$

includes only iterated Ito stochastic integrals of multiplicity 4. At the same time (see (246)), the quantity

$$\frac{1}{2}\int\limits_t^T\int\limits_t^{t_4}\int\limits_t^{t_3}dt_1d\mathbf{w}^{(i_3)}_{t_3}d\mathbf{w}^{(i_4)}_{t_4}-\sum_{j_4,j_3=0}^{q}\sum_{j_1=0}^{p}C_{j_4j_3j_1j_1}\zeta^{(i_3)}_{j_3}\zeta^{(i_4)}_{j_4}$$

contains only iterated Ito stochastic integrals of multiplicity 2. This means that from (245) we get

$$\mathsf{M}\left\{\left(I^{*(i_1i_2i_3i_4)}_{(0000)T,t}-I^{*(i_1i_2i_3i_4)q}_{(0000)T,t}\right)^2\right\}=\mathsf{M}\left\{\left(I^{(i_1i_2i_3i_4)}_{(0000)T,t}-I^{(i_1i_2i_3i_4)q}_{(0000)T,t}\right)^2\right\}+$$

$$+\mathsf{M}\left\{\left(\frac{1}{2}\int\limits_t^T\int\limits_t^{t_4}(t_3-t)d\mathbf{w}^{(i_3)}_{t_3}d\mathbf{w}^{(i_4)}_{t_4}-\sum_{j_4,j_3=0}^{q}\sum_{j_1=0}^{q}C_{j_4j_3j_1j_1}\zeta^{(i_3)}_{j_3}\zeta^{(i_4)}_{j_4}\right)^2\right\}=$$

$$=\mathsf{M}\left\{\left(I^{(i_1i_2i_3i_4)}_{(0000)T,t}-I^{(i_1i_2i_3i_4)q}_{(0000)T,t}\right)^2\right\}+\frac{1}{4}\int\limits_t^T\int\limits_t^{t_4}(t_3-t)^2dt_3dt_4+$$

$$+\sum_{j_4,j_3=0}^{q}\left(\sum_{j_1=0}^{q}C_{j_4j_3j_1j_1}\right)^2-\sum_{j_4,j_3=0}^{q}\sum_{j_1=0}^{q}C_{j_4j_3j_1j_1}\int\limits_t^T\phi_{j_4}(t_4)\int\limits_t^{t_4}\phi_{j_3}(t_3)(t_3-t)dt_3dt_4=$$

$$=\mathsf{M}\left\{\left(I^{(i_1i_2i_3i_4)}_{(0000)T,t}-I^{(i_1i_2i_3i_4)q}_{(0000)T,t}\right)^2\right\}+\frac{(T-t)^4}{48}+\sum_{j_4,j_3=0}^{q}\left(\sum_{j_1=0}^{q}C_{j_4j_3j_1j_1}\right)^2+$$

$$+\sum_{j_4,j_3=0}^{q}\sum_{j_1=0}^{q}C_{j_4j_3j_1j_1}C_{j_4j_3}^{10}, \tag{247}$$

where

$$C_{j_4j_3}^{10}=\int\limits_t^T\phi_{j_4}(t_4)\int\limits_t^{t_4}\phi_{j_3}(t_3)(t-t_3)dt_3dt_4. \tag{248}$$

Using (35) and (247), we finally obtain

$$\mathsf{M}\left\{\left(I_{(0000)T,t}^{*(i_1i_2i_3i_4)}-I_{(0000)T,t}^{*(i_1i_2i_3i_4)q}\right)^2\right\}=\frac{(T-t)^4}{16}-\sum_{j_1,j_2,j_3,j_4=0}^{q}C_{j_4j_3j_2j_1}\left(\sum_{(j_1,j_2)}C_{j_4j_3j_2j_1}\right)+$$

$$+\sum_{j_4,j_3=0}^{q}\left(\sum_{j_1=0}^{q}C_{j_4j_3j_1j_1}\right)^2+\sum_{j_4,j_3=0}^{q}\sum_{j_1=0}^{q}C_{j_4j_3j_1j_1}C_{j_4j_3}^{10}, \tag{249}$$

where $i_1=i_2\ne i_3,i_4;\ i_3\ne i_4$.

Consider the cases (232), (233) by analogy with the case (231) using (36), (37). We have

$$\mathsf{M}\left\{\left(I_{(0000)T,t}^{*(i_1i_2i_3i_4)}-I_{(0000)T,t}^{*(i_1i_2i_3i_4)q}\right)^2\right\}=\frac{(T-t)^4}{24}-\sum_{j_1,j_2,j_3,j_4=0}^{q}C_{j_4j_3j_2j_1}\left(\sum_{(j_1,j_3)}C_{j_4j_3j_2j_1}\right)+$$

$$+\sum_{j_4,j_2=0}^{q}\left(\sum_{j_1=0}^{q}C_{j_4j_1j_2j_1}\right)^2,$$

where $i_1=i_3\ne i_2,i_4$ and $i_2\ne i_4$;

$$\mathsf{M}\left\{\left(I_{(0000)T,t}^{*(i_1i_2i_3i_4)}-I_{(0000)T,t}^{*(i_1i_2i_3i_4)q}\right)^2\right\}=\frac{(T-t)^4}{24}-\sum_{j_1,j_2,j_3,j_4=0}^{q}C_{j_4j_3j_2j_1}\left(\sum_{(j_1,j_4)}C_{j_4j_3j_2j_1}\right)+$$

$$+\sum_{j_3,j_2=0}^{q}\left(\sum_{j_1=0}^{q}C_{j_1j_3j_2j_1}\right)^2,$$

where $i_1=i_4\ne i_2,i_3$ and $i_2\ne i_3$.

Consider the case (234) by analogy with the case (231). We have

$$\mathsf{M}\left\{\left(I_{(0000)T,t}^{*(i_1i_2i_3i_4)}-I_{(0000)T,t}^{*(i_1i_2i_3i_4)q}\right)^2\right\}=\mathsf{M}\left\{\left(I_{(0000)T,t}^{(i_1i_2i_3i_4)}-I_{(0000)T,t}^{(i_1i_2i_3i_4)q}\right)^2\right\}+$$

$$+\mathsf{M}\left\{\left(\frac{1}{2}\int\limits_t^T\int\limits_t^{t_4}\int\limits_t^{t_2}d\mathbf{w}_{t_1}^{(i_1)}dt_2d\mathbf{w}_{t_4}^{(i_4)}-\sum_{j_4,j_1=0}^{q}\sum_{j_2=0}^{q}C_{j_4j_2j_2j_1}\zeta_{j_1}^{(i_1)}\zeta_{j_4}^{(i_4)}\right)^2\right\}=$$

$$=\mathsf{M}\left\{\left(I_{(0000)T,t}^{(i_1i_2i_3i_4)}-I_{(0000)T,t}^{(i_1i_2i_3i_4)q}\right)^2\right\}+$$

$$+\mathsf{M}\left\{\left(\frac{1}{2}\int\limits_t^T\int\limits_t^{t_4}(t_4-t_1)d\mathbf{w}_{t_1}^{(i_1)}d\mathbf{w}_{t_4}^{(i_4)}-\sum_{j_4,j_1=0}^{q}\sum_{j_2=0}^{q}C_{j_4j_2j_2j_1}\zeta_{j_1}^{(i_1)}\zeta_{j_4}^{(i_4)}\right)^2\right\}=$$

$$=\mathsf{M}\left\{\left(I_{(0000)T,t}^{(i_1i_2i_3i_4)}-I_{(0000)T,t}^{(i_1i_2i_3i_4)q}\right)^2\right\}+\frac{(T-t)^4}{48}+\sum_{j_4,j_1=0}^{q}\left(\sum_{j_2=0}^{q}C_{j_4j_2j_2j_1}\right)^2-$$

$$-\sum_{j_4,j_1=0}^{q}\sum_{j_2=0}^{q}C_{j_4j_2j_2j_1}\int\limits_t^T\phi_{j_4}(t_4)\int\limits_t^{t_4}\phi_{j_1}(t_1)(t_4-t_1)dt_3dt_4.$$

Then applying (38), we obtain

$$\mathsf{M}\left\{\left(I_{(0000)T,t}^{*(i_1i_2i_3i_4)}-I_{(0000)T,t}^{*(i_1i_2i_3i_4)q}\right)^2\right\}=\frac{(T-t)^4}{16}-\sum_{j_1,j_2,j_3,j_4=0}^{q}C_{j_4j_3j_2j_1}\left(\sum_{(j_2,j_3)}C_{j_4j_3j_2j_1}\right)+$$

$$+\sum_{j_4,j_1=0}^{q}\left(\sum_{j_2=0}^{q}C_{j_4j_2j_2j_1}\right)^2-\sum_{j_4,j_1=0}^{q}\sum_{j_2=0}^{q}C_{j_4j_2j_2j_1}\left(C_{j_4j_1}^{10}-C_{j_4j_1}^{01}\right),$$

where $i_2=i_3\ne i_1,i_4$ and $i_1\ne i_4$; $C_{j_4j_1}^{10}$ is defined by (248) and

$$C_{j_4j_1}^{01}=\int\limits_t^T\phi_{j_4}(t_4)(t-t_4)\int\limits_t^{t_4}\phi_{j_1}(t_1)dt_1dt_4. \tag{250}$$

For the case (235) by analogy with the case (231) and using (39), we get

$$\mathsf{M}\left\{\left(I_{(0000)T,t}^{*(i_1i_2i_3i_4)}-I_{(0000)T,t}^{*(i_1i_2i_3i_4)q}\right)^2\right\}=\frac{(T-t)^4}{24}-\sum_{j_1,j_2,j_3,j_4=0}^{q}C_{j_4j_3j_2j_1}\left(\sum_{(j_2,j_4)}C_{j_4j_3j_2j_1}\right)+$$

$$+\sum_{j_3,j_1=0}^{q}\left(\sum_{j_2=0}^{q}C_{j_2j_3j_2j_1}\right)^2,$$

where $i_2=i_4\ne i_1,i_3$ and $i_1\ne i_3$.

Consider the case (236) by analogy with the case (231). Note that [22]-[24] (see Example 3.1 in Sect. 3.6)

$$
\int\limits_t^T \int\limits_t^{t_3} \int\limits_t^{t_2} d\mathbf{w}_{t_1}^{(i_1)} d\mathbf{w}_{t_2}^{(i_2)} dt_3 = \int\limits_t^T (T-t_2) \int\limits_t^{t_2} d\mathbf{w}_{t_1}^{(i_1)} d\mathbf{w}_{t_2}^{(i_2)} \quad \text{w. p. 1.} \tag{251}
$$

Using (251), we obtain

$$
\mathsf{M}\left\{\left(I_{(0000)T,t}^{*(i_1 i_2 i_3 i_4)} - I_{(0000)T,t}^{*(i_1 i_2 i_3 i_4)q}\right)^2\right\} = \mathsf{M}\left\{\left(I_{(0000)T,t}^{(i_1 i_2 i_3 i_4)} - I_{(0000)T,t}^{(i_1 i_2 i_3 i_4)q}\right)^2\right\} +
$$

$$
+\mathsf{M}\left\{\left(\frac{1}{2}\int\limits_t^T (T-t_2)\int\limits_t^{t_2} d\mathbf{w}_{t_1}^{(i_1)} d\mathbf{w}_{t_2}^{(i_2)} - \sum_{j_2,j_1=0}^{q}\sum_{j_3=0}^{q} C_{j_3 j_3 j_2 j_1}\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}\right)^2\right\} =
$$

$$
= \mathsf{M}\left\{\left(I_{(0000)T,t}^{(i_1 i_2 i_3 i_4)} - I_{(0000)T,t}^{(i_1 i_2 i_3 i_4)q}\right)^2\right\} + \frac{(T-t)^4}{48} + \sum_{j_2,j_1=0}^{q}\left(\sum_{j_3=0}^{q} C_{j_3 j_3 j_2 j_1}\right)^2 -
$$

$$
- \sum_{j_2,j_1=0}^{q}\sum_{j_3=0}^{q} C_{j_3 j_3 j_2 j_1}\int\limits_t^T (T-t_2)\phi_{j_2}(t_2)\int\limits_t^{t_2}\phi_{j_1}(t_1)dt_1 dt_2.
$$

Then applying (40), we get

$$
\mathsf{M}\left\{\left(I_{(0000)T,t}^{*(i_1 i_2 i_3 i_4)} - I_{(0000)T,t}^{*(i_1 i_2 i_3 i_4)q}\right)^2\right\} = \frac{(T-t)^4}{16} - \sum_{j_1,j_2,j_3,j_4=0}^{q} C_{j_4 j_3 j_2 j_1}\left(\sum_{(j_3,j_4)} C_{j_4 j_3 j_2 j_1}\right) +
$$

$$
+ \sum_{j_2,j_1=0}^{q}\left(\sum_{j_3=0}^{q} C_{j_3 j_3 j_2 j_1}\right)^2 - \sum_{j_2,j_1=0}^{q}\sum_{j_3=0}^{q} C_{j_3 j_3 j_2 j_1}\left((T-t)C_{j_2 j_1} + C_{j_2 j_1}^{01}\right),
$$

where $i_3 = i_4 \ne i_1, i_2$ and $i_1 \ne i_2$; $C_{j_2 j_1}^{01}$ is defined by (250) and

$$
C_{j_2 j_1} = \int\limits_t^T \phi_{j_2}(t_2)\int\limits_t^{t_2}\phi_{j_1}(t_1)dt_1 dt_2.
$$

Consider the case (237). From (244) we have

$$
\mathsf{M}\left\{\left(I_{(0000)T,t}^{*(i_1 i_1 i_1 i_4)} - I_{(0000)T,t}^{*(i_1 i_1 i_1 i_4)q}\right)^2\right\} = \mathsf{M}\left\{\left(I_{(0000)T,t}^{(i_1 i_1 i_1 i_4)} + \frac{1}{2}\int\limits_t^T \int\limits_t^{t_4} \int\limits_t^{t_3} dt_1 d\mathbf{w}_{t_3}^{(i_1)} d\mathbf{w}_{t_4}^{(i_4)} +\right.\right.
$$

$$
+\frac{1}{2}\int\limits_t^T \int\limits_t^{t_4} \int\limits_t^{t_2} d\mathbf{w}_{t_1}^{(i_1)} dt_2 d\mathbf{w}_{t_4}^{(i_4)} - I_{(0000)T,t}^{(i_1 i_1 i_1 i_4)q} - \sum_{j_4,j_3=0}^{q}\sum_{j_1=0}^{q} C_{j_4 j_3 j_1 j_1}\zeta_{j_3}^{(i_1)}\zeta_{j_4}^{(i_4)} -
$$

$$-\sum_{j_4,j_2=0}^{q}\sum_{j_1=0}^{q}C_{j_4j_1j_2j_1}\zeta_{j_2}^{(i_1)}\zeta_{j_4}^{(i_4)}-\sum_{j_4,j_1=0}^{q}\sum_{j_2=0}^{q}C_{j_4j_2j_2j_1}\zeta_{j_1}^{(i_1)}\zeta_{j_4}^{(i_4)}\Biggr)^2\Biggr\}. \tag{252}$$

Furthermore,

$$\int\limits_t^T\int\limits_t^{t_4}\int\limits_t^{t_3}dt_1d\mathbf{w}_{t_3}^{(i_1)}d\mathbf{w}_{t_4}^{(i_4)}+\int\limits_t^T\int\limits_t^{t_4}\int\limits_t^{t_2}d\mathbf{w}_{t_1}^{(i_1)}dt_2d\mathbf{w}_{t_4}^{(i_4)}=$$

$$=\int\limits_t^T\int\limits_t^{t_4}(t_1-t)d\mathbf{w}_{t_1}^{(i_1)}d\mathbf{w}_{t_4}^{(i_4)}+\int\limits_t^T\int\limits_t^{t_4}(t_4-t_1)d\mathbf{w}_{t_1}^{(i_1)}d\mathbf{w}_{t_4}^{(i_4)}=$$

$$=\int\limits_t^T(t_4-t)\int\limits_t^{t_4}d\mathbf{w}_{t_1}^{(i_1)}d\mathbf{w}_{t_4}^{(i_4)}\quad \text{w. p. 1.} \tag{253}$$

From (252) and (253) we obtain

$$\mathsf{M}\left\{\left(I_{(0000)T,t}^{*(i_1i_1i_1i_4)}-I_{(0000)T,t}^{*(i_1i_1i_1i_4)q}\right)^2\right\}=\mathsf{M}\left\{\left(I_{(0000)T,t}^{(i_1i_1i_1i_4)}-I_{(0000)T,t}^{(i_1i_1i_1i_4)q}\right)^2\right\}+$$

$$+\mathsf{M}\left\{\left(\frac{1}{2}\int\limits_t^T(t_4-t)\int\limits_t^{t_4}d\mathbf{w}_{t_1}^{(i_1)}d\mathbf{w}_{t_4}^{(i_4)}-\sum_{j_4,j_1=0}^{q}\sum_{j_2=0}^{q}\left(C_{j_4j_1j_2j_2}+C_{j_4j_2j_1j_2}+C_{j_4j_2j_2j_1}\right)\zeta_{j_1}^{(i_1)}\zeta_{j_4}^{(i_4)}\right)^2\right\}=$$

$$=\mathsf{M}\left\{\left(I_{(0000)T,t}^{(i_1i_1i_1i_4)}-I_{(0000)T,t}^{(i_1i_1i_1i_4)q}\right)^2\right\}+\frac{(T-t)^4}{16}+$$

$$+\sum_{j_4,j_1=0}^{q}\left(\sum_{j_2=0}^{q}\left(C_{j_4j_1j_2j_2}+C_{j_4j_2j_1j_2}+C_{j_4j_2j_2j_1}\right)\right)^2-$$

$$-\sum_{j_4,j_1=0}^{q}\sum_{j_2=0}^{q}\left(C_{j_4j_1j_2j_2}+C_{j_4j_2j_1j_2}+C_{j_4j_2j_2j_1}\right)\int\limits_t^T(t_4-t)\phi_{j_4}(t_4)\int\limits_t^{t_4}\phi_{j_1}(t_1)dt_1dt_4. \tag{254}$$

Using (41) and (254), we finally get

$$\mathsf{M}\left\{\left(I_{(0000)T,t}^{*(i_1i_2i_3i_4)}-I_{(0000)T,t}^{*(i_1i_2i_3i_4)q}\right)^2\right\}=\frac{5(T-t)^4}{48}-\sum_{j_1,j_2,j_3,j_4=0}^{q}C_{j_4j_3j_2j_1}\left(\sum_{(j_1,j_2,j_3)}C_{j_4j_3j_2j_1}\right)+$$

$$+\sum_{j_4,j_1=0}^{q}\left(\sum_{j_2=0}^{q}\left(C_{j_4j_1j_2j_2}+C_{j_4j_2j_1j_2}+C_{j_4j_2j_2j_1}\right)\right)^2+$$

$$+\sum_{j_4,j_1=0}^{q}\sum_{j_2=0}^{q}\left(C_{j_4j_1j_2j_2}+C_{j_4j_2j_1j_2}+C_{j_4j_2j_2j_1}\right)C_{j_4j_2}^{01},$$

where $i_1=i_2=i_3\neq i_4$.

Consider the case (238). From (244) we have

$$\mathsf{M}\left\{\left(I_{(0000)T,t}^{*(i_1i_2i_2i_2)}-I_{(0000)T,t}^{*(i_1i_2i_2i_2)q}\right)^2\right\}=\mathsf{M}\left\{\left(I_{(0000)T,t}^{(i_1i_2i_2i_2)}+\frac{1}{2}\int\limits_t^T\int\limits_t^{t_4}\int\limits_t^{t_2}d\mathbf{w}_{t_1}^{(i_1)}dt_2d\mathbf{w}_{t_4}^{(i_2)}+\right.\right.$$

$$+\frac{1}{2}\int\limits_t^T\int\limits_t^{t_3}\int\limits_t^{t_2}d\mathbf{w}_{t_1}^{(i_1)}d\mathbf{w}_{t_2}^{(i_2)}dt_3-I_{(0000)T,t}^{(i_1i_2i_2i_2)q}-\sum_{j_4,j_1=0}^{q}\sum_{j_2=0}^{q}C_{j_4j_2j_2j_1}\zeta_{j_1}^{(i_1)}\zeta_{j_4}^{(i_2)}-$$

$$\left.\left.-\sum_{j_3,j_1=0}^{q}\sum_{j_2=0}^{q}C_{j_2j_3j_2j_1}\zeta_{j_1}^{(i_1)}\zeta_{j_3}^{(i_2)}-\sum_{j_2,j_1=0}^{q}\sum_{j_3=0}^{q}C_{j_3j_3j_2j_1}\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}\right)^2\right\}. \quad (255)$$

Moreover,

$$\int\limits_t^T\int\limits_t^{t_4}\int\limits_t^{t_2}d\mathbf{w}_{t_1}^{(i_1)}dt_2d\mathbf{w}_{t_4}^{(i_2)}+\int\limits_t^T\int\limits_t^{t_3}\int\limits_t^{t_2}d\mathbf{w}_{t_1}^{(i_1)}d\mathbf{w}_{t_2}^{(i_2)}dt_3=$$

$$=\int\limits_t^T\int\limits_t^{t_4}(t_4-t_1)d\mathbf{w}_{t_1}^{(i_1)}d\mathbf{w}_{t_4}^{(i_2)}+\int\limits_t^T\int\limits_t^{t_4}(T-t_4)d\mathbf{w}_{t_1}^{(i_1)}d\mathbf{w}_{t_4}^{(i_2)}=$$

$$=\int\limits_t^T\int\limits_t^{t_4}(T-t_1)d\mathbf{w}_{t_1}^{(i_1)}d\mathbf{w}_{t_4}^{(i_2)}\quad \text{w. p. 1.} \quad (256)$$

From (255) and (256) we get

$$\mathsf{M}\left\{\left(I_{(0000)T,t}^{*(i_1i_2i_2i_2)}-I_{(0000)T,t}^{*(i_1i_2i_2i_2)q}\right)^2\right\}=\mathsf{M}\left\{\left(I_{(0000)T,t}^{(i_1i_2i_2i_2)}-I_{(0000)T,t}^{(i_1i_2i_2i_2)q}\right)^2\right\}+$$

$$+\mathsf{M}\left\{\left(\frac{1}{2}\int\limits_t^T\int\limits_t^{t_4}(T-t_1)d\mathbf{w}_{t_1}^{(i_1)}d\mathbf{w}_{t_4}^{(i_2)}-\sum_{j_4,j_1=0}^{q}\sum_{j_2=0}^{q}\left(C_{j_4j_2j_2j_1}+C_{j_2j_4j_2j_1}+C_{j_2j_2j_4j_1}\right)\zeta_{j_1}^{(i_1)}\zeta_{j_4}^{(i_2)}\right)^2\right\}=$$

$$=\mathsf{M}\left\{\left(I_{(0000)T,t}^{(i_1i_2i_2i_2)}-I_{(0000)T,t}^{(i_1i_2i_2i_2)q}\right)^2\right\}+\frac{(T-t)^4}{16}+$$

$$+\sum_{j_4,j_1=0}^{q}\left(\sum_{j_2=0}^{q}\left(C_{j_4j_2j_2j_1}+C_{j_2j_4j_2j_1}+C_{j_2j_2j_4j_1}\right)\right)^2-$$

$$
(257) \qquad -\sum_{j_4,j_1=0}^{q}\sum_{j_2=0}^{q}\left(C_{j_4j_2j_2j_1}+C_{j_2j_4j_2j_1}+C_{j_2j_2j_4j_1}\right)\int\limits_t^T\phi_{j_4}(t_4)\int\limits_t^{t_4}(T-t_1)\phi_{j_1}(t_1)dt_1dt_4.
$$

Applying (42) and (257), we finally obtain

$$
\mathsf{M}\left\{\left(I_{(0000)T,t}^{*(i_1i_2i_3i_4)}-I_{(0000)T,t}^{*(i_1i_2i_3i_4)q}\right)^2\right\}=\frac{5(T-t)^4}{48}-\sum_{j_1,j_2,j_3,j_4=0}^{q}C_{j_4j_3j_2j_1}\left(\sum_{(j_2,j_3,j_4)}C_{j_4j_3j_2j_1}\right)+
$$

$$
+\sum_{j_4,j_1=0}^{q}\left(\sum_{j_2=0}^{q}\left(C_{j_4j_2j_2j_1}+C_{j_2j_4j_2j_1}+C_{j_2j_2j_4j_1}\right)\right)^2-
$$

$$
-\sum_{j_4,j_1=0}^{q}\sum_{j_2=0}^{q}\left(C_{j_4j_2j_2j_1}+C_{j_2j_4j_2j_1}+C_{j_2j_2j_4j_1}\right)\left((T-t)C_{j_4j_1}+C_{j_4j_1}^{10}\right),
$$

where $i_2=i_3=i_4\neq i_1$.

For the cases (239), (240) by analogy with the case (238) and using (43), (44), we obtain

$$
\mathsf{M}\left\{\left(I_{(0000)T,t}^{*(i_1i_2i_3i_4)}-I_{(0000)T,t}^{*(i_1i_2i_3i_4)q}\right)^2\right\}=\frac{(T-t)^4}{16}-\sum_{j_1,j_2,j_3,j_4=0}^{q}C_{j_4j_3j_2j_1}\left(\sum_{(j_1,j_2,j_4)}C_{j_4j_3j_2j_1}\right)+
$$

$$

$$

w. p. 1.

The relations (258)–(260) and (251) imply the following

$$
\mathsf{M}\left\{\left(I_{(0000)T,t}^{*(i_1 i_1 i_3 i_3)}-I_{(0000)T,t}^{*(i_1 i_1 i_3 i_3)q}\right)^2\right\}=\mathsf{M}\left\{\left(I_{(0000)T,t}^{(i_1 i_1 i_3 i_3)}-I_{(0000)T,t}^{(i_1 i_1 i_3 i_3)q}\right)^2\right\}+
$$

$$
+\mathsf{M}\left\{\left(\frac{1}{2}\int\limits_t^T\int\limits_t^{t_4}(t_3-t)d\mathbf{w}_{t_3}^{(i_3)}d\mathbf{w}_{t_4}^{(i_3)}-\sum_{j_4,j_3=0}^{q}\sum_{j_1=0}^{q}C_{j_4 j_3 j_1 j_1}\left(\zeta_{j_3}^{(i_3)}\zeta_{j_4}^{(i_3)}-\mathbf{1}_{\{j_3=j_4\}}\right)\right)^2\right\}+
$$

$$+\mathsf{M}\left\{\left(\frac{1}{2}\int\limits_t^T\int\limits_t^{t_3}\int\limits_t^{t_2} d\mathbf{w}_{t_1}^{(i_1)}d\mathbf{w}_{t_2}^{(i_1)}dt_3-\sum_{j_2,j_1=0}^{q}\sum_{j_3=0}^{q}C_{j_3j_3j_2j_1}\left(\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_1)}-\mathbf{1}_{\{j_1=j_2\}}\right)\right)^2\right\}+$$

$$+\left(\frac{(T-t)^2}{8}-\sum_{j_3,j_1=0}^{q}C_{j_3j_3j_1j_1}\right)^2=\mathsf{M}\left\{\left(I_{(0000)T,t}^{(i_1i_1i_3i_3)}-I_{(0000)T,t}^{(i_1i_1i_3i_3)q}\right)^2\right\}+$$

$$+\mathsf{M}\left\{\left(\frac{1}{2}\int\limits_t^T\int\limits_t^{t_4}(t_3-t)d\mathbf{w}_{t_3}^{(i_3)}d\mathbf{w}_{t_4}^{(i_3)}-\sum_{j_4,j_3=0}^{q}\sum_{j_1=0}^{q}C_{j_4j_3j_1j_1}\left(\zeta_{j_3}^{(i_3)}\zeta_{j_4}^{(i_3)}-\mathbf{1}_{\{j_3=j_4\}}\right)\right)^2\right\}+$$

$$+\mathsf{M}\left\{\left(\frac{1}{2}\int\limits_t^T(T-t_2)\int\limits_t^{t_2} d\mathbf{w}_{t_1}^{(i_1)}d\mathbf{w}_{t_2}^{(i_1)}-\sum_{j_2,j_1=0}^{q}\sum_{j_3=0}^{q}C_{j_3j_3j_2j_1}\left(\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_1)}-\mathbf{1}_{\{j_1=j_2\}}\right)\right)^2\right\}+$$

$$+\left(\frac{(T-t)^2}{8}-\sum_{j_3,j_1=0}^{q}C_{j_3j_3j_1j_1}\right)^2=$$

$$=\mathsf{M}\left\{\left(I_{(0000)T,t}^{(i_1i_1i_3i_3)}-I_{(0000)T,t}^{(i_1i_1i_3i_3)q}\right)^2\right\}+\frac{(T-t)^4}{48}+\sum_{j_4,j_3=0}^{q}\sum_{j_1=0}^{q}C_{j_4j_3j_1j_1}\left(C_{j_3j_4}^{10}+C_{j_4j_3}^{10}\right)+$$

$$+\mathsf{M}\left\{\left(\sum_{j_4,j_3=0}^{q}\sum_{j_1=0}^{q}C_{j_4j_3j_1j_1}\left(\zeta_{j_3}^{(i_3)}\zeta_{j_4}^{(i_3)}-\mathbf{1}_{\{j_3=j_4\}}\right)\right)^2\right\}+$$

$$+\frac{(T-t)^4}{48}-\sum_{j_2,j_1=0}^{q}\sum_{j_3=0}^{q}C_{j_3j_3j_2j_1}\left((T-t)\left(C_{j_1j_2}+C_{j_2j_1}\right)+C_{j_1j_2}^{01}+C_{j_2j_1}^{01}\right)+$$

$$+\mathsf{M}\left\{\left(\sum_{j_2,j_1=0}^{q}\sum_{j_3=0}^{q}C_{j_3j_3j_2j_1}\left(\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_1)}-\mathbf{1}_{\{j_1=j_2\}}\right)\right)^2\right\}+$$

$$+\left(\frac{(T-t)^2}{8}-\sum_{j_3,j_1=0}^{q}C_{j_3j_3j_1j_1}\right)^2. \tag{261}$$

Furthermore,

$$\mathsf{M}\left\{\left(\sum_{j_4,j_3=0}^{q}\sum_{j_1=0}^{q}C_{j_4j_3j_1j_1}\left(\zeta_{j_3}^{(i_3)}\zeta_{j_4}^{(i_3)}-\mathbf{1}_{\{j_3=j_4\}}\right)\right)^2\right\}=$$

$$=\mathsf{M}\left\{\left(\sum_{j_4,j_3=0}^{q}\sum_{j_1=0}^{q}C_{j_4j_3j_1j_1}\zeta_{j_3}^{(i_3)}\zeta_{j_4}^{(i_3)}\right)^2\right\}-2\left(\sum_{j_3,j_1=0}^{q}C_{j_3j_3j_1j_1}\right)^2+\left(\sum_{j_3,j_1=0}^{q}C_{j_3j_3j_1j_1}\right)^2=$$

$$=\mathsf{M}\left\{\left(\sum_{j_4,j_3=0}^{q}\sum_{j_1=0}^{q}C_{j_4j_3j_1j_1}\zeta_{j_3}^{(i_3)}\zeta_{j_4}^{(i_3)}\right)^2\right\}-\left(\sum_{j_3,j_1=0}^{q}C_{j_3j_3j_1j_1}\right)^2, \tag{262}$$

$$\mathsf{M}\left\{\left(\sum_{j_2,j_1=0}^{q}\sum_{j_3=0}^{q}C_{j_3j_3j_2j_1}\left(\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_1)}-\mathbf{1}_{\{j_1=j_2\}}\right)\right)^2\right\}=$$

$$=\mathsf{M}\left\{\left(\sum_{j_2,j_1=0}^{q}\sum_{j_3=0}^{q}C_{j_3j_3j_2j_1}\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_1)}\right)^2\right\}-\left(\sum_{j_1,j_3=0}^{q}C_{j_3j_3j_1j_1}\right)^2. \tag{263}$$

We have [32], p. 71 (also see [22], Sect. 2.3)

$$\mathsf{M}\left\{\left(\sum_{j_3,j_4=0}^{q}a_{j_4j_3}\zeta_{j_3}^{(i)}\zeta_{j_4}^{(i)}\right)^2\right\}=\left(\sum_{j_3=0}^{q}a_{j_3j_3}\right)^2+\sum_{j_4=0}^{q}\sum_{j_3=0}^{j_4-1}\left(a_{j_3j_4}+a_{j_4j_3}\right)^2+2\sum_{j_4=0}^{q}\left(a_{j_4j_4}\right)^2, \tag{264}$$

where $i=1,\ldots,m$ and $a_{j_4j_3}$ $(j_3,j_4=0,1,\ldots,q)$ are scalar nonrandom coefficients.

Applying (264), we obtain

$$\mathsf{M}\left\{\left(\sum_{j_4,j_3=0}^{q}\sum_{j_1=0}^{q}C_{j_4j_3j_1j_1}\zeta_{j_3}^{(i_3)}\zeta_{j_4}^{(i_3)}\right)^2\right\}=$$

(265)

$$=\left(\sum_{j_3,j_1=0}^{q}C_{j_3j_3j_1j_1}\right)^2+\sum_{j_4=0}^{q}\sum_{j_3=0}^{j_4-1}\left(\sum_{j_1=0}^{q}C_{j_3j_4j_1j_1}+\sum_{j_1=0}^{q}C_{j_4j_3j_1j_1}\right)^2+2\sum_{j_4=0}^{q}\left(\sum_{j_1=0}^{q}C_{j_4j_4j_1j_1}\right)^2.$$

From (262) and (265) we get

$$\mathsf{M}\left\{\left(\sum_{j_4,j_3=0}^{q}\sum_{j_1=0}^{q}C_{j_4j_3j_1j_1}\left(\zeta_{j_3}^{(i_3)}\zeta_{j_4}^{(i_3)}-\mathbf{1}_{\{j_3=j_4\}}\right)\right)^2\right\}=$$

$$=\sum_{j_4=0}^{q}\sum_{j_3=0}^{j_4-1}\left(\sum_{j_1=0}^{q}C_{j_3j_4j_1j_1}+\sum_{j_1=0}^{q}C_{j_4j_3j_1j_1}\right)^2+2\sum_{j_4=0}^{q}\left(\sum_{j_1=0}^{q}C_{j_4j_4j_1j_1}\right)^2. \tag{266}$$

By analogy with (266) we obtain

$$
\mathsf{M}\left\{\left(\sum_{j_2,j_1=0}^{q}\sum_{j_3=0}^{q}C_{j_3j_3j_2j_1}\left(\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_1)}-\mathbf{1}_{\{j_1=j_2\}}\right)\right)^2\right\}=
$$

$$
=\sum_{j_2=0}^{q}\sum_{j_1=0}^{j_2-1}\left(\sum_{j_3=0}^{q}C_{j_3j_3j_1j_2}+\sum_{j_3=0}^{q}C_{j_3j_3j_2j_1}\right)^2+2\sum_{j_2=0}^{q}\left(\sum_{j_3=0}^{q}C_{j_3j_3j_2j_2}\right)^2. \tag{267}
$$

Combining (45), (261), (266), and (267), we finally have

$$
\mathsf{M}\left\{\left(I_{(0000)T,t}^{*(i_1i_2i_3i_4)}-I_{(0000)T,t}^{*(i_1i_2i_3i_4)q}\right)^2\right\}=\frac{(T-t)^4}{12}-
$$

$$
-\sum_{j_1,j_2,j_3,j_4=0}^{q}C_{j_4j_3j_2j_1}\left(\sum_{(j_1,j_2)}\left(\sum_{(j_3,j_4)}C_{j_4j_3j_2j_1}\right)\right)+\sum_{j_4,j_3=0}^{q}\sum_{j_1=0}^{q}C_{j_4j_3j_1j_1}\left(C_{j_3j_4}^{10}+C_{j_4j_3}^{10}\right)+
$$

$$
+\sum_{j_4=0}^{q}\sum_{j_3=0}^{j_4-1}\left(\sum_{j_1=0}^{q}C_{j_3j_4j_1j_1}+\sum_{j_1=0}^{q}C_{j_4j_3j_1j_1}\right)^2+2\sum_{j_4=0}^{q}\left(\sum_{j_1=0}^{q}C_{j_4j_4j_1j_1}\right)^2-
$$

$$
-\sum_{j_2,j_1=0}^{q}\sum_{j_3=0}^{q}C_{j_3j_3j_2j_1}\left((T-t)C_{j_1}C_{j_2}+C_{j_1j_2}^{01}+C_{j_2j_1}^{01}\right)+
$$

$$
+\sum_{j_2=0}^{q}\sum_{j_1=0}^{j_2-1}\left(\sum_{j_3=0}^{q}C_{j_3j_3j_1j_2}+\sum_{j_3=0}^{q}C_{j_3j_3j_2j_1}\right)^2+2\sum_{j_2=0}^{q}\left(\sum_{j_3=0}^{q}C_{j_3j_3j_2j_2}\right)^2+
$$

$$
+\left(\frac{(T-t)^2}{8}-\sum_{j_3,j_1=0}^{q}C_{j_3j_3j_1j_1}\right)^2,
$$

where $i_1=i_2\neq i_3=i_4$ and

$$
C_j=\int\limits_t^T\phi_j(\tau)d\tau=\begin{cases}\sqrt{T-t}, & j=0\\ 0, & j\neq 0\end{cases}.
$$

Consider the case (242) by analogy with the case (241). Using (244), we obtain

$$
\mathsf{M}\left\{\left(I_{(0000)T,t}^{*(i_1i_2i_1i_2)}-I_{(0000)T,t}^{*(i_1i_2i_1i_2)q}\right)^2\right\}=\mathsf{M}\left\{\left(I_{(0000)T,t}^{(i_1i_2i_1i_2)}-I_{(0000)T,t}^{(i_1i_2i_1i_2)q}-\right.\right.
$$

$$
-\sum_{j_4,j_2=0}^{q}\sum_{j_1=0}^{q} C_{j_4j_1j_2j_1}\zeta_{j_2}^{(i_2)}\zeta_{j_4}^{(i_2)} - \sum_{j_3,j_1=0}^{q}\sum_{j_2=0}^{q} C_{j_2j_3j_2j_1}\zeta_{j_1}^{(i_1)}\zeta_{j_3}^{(i_1)} + \sum_{j_2,j_1=0}^{q} C_{j_2j_1j_2j_1}\Biggr)^2\Biggr\} =
$$

$$
= \mathsf{M}\Biggl\{\Biggl(I_{(0000)T,t}^{(i_1i_2i_1i_2)} - I_{(0000)T,t}^{(i_1i_2i_1i_2)q} - \sum_{j_4,j_2=0}^{q}\sum_{j_1=0}^{q} C_{j_4j_1j_2j_1}\left(\zeta_{j_2}^{(i_2)}\zeta_{j_4}^{(i_2)} - \mathbf{1}_{\{j_2=j_4\}}\right) -
$$

$$
-\sum_{j_3,j_1=0}^{q}\sum_{j_2=0}^{q} C_{j_2j_3j_2j_1}\left(\zeta_{j_1}^{(i_1)}\zeta_{j_3}^{(i_1)} - \mathbf{1}_{\{j_1=j_3\}}\right) - \sum_{j_2,j_1=0}^{q} C_{j_2j_1j_2j_1}\Biggr)^2\Biggr\} =
$$

$$
= \mathsf{M}\left\{\left(I_{(0000)T,t}^{(i_1i_2i_1i_2)} - I_{(0000)T,t}^{(i_1i_2i_1i_2)q}\right)^2\right\} +
$$

$$
+\mathsf{M}\left\{\left(\sum_{j_4,j_2=0}^{q}\sum_{j_1=0}^{q} C_{j_4j_1j_2j_1}\left(\zeta_{j_2}^{(i_2)}\zeta_{j_4}^{(i_2)} - \mathbf{1}_{\{j_2=j_4\}}\right)\right)^2\right\} +
$$

$$
+\mathsf{M}\left\{\left(\sum_{j_3,j_1=0}^{q}\sum_{j_2=0}^{q} C_{j_2j_3j_2j_1}\left(\zeta_{j_1}^{(i_1)}\zeta_{j_3}^{(i_1)} - \mathbf{1}_{\{j_1=j_3\}}\right)\right)^2\right\} +
$$

$$
+\left(\sum_{j_2,j_1=0}^{q} C_{j_2j_1j_2j_1}\right)^2. \tag{268}
$$

Applying (46) and (268), we finally get

$$
\mathsf{M}\left\{\left(I_{(0000)T,t}^{*(i_1i_2i_3i_4)} - I_{(0000)T,t}^{*(i_1i_2i_3i_4)q}\right)^2\right\} = \frac{(T-t)^4}{24} - \sum_{j_1,j_2,j_3,j_4=0}^{q} C_{j_4j_3j_2j_1}\left(\sum_{(j_1,j_3)}\left(\sum_{(j_2,j_4)} C_{j_4j_3j_2j_1}\right)\right)+
$$

$$
+\sum_{j_4=0}^{q}\sum_{j_2=0}^{j_4-1}\left(\sum_{j_1=0}^{q} C_{j_2j_1j_4j_1} + \sum_{j_1=0}^{q} C_{j_4j_1j_2j_1}\right)^2 + 2\sum_{j_4=0}^{q}\left(\sum_{j_1=0}^{q} C_{j_4j_1j_4j_1}\right)^2 +
$$

$$
+\sum_{j_3=0}^{q}\sum_{j_1=0}^{j_3-1}\left(\sum_{j_2=0}^{q} C_{j_2j_1j_2j_3} + \sum_{j_2=0}^{q} C_{j_2j_3j_2j_1}\right)^2 + 2\sum_{j_3=0}^{q}\left(\sum_{j_2=0}^{q} C_{j_2j_3j_2j_3}\right)^2 +
$$

$$
+\left(\sum_{j_2,j_1=0}^{q} C_{j_2j_1j_2j_1}\right)^2,
$$

where $i_1 = i_3 \neq i_2 = i_4$.

Consider the case (243) by analogy with the cases (241) and (242). Applying (244), we obtain

$$\mathsf{M}\left\{\left(I_{(0000)T,t}^{*(i_1i_2i_2i_1)}-I_{(0000)T,t}^{*(i_1i_2i_2i_1)q}\right)^2\right\}=$$

$$=\mathsf{M}\left\{\left(I_{(0000)T,t}^{(i_1i_2i_2i_1)}+\frac{1}{2}\int\limits_t^T\int\limits_t^{t_4}\int\limits_t^{t_2}d\mathbf{w}_{t_1}^{(i_1)}dt_2d\mathbf{w}_{t_4}^{(i_1)}-I_{(0000)T,t}^{(i_1i_2i_2i_1)q}-\right.\right.$$

$$\left.\left.-\sum_{j_3,j_2=0}^{q}\sum_{j_1=0}^{q}C_{j_1j_3j_2j_1}\zeta_{j_2}^{(i_2)}\zeta_{j_3}^{(i_2)}-\sum_{j_4,j_1=0}^{q}\sum_{j_2=0}^{q}C_{j_4j_2j_2j_1}\zeta_{j_1}^{(i_1)}\zeta_{j_4}^{(i_1)}+\sum_{j_2,j_1=0}^{q}C_{j_1j_2j_2j_1}\right)^2\right\}=$$

$$=\mathsf{M}\left\{\left(I_{(0000)T,t}^{(i_1i_2i_2i_1)}-I_{(0000)T,t}^{(i_1i_2i_2i_1)q}+\right.\right.$$

$$+\frac{1}{2}\int\limits_t^T\int\limits_t^{t_4}\int\limits_t^{t_2}d\mathbf{w}_{t_1}^{(i_1)}dt_2d\mathbf{w}_{t_4}^{(i_1)}-\sum_{j_4,j_1=0}^{q}\sum_{j_2=0}^{q}C_{j_4j_2j_2j_1}\left(\zeta_{j_1}^{(i_1)}\zeta_{j_4}^{(i_1)}-\mathbf{1}_{\{j_1=j_4\}}\right)-$$

$$+\mathsf{M}\left\{\left(\frac{1}{2}\int\limits_t^T\int\limits_t^{t_4}(t_4-t_1)d\mathbf{w}_{t_1}^{(i_1)}d\mathbf{w}_{t_4}^{(i_1)}-\sum_{j_4,j_1=0}^{q}\sum_{j_2=0}^{q}C_{j_4j_2j_2j_1}\left(\zeta_{j_1}^{(i_1)}\zeta_{j_4}^{(i_1)}-\mathbf{1}_{\{j_1=j_4\}}\right)\right)^2\right\}+$$

$$+\mathsf{M}\left\{\left(\sum_{j_3,j_2=0}^{q}\sum_{j_1=0}^{q}C_{j_1j_3j_2j_1}\left(\zeta_{j_2}^{(i_2)}\zeta_{j_3}^{(i_2)}-\mathbf{1}_{\{j_2=j_3\}}\right)\right)^2\right\}+$$

$$+\left(\sum_{j_2,j_1=0}^{q}C_{j_1j_2j_2j_1}\right)^2=$$

$$=\mathsf{M}\left\{\left(I_{(0000)T,t}^{(i_1i_2i_2i_1)}-I_{(0000)T,t}^{(i_1i_2i_2i_1)q}\right)^2\right\}+\frac{(T-t)^4}{48}-$$

$$-\sum_{j_4,j_1=0}^{q}\sum_{j_2=0}^{q}C_{j_4j_2j_2j_1}\left(\int\limits_t^T\phi_{j_4}(t_4)\int\limits_t^{t_4}(t_4-t_1)\phi_{j_1}(t_1)dt_1dt_4+\int\limits_t^T\phi_{j_1}(t_4)\int\limits_t^{t_4}(t_4-t_1)\phi_{j_4}(t_1)dt_1dt_4\right)+$$

$$+\mathsf{M}\left\{\left(\sum_{j_4,j_1=0}^{q}\sum_{j_2=0}^{q}C_{j_4j_2j_2j_1}\left(\zeta_{j_1}^{(i_1)}\zeta_{j_4}^{(i_1)}-\mathbf{1}_{\{j_1=j_4\}}\right)\right)^2\right\}+$$

$$+\mathsf{M}\left\{\left(\sum_{j_3,j_2=0}^{q}\sum_{j_1=0}^{q}C_{j_1j_3j_2j_1}\left(\zeta_{j_2}^{(i_2)}\zeta_{j_3}^{(i_2)}-\mathbf{1}_{\{j_2=j_3\}}\right)\right)^2\right\}+$$

$$+\left(\sum_{j_2,j_1=0}^{q}C_{j_1j_2j_2j_1}\right)^2. \tag{269}$$

Applying (47) and (269), we finally obtain

$$\mathsf{M}\left\{\left(I_{(0000)T,t}^{*(i_1i_2i_3i_4)}-I_{(0000)T,t}^{*(i_1i_2i_3i_4)q}\right)^2\right\}=\frac{(T-t)^4}{16}-\sum_{j_1,j_2,j_3,j_4=0}^{q}C_{j_4j_3j_2j_1}\left(\sum_{(j_1,j_4)}\left(\sum_{(j_2,j_3)}C_{j_4j_3j_2j_1}\right)\right)-$$

$$-\sum_{j_4,j_1=0}^{q}\sum_{j_2=0}^{q}C_{j_4j_2j_2j_1}\left(C_{j_4j_1}^{10}+C_{j_1j_4}^{10}-C_{j_4j_1}^{01}-C_{j_1j_4}^{01}\right)+$$

$$+\sum_{j_4=0}^{q}\sum_{j_1=0}^{j_4-1}\left(\sum_{j_2=0}^{q}C_{j_1j_2j_2j_4}+\sum_{j_2=0}^{q}C_{j_4j_2j_2j_1}\right)^2+2\sum_{j_4=0}^{q}\left(\sum_{j_2=0}^{q}C_{j_4j_2j_2j_4}\right)^2+$$

$$+\sum_{j_3=0}^{q}\sum_{j_2=0}^{j_3-1}\left(\sum_{j_1=0}^{q}C_{j_1j_2j_3j_1}+\sum_{j_1=0}^{q}C_{j_1j_3j_2j_1}\right)^2+2\sum_{j_3=0}^{q}\left(\sum_{j_1=0}^{q}C_{j_1j_3j_3j_1}\right)^2+$$

$$+\left(\sum_{j_2,j_1=0}^{q}C_{j_1j_2j_2j_1}\right)^2,$$

where $i_1=i_4\neq i_2=i_3$.

COMPARATIVE ANALYSIS OF THE EFFICIENCY OF APPLICATION OF LEGENDRE POLYNOMIALS AND TRIGONOMETRIC FUNCTIONS TO THE NUMERICAL INTEGRATION OF ITO STOCHASTIC DIFFERENTIAL EQUATIONS

DMITRIY F. KUZNETSOV

Abstract. The article is devoted to comparative analysis of the efficiency of application of Legendre polynomials and trigonometric functions to the numerical integration of Ito stochastic differential equations in the framework of the method of approximation of iterated Ito and Stratonovich stochastic integrals based on generalized multiple Fourier series. On the example of iterated Ito stochastic integrals of multiplicities 1 to 3 from the Taylor–Ito expansion it is shown that expansions of stochastic integrals based on Legendre polynomials are essentially simpler and require significantly less computational costs compared to their analogues obtained using the trigonometric system of functions. The results of the article can be useful for construction of high-order strong numerical methods for Ito stochastic differential equations.

Contents

Mathematics Subject Classification: 60H05, 60H10, 42B05, 42C10.
Keywords: Iterated Stratonovich stochastic integral, Iterated Ito stochastic integral, Generalized multiple Fourier series, Multiple Fourier–Legendre series, Multiple trigonometric Fourier series, Mean-square approximation, Expansion.

1. Introduction

In a lot of author's publications [1]-[43] the mean-square approximation method for iterated Ito and Stratonovich stochastic integrals based on generalized multiple Fourier series is proposed and developed (see Theorems 1–8 below). Further, we will call this method as the method of generalized multiple Fourier series. Under the term "generalized multiple Fourier series" we understand the Fourier series constructed using various complete orthonormal systems of functions in the space $L_2([t,T])$, and not only using the trigonometric system of functions. Here $[t,T]$ is an interval of integration of iterated Ito or Stratonovich stochastic integrals.

It is well known the another approach to series expansion of stochastic processes using eigenfunctions of their covariance operators (the so-called Karhunen–Loeve expansion) [44]. If the stochastic process is the Brownian bridge process on the time interval $[t,T]$, then the eigenfunctions of its covariance operator will be trigonometric functions which form a complete orthonormal system of functions in the space $L_2([t,T])$ [45]. This means that the basis functions in the mentioned approach can only be trigonometric functions. In [45]-[49] the series expansion of the Brownian bridge process was used for the expansion and mean-square approximation of iterated Ito and Stratonovich stochastic integrals. Further, we will call this expansion as the Milstein expansion.

As mentioned above, in contrast to the Milstein expansion the method of generalized multiple Fourier series [1]-[43] (see Theorems 1, 2 below) allows to use different systems of basis functions. Thus, we can set the problem of choice the optimal system of basis functions within the framework of the method of generalized multiple Fourier series. Some ideas on the solution of the mentioned problem were given in a number of the author's works [4]-[13], [16]-[20].

For example, in [4]-[13], [16], [17] it was shown that expansions for simplest iterated (double) Stratonovich stochastic integrals based on the systems of Haar and Rademacher–Walsh functions are too complex and ineffective in practice. In these works, a very brief comparison of the efficiency of application of Legendre polynomials and trigonometric functions in the framework of the method of generalized multiple Fourier series was also carried out. The subject of this article is the development and refinement of the results obtained in [4]-[13], [16], [17] in this direction.

2. Milstein Approach

Let $(\Omega,\ \mathrm{F},\ \mathsf{P})$ be a complete probability space. Let $\{\mathrm{F}_t, t\in[0,T]\}$ be a nondecreasing right-continous family of σ-algebras of F, and let $\mathbf{f}_t$ be a standard m-dimensional Wiener stochastic process, which is F_t-measurable for any $t\in[0,T]$. We assume that the components $\mathbf{f}_t^{(i)}$ $(i=1,\ldots,m)$ of this process are independent. Consider the Brownian bridge process [45]

$$\mathbf{f}_t-\frac{t}{\Delta}\mathbf{f}_{\Delta},\quad t\in[0,\Delta]. \tag{1}$$

The componentwise expansion of the stochastic process (1) into converging in the mean-square sense trigonometric Fourier series (version of the so-called Karhunen–Loeve expansion) has the following form [45]

$$\mathbf{f}_t^{(i)}-\frac{t}{\Delta}\mathbf{f}_\Delta^{(i)}=\frac{1}{2}a_{i,0}+\sum_{r=1}^{\infty}\left(a_{i,r}\cos\frac{2\pi rt}{\Delta}+b_{i,r}\sin\frac{2\pi rt}{\Delta}\right), \tag{2}$$

where

$$a_{i,r}=\frac{2}{\Delta}\int\limits_0^{\Delta}\left(\mathbf{f}_s^{(i)}-\frac{s}{\Delta}\mathbf{f}_\Delta^{(i)}\right)\cos\frac{2\pi rs}{\Delta}ds,\quad b_{i,r}=\frac{2}{\Delta}\int\limits_0^{\Delta}\left(\mathbf{f}_s^{(i)}-\frac{s}{\Delta}\mathbf{f}_\Delta^{(i)}\right)\sin\frac{2\pi rs}{\Delta}ds,$$

where $r=0,1,\ldots;\ i=1,\ldots,m$.

It is easy to demonstrate [45] that the random variables $a_{i,r}, b_{i,r}$ are Gaussian ones and they satisfy the following relations

$$\mathsf{M}\left\{a_{i,r}b_{i,r}\right\}=\mathsf{M}\left\{a_{i,r}b_{i,k}\right\}=0,\quad \mathsf{M}\left\{a_{i,r}a_{i,k}\right\}=\mathsf{M}\left\{b_{i,r}b_{i,k}\right\}=0,$$

$$\mathsf{M}\left\{a_{i_1,r}a_{i_2,r}\right\}=\mathsf{M}\left\{b_{i_1,r}b_{i_2,r}\right\}=0,\quad \mathsf{M}\left\{a_{i,r}^2\right\}=\mathsf{M}\left\{b_{i,r}^2\right\}=\frac{\Delta}{2\pi^2r^2},$$

where $i,i_1,i_2=1,\ldots,m;\ r\neq k;\ i_1\neq i_2$; M denotes a mathematical expectation.

According to (2), we have

$$\mathbf{f}_t^{(i)}=\mathbf{f}_\Delta^{(i)}\frac{t}{\Delta}+\frac{1}{2}a_{i,0}+\sum_{r=1}^{\infty}\left(a_{i,r}\cos\frac{2\pi rt}{\Delta}+b_{i,r}\sin\frac{2\pi rt}{\Delta}\right), \tag{3}$$

where the series converges in the mean-square sense.

Denote

$$J_{(\lambda_1\ldots\lambda_k)T,t}^{(i_1\ldots i_k)}=\int\limits_t^T\ldots\int\limits_t^{t_2}d\mathbf{w}_{t_1}^{(i_1)}\ldots d\mathbf{w}_{t_k}^{(i_k)}, \tag{4}$$

$$J_{(\lambda_1\ldots\lambda_k)T,t}^{*(i_1\ldots i_k)}=\int\limits_t^{*T}\ldots\int\limits_t^{*t_2}d\mathbf{w}_{t_1}^{(i_1)}\ldots d\mathbf{w}_{t_k}^{(i_k)}, \tag{5}$$

$$J[\psi^{(k)}]_{T,t}=\int\limits_t^T\psi_k(t_k)\ldots\int\limits_t^{t_2}\psi_1(t_1)d\mathbf{w}_{t_1}^{(i_1)}\ldots d\mathbf{w}_{t_k}^{(i_k)}, \tag{6}$$

$$J^*[\psi^{(k)}]_{T,t}=\int\limits_t^{*T}\psi_k(t_k)\ldots\int\limits_t^{*t_2}\psi_1(t_1)d\mathbf{w}_{t_1}^{(i_1)}\ldots d\mathbf{w}_{t_k}^{(i_k)}, \tag{7}$$

where every $\psi_l(\tau)$ $(l=1,\ldots,k)$ is a non-random function on $[t,T]$; $\mathbf{w}_\tau^{(i)}=\mathbf{f}_\tau^{(i)}$ for $i=1,\ldots,m$ and $\mathbf{w}_\tau^{(0)}=\tau$; $i_1,\ldots,i_k=0,1,\ldots,m$; $\lambda_l=0$ for $i_l=0$ and $\lambda_l=1$ for $i_l=1,\ldots,m$ $(l=1,\ldots,k)$;

$$\int \text{ and } \int\limits^{*}$$

denote Ito and Stratonovich stochastic integrals, respectively. In this paper we use the definition of the Stratonovich stochastic integral from [46], [47].

In [45] Milstein G.N. obtained the following expansion of $J^{(i_1 i_2)}_{(11)T,t}$ using the expansion (3)

(8)
$$J^{(i_1 i_2)}_{(11)T,t} = \frac{1}{2}(T-t)\Biggl(\zeta_0^{(i_1)}\zeta_0^{(i_2)} + \frac{1}{\pi}\sum_{r=1}^{\infty}\frac{1}{r}\left(\zeta_{2r}^{(i_1)}\zeta_{2r-1}^{(i_2)} - \zeta_{2r-1}^{(i_1)}\zeta_{2r}^{(i_2)} + \sqrt{2}\left(\zeta_{2r-1}^{(i_1)}\zeta_0^{(i_2)} - \zeta_0^{(i_1)}\zeta_{2r-1}^{(i_2)}\right)\right)\Biggr),$$

where the series converges in the mean-square sense; $i_1 \ne i_2$; $i_1, i_2 = 1,\ldots,m$;

$$\zeta_j^{(i)} = \int\limits_t^T \phi_j(s) d\mathbf{f}_s^{(i)}$$

are independent standard Gaussian random variables for various i or j;

$$\phi_j(s) = \frac{1}{\sqrt{T-t}}\begin{cases} 1 & \text{for } j=0 \\ \sqrt{2}\sin(2\pi r(s-t)/(T-t)) & \text{for } j=2r-1 \\ \sqrt{2}\cos(2\pi r(s-t)/(T-t)) & \text{for } j=2r \end{cases}, \tag{9}$$

where $r = 1, 2, \ldots$ Moreover, [45]

$$J^{(i_1)}_{(1)T,t} = \sqrt{T-t}\,\zeta_0^{(i_1)}, \tag{10}$$

where $i_1 = 1,\ldots,m$.

In principle for implementing the strong numerical method with the order 1.0 of accuracy (Milstein method [45]) for Ito stochastic differential equations it is sufficient to take the following approximations

$$J^{(i_1)q}_{(1)T,t} \stackrel{\textsf{def}}{=} J^{(i_1)}_{(1)T,t} = \sqrt{T-t}\,\zeta_0^{(i_1)}, \tag{11}$$

(12)
$$J^{(i_1 i_2)q}_{(11)T,t} = \frac{1}{2}(T-t)\Biggl(\zeta_0^{(i_1)}\zeta_0^{(i_2)} + \frac{1}{\pi}\sum_{r=1}^{q}\frac{1}{r}\left(\zeta_{2r}^{(i_1)}\zeta_{2r-1}^{(i_2)} - \zeta_{2r-1}^{(i_1)}\zeta_{2r}^{(i_2)} + \sqrt{2}\left(\zeta_{2r-1}^{(i_1)}\zeta_0^{(i_2)} - \zeta_0^{(i_1)}\zeta_{2r-1}^{(i_2)}\right)\right)\Biggr),$$

where $i_1 \ne i_2$; $i_1, i_2 = 1,\ldots,m$.

It is not difficult to show that

$$\mathsf{M}\left\{\left(J_{(11)T,t}^{(i_1i_2)}-J_{(11)T,t}^{(i_1i_2)q}\right)^2\right\}=\frac{3(T-t)^2}{2\pi^2}\left(\frac{\pi^2}{6}-\sum_{r=1}^{q}\frac{1}{r^2}\right). \tag{13}$$

However, this approach has an obvious drawback. Indeed, we have too complex formulas for the stochastic integrals with Gaussian distribution

$$J_{(01)T,t}^{(0i_1)}=\frac{(T-t)^{3/2}}{2}\left(\zeta_0^{(i_1)}-\frac{\sqrt{2}}{\pi}\sum_{r=1}^{\infty}\frac{1}{r}\zeta_{2r-1}^{(i_1)}\right), \tag{14}$$

$$J_{(001)T,t}^{(00i_1)}=(T-t)^{5/2}\left(\frac{1}{6}\zeta_0^{(i_1)}+\frac{1}{2\sqrt{2}\pi^2}\sum_{r=1}^{\infty}\frac{1}{r^2}\zeta_{2r}^{(i_1)}-\frac{1}{2\sqrt{2}\pi}\sum_{r=1}^{\infty}\frac{1}{r}\zeta_{2r-1}^{(i_1)}\right),$$

$$J_{(01)T,t}^{(0i_1)q}=\frac{(T-t)^{3/2}}{2}\left(\zeta_0^{(i_1)}-\frac{\sqrt{2}}{\pi}\sum_{r=1}^{q}\frac{1}{r}\zeta_{2r-1}^{(i_1)}\right),$$

$$J_{(001)T,t}^{(00i_1)q}=(T-t)^{5/2}\left(\frac{1}{6}\zeta_0^{(i_1)}+\frac{1}{2\sqrt{2}\pi^2}\sum_{r=1}^{q}\frac{1}{r^2}\zeta_{2r}^{(i_1)}-\frac{1}{2\sqrt{2}\pi}\sum_{r=1}^{q}\frac{1}{r}\zeta_{2r-1}^{(i_1)}\right),$$

where the sense of notations from (12) is hold.

In [45] Milstein G.N. proposed the following mean-square approximations on the base of the expansions (8), (14)

$$J_{(01)T,t}^{(0i_1)q}=\frac{(T-t)^{3/2}}{2}\left(\zeta_0^{(i_1)}-\frac{\sqrt{2}}{\pi}\left(\sum_{r=1}^{q}\frac{1}{r}\zeta_{2r-1}^{(i_1)}+\sqrt{\alpha_q}\xi_q^{(i_1)}\right)\right), \tag{15}$$

$$J_{(11)T,t}^{(i_1i_2)q}=\frac{1}{2}(T-t)\Biggl(\zeta_0^{(i_1)}\zeta_0^{(i_2)}+\frac{1}{\pi}\sum_{r=1}^{q}\frac{1}{r}\left(\zeta_{2r}^{(i_1)}\zeta_{2r-1}^{(i_2)}-\zeta_{2r-1}^{(i_1)}\zeta_{2r}^{(i_2)}+\right.$$

$$\left.+\sqrt{2}\left(\zeta_{2r-1}^{(i_1)}\zeta_0^{(i_2)}-\zeta_0^{(i_1)}\zeta_{2r-1}^{(i_2)}\right)\right)+\frac{\sqrt{2}}{\pi}\sqrt{\alpha_q}\left(\xi_q^{(i_1)}\zeta_0^{(i_2)}-\zeta_0^{(i_1)}\xi_q^{(i_2)}\right)\Biggr), \tag{16}$$

where $i_1\ne i_2$ in (16), and

$$\xi_q^{(i)}=\frac{1}{\sqrt{\alpha_q}}\sum_{r=q+1}^{\infty}\frac{1}{r}\,\zeta_{2r-1}^{(i)},\quad \alpha_q=\frac{\pi^2}{6}-\sum_{r=1}^{q}\frac{1}{r^2}, \tag{17}$$

where $\zeta_0^{(i)}$, $\zeta_{2r}^{(i)}$, $\zeta_{2r-1}^{(i)}$, $\xi_q^{(i)}$; $r=1,\ldots,q$; $i=1,\ldots,m$ are independent standard Gaussian random variables.

Obviously, for the approximations (15) and (16) we obtain [45]

$$\mathsf{M}\left\{\left(J_{(01)T,t}^{(0i_1)}-J_{(01)T,t}^{(0i_1)q}\right)^2\right\}=0,$$

$$\mathsf{M}\left\{\left(J_{(11)T,t}^{(i_1 i_2)}-J_{(11)T,t}^{(i_1 i_2)q}\right)^2\right\}=\frac{(T-t)^2}{2\pi^2}\left(\frac{\pi^2}{6}-\sum_{r=1}^{q}\frac{1}{r^2}\right). \tag{18}$$

This idea has been developed in [46]-[48]. For example, the approximation $J_{(001)T,t}^{(00i_1)q}$, which corresponds to (15), (16) has the form [46]-[48]

$$J_{(001)T,t}^{(00i_1)q}=(T-t)^{5/2}\left(\frac{1}{6}\zeta_0^{(i_1)}+\frac{1}{2\sqrt{2}\pi^2}\left(\sum_{r=1}^{q}\frac{1}{r^2}\zeta_{2r}^{(i_1)}+\sqrt{\beta_q}\mu_q^{(i_1)}\right)-\right.$$

$$\left.-\frac{1}{2\sqrt{2}\pi}\left(\sum_{r=1}^{q}\frac{1}{r}\zeta_{2r-1}^{(i_1)}+\sqrt{\alpha_q}\xi_q^{(i_1)}\right)\right), \tag{19}$$

$$\mathsf{M}\left\{\left(J_{(001)T,t}^{(00i_1)}-J_{(001)T,t}^{(00i_1)q}\right)^2\right\}=0,$$

where $\xi_q^{(i)}$ and α_q have the form (17) and

$$\mu_q^{(i)}=\frac{1}{\sqrt{\beta_q}}\sum_{r=q+1}^{\infty}\frac{1}{r^2}\ \zeta_{2r}^{(i)},\quad \beta_q=\frac{\pi^4}{90}-\sum_{r=1}^{q}\frac{1}{r^4},$$

$\phi_j(s)$ is defined by (9); $\zeta_0^{(i)}$, $\zeta_{2r}^{(i)}$, $\zeta_{2r-1}^{(i)}$, $\xi_q^{(i)}$, $\mu_q^{(i)}$ $(r=1,\ldots,q;\ i=1,\ldots,m)$ are independent standard Gaussian random variables.

Nevetheless, the expansions (15), (19) are too complex for approximation of two Gaussian random variables $J_{(01)T,t}^{(0i_1)}$, $J_{(001)T,t}^{(00i_1)}$.

Further, we will see that introduction of random variables $\xi_q^{(i)}$ and $\mu_q^{(i)}$ will sharply complicate the approximation of the stochastic integral $J_{(111)T,t}^{(i_1 i_2 i_3)}$; $i_1,i_2,i_3=1,\ldots,m$ within the framework of the Milshtein approach. This is due to the fact that the number q is fixed for all stochastic integrals included into the considered collection. However, it is clear that due to the smallness of $T-t$, the number q for $J_{(111)T,t}^{(i_1 i_2 i_3)}$ could be taken significantly less than the number q in the formula (16). This feature is also valid for the formulas (15), (19).

On the other hand, the following very simple formulas are well known

$$J_{(1)T,t}^{(i_1)}=\sqrt{T-t}\zeta_0^{(i_1)}, \tag{20}$$

$$J_{(01)T,t}^{(0i_1)}=\frac{(T-t)^{3/2}}{2}\left(\zeta_0^{(i_1)}+\frac{1}{\sqrt{3}}\zeta_1^{(i_1)}\right), \tag{21}$$

$$J_{(001)T,t}^{(00i_1)}=\frac{(T-t)^{5/2}}{6}\left(\zeta_0^{(i_1)}+\frac{\sqrt{3}}{2}\zeta_1^{(i_1)}+\frac{1}{2\sqrt{5}}\zeta_2^{(i_1)}\right), \tag{22}$$

where $\zeta_0^{(i)}$, $\zeta_1^{(i)}$, $\zeta_2^{(i)}$; $i=1,\ldots,m$ are indepentent standard Gaussian random variables.

Looking ahead, we note that the formulas (20)-(22) are part of the method that will be discussed in the next section (see Theorems 1, 2 below).

To obtain the Milstein expansion for (7) the truncated expansions (3) of components of the Wiener process $\mathbf{f}_s$ must be iteratively substituted in the single integrals, and the integrals must be calculated, starting from the innermost integral. This is a complicated procedure that obviously does not lead to a general expansion of (7) valid for an arbitrary multiplicity k. For this reason, only expansions of simplest single, double, and triple integrals (7) were obtained [45]-[50].

At that, in [45], [49] the case $\psi_1(s), \psi_2(s) \equiv 1$ and $i_1, i_2 = 0, 1, \ldots, m$ is considered. In [46]-[48], [50] the attempt to consider the case $\psi_1(s), \psi_2(s), \psi_3(s) \equiv 1$ and $i_1, i_2, i_3 = 0, 1, \ldots, m$ is implemented.

Note that generally speaking the mean-square convergence of the approximation

$$J^{*(i_1 i_2 i_3)q}_{(111)T,t}$$

(obtained by the Milstein approach) to the appropriate iterated Stratonovich stochastic integral

$$J^{*(i_1 i_2 i_3)}_{(111)T,t}$$

must be proved separately due to iterated application of passing to the limit in the Milstein approach [45]. However, in [46] (pp. 438-439), [47] (Sect. 5.8, pp. 202–204), [48] (pp. 82-84), [50] (pp. 263-264) the authors use the Wong–Zakai approximation [52]-[54] (without rigorous proof) within the frames of the mentioned approach based on the Karhunen–Loeve expansion of the Brownian bridge process [45] (see discussion in Sect. 11 for details).

3. Method of Generalized Multiple Fourier Series

Let us consider an another approach to the expansion of iterated Ito stochastic integrals [4]-[43] (method of generalized multiple Fourier series).

The idea of this method is as follows: the iterated Ito stochastic integral (6) of multiplicity k is represented as the multiple stochastic integral from the certain non-random discontinuous function of k variables defined on the hypercube $[t, T]^k$, where $[t, T]$ is the interval of integration of the iterated Ito stochastic integral. Then, the indicated non-random function is expanded in the hypercube $[t, T]^k$ into the generalized multiple Fourier series converging in the sense of norm in Hilbert space $L_2([t, T]^k)$. After a number of nontrivial transformations we come (see Theorems 1, 2 below) to the mean-square convergening expansion of the iterated Ito stochastic integral (6) into the multiple series of products of standard Gaussian random variables. Coefficients of this series are coefficients of generalized multiple Fourier series for the mentioned non-random function of k variables, which can be calculated using the explicit formula regardless of the multiplicity k of the iterated Ito stochastic integral (6).

Suppose that every $\psi_l(\tau)$ $(l = 1, \ldots, k)$ is a non-random function from the space $L_2([t, T])$. Define the following function on the hypercube $[t, T]^k$

$$K(t_1, \ldots, t_k) = \begin{cases} \psi_1(t_1) \ldots \psi_k(t_k) & \text{for} \quad t_1 < \ldots < t_k \\ \\ 0 & \text{otherwise} \end{cases}, \quad t_1, \ldots, t_k \in [t, T], \quad k \geq 2, \tag{23}$$

and $K(t_1) \equiv \psi_1(t_1)$ for $t_1 \in [t, T]$.

Suppose that $\{\phi_j(x)\}_{j=0}^{\infty}$ is a complete orthonormal system of functions in the space $L_2([t, T])$.

The function $K(t_1,\ldots,t_k)$ belongs to the space $L_2([t,T]^k)$. At this situation it is well known that the generalized multiple Fourier series of $K(t_1,\ldots,t_k)\in L_2([t,T]^k)$ is converging to $K(t_1,\ldots,t_k)$ in the hypercube $[t,T]^k$ in the mean-square sense, i.e.

$$\lim_{p_1,\ldots,p_k\to\infty}\left\|K(t_1,\ldots,t_k)-\sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k}C_{j_k\ldots j_1}\prod_{l=1}^{k}\phi_{j_l}(t_l)\right\|_{L_2([t,T]^k)}=0, \tag{24}$$

where

$$C_{j_k\ldots j_1}=\int\limits_{[t,T]^k}K(t_1,\ldots,t_k)\prod_{l=1}^{k}\phi_{j_l}(t_l)dt_1\ldots dt_k \tag{25}$$

is the Fourier coefficient,

$$\|f\|_{L_2([t,T]^k)}=\left(\int\limits_{[t,T]^k}f^2(t_1,\ldots,t_k)dt_1\ldots dt_k\right)^{1/2}.$$

Consider the partition $\{\tau_j\}_{j=0}^{N}$ of $[t,T]$ such that

$$t=\tau_0<\ldots<\tau_N=T,\quad \Delta_N=\max_{0\le j\le N-1}\Delta\tau_j\to 0\ \text{ if }\ N\to\infty,\quad \Delta\tau_j=\tau_{j+1}-\tau_j. \tag{26}$$

Theorem 1 [4] (2006), [5]-[32]. *Suppose that every $\psi_l(\tau)$ $(l=1,\ldots,k)$ is a continuous nonrandom function on the interval $[t,T]$ and $\{\phi_j(x)\}_{j=0}^{\infty}$ is a complete orthonormal system of continuous functions in the space $L_2([t,T])$. Then*

$$J[\psi^{(k)}]_{T,t}=\underset{p_1,\ldots,p_k\to\infty}{\text{l.i.m.}}\sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k}C_{j_k\ldots j_1}\Biggl(\prod_{l=1}^{k}\zeta_{j_l}^{(i_l)}-$$

$$-\underset{N\to\infty}{\text{l.i.m.}}\sum_{(l_1,\ldots,l_k)\in\mathrm{G}_k}\phi_{j_1}(\tau_{l_1})\Delta\mathbf{w}_{\tau_{l_1}}^{(i_1)}\ldots\phi_{j_k}(\tau_{l_k})\Delta\mathbf{w}_{\tau_{l_k}}^{(i_k)}\Biggr), \tag{27}$$

where $J[\psi^{(k)}]_{T,t}$ is defined by (6),

$$\mathrm{G}_k=\mathrm{H}_k\backslash\mathrm{L}_k,\quad \mathrm{H}_k=\{(l_1,\ldots,l_k):\ l_1,\ldots,l_k=0,\ 1,\ldots,N-1\},$$

$$\mathrm{L}_k=\{(l_1,\ldots,l_k):\ l_1,\ldots,l_k=0,\ 1,\ldots,N-1;\ l_g\ne l_r\ (g\ne r);\ g,r=1,\ldots,k\},$$

l.i.m. *is a limit in the mean-square sense, $i_1,\ldots,i_k=0,1,\ldots,m$,*

$$\zeta_j^{(i)} = \int\limits_t^T \phi_j(s) d\mathbf{w}_s^{(i)} \tag{28}$$

are independent standard Gaussian random variables for various i or j (if $i \neq 0$), $C_{j_k \ldots j_1}$ is the Fourier coefficient (25)*, $\Delta \mathbf{w}_{\tau_j}^{(i)} = \mathbf{w}_{\tau_{j+1}}^{(i)} - \mathbf{w}_{\tau_j}^{(i)}$ $(i = 0, 1, \ldots, m)$, $\{\tau_j\}_{j=0}^N$ is a partition of the interval $[t, T]$, which satisfies the condition* (26)*.*

Note that the continuity condition of $\phi_j(x)$ can be weakened (see [4]-[21]). Moreover, Theorem 1 can be generalized to the case of an arbitrary complete orthonormal systems of functions in the space $L_2([t, T])$ (see Theorem 2 below).

In order to evaluate the significance of Theorem 1 for practice we will demonstrate its transformed particular cases for $k = 1, \ldots, 6$ [4]-[32]

$$J[\psi^{(1)}]_{T,t} = \underset{p_1 \to \infty}{\text{l.i.m.}} \sum_{j_1=0}^{p_1} C_{j_1} \zeta_{j_1}^{(i_1)}, \tag{29}$$

$$J[\psi^{(2)}]_{T,t} = \underset{p_1, p_2 \to \infty}{\text{l.i.m.}} \sum_{j_1=0}^{p_1} \sum_{j_2=0}^{p_2} C_{j_2 j_1} \left(\zeta_{j_1}^{(i_1)} \zeta_{j_2}^{(i_2)} - \mathbf{1}_{\{i_1 = i_2 \neq 0\}} \mathbf{1}_{\{j_1 = j_2\}} \right), \tag{30}$$

$$J[\psi^{(3)}]_{T,t} = \underset{p_1, \ldots, p_3 \to \infty}{\text{l.i.m.}} \sum_{j_1=0}^{p_1} \sum_{j_2=0}^{p_2} \sum_{j_3=0}^{p_3} C_{j_3 j_2 j_1} \Biggl(\zeta_{j_1}^{(i_1)} \zeta_{j_2}^{(i_2)} \zeta_{j_3}^{(i_3)} -$$

$$-\mathbf{1}_{\{i_1 = i_2 \neq 0\}} \mathbf{1}_{\{j_1 = j_2\}} \zeta_{j_3}^{(i_3)} - \mathbf{1}_{\{i_2 = i_3 \neq 0\}} \mathbf{1}_{\{j_2 = j_3\}} \zeta_{j_1}^{(i_1)} - \mathbf{1}_{\{i_1 = i_3 \neq 0\}} \mathbf{1}_{\{j_1 = j_3\}} \zeta_{j_2}^{(i_2)} \Biggr), \tag{31}$$

$$J[\psi^{(4)}]_{T,t} = \underset{p_1, \ldots, p_4 \to \infty}{\text{l.i.m.}} \sum_{j_1=0}^{p_1} \ldots \sum_{j_4=0}^{p_4} C_{j_4 \ldots j_1} \Biggl(\prod_{l=1}^{4} \zeta_{j_l}^{(i_l)} -$$

$$-\mathbf{1}_{\{i_1 = i_2 \neq 0\}} \mathbf{1}_{\{j_1 = j_2\}} \zeta_{j_3}^{(i_3)} \zeta_{j_4}^{(i_4)} - \mathbf{1}_{\{i_1 = i_3 \neq 0\}} \mathbf{1}_{\{j_1 = j_3\}} \zeta_{j_2}^{(i_2)} \zeta_{j_4}^{(i_4)} -$$

$$-\mathbf{1}_{\{i_1 = i_4 \neq 0\}} \mathbf{1}_{\{j_1 = j_4\}} \zeta_{j_2}^{(i_2)} \zeta_{j_3}^{(i_3)} - \mathbf{1}_{\{i_2 = i_3 \neq 0\}} \mathbf{1}_{\{j_2 = j_3\}} \zeta_{j_1}^{(i_1)} \zeta_{j_4}^{(i_4)} -$$

$$-\mathbf{1}_{\{i_2 = i_4 \neq 0\}} \mathbf{1}_{\{j_2 = j_4\}} \zeta_{j_1}^{(i_1)} \zeta_{j_3}^{(i_3)} - \mathbf{1}_{\{i_3 = i_4 \neq 0\}} \mathbf{1}_{\{j_3 = j_4\}} \zeta_{j_1}^{(i_1)} \zeta_{j_2}^{(i_2)} +$$

$$+\mathbf{1}_{\{i_1 = i_2 \neq 0\}} \mathbf{1}_{\{j_1 = j_2\}} \mathbf{1}_{\{i_3 = i_4 \neq 0\}} \mathbf{1}_{\{j_3 = j_4\}} +$$

$$+\mathbf{1}_{\{i_1 = i_3 \neq 0\}} \mathbf{1}_{\{j_1 = j_3\}} \mathbf{1}_{\{i_2 = i_4 \neq 0\}} \mathbf{1}_{\{j_2 = j_4\}} +$$

$$+ \mathbf{1}_{\{i_1 = i_4 \neq 0\}} \mathbf{1}_{\{j_1 = j_4\}} \mathbf{1}_{\{i_2 = i_3 \neq 0\}} \mathbf{1}_{\{j_2 = j_3\}} \Biggr), \tag{32}$$

$$J[\psi^{(5)}]_{T,t}=\underset{p_1,\ldots,p_5\to\infty}{\text{l.i.m.}}\sum_{j_1=0}^{p_1}\ldots\sum_{j_5=0}^{p_5}C_{j_5\ldots j_1}\Biggl(\prod_{l=1}^{5}\zeta_{j_l}^{(i_l)}-$$
$$-\mathbf{1}_{\{i_1=i_2\ne 0\}}\mathbf{1}_{\{j_1=j_2\}}\zeta_{j_3}^{(i_3)}\zeta_{j_4}^{(i_4)}\zeta_{j_5}^{(i_5)}-\mathbf{1}_{\{i_1=i_3\ne 0\}}\mathbf{1}_{\{j_1=j_3\}}\zeta_{j_2}^{(i_2)}\zeta_{j_4}^{(i_4)}\zeta_{j_5}^{(i_5)}-$$
$$-\mathbf{1}_{\{i_1=i_4\ne 0\}}\mathbf{1}_{\{j_1=j_4\}}\zeta_{j_2}^{(i_2)}\zeta_{j_3}^{(i_3)}\zeta_{j_5}^{(i_5)}-\mathbf{1}_{\{i_1=i_5\ne 0\}}\mathbf{1}_{\{j_1=j_5\}}\zeta_{j_2}^{(i_2)}\zeta_{j_3}^{(i_3)}\zeta_{j_4}^{(i_4)}-$$
$$-\mathbf{1}_{\{i_2=i_3\ne 0\}}\mathbf{1}_{\{j_2=j_3\}}\zeta_{j_1}^{(i_1)}\zeta_{j_4}^{(i_4)}\zeta_{j_5}^{(i_5)}-\mathbf{1}_{\{i_2=i_4\ne 0\}}\mathbf{1}_{\{j_2=j_4\}}\zeta_{j_1}^{(i_1)}\zeta_{j_3}^{(i_3)}\zeta_{j_5}^{(i_5)}-$$

&\qquad-\mathbf{1}_{\{i_6=i_5\ne 0\}}\mathbf{1}_{\{j_6=j_5\}}\mathbf{1}_{\{i_1=i_3\ne 0\}}\mathbf{1}_{\{j_1=j_3\}}\mathbf{1}_{\{i_2=i_4\ne 0\}}\mathbf{1}_{\{j_2=j_4\}}\Bigg),
\end{aligned}
\tag{34}
$$

where $\mathbf{1}_A$ is the indicator of the set A.

As a result we obtain the following new possibilities and advantages compared with the method based on the Milstein approach [45].

There is the explicit formula (see (25)) for calculation of expansion coefficients of the iterated Ito stochastic integral (6) with any fixed multiplicity k.

We have new possibilities for exact calculation of the mean-square error of approximation of the iterated Ito stochastic integrals (6) (see Theorem 8 below).

Since the used multiple Fourier series is a generalized in the sense that it is built using various complete orthonormal systems of functions in the space $L_2([t,T])$, we have new possibilities for approximation — we can use not only trigonometric functions as in the Milstein approach [45] but Legendre polynomials. As it turned out (see below), it is more convenient to work with Legendre polynomials for constructing approximations of the iterated Ito stochastic integrals (6). We can choose different numbers q (see Sect. 7) for approximations of different iterated Ito stochastic integrals from the family (6). This is impossible for approximations based on the Milstein approach [45]. Approximations based on Legendre polynomials essentially simpler than approximations based on trigonometric functions (see (15), (19), (21), (22)).

As we mentioned before, the Milstein approach [45] based on the Karhunen–Loeve expansion of the Brownian bridge process leads to iterated series (in contrast with multiple series from Theorems 1–7) starting at least from the second or third multiplicity of iterated stochastic integrals. Multiple series are more convenient for approximation than the iterated ones, since partial sums of multiple series converge for any possible case of convergence to infinity of their upper limits of summation (let us denote them as $p_1,\ldots,p_k$). For example, when $p_1=\ldots=p_k=p\to\infty$. For iterated series, the condition $p_1=\ldots=p_k=p\to\infty$ obviously does not guarantee the convergence of this series.

However, in [46] (pp. 438-439), [47] (Sect. 5.8, pp. 202–204), [48] (pp. 82-84), [50] (pp. 263-264) the authors use (without rigorous proof) the condition $p_1=p_2=p_3=q\to\infty$ within the frames of the mentioned approach based on the Karhunen–Loeve expansion of the Brownian bridge process [45] together with the Wong–Zakai approximation [52]-[54] (see discussion in Sect. 11 for details).

For further consideration, let us consider the generalization of formulas (29)–(34) for the case of an arbitrary multiplicity k ($k\in\mathbb{N}$) of the iterated Ito stochastic integral $J[\psi^{(k)}]_{T,t}$ defined by (6). In order to do this, let us introduce some notations. Consider the unordered set $\{1,2,\ldots,k\}$ and separate it into two parts: the first part consists of r unordered pairs (sequence order of these pairs is also unimportant) and the second one consists of the remaining $k-2r$ numbers. So, we have

$$(\{\underbrace{\{g_1,g_2\},\ldots,\{g_{2r-1},g_{2r}\}}_{\text{part 1}}\},\{\underbrace{q_1,\ldots,q_{k-2r}}_{\text{part 2}}\}), \tag{35}$$

where

$$\{g_1,g_2,\ldots,g_{2r-1},g_{2r},q_1,\ldots,q_{k-2r}\}=\{1,2,\ldots,k\},$$

braces mean an unordered set, and parentheses mean an ordered set.

We will say that (35) is a partition and consider the sum with respect to all possible partitions

$$\sum_{\substack{(\{\{g_1,g_2\},\ldots,\{g_{2r-1},g_{2r}\}\},\{q_1,\ldots,q_{k-2r}\})\\ \{g_1,g_2,\ldots,g_{2r-1},g_{2r},q_1,\ldots,q_{k-2r}\}=\{1,2,\ldots,k\}}} a_{g_1g_2,\ldots,g_{2r-1}g_{2r},q_1\ldots q_{k-2r}}. \tag{36}$$

Below there are several examples of sums in the form (36)

$$\sum_{\substack{(\{g_1,g_2\})\\ \{g_1,g_2\}=\{1,2\}}} a_{g_1g_2}=a_{12},$$

$$\sum_{\substack{(\{\{g_1,g_2\},\{g_3,g_4\}\})\\ \{g_1,g_2,g_3,g_4\}=\{1,2,3,4\}}} a_{g_1g_2g_3g_4} = a_{1234} + a_{1324} + a_{2314},$$

$$\sum_{\substack{(\{g_1,g_2\},\{q_1,q_2\})\\ \{g_1,g_2,q_1,q_2\}=\{1,2,3,4\}}} a_{g_1g_2,q_1q_2} =$$

$$= a_{12,34} + a_{13,24} + a_{14,23} + a_{23,14} + a_{24,13} + a_{34,12},$$

$$\sum_{\substack{(\{g_1,g_2\},\{q_1,q_2,q_3\})\\ \{g_1,g_2,q_1,q_2,q_3\}=\{1,2,3,4,5\}}} a_{g_1g_2,q_1q_2q_3} =$$

$$= a_{12,345} + a_{13,245} + a_{14,235} + a_{15,234} + a_{23,145} + a_{24,135} +$$
$$+ a_{25,134} + a_{34,125} + a_{35,124} + a_{45,123},$$

$$\sum_{\substack{(\{\{g_1,g_2\},\{g_3,g_4\}\},\{q_1\})\\ \{g_1,g_2,g_3,g_4,q_1\}=\{1,2,3,4,5\}}} a_{g_1g_2,g_3g_4,q_1} =$$

$$= a_{12,34,5} + a_{13,24,5} + a_{14,23,5} + a_{12,35,4} + a_{13,25,4} + a_{15,23,4} +$$
$$+ a_{12,54,3} + a_{15,24,3} + a_{14,25,3} + a_{15,34,2} + a_{13,54,2} + a_{14,53,2} +$$
$$+ a_{52,34,1} + a_{53,24,1} + a_{54,23,1}.$$

Now we can write (27) as

$$J[\psi^{(k)}]_{T,t} = \underset{p_1,\ldots,p_k\to\infty}{\text{l.i.m.}} \sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k} C_{j_k\ldots j_1}\Biggl(\prod_{l=1}^{k}\zeta_{j_l}^{(i_l)} + \sum_{r=1}^{[k/2]}(-1)^r \times$$

$$\times \sum_{\substack{(\{\{g_1,g_2\},\ldots,\{g_{2r-1},g_{2r}\}\},\{q_1,\ldots,q_{k-2r}\})\\ \{g_1,g_2,\ldots,g_{2r-1},g_{2r},q_1,\ldots,q_{k-2r}\}=\{1,2,\ldots,k\}}} \prod_{s=1}^{r} \mathbf{1}_{\{i_{g_{2s-1}}=\,i_{g_{2s}}\neq 0\}}\mathbf{1}_{\{j_{g_{2s-1}}=\,j_{g_{2s}}\}} \prod_{l=1}^{k-2r}\zeta_{j_{q_l}}^{(i_{q_l})}\Biggr), \tag{37}$$

where $[x]$ is an integer part of a real number x; another notations are the same as in Theorem **1**.

In particular, from (37) for $k=5$ we obtain

$$J[\psi^{(5)}]_{T,t} = \underset{p_1,\ldots,p_5\to\infty}{\text{l.i.m.}} \sum_{j_1=0}^{p_1}\ldots\sum_{j_5=0}^{p_5} C_{j_5\ldots j_1}\Biggl(\prod_{l=1}^{5}\zeta_{j_l}^{(i_l)} -$$

$$- \sum_{\substack{(\{g_1,g_2\},\{q_1,q_2,q_3\})\\ \{g_1,g_2,q_1,q_2,q_3\}=\{1,2,3,4,5\}}} \mathbf{1}_{\{i_{g_1}=\,i_{g_2}\neq 0\}}\mathbf{1}_{\{j_{g_1}=\,j_{g_2}\}}\prod_{l=1}^{3}\zeta_{j_{q_l}}^{(i_{q_l})} +$$

$$+\sum_{\substack{(\{\{g_1,g_2\},\{g_3,g_4\}\},\{q_1\})\\ \{g_1,g_2,g_3,g_4,q_1\}=\{1,2,3,4,5\}}} \mathbf{1}_{\{i_{g_1}=\,i_{g_2}\ne 0\}}\mathbf{1}_{\{j_{g_1}=\,j_{g_2}\}}\mathbf{1}_{\{i_{g_3}=\,i_{g_4}\ne 0\}}\mathbf{1}_{\{j_{g_3}=\,j_{g_4}\}}\zeta_{j_{q_1}}^{(i_{q_1})}\Biggr).$$

The last equality obviously agrees with (33).

Let us consider the generalization of Theorem 1 for the case of an arbitrary complete orthonormal systems of functions in the space $L_2([t,T])$ and $\psi_1(\tau),\ldots,\psi_k(\tau)\in L_2([t,T])$.

Theorem 2 [18] (Sect. 1.11), [21] (Sect. 15). *Suppose that $\psi_1(\tau),\ldots,\psi_k(\tau)\in L_2([t,T])$ and $\{\phi_j(x)\}_{j=0}^{\infty}$ is an arbitrary complete orthonormal system of functions in the space $L_2([t,T])$. Then the following expansion*

$$J[\psi^{(k)}]_{T,t}=\underset{p_1,\ldots,p_k\to\infty}{\text{l.i.m.}}\sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k}C_{j_k\ldots j_1}\Biggl(\prod_{l=1}^{k}\zeta_{j_l}^{(i_l)}+\sum_{r=1}^{[k/2]}(-1)^r\times$$

$$\times\sum_{\substack{(\{\{g_1,g_2\},\ldots,\{g_{2r-1},g_{2r}\}\},\{q_1,\ldots,q_{k-2r}\})\\ \{g_1,g_2,\ldots,g_{2r-1},g_{2r},q_1,\ldots,q_{k-2r}\}=\{1,2,\ldots,k\}}}\prod_{s=1}^{r}\mathbf{1}_{\{i_{g_{2s-1}}=\,i_{g_{2s}}\ne 0\}}\mathbf{1}_{\{j_{g_{2s-1}}=\,j_{g_{2s}}\}}\prod_{l=1}^{k-2r}\zeta_{j_{q_l}}^{(i_{q_l})}\Biggr) \tag{38}$$

converging in the mean-square sense is valid, where $[x]$ is an integer part of a real number x; another notations are the same as in Theorem 1.

It should be noted that an analogue of Theorem 2 was considered in [51]. Note that we use another notations [18] (Sect. 1.11), [21] (Sect. 15) in comparison with [51]. Moreover, the proof of an analogue of Theorem 2 from [51] is somewhat different from the proof given in [18] (Sect. 1.11), [21] (Sect. 15).

4. Expansions of Iterated Stratonovich Stochastic Integrals of Multiplicities 1 to 6

In a number the author's works [8]-[20], [22], [27] Theorems 1, 2 have been adapted for the integrals (7) of multiplicities 2 to 4. Let us collect some old results in the following theorem.

Theorem 3 [8]-[20], [22], [27]. *Suppose that $\{\phi_j(x)\}_{j=0}^{\infty}$ is a complete orthonormal system of Legendre polynomials or trigonometric functions in the space $L_2([t,T])$. At the same time $\psi_2(\tau)$ is a continuously differentiable function on $[t,T]$ and $\psi_1(\tau),\psi_3(\tau)$ are twice continuously differentiable functions on $[t,T]$. Then*

$$J^*[\psi^{(2)}]_{T,t}=\underset{p_1,p_2\to\infty}{\text{l.i.m.}}\sum_{j_1=0}^{p_1}\sum_{j_2=0}^{p_2}C_{j_2j_1}\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}\quad(i_1,i_2=1,\ldots,m), \tag{39}$$

$$J^*[\psi^{(3)}]_{T,t}=\underset{p_1,p_2,p_3\to\infty}{\text{l.i.m.}}\sum_{j_1=0}^{p_1}\sum_{j_2=0}^{p_2}\sum_{j_3=0}^{p_3}C_{j_3j_2j_1}\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}\zeta_{j_3}^{(i_3)}\quad(i_1,i_2,i_3=0,1,\ldots,m), \tag{40}$$

$$J^*[\psi^{(3)}]_{T,t}=\underset{p\to\infty}{\text{l.i.m.}}\sum_{j_1,j_2,j_3=0}^{p}C_{j_3j_2j_1}\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}\zeta_{j_3}^{(i_3)}\quad(i_1,i_2,i_3=1,\ldots,m), \tag{41}$$

$$J^*[\psi^{(4)}]_{T,t} = \underset{p\to\infty}{\text{l.i.m.}} \sum_{j_1,\ldots,j_4=0}^{p} C_{j_4 j_3 j_2 j_1} \zeta_{j_1}^{(i_1)} \zeta_{j_2}^{(i_2)} \zeta_{j_3}^{(i_3)} \zeta_{j_4}^{(i_4)} \quad (i_1,\ldots,i_4 = 0,1,\ldots,m), \tag{42}$$

where $J^*[\psi^{(k)}]_{T,t}$ *is defined by* (7), *and* $\psi_l(\tau) \equiv 1$ $(l = 1,\ldots,4)$ *in* (40), (42); *another notations are the same as in Theorems* 1, 2.

Recently, a new approach to the expansion and mean-square approximation of iterated Stratonovich stochastic integrals has been obtained [18] (Sect. 2.10–2.16), [22] (Sect. 13–19), [23] (Sect. 7–13), [27] (Sect. 5–11), [42] (Sect. 4–9). Let us formulate four theorems that were proved using this approach.

Theorem 4 [18], [22], [23], [27], [42]. *Suppose that* $\{\phi_j(x)\}_{j=0}^{\infty}$ *is a complete orthonormal system of Legendre polynomials or trigonometric functions in the space* $L_2([t,T])$. *Furthermore, let* $\psi_1(\tau), \psi_2(\tau), \psi_3(\tau)$ *are continuously differentiable nonrandom functions on* $[t,T]$. *Then, for the iterated Stratonovich stochastic integral of third multiplicity*

$$J^*[\psi^{(3)}]_{T,t} = \int\limits_t^{*T} \psi_3(t_3) \int\limits_t^{*t_3} \psi_2(t_2) \int\limits_t^{*t_2} \psi_1(t_1) d\mathbf{w}_{t_1}^{(i_1)} d\mathbf{w}_{t_2}^{(i_2)} d\mathbf{w}_{t_3}^{(i_3)} \quad (i_1,i_2,i_3 = 0,1,\ldots,m)$$

the following relations

$$J^*[\psi^{(3)}]_{T,t} = \underset{p\to\infty}{\text{l.i.m.}} \sum_{j_1,j_2,j_3=0}^{p} C_{j_3 j_2 j_1} \zeta_{j_1}^{(i_1)} \zeta_{j_2}^{(i_2)} \zeta_{j_3}^{(i_3)}, \tag{43}$$

$$\mathsf{M}\left\{\left(J^*[\psi^{(3)}]_{T,t} - \sum_{j_1,j_2,j_3=0}^{p} C_{j_3 j_2 j_1} \zeta_{j_1}^{(i_1)} \zeta_{j_2}^{(i_2)} \zeta_{j_3}^{(i_3)}\right)^2\right\} \le \frac{C}{p} \tag{44}$$

are fulfilled, where $i_1,i_2,i_3 = 0,1,\ldots,m$ *in* (43) *and* $i_1,i_2,i_3 = 1,\ldots,m$ *in* (44), *constant* C *is independent of* p,

$$C_{j_3 j_2 j_1} = \int\limits_t^{T} \psi_3(t_3)\phi_{j_3}(t_3) \int\limits_t^{t_3} \psi_2(t_2)\phi_{j_2}(t_2) \int\limits_t^{t_2} \psi_1(t_1)\phi_{j_1}(t_1) dt_1 dt_2 dt_3$$

and

$$\zeta_j^{(i)} = \int\limits_t^T \phi_j(\tau) d\mathbf{f}_\tau^{(i)}$$

are independent standard Gaussian random variables for various i *or* j (*in the case when* $i \neq 0$); *another notations are the same as in Theorems* 1, 2.

Theorem 5 [18], [22], [23], [27], [42]. *Let* $\{\phi_j(x)\}_{j=0}^{\infty}$ *be a complete orthonormal system of Legendre polynomials or trigonometric functions in the space* $L_2([t,T])$. *Furthermore, let* $\psi_1(\tau),\ldots, \psi_4(\tau)$ *be continuously differentiable nonrandom functions on* $[t,T]$. *Then, for the iterated Stratonovich stochastic integral of fourth multiplicity*

(45) $$J^{*}[\psi^{(4)}]_{T,t}=\int\limits_t^{*T}\psi_4(t_4)\int\limits_t^{*t_4}\psi_3(t_3)\int\limits_t^{*t_3}\psi_2(t_2)\int\limits_t^{*t_2}\psi_1(t_1)d\mathbf{w}_{t_1}^{(i_1)}d\mathbf{w}_{t_2}^{(i_2)}d\mathbf{w}_{t_3}^{(i_3)}d\mathbf{w}_{t_4}^{(i_4)}$$

the following relations

(46) $$J^{*}[\psi^{(4)}]_{T,t}=\underset{p\to\infty}{\text{l.i.m.}}\sum_{j_1,j_2,j_3,j_4=0}^{p}C_{j_4j_3j_2j_1}\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}\zeta_{j_3}^{(i_3)}\zeta_{j_4}^{(i_4)},$$

(47) $$\mathsf{M}\left\{\left(J^{*}[\psi^{(4)}]_{T,t}-\sum_{j_1,j_2,j_3,j_4=0}^{p}C_{j_4j_3j_2j_1}\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}\zeta_{j_3}^{(i_3)}\zeta_{j_4}^{(i_4)}\right)^2\right\}\le\frac{C}{p^{1-\varepsilon}}$$

are fulfilled, where $i_1,\ldots,i_4=0,1,\ldots,m$ *in* (45), (46) *and* $i_1,\ldots,i_4=1,\ldots,m$ *in* (47), *constant* C *does not depend on* p, ε *is an arbitrary small positive real number for the case of complete orthonormal system of Legendre polynomials in the space* $L_2([t,T])$ *and* $\varepsilon=0$ *for the case of complete orthonormal system of trigonometric functions in the space* $L_2([t,T])$,

$$C_{j_4j_3j_2j_1}=$$

$$=\int\limits_t^{T}\psi_4(t_4)\phi_{j_4}(t_4)\int\limits_t^{t_4}\psi_3(t_3)\phi_{j_3}(t_3)\int\limits_t^{t_3}\psi_2(t_2)\phi_{j_2}(t_2)\int\limits_t^{t_2}\psi_1(t_1)\phi_{j_1}(t_1)dt_1dt_2dt_3dt_4;$$

another notations are the same as in Theorem 4.

Theorem 6 [18], [22], [23], [27], [42]. *Assume that* $\{\phi_j(x)\}_{j=0}^{\infty}$ *is a complete orthonormal system of Legendre polynomials or trigonometric functions in the space* $L_2([t,T])$ *and* $\psi_1(\tau),\ldots,\psi_5(\tau)$ *are continuously differentiable nonrandom functions on* $[t,T]$. *Then, for the iterated Stratonovich stochastic integral of fifth multiplicity*

(48) $$J^{*}[\psi^{(5)}]_{T,t}=\int\limits_t^{*T}\psi_5(t_5)\ldots\int\limits_t^{*t_2}\psi_1(t_1)d\mathbf{w}_{t_1}^{(i_1)}\ldots d\mathbf{w}_{t_5}^{(i_5)}$$

the following relations

(49) $$J^{*}[\psi^{(5)}]_{T,t}=\underset{p\to\infty}{\text{l.i.m.}}\sum_{j_1,\ldots,j_5=0}^{p}C_{j_5\ldots j_1}\zeta_{j_1}^{(i_1)}\ldots\zeta_{j_5}^{(i_5)},$$

(50) $$\mathsf{M}\left\{\left(J^{*}[\psi^{(5)}]_{T,t}-\sum_{j_1,\ldots,j_5=0}^{p}C_{j_5\ldots j_1}\zeta_{j_1}^{(i_1)}\ldots\zeta_{j_5}^{(i_5)}\right)^2\right\}\le\frac{C}{p^{1-\varepsilon}}$$

are fulfilled, where $i_1,\ldots,i_5=0,1,\ldots,m$ *in* (48), (49) *and* $i_1,\ldots,i_5=1,\ldots,m$ *in* (50), *constant* C *is independent of* p, ε *is an arbitrary small positive real number for the case of complete orthonormal system of Legendre polynomials in the space* $L_2([t,T])$ *and* $\varepsilon=0$ *for the case of complete orthonormal system of trigonometric functions in the space* $L_2([t,T])$,

$$C_{j_5\ldots j_1}=\int\limits_t^T\psi_5(t_5)\phi_{j_5}(t_5)\ldots\int\limits_t^{t_2}\psi_1(t_1)\phi_{j_1}(t_1)dt_1\ldots dt_5;$$

another notations are the same as in Theorems 4, 5.

Theorem 7 [18], [22], [23], [27], [43]. *Suppose that* $\{\phi_j(x)\}_{j=0}^{\infty}$ *is a complete orthonormal system of Legendre polynomials or trigonometric functions in the space* $L_2([t,T])$. *Then, for the iterated Stratonovich stochastic integral of sixth multiplicity*

$$J_{T,t}^{*(i_1\ldots i_6)}=\int\limits_t^{*T}\ldots\int\limits_t^{*t_2}d\mathbf{w}_{t_1}^{(i_1)}\ldots d\mathbf{w}_{t_6}^{(i_6)} \tag{51}$$

the following expansion

$$J_{T,t}^{*(i_1\ldots i_6)}=\underset{p\to\infty}{\text{l.i.m.}}\sum_{j_1,\ldots,j_6=0}^{p}C_{j_6\ldots j_1}\zeta_{j_1}^{(i_1)}\ldots\zeta_{j_6}^{(i_6)}$$

that converges in the mean-square sense is valid, where $i_1,\ldots,i_6=0,1,\ldots,m$,

$$C_{j_6\ldots j_1}=\int\limits_t^T\phi_{j_6}(t_6)\ldots\int\limits_t^{t_2}\phi_{j_1}(t_1)dt_1\ldots dt_6$$

another notations are the same as in Theorems 4–6.

Note that an analogue of Theorem 3 for the case of iterated Stratonovich stochastic integrals of multiplicity 1 follows from (29).

5. Exact Calculation of the Mean-Square Error in Theorems 1, 2

As we mentioned above, Theorems 1, 2 give new possibilities for exact calculation of the mean-square error of approximation of iterated Ito stochastic integrals (see Theorem 8 below).

Assume that $J[\psi^{(k)}]_{T,t}^{p_1\ldots p_k}$ is the approximation of (6), which is the expression before passing to the limit $\underset{p_1,\ldots,p_k\to\infty}{\text{l.i.m.}}$ on the right-hand side of (38)

$$J[\psi^{(k)}]_{T,t}^{p_1\ldots p_k}=\sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k}C_{j_k\ldots j_1}\Biggl(\prod_{l=1}^{k}\zeta_{j_l}^{(i_l)}+\sum_{r=1}^{[k/2]}(-1)^r\times$$

$$\times\sum_{\substack{(\{\{g_1,g_2\},\ldots,\{g_{2r-1},g_{2r}\}\},\{q_1,\ldots,q_{k-2r}\})\\ \{g_1,g_2,\ldots,g_{2r-1},g_{2r},q_1,\ldots,q_{k-2r}\}=\{1,2,\ldots,k\}}}\prod_{s=1}^{r}\mathbf{1}_{\{i_{g_{2s-1}}=\,i_{g_{2s}}\ne 0\}}\mathbf{1}_{\{j_{g_{2s-1}}=\,j_{g_{2s}}\}}\prod_{l=1}^{k-2r}\zeta_{j_{q_l}}^{(i_{q_l})}\Biggr),$$

where $[x]$ is an integer part of a real number x; another notations are the same as in Theorems 1, 2.

Let us denote

$$\mathsf{M}\left\{\left(J[\psi^{(k)}]_{T,t}-J[\psi^{(k)}]_{T,t}^{p_1,\ldots,p_k}\right)^2\right\}\stackrel{\rm def}{=}E_k^{p_1,\ldots,p_k},$$

$$E_k^{p_1,\ldots,p_k}\stackrel{\rm def}{=}E_k^p\ \ \hbox{if}\ \ p_1=\ldots=p_k=p,$$

$$\|K\|_{L_2([t,T]^k)}^2=\int\limits_{[t,T]^k}K^2(t_1,\ldots,t_k)dt_1\ldots dt_k\stackrel{\rm def}{=}I_k.$$

In [13]-[21], [28] it was shown that

$$E_k^{p_1,\ldots,p_k}\le k!\left(I_k-\sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k}C_{j_k\ldots j_1}^2\right) \tag{52}$$

if $i_1,\ldots,i_k=1,\ldots,m$ $(0<T-t<\infty)$ or $i_1,\ldots,i_k=0,1,\ldots,m$ $(0<T-t<1)$.
Moreover [6]-[21],

$$\mathsf{M}\left\{\left(J[\psi^{(k)}]_{T,t}-J[\psi^{(k)}]_{T,t}^{p_1,\ldots,p_k}\right)^{2n}\right\}\le C_{n,k}\left(I_k-\sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k}C_{j_k\ldots j_1}^2\right)^n,$$

where constant $C_{n,k}$ depends only on n and k $(n\in\mathbb{N})$.
The value E_k^p can be calculated exactly.

Theorem 8 [18] (Sect. 1.12), [28] (Sect. 6). *Suppose that $\{\phi_j(x)\}_{j=0}^{\infty}$ is an arbitrary complete orthonormal system of functions in the space $L_2([t,T])$ and $\psi_1(\tau),\ldots,\psi_k(\tau)\in L_2([t,T])$, $i_1,\ldots,i_k=1,\ldots,m$. Then*

$$E_k^p=I_k-\sum_{j_1,\ldots,j_k=0}^{p}C_{j_k\ldots j_1}\mathsf{M}\left\{J[\psi^{(k)}]_{T,t}\sum_{(j_1,\ldots,j_k)}\int\limits_t^T\phi_{j_k}(t_k)\ldots\int\limits_t^{t_2}\phi_{j_1}(t_1)d\mathbf{f}_{t_1}^{(i_1)}\ldots d\mathbf{f}_{t_k}^{(i_k)}\right\}, \tag{53}$$

where $i_1,\ldots,i_k=1,\ldots,m$; the expression

$$\sum_{(j_1,\ldots,j_k)}$$

means the sum with respect to all possible permutations $(j_1,\ldots,j_k)$. At the same time if j_r swapped with j_q in the permutation $(j_1,\ldots,j_k)$, then i_r swapped with i_q in the permutation $(i_1,\ldots,i_k)$; another notations are the same as in Theorems 1, 2.

Note that

$$\mathsf{M}\left\{J[\psi^{(k)}]_{T,t}\int\limits_t^T \phi_{j_k}(t_k)\ldots\int\limits_t^{t_2}\phi_{j_1}(t_1)d\mathbf{f}_{t_1}^{(i_1)}\ldots d\mathbf{f}_{t_k}^{(i_k)}\right\}=C_{j_k\ldots j_1}.$$

Then from Theorem 8 for pairwise different $i_1,\ldots,i_k$ and for $i_1=\ldots=i_k$ we obtain

$$E_k^p=I_k-\sum_{j_1,\ldots,j_k=0}^{p}C_{j_k\ldots j_1}^2,$$

$$E_k^p=I_k-\sum_{j_1,\ldots,j_k=0}^{p}C_{j_k\ldots j_1}\left(\sum_{(j_1,\ldots,j_k)}C_{j_k\ldots j_1}\right).$$

Consider some examples of application of Theorem 8 $(i_1,i_2,i_3=1,\ldots,m)$

$$E_2^p=I_2-\sum_{j_1,j_2=0}^{p}C_{j_2j_1}^2-\sum_{j_1,j_2=0}^{p}C_{j_2j_1}C_{j_1j_2}\quad (i_1=i_2),$$

$$E_3^p=I_3-\sum_{j_3,j_2,j_1=0}^{p}C_{j_3j_2j_1}^2-\sum_{j_3,j_2,j_1=0}^{p}C_{j_3j_1j_2}C_{j_3j_2j_1}\quad (i_1=i_2\ne i_3), \tag{54}$$

$$E_3^p=I_3-\sum_{j_3,j_2,j_1=0}^{p}C_{j_3j_2j_1}^2-\sum_{j_3,j_2,j_1=0}^{p}C_{j_2j_3j_1}C_{j_3j_2j_1}\quad (i_1\ne i_2=i_3), \tag{55}$$

$$E_3^p=I_3-\sum_{j_3,j_2,j_1=0}^{p}C_{j_3j_2j_1}^2-\sum_{j_3,j_2,j_1=0}^{p}C_{j_3j_2j_1}C_{j_1j_2j_3}\quad (i_1=i_3\ne i_2). \tag{56}$$

6. Comparative Analysis of the Efficiency of Application of Legendre Polynomials and Trigonometric Functions for the Integral $J_{(11)T,t}^{(i_1i_2)}$

Using Theorems 1, 2 and complete orthonormal system of Legendre polynomials in the space $L_2([t,T])$ it is shown [4]-[43] (also see [1]-[3]) that

$$J_{(11)T,t}^{(i_1i_2)}=\frac{T-t}{2}\left(\zeta_0^{(i_1)}\zeta_0^{(i_2)}+\sum_{i=1}^{\infty}\frac{1}{\sqrt{4i^2-1}}\left(\zeta_{i-1}^{(i_1)}\zeta_i^{(i_2)}-\zeta_i^{(i_1)}\zeta_{i-1}^{(i_2)}\right)-\mathbf{1}_{\{i_1=i_2\}}\right), \tag{57}$$

where the series converges in the mean-square sense; $i_1,i_2=1,\ldots,m$,

$$\zeta_j^{(i)}=\int\limits_t^T\phi_j(s)d\mathbf{f}_s^{(i)}$$

Table 1. Numbers $q_{\rm trig}$, $q_{\rm trig}^*$, $q_{\rm pol}$

$T-t$	2^{-5}	2^{-6}	2^{-7}	2^{-8}	2^{-9}	2^{-10}	2^{-11}	2^{-12}
$q_{\rm trig}$	3	4	7	14	27	53	105	209
$q_{\rm trig}^*$	6	11	20	40	79	157	312	624
$q_{\rm pol}$	5	9	17	33	65	129	257	513

are independent standard Gaussian random variables for various i or j,

$$\phi_j(x)=\sqrt{\frac{2j+1}{T-t}}P_j\left(\left(x-\frac{T+t}{2}\right)\frac{2}{T-t}\right);\ j=0,1,2,\ldots, \tag{58}$$

where $P_j(x)$ is the Legendre polynomial.

The formula (57) can also be found in [1]-[3]. It is not difficult to show that [1]-[32]

$$\mathsf{M}\left\{\left(J_{(11)T,t}^{(i_1i_2)}-J_{(11)T,t}^{(i_1i_2)q}\right)^2\right\}=\frac{(T-t)^2}{2}\left(\frac{1}{2}-\sum_{i=1}^{q}\frac{1}{4i^2-1}\right), \tag{59}$$

where

$$J_{(11)T,t}^{(i_1i_2)q}=\frac{T-t}{2}\left(\zeta_0^{(i_1)}\zeta_0^{(i_2)}+\sum_{i=1}^{q}\frac{1}{\sqrt{4i^2-1}}\left(\zeta_{i-1}^{(i_1)}\zeta_i^{(i_2)}-\zeta_i^{(i_1)}\zeta_{i-1}^{(i_2)}\right)-\mathbf{1}_{\{i_1=i_2\}}\right). \tag{60}$$

Let us compare (60) with (16) and (59) with (18). Consider minimal natural numbers $q_{\rm trig}$ and $q_{\rm pol}$, which satisfy to (see Table 1)

$$\frac{(T-t)^2}{2}\left(\frac{1}{2}-\sum_{i=1}^{q_{\rm pol}}\frac{1}{4i^2-1}\right)\le (T-t)^3,$$

$$\frac{(T-t)^2}{2\pi^2}\left(\frac{\pi^2}{6}-\sum_{r=1}^{q_{\rm trig}}\frac{1}{r^2}\right)\le (T-t)^3.$$

Thus, we have

$$\frac{q_{\rm pol}}{q_{\rm trig}}\ \approx\ 1.67,\ \ 2.22,\ \ 2.43,\ \ 2.36,\ \ 2.41,\ \ 2.43,\ \ 2.45,\ \ 2.45.$$

The formula (16) includes $(4q+4)m$ independent standard Gaussian random variables. At the same time the folmula (60) includes only $(2q+2)m$ independent standard Gaussian random variables. Moreover, the formula (60) is simpler than the formula (16). Thus, in this case we can talk about approximately equal computational costs for the formulas (16) and (60).

There is one important feature. As we mentioned above, further we will see that introduction of random variables $\xi_q^{(i)}$ and $\mu_q^{(i)}$ will sharply complicate the approximation of the iterated stochastic integral $J_{(111)T,t}^{(i_1i_2i_3)}$; $i_1,i_2,i_3=1,\ldots,m$. This is due to the fact that the number q is fixed for all stochastic integrals, which included into the considered collection. However, it is clear that due to the smallness of $T-t$, the number q for $J_{(111)T,t}^{(i_1i_2i_3)}$ could be chosen significantly less than in the formula (16). This feature is also valid for the formulas (15), (19). However, for the case of Legendre polynomials we can choose different numbers q for different iterated stochastic integrals.

From the other hand, if we will not introduce the random variables $\xi_q^{(i)}$ and $\mu_q^{(i)}$, then the mean-square error of approximation of the iterated stochastic integral $J_{(11)T,t}^{(i_1i_2)}$ will be three times larger (see (13)). Moreover, in this case the stochastic integrals $J_{(01)T,t}^{(0i_1)}$, $J_{(001)T,t}^{(00i_1)}$ (with Gaussian distribution) will be approximated worse.

Consider minimal natural numbers $q_{\rm trig}^*$, which satisfy to (see Table 1)

$$\frac{3(T-t)^2}{2\pi^2}\left(\frac{\pi^2}{6}-\sum_{r=1}^{q_{\rm trig}^*}\frac{1}{r^2}\right)\le (T-t)^3.$$

In this situation we can talk about the advantage of Legendre polynomials ($q_{\rm trig}^*>q_{pol}$ and (16) is more complex than (60)).

7. Comparative Analysis of the Efficiency of Application of Legendre Polynomials and Trigonometric Functions for the Integrals $J_{(1)T,t}^{(i_1)}$, $J_{(11)T,t}^{(i_1i_2)}$, $J_{(01)T,t}^{(0i_1)}$, $J_{(10)T,t}^{(i_10)}$, $J_{(111)T,t}^{(i_1i_2i_3)}$

It is well known [45]-[49] that for implementation of strong Taylor–Ito numerical methods with the order 1.5 of accuracy for Ito stochastic differential equations we need to approximate the following collection of iterated Ito stochastic integrals

$$J_{(1)T,t}^{(i_1)},\quad J_{(11)T,t}^{(i_1i_2)},\quad J_{(01)T,t}^{(0i_1)},\quad J_{(10)T,t}^{(i_10)},\quad J_{(111)T,t}^{(i_1i_2i_3)}.$$

Using Theorems 1, 2 for the system of trigonometric functions, we have [4]-[32] (also see [1]-[3])

$$J_{(1)T,t}^{(i_1)}=\sqrt{T-t}\zeta_0^{(i_1)}, \tag{61}$$

$$J_{(11)T,t}^{(i_1i_2)q}=\frac{1}{2}(T-t)\Biggl(\zeta_0^{(i_1)}\zeta_0^{(i_2)}+\frac{1}{\pi}\sum_{r=1}^{q}\frac{1}{r}\left(\zeta_{2r}^{(i_1)}\zeta_{2r-1}^{(i_2)}-\zeta_{2r-1}^{(i_1)}\zeta_{2r}^{(i_2)}+\right.$$
$$\left.+\sqrt{2}\left(\zeta_{2r-1}^{(i_1)}\zeta_0^{(i_2)}-\zeta_0^{(i_1)}\zeta_{2r-1}^{(i_2)}\right)\right)+$$
$$+\frac{\sqrt{2}}{\pi}\sqrt{\alpha_q}\left(\xi_q^{(i_1)}\zeta_0^{(i_2)}-\zeta_0^{(i_1)}\xi_q^{(i_2)}\right)-\mathbf{1}_{\{i_1=i_2\}}\Biggr), \tag{62}$$

$$J_{(01)T,t}^{(0i_1)q}=\frac{(T-t)^{3/2}}{2}\left(\zeta_0^{(i_1)}-\frac{\sqrt{2}}{\pi}\left(\sum_{r=1}^{q}\frac{1}{r}\zeta_{2r-1}^{(i_1)}+\sqrt{\alpha_q}\xi_q^{(i_1)}\right)\right), \tag{63}$$

$$J_{(10)T,t}^{(i_1 0)q}=\frac{(T-t)^{3/2}}{2}\left(\zeta_0^{(i_1)}+\frac{\sqrt{2}}{\pi}\left(\sum_{r=1}^{q}\frac{1}{r}\zeta_{2r-1}^{(i_1)}+\sqrt{\alpha_q}\xi_q^{(i_1)}\right)\right), \tag{64}$$

$$J_{(111)T,t}^{(i_1 i_2 i_3)q}=(T-t)^{3/2}\left(\frac{1}{6}\zeta_0^{(i_1)}\zeta_0^{(i_2)}\zeta_0^{(i_3)}+\frac{\sqrt{\alpha_q}}{2\sqrt{2}\pi}\left(\xi_q^{(i_1)}\zeta_0^{(i_2)}\zeta_0^{(i_3)}-\xi_q^{(i_3)}\zeta_0^{(i_2)}\zeta_0^{(i_1)}\right)+\right.$$
$$+\frac{1}{2\sqrt{2}\pi^2}\sqrt{\beta_q}\left(\mu_q^{(i_1)}\zeta_0^{(i_2)}\zeta_0^{(i_3)}-2\mu_q^{(i_2)}\zeta_0^{(i_1)}\zeta_0^{(i_3)}+\mu_q^{(i_3)}\zeta_0^{(i_1)}\zeta_0^{(i_2)}\right)+$$
$$+\frac{1}{2\sqrt{2}}\sum_{r=1}^{q}\left(\frac{1}{\pi r}\left(\zeta_{2r-1}^{(i_1)}\zeta_0^{(i_2)}\zeta_0^{(i_3)}-\zeta_{2r-1}^{(i_3)}\zeta_0^{(i_2)}\zeta_0^{(i_1)}\right)+\right.$$
$$\left.+\frac{1}{\pi^2 r^2}\left(\zeta_{2r}^{(i_1)}\zeta_0^{(i_2)}\zeta_0^{(i_3)}-2\zeta_{2r}^{(i_2)}\zeta_0^{(i_3)}\zeta_0^{(i_1)}+\zeta_{2r}^{(i_3)}\zeta_0^{(i_2)}\zeta_0^{(i_1)}\right)\right)+$$
$$+\sum_{r=1}^{q}\left(\frac{1}{4\pi r}\left(\zeta_{2r}^{(i_1)}\zeta_{2r-1}^{(i_2)}\zeta_0^{(i_3)}-\zeta_{2r-1}^{(i_1)}\zeta_{2r}^{(i_2)}\zeta_0^{(i_3)}-\zeta_{2r-1}^{(i_2)}\zeta_{2r}^{(i_3)}\zeta_0^{(i_1)}+\zeta_{2r-1}^{(i_3)}\zeta_{2r}^{(i_2)}\zeta_0^{(i_1)}\right)+\right.$$
$$+\frac{1}{8\pi^2 r^2}\left(3\zeta_{2r-1}^{(i_1)}\zeta_{2r-1}^{(i_2)}\zeta_0^{(i_3)}+\zeta_{2r}^{(i_1)}\zeta_{2r}^{(i_2)}\zeta_0^{(i_3)}-6\zeta_{2r-1}^{(i_1)}\zeta_{2r-1}^{(i_3)}\zeta_0^{(i_2)}+\right.$$
$$\left.\left.\left.+3\zeta_{2r-1}^{(i_2)}\zeta_{2r-1}^{(i_3)}\zeta_0^{(i_1)}-2\zeta_{2r}^{(i_1)}\zeta_{2r}^{(i_3)}\zeta_0^{(i_2)}+\zeta_{2r}^{(i_3)}\zeta_{2r}^{(i_2)}\zeta_0^{(i_1)}\right)\right)+D_{T,t}^{(i_1 i_2 i_3)q}\right), \tag{65}$$

where

$$D_{T,t}^{(i_1 i_2 i_3)q}=\frac{1}{2\pi^2}\sum_{\substack{r,l=1\\ r\ne l}}^{q}\left(\frac{1}{r^2-l^2}\left(\zeta_{2r}^{(i_1)}\zeta_{2l}^{(i_2)}\zeta_0^{(i_3)}-\zeta_{2r}^{(i_2)}\zeta_0^{(i_1)}\zeta_{2l}^{(i_3)}+\right.\right.$$
$$\left.\left.+\frac{r}{l}\zeta_{2r-1}^{(i_1)}\zeta_{2l-1}^{(i_2)}\zeta_0^{(i_3)}-\frac{l}{r}\zeta_0^{(i_1)}\zeta_{2r-1}^{(i_2)}\zeta_{2l-1}^{(i_3)}\right)-\frac{1}{rl}\zeta_{2r-1}^{(i_1)}\zeta_0^{(i_2)}\zeta_{2l-1}^{(i_3)}\right)+$$
$$+\frac{1}{4\sqrt{2}\pi^2}\left(\sum_{r,m=1}^{q}\left(\frac{2}{rm}\left(-\zeta_{2r-1}^{(i_1)}\zeta_{2m-1}^{(i_2)}\zeta_{2m}^{(i_3)}+\zeta_{2r-1}^{(i_1)}\zeta_{2r}^{(i_2)}\zeta_{2m-1}^{(i_3)}+\right.\right.\right.$$
$$\left.+\zeta_{2r-1}^{(i_1)}\zeta_{2m}^{(i_2)}\zeta_{2m-1}^{(i_3)}-\zeta_{2r}^{(i_1)}\zeta_{2r-1}^{(i_2)}\zeta_{2m-1}^{(i_3)}\right)+$$
$$+\frac{1}{m(r+m)}\left(-\zeta_{2(m+r)}^{(i_1)}\zeta_{2r}^{(i_2)}\zeta_{2m}^{(i_3)}-\zeta_{2(m+r)-1}^{(i_1)}\zeta_{2r-1}^{(i_2)}\zeta_{2m}^{(i_3)}-\right.$$
$$\left.\left.-\zeta_{2(m+r)-1}^{(i_1)}\zeta_{2r}^{(i_2)}\zeta_{2m-1}^{(i_3)}+\zeta_{2(m+r)}^{(i_1)}\zeta_{2r-1}^{(i_2)}\zeta_{2m-1}^{(i_3)}\right)\right)+$$
$$+\sum_{m=1}^{q}\sum_{l=m+1}^{q}\left(\frac{1}{m(l-m)}\left(\zeta_{2(l-m)}^{(i_1)}\zeta_{2l}^{(i_2)}\zeta_{2m}^{(i_3)}+\zeta_{2(l-m)-1}^{(i_1)}\zeta_{2l-1}^{(i_2)}\zeta_{2m}^{(i_3)}-\right.\right.$$
$$\left.-\zeta_{2(l-m)-1}^{(i_1)}\zeta_{2l}^{(i_2)}\zeta_{2m-1}^{(i_3)}+\zeta_{2(l-m)}^{(i_1)}\zeta_{2l-1}^{(i_2)}\zeta_{2m-1}^{(i_3)}\right)+$$
$$+\frac{1}{l(l-m)}\left(-\zeta_{2(l-m)}^{(i_1)}\zeta_{2m}^{(i_2)}\zeta_{2l}^{(i_3)}+\zeta_{2(l-m)-1}^{(i_1)}\zeta_{2m-1}^{(i_2)}\zeta_{2l}^{(i_3)}-\right.$$

TABLE 2. Confirmation of the formula (67)

$\varepsilon/(T-t)^3$	0.0459	0.0072	$7.5722 \cdot 10^{-4}$	$7.5973 \cdot 10^{-5}$	$7.5990 \cdot 10^{-6}$
q	1	10	100	1000	10000

$$-\zeta_{2(l-m)-1}^{(i_1)}\zeta_{2m}^{(i_2)}\zeta_{2l-1}^{(i_3)}-\zeta_{2(l-m)}^{(i_1)}\zeta_{2m-1}^{(i_2)}\zeta_{2l-1}^{(i_3)}\Biggr)\Biggr)\Biggr),$$

where

$$\xi_q^{(i)}=\frac{1}{\sqrt{\alpha_q}}\sum_{r=q+1}^{\infty}\frac{1}{r}\,\zeta_{2r-1}^{(i)},\quad \alpha_q=\frac{\pi^2}{6}-\sum_{r=1}^{q}\frac{1}{r^2},$$

$$\mu_q^{(i)}=\frac{1}{\sqrt{\beta_q}}\sum_{r=q+1}^{\infty}\frac{1}{r^2}\,\zeta_{2r}^{(i)},\quad \beta_q=\frac{\pi^4}{90}-\sum_{r=1}^{q}\frac{1}{r^4},$$

and $\zeta_0^{(i)}$, $\zeta_{2r}^{(i)}$, $\zeta_{2r-1}^{(i)}$, $\xi_q^{(i)}$, $\mu_q^{(i)}$ $(r=1,\ldots,q;\ i=1,\ldots,m)$ are independent standard Gaussian random variables. Moreover, in (65) we suppose that $i_1\ne i_2$, $i_1\ne i_3$, $i_2\ne i_3$.

Mean-square errors for the approximations (62)–(65) are represented by the formulas

$$\mathsf{M}\left\{\left(J_{(01)T,t}^{(0i_1)}-J_{(01)T,t}^{(0i_1)q}\right)^2\right\}=0,$$

$$\mathsf{M}\left\{\left(J_{(10)T,t}^{(i_10)}-J_{(10)T,t}^{(i_10)q}\right)^2\right\}=0,$$

$$\mathsf{M}\left\{\left(J_{(11)T,t}^{(i_1i_2)}-J_{(11)T,t}^{(i_1i_2)q}\right)^2\right\}=\frac{(T-t)^2}{2\pi^2}\left(\frac{\pi^2}{6}-\sum_{r=1}^{q}\frac{1}{r^2}\right), \tag{66}$$

$$\mathsf{M}\left\{\left(J_{(111)T,t}^{(i_1i_2i_3)}-J_{(111)T,t}^{(i_1i_2i_3)q}\right)^2\right\}=(T-t)^3\Biggl(\frac{4}{45}-\frac{1}{4\pi^2}\sum_{r=1}^{q}\frac{1}{r^2}-$$

$$-\frac{55}{32\pi^4}\sum_{r=1}^{q}\frac{1}{r^4}-\frac{1}{4\pi^4}\sum_{\substack{r,l=1\\r\ne l}}^{q}\frac{5l^4+4r^4-3r^2l^2}{r^2l^2\left(r^2-l^2\right)^2}\Biggr), \tag{67}$$

where $i_1\ne i_2,\ i_1\ne i_3,\ i_2\ne i_3$.

In Table 2, we can see the numerical confirmation of the formula (67) (ε is a right-hand side of (67)).

Note that the formulas (61), (62) have been obtained for the first time in [45]. Using (61), (62), we can realize numerically the explicit one-step strong Taylor–Ito numerical method with the order 1.0 of accuracy (Milstein scheme [45]). The analogue of the formula (65) has been obtained for the first time in [46]-[48].

As we mentioned above, the Milstein approach (see Sect. 2) leads to iterated application of the operation of limit transition. The analogue of (65) has been derived in [46]-[48], [50] on the base of the Milstein approach [45]. It means that the authors of the works [46]-[48], [50] could not formally use the double sum with the upper limit q in the analogue of (65) in [46] (pp. 438-439), [47] (Sect. 5.8, pp. 202–204), [48] (pp. 82-84), [50] (pp. 263-264) on the base of the Wong–Zakai approximation [52]-[54] (see discussion in Sect. 11 for details). From the other hand, the correctness of (65) follows directly from Theorems 1, 2. Note that (65) has been obtained reasonably for the first time in [4]. The version of (65) but without using the random variables $\xi_q^{(i)}$ and $\mu_q^{(i)}$ can be found in [1]-[3].

The formula (66) appears for the first time in [45]. The mean-square error (67) has been obtained for the first time in [4] on the base of the simplified variant of Theorem 8 (the case of pairwise different $i_1,\ldots,i_k$).

As we noted above, the number q must be the same in (62)–(65). This is the main drawback of this approach because really the number q in (65) can be chosen essentially smaller than in (62).

Note that in (65) we can replace $J_{(111)T,t}^{(i_1 i_2 i_3)q}$ with $J_{(111)T,t}^{*(i_1 i_2 i_3)q}$ and (65) will when be valid for any $i_1, i_2, i_3 = 0, 1, \ldots, m$ (see Theorem 3).

Consider approximations of the iterated Ito stochastic integrals

$$J_{(1)T,t}^{(i_1)},\quad J_{(11)T,t}^{(i_1 i_2)},\quad J_{(01)T,t}^{(0 i_1)},\quad J_{(10)T,t}^{(i_1 0)},\quad J_{(111)T,t}^{(i_1 i_2 i_3)}\quad (i_1,i_2,i_3=1,\ldots,m)$$

on the base of Theorems 1, 2 (the case of Legendre polynomials) [1]-[32]

$$J_{(1)T,t}^{(i_1)}=\sqrt{T-t}\,\zeta_0^{(i_1)}, \tag{68}$$

$$J_{(11)T,t}^{(i_1 i_2)q}=\frac{T-t}{2}\left(\zeta_0^{(i_1)}\zeta_0^{(i_2)}+\sum_{i=1}^{q}\frac{1}{\sqrt{4i^2-1}}\left(\zeta_{i-1}^{(i_1)}\zeta_i^{(i_2)}-\zeta_i^{(i_1)}\zeta_{i-1}^{(i_2)}\right)-\mathbf{1}_{\{i_1=i_2\}}\right), \tag{69}$$

$$J_{(01)T,t}^{(0 i_1)}=\frac{(T-t)^{3/2}}{2}\left(\zeta_0^{(i_1)}+\frac{1}{\sqrt{3}}\zeta_1^{(i_1)}\right), \tag{70}$$

$$J_{(10)T,t}^{(i_1 0)}=\frac{(T-t)^{3/2}}{2}\left(\zeta_0^{(i_1)}-\frac{1}{\sqrt{3}}\zeta_1^{(i_1)}\right), \tag{71}$$

$$J_{(111)T,t}^{(i_1 i_2 i_3)q_1}=\sum_{j_1,j_2,j_3=0}^{q_1}C_{j_3 j_2 j_1}\Biggl(\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}\zeta_{j_3}^{(i_3)}-\mathbf{1}_{\{i_1=i_2\}}\mathbf{1}_{\{j_1=j_2\}}\zeta_{j_3}^{(i_3)}-$$

$$-\mathbf{1}_{\{i_2=i_3\}}\mathbf{1}_{\{j_2=j_3\}}\zeta_{j_1}^{(i_1)}-\mathbf{1}_{\{i_1=i_3\}}\mathbf{1}_{\{j_1=j_3\}}\zeta_{j_2}^{(i_2)}\Biggr),\quad q_1\ll q, \tag{72}$$

$$J_{(111)T,t}^{(i_1 i_1 i_1)}=\frac{1}{6}(T-t)^{3/2}\left(\left(\zeta_0^{(i_1)}\right)^3-3\zeta_0^{(i_1)}\right),$$

$$C_{j_3 j_2 j_1}=\int\limits_t^T\phi_{j_3}(z)\int\limits_t^z\phi_{j_2}(y)\int\limits_t^y\phi_{j_1}(x)dxdydz=$$

$$
=\frac{\sqrt{(2j_1+1)(2j_2+1)(2j_3+1)}}{8}(T-t)^{3/2}\bar{C}_{j_3j_2j_1},
$$

$$
\bar{C}_{j_3j_2j_1}=\int\limits_{-1}^{1}P_{j_3}(z)\int\limits_{-1}^{z}P_{j_2}(y)\int\limits_{-1}^{y}P_{j_1}(x)dxdydz, \tag{73}
$$

where $\phi_j(x)$ has the form (58) and $P_i(x)$ is the Legendre polynomial ($i=0,1,2,\ldots$).

Mean-square errors for the approximations (69), (72) are represented by the formulas (see Theorem 8 and (52)) [1]-[32]

$$
\mathsf{M}\left\{\left(J_{(11)T,t}^{(i_1i_2)}-J_{(11)T,t}^{(i_1i_2)q}\right)^2\right\}=\frac{(T-t)^2}{2}\left(\frac{1}{2}-\sum_{i=1}^{q}\frac{1}{4i^2-1}\right)\quad (i_1\ne i_2), \tag{74}
$$

$$
\mathsf{M}\left\{\left(J_{(111)T,t}^{(i_1i_2i_3)}-J_{(111)T,t}^{(i_1i_2i_3)q_1}\right)^2\right\}=\frac{(T-t)^3}{6}-\sum_{j_3,j_2,j_1=0}^{q_1}C_{j_3j_2j_1}^2\quad (i_1\ne i_2, i_1\ne i_3, i_2\ne i_3), \tag{75}
$$

$$
\mathsf{M}\left\{\left(J_{(111)T,t}^{(i_1i_2i_3)}-J_{(111)T,t}^{(i_1i_2i_3)q_1}\right)^2\right\}=\frac{(T-t)^3}{6}-\sum_{j_3,j_2,j_1=0}^{q_1}C_{j_3j_2j_1}^2-
$$

$$
-\sum_{j_3,j_2,j_1=0}^{q_1}C_{j_2j_3j_1}C_{j_3j_2j_1}\quad (i_1\ne i_2=i_3), \tag{76}
$$

$$
\mathsf{M}\left\{\left(J_{(111)T,t}^{(i_1i_2i_3)}-J_{(111)T,t}^{(i_1i_2i_3)q_1}\right)^2\right\}=\frac{(T-t)^3}{6}-\sum_{j_3,j_2,j_1=0}^{q_1}C_{j_3j_2j_1}^2-
$$

$$
-\sum_{j_3,j_2,j_1=0}^{q_1}C_{j_3j_2j_1}C_{j_1j_2j_3}\quad (i_1=i_3\ne i_2), \tag{77}
$$

$$
\mathsf{M}\left\{\left(J_{(111)T,t}^{(i_1i_2i_3)}-J_{(111)T,t}^{(i_1i_2i_3)q_1}\right)^2\right\}=\frac{(T-t)^3}{6}-\sum_{j_3,j_2,j_1=0}^{q_1}C_{j_3j_2j_1}^2-
$$

$$
-\sum_{j_3,j_2,j_1=0}^{q_1}C_{j_3j_1j_2}C_{j_3j_2j_1}\quad (i_1=i_2\ne i_3), \tag{78}
$$

$$
\mathsf{M}\left\{\left(J_{(111)T,t}^{(i_1i_2i_3)}-J_{(111)T,t}^{(i_1i_2i_3)q_1}\right)^2\right\}\le 6\left(\frac{(T-t)^3}{6}-\sum_{j_3,j_2,j_1=0}^{q_1}C_{j_3j_2j_1}^2\right)\quad (i_1,i_2,i_3=1,\ldots,m). \tag{79}
$$

Let us compare the efficiency of application of Legendre polynomials and trigonometric functions for the iterated stochastic integrals $J_{(11)T,t}^{(i_1 i_2)}$, $J_{(111)T,t}^{(i_1 i_2 i_3)}$.

Consider the following conditions $(i_1 \neq i_2,\ i_1 \neq i_3,\ i_2 \neq i_3)$

$$\frac{(T-t)^2}{2}\left(\frac{1}{2}-\sum_{i=1}^{q}\frac{1}{4i^2-1}\right)\le (T-t)^4, \tag{80}$$

$$(T-t)^3\left(\frac{1}{6}-\sum_{j_1,j_2,j_3=0}^{q_1}\frac{\left(C_{j_3j_2j_1}\right)^2}{(T-t)^3}\right)\le (T-t)^4, \tag{81}$$

$$\frac{(T-t)^2}{2\pi^2}\left(\frac{\pi^2}{6}-\sum_{r=1}^{p}\frac{1}{r^2}\right)\le (T-t)^4, \tag{82}$$

$$(T-t)^3\left(\frac{4}{45}-\frac{1}{4\pi^2}\sum_{r=1}^{p_1}\frac{1}{r^2}-\frac{55}{32\pi^4}\sum_{r=1}^{p_1}\frac{1}{r^4}-\frac{1}{4\pi^4}\sum_{\substack{r,l=1\\ r\neq l}}^{p_1}\frac{5l^4+4r^4-3r^2l^2}{r^2l^2\left(r^2-l^2\right)^2}\right)\le (T-t)^4, \tag{83}$$

where

$$C_{j_3j_2j_1}=\frac{\sqrt{(2j_1+1)(2j_2+1)(2j_3+1)}}{8}(T-t)^{3/2}\bar{C}_{j_3j_2j_1},$$

$$\bar{C}_{j_3j_2j_1}=\int\limits_{-1}^{1}P_{j_3}(z)\int\limits_{-1}^{z}P_{j_2}(y)\int\limits_{-1}^{y}P_{j_1}(x)dxdydz,$$

where $P_i(x)$ is the Legendre polynomial.

In Tables 3 and 4, we can see minimal numbers q, q_1, p, p_1, which satisfy the conditions (80)–(83). As we mentioned above, the numbers q, q_1 are different. At that $q_1 \ll q$ (the case of Legendre polynomials). As we saw in the previous sections, we cannot take different numbers p, p_1 for the case of trigonometric functions. Thus, we have to choose $q = p$ in (62)–(65). This leads to huge computational costs (see very complex formula (65)). From the other hand, we can choose different numbers q in (62)–(65). At that we must exclude the random variables $\xi_q^{(i)}$, $\mu_q^{(i)}$ from (62)–(65).

At this situation for the case $i_1 \neq i_2$, $i_2 \neq i_3$, $i_1 \neq i_3$ we have

$$\frac{3(T-t)^2}{2\pi^2}\left(\frac{\pi^2}{6}-\sum_{r=1}^{p^*}\frac{1}{r^2}\right)\le (T-t)^4, \tag{84}$$

$$(T-t)^3\left(\frac{5}{36}-\frac{1}{2\pi^2}\sum_{r=1}^{p_1^*}\frac{1}{r^2}-\frac{79}{32\pi^4}\sum_{r=1}^{p_1^*}\frac{1}{r^4}-\frac{1}{4\pi^4}\sum_{\substack{r,l=1\\ r\neq l}}^{p_1^*}\frac{5l^4+4r^4-3r^2l^2}{r^2l^2\left(r^2-l^2\right)^2}\right)\le (T-t)^4, \tag{85}$$

where the left-hand sides of (84), (85) correspond to (16), (65) but without $\xi_q^{(i)}$, $\mu_q^{(i)}$. In Table 4, we can see minimal numbers p^*, p_1^*, which satisfy the conditions (84), (85).

TABLE 3. Numbers q, q_1

$T-t$	0.08222	0.05020	0.02310	0.01956
q	19	51	235	328
q_1	1	2	5	6

TABLE 4. Numbers p, p_1, p^*, p_1^*

$T-t$	0.08222	0.05020	0.02310	0.01956
p	8	21	96	133
p_1	1	1	3	4
p^*	23	61	286	398
p_1^*	1	2	4	5

TABLE 5. Confirmation of the formula (85)

$\varepsilon/(T-t)^3$	0.0629	0.0097	0.0010	$1.0129\cdot 10^{-4}$	$1.0132\cdot 10^{-5}$
q	1	10	100	1000	10000

Moreover,

$$\mathsf{M}\left\{\left(J_{(01)T,t}^{(0i_1)}-J_{(01)T,t}^{(0i_1)q}\right)^2\right\}=\mathsf{M}\left\{\left(J_{(10)T,t}^{(i_10)}-J_{(10)T,t}^{(i_10)q}\right)^2\right\}=$$

$$=\frac{(T-t)^3}{2\pi^2}\left(\frac{\pi^2}{6}-\sum_{r=1}^{q}\frac{1}{r^2}\right)\neq 0, \tag{86}$$

where $J_{(01)T,t}^{(0i_1)q}$, $J_{(10)T,t}^{(i_10)q}$ are defined by the formulas (63), (64).

It is not difficult to see that the numbers $q_{\rm trig}$ in Table 1 correspond to minimal numbers $q_{\rm trig}$, which satisfy the condition

$$\frac{(T-t)^3}{2\pi^2}\left(\frac{\pi^2}{6}-\sum_{r=1}^{q_{\rm trig}}\frac{1}{r^2}\right)\le (T-t)^4.$$

From the other hand, the right-hand sides of (70), (71) include only two random variables. In this situation we can again talk about the advantage of Ledendre polynomials.

In Table 5, we can see the numerical confirmation of the formula (85) (ε is a left-hand side of the formula (85)).

8. Comparative Analysis of the Efficiency of Application of Legendre Polynomials and Trigonometric Functions for the Integral $J_{(011)T,t}^{*(0i_1i_2)}$

In this section, we compare computational costs for the iterated Stratonovich stochastic integral $J_{(011)T,t}^{*(0i_1i_2)}$ $(i_1,i_2=1,\ldots,m)$ within the frames of the method of generalized multiple Fourier series for the systems of Legendre polynomials and trigomomenric functions.

Using Theorem 3 for the case of trigonometric system of functions, we obtain [4]-[32] (also see [1]-[3])

$$
\begin{aligned}
J_{(011)T,t}^{*(0i_1i_2)q}=(T-t)^2\Biggl(&\frac{1}{6}\zeta_0^{(i_1)}\zeta_0^{(i_2)}-\frac{1}{2\sqrt{2}\pi}\sqrt{\alpha_q}\xi_q^{(i_2)}\zeta_0^{(i_1)}+\\
&+\frac{1}{2\sqrt{2}\pi^2}\sqrt{\beta_q}\left(\mu_q^{(i_2)}\zeta_0^{(i_1)}-2\mu_q^{(i_1)}\zeta_0^{(i_2)}\right)+\\
&+\frac{1}{2\sqrt{2}}\sum_{r=1}^{q}\left(-\frac{1}{\pi r}\zeta_{2r-1}^{(i_2)}\zeta_0^{(i_1)}+\frac{1}{\pi^2r^2}\left(\zeta_{2r}^{(i_2)}\zeta_0^{(i_1)}-2\zeta_{2r}^{(i_1)}\zeta_0^{(i_2)}\right)\right)-\\
&-\frac{1}{2\pi^2}\sum_{\substack{r,l=1\\ r\ne l}}^{q}\frac{1}{r^2-l^2}\left(\zeta_{2r}^{(i_1)}\zeta_{2l}^{(i_2)}+\frac{l}{r}\zeta_{2r-1}^{(i_1)}\zeta_{2l-1}^{(i_2)}\right)+\\
&+\sum_{r=1}^{q}\Biggl(\frac{1}{4\pi r}\left(\zeta_{2r}^{(i_1)}\zeta_{2r-1}^{(i_2)}-\zeta_{2r-1}^{(i_1)}\zeta_{2r}^{(i_2)}\right)+\\
&+\frac{1}{8\pi^2r^2}\left(3\zeta_{2r-1}^{(i_1)}\zeta_{2r-1}^{(i_2)}+\zeta_{2r}^{(i_2)}\zeta_{2r}^{(i_1)}\right)\Biggr)\Biggr).
\end{aligned}
\tag{87}
$$

For the case $i_1\ne i_2$ from Theorem 8 we get [4]-[32] (also see [1]-[3])

$$
\begin{aligned}
\mathsf{M}\left\{\left(J_{(011)T,t}^{*(0i_1i_2)}-J_{(011)T,t}^{*(0i_1i_2)q}\right)^2\right\}=\frac{(T-t)^4}{4}\Biggl(&\frac{1}{9}-\frac{1}{2\pi^2}\sum_{r=1}^{q}\frac{1}{r^2}-\\
&-\frac{5}{8\pi^4}\sum_{r=1}^{q}\frac{1}{r^4}-\frac{1}{\pi^4}\sum_{\substack{k,l=1\\ k\ne l}}^{q}\frac{k^2+l^2}{l^2\left(l^2-k^2\right)^2}\Biggr).
\end{aligned}
\tag{88}
$$

Analogues of the formulas (87), (88) for the case of Legendre polynomials will look as follows [4]-[32] (also see [1]-[3])

$$
\begin{aligned}
J_{(011)T,t}^{*(0i_1i_2)q}=\frac{T-t}{2}J_{(11)T,t}^{*(i_1i_2)q}+\frac{(T-t)^2}{4}\Biggl(&\frac{1}{\sqrt{3}}\zeta_0^{(i_2)}\zeta_1^{(i_1)}+\\
&+\sum_{i=0}^{q}\left(\frac{(i+1)\zeta_{i+2}^{(i_2)}\zeta_i^{(i_1)}-(i+2)\zeta_i^{(i_2)}\zeta_{i+2}^{(i_1)}}{\sqrt{(2i+1)(2i+5)}(2i+3)}+\frac{\zeta_i^{(i_1)}\zeta_i^{(i_2)}}{(2i-1)(2i+3)}\right)\Biggr),
\end{aligned}
\tag{89}
$$

where

TABLE 6. Confirmation of the formula (88)

$4\varepsilon/(T-t)^4$	0.0540	0.0082	$8.4261 \cdot 10^{-4}$	$8.4429 \cdot 10^{-5}$	$8.4435 \cdot 10^{-6}$
q	1	10	100	1000	10000

TABLE 7. Confirmation of the formula (90)

$16\varepsilon/(T-t)^4$	0.3797	0.0581	0.0062	$6.2450 \cdot 10^{-4}$	$6.2495 \cdot 10^{-5}$
q	1	10	100	1000	10000

$$J^{*(i_1 i_2)q}_{(11)T,t} = \frac{T-t}{2}\left(\zeta_0^{(i_1)}\zeta_0^{(i_2)} + \sum_{i=1}^{q}\frac{1}{\sqrt{4i^2-1}}\left(\zeta_{i-1}^{(i_1)}\zeta_i^{(i_2)} - \zeta_i^{(i_1)}\zeta_{i-1}^{(i_2)}\right)\right),$$

$$\mathsf{M}\left\{\left(J^{*(0i_1i_2)}_{(011)T,t} - J^{*(0i_1i_2)q}_{(011)T,t}\right)^2\right\} =$$

$$= \frac{(T-t)^4}{16}\left(\frac{5}{9} - 2\sum_{i=2}^{q}\frac{1}{4i^2-1} - \sum_{i=1}^{q}\frac{1}{(2i-1)^2(2i+3)^2} - \right.$$

$$\left. - \sum_{i=0}^{q}\frac{(i+2)^2+(i+1)^2}{(2i+1)(2i+5)(2i+3)^2}\right) \quad (i_1 \neq i_2). \tag{90}$$

In Tables 6 and 7, we can see the numerical confirmation of the formulas (88) and (90) (ε is the right-hand side of (88), (90)).

Let us compare the complexity of the formulas (87) and (89). The formula (87) includes the double sum

$$\frac{1}{2\pi^2}\sum_{\substack{r,l=1\\ r\neq l}}^{q}\frac{1}{r^2-l^2}\left(\zeta_{2r}^{(i_1)}\zeta_{2l}^{(i_2)} + \frac{l}{r}\zeta_{2r-1}^{(i_1)}\zeta_{2l-1}^{(i_2)}\right).$$

Thus, the formula (87) is more complex than the formula (89) even if we take identical numbers q in these formulas. As we noted above, the number q in (87) must be equal to the number q from the formula (16), so it is much larger than the number q from the formula (89). As a result, we have obvious advantage of the formula (89) in computational costs. As we mentioned above, if we will not use the random variables $\xi_q^{(i)}$ and $\mu_q^{(i)}$, then the number q in (87) can be chosen smaller, but the mean-square error of approximation of the stochastic integral $J^{(i_1i_2)}_{(11)T,t}$ will be three times larger (see (13)). Moreover, in this case the stochastic integrals $J^{(0i_1)}_{(01)T,t}$, $J^{(i_10)}_{(10)T,t}$, $J^{(00i_1)}_{(001)T,t}$ (with Gaussian distribution) will be approximated worse. In this situation we can again talk about the advantage of Ledendre polynomials.

9. Conclusions

Summing up the results of previous sections, we can come to the following conclusions.

1. We can talk about approximately equal computational costs for the formulas (16) and (60). This means that computational costs for implementing the Milstein scheme (explicit one-step strong Taylor–Ito numerical method with the order $\gamma = 1.0$ of accuracy for Ito stochastic differential equations [45]) for the case of Legendre polynomials and for the case of trigonometric functions are approximately the same.

2. If we will not use the random variables $\xi_q^{(i)}$ (see (16)), then the mean-square error of approximation of the stochastic integral $J_{(11)T,t}^{(i_1 i_2)}$ will be three times larger (see (13)). In this situation, we can talk about the advantage of Ledendre polynomials in the Milstein method. Moreover, in this case the stochastic integrals $J_{(01)T,t}^{(0 i_1)}$, $J_{(10)T,t}^{(i_1 0)}$, $J_{(001)T,t}^{(00 i_1)}$ (with Gaussian distribution) will be approximated worse.

3. If we talk about the explicit one-step strong Taylor–Ito scheme with the order $\gamma = 1.5$ of accuracy for Ito stochastic differential equations, then the numbers q, q_1 (see (69), (72)) are different. At that $q_1 \ll q$ (the case of Legendre polynomials). The number q must be the same in (62)–(65) (the case of trigonometric functions). This leads to huge computational costs (see very complex formula (65)). From the other hand, we can take different numbers q in (62)–(65). At that we should exclude the random variables $\xi_q^{(i)}$, $\mu_q^{(i)}$ from (62)–(65). This leads to another problems, which we discussed above (see Conclusion 1).

4. In addition, the author supposes that effect described in Conclusion 3 will be more impressive when analyzing more complex sets of iterated Ito and Stratonovich stochastic integrals (when $\gamma = 2.0,\ 2.5,\ 3.0,\ \ldots$; here γ has the same meaning as in Conclusion 3). This supposition is based on the fact that the polynomial system of functions has the significant advantage (compared with the trigonometric system) for approximation of iterated stochastic integrals for which not all weight functions are equal to 1.

10. Further Development of Multiple Fourier–Legendre Series Approach to the Mean-Square Approximation of Iterated Ito and Stratonovich Stochastic Integrals of Multiplicities 3 to 5

From Theorems 1, 2 for $k = 4$ and 5 we obtain

$$
\begin{aligned}
J_{(\lambda_1\lambda_2\lambda_3\lambda_4)T,t}^{(i_1 i_2 i_3 i_4)q} = \sum_{j_1,j_2,j_3,j_4=0}^{q} C_{j_4 j_3 j_2 j_1} \Biggl(&\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}\zeta_{j_3}^{(i_3)}\zeta_{j_4}^{(i_4)} - \\
&-\mathbf{1}_{\{i_1=i_2\neq 0\}}\mathbf{1}_{\{j_1=j_2\}}\zeta_{j_3}^{(i_3)}\zeta_{j_4}^{(i_4)} - \mathbf{1}_{\{i_1=i_3\neq 0\}}\mathbf{1}_{\{j_1=j_3\}}\zeta_{j_2}^{(i_2)}\zeta_{j_4}^{(i_4)} - \\
&-\mathbf{1}_{\{i_1=i_4\neq 0\}}\mathbf{1}_{\{j_1=j_4\}}\zeta_{j_2}^{(i_2)}\zeta_{j_3}^{(i_3)} - \mathbf{1}_{\{i_2=i_3\neq 0\}}\mathbf{1}_{\{j_2=j_3\}}\zeta_{j_1}^{(i_1)}\zeta_{j_4}^{(i_4)} - \\

where

$$J_{(\lambda_1\lambda_2\lambda_3\lambda_4)T,t}^{(i_1 i_2 i_3 i_4)}, \quad J_{(\lambda_1\lambda_2\lambda_3\lambda_4\lambda_5)T,t}^{(i_1 i_2 i_3 i_4 i_5)}$$

are defined by the formula (4); $q_1 < q$; $\mathbf{1}_A$ is the indicator of the set A; $i_1, i_2, i_3, i_4, i_5 = 0, 1, \ldots, m$, and

$$C_{j_4 j_3 j_2 j_1} = \int\limits_t^T \phi_{j_4}(u) \int\limits_t^u \phi_{j_3}(z) \int\limits_t^z \phi_{j_2}(y) \int\limits_t^y \phi_{j_1}(x) dx dy dz du =$$
$$= \sqrt{(2j_1+1)(2j_2+1)(2j_3+1)(2j_4+1)}\ \frac{(T-t)^2}{16}\ \bar{C}_{j_4 j_3 j_2 j_1},$$

$$C_{j_5 j_4 j_3 j_2 j_1} = \int\limits_t^T \phi_{j_5}(v) \int\limits_t^v \phi_{j_4}(u) \int\limits_t^u \phi_{j_3}(z) \int\limits_t^z \phi_{j_2}(y) \int\limits_t^y \phi_{j_1}(x) dx dy dz du dv =$$
$$= \sqrt{(2j_1+1)(2j_2+1)(2j_3+1)(2j_4+1)(2j_5+1)}\ \frac{(T-t)^{5/2}}{32}\ \bar{C}_{j_5 j_4 j_3 j_2 j_1},$$

$$\bar{C}_{j_4 j_3 j_2 j_1} = \int\limits_{-1}^1 P_{j_4}(u) \int\limits_{-1}^u P_{j_3}(z) \int\limits_{-1}^z P_{j_2}(y) \int\limits_{-1}^y P_{j_1}(x) dx dy dz du, \tag{93}$$

(94) $$\bar{C}_{j_5 j_4 j_3 j_2 j_1}=\int\limits_{-1}^{1}P_{j_5}(v)\int\limits_{-1}^{v}P_{j_4}(u)\int\limits_{-1}^{u}P_{j_3}(z)\int\limits_{-1}^{z}P_{j_2}(y)\int\limits_{-1}^{y}P_{j_1}(x)dxdydzdudv,$$

where $P_i(x)$ $(i=0,1,2,\ldots)$ is the Legendre polynomial,

$$\zeta_j^{(i)}=\int\limits_t^T\phi_j(s)d\mathbf{w}_s^{(i)}$$

are independent standard Gaussian random variables for various i or j (if $i\neq 0$),

$$\phi_j(x)=\sqrt{\frac{2j+1}{T-t}}P_j\left(\left(x-\frac{T+t}{2}\right)\frac{2}{T-t}\right),\quad j=0,1,2,\ldots$$

is a complete orthonormal system of Legendre polynomials in the space $L_2([t,T])$.

Note that the Fourier–Legendre coefficients $\bar{C}_{j_4 j_3 j_2 j_1}$, $\bar{C}_{j_5 j_4 j_3 j_2 j_1}$, and $\bar{C}_{j_3 j_2 j_1}$ (see (73)) can be calculated exactly using DERIVE or MAPLE (computer algebra systems). Several tables with these coefficients can be found in [4]-[20], [24], [31]. The database with 270,000 of exactly calculated Fourier–Legendre coefficients is descibed in [34], [35]. Note that the mentioned Fourier–Legendre coefficients not depend on the integration step $T-t$ of numerical methods for Ito stochastic differential equations. So, $T-t$ can be not a constant in this approach.

From (52) $(0<T-t<1)$ we obtain

(95) $$\mathsf{M}\left\{\left(J_{(\lambda_1\lambda_2\lambda_3\lambda_4)T,t}^{(i_1 i_2 i_3 i_4)}-J_{(\lambda_1\lambda_2\lambda_3\lambda_4)T,t}^{(i_1 i_2 i_3 i_4)q}\right)^2\right\}\le 24\left(\frac{(T-t)^4}{24}-\sum_{j_1,j_2,j_3,j_4=0}^{q}C_{j_4 j_3 j_2 j_1}^2\right),$$

(96) $$\mathsf{M}\left\{\left(J_{(\lambda_1\lambda_2\lambda_3\lambda_4\lambda_5)T,t}^{(i_1 i_2 i_3 i_4 i_5)}-J_{(\lambda_1\lambda_2\lambda_3\lambda_4\lambda_5)T,t}^{(i_1 i_2 i_3 i_4 i_5)q_1}\right)^2\right\}\le 120\left(\frac{(T-t)^5}{120}-\sum_{j_1,j_2,j_3,j_4,j_5=0}^{q_1}C_{j_5 j_4 j_3 j_2 j_1}^2\right).$$

Note that in practice the numbers q,q_1 in (72), (91), (92) can be selected not large. For example, for the case of pairwise different $i_1,i_2,i_3,i_4,i_5=1,\ldots,m$ we obtain

(97) $$\mathsf{M}\left\{\left(J_{(111)T,t}^{(i_1 i_2 i_3)}-J_{(111)T,t}^{(i_1 i_2 i_3)6}\right)^2\right\}=\frac{(T-t)^3}{6}-\sum_{j_1,j_2,j_3=0}^{6}C_{j_3 j_2 j_1}^2\approx 0.01956000(T-t)^3,$$

(98) $$\mathsf{M}\left\{\left(J_{(1111)T,t}^{(i_1 i_2 i_3 i_4)}-J_{(1111)T,t}^{(i_1 i_2 i_3 i_4)2}\right)^2\right\}=\frac{(T-t)^4}{24}-\sum_{j_1,j_2,j_3,j_4=0}^{2}C_{j_4 j_3 j_2 j_1}^2\approx 0.02360840(T-t)^4,$$

(99) $$\mathsf{M}\left\{\left(J_{(11111)T,t}^{(i_1 i_2 i_3 i_4 i_5)}-J_{(11111)T,t}^{(i_1 i_2 i_3 i_4 i_5)1}\right)^2\right\}=\frac{(T-t)^5}{120}-\sum_{j_1,j_2,j_3,j_4,j_5=0}^{1}C_{j_5 j_4 j_3 j_2 j_1}^2\approx 0.00759105(T-t)^5.$$

From Theorems 3–6 we have

$$J^{*(i_1 i_2 i_3)q}_{(\lambda_1\lambda_2,\lambda_3)T,t}=\sum_{j_1,j_2,j_3=0}^{q} C_{j_3 j_2 j_1}\zeta^{(i_1)}_{j_1}\zeta^{(i_2)}_{j_2}\zeta^{(i_3)}_{j_3},$$

$$J^{*(i_1 i_2 i_3 i_4)q_1}_{(\lambda_1\lambda_2,\lambda_3\lambda_4)T,t}=\sum_{j_1,j_2,j_3,j_4=0}^{q_1} C_{j_4 j_3 j_2 j_1}\zeta^{(i_1)}_{j_1}\zeta^{(i_2)}_{j_2}\zeta^{(i_3)}_{j_3}\zeta^{(i_4)}_{j_4},$$

$$J^{*(i_1 i_2 i_3 i_4 i_5)q_2}_{(\lambda_1\lambda_2,\lambda_3\lambda_4\lambda_5)T,t}=\sum_{j_1,j_2,j_3,j_4,j_5=0}^{q_2} C_{j_5 j_4 j_3 j_2 j_1}\zeta^{(i_1)}_{j_1}\zeta^{(i_2)}_{j_2}\zeta^{(i_3)}_{j_3}\zeta^{(i_4)}_{j_4}\zeta^{(i_5)}_{j_5},$$

where

$$J^{*(i_1 i_2 i_3)}_{(\lambda_1\lambda_2\lambda_3)T,t},\ J^{*(i_1 i_2 i_3 i_4)}_{(\lambda_1\lambda_2\lambda_3\lambda_4)T,t},\ J^{*(i_1 i_2 i_3 i_4 i_5)}_{(\lambda_1\lambda_2\lambda_3\lambda_4\lambda_5)T,t}$$

are defined by the formula (5).

The values

$$\mathsf{M}\left\{\left(J^{*(i_1 i_2 i_3)}_{(111)T,t}-J^{*(i_1 i_2 i_3)6}_{(111)T,t}\right)^2\right\},\quad \mathsf{M}\left\{\left(J^{*(i_1 i_2 i_3 i_4)}_{(1111)T,t}-J^{*(i_1 i_2 i_3 i_4)2}_{(1111)T,t}\right)^2\right\},$$

$$\mathsf{M}\left\{\left(J^{*(i_1 i_2 i_3 i_4 i_5)}_{(11111)T,t}-J^{*(i_1 i_2 i_3 i_4 i_5)1}_{(11111)T,t}\right)^2\right\}$$

are equal to the right-hand sides of (97)–(99) for the case of pairwise different $i_1, i_2, i_3, i_4, i_5 = 1, \ldots, m$.

Note that the optimization of the mean-square approximation procedures for the itertaed Ito stochastic integrals (6) of multiplicities 1 to 5 is carried out in [55], [56].

11. Theorems 1–7 from Point of View of the Wong–Zakai Approximation

The iterated Ito stochastic integrals and solutions of Ito SDEs are complex and important functionals from the independent components $\mathbf{f}_s^{(i)}$, $i = 1, \ldots, m$ of the multidimensional Wiener process $\mathbf{f}_s$, $s \in [0, T]$. Let $\mathbf{f}_s^{(i)p}$, $p \in \mathbb{N}$ be some approximation of $\mathbf{f}_s^{(i)}$, $i = 1, \ldots, m$. Suppose that $\mathbf{f}_s^{(i)p}$ converges to $\mathbf{f}_s^{(i)}$, $i = 1, \ldots, m$ if $p \to \infty$ in some sense and has differentiable sample trajectories.

A natural question arises: if we replace $\mathbf{f}_s^{(i)}$ by $\mathbf{f}_s^{(i)p}$, $i = 1, \ldots, m$ in the functionals mentioned above, will the resulting functionals converge to the original functionals from the components $\mathbf{f}_s^{(i)}$, $i = 1, \ldots, m$ of the multidimentional Wiener process $\mathbf{f}_s$? The answere to this question is negative in the general case. However, in the pioneering works of Wong E. and Zakai M. [52], [53], it was shown that under the special conditions and for some types of approximations of the Wiener process the answere is affirmative with one peculiarity: the convergence takes place to the iterated Stratonovich stochastic integrals and solutions of Stratonovich SDEs and not to iterated Ito stochastic integrals and solutions of Ito stochastic differential equations. The piecewise linear approximation as well as the regularization by convolution [52]-[54] relate the mentioned types of approximations of the Wiener process. The above approximation of stochastic integrals and solutions of SDEs is often called the Wong–Zakai approximation.

Let $\mathbf{f}_s$, $s \in [0,T]$ be an m-dimensional standard Wiener process with independent components $\mathbf{f}_s^{(i)}$, $i = 1, \ldots, m$. It is well known that the following representation takes place [57], [58]

$$\mathbf{f}_\tau^{(i)} - \mathbf{f}_t^{(i)} = \sum_{j=0}^{\infty} \int\limits_t^\tau \phi_j(s)ds\ \zeta_j^{(i)}, \quad \zeta_j^{(i)} = \int\limits_t^T \phi_j(s)d\mathbf{f}_s^{(i)}, \tag{100}$$

where $\tau \in [t,T]$, $t \geq 0$, $\{\phi_j(x)\}_{j=0}^{\infty}$ is an arbitrary complete orthonormal system of functions in the space $L_2([t,T])$, and $\zeta_j^{(i)}$ are independent standard Gaussian random variables for various i or j. Moreover, the series (100) converges for any $\tau \in [t,T]$ in the mean-square sense.

Let $\mathbf{f}_\tau^{(i)p} - \mathbf{f}_t^{(i)p}$ be the mean-square approximation of the process $\mathbf{f}_\tau^{(i)} - \mathbf{f}_t^{(i)}$, which has the following form

$$\mathbf{f}_\tau^{(i)p} - \mathbf{f}_t^{(i)p} = \sum_{j=0}^{p} \int\limits_t^\tau \phi_j(s)ds\ \zeta_j^{(i)}. \tag{101}$$

From (101) we obtain

$$d\mathbf{f}_\tau^{(i)p} = \sum_{j=0}^{p} \phi_j(\tau)\zeta_j^{(i)} d\tau. \tag{102}$$

Consider the following iterated Riemann–Stieltjes integral

$$\int\limits_t^T \psi_k(t_k) \ldots \int\limits_t^{t_2} \psi_1(t_1) d\mathbf{w}_{t_1}^{(i_1)p_1} \ldots d\mathbf{w}_{t_k}^{(i_k)p_k}, \tag{103}$$

where $p_1, \ldots, p_k \in \mathbb{N}$, $i_1, \ldots, i_k = 0, 1, \ldots, m$,

$$d\mathbf{w}_\tau^{(i)p} = \begin{cases} d\mathbf{f}_\tau^{(i)p} & \text{for} \quad i = 1, \ldots, m \\ \\ d\tau & \text{for} \quad i = 0 \end{cases}, \tag{104}$$

and $d\mathbf{f}_\tau^{(i)p}$ in defined by the relation (102).

Let us substitute (102) into (103)

$$\int\limits_t^T \psi_k(t_k) \ldots \int\limits_t^{t_2} \psi_1(t_1) d\mathbf{w}_{t_1}^{(i_1)p_1} \ldots d\mathbf{w}_{t_k}^{(i_k)p_k} = \sum_{j_1=0}^{p_1} \ldots \sum_{j_k=0}^{p_k} C_{j_k \ldots j_1} \prod_{l=1}^{k} \zeta_{j_l}^{(i_l)}, \tag{105}$$

where

$$\zeta_j^{(i)} = \int\limits_t^T \phi_j(s) d\mathbf{w}_s^{(i)}$$

are independent standard Gaussian random variables for various i or j (in the case when $i \neq 0$), $\mathbf{w}_s^{(i)} = \mathbf{f}_s^{(i)}$ for $i = 1, \ldots, m$ and $\mathbf{w}_s^{(0)} = s$,

$$C_{j_k\ldots j_1}=\int\limits_t^T\psi_k(t_k)\phi_{j_k}(t_k)\ldots\int\limits_t^{t_2}\psi_1(t_1)\phi_{j_1}(t_1)dt_1\ldots dt_k$$

is the Fourier coefficient.

To best of our knowledge [52]-[54] the approximations of the Wiener process in the Wong–Zakai approximation must satisfy fairly strong restrictions [54] (see Definition 7.1, pp. 480–481). Moreover, approximations of the Wiener process that are similar to (101) were not considered in [52], [53] (also see [54], Theorems 7.1, 7.2). Therefore, the proof of analogs of Theorems 7.1 and 7.2 [54] for approximations of the Wiener process based on its series expansion (100) should be carried out separately. Thus, the mean-square convergence of the right-hand side of (105) to the iterated Stratonovich stochastic integral (7) does not follow from the results of the papers [52], [53] (also see [54], Theorems 7.1, 7.2).

From the other hand, Theorems 1–7 from this paper can be considered as the proof of the Wong–Zakai approximation for the iterated Stratonovich stochastic integrals (7) of multiplicities 1 to 6 based on the approximation (101) of the Wiener process. At that, the Riemann–Stieltjes integrals (103) converge (according to Theorems 1–7) to the appropriate Stratonovich stochastic integrals (7). Recall that $\{\phi_j(x)\}_{j=0}^{\infty}$ (see (100), (101), and Theorems 3–7) is a complete orthonormal system of Legendre polynomials or trigonometric functions in the space $L_2([t,T])$.

To illustrate the above reasoning, consider two examples for the case $k=2$, $\psi_1(s)$, $\psi_2(s)\equiv 1$; $i_1,i_2=1,\ldots,m$.

The first example relates to the piecewise linear approximation of the multidimensional Wiener process (these approximations were considered in [52]-[54]).

Let $\mathbf{b}_{\Delta}^{(i)}(t)$, $t\in[0,T]$ be the piecewise linear approximation of the ith component $\mathbf{f}_t^{(i)}$ of the multidimensional standard Wiener process $\mathbf{f}_t$, $t\in[0,T]$ with independent components $\mathbf{f}_t^{(i)}$, $i=1,\ldots,m$, i.e.

$$\mathbf{b}_{\Delta}^{(i)}(t)=\mathbf{f}_{k\Delta}^{(i)}+\frac{t-k\Delta}{\Delta}\Delta\mathbf{f}_{k\Delta}^{(i)},$$

where

$$\Delta\mathbf{f}_{k\Delta}^{(i)}=\mathbf{f}_{(k+1)\Delta}^{(i)}-\mathbf{f}_{k\Delta}^{(i)},\quad t\in[k\Delta,(k+1)\Delta),\quad k=0,1,\ldots,N-1.$$

Note that w. p. 1

$$\frac{d\mathbf{b}_{\Delta}^{(i)}}{dt}(t)=\frac{\Delta\mathbf{f}_{k\Delta}^{(i)}}{\Delta},\quad t\in[k\Delta,(k+1)\Delta),\quad k=0,1,\ldots,N-1. \tag{106}$$

Consider the following iterated Riemann–Stieltjes integral

$$\int\limits_0^T\int\limits_0^s d\mathbf{b}_{\Delta}^{(i_1)}(\tau)d\mathbf{b}_{\Delta}^{(i_2)}(s),\quad i_1,i_2=1,\ldots,m.$$

Using (106) and additive property of the Riemann–Stieltjes integrals, we can write w. p. 1

$$\int_0^T\int_0^s d\mathbf{b}_{\Delta}^{(i_1)}(\tau)d\mathbf{b}_{\Delta}^{(i_2)}(s)=\int_0^T\int_0^s \frac{d\mathbf{b}_{\Delta}^{(i_1)}}{d\tau}(\tau)d\tau\frac{d\mathbf{b}_{\Delta}^{(i_2)}}{ds}(s)ds=$$

$$=\sum_{l=0}^{N-1}\int\limits_{l\Delta}^{(l+1)\Delta}\left(\sum_{q=0}^{l-1}\int\limits_{q\Delta}^{(q+1)\Delta}\frac{\Delta\mathbf{f}_{q\Delta}^{(i_1)}}{\Delta}d\tau+\int\limits_{l\Delta}^{s}\frac{\Delta\mathbf{f}_{l\Delta}^{(i_1)}}{\Delta}d\tau\right)\frac{\Delta\mathbf{f}_{l\Delta}^{(i_2)}}{\Delta}ds=$$

$$=\sum_{l=0}^{N-1}\sum_{q=0}^{l-1}\Delta\mathbf{f}_{q\Delta}^{(i_1)}\Delta\mathbf{f}_{l\Delta}^{(i_2)}+\frac{1}{\Delta^2}\sum_{l=0}^{N-1}\Delta\mathbf{f}_{l\Delta}^{(i_1)}\Delta\mathbf{f}_{l\Delta}^{(i_2)}\int\limits_{l\Delta}^{(l+1)\Delta}\int\limits_{l\Delta}^{s}d\tau ds=$$

$$=\sum_{l=0}^{N-1}\sum_{q=0}^{l-1}\Delta\mathbf{f}_{q\Delta}^{(i_1)}\Delta\mathbf{f}_{l\Delta}^{(i_2)}+\frac{1}{2}\sum_{l=0}^{N-1}\Delta\mathbf{f}_{l\Delta}^{(i_1)}\Delta\mathbf{f}_{l\Delta}^{(i_2)}. \tag{107}$$

Using (107) it is not difficult to show that

$$\underset{N\to\infty}{\text{l.i.m.}}\int_0^T\int_0^s d\mathbf{b}_{\Delta}^{(i_1)}(\tau)d\mathbf{b}_{\Delta}^{(i_2)}(s)=\int_0^T\int_0^s d\mathbf{f}_{\tau}^{(i_1)}d\mathbf{f}_{s}^{(i_2)}+\frac{1}{2}\mathbf{1}_{\{i_1=i_2\}}\int_0^T ds=$$

$$=\int_0^{*T}\int_0^{*s} d\mathbf{f}_{\tau}^{(i_1)}d\mathbf{f}_{s}^{(i_2)}, \tag{108}$$

where $\Delta\to 0$ if $N\to\infty$ $(N\Delta=T)$.

Obviously, (108) agrees with Theorem 7.1 (see [54], p. 486).

The next example relates to the approximation of the Wiener process based on its series expansion (100) for $t=0$, where $\{\phi_j(x)\}_{j=0}^{\infty}$ is a complete orthonormal system of Legendre polynomials or trigonometric functions in the space $L_2([0,T])$.

Consider the following iterated Riemann–Stieltjes integral

$$\int_0^T\int_0^s d\mathbf{f}_{\tau}^{(i_1)p}d\mathbf{f}_{s}^{(i_2)p},\quad i_1,i_2=1,\ldots,m, \tag{109}$$

where $d\mathbf{f}_{\tau}^{(i)p}$ is defined by the relation (102).

Let us substitute (102) into (109)

$$\int_0^T\int_0^s d\mathbf{f}_{\tau}^{(i_1)p}d\mathbf{f}_{s}^{(i_2)p}=\sum_{j_1,j_2=0}^{p}C_{j_2j_1}\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}, \tag{110}$$

where

$$C_{j_2j_1}=\int\limits_0^T\phi_{j_2}(s)\int\limits_0^s\phi_{j_1}(\tau)d\tau ds$$

is the Fourier coefficient; another notations are the same as in (105).

As we noted above, approximations of the Wiener process that are similar to (101) were not considered in [52], [53] (also see Theorems 7.1, 7.2 in [54]). Furthermore, the extension of the results of Theorems 7.1 and 7.2 [54] to the case under consideration is not obvious.

On the other hand, we can apply the theory built in Chapters 1 and 2 of the monographs [18]-[20]. More precisely, using Theorem 3, we obtain from (110) the desired result

$$\text{l.i.m.}_{p\to\infty}\int\limits_0^T\int\limits_0^s d\mathbf{f}_\tau^{(i_1)p}d\mathbf{f}_s^{(i_2)p}=\text{l.i.m.}_{p\to\infty}\sum_{j_1,j_2=0}^{p}C_{j_2j_1}\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}=\int\limits_0^{*T}\int\limits_0^{*s}d\mathbf{f}_\tau^{(i_1)}d\mathbf{f}_s^{(i_2)}. \tag{111}$$

From the other hand, by Theorems 1, 2 (see (30)) for the case $k=2$ we obtain from (110) the following relation

$$\text{l.i.m.}_{p\to\infty}\int\limits_0^T\int\limits_0^s d\mathbf{f}_\tau^{(i_1)p}d\mathbf{f}_s^{(i_2)p}=\text{l.i.m.}_{p\to\infty}\sum_{j_1,j_2=0}^{p}C_{j_2j_1}\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}=$$

$$=\text{l.i.m.}_{p\to\infty}\sum_{j_1,j_2=0}^{p}C_{j_2j_1}\left(\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}-\mathbf{1}_{\{i_1=i_2\}}\mathbf{1}_{\{j_1=j_2\}}\right)+\mathbf{1}_{\{i_1=i_2\}}\sum_{j_1=0}^{\infty}C_{j_1j_1}=$$

$$=\int\limits_0^T\int\limits_0^s d\mathbf{f}_\tau^{(i_1)}d\mathbf{f}_s^{(i_2)}+\mathbf{1}_{\{i_1=i_2\}}\sum_{j_1=0}^{\infty}C_{j_1j_1}. \tag{112}$$

Since

$$\sum_{j_1=0}^{\infty}C_{j_1j_1}=\frac{1}{2}\sum_{j_1=0}^{\infty}\left(\int\limits_0^T\phi_j(\tau)d\tau\right)^2=\frac{1}{2}\left(\int\limits_0^T\phi_0(\tau)d\tau\right)^2=\frac{1}{2}\int\limits_0^T ds,$$

then from (112) we obtain (111).

DEVELOPMENT AND APPLICATION OF THE FOURIER METHOD TO THE MEAN-SQUARE APPROXIMATION OF ITERATED ITO AND STRATONOVICH STOCHASTIC INTEGRALS

DMITRIY F. KUZNETSOV

ABSTRACT. The article is devoted to the mean-square approximation of iterated Ito and Stratonovich stochastic integrals in the context of the numerical integration of Ito stochastic differential equations. The expansion of iterated Ito stochastic integrals of arbitrary multiplicity k ($k \in \mathbb{N}$) and expansions of iterated Stratonovich stochastic integrals of multiplicities 1 to 6 have been obtained. Considerable attention is paid to expansions based on multiple Fourier–Legendre series. The exact and approximate expressions for the mean-square error of approximation of iterated Ito stochastic integrals are derived. The results of the article will be useful for numerical integration of Ito stochastic differential equations with non-commutative noise.

1. Introduction

Let $(\Omega, \mathrm{F}, \mathsf{P})$ be a complete probability space, let $\{\mathrm{F}_t, t \in [0,T]\}$ be a nondecreasing right-continous family of σ-algebras of F, and let $\mathbf{f}_t$ be a standard m-dimensional Wiener stochastic process, which is F_t-measurable for any $t \in [0,T]$. We assume that the components $\mathbf{f}_t^{(i)}$ $(i = 1,\ldots,m)$ of this process are independent. Consider an Ito stochastic differential equation (SDE) in the integral form

$$\mathbf{x}_t = \mathbf{x}_0 + \int\limits_0^t \mathbf{a}(\mathbf{x}_\tau,\tau)d\tau + \int\limits_0^t B(\mathbf{x}_\tau,\tau)d\mathbf{f}_\tau, \quad \mathbf{x}_0 = \mathbf{x}(0,\omega). \tag{1}$$

Here $\mathbf{x}_t$ is some n-dimensional stochastic process satisfying to (1). The nonrandom functions $\mathbf{a}: \mathbb{R}^n \times [0,T] \to \mathbb{R}^n$, $B: \mathbb{R}^n \times [0,T] \to \mathbb{R}^{n\times m}$ guarantee the existence and uniqueness up to stochastic equivalence of a solution of the equation (1) [1]. The second integral on the right-hand side of (1) is interpreted as an Ito stochastic integral. Let $\mathbf{x}_0$ be an n-dimensional random variable, which is F_0-measurable and $\mathsf{M}\{|\mathbf{x}_0|^2\} < \infty$ (M denotes a mathematical expectation). We assume that $\mathbf{x}_0$ and $\mathbf{f}_t - \mathbf{f}_0$ are independent when $t > 0$.

It is well known [2]-[5] that Ito SDEs are adequate mathematical models of dynamic systems of different physical nature that are affected by random perturbations. For example, Ito SDEs are used as mathematical models in stochastic mathematical finance, hydrology, seismology, geophysics, chemical kinetics, population dynamics, electrodynamics, medicine and other fields [2]-[5]. Also these equations arise in optimal stochastic control, signal filtering against the background of random noises, parameter estimation for stochastic systems as well as in stochastic stability and bifurcations analysis [2], [4].

One of the effective approaches to the numerical integration of Ito SDEs is an approach based on the Taylor–Ito and Taylor–Stratonovich expansions [2]-[26]. The most important feature of such expansions is a presence in them of the so-called iterated Ito and Stratonovich stochastic integrals, which play the key role for solving the problem of numerical integration of Ito SDEs and have the following form

$$J[\psi^{(k)}]_{T,t} = \int\limits_t^T \psi_k(t_k)\ldots\int\limits_t^{t_2} \psi_1(t_1)d\mathbf{w}_{t_1}^{(i_1)}\ldots d\mathbf{w}_{t_k}^{(i_k)}, \tag{2}$$

$$J^*[\psi^{(k)}]_{T,t} = \int\limits_t^{*T} \psi_k(t_k)\ldots\int\limits_t^{*t_2} \psi_1(t_1)d\mathbf{w}_{t_1}^{(i_1)}\ldots d\mathbf{w}_{t_k}^{(i_k)}, \tag{3}$$

where every $\psi_l(\tau)$ $(l = 1,\ldots,k)$ is a nonrandom function on $[t,T]$, $\mathbf{w}_\tau^{(i)} = \mathbf{f}_\tau^{(i)}$ for $i = 1,\ldots,m$ and $\mathbf{w}_\tau^{(0)} = \tau,\ \ i_1,\ldots,i_k = 0,1,\ldots,m,$

$$\int \quad \text{and} \quad \int\limits^{*}$$

denote Ito and Stratonovich stochastic integrals, respectively (in this paper, we use the definition of the Stratonovich stochastic integral from [2]).

Note that $\psi_l(\tau) \equiv 1$ $(l = 1,\ldots,k)$ and $i_1,\ldots,i_k = 0,1,\ldots,m$ in [2]-[5]. At the same time $\psi_l(\tau) \equiv (t-\tau)^{q_l}$ $(l = 1,\ldots,k;\ q_1,\ldots,q_k = 0,1,2,\ldots)$ and $i_1,\ldots,i_k = 1,\ldots,m$ in [6]-[26].

Effective solution of the problem of combined mean-square approximation for collections of iterated Ito and Stratonovich stochastic integrals (2) and (3) composes the subject of this article (also see author's publications [9]-[54]).

We want to mention in short that there are two main criteria of the numerical methods convergence for Ito SDEs [2]-[5]: a strong or mean-square criterion and a weak criterion, where the subject of approximation is not the solution of Ito SDE, simply stated, but the distribution of Ito SDE solution.

Using the strong numerical methods, we can build sample pathes of Ito SDEs numerically. That is why strong numerical methods are using when constructing new mathematical models on the basis of Ito SDEs. Moreover, these methods are the tool for the numerical solution of different mathematical problems connected with Ito SDEs (see above) [2]-[5].

Strong numerical methods for Ito SDEs require the combined mean-square approximation of collections of iterated Ito and Stratonovich stochastic integrals (2) and (3). The problem of effective jointly numerical modeling (with respect to the mean-square criterion of convergence) of iterated Ito and Stratonovich stochastic integrals (2) and (3) is complex from both theoretical and computational points of view [2]-[59].

The only exception is connected with a narrow particular case, when $i_1 = \ldots = i_k \neq 0$ and $\psi_1(\tau), \ldots, \psi_k(\tau) \equiv \psi(\tau)$. This case allows the investigation with using of the Ito formula [2]-[5].

Note that even for the mentioned coincidence ($i_1 = \ldots = i_k \neq 0$), but for different functions $\psi_1(\tau), \ldots, \psi_k(\tau)$ the mentioned difficulties persist. As a result, relatively simple families of iterated Ito and Stratonovich stochastic integrals, which can be often met in the applications, cannot be expressed effectively in a finite form (with respect to the mean-square criterion of approximation) using the system of standard Gaussian random variables.

Why the problem of the mean-square approximation of iterated Ito and Stratonovich stochastic integrals is so complex?

Firstly, the mentioned stochastic integrals (in the case of fixed limits of integration) are the random variables, whose density functions are unknown in the general case. The exception is connected with the narrow particular case which is the simplest iterated Ito stochastic integral (2) with multiplicity 2 and $\psi_1(\tau), \psi_2(\tau) \equiv 1$, $i_1, i_2 = 1, \ldots, m$. Nevertheless, the knowledge of this density function not gives a simple way for approximation of iterated Ito stochastic integral (2) of multiplicity 2 [55].

Secondly, we need to approximate not only one stochastic integral, but several iterated stochastic integrals which are complexly dependent in a probabilistic meaning.

Often, the problem of combined mean-square approximation of iterated Ito and Stratonovich stochastic integrals occurs even in cases when the exact solution of Ito SDE is known. It means that even if we know the solution of Ito SDE, we cannot model it numerically without the combined numerical modeling of iterated Ito and Stratonovich stochastic integrals.

Note that for a number of special types of Ito SDEs the problem of the mean-square approximation of iterated Ito and Stratonovich stochastic integrals can be simplified but cannot be solved. The equations with additive vector noise, with scalar additive noise, with scalar non-additive noise, with a small parameter are related to such types of equations [2]-[5].

For the mentioned types of equations, simplifications are connected to the fact that some members from stochastic Taylor expansions are equal to zero or we may neglect some members from these expansions due to the presence of a small parameter [2]-[5].

Seems that iterated stochastic integrals may be approximated by multiple integral sums of different types [3], [5], [56]. However, this approach implies the partitioning of the interval of integration $[t, T]$ for iterated stochastic integrals. The length $T - t$ of this interval is already fairly small (because it is a step of integration of numerical methods for Ito SDEs) and does not need to be partitioned. Computational experiments show that the application of numerical simulation for iterated stochastic integrals (in which the interval of integration $[t, T]$ is partitioned) leads to unacceptably high computational cost and accumulation of computation errors [9].

In [3] (also see [2], [4], [5], [57], [60]), Milstein G.N. proposed to expand (2) or (3) into the iterated series of products of standard Gaussian random variables by representing the Wiener process as a trigonometric Fourier series with random coefficients (version of the so-called Karhunen–Loeve expansion of the Brownian bridge process). To obtain the Milstein expansion of (3), the truncated Fourier expansions of components of the multidimensional Wiener process $\mathbf{f}_s$ must be iteratively substituted in the single integrals, and the integrals must be calculated, starting from the innermost integral. This is a complicated procedure that does not lead to a general expansion of (3) valid for an arbitrary multiplicity k. For this reason, only expansions of single, double and triple stochastic integrals (3) were obtained [2], [4], [57], [60] ($k = 1, 2, 3$), [3], [5] ($k = 1, 2$) for the case $\psi_1(\tau), \psi_2(\tau), \psi_3(\tau) \equiv 1$; $i_1, i_2, i_3 = 0, 1, \ldots, m$.

It should be noted that the authors of the publications [2] (Sect. 5.8, pp. 202–204), [4] (pp. 82-84), [57] (pp. 438-439), [60] (pp. 263-264) use the Wong–Zakai approximation [61]-[63] (without rigorous proof) within the frames of the mentioned approach [3] based on the approximation of the Wiener process in the form of its series expansion (see discussion in Sect. 7 for detail).

Note that in [58], [59] the truncated expansions of the Wiener processes based on the Haar functions [59] and trigonometric functions [58], [59] were applied for the expansion of double [58], [59] and triple [58] Ito stochastic integrals (2). The expansions from [58], [59] also lead to iterated application of the operation of limit transition as in the Milstein approach [3].

It is necessary to note that the Milstein approach [3] excelled at least in several times (or even in several orders) the methods of multiple integral sums [3], [5], [56] considering computational costs in the sense of their diminishing [3], [5], [9].

An alternative and more general strong approximation method was proposed for (3) in [47] (also see [6], [13]-[18], [21], [23]-[26]). In these papers $J^*[\psi^{(k)}]_{T,t}$ was represented as the multiple stochastic integral of the certain discontinuous nonrandom function of k ($k \in \mathbb{N}$) variables, and the function was then expanded into the generalized iterated Fourier series by complete system of continuously differentiable functions that are orthonormal in the space $L_2([t, T])$. As a result, the general iterated series expansion of products of standard Gaussian random variables was obtained in [47] (also see [6], [13]-[18], [21], [23]-[26]) for the iterated Stratonovich stochastic integrals (3) of arbitrary multiplicity k ($k \in \mathbb{N}$). Hereinafter, this method is referred to as the method of generalized iterated Fourier series.

Consider the formulation of the method of generalized iterated Fourier series. Let us introduce the following function $K(t_1, \ldots, t_k)$ defined on the k-dimensional hypercube $[t, T]^k$

$$K(t_1, \ldots, t_k) = \begin{cases} \psi_1(t_1) \ldots \psi_k(t_k), & t_1 < \ldots < t_k \\ \\ 0, & \text{otherwise} \end{cases} = \prod_{l=1}^{k} \psi_l(t_l) \prod_{l=1}^{k-1} \mathbf{1}_{\{t_l < t_{l+1}\}}, \tag{4}$$

where $t_1, \ldots, t_k \in [t, T]$ ($k \ge 2$) and $K(t_1) \equiv \psi_1(t_1)$ for $t_1 \in [t, T]$. Here $\psi_1(\tau), \ldots, \psi_k(\tau) \in L_2([t, T])$ and $\mathbf{1}_A$ denotes the indicator of the set A.

Theorem 1 [47] (1997), [6], [13]-[18], [21], [23]-[26]. *Suppose that every $\psi_l(\tau)$ ($l = 1, \ldots, k$) is a continuously differentiable function at the interval $[t, T]$ and $\{\phi_j(x)\}_{j=0}^{\infty}$ is a complete orthonormal system of Legendre polynomials or trigonometric functions in the space $L_2([t, T])$. Then, the iterated Stratonovich stochastic integral (3) is expanded into the converging in the mean of degree $2n$ ($n \in \mathbb{N}$) iterated series*

$$J^*[\psi^{(k)}]_{T,t} = \sum_{j_1=0}^{\infty} \ldots \sum_{j_k=0}^{\infty} C_{j_k \ldots j_1} \prod_{l=1}^{k} \zeta_{j_l}^{(i_l)}, \tag{5}$$

which means the following

$$\lim_{p_1\to\infty}\overline{\lim_{p_2\to\infty}}\ldots\overline{\lim_{p_k\to\infty}}\ \mathsf{M}\left\{\left(J^*[\psi^{(k)}]_{T,t}-\sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k}C_{j_k\ldots j_1}\prod_{l=1}^{k}\zeta_{j_l}^{(i_l)}\right)^{2n}\right\}=0, \tag{6}$$

where $\overline{\lim}$ *means* $\limsup$,

$$\zeta_j^{(i)}=\int\limits_t^T\phi_j(\tau)d\mathbf{w}_\tau^{(i)} \tag{7}$$

are independent standard Gaussian random variables for various i or j (if $i\neq 0$) and

$$C_{j_k\ldots j_1}=\int\limits_{[t,T]^k}K(t_1,\ldots,t_k)\prod_{l=1}^{k}\phi_{j_l}(t_l)dt_1\ldots dt_k \tag{8}$$

is the Fourier coefficient.

The proof of Theorem 1 is based on the following statement.

Lemma 1 [47] (also see [6], [13]-[18], [21], [23]-[26]). *Under the conditions of Theorem* 1 *the function $K^*(t_1,\ldots,t_k)$ is represented in any internal point of the hypercube $[t,T]^k$ by the generalized iterated Fourier series*

$$K^*(t_1,\ldots,t_k)=\sum_{j_1=0}^{\infty}\ldots\sum_{j_k=0}^{\infty}C_{j_k\ldots j_1}\prod_{l=1}^{k}\phi_{j_l}(t_l),\quad (t_1,\ldots,t_k)\in(t,T)^k, \tag{9}$$

where

$$K^*(t_1,\ldots,t_k)=\prod_{l=1}^{k}\psi_l(t_l)\prod_{l=1}^{k-1}\left(\mathbf{1}_{\{t_l<t_{l+1}\}}+\frac{1}{2}\mathbf{1}_{\{t_l=t_{l+1}\}}\right)=$$

$$=\prod_{l=1}^{k}\psi_l(t_l)\left(\prod_{l=1}^{k-1}\mathbf{1}_{\{t_l<t_{l+1}\}}+\sum_{r=1}^{k-1}\frac{1}{2^r}\sum_{\substack{s_r,\ldots,s_1=1\\ s_r>\ldots>s_1}}^{k-1}\prod_{l=1}^{r}\mathbf{1}_{\{t_{s_l}=t_{s_l+1}\}}\prod_{\substack{l=1\\ l\neq s_1,\ldots,s_r}}^{k-1}\mathbf{1}_{\{t_l<t_{l+1}\}}\right)$$

for $t_1,\ldots,t_k\in[t,T]$ $(k\geq 2)$ and $K^*(t_1)\equiv\psi_1(t_1)$ for $t_1\in[t,T]$, $\mathbf{1}_A$ is the indicator of the set A, the Fourier coefficient $C_{j_k\ldots j_1}$ has the form (8). *At that, the iterated series* (9) *converges at the boundary of the hypercube $[t,T]^k$ (not necessarily to the function $K^*(t_1,\ldots,t_k)$).*

In [6], [13]-[18], [21], [23]-[26], [47] it was shown that the method of generalized iterated Fourier series leads for $k=2$ and $\psi_1(\tau)$, $\psi_2(\tau)\equiv 1$ (the case of trigonometric system of functions) to the Milstein expansion of (3) [3].

As we noted above, the method of generalized iterated Fourier series as well as the method from [3] lead to iterated application of the operation of limit transition. So, the convergence problem of the following approximation

$$J^*[\psi^{(k)}]_{T,t}^p=\sum_{j_1,\ldots,j_k=0}^{p}C_{j_k\ldots j_1}\prod_{l=1}^{k}\zeta_{j_l}^{(i_l)} \tag{10}$$

to $J^*[\psi^{(k)}]_{T,t}$ if $p \to \infty$ in the mean-square sense must be considered separately (see Sect. 2 and discussion in Sect. 7 for detail). The mentioned problem appears for triple stochastic integrals or even for some double stochastic integrals in the case, when $\psi_1(\tau),\ \psi_2(\tau) \not\equiv 1$ (see above).

2. Method of the Mean-Square Approximation of Iterated Ito Stochastic Integrals Based on Generalized Multiple Fourier Series

In the previous section we paid attention on the fact that the method from [3] and the method of generalized iterated Fourier series [6], [13]-[18], [21], [23]-[26], [47] lead to iterated application of the operation of limit transition. So these methods may not converge in the mean-square sense to the appropriate iterated stochastic integrals (3) for some methods of series summation (see (10)).

The difficulties noted above can be overcome by the another method. The idea of this method is as follows: the iterated Ito stochastic integral (2) of multiplicity k ($k \in \mathbb{N}$) is represented as the multiple stochastic integral from the nonrandom discontinuous function $K(t_1,\ldots,t_k)$ defined on the hypercube $[t,T]^k$ by the relation (4), where $[t,T]$ is the interval of integration of the iterated Ito stochastic integral. Then, the function $K(t_1,\ldots,t_k)$ is expanded in the hypercube $[t,T]^k$ into the generalized multiple Fourier series converging in the sense of norm in Hilbert space $L_2([t,T]^k)$. After a number of nontrivial transformations we come (see Theorems 2–4 below) to the mean-square convergening expansion of the iterated Ito stochastic integral (2) into the multiple series of products of standard Gaussian random variables. The coefficients of this series are the coefficients of the generalized multiple Fourier series for the function $K(t_1,\ldots,t_k)$, which can be calculated using the explicit formula regardless of multiplicity k of the iterated Ito stochastic integral. Hereinafter, this method is referred to as the method of generalized multiple Fourier series.

Suppose that $\{\phi_j(x)\}_{j=0}^{\infty}$ is a complete orthonormal system of functions in the space $L_2([t,T])$. The function $K(t_1,\ldots,t_k)$ (defined by (4)) belongs to the space $L_2([t,T]^k)$. At this situation it is well known that the generalized multiple Fourier series of $K(t_1,\ldots,t_k) \in L_2([t,T]^k)$ is converging to $K(t_1,\ldots,t_k)$ in the hypercube $[t,T]^k$ in the mean-square sense, i.e.

$$\lim_{p_1,\ldots,p_k\to\infty}\left\|K(t_1,\ldots,t_k)-\sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k}C_{j_k\ldots j_1}\prod_{l=1}^{k}\phi_{j_l}(t_l)\right\|_{L_2([t,T]^k)}=0, \tag{11}$$

where

$$C_{j_k\ldots j_1}=\int\limits_{[t,T]^k}K(t_1,\ldots,t_k)\prod_{l=1}^{k}\phi_{j_l}(t_l)dt_1\ldots dt_k \tag{12}$$

is the Fourier coefficient, and

$$\|f\|_{L_2([t,T]^k)}=\left(\int\limits_{[t,T]^k}f^2(t_1,\ldots,t_k)dt_1\ldots dt_k\right)^{1/2}.$$

Consider the partition $\{\tau_j\}_{j=0}^{N}$ of $[t,T]$ such that

$$t=\tau_0<\ldots<\tau_N=T,\quad \Delta_N=\max_{0\le j\le N-1}\Delta\tau_j\to 0\ \text{ if }\ N\to\infty,\quad \Delta\tau_j=\tau_{j+1}-\tau_j. \tag{13}$$

Theorem 2 [9] (2006), [10], [21], [23]-[46]. *Suppose that every $\psi_l(\tau)$ $(l=1,\ldots,k)$ is a continuous function on $[t,T]$ and $\{\phi_j(x)\}_{j=0}^{\infty}$ is a complete orthonormal system of continuous functions in the space $L_2([t,T])$. Then*

$$J[\psi^{(k)}]_{T,t} = \underset{p_1,\ldots,p_k\to\infty}{\text{l.i.m.}} \sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k} C_{j_k\ldots j_1}\Biggl(\prod_{l=1}^{k}\zeta_{j_l}^{(i_l)} -$$

$$- \underset{N\to\infty}{\text{l.i.m.}} \sum_{(l_1,\ldots,l_k)\in \mathrm{G}_k} \phi_{j_1}(\tau_{l_1})\Delta\mathbf{w}_{\tau_{l_1}}^{(i_1)}\ldots\phi_{j_k}(\tau_{l_k})\Delta\mathbf{w}_{\tau_{l_k}}^{(i_k)}\Biggr), \quad (14)$$

where

$$\mathrm{G}_k=\mathrm{H}_k\backslash\mathrm{L}_k,\quad \mathrm{H}_k=\{(l_1,\ldots,l_k):\ l_1,\ldots,l_k=0,\ 1,\ldots,N-1\},$$

$$\mathrm{L}_k=\{(l_1,\ldots,l_k):\ l_1,\ldots,l_k=0,\ 1,\ldots,N-1;\ l_g\ne l_r\ (g\ne r);\ g,r=1,\ldots,k\},$$

l.i.m. *is a limit in the mean-square sense, $i_1,\ldots,i_k=0,1,\ldots,m$,*

$$\zeta_j^{(i)}=\int\limits_t^T \phi_j(\tau)d\mathbf{w}_\tau^{(i)} \quad (15)$$

are independent standard Gaussian random variables for various i or j (if $i\ne 0$), $C_{j_k\ldots j_1}$ is the Fourier coefficient (12), $\Delta\mathbf{w}_{\tau_j}^{(i)}=\mathbf{w}_{\tau_{j+1}}^{(i)}-\mathbf{w}_{\tau_j}^{(i)}$ $(i=0,\ 1,\ldots,m)$, $\{\tau_j\}_{j=0}^{N}$ *is a partition of $[t,T]$, which satisfies the condition* (13).

Proof. The proof of Theorem 2 is based on Lemmas 5.1–5.3 [23] (P. A.253–A.259), Lemmas 1.1–1.3 [24]-[26] or Lemmas 1–3 [34]. According to Lemma 5.1 [23], Lemma 1.1 [24]-[26] or Lemma 1 [34], we have

$$J[\psi^{(k)}]_{T,t}=\underset{N\to\infty}{\text{l.i.m.}}\sum_{l_k=0}^{N-1}\ldots\sum_{l_1=0}^{l_2-1}\psi_1(\tau_{l_1})\ldots\psi_k(\tau_{l_k})\Delta\mathbf{w}_{\tau_{l_1}}^{(i_1)}\ldots\Delta\mathbf{w}_{\tau_{l_k}}^{(i_k)}=$$

$$=\underset{N\to\infty}{\text{l.i.m.}}\sum_{l_k=0}^{N-1}\ldots\sum_{l_1=0}^{l_2-1}K(\tau_{l_1},\ldots,\tau_{l_k})\Delta\mathbf{w}_{\tau_{l_1}}^{(i_1)}\ldots\Delta\mathbf{w}_{\tau_{l_k}}^{(i_k)}=$$

$$=\underset{N\to\infty}{\text{l.i.m.}}\sum_{l_k=0}^{N-1}\ldots\sum_{l_1=0}^{N-1}K(\tau_{l_1},\ldots,\tau_{l_k})\Delta\mathbf{w}_{\tau_{l_1}}^{(i_1)}\ldots\Delta\mathbf{w}_{\tau_{l_k}}^{(i_k)}=$$

$$=\underset{N\to\infty}{\text{l.i.m.}}\sum_{\substack{l_1,\ldots,l_k=0\\ l_q\ne l_r;\ q\ne r;\ q,r=1,\ldots,k}}^{N-1}K(\tau_{l_1},\ldots,\tau_{l_k})\Delta\mathbf{w}_{\tau_{l_1}}^{(i_1)}\ldots\Delta\mathbf{w}_{\tau_{l_k}}^{(i_k)}=$$

$$
= \int\limits_t^T \ldots \int\limits_t^{t_2} \sum_{(t_1,\ldots,t_k)} \Bigl(K(t_1,\ldots,t_k) d\mathbf{w}_{t_1}^{(i_1)} \ldots d\mathbf{w}_{t_k}^{(i_k)} \Bigr), \tag{16}
$$

where permutations $(t_1,\ldots,t_k)$ when summing are performed only in the expression, which is enclosed in parentheses.

It is easy to see that (16) can be written in the form [23]-[26], [34]

$$
J[\psi^{(k)}]_{T,t} = \sum_{(t_1,\ldots,t_k)} \int\limits_t^T \ldots \int\limits_t^{t_2} K(t_1,\ldots,t_k) d\mathbf{w}_{t_1}^{(i_1)} \ldots d\mathbf{w}_{t_k}^{(i_k)},
$$

where permutations $(t_1,\ldots,t_k)$ when summing are performed only in the values $d\mathbf{w}_{t_1}^{(i_1)} \ldots d\mathbf{w}_{t_k}^{(i_k)}$. At the same time the indexes near upper limits of integration in the iterated stochastic integrals are changed correspondently and if t_r swapped with t_q in the permutation $(t_1,\ldots,t_k)$, then i_r swapped with i_q in the permutation $(i_1,\ldots,i_k)$.

Since the integration of bounded function with respect to the set of measure zero for Riemann or Lebesgue integrals gives zero result, then the following formula is correct for these integrals

$$
\int\limits_{[t,T]^k} |G(t_1,\ldots,t_k)| dt_1 \ldots dt_k = \sum_{(t_1,\ldots,t_k)} \int\limits_t^T \ldots \int\limits_t^{t_2} |G(t_1,\ldots,t_k)| dt_1 \ldots dt_k, \tag{17}
$$

where permutations $(t_1,\ldots,t_k)$ when summing are performed only in the values $dt_1,\ldots,dt_k$. At the same time the indexes near upper limits of integration are changed correspondently and the function $|G(t_1,\ldots,t_k)|$ is supposed as integrated in the hypercube $[t,T]^k$.

According to Lemmas 5.1–5.3 [23] (P. A.253–A.259), Lemmas 1.1–1.3 [24]-[26] or Lemmas 1–3 [34], we get the following representation

$$
J[\psi^{(k)}]_{T,t} = \sum_{j_1=0}^{p_1} \ldots \sum_{j_k=0}^{p_k} C_{j_k\ldots j_1} \int\limits_t^T \ldots \int\limits_t^{t_2} \sum_{(t_1,\ldots,t_k)} \Bigl(\phi_{j_1}(t_1) \ldots \phi_{j_k}(t_k) d\mathbf{w}_{t_1}^{(i_1)} \ldots d\mathbf{w}_{t_k}^{(i_k)} \Bigr) +
$$

$$
+ R_{T,t}^{p_1,\ldots,p_k} =
$$

$$
= \sum_{j_1=0}^{p_1} \ldots \sum_{j_k=0}^{p_k} C_{j_k\ldots j_1} \underset{N\to\infty}{\text{l.i.m.}} \sum_{\substack{l_1,\ldots,l_k=0\\ l_q\ne l_r;\ q\ne r;\ q,r=1,\ldots,k}}^{N-1} \phi_{j_1}(\tau_{l_1}) \ldots \phi_{j_k}(\tau_{l_k}) \Delta\mathbf{w}_{\tau_{l_1}}^{(i_1)} \ldots \Delta\mathbf{w}_{\tau_{l_k}}^{(i_k)} +
$$

$$
+ R_{T,t}^{p_1,\ldots,p_k} = \tag{18}
$$

$$
= \sum_{j_1=0}^{p_1} \ldots \sum_{j_k=0}^{p_k} C_{j_k\ldots j_1} \Biggl(\underset{N\to\infty}{\text{l.i.m.}} \sum_{l_1,\ldots,l_k=0}^{N-1} \phi_{j_1}(\tau_{l_1}) \ldots \phi_{j_k}(\tau_{l_k}) \Delta\mathbf{w}_{\tau_{l_1}}^{(i_1)} \ldots \Delta\mathbf{w}_{\tau_{l_k}}^{(i_k)} -
$$

$$-\underset{N\to\infty}{\text{l.i.m.}}\sum_{(l_1,\ldots,l_k)\in\mathrm{G}_k}\phi_{j_1}(\tau_{l_1})\Delta\mathbf{w}_{\tau_{l_1}}^{(i_1)}\ldots\phi_{j_k}(\tau_{l_k})\Delta\mathbf{w}_{\tau_{l_k}}^{(i_k)}\Biggr)+$$

$$+R_{T,t}^{p_1,\ldots,p_k}=$$

$$=\sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k}C_{j_k\ldots j_1}\left(\prod_{l=1}^{k}\zeta_{j_l}^{(i_l)}-\underset{N\to\infty}{\text{l.i.m.}}\sum_{(l_1,\ldots,l_k)\in\mathrm{G}_k}\phi_{j_1}(\tau_{l_1})\Delta\mathbf{w}_{\tau_{l_1}}^{(i_1)}\ldots\phi_{j_k}(\tau_{l_k})\Delta\mathbf{w}_{\tau_{l_k}}^{(i_k)}\right)+$$

$$+R_{T,t}^{p_1,\ldots,p_k}\quad\text{w. p. 1,}\tag{19}$$

where

$$R_{T,t}^{p_1,\ldots,p_k}=$$

$$=\sum_{(t_1,\ldots,t_k)}\int\limits_t^T\ldots\int\limits_t^{t_2}\left(K(t_1,\ldots,t_k)-\sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k}C_{j_k\ldots j_1}\prod_{l=1}^{k}\phi_{j_l}(t_l)\right)d\mathbf{w}_{t_1}^{(i_1)}\ldots d\mathbf{w}_{t_k}^{(i_k)},\tag{20}$$

where permutations $(t_1,\ldots,t_k)$ when summing are performed only in the values $d\mathbf{w}_{t_1}^{(i_1)}\ldots d\mathbf{w}_{t_k}^{(i_k)}$. At the same time the indexes near upper limits of integration in the iterated stochastic integrals are changed correspondently and if t_r swapped with t_q in the permutation $(t_1,\ldots,t_k)$, then i_r swapped with i_q in the permutation $(i_1,\ldots,i_k)$.

Let us estimate the remainder $R_{T,t}^{p_1,\ldots,p_k}$ of the series.

By Lemma 5.2 [23] (pp. A.257–A.258), Lemma 1.2 [24]-[26] or Lemma 2 [34] we have (see (17))

$$\mathsf{M}\left\{\left(R_{T,t}^{p_1,\ldots,p_k}\right)^2\right\}\le$$

$$\le C_k\sum_{(t_1,\ldots,t_k)}\int\limits_t^T\ldots\int\limits_t^{t_2}\left(K(t_1,\ldots,t_k)-\sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k}C_{j_k\ldots j_1}\prod_{l=1}^{k}\phi_{j_l}(t_l)\right)^2dt_1\ldots dt_k=$$

$$=C_k\int\limits_{[t,T]^k}\left(K(t_1,\ldots,t_k)-\sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k}C_{j_k\ldots j_1}\prod_{l=1}^{k}\phi_{j_l}(t_l)\right)^2dt_1\ldots dt_k\to 0\tag{21}$$

if $p_1,\ldots,p_k\to\infty$, where constant C_k depends only on the multiplicity k of the iterated Ito stochastic integral. Theorem 2 is proved.

In order to evaluate the significance of Theorem 2 for practice we will demonstrate its transformed particular cases for $k=1,\ldots,6$ [9]-[21], [23]-[46]

$$J[\psi^{(1)}]_{T,t} = \underset{p_1\to\infty}{\text{l.i.m.}} \sum_{j_1=0}^{p_1} C_{j_1}\zeta_{j_1}^{(i_1)}, \tag{22}$$

$$J[\psi^{(2)}]_{T,t} = \underset{p_1,p_2\to\infty}{\text{l.i.m.}} \sum_{j_1=0}^{p_1}\sum_{j_2=0}^{p_2} C_{j_2j_1}\Biggl(\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)} - \mathbf{1}_{\{i_1=i_2\ne 0\}}\mathbf{1}_{\{j_1=j_2\}}\Biggr), \tag{23}$$

$$J[\psi^{(3)}]_{T,t} = \underset{p_1,\ldots,p_3\to\infty}{\text{l.i.m.}} \sum_{j_1=0}^{p_1}\sum_{j_2=0}^{p_2}\sum_{j_3=0}^{p_3} C_{j_3j_2j_1}\Biggl(\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}\zeta_{j_3}^{(i_3)} -$$
$$-\mathbf{1}_{\{i_1=i_2\ne 0\}}\mathbf{1}_{\{j_1=j_2\}}\zeta_{j_3}^{(i_3)} - \mathbf{1}_{\{i_2=i_3\ne 0\}}\mathbf{1}_{\{j_2=j_3\}}\zeta_{j_1}^{(i_1)} - \mathbf{1}_{\{i_1=i_3\ne 0\}}\mathbf{1}_{\{j_1=j_3\}}\zeta_{j_2}^{(i_2)}\Biggr), \tag{24}$$

where $\mathbf{1}_A$ is the indicator of the set A.

The convergence in the mean of degree $2n$ ($n\in\mathbb{N}$) in Theorem 2 is proved in [11]-[18], [21], [23]-[26], [34]. Moreover, the complete orthonormal systems of Haar and Rademacher–Walsh functions in the space $L_2([t,T])$ also can be applied in Theorem 2 [11]-[18], [21], [23]-[26], [34]. The convergence w. p. 1 in Theorem 2 is proved in [24]-[26], [28], [33], [42] for complete orthonormal systems of Legendre polynomials and trigonometric functions in the space $L_2([t,T])$. The modifications of Theorem 2 were obtained in [23]-[26], [35] for complete orthonormal with weight $r(t_1)\ldots r(t_k)\ge 0$ systems of functions in the space $L_2([t,T]^k)$ ($k\in\mathbb{N}$) as well as for some other types of iterated stochastic integrals (iterated stochastic integrals with respect to martingale Poisson measures and iterated stochastic integrals with respect to martingales). Application of Theorem 2 and Theorem 4 (see below) for the mean-square approximation of iterated stochastic integrals with respect to the infinite-dimensional Q-Wiener process can be found in the monographs [24]-[26] (Chapter 7) and in [43]-[46].

Note that the correctness of formulas (22)–(27) can be verified by the fact that if $i_1=\ldots=i_6=i=1,\ldots,m$ and $\psi_1(\tau),\ldots,\psi_6(\tau)\equiv\psi(\tau)$, then we can derive from (22)–(27) the well known equalities

$$J[\psi^{(1)}]_{T,t}=\frac{1}{1!}\delta_{T,t},$$

$$J[\psi^{(2)}]_{T,t}=\frac{1}{2!}\left(\delta_{T,t}^2-\Delta_{T,t}\right),$$

$$J[\psi^{(3)}]_{T,t}=\frac{1}{3!}\left(\delta_{T,t}^3-3\delta_{T,t}\Delta_{T,t}\right),$$

$$J[\psi^{(4)}]_{T,t}=\frac{1}{4!}\left(\delta_{T,t}^4-6\delta_{T,t}^2\Delta_{T,t}+3\Delta_{T,t}^2\right),$$

$$J[\psi^{(5)}]_{T,t}=\frac{1}{5!}\left(\delta_{T,t}^5-10\delta_{T,t}^3\Delta_{T,t}+15\delta_{T,t}\Delta_{T,t}^2\right),$$

$$J[\psi^{(6)}]_{T,t} = \frac{1}{6!}\left(\delta^6_{T,t} - 15\delta^4_{T,t}\Delta_{T,t} + 45\delta^2_{T,t}\Delta^2_{T,t} - 15\Delta^3_{T,t}\right)$$

w. p. 1 [9]-[18], [21]-[26], where

$$\delta_{T,t} = \int\limits_t^T \psi(\tau) d\mathbf{f}^{(i)}_\tau, \quad \Delta_{T,t} = \int\limits_t^T \psi^2(\tau) d\tau.$$

Note that the mentioned equalities can be independently obtained using the Ito formula and Hermite polynomials.

For further consideration, let us consider the generalization of formulas (22)–(27) for the case of an arbitrary multiplicity k ($k \in \mathbb{N}$) of the iterated Ito stochastic integral $J[\psi^{(k)}]_{T,t}$ defined by (2). In order to do this, let us introduce some notations. Consider the unordered set $\{1, 2, \ldots, k\}$ and separate it into two parts: the first part consists of r unordered pairs (sequence order of these pairs is also unimportant) and the second one consists of the remaining $k - 2r$ numbers. So, we have

$$(\{\underbrace{\{g_1, g_2\}, \ldots, \{g_{2r-1}, g_{2r}\}}_{\text{part 1}}\}, \{\underbrace{q_1, \ldots, q_{k-2r}}_{\text{part 2}}\}), \tag{28}$$

where

$$\{g_1, g_2, \ldots, g_{2r-1}, g_{2r}, q_1, \ldots, q_{k-2r}\} = \{1, 2, \ldots, k\},$$

braces mean an unordered set, and parentheses mean an ordered set.

We will say that (28) is a partition and consider the sum with respect to all possible partitions

$$\sum_{\substack{(\{\{g_1,g_2\},\ldots,\{g_{2r-1},g_{2r}\}\},\{q_1,\ldots,q_{k-2r}\})\\ \{g_1,g_2,\ldots,g_{2r-1},g_{2r},q_1,\ldots,q_{k-2r}\}=\{1,2,\ldots,k\}}} a_{g_1g_2,\ldots,g_{2r-1}g_{2r},q_1\ldots q_{k-2r}}. \tag{29}$$

Below there are several examples of sums in the form (29)

$$\sum_{\substack{(\{g_1,g_2\})\\ \{g_1,g_2\}=\{1,2\}}} a_{g_1g_2} = a_{12},$$

$$\sum_{\substack{(\{\{g_1,g_2\},\{g_3,g_4\}\})\\ \{g_1,g_2,g_3,g_4\}=\{1,2,3,4\}}} a_{g_1g_2g_3g_4} = a_{1234} + a_{1324} + a_{2314},$$

$$\sum_{\substack{(\{g_1,g_2\},\{q_1,q_2\})\\ \{g_1,g_2,q_1,q_2\}=\{1,2,3,4\}}} a_{g_1g_2,q_1q_2} =$$

$$= a_{12,34} + a_{13,24} + a_{14,23} + a_{23,14} + a_{24,13} + a_{34,12},$$

$$\sum_{\substack{(\{g_1,g_2\},\{q_1,q_2,q_3\})\\ \{g_1,g_2,q_1,q_2,q_3\}=\{1,2,3,4,5\}}} a_{g_1g_2,q_1q_2q_3} =$$

$$
= a_{12,345} + a_{13,245} + a_{14,235} + a_{15,234} + a_{23,145} + a_{24,135} +
$$
$$
+ a_{25,134} + a_{34,125} + a_{35,124} + a_{45,123},
$$

$$
\sum_{\substack{(\{\{g_1,g_2\},\{g_3,g_4\}\},\{q_1\})\\ \{g_1,g_2,g_3,g_4,q_1\}=\{1,2,3,4,5\}}} a_{g_1g_2,g_3g_4,q_1} =
$$

$$
= a_{12,34,5} + a_{13,24,5} + a_{14,23,5} + a_{12,35,4} + a_{13,25,4} + a_{15,23,4} +
$$
$$
+ a_{12,54,3} + a_{15,24,3} + a_{14,25,3} + a_{15,34,2} + a_{13,54,2} + a_{14,53,2} +
$$
$$
+ a_{52,34,1} + a_{53,24,1} + a_{54,23,1}.
$$

Now, we can formulate Theorem 2 (see (14)) using the alternative form.

Theorem 3 [12] (2009) (also see [13]-[18], [21], [23]-[26]. *Under the conditions of Theorem* 2 *the following expansion*

$$
J[\psi^{(k)}]_{T,t} = \underset{p_1,\ldots,p_k\to\infty}{\text{l.i.m.}} \sum_{j_1=0}^{p_1} \ldots \sum_{j_k=0}^{p_k} C_{j_k\ldots j_1} \Biggl(\prod_{l=1}^{k} \zeta_{j_l}^{(i_l)} + \sum_{r=1}^{[k/2]} (-1)^r \times
$$

$$
\times \sum_{\substack{(\{\{g_1,g_2\},\ldots,\{g_{2r-1},g_{2r}\}\},\{q_1,\ldots,q_{k-2r}\})\\ \{g_1,g_2,\ldots,g_{2r-1},g_{2r},q_1,\ldots,q_{k-2r}\}=\{1,2,\ldots,k\}}} \prod_{s=1}^{r} \mathbf{1}_{\{i_{g_{2s-1}}=\ i_{g_{2s}}\neq 0\}} \mathbf{1}_{\{j_{g_{2s-1}}=\ j_{g_{2s}}\}} \prod_{l=1}^{k-2r} \zeta_{j_{q_l}}^{(i_{q_l})} \Biggr) \tag{30}
$$

converging in the mean-square sense is valid, where $[x]$ *is an integer part of a real number* x; *another notations are the same as in Theorem* 2.

In particular, from (30) for $k=5$ we obtain

$$
J[\psi^{(5)}]_{T,t} = \underset{p_1,\ldots,p_5\to\infty}{\text{l.i.m.}} \sum_{j_1=0}^{p_1} \ldots \sum_{j_5=0}^{p_5} C_{j_5\ldots j_1} \Biggl(\prod_{l=1}^{5} \zeta_{j_l}^{(i_l)} -
$$

$$
- \sum_{\substack{(\{g_1,g_2\},\{q_1,q_2,q_3\})\\ \{g_1,g_2,q_1,q_2,q_3\}=\{1,2,3,4,5\}}} \mathbf{1}_{\{i_{g_1}=\ i_{g_2}\neq 0\}} \mathbf{1}_{\{j_{g_1}=\ j_{g_2}\}} \prod_{l=1}^{3} \zeta_{j_{q_l}}^{(i_{q_l})} +
$$

$$
+ \sum_{\substack{(\{\{g_1,g_2\},\{g_3,g_4\}\},\{q_1\})\\ \{g_1,g_2,g_3,g_4,q_1\}=\{1,2,3,4,5\}}} \mathbf{1}_{\{i_{g_1}=\ i_{g_2}\neq 0\}} \mathbf{1}_{\{j_{g_1}=\ j_{g_2}\}} \mathbf{1}_{\{i_{g_3}=\ i_{g_4}\neq 0\}} \mathbf{1}_{\{j_{g_3}=\ j_{g_4}\}} \zeta_{j_{q_1}}^{(i_{q_1})} \Biggr).
$$

The last equality obviously agrees with (26).

3. A Generalization of Theorems 2, 3 to the Case of an Arbitrary Complete Orthonormal System of Functions in the Space $L_2([t,T])$ and $\psi_1(\tau), \ldots, \psi_k(\tau) \in L_2([t,T])$

In this section, we will use the definition of the multiple Wiener stochastic integral from [64], [65] to generalize Theorems 2, 3 to the case of an arbitrary complete orthonormal system of functions in the space $L_2([t,T])$ and $\psi_1(\tau), \ldots, \psi_k(\tau) \in L_2([t,T])$.

Consider the following step function on the hypercube $[t,T]^k$

$$\Phi_N(t_1,\ldots,t_k) = \sum_{l_1,\ldots,l_k=0}^{N-1} a_{l_1\ldots l_k} \mathbf{1}_{[\tau_{l_1},\tau_{l_1+1})}(t_1)\ldots \mathbf{1}_{[\tau_{l_k},\tau_{l_k+1})}(t_k), \tag{31}$$

where $a_{l_1\ldots l_k} \in \mathbb{R}$ and such that $a_{l_1\ldots l_k} = 0$ if $l_p = l_q$ for some $p \neq q$,

$$\mathbf{1}_A(\tau) = \begin{cases} 1 & \text{if } \tau \in A \\ 0 & \text{otherwise} \end{cases},$$

$N \in \mathbb{N}$, $\{\tau_j\}_{j=0}^{N}$ is a partition of $[t,T]$, which satisfies the condition (13):

$$t = \tau_0 < \ldots < \tau_N = T, \quad \Delta_N = \max_{0 \le j \le N-1} \Delta\tau_j \to 0 \ \text{ if } \ N \to \infty, \quad \Delta\tau_j = \tau_{j+1} - \tau_j. \tag{32}$$

Let us define the multiple Wiener stochastic integral for $\Phi_N(t_1,\ldots,t_k)$ [64], [65]

$$J'[\Phi_N]_{T,t}^{(i_1\ldots i_k)} \stackrel{\mathsf{def}}{=} \sum_{l_1,\ldots,l_k=0}^{N-1} a_{l_1\ldots l_k} \Delta\mathbf{w}_{\tau_{l_1}}^{(i_1)} \ldots \Delta\mathbf{w}_{\tau_{l_k}}^{(i_k)}, \tag{33}$$

where $\Delta\mathbf{w}_{\tau_j}^{(i)} = \mathbf{w}_{\tau_{j+1}}^{(i)} - \mathbf{w}_{\tau_j}^{(i)}$, $i = 0,1,\ldots,m$, $\mathbf{w}_{\tau}^{(0)} = \tau$.

It is known (see [65], Lemma 9.6.4) that for any $\Phi(t_1,\ldots,t_k) \in L_2([t,T]^k)$ there exists a sequence of step functions $\Phi_N(t_1,\ldots,t_k)$ of the form (31) such that

$$\lim_{N\to\infty} \int\limits_{[t,T]^k} \left(\Phi(t_1,\ldots,t_k) - \Phi_N(t_1,\ldots,t_k)\right)^2 dt_1\ldots dt_k = 0. \tag{34}$$

We have

$$\Phi_N(t_1,\ldots,t_k) = \sum_{l_1,\ldots,l_k=0}^{N-1} a_{l_1\ldots l_k} \mathbf{1}_{[\tau_{l_1},\tau_{l_1+1})}(t_1)\ldots \mathbf{1}_{[\tau_{l_k},\tau_{l_k+1})}(t_k) =$$

$$= \sum_{(l_1,\ldots,l_k)} \sum_{\substack{l_1,\ldots,l_k=0 \\ l_1<l_2<\ldots<l_k}}^{N-1} a_{l_1\ldots l_k} \mathbf{1}_{[\tau_{l_1},\tau_{l_1+1})}(t_1)\ldots \mathbf{1}_{[\tau_{l_k},\tau_{l_k+1})}(t_k), \tag{35}$$

where permutations $(l_1,\ldots,l_k)$ when summing are performed only in the expression $l_1<l_2<\ldots<l_k$ (recall that $a_{l_1\ldots l_k}=0$ if $l_p=l_q$ for some $p\ne q$).

Using (35), we get

$$\sum_{(t_1,\ldots,t_k)}\int\limits_t^T\ldots\int\limits_t^{t_2}\Phi_N(t_1,\ldots,t_k)d\mathbf{w}_{t_1}^{(i_1)}\ldots d\mathbf{w}_{t_k}^{(i_k)}= \tag{36}$$

$$=\sum_{(l_1,\ldots,l_k)}\sum_{\substack{l_1,\ldots,l_k=0\\ l_1<l_2<\ldots<l_k}}^{N-1}a_{l_1\ldots l_k}\Delta\mathbf{w}_{\tau_{l_1}}^{(i_1)}\ldots\Delta\mathbf{w}_{\tau_{l_k}}^{(i_k)}=$$

$$=\sum_{\substack{l_1,\ldots,l_k=0\\ l_q\ne l_r;\ q\ne r;\ q,r=1,\ldots,k}}^{N-1}a_{l_1\ldots l_k}\Delta\mathbf{w}_{\tau_{l_1}}^{(i_1)}\ldots\Delta\mathbf{w}_{\tau_{l_k}}^{(i_k)}=$$

$$=J'[\Phi_N]_{T,t}^{(i_1\ldots i_k)}\quad \text{w. p. 1}, \tag{37}$$

where permutations $(t_1,\ldots,t_k)$ when summing are performed only in the values $d\mathbf{w}_{t_1}^{(i_1)}\ldots d\mathbf{w}_{t_k}^{(i_k)}$ and permutations $(l_1,\ldots,l_k)$ when summing are performed only in the expression $l_1<l_2<\ldots<l_k$. At the same time the indices near upper limits of integration in the iterated stochastic integrals in (36) are changed correspondently and if t_r swapped with t_q in the permutation $(t_1,\ldots,t_k)$, then i_r swapped with i_q in the permutation $(i_1,\ldots,i_k)$ (see (36)). In addition, the multiple Wiener stochastic integral $J'[\Phi_N]_{T,t}^{(i_1\ldots i_k)}$ is defined by (33) and

$$\int\limits_t^T\ldots\int\limits_t^{t_2}\Phi_N(t_1,\ldots,t_k)d\mathbf{w}_{t_1}^{(i_1)}\ldots d\mathbf{w}_{t_k}^{(i_k)}$$

is the iterated Ito stochastic integral.

Using (34), (37), Lemma 2, and (17) for Lebesgue integrals, we have

$$\mathsf{M}\left\{\left(J'[\Phi_N]_{T,t}^{(i_1\ldots i_k)}-J'[\Phi_M]_{T,t}^{(i_1\ldots i_k)}\right)^2\right\}\le$$

$$\le C_k\sum_{(t_1,\ldots,t_k)}\int\limits_t^T\ldots\int\limits_t^{t_2}\left(\Phi_N(t_1,\ldots,t_k)-\Phi_M(t_1,\ldots,t_k)\right)^2dt_1\ldots dt_k=$$

$$=C_k\int\limits_{[t,T]^k}\left(\Phi_N(t_1,\ldots,t_k)-\Phi_M(t_1,\ldots,t_k)\right)^2dt_1\ldots dt_k=$$

$$=C_k\left\|\Phi_N-\Phi_M\right\|_{L_2([t,T]^k)}^2\le$$

$$\le 2C_k\left(\left\|\Phi_N-\Phi\right\|_{L_2([t,T]^k)}^2+\left\|\Phi-\Phi_M\right\|_{L_2([t,T]^k)}^2\right)^2\to 0$$

if $N,M\to\infty$, where constant C_k depends only on the multiplicity k of the multiple Wiener stochastic integral.

Thus, there exists the limit

$$\underset{N\to\infty}{\text{l.i.m.}}\ J'[\Phi_N]_{T,t}^{(i_1\ldots i_k)}.$$

We will define the multiple Wiener stochastic integral for $\Phi(t_1,\ldots,t_k)\in L_2([t,T]^k)$ by the formula [64], [65]

$$J'[\Phi]_{T,t}^{(i_1\ldots i_k)} \stackrel{\sf def}{=} \underset{N\to\infty}{\text{l.i.m.}}\ J'[\Phi_N]_{T,t}^{(i_1\ldots i_k)} = \underset{N\to\infty}{\text{l.i.m.}} \sum_{l_1,\ldots,l_k=0}^{N-1} a_{l_1\ldots l_k}\Delta\mathbf{w}_{\tau_{l_1}}^{(i_1)}\ldots\Delta\mathbf{w}_{\tau_{l_k}}^{(i_k)}, \tag{38}$$

where $\Phi_N(t_1,\ldots,t_k)$ is defined by (31), $\Delta\mathbf{w}_{\tau_j}^{(i)}=\mathbf{w}_{\tau_{j+1}}^{(i)}-\mathbf{w}_{\tau_j}^{(i)}$, $i=0,1,\ldots,m$, $\mathbf{w}_{\tau}^{(0)}=\tau$.

Let us prove the following equality

$$J'[\Phi]_{T,t}^{(i_1\ldots i_k)} = \sum_{(t_1,\ldots,t_k)} \int\limits_t^T\ldots\int\limits_t^{t_2}\Phi(t_1,\ldots,t_k)d\mathbf{w}_{t_1}^{(i_1)}\ldots d\mathbf{w}_{t_k}^{(i_k)}\quad \text{w. p. 1}, \tag{39}$$

where permutations $(t_1,\ldots,t_k)$ when summing are performed only in the values $d\mathbf{w}_{t_1}^{(i_1)}\ldots d\mathbf{w}_{t_k}^{(i_k)}$. At the same time the indices near upper limits of integration in the iterated stochastic integrals are changed correspondently and if t_r swapped with t_q in the permutation $(t_1,\ldots,t_k)$, then i_r swapped with i_q in the permutation $(i_1,\ldots,i_k)$. In addition, the multiple Wiener stochastic integral $J'[\Phi]_{T,t}^{(i_1\ldots i_k)}$ is defined by (38) and

$$\int\limits_t^T\ldots\int\limits_t^{t_2}\Phi(t_1,\ldots,t_k)d\mathbf{w}_{t_1}^{(i_1)}\ldots d\mathbf{w}_{t_k}^{(i_k)}$$

is the iterated Ito stochastic integral.

The equality (39) has already been proved for the case $\Phi(t_1,\ldots,t_k)=\Phi_N(t_1,\ldots,t_k)$ (see (37)). From (37) we have

$$J'[\Phi_N]_{T,t}^{(i_1\ldots i_k)} = \sum_{(t_1,\ldots,t_k)} \int\limits_t^T\ldots\int\limits_t^{t_2}\Phi_N(t_1,\ldots,t_k)d\mathbf{w}_{t_1}^{(i_1)}\ldots d\mathbf{w}_{t_k}^{(i_k)} =$$

$$= \sum_{(t_1,\ldots,t_k)} \int\limits_t^T\ldots\int\limits_t^{t_2}\Phi(t_1,\ldots,t_k)d\mathbf{w}_{t_1}^{(i_1)}\ldots d\mathbf{w}_{t_k}^{(i_k)}+$$

$$+\sum_{(t_1,\ldots,t_k)} \int\limits_t^T\ldots\int\limits_t^{t_2}\left(\Phi_N(t_1,\ldots,t_k)-\Phi(t_1,\ldots,t_k)\right)d\mathbf{w}_{t_1}^{(i_1)}\ldots d\mathbf{w}_{t_k}^{(i_k)}\quad \text{w. p. 1}. \tag{40}$$

Passing to the limit $\underset{N\to\infty}{\text{l.i.m.}}$ in the equality (40), we obtain

$$J'[\Phi]_{T,t}^{(i_1\ldots i_k)} = \sum_{(t_1,\ldots,t_k)} \int\limits_t^T\ldots\int\limits_t^{t_2}\Phi(t_1,\ldots,t_k)d\mathbf{w}_{t_1}^{(i_1)}\ldots d\mathbf{w}_{t_k}^{(i_k)}+$$

$$+\underset{N\to\infty}{\text{l.i.m.}}\sum_{(t_1,\ldots,t_k)}\int\limits_t^T\ldots\int\limits_t^{t_2}\left(\Phi_N(t_1,\ldots,t_k)-\Phi(t_1,\ldots,t_k)\right)d\mathbf{w}_{t_1}^{(i_1)}\ldots d\mathbf{w}_{t_k}^{(i_k)}\quad \text{w. p. 1.} \tag{41}$$

Using Lemma 1.2 [24]-[26] or Lemma 2 [34] as well as (17) for Lebesgue integrals and (34), we get

$$\mathsf{M}\left\{\left(\sum_{(t_1,\ldots,t_k)}\int\limits_t^T\ldots\int\limits_t^{t_2}\left(\Phi_N(t_1,\ldots,t_k)-\Phi(t_1,\ldots,t_k)\right)d\mathbf{w}_{t_1}^{(i_1)}\ldots d\mathbf{w}_{t_k}^{(i_k)}\right)^2\right\}\le$$

$$\le C_k\sum_{(t_1,\ldots,t_k)}\int\limits_t^T\ldots\int\limits_t^{t_2}\left(\Phi_N(t_1,\ldots,t_k)-\Phi(t_1,\ldots,t_k)\right)^2 dt_1\ldots dt_k=$$

$$=C_k\int\limits_{[t,T]^k}\left(\Phi_N(t_1,\ldots,t_k)-\Phi(t_1,\ldots,t_k)\right)^2 dt_1\ldots dt_k\ \to 0 \tag{42}$$

if $N\to\infty$, where constant C_k depends only on the multiplicity k of the multiple Wiener stochastic integral.

The relations (41) and (42) prove the equality (39). From (39) we have

$$J[\psi^{(k)}]_{T,t}^{(i_1\ldots i_k)}=\int\limits_t^T\psi_k(t_k)\ldots\int\limits_t^{t_2}\psi_1(t_1)d\mathbf{w}_{t_1}^{(i_1)}\ldots d\mathbf{w}_{t_k}^{(i_k)}=J'[K]_{T,t}^{(i_1\ldots i_k)}\quad\text{w. p. 1,} \tag{43}$$

where $K=K(t_1,\ldots,t_k)$ is defined by (4).

Applying (43), we obtain

$$J[\psi^{(k)}]_{T,t}^{(i_1\ldots i_k)}=J'[K]_{T,t}^{(i_1\ldots i_k)}=\sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k}C_{j_k\ldots j_1}J'[\phi_{j_1}\ldots\phi_{j_k}]_{T,t}^{(i_1\ldots i_k)}+J'[R_{p_1\ldots p_k}]_{T,t}^{(i_1\ldots i_k)} \tag{44}$$

w. p. 1, where

$$R_{p_1\ldots p_k}(t_1,\ldots,t_k)\stackrel{\text{def}}{=}K(t_1,\ldots,t_k)-\sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k}C_{j_k\ldots j_1}\prod_{l=1}^k\phi_{j_l}(t_l) \tag{45}$$

and

$$C_{j_k\ldots j_1}=\int\limits_{[t,T]^k}K(t_1,\ldots,t_k)\prod_{l=1}^k\phi_{j_l}(t_l)dt_1\ldots dt_k \tag{46}$$

is the Fourier coefficient corresponding to $K(t_1,\ldots,t_k)$.

Again applying (39), we have

(47)

$$J'[R_{p_1\ldots p_k}]_{T,t}^{(i_1\ldots i_k)}=\sum_{(t_1,\ldots,t_k)}\int\limits_t^T\ldots\int\limits_t^{t_2}\left(K(t_1,\ldots,t_k)-\sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k}C_{j_k\ldots j_1}\prod_{l=1}^k\phi_{j_l}(t_l)\right)d\mathbf{w}_{t_1}^{(i_1)}\ldots d\mathbf{w}_{t_k}^{(i_k)},$$

where permutations $(t_1,\ldots,t_k)$ when summing are performed only in the values $d\mathbf{w}_{t_1}^{(i_1)}\ldots d\mathbf{w}_{t_k}^{(i_k)}$. At the same time the indices near upper limits of integration in the iterated stochastic integrals are changed correspondently and if t_r swapped with t_q in the permutation $(t_1,\ldots,t_k)$, then i_r swapped with i_q in the permutation $(i_1,\ldots,i_k)$. In addition, the multiple Wiener stochastic integral $J'[R_{p_1\ldots p_k}]_{T,t}^{(i_1\ldots i_k)}$ is defined by (38).

Using Lemma 1.2 [24]-[26] or Lemma 2 [34], (11) as well as (17) for Lebesgue integrals, we have

$$\mathsf{M}\left\{\left(J'[R_{p_1\ldots p_k}]_{T,t}^{(i_1\ldots i_k)}\right)^2\right\}\le$$

$$\le C_k\sum_{(t_1,\ldots,t_k)}\int\limits_t^T\ldots\int\limits_t^{t_2}\left(K(t_1,\ldots,t_k)-\sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k}C_{j_k\ldots j_1}\prod_{l=1}^k\phi_{j_l}(t_l)\right)^2 dt_1\ldots dt_k=$$

(48)

$$=C_k\int\limits_{[t,T]^k}\left(K(t_1,\ldots,t_k)-\sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k}C_{j_k\ldots j_1}\prod_{l=1}^k\phi_{j_l}(t_l)\right)^2 dt_1\ldots dt_k\to 0$$

if $p_1,\ldots,p_k\to\infty$, where constant C_k depends only on the multiplicity k of the iterated Ito stochastic integral $J[\psi^{(k)}]_{T,t}^{(i_1\ldots i_k)}$.

Thus, the following theorem is proved.

Theorem 4 [24] (Sect. 1.11), [34] (Sect. 15). *Suppose that* $\psi_1(\tau),\ldots,\psi_k(\tau)\in L_2([t,T])$ *and* $\{\phi_j(x)\}_{j=0}^{\infty}$ *is an arbitrary complete orthonormal system of functions in the space* $L_2([t,T])$. *Then the following expansion*

$$J[\psi^{(k)}]_{T,t}=\underset{p_1,\ldots,p_k\to\infty}{\text{l.i.m.}}\sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k}C_{j_k\ldots j_1}\left(\prod_{l=1}^k\zeta_{j_l}^{(i_l)}+\sum_{r=1}^{[k/2]}(-1)^r\times\right.$$

$$\left.\times\sum_{\substack{(\{\{g_1,g_2\},\ldots,\{g_{2r-1},g_{2r}\}\},\{q_1,\ldots,q_{k-2r}\})\\ \{g_1,g_2,\ldots,g_{2r-1},g_{2r},q_1,\ldots,q_{k-2r}\}=\{1,2,\ldots,k\}}}\prod_{s=1}^r\mathbf{1}_{\{i_{g_{2s-1}}=\,i_{g_{2s}}\ne 0\}}\mathbf{1}_{\{j_{g_{2s-1}}=\,j_{g_{2s}}\}}\prod_{l=1}^{k-2r}\zeta_{j_{q_l}}^{(i_{q_l})}\right)$$

converging in the mean-square sense is valid, where $[x]$ *is an integer part of a real number* x; *another notations are the same as in Theorems* 2, 3.

It should be noted that an analogue of Theorem 4 was considered in [66]. Note that we use another notations [24] (Sect. 1.11), [34] (Sect. 15) in comparison with [66]. Moreover, the proof of an analogue of Theorem 4 from [66] is somewhat different from the proof given in [24] (Sect. 1.11), [34] (Sect. 15).

4. Expansions of Iterated Stratonovich Stochastic Integrals of Multiplicities 1 to 6 Based on Multiple Fourier–Legendre Series and Multiple Trigonometric Fourier Series

In a number of works of the author [14]-[18], [21], [23]-[27], [31] Theorems 2, 4 have been adapted for the iterated Stratonovich stochastic integrals (3) of multiplicities 2 to 6. Let us collect some old results in the following statement.

Theorem 5 [14]-[18], [21], [23]-[27], [31]. *Suppose that $\{\phi_j(x)\}_{j=0}^{\infty}$ is a complete orthonormal system of Legendre polynomials or trigonometric functions in the space $L_2([t,T])$. At the same time $\psi_2(\tau)$ is a continuously differentiable function on $[t,T]$ and $\psi_1(\tau)$, $\psi_3(\tau)$ are twice continuously differentiable functions on $[t,T]$. Then*

$$J^*[\psi^{(2)}]_{T,t} = \underset{p_1,p_2\to\infty}{\text{l.i.m.}} \sum_{j_1=0}^{p_1}\sum_{j_2=0}^{p_2} C_{j_2j_1}\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)} \quad (i_1,i_2=1,\ldots,m), \tag{49}$$

$$J^*[\psi^{(3)}]_{T,t} = \underset{p_1,p_2,p_3\to\infty}{\text{l.i.m.}} \sum_{j_1=0}^{p_1}\sum_{j_2=0}^{p_2}\sum_{j_3=0}^{p_3} C_{j_3j_2j_1}\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}\zeta_{j_3}^{(i_3)} \quad (i_1,i_2,i_3=0,1,\ldots,m), \tag{50}$$

$$J^*[\psi^{(3)}]_{T,t} = \underset{p\to\infty}{\text{l.i.m.}} \sum_{j_1,j_2,j_3=0}^{p} C_{j_3j_2j_1}\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}\zeta_{j_3}^{(i_3)} \quad (i_1,i_2,i_3=1,\ldots,m), \tag{51}$$

$$J^*[\psi^{(4)}]_{T,t} = \underset{p\to\infty}{\text{l.i.m.}} \sum_{j_1,\ldots,j_4=0}^{p} C_{j_4j_3j_2j_1}\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}\zeta_{j_3}^{(i_3)}\zeta_{j_4}^{(i_4)} \quad (i_1,\ldots,i_4=0,1,\ldots,m), \tag{52}$$

where $J^*[\psi^{(k)}]_{T,t}$ is defined by (3) *and $\psi_l(\tau)\equiv 1$ $(l=1,\ldots,4)$ in* (50), (52); *another notations are the same as in Theorems* 2–4.

Recently, a new approach to the expansion and mean-square approximation of iterated Stratonovich stochastic integrals has been obtained [24] (Sect. 2.10–2.16), [27] (Sect. 13–19), [31] (Sect. 5–11), [32] (Sect. 7–13), [54] (Sect. 4–9). Let us formulate four theorems that were obtained using this approach.

Theorem 6 [24], [27], [31], [32], [54]. *Suppose that $\{\phi_j(x)\}_{j=0}^{\infty}$ is a complete orthonormal system of Legendre polynomials or trigonometric functions in the space $L_2([t,T])$. Furthermore, let $\psi_1(\tau),\psi_2(\tau)$, $\psi_3(\tau)$ are continuously differentiable nonrandom functions on $[t,T]$. Then, for the iterated Stratonovich stochastic integral of third multiplicity*

$$J^*[\psi^{(3)}]_{T,t} = \int\limits_t^{*T}\psi_3(t_3)\int\limits_t^{*t_3}\psi_2(t_2)\int\limits_t^{*t_2}\psi_1(t_1)d\mathbf{w}_{t_1}^{(i_1)}d\mathbf{w}_{t_2}^{(i_2)}d\mathbf{w}_{t_3}^{(i_3)} \quad (i_1,i_2,i_3=0,1,\ldots,m)$$

the following relations

$$J^*[\psi^{(3)}]_{T,t} = \underset{p\to\infty}{\text{l.i.m.}} \sum_{j_1,j_2,j_3=0}^{p} C_{j_3j_2j_1}\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}\zeta_{j_3}^{(i_3)}, \tag{53}$$

$$\mathsf{M}\left\{\left(J^*[\psi^{(3)}]_{T,t}-\sum_{j_1,j_2,j_3=0}^{p}C_{j_3j_2j_1}\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}\zeta_{j_3}^{(i_3)}\right)^2\right\}\le\frac{C}{p} \tag{54}$$

are fulfilled, where $i_1,i_2,i_3=0,1,\ldots,m$ *in* (53) *and* $i_1,i_2,i_3=1,\ldots,m$ *in* (54)*, constant* C *is independent of* p,

$$C_{j_3j_2j_1}=\int\limits_t^T\psi_3(t_3)\phi_{j_3}(t_3)\int\limits_t^{t_3}\psi_2(t_2)\phi_{j_2}(t_2)\int\limits_t^{t_2}\psi_1(t_1)\phi_{j_1}(t_1)dt_1dt_2dt_3$$

and

$$\zeta_j^{(i)}=\int\limits_t^T\phi_j(\tau)d\mathbf{f}_\tau^{(i)}$$

are independent standard Gaussian random variables for various i *or* j *(in the case when* $i\ne 0$*); another notations are the same as in Theorems* 2–4.

Theorem 7 [24], [27], [31], [32], [54]. *Let* $\{\phi_j(x)\}_{j=0}^{\infty}$ *be a complete orthonormal system of Legendre polynomials or trigonometric functions in the space* $L_2([t,T])$*. Furthermore, let* $\psi_1(\tau),\ldots,\ \psi_4(\tau)$ *be continuously differentiable nonrandom functions on* $[t,T]$*. Then, for the iterated Stratonovich stochastic integral of fourth multiplicity*

$$J^*[\psi^{(4)}]_{T,t}=\int\limits_t^{*T}\psi_4(t_4)\int\limits_t^{*t_4}\psi_3(t_3)\int\limits_t^{*t_3}\psi_2(t_2)\int\limits_t^{*t_2}\psi_1(t_1)d\mathbf{w}_{t_1}^{(i_1)}d\mathbf{w}_{t_2}^{(i_2)}d\mathbf{w}_{t_3}^{(i_3)}d\mathbf{w}_{t_4}^{(i_4)} \tag{55}$$

the following relations

$$J^*[\psi^{(4)}]_{T,t}=\underset{p\to\infty}{\text{l.i.m.}}\sum_{j_1,j_2,j_3,j_4=0}^{p}C_{j_4j_3j_2j_1}\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}\zeta_{j_3}^{(i_3)}\zeta_{j_4}^{(i_4)}, \tag{56}$$

$$\mathsf{M}\left\{\left(J^*[\psi^{(4)}]_{T,t}-\sum_{j_1,j_2,j_3,j_4=0}^{p}C_{j_4j_3j_2j_1}\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}\zeta_{j_3}^{(i_3)}\zeta_{j_4}^{(i_4)}\right)^2\right\}\le\frac{C}{p^{1-\varepsilon}} \tag{57}$$

are fulfilled, where $i_1,\ldots,i_4=0,1,\ldots,m$ *in* (55), (56) *and* $i_1,\ldots,i_4=1,\ldots,m$ *in* (57)*, constant* C *does not depend on* p*,* ε *is an arbitrary small positive real number for the case of complete orthonormal system of Legendre polynomials in the space* $L_2([t,T])$ *and* $\varepsilon=0$ *for the case of complete orthonormal system of trigonometric functions in the space* $L_2([t,T])$,

$$C_{j_4j_3j_2j_1}=$$

$$=\int\limits_t^T\psi_4(t_4)\phi_{j_4}(t_4)\int\limits_t^{t_4}\psi_3(t_3)\phi_{j_3}(t_3)\int\limits_t^{t_3}\psi_2(t_2)\phi_{j_2}(t_2)\int\limits_t^{t_2}\psi_1(t_1)\phi_{j_1}(t_1)dt_1dt_2dt_3dt_4;$$

another notations are the same as in Theorem 6.

Theorem 8 [24], [27], [31], [32], [54]. *Assume that* $\{\phi_j(x)\}_{j=0}^{\infty}$ *is a complete orthonormal system of Legendre polynomials or trigonometric functions in the space* $L_2([t,T])$ *and* $\psi_1(\tau),\ldots,\psi_5(\tau)$ *are continuously differentiable nonrandom functions on* $[t,T]$. *Then, for the iterated Stratonovich stochastic integral of fifth multiplicity*

$$J^*[\psi^{(5)}]_{T,t}=\int\limits_t^{*T}\psi_5(t_5)\ldots\int\limits_t^{*t_2}\psi_1(t_1)d\mathbf{w}_{t_1}^{(i_1)}\ldots d\mathbf{w}_{t_5}^{(i_5)} \tag{58}$$

the following relations

$$J^*[\psi^{(5)}]_{T,t}=\underset{p\to\infty}{\text{l.i.m.}}\sum_{j_1,\ldots,j_5=0}^{p}C_{j_5\ldots j_1}\zeta_{j_1}^{(i_1)}\ldots\zeta_{j_5}^{(i_5)}, \tag{59}$$

$$\mathsf{M}\left\{\left(J^*[\psi^{(5)}]_{T,t}-\sum_{j_1,\ldots,j_5=0}^{p}C_{j_5\ldots j_1}\zeta_{j_1}^{(i_1)}\ldots\zeta_{j_5}^{(i_5)}\right)^2\right\}\le\frac{C}{p^{1-\varepsilon}} \tag{60}$$

are fulfilled, where $i_1,\ldots,i_5=0,1,\ldots,m$ *in* (58), (59) *and* $i_1,\ldots,i_5=1,\ldots,m$ *in* (60), *constant* C *is independent of* p, ε *is an arbitrary small positive real number for the case of complete orthonormal system of Legendre polynomials in the space* $L_2([t,T])$ *and* $\varepsilon=0$ *for the case of complete orthonormal system of trigonometric functions in the space* $L_2([t,T])$,

$$C_{j_5\ldots j_1}=\int\limits_t^{T}\psi_5(t_5)\phi_{j_5}(t_5)\ldots\int\limits_t^{t_2}\psi_1(t_1)\phi_{j_1}(t_1)dt_1\ldots dt_5;$$

another notations are the same as in Theorems 6, 7.

Theorem 9 [24], [27], [31], [32]. *Suppose that* $\{\phi_j(x)\}_{j=0}^{\infty}$ *is a complete orthonormal system of Legendre polynomials or trigonometric functions in the space* $L_2([t,T])$. *Then, for the iterated Stratonovich stochastic integral of sixth multiplicity*

$$J_{T,t}^{*(i_1\ldots i_6)}=\int\limits_t^{*T}\ldots\int\limits_t^{*t_2}d\mathbf{w}_{t_1}^{(i_1)}\ldots d\mathbf{w}_{t_6}^{(i_6)}$$

the following expansion

$$J_{T,t}^{*(i_1\ldots i_6)}=\underset{p\to\infty}{\text{l.i.m.}}\sum_{j_1,\ldots,j_6=0}^{p}C_{j_6\ldots j_1}\zeta_{j_1}^{(i_1)}\ldots\zeta_{j_6}^{(i_6)}$$

that converges in the mean-square sense is valid, where $i_1,\ldots,i_6=0,1,\ldots,m$,

$$C_{j_6\ldots j_1}=\int\limits_t^{T}\phi_{j_6}(t_6)\ldots\int\limits_t^{t_2}\phi_{j_1}(t_1)dt_1\ldots dt_6;$$

another notations are the same as in Theorems 6–8.

5. Exact and Approximate Expressions for the Mean-Square Error of Approximation of Iterated Ito Stochastic Integrals in Theorems 2, 4

Theorem 10 [19]-[21], [23]-[26], [33]. *Suppose that every* $\psi_l(\tau)$ $(l=1,\ldots,k)$ *is a continuous function on* $[t,T]$ *and* $\{\phi_j(x)\}_{j=0}^{\infty}$ *is a complete orthonormal system of continuous functions in the space* $L_2([t,T])$. *Then*

$$\mathsf{M}\left\{\left(J[\psi^{(k)}]_{T,t}-J[\psi^{(k)}]_{T,t}^p\right)^2\right\}=\int\limits_{[t,T]^k}K^2(t_1,\ldots,t_k)dt_1\ldots dt_k-$$

$$-\sum_{j_1=0}^{p}\ldots\sum_{j_k=0}^{p}C_{j_k\ldots j_1}\mathsf{M}\left\{J[\psi^{(k)}]_{T,t}\sum_{(j_1,\ldots,j_k)}\int\limits_t^T\phi_{j_k}(t_k)\ldots\int\limits_t^{t_2}\phi_{j_1}(t_1)d\mathbf{f}_{t_1}^{(i_1)}\ldots d\mathbf{f}_{t_k}^{(i_k)}\right\},$$

where

$$J[\psi^{(k)}]_{T,t}=\int\limits_t^T\psi_k(t_k)\ldots\int\limits_t^{t_2}\psi_1(t_1)d\mathbf{f}_{t_1}^{(i_1)}\ldots d\mathbf{f}_{t_k}^{(i_k)}\quad(i_1,\ldots,i_k=1,\ldots,m),$$

(61)
$$J[\psi^{(k)}]_{T,t}^p=\sum_{j_1=0}^{p}\ldots\sum_{j_k=0}^{p}C_{j_k\ldots j_1}\left(\prod_{l=1}^{k}\zeta_{j_l}^{(i_l)}-S_{j_1,\ldots,j_k}^{(i_1\ldots i_k)}\right),$$

(62)
$$S_{j_1,\ldots,j_k}^{(i_1\ldots i_k)}=\underset{N\to\infty}{\text{l.i.m.}}\sum_{(l_1,\ldots,l_k)\in\mathrm{G}_k}\phi_{j_1}(\tau_{l_1})\Delta\mathbf{f}_{\tau_{l_1}}^{(i_1)}\ldots\phi_{j_k}(\tau_{l_k})\Delta\mathbf{f}_{\tau_{l_k}}^{(i_k)},$$

the Fourier coefficient $C_{j_k\ldots j_1}$ *has the form* (12),

(63)
$$\zeta_j^{(i)}=\int\limits_t^T\phi_j(\tau)d\mathbf{f}_\tau^{(i)}$$

are independent standard Gaussian random variables for various i *or* j $(i=1,\ldots,m)$,

$$\sum_{(j_1,\ldots,j_k)}$$

means the sum with respect to all possible permutations $(j_1,\ldots,j_k)$ *(at that, if* j_r *swapped with* j_q *in the permutation* $(j_1,\ldots,j_k)$*, then* i_r *swapped with* i_q *in the permutation* $(i_1,\ldots,i_k)$*); another notations are the same as in Theorem* 2.

Proof. Using Theorem 2 for the case $p_1=\ldots=p_k=p$ and $i_1,\ldots,i_k=1,\ldots,m$, we obtain

$$J[\psi^{(k)}]_{T,t} = \underset{p\to\infty}{\text{l.i.m.}} \sum_{j_1=0}^{p} \ldots \sum_{j_k=0}^{p} C_{j_k\ldots j_1} \left(\prod_{l=1}^{k} \zeta_{j_l}^{(i_l)} - S_{j_1,\ldots,j_k}^{(i_1\ldots i_k)} \right). \tag{64}$$

For $n > p$ we can write

$$J[\psi^{(k)}]_{T,t}^{n} = \left(\sum_{j_1=0}^{p} + \sum_{j_1=p+1}^{n} \right) \ldots \left(\sum_{j_k=0}^{p} + \sum_{j_k=p+1}^{n} \right) C_{j_k\ldots j_1} \left(\prod_{l=1}^{k} \zeta_{j_l}^{(i_l)} - S_{j_1,\ldots,j_k}^{(i_1\ldots i_k)} \right) =$$

$$= J[\psi^{(k)}]_{T,t}^{p} + \xi[\psi^{(k)}]_{T,t}^{p+1,n}. \tag{65}$$

Let us prove that due to the special structure of random variables $S_{j_1,\ldots,j_k}^{(i_1\ldots i_k)}$ (also see (23)–(27)) the following relations are correct

$$\mathsf{M}\left\{ \prod_{l=1}^{k} \zeta_{j_l}^{(i_l)} - S_{j_1,\ldots,j_k}^{(i_1\ldots i_k)} \right\} = 0, \tag{66}$$

$$\mathsf{M}\left\{ \left(\prod_{l=1}^{k} \zeta_{j_l}^{(i_l)} - S_{j_1,\ldots,j_k}^{(i_1\ldots i_k)} \right) \left(\prod_{l=1}^{k} \zeta_{j_l'}^{(i_l)} - S_{j_1',\ldots,j_k'}^{(i_1\ldots i_k)} \right) \right\} = 0, \tag{67}$$

where

$$(j_1,\ldots,j_k) \in \mathrm{K}_p, \quad (j_1',\ldots,j_k') \in \mathrm{K}_n \backslash \mathrm{K}_p$$

and

$$\mathrm{K}_n = \left\{ (j_1,\ldots,j_k) :\ 0 \le j_1,\ldots,j_k \le n \right\},$$

$$\mathrm{K}_p = \left\{ (j_1,\ldots,j_k) :\ 0 \le j_1,\ldots,j_k \le p \right\}.$$

Let us prove (66). For the case $i_1,\ldots,i_k = 1,\ldots,m$ and $p_1 = \ldots = p_k = p$ from (18) and (19) we obtain

$$\prod_{l=1}^{k} \zeta_{j_l}^{(i_l)} - S_{j_1,\ldots,j_k}^{(i_1\ldots i_k)} = \underset{N\to\infty}{\text{l.i.m.}} \sum_{\substack{l_1,\ldots,l_k=0 \\ l_q\ne l_r;\ q\ne r;\ q,r=1,\ldots,k}}^{N-1} \phi_{j_1}(\tau_{l_1})\ldots\phi_{j_k}(\tau_{l_k}) \Delta\mathbf{f}_{\tau_{l_1}}^{(i_1)} \ldots \Delta\mathbf{f}_{\tau_{l_k}}^{(i_k)} =$$

$$= \sum_{(j_1,\ldots,j_k)} \int_t^T \phi_{j_k}(t_k) \ldots \int_t^{t_2} \phi_{j_1}(t_1) d\mathbf{f}_{t_1}^{(i_1)} \ldots d\mathbf{f}_{t_k}^{(i_k)} \quad \text{w. p. 1}, \tag{68}$$

where

$$\sum_{(j_1,\ldots,j_k)}$$

means the sum with respect to all possible permutations $(j_1,\ldots,j_k)$. At the same time if j_r swapped with j_q in the permutation $(j_1,\ldots,j_k)$, then i_r swapped with i_q in the permutation $(i_1,\ldots,i_k)$.

From (68) due to the moment property of Ito stochastic integral we obtain (66).

Let us prove (67). From (68) we have

$$
0\le\left|{\sf M}\left\{\left(\prod_{l=1}^{k}\zeta_{j_l}^{(i_l)}-S_{j_1,\ldots,j_k}^{(i_1\ldots i_k)}\right)\left(\prod_{l=1}^{k}\zeta_{j_l'}^{(i_l)}-S_{j_1',\ldots,j_k'}^{(i_1\ldots i_k)}\right)\right\}\right|=
$$

$$
=\left|{\sf M}\left\{\sum_{(j_1,\ldots,j_k)}\sum_{(j_1',\ldots,j_k')}\int\limits_t^T\phi_{j_k}(t_k)\ldots\int\limits_t^{t_2}\phi_{j_1}(t_1)d{\bf f}_{t_1}^{(i_1)}\ldots d{\bf f}_{t_k}^{(i_k)}\times\right.\right.
$$

$$
\left.\left.\times\int\limits_t^T\phi_{j_k'}(t_k)\ldots\int\limits_t^{t_2}\phi_{j_1'}(t_1)d{\bf f}_{t_1}^{(i_1)}\ldots d{\bf f}_{t_k}^{(i_k)}\right\}\right|\le
$$

$$
\le\sum_{(j_1',\ldots,j_k')}\int\limits_t^T\phi_{j_k}(t_k)\phi_{j_k'}(t_k)dt_k\ldots\int\limits_t^T\phi_{j_1}(t_1)\phi_{j_1'}(t_1)dt_1=
$$

$$
=\sum_{(j_1',\ldots,j_k')}{\bf 1}_{\{j_1=j_1'\}}\ldots{\bf 1}_{\{j_k=j_k'\}}, \tag{69}
$$

where where ${\bf 1}_A$ is the indicator of the set A. From (69) we obtain (67).

Consider in detail the case $k=3$ in (69). We have

$$
\left|{\sf M}\left\{\sum_{(j_1,j_2,j_3)}\sum_{(j_1',j_2',j_3')}\int\limits_t^T\phi_{j_3}(t_3)\int\limits_t^{t_3}\phi_{j_2}(t_2)\int\limits_t^{t_2}\phi_{j_1}(t_1)d{\bf f}_{t_1}^{(i_1)}d{\bf f}_{t_2}^{(i_2)}d{\bf f}_{t_3}^{(i_3)}\times\right.\right.
$$

$$
\left.\left.\times\int\limits_t^T\phi_{j_3'}(t_3)\int\limits_t^{t_3}\phi_{j_2'}(t_2)\int\limits_t^{t_2}\phi_{j_1'}(t_1)d{\bf f}_{t_1}^{(i_1)}d{\bf f}_{t_2}^{(i_2)}d{\bf f}_{t_3}^{(i_3)}\right\}\right|=
$$

$$
=\left|\int\limits_t^T\phi_{j_3}(s)\phi_{j_3'}(s)ds\int\limits_t^T\phi_{j_2}(s)\phi_{j_2'}(s)ds\int\limits_t^T\phi_{j_1}(s)\phi_{j_1'}(s)ds+\right.
$$

$$
+{\bf 1}_{\{i_1=i_2\}}\int\limits_t^T\phi_{j_3}(s)\phi_{j_3'}(s)ds\int\limits_t^T\phi_{j_1}(s)\phi_{j_2'}(s)ds\int\limits_t^T\phi_{j_2}(s)\phi_{j_1'}(s)ds+
$$

$$
+{\bf 1}_{\{i_2=i_3\}}\int\limits_t^T\phi_{j_1}(s)\phi_{j_1'}(s)ds\int\limits_t^T\phi_{j_2}(s)\phi_{j_3'}(s)ds\int\limits_t^T\phi_{j_3}(s)\phi_{j_2'}(s)ds+
$$

$$
+{\bf 1}_{\{i_1=i_3\}}\int\limits_t^T\phi_{j_1}(s)\phi_{j_3'}(s)ds\int\limits_t^T\phi_{j_2}(s)\phi_{j_2'}(s)ds\int\limits_t^T\phi_{j_3}(s)\phi_{j_1'}(s)ds+
$$

$$+\mathbf{1}_{\{i_1=i_2=i_3\}}\int\limits_t^T\phi_{j_2}(s)\phi_{j_3'}(s)ds\int\limits_t^T\phi_{j_1}(s)\phi_{j_2'}(s)ds\int\limits_t^T\phi_{j_3}(s)\phi_{j_1'}(s)ds+$$

$$+\mathbf{1}_{\{i_1=i_2=i_3\}}\int\limits_t^T\phi_{j_1}(s)\phi_{j_3'}(s)ds\int\limits_t^T\phi_{j_3}(s)\phi_{j_2'}(s)ds\int\limits_t^T\phi_{j_2}(s)\phi_{j_1'}(s)ds\Biggr|=$$

$$=\Bigl|\mathbf{1}_{\{j_3=j_3'\}}\mathbf{1}_{\{j_2=j_2'\}}\mathbf{1}_{\{j_1=j_1'\}}+\mathbf{1}_{\{i_1=i_2\}}\cdot\mathbf{1}_{\{j_3=j_3'\}}\mathbf{1}_{\{j_1=j_2'\}}\mathbf{1}_{\{j_2=j_1'\}}+$$

$$+\mathbf{1}_{\{i_2=i_3\}}\cdot\mathbf{1}_{\{j_1=j_1'\}}\mathbf{1}_{\{j_2=j_3'\}}\mathbf{1}_{\{j_3=j_2'\}}+\mathbf{1}_{\{i_1=i_3\}}\cdot\mathbf{1}_{\{j_1=j_3'\}}\mathbf{1}_{\{j_2=j_2'\}}\mathbf{1}_{\{j_3=j_1'\}}+$$

$$+\mathbf{1}_{\{i_1=i_2=i_3\}}\cdot\mathbf{1}_{\{j_2=j_3'\}}\mathbf{1}_{\{j_1=j_2'\}}\mathbf{1}_{\{j_3=j_1'\}}+\mathbf{1}_{\{i_1=i_2=i_3\}}\cdot\mathbf{1}_{\{j_1=j_3'\}}\mathbf{1}_{\{j_3=j_2'\}}\mathbf{1}_{\{j_2=j_1'\}}\Bigr|\le$$

$$\le\mathbf{1}_{\{j_3=j_3'\}}\mathbf{1}_{\{j_2=j_2'\}}\mathbf{1}_{\{j_1=j_1'\}}+\mathbf{1}_{\{j_3=j_3'\}}\mathbf{1}_{\{j_1=j_2'\}}\mathbf{1}_{\{j_2=j_1'\}}+$$

$$+\mathbf{1}_{\{j_1=j_1'\}}\mathbf{1}_{\{j_2=j_3'\}}\mathbf{1}_{\{j_3=j_2'\}}+\mathbf{1}_{\{j_1=j_3'\}}\mathbf{1}_{\{j_2=j_2'\}}\mathbf{1}_{\{j_3=j_1'\}}+$$

$$+\mathbf{1}_{\{j_2=j_3'\}}\mathbf{1}_{\{j_1=j_2'\}}\mathbf{1}_{\{j_3=j_1'\}}+\mathbf{1}_{\{j_1=j_3'\}}\mathbf{1}_{\{j_3=j_2'\}}\mathbf{1}_{\{j_2=j_1'\}}=$$

$$=\sum_{(j_1',j_2',j_3')}\mathbf{1}_{\{j_1=j_1'\}}\mathbf{1}_{\{j_2=j_2'\}}\mathbf{1}_{\{j_3=j_3'\}},$$

where we used the relation

$$\int\limits_t^T\phi_g(s)\phi_q(s)ds=\mathbf{1}_{\{g=q\}},\quad g,q=0,1,2\ldots$$

From (66) and (67) we obtain

$$\mathsf{M}\left\{J[\psi^{(k)}]_{T,t}^{p}\xi[\psi^{(k)}]_{T,t}^{p+1,n}\right\}=0.$$

Due to (61), (64), and (65) we can write

$$\xi[\psi^{(k)}]_{T,t}^{p+1,n}=J[\psi^{(k)}]_{T,t}^{n}-J[\psi^{(k)}]_{T,t}^{p},$$

$$\underset{n\to\infty}{\text{l.i.m.}}\ \xi[\psi^{(k)}]_{T,t}^{p+1,n}=J[\psi^{(k)}]_{T,t}-J[\psi^{(k)}]_{T,t}^{p}\stackrel{\text{def}}{=}\xi[\psi^{(k)}]_{T,t}^{p+1}.$$

We have

$$0\le\left|\mathsf{M}\left\{\xi[\psi^{(k)}]_{T,t}^{p+1}J[\psi^{(k)}]_{T,t}^{p}\right\}\right|=$$

$$= \left|\mathsf{M}\left\{\left(\xi[\psi^{(k)}]_{T,t}^{p+1} - \xi[\psi^{(k)}]_{T,t}^{p+1,n} + \xi[\psi^{(k)}]_{T,t}^{p+1,n}\right) J[\psi^{(k)}]_{T,t}^{p}\right\}\right| =$$

$$\le \left|\mathsf{M}\left\{\left(\xi[\psi^{(k)}]_{T,t}^{p+1} - \xi[\psi^{(k)}]_{T,t}^{p+1,n}\right) J[\psi^{(k)}]_{T,t}^{p}\right\}\right| + \left|\mathsf{M}\left\{\xi[\psi^{(k)}]_{T,t}^{p+1,n} J[\psi^{(k)}]_{T,t}^{p}\right\}\right| =$$

$$= \left|\mathsf{M}\left\{\left(J[\psi^{(k)}]_{T,t} - J[\psi^{(k)}]_{T,t}^{n}\right) J[\psi^{(k)}]_{T,t}^{p}\right\}\right| \le$$

$$\le \sqrt{\mathsf{M}\left\{\left(J[\psi^{(k)}]_{T,t} - J[\psi^{(k)}]_{T,t}^{n}\right)^2\right\}}\sqrt{\mathsf{M}\left\{\left(J[\psi^{(k)}]_{T,t}^{p}\right)^2\right\}} \le$$

$$\le \sqrt{\mathsf{M}\left\{\left(J[\psi^{(k)}]_{T,t} - J[\psi^{(k)}]_{T,t}^{n}\right)^2\right\}} \times$$

$$\times \left(\sqrt{\mathsf{M}\left\{\left(J[\psi^{(k)}]_{T,t}^{p} - J[\psi^{(k)}]_{T,t}\right)^2\right\}} + \sqrt{\mathsf{M}\left\{\left(J[\psi^{(k)}]_{T,t}\right)^2\right\}}\right) \le$$

$$\le K\sqrt{\mathsf{M}\left\{\left(J[\psi^{(k)}]_{T,t} - J[\psi^{(k)}]_{T,t}^{n}\right)^2\right\}} \to 0 \quad \text{if} \quad n \to \infty, \tag{70}$$

where K is a constant.

From (70) it follows that

$$\mathsf{M}\left\{\xi[\psi^{(k)}]_{T,t}^{p+1} J[\psi^{(k)}]_{T,t}^{p}\right\} = 0$$

or

$$\mathsf{M}\left\{\left(J[\psi^{(k)}]_{T,t} - J[\psi^{(k)}]_{T,t}^{p}\right) J[\psi^{(k)}]_{T,t}^{p}\right\} = 0.$$

The last equality means that

$$\mathsf{M}\left\{J[\psi^{(k)}]_{T,t} J[\psi^{(k)}]_{T,t}^{p}\right\} = \mathsf{M}\left\{\left(J[\psi^{(k)}]_{T,t}^{p}\right)^2\right\}. \tag{71}$$

Taking into account (71), we obtain

$$\mathsf{M}\left\{\left(J[\psi^{(k)}]_{T,t} - J[\psi^{(k)}]_{T,t}^{p}\right)^2\right\} = \mathsf{M}\left\{\left(J[\psi^{(k)}]_{T,t}\right)^2\right\} +$$

$$+\mathsf{M}\left\{\left(J[\psi^{(k)}]_{T,t}^{p}\right)^2\right\} - 2\mathsf{M}\left\{J[\psi^{(k)}]_{T,t} J[\psi^{(k)}]_{T,t}^{p}\right\} = \mathsf{M}\left\{\left(J[\psi^{(k)}]_{T,t}\right)^2\right\} -$$

$$-\mathsf{M}\left\{J[\psi^{(k)}]_{T,t}J[\psi^{(k)}]_{T,t}^{p}\right\}=$$

$$=\int\limits_{[t,T]^k} K^2(t_1,\ldots,t_k)dt_1\ldots dt_k-\mathsf{M}\left\{J[\psi^{(k)}]_{T,t}J[\psi^{(k)}]_{T,t}^{p}\right\}. \tag{72}$$

Consider the value

$$\mathsf{M}\left\{J[\psi^{(k)}]_{T,t}J[\psi^{(k)}]_{T,t}^{p}\right\}.$$

From (61) and (68) we obtain

$$J[\psi^{(k)}]_{T,t}^{p}=\sum_{j_1=0}^{p}\ldots\sum_{j_k=0}^{p}C_{j_k\ldots j_1}\sum_{(j_1,\ldots,j_k)}\int\limits_t^T\phi_{j_k}(t_k)\ldots\int\limits_t^{t_2}\phi_{j_1}(t_1)d\mathbf{f}_{t_1}^{(i_1)}\ldots d\mathbf{f}_{t_k}^{(i_k)}. \tag{73}$$

After substituting (73) into (72) we obtain (79). Theorem 10 is proved.

Let $J[\psi^{(k)}]_{T,t}^{p_1,\ldots,p_k}$ be the expression before passing to the limit $\underset{p_1,\ldots,p_k\to\infty}{\text{l.i.m.}}$ in (14). Denote

$$\mathsf{M}\left\{\left(J[\psi^{(k)}]_{T,t}-J[\psi^{(k)}]_{T,t}^{p_1,\ldots,p_k}\right)^2\right\}\stackrel{\text{def}}{=}E_k^{p_1,\ldots,p_k},$$

$$E_k^{p_1,\ldots,p_k}\stackrel{\text{def}}{=}E_k^{p}\quad\text{if}\quad p_1=\ldots=p_k=p,$$

$$\|K\|_{L_2([t,T]^k)}^2=\int\limits_{[t,T]^k}K^2(t_1,\ldots,t_k)dt_1\ldots dt_k\stackrel{\text{def}}{=}I_k.$$

In [21], [23]-[26], [33] it was shown that

$$E_k^{p_1,\ldots,p_k}\le k!\left(I_k-\sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k}C_{j_k\ldots j_1}^2\right) \tag{74}$$

if

$$i_1,\ldots,i_k=1,\ldots,m\quad(0<T-t<\infty)$$

or

$$i_1,\ldots,i_k=0,1,\ldots,m\quad(0<T-t<1).$$

Moreover, in [11]-[18], [21], [23]-[26], [34] it was shown that

$$\mathsf{M}\left\{\left(J[\psi^{(k)}]_{T,t}-J[\psi^{(k)}]_{T,t}^{p_1,\ldots,p_k}\right)^{2n}\right\}\le C_{n,k}\left(I_k-\sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k}C_{j_k\ldots j_1}^2\right)^n,$$

where

$$C_{n,k}=(k!)^{2n}(n(2n-1))^{n(k-1)}(2n-1)!! \quad (n\in\mathbb{N}).$$

Remark 1. *Note that*

$$\mathsf{M}\left\{J[\psi^{(k)}]_{T,t}\int\limits_t^T\phi_{j_k}(t_k)\ldots\int\limits_t^{t_2}\phi_{j_1}(t_1)d\mathbf{f}_{t_1}^{(i_1)}\ldots d\mathbf{f}_{t_k}^{(i_k)}\right\}=$$

$$=\int\limits_t^T\psi_k(t_k)\phi_{j_k}(t_k)\ldots\int\limits_t^{t_2}\psi_1(t_1)\phi_{j_1}(t_1)dt_1\ldots dt_k=C_{j_k\ldots j_1}.$$

Then from Theorem 10 *for pairwise different* $i_1,\ldots,i_k$ *and for* $i_1=\ldots=i_k$ *we get*

$$E_k^p=I_k-\sum_{j_1,\ldots,j_k=0}^{p}C_{j_k\ldots j_1}^2, \tag{75}$$

$$E_k^p=I_k-\sum_{j_1,\ldots,j_k=0}^{p}C_{j_k\ldots j_1}\left(\sum_{(j_1,\ldots,j_k)}C_{j_k\ldots j_1}\right).$$

Consider some examples of application of Theorem 10 $(i_1,\ldots,i_5=1,\ldots,m)$

$$E_2^p=I_2-\sum_{j_1,j_2=0}^{p}C_{j_2j_1}^2-\sum_{j_1,j_2=0}^{p}C_{j_2j_1}C_{j_1j_2}\quad (i_1=i_2),$$

$$E_3^p=I_3-\sum_{j_3,j_2,j_1=0}^{p}C_{j_3j_2j_1}^2-\sum_{j_3,j_2,j_1=0}^{p}C_{j_3j_1j_2}C_{j_3j_2j_1}\quad (i_1=i_2\ne i_3), \tag{76}$$

$$E_3^p=I_3-\sum_{j_3,j_2,j_1=0}^{p}C_{j_3j_2j_1}^2-\sum_{j_3,j_2,j_1=0}^{p}C_{j_2j_3j_1}C_{j_3j_2j_1}\quad (i_1\ne i_2=i_3), \tag{77}$$

$$E_3^p=I_3-\sum_{j_3,j_2,j_1=0}^{p}C_{j_3j_2j_1}^2-\sum_{j_3,j_2,j_1=0}^{p}C_{j_3j_2j_1}C_{j_1j_2j_3}\quad (i_1=i_3\ne i_2), \tag{78}$$

$$E_4^p=I_4-\sum_{j_1,\ldots,j_4=0}^{p}C_{j_4\ldots j_1}\left(\sum_{(j_1,j_2)}C_{j_4\ldots j_1}\right)\quad (i_1=i_2\ne i_3,i_4;\ i_3\ne i_4),$$

$$E_4^p = I_4 - \sum_{j_1,\ldots,j_4=0}^{p} C_{j_4\ldots j_1} \left(\sum_{(j_1,j_4)} C_{j_4\ldots j_1} \right) \quad (i_1 = i_4 \neq i_2, i_3;\ i_2 \neq i_3),$$

$$E_4^p = I_4 - \sum_{j_1,\ldots,j_4=0}^{p} C_{j_4\ldots j_1} \left(\sum_{(j_1,j_2,j_3)} C_{j_4\ldots j_1} \right) \quad (i_1 = i_2 = i_3 \neq i_4),$$

$$E_4^p = I_4 - \sum_{j_1,\ldots,j_4=0}^{p} C_{j_4\ldots j_1} \left(\sum_{(j_2,j_3,j_4)} C_{j_4\ldots j_1} \right) \quad (i_2 = i_3 = i_4 \neq i_1),$$

$$E_4^p = I_4 - \sum_{j_1,\ldots,j_4=0}^{p} C_{j_4\ldots j_1} \left(\sum_{(j_1,j_2)} \left(\sum_{(j_3,j_4)} C_{j_4\ldots j_1} \right) \right) \quad (i_1 = i_2 \neq i_3 = i_4),$$

$$E_4^p = I_4 - \sum_{j_1,\ldots,j_4=0}^{p} C_{j_4\ldots j_1} \left(\sum_{(j_1,j_4)} \left(\sum_{(j_2,j_3)} C_{j_4\ldots j_1} \right) \right) \quad (i_1 = i_4 \neq i_2 = i_3),$$

$$E_5^p = I_5 - \sum_{j_1,\ldots,j_5=0}^{p} C_{j_5\ldots j_1} \left(\sum_{(j_2,j_4)} \left(\sum_{(j_3,j_5)} C_{j_5\ldots j_1} \right) \right) \quad (i_1 \neq i_2 = i_4 \neq i_3 = i_5 \neq i_1),$$

$$E_5^p = I_5 - \sum_{j_1,\ldots,j_5=0}^{p} C_{j_5\ldots j_1} \left(\sum_{(j_4,j_5)} \left(\sum_{(j_1,j_2,j_3)} C_{j_5\ldots j_1} \right) \right) \quad (i_1 = i_2 = i_3 \neq i_4 = i_5),$$

$$E_5^p = I_5 - \sum_{j_1,\ldots,j_5=0}^{p} C_{j_5\ldots j_1} \left(\sum_{(j_1,j_3,j_4,j_5)} C_{j_5\ldots j_1} \right) \quad (i_1 = i_3 = i_4 = i_5 \neq i_2).$$

Consider a generalization of Theorem 10 to the case of an arbitrary complete orthonormal system of functions in the space $L_2([t,T])$ and $\psi_1(\tau),\ \ldots, \psi_k(\tau) \in L_2([t,T])$

Theorem 11 [24] (Sect. 1.12), [33] (Sect. 6). *Suppose that $\{\phi_j(x)\}_{j=0}^{\infty}$ is an arbitrary complete orthonormal system of functions in the space $L_2([t,T])$ and $\psi_1(\tau),\ldots,\psi_k(\tau) \in L_2([t,T])$, $i_1,\ldots,i_k = 1,\ldots,m$. Then*

$$\mathsf{M}\left\{\left(J[\psi^{(k)}]_{T,t} - J[\psi^{(k)}]_{T,t}^p\right)^2\right\} = \int\limits_{[t,T]^k} K^2(t_1,\ldots,t_k)dt_1\ldots dt_k -$$

$$-\sum_{j_1,\ldots,j_k=0}^{p} C_{j_k\ldots j_1} \mathsf{M}\left\{J[\psi^{(k)}]_{T,t} \sum_{(j_1,\ldots,j_k)} \int\limits_t^T \phi_{j_k}(t_k)\ldots \int\limits_t^{t_2} \phi_{j_1}(t_1) d\mathbf{f}_{t_1}^{(i_1)} \ldots d\mathbf{f}_{t_k}^{(i_k)}\right\}, \tag{79}$$

where $i_1,\ldots,i_k = 1,\ldots,m$; the expression

$$\sum_{(j_1,\ldots,j_k)}$$

means the sum with respect to all possible permutations $(j_1,\ldots,j_k)$. At the same time if j_r swapped with j_q in the permutation $(j_1,\ldots,j_k)$, then i_r swapped with i_q in the permutation $(i_1,\ldots,i_k)$,

$$J[\psi^{(k)}]_{T,t}^{p} = \sum_{j_1,\ldots,j_k=0}^{p} C_{j_k\ldots j_1}\Biggl(\prod_{l=1}^{k}\zeta_{j_l}^{(i_l)} + \sum_{r=1}^{[k/2]}(-1)^r\times$$

$$\times \sum_{\substack{(\{\{g_1,g_2\},\ldots,\{g_{2r-1},g_{2r}\}\},\{q_1,\ldots,q_{k-2r}\})\\ \{g_1,g_2,\ldots,g_{2r-1},g_{2r},q_1,\ldots,q_{k-2r}\}=\{1,2,\ldots,k\}}} \prod_{s=1}^{r}\mathbf{1}_{\{i_{g_{2s-1}}=\ i_{g_{2s}}\neq 0\}}\mathbf{1}_{\{j_{g_{2s-1}}=\ j_{g_{2s}}\}}\prod_{l=1}^{k-2r}\zeta_{j_{q_l}}^{(i_{q_l})}\Biggr);$$

another notations are the same as in Theorems 2–4.

6. Approximation of Specific Iterated Ito and Stratonovich Stochastic Integrals

In this section we provide considerable practical material (based on Theorems 2–9 and Legendre polynomials) concerning expansions and approximations of iterated Ito and Stratonovich stochastic integrals. The question about what kind of functions (polynomial or trigonometric) is more convenient for the mean-square approximation of iterated stochastic integrals is also considered.

Let us consider the following iterated Ito and Stratonovich stochastic integrals

$$I_{(l_1\ldots l_k)T,t}^{(i_1\ldots i_k)} = \int\limits_t^T (t-t_k)^{l_k}\ldots\int\limits_t^{t_2}(t-t_1)^{l_1}d\mathbf{f}_{t_1}^{(i_1)}\ldots d\mathbf{f}_{t_k}^{(i_k)}, \tag{80}$$

$$I_{(l_1\ldots l_k)T,t}^{*(i_1\ldots i_k)} = \int\limits_t^{*T} (t-t_k)^{l_k}\ldots\int\limits_t^{*t_2}(t-t_1)^{l_1}d\mathbf{f}_{t_1}^{(i_1)}\ldots d\mathbf{f}_{t_k}^{(i_k)}, \tag{81}$$

where $i_1,\ldots,i_k = 1,\ldots,m,\ \ l_1,\ldots,l_k = 0,1,\ldots$

The complete orthonormal system of Legendre polynomials in the space $L_2([t,T])$ looks as follows

$$\phi_j(x) = \sqrt{\frac{2j+1}{T-t}}P_j\left(\left(x-\frac{T+t}{2}\right)\frac{2}{T-t}\right),\quad j=0,1,2,\ldots, \tag{82}$$

where $P_j(x)$ is the Legendre polynomial.

Using the system of functions (82) as well as Theorems 2–9, we obtain the following expansions of iterated Ito and Stratonovich stochastic integrals (80), (81) [24]

$$I_{(0)T,t}^{(i_1)} = \sqrt{T-t}\zeta_0^{(i_1)},$$

$$I_{(1)T,t}^{(i_1)} = -\frac{(T-t)^{3/2}}{2}\left(\zeta_0^{(i_1)}+\frac{1}{\sqrt{3}}\zeta_1^{(i_1)}\right), \tag{83}$$

$$I_{(2)T,t}^{(i_1)} = \frac{(T-t)^{5/2}}{3}\left(\zeta_0^{(i_1)}+\frac{\sqrt{3}}{2}\zeta_1^{(i_1)}+\frac{1}{2\sqrt{5}}\zeta_2^{(i_1)}\right), \tag{84}$$

(85)
$$I_{(00)T,t}^{*(i_1 i_2)}=\frac{T-t}{2}\left(\zeta_0^{(i_1)}\zeta_0^{(i_2)}+\sum_{i=1}^{\infty}\frac{1}{\sqrt{4i^2-1}}\left(\zeta_{i-1}^{(i_1)}\zeta_i^{(i_2)}-\zeta_i^{(i_1)}\zeta_{i-1}^{(i_2)}\right)\right),$$

$$I_{(00)T,t}^{(i_1 i_2)}=\frac{T-t}{2}\left(\zeta_0^{(i_1)}\zeta_0^{(i_2)}+\sum_{i=1}^{\infty}\frac{1}{\sqrt{4i^2-1}}\left(\zeta_{i-1}^{(i_1)}\zeta_i^{(i_2)}-\zeta_i^{(i_1)}\zeta_{i-1}^{(i_2)}\right)-\mathbf{1}_{\{i_1=i_2\}}\right),$$

$$I_{(01)T,t}^{*(i_1 i_2)}=-\frac{T-t}{2}I_{(00)T,t}^{*(i_1 i_2)}-\frac{(T-t)^2}{4}\Biggl(\frac{1}{\sqrt{3}}\zeta_0^{(i_1)}\zeta_1^{(i_2)}+$$

$$+\sum_{i=0}^{\infty}\left(\frac{(i+2)\zeta_i^{(i_1)}\zeta_{i+2}^{(i_2)}-(i+1)\zeta_{i+2}^{(i_1)}\zeta_i^{(i_2)}}{\sqrt{(2i+1)(2i+5)}(2i+3)}-\frac{\zeta_i^{(i_1)}\zeta_i^{(i_2)}}{(2i-1)(2i+3)}\right)\Biggr),$$

$$I_{(10)T,t}^{*(i_1 i_2)}=-\frac{T-t}{2}I_{(00)T,t}^{*(i_1 i_2)}-\frac{(T-t)^2}{4}\Biggl(\frac{1}{\sqrt{3}}\zeta_0^{(i_2)}\zeta_1^{(i_1)}+$$

(86)
$$+\sum_{i=0}^{\infty}\left(\frac{(i+1)\zeta_{i+2}^{(i_2)}\zeta_i^{(i_1)}-(i+2)\zeta_i^{(i_2)}\zeta_{i+2}^{(i_1)}}{\sqrt{(2i+1)(2i+5)}(2i+3)}+\frac{\zeta_i^{(i_1)}\zeta_i^{(i_2)}}{(2i-1)(2i+3)}\right)\Biggr),$$

or

$$I_{(01)T,t}^{*(i_1 i_2)}=\underset{p\to\infty}{\text{l.i.m.}}\sum_{j_1,j_2=0}^{p}C_{j_2 j_1}^{01}\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)},$$

$$I_{(10)T,t}^{*(i_1 i_2)}=\underset{p\to\infty}{\text{l.i.m.}}\sum_{j_1,j_2=0}^{p}C_{j_2 j_1}^{10}\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)},$$

where

$$C_{j_2 j_1}^{01}=\frac{\sqrt{(2j_1+1)(2j_2+1)}}{8}(T-t)^2\bar{C}_{j_2 j_1}^{01},$$

$$C_{j_2 j_1}^{10}=\frac{\sqrt{(2j_1+1)(2j_2+1)}}{8}(T-t)^2\bar{C}_{j_2 j_1}^{10},$$

$$\bar{C}_{j_2 j_1}^{01}=-\int\limits_{-1}^{1}(1+y)P_{j_2}(y)\int\limits_{-1}^{y}P_{j_1}(x)dxdy,$$

$$\bar{C}_{j_2 j_1}^{10}=-\int\limits_{-1}^{1}P_{j_2}(y)\int\limits_{-1}^{y}(1+x)P_{j_1}(x)dxdy;$$

$$I_{(10)T,t}^{(i_1 i_2)}=I_{(10)T,t}^{*(i_1 i_2)}+\frac{1}{4}\mathbf{1}_{\{i_1=i_2\}}(T-t)^2,\quad I_{(01)T,t}^{(i_1 i_2)}=I_{(01)T,t}^{*(i_1 i_2)}+\frac{1}{4}\mathbf{1}_{\{i_1=i_2\}}(T-t)^2\quad \text{w. p. 1},$$

$$I_{(01)T,t}^{(i_1i_2)}=-\frac{T-t}{2}I_{(00)T,t}^{(i_1i_2)}-\frac{(T-t)^2}{4}\Biggl(\frac{1}{\sqrt{3}}\zeta_0^{(i_1)}\zeta_1^{(i_2)}+$$

$$+\sum_{i=0}^{\infty}\Biggl(\frac{(i+2)\zeta_i^{(i_1)}\zeta_{i+2}^{(i_2)}-(i+1)\zeta_{i+2}^{(i_1)}\zeta_i^{(i_2)}}{\sqrt{(2i+1)(2i+5)}(2i+3)}-\frac{\zeta_i^{(i_1)}\zeta_i^{(i_2)}}{(2i-1)(2i+3)}\Biggr)\Biggr),$$

$$I_{(10)T,t}^{(i_1i_2)}=-\frac{T-t}{2}I_{(00)T,t}^{(i_1i_2)}-\frac{(T-t)^2}{4}\Biggl(\frac{1}{\sqrt{3}}\zeta_0^{(i_2)}\zeta_1^{(i_1)}+$$

$$+\sum_{i=0}^{\infty}\Biggl(\frac{(i+1)\zeta_{i+2}^{(i_2)}\zeta_i^{(i_1)}-(i+2)\zeta_i^{(i_2)}\zeta_{i+2}^{(i_1)}}{\sqrt{(2i+1)(2i+5)}(2i+3)}+\frac{\zeta_i^{(i_1)}\zeta_i^{(i_2)}}{(2i-1)(2i+3)}\Biggr)\Biggr),$$

or

$$I_{(01)T,t}^{(i_1i_2)}=\underset{p\to\infty}{\text{l.i.m.}}\sum_{j_1,j_2=0}^{p}C_{j_2j_1}^{01}\Biggl(\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}-\mathbf{1}_{\{i_1=i_2\}}\mathbf{1}_{\{j_1=j_2\}}\Biggr),$$

$$I_{(10)T,t}^{(i_1i_2)}=\underset{p\to\infty}{\text{l.i.m.}}\sum_{j_1,j_2=0}^{p}C_{j_2j_1}^{10}\Biggl(\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}-\mathbf{1}_{\{i_1=i_2\}}\mathbf{1}_{\{j_1=j_2\}}\Biggr),$$

$$I_{(000)T,t}^{*(i_1i_2i_3)}=\underset{p\to\infty}{\text{l.i.m.}}\sum_{j_1,j_2,j_3=0}^{p}C_{j_3j_2j_1}\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}\zeta_{j_3}^{(i_3)},$$

$$I_{(000)T,t}^{(i_1i_2i_3)}=\underset{p\to\infty}{\text{l.i.m.}}\sum_{j_1,j_2,j_3=0}^{p}C_{j_3j_2j_1}\Biggl(\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}\zeta_{j_3}^{(i_3)}-\mathbf{1}_{\{i_1=i_2\neq 0\}}\mathbf{1}_{\{j_1=j_2\}}\zeta_{j_3}^{(i_3)}-$$

(87)
$$-\mathbf{1}_{\{i_2=i_3\neq 0\}}\mathbf{1}_{\{j_2=j_3\}}\zeta_{j_1}^{(i_1)}-\mathbf{1}_{\{i_1=i_3\neq 0\}}\mathbf{1}_{\{j_1=j_3\}}\zeta_{j_2}^{(i_2)}\Biggr),$$

$$I_{(000)T,t}^{(i_1i_1i_1)}=\frac{1}{6}(T-t)^{3/2}\left(\left(\zeta_0^{(i_1)}\right)^3-3\zeta_0^{(i_1)}\right)\quad \text{w. p. 1},$$

$$I_{(000)T,t}^{*(i_1i_1i_1)}=\frac{1}{6}(T-t)^{3/2}\left(\zeta_0^{(i_1)}\right)^3\quad \text{w. p. 1},$$

where

(88)

Consider the approximation $I_{(00)T,t}^{*(i_1i_2)q}$ of the iterated stochastic integral $I_{(00)T,t}^{*(i_1i_2)}$ obtained from (85) by replacing ∞ on q.

It is easy to prove that [47] (1997)

$$\mathsf{M}\left\{\left(I_{(00)T,t}^{*(i_1i_2)}-I_{(00)T,t}^{*(i_1i_2)q}\right)^2\right\}=\frac{(T-t)^2}{2}\left(\frac{1}{2}-\sum_{i=1}^{q}\frac{1}{4i^2-1}\right)\quad(i_1\neq i_2).$$

Further, using Theorems 10, 11, we obtain for $i_1\neq i_2$

$$\mathsf{M}\left\{\left(I_{(10)T,t}^{*(i_1i_2)}-I_{(10)T,t}^{*(i_1i_2)q}\right)^2\right\}=\mathsf{M}\left\{\left(I_{(01)T,t}^{*(i_1i_2)}-I_{(01)T,t}^{*(i_1i_2)q}\right)^2\right\}=$$

$$=\frac{(T-t)^4}{16}\left(\frac{5}{9}-2\sum_{i=2}^{q}\frac{1}{4i^2-1}-\sum_{i=1}^{q}\frac{1}{(2i-1)^2(2i+3)^2}-\sum_{i=0}^{q}\frac{(i+2)^2+(i+1)^2}{(2i+1)(2i+5)(2i+3)^2}\right).$$

For the case $i_1=i_2$ using Theorems 10, 11, we have

$$\mathsf{M}\left\{\left(I_{(10)T,t}^{(i_1i_1)}-I_{(10)T,t}^{(i_1i_1)q}\right)^2\right\}=\mathsf{M}\left\{\left(I_{(01)T,t}^{(i_1i_1)}-I_{(01)T,t}^{(i_1i_1)q}\right)^2\right\}=$$

$$=\frac{(T-t)^4}{16}\left(\frac{1}{9}-\sum_{i=0}^{q}\frac{1}{(2i+1)(2i+5)(2i+3)^2}-2\sum_{i=1}^{q}\frac{1}{(2i-1)^2(2i+3)^2}\right).\qquad(100)$$

On the basis of the presented expansions of iterated stochastic integrals we can see that increasing of multiplicities of these integrals or degree indexes of their weight functions leads to a noticeable complication of formulas for the mentioned expansions.

However, increasing of the mentioned parameters leads to increasing of orders of smallness with respect to $T-t$ in the mean-square sense for iterated stochastic integrals. As a result, this feature leads to a sharp decrease of member quantities in expansions of iterated stochastic integrals, which are required for achieving the acceptable accuracy of approximation. In the context of it, let us consider the approach to approximation of iterated stochastic integrals, which provides a possibility to obtain the mean-square approximations of the required accuracy without the using of complex expansions.

Let us analyze the following approximation of triple stochastic integral on the base of (87)

$$I_{(000)T,t}^{(i_1 i_2 i_3)q_1} = \sum_{j_1,j_2,j_3=0}^{q_1} C_{j_3 j_2 j_1} \Biggl(\zeta_{j_1}^{(i_1)} \zeta_{j_2}^{(i_2)} \zeta_{j_3}^{(i_3)} - \mathbf{1}_{\{i_1=i_2\}} \mathbf{1}_{\{j_1=j_2\}} \zeta_{j_3}^{(i_3)} -$$

$$- \mathbf{1}_{\{i_2=i_3\}} \mathbf{1}_{\{j_2=j_3\}} \zeta_{j_1}^{(i_1)} - \mathbf{1}_{\{i_1=i_3\}} \mathbf{1}_{\{j_1=j_3\}} \zeta_{j_2}^{(i_2)} \Biggr), \qquad (101)$$

where $C_{j_3 j_2 j_1}$ is defined by (88), (89).

In particular, from (101) for $i_1 \neq i_2$, $i_2 \neq i_3$, $i_1 \neq i_3$ we obtain

$$I_{(000)T,t}^{(i_1 i_2 i_3)q_1} = \sum_{j_1,j_2,j_3=0}^{q_1} C_{j_3 j_2 j_1} \zeta_{j_1}^{(i_1)} \zeta_{j_2}^{(i_2)} \zeta_{j_3}^{(i_3)}. \qquad (102)$$

Using (74), (75), (76)–(78), we get

$$\mathsf{M}\left\{ \left(I_{(000)T,t}^{(i_1 i_2 i_3)} - I_{(000)T,t}^{(i_1 i_2 i_3)q_1} \right)^2 \right\} =$$

$$= \frac{(T-t)^3}{6} - \sum_{j_1,j_2,j_3=0}^{q_1} C_{j_3 j_2 j_1}^2 \quad (i_1 \neq i_2, i_1 \neq i_3, i_2 \neq i_3), \qquad (103)$$

$$\mathsf{M}\left\{ \left(I_{(000)T,t}^{(i_1 i_2 i_3)} - I_{(000)T,t}^{(i_1 i_2 i_3)q_1} \right)^2 \right\} =$$

$$= \frac{(T-t)^3}{6} - \sum_{j_1,j_2,j_3=0}^{q_1} C_{j_3 j_2 j_1}^2 - \sum_{j_1,j_2,j_3=0}^{q_1} C_{j_2 j_3 j_1} C_{j_3 j_2 j_1} \quad (i_1 \neq i_2 = i_3), \qquad (104)$$

$$\mathsf{M}\left\{ \left(I_{(000)T,t}^{(i_1 i_2 i_3)} - I_{(000)T,t}^{(i_1 i_2 i_3)q_1} \right)^2 \right\} =$$

$$= \frac{(T-t)^3}{6} - \sum_{j_1,j_2,j_3=0}^{q_1} C_{j_3 j_2 j_1}^2 - \sum_{j_1,j_2,j_3=0}^{q_1} C_{j_3 j_2 j_1} C_{j_1 j_2 j_3} \quad (i_1 = i_3 \neq i_2), \qquad (105)$$

$$\mathsf{M}\left\{ \left(I_{(000)T,t}^{(i_1 i_2 i_3)} - I_{(000)T,t}^{(i_1 i_2 i_3)q_1} \right)^2 \right\} =$$

$$= \frac{(T-t)^3}{6} - \sum_{j_1,j_2,j_3=0}^{q_1} C_{j_3 j_2 j_1}^2 - \sum_{j_1,j_2,j_3=0}^{q_1} C_{j_3 j_1 j_2} C_{j_3 j_2 j_1} \quad (i_1 = i_2 \neq i_3), \qquad (106)$$

$$\mathsf{M}\left\{\left(I_{(000)T,t}^{(i_1 i_2 i_3)}-I_{(000)T,t}^{(i_1 i_2 i_3)q_1}\right)^2\right\}\le 6\left(\frac{(T-t)^3}{6}-\sum_{j_1,j_2,j_3=0}^{q_1}C_{j_3 j_2 j_1}^2\right)\quad (i_1,i_2,i_3=1,\ldots,m). \tag{107}$$

We can act similarly with more complicated iterated stochastic integrals. For example, for the approximation of stochastic integral $I_{(0000)T,t}^{(i_1 i_2 i_3 i_4)}$ we can write (see (93))

$$I_{(0000)T,t}^{(i_1 i_2 i_3 i_4)q_2}=\sum_{j_1,j_2,j_3,j_4=0}^{q_2}C_{j_4 j_3 j_2 j_1}\Biggl(\prod_{l=1}^{4}\zeta_{j_l}^{(i_l)}-$$
$$-\mathbf{1}_{\{i_1=i_2\}}\mathbf{1}_{\{j_1=j_2\}}\zeta_{j_3}^{(i_3)}\zeta_{j_4}^{(i_4)}-\mathbf{1}_{\{i_1=i_3\}}\mathbf{1}_{\{j_1=j_3\}}\zeta_{j_2}^{(i_2)}\zeta_{j_4}^{(i_4)}-$$
$$-\mathbf{1}_{\{i_1=i_4\}}\mathbf{1}_{\{j_1=j_4\}}\zeta_{j_2}^{(i_2)}\zeta_{j_3}^{(i_3)}-\mathbf{1}_{\{i_2=i_3\}}\mathbf{1}_{\{j_2=j_3\}}\zeta_{j_1}^{(i_1)}\zeta_{j_4}^{(i_4)}-$$
$$-\mathbf{1}_{\{i_2=i_4\}}\mathbf{1}_{\{j_2=j_4\}}\zeta_{j_1}^{(i_1)}\zeta_{j_3}^{(i_3)}-\mathbf{1}_{\{i_3=i_4\}}\mathbf{1}_{\{j_3=j_4\}}\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}+$$
$$+\mathbf{1}_{\{i_1=i_2\}}\mathbf{1}_{\{j_1=j_2\}}\mathbf{1}_{\{i_3=i_4\}}\mathbf{1}_{\{j_3=j_4\}}+\mathbf{1}_{\{i_1=i_3\}}\mathbf{1}_{\{j_1=j_3\}}\mathbf{1}_{\{i_2=i_4\}}\mathbf{1}_{\{j_2=j_4\}}+$$
$$+\mathbf{1}_{\{i_1=i_4\}}\mathbf{1}_{\{j_1=j_4\}}\mathbf{1}_{\{i_2=i_3\}}\mathbf{1}_{\{j_2=j_3\}}\Biggr),$$

where $C_{j_4 j_3 j_2 j_1}$ is defined by (94), (95). Moreover, according to (74)

$$\mathsf{M}\left\{\left(I_{(0000)T,t}^{(i_1 i_2 i_3 i_4)}-I_{(0000)T,t}^{(i_1 i_2 i_3 i_4)q_2}\right)^2\right\}\le 24\left(\frac{(T-t)^4}{24}-\sum_{j_1,j_2,j_3,j_4=0}^{q_2}C_{j_4 j_3 j_2 j_1}^2\right)\quad (i_1,i_2,i_3,i_4=1,\ldots,m).$$

For pairwise different $i_1,i_2,i_3,i_4=1,\ldots,m$ from (75) we obtain

$$\mathsf{M}\left\{\left(I_{(0000)T,t}^{(i_1 i_2 i_3 i_4)}-I_{(0000)T,t}^{(i_1 i_2 i_3 i_4)q_2}\right)^2\right\}=\frac{(T-t)^4}{24}-\sum_{j_1,j_2,j_3,j_4=0}^{q_2}C_{j_4 j_3 j_2 j_1}^2. \tag{108}$$

Using Theorems 10, 11, we can calculate exactly the left-hand side of (108) for any possible combinations of i_1,i_2,i_3,i_4. These relations were obtained in [23]-[26], [33].

In Tables 1–3, we have some examples of exact values of the Fourier–Legendre coefficients (here and further in this article the Fourier–Legendre coefficients have been calculated exactly using Derive (computer algebra system)). Note that in [49], [50] we used the database with 270,000 exactly calculated Fourier–Legendre coefficients. These coefficients [49], [50] were calculated using the Python programming language.

Assume that $q_1=6$. Calculating the value of expression (103) for $q_1=6$, $i_1\ne i_2$, $i_1\ne i_3$, $i_3\ne i_2$, we obtain

$$\mathsf{M}\left\{\left(I_{(000)T,t}^{(i_1 i_2 i_3)}-I_{(000)T,t}^{(i_1 i_2 i_3)q_1}\right)^2\right\}\approx 0.01956(T-t)^3.$$

Let us choose, for example, $q_2 = 2$. In the case of pairwise different i_1, i_2, i_3, i_4 we have from (108) the following approximate equality

(109) $$\mathsf{M}\left\{\left(I_{(0000)T,t}^{(i_1i_2i_3i_4)} - I_{(0000)T,t}^{(i_1i_2i_3i_4)q_2}\right)^2\right\} \approx 0.0236084(T-t)^4.$$

Consider the approximations

$$I_{(001)T,t}^{(i_1i_2i_3)q_3}, \quad I_{(010)T,t}^{(i_1i_2i_3)q_3}, \quad I_{(100)T,t}^{(i_1i_2i_3)q_3}, \quad I_{(00000)T,t}^{(i_1i_2i_3i_4i_5)q_4}$$

based on the expansions (96)–(99).

Assume that $q_3 = 2$, $q_4 = 1$. In the case of pairwise different $i_1, \ldots, i_5$ we obtain

$$\mathsf{M}\left\{\left(I_{(100)T,t}^{(i_1i_2i_3)} - I_{(100)T,t}^{(i_1i_2i_3)q_3}\right)^2\right\} = \frac{(T-t)^5}{60} - \sum_{j_1,j_2,j_3=0}^{2} \left(C_{j_3j_2j_1}^{100}\right)^2 \approx 0.00815429(T-t)^5,$$

$$\mathsf{M}\left\{\left(I_{(010)T,t}^{(i_1i_2i_3)} - I_{(010)T,t}^{(i_1i_2i_3)q_3}\right)^2\right\} = \frac{(T-t)^5}{20} - \sum_{j_1,j_2,j_3=0}^{2} \left(C_{j_3j_2j_1}^{010}\right)^2 \approx 0.0173903(T-t)^5,$$

$$\mathsf{M}\left\{\left(I_{(001)T,t}^{(i_1i_2i_3)}-I_{(001)T,t}^{(i_1i_2i_3)q_3}\right)^2\right\}=\frac{(T-t)^5}{10}-\sum_{j_1,j_2,j_3=0}^{2}\left(C_{j_3j_2j_1}^{001}\right)^2\approx 0.0252801(T-t)^5,$$

$$\mathsf{M}\left\{\left(I_{(00000)T,t}^{(i_1i_2i_3i_4i_5)}-I_{(00000)T,t}^{(i_1i_2i_3i_4i_5)q_4}\right)^2\right\}=$$

$$=\frac{(T-t)^5}{120}-\sum_{j_1,j_2,j_3,j_4,j_5=0}^{1}C_{j_5j_4j_3j_2j_1}^2\approx 0.00759105(T-t)^5.$$

Note that from (74) we have

$$\mathsf{M}\left\{\left(I_{(00000)T,t}^{(i_1i_2i_3i_4i_5)}-I_{(0000)T,t}^{(i_1i_2i_3i_4i_5)q_4}\right)^2\right\}\le 120\left(\frac{(T-t)^5}{120}-\sum_{j_1,j_2,j_3,j_4,j_5=0}^{q_4}C_{j_5j_4j_3j_2j_1}^2\right),$$

where $i_1,\ldots,i_5=1,\ldots,m$.

Let us consider the expansions of Ito stochastic integrals $I_{(1)T,t}^{(i_1)}$, $I_{(2)T,t}^{(i_1)}$ based on the Milstein approach from [3], which was mentioned in Sect. 1 (also see [2], [57])

(110) $$I_{(1)T,t}^{(i_1)q}=-\frac{(T-t)^{3/2}}{2}\left(\zeta_0^{(i_1)}-\frac{\sqrt{2}}{\pi}\left(\sum_{r=1}^{q}\frac{1}{r}\zeta_{2r-1}^{(i_1)}+\sqrt{\alpha_q}\xi_q^{(i_1)}\right)\right),$$

$$I_{(2)T,t}^{(i_1)q}=(T-t)^{5/2}\left(\frac{1}{3}\zeta_0^{(i_1)}+\frac{1}{\sqrt{2}\pi^2}\left(\sum_{r=1}^{q}\frac{1}{r^2}\zeta_{2r}^{(i_1)}+\sqrt{\beta_q}\mu_q^{(i_1)}\right)-\right.$$

(111) $$\left.-\frac{1}{\sqrt{2}\pi}\left(\sum_{r=1}^{q}\frac{1}{r}\zeta_{2r-1}^{(i_1)}+\sqrt{\alpha_q}\xi_q^{(i_1)}\right)\right),$$

where $\zeta_j^{(i)}$ is defined by the formula (15), $\phi_j(\tau)$ is a complete orthonormal system of trigonometric functions in the space $L_2([t,T])$, and $\zeta_0^{(i)}$, $\zeta_{2r}^{(i)}$, $\zeta_{2r-1}^{(i)}$, $\xi_q^{(i)}$, $\mu_q^{(i)}$ $(r=1,\ldots,q,\ i=1,\ldots,m)$ are independent standard Gaussian random variables, $i_1=1,\ldots,m$,

$$\xi_q^{(i)}=\frac{1}{\sqrt{\alpha_q}}\sum_{r=q+1}^{\infty}\frac{1}{r}\zeta_{2r-1}^{(i)},\quad \alpha_q=\frac{\pi^2}{6}-\sum_{r=1}^{q}\frac{1}{r^2},$$

$$\mu_q^{(i)}=\frac{1}{\sqrt{\beta_q}}\sum_{r=q+1}^{\infty}\frac{1}{r^2}\ \zeta_{2r}^{(i)},\quad \beta_q=\frac{\pi^4}{90}-\sum_{r=1}^{q}\frac{1}{r^4}.$$

It is obvious that (110), (6) significantly more complicated compared to (83), (84).

Another example of obvious advantage of the Legendre polynomials over the trigonometric functions (in the framework of the considered problem) is the truncated expansion of iterated Stratonovich stochastic integral $I_{(10)T,t}^{*(i_1 i_2)}$ obtained by Theorem 5, in which instead of the double Fourier–Legendre series (see (85), (86)) is taken the double trigonometric Fourier series

$$
\begin{aligned}
I_{(10)T,t}^{*(i_1 i_2)q} = -(T-t)^2 \Biggl(& \frac{1}{6}\zeta_0^{(i_1)}\zeta_0^{(i_2)} - \frac{1}{2\sqrt{2}\pi}\sqrt{\alpha_q}\xi_q^{(i_2)}\zeta_0^{(i_1)} + \\
& + \frac{1}{2\sqrt{2}\pi^2}\sqrt{\beta_q}\left(\mu_q^{(i_2)}\zeta_0^{(i_1)} - 2\mu_q^{(i_1)}\zeta_0^{(i_2)}\right) + \\
& + \frac{1}{2\sqrt{2}}\sum_{r=1}^{q}\left(-\frac{1}{\pi r}\zeta_{2r-1}^{(i_2)}\zeta_0^{(i_1)} + \frac{1}{\pi^2 r^2}\left(\zeta_{2r}^{(i_2)}\zeta_0^{(i_1)} - 2\zeta_{2r}^{(i_1)}\zeta_0^{(i_2)}\right)\right) - \\
& - \frac{1}{2\pi^2}\sum_{\substack{r,l=1\\ r\ne l}}^{q}\frac{1}{r^2-l^2}\left(\zeta_{2r}^{(i_1)}\zeta_{2l}^{(i_2)} + \frac{l}{r}\zeta_{2r-1}^{(i_1)}\zeta_{2l-1}^{(i_2)}\right) + \\
& + \sum_{r=1}^{q}\Biggl(\frac{1}{4\pi r}\left(\zeta_{2r}^{(i_1)}\zeta_{2r-1}^{(i_2)} - \zeta_{2r-1}^{(i_1)}\zeta_{2r}^{(i_2)}\right) + \\
& + \frac{1}{8\pi^2 r^2}\left(3\zeta_{2r-1}^{(i_1)}\zeta_{2r-1}^{(i_2)} + \zeta_{2r}^{(i_2)}\zeta_{2r}^{(i_1)}\right)\Biggr)\Biggr), \qquad (112)
\end{aligned}
$$

where the meaning of the notations included in (110), (6) is saved.

7. Theorems 2–9 from Point of View of the Wong–Zakai Approximation

The iterated Ito stochastic integrals and solutions of Ito SDEs are complex and important functionals from the independent components $\mathbf{f}_s^{(i)}$, $i=1,\ldots,m$ of the multidimensional Wiener process $\mathbf{f}_s$, $s\in[0,T]$. Let $\mathbf{f}_s^{(i)p}$, $p\in\mathbb{N}$ be some approximation of $\mathbf{f}_s^{(i)}$, $i=1,\ldots,m$. Suppose that $\mathbf{f}_s^{(i)p}$ converges to $\mathbf{f}_s^{(i)}$, $i=1,\ldots,m$ if $p\to\infty$ in some sense and has differentiable sample trajectories.

A natural question arises: if we replace $\mathbf{f}_s^{(i)}$ by $\mathbf{f}_s^{(i)p}$, $i=1,\ldots,m$ in the functionals mentioned above, will the resulting functionals converge to the original functionals from the components $\mathbf{f}_s^{(i)}$, $i=1,\ldots,m$ of the multidimentional Wiener process $\mathbf{f}_s$? The answere to this question is negative in the general case. However, in the pioneering works of Wong E. and Zakai M. [61], [62], it was shown that under the special conditions and for some types of approximations of the Wiener process the answere is affirmative with one peculiarity: the convergence takes place to the iterated Stratonovich stochastic integrals and solutions of Stratonovich SDEs and not to iterated Ito stochastic integrals and solutions of Ito SDEs. The piecewise linear approximation as well as the regularization by convolution [61]-[63] relate the mentioned types of approximations of the Wiener process. The above approximation of stochastic integrals and solutions of SDEs is often called the Wong–Zakai approximation.

Let $\mathbf{f}_s$, $s\in[0,T]$ be an m-dimensional standard Wiener process with independent components $\mathbf{f}_s^{(i)}$, $i=1,\ldots,m$. It is well known that the following representation takes place [67], [68]

$$
\mathbf{f}_\tau^{(i)} - \mathbf{f}_t^{(i)} = \sum_{j=0}^{\infty}\int\limits_t^{\tau}\phi_j(s)ds\ \zeta_j^{(i)}, \quad \zeta_j^{(i)} = \int\limits_t^{T}\phi_j(s)d\mathbf{f}_s^{(i)}, \qquad (113)
$$

where $\tau\in[t,T]$, $t\ge 0$, $\{\phi_j(x)\}_{j=0}^{\infty}$ is an arbitrary complete orthonormal system of functions in the space $L_2([t,T])$, and $\zeta_j^{(i)}$ are independent standard Gaussian random variables for various i or j. Moreover, the series (113) converges for any $\tau\in[t,T]$ in the mean-square sense.

Let $\mathbf{f}_\tau^{(i)p}-\mathbf{f}_t^{(i)p}$ be the mean-square approximation of the process $\mathbf{f}_\tau^{(i)}-\mathbf{f}_t^{(i)}$, which has the following form

$$\mathbf{f}_\tau^{(i)p}-\mathbf{f}_t^{(i)p}=\sum_{j=0}^{p}\int\limits_t^{\tau}\phi_j(s)ds\ \zeta_j^{(i)}. \tag{114}$$

From (114) we obtain

$$d\mathbf{f}_\tau^{(i)p}=\sum_{j=0}^{p}\phi_j(\tau)\zeta_j^{(i)}d\tau. \tag{115}$$

Consider the following iterated Riemann–Stieltjes integral

$$\int\limits_t^T\psi_k(t_k)\ldots\int\limits_t^{t_2}\psi_1(t_1)d\mathbf{w}_{t_1}^{(i_1)p_1}\ldots d\mathbf{w}_{t_k}^{(i_k)p_k}, \tag{116}$$

where $p_1,\ldots,p_k\in\mathbb{N},\ \ i_1,\ldots,i_k=0,1,\ldots,m,$

$$d\mathbf{w}_\tau^{(i)p}=\begin{cases}d\mathbf{f}_\tau^{(i)p} & \text{for}\quad i=1,\ldots,m\\ \\ d\tau & \text{for}\quad i=0\end{cases}, \tag{117}$$

and $d\mathbf{f}_\tau^{(i)p}$ in defined by the relation (115).

Let us substitute (115) into (116)

$$\int\limits_t^T\psi_k(t_k)\ldots\int\limits_t^{t_2}\psi_1(t_1)d\mathbf{w}_{t_1}^{(i_1)p_1}\ldots d\mathbf{w}_{t_k}^{(i_k)p_k}=\sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k}C_{j_k\ldots j_1}\prod_{l=1}^{k}\zeta_{j_l}^{(i_l)}, \tag{118}$$

where

$$\zeta_j^{(i)}=\int\limits_t^T\phi_j(s)d\mathbf{w}_s^{(i)}$$

are independent standard Gaussian random variables for various i or j (in the case when $i\ne 0$), $\mathbf{w}_s^{(i)}=\mathbf{f}_s^{(i)}$ for $i=1,\ldots,m$ and $\mathbf{w}_s^{(0)}=s$,

$$C_{j_k\ldots j_1}=\int\limits_t^T\psi_k(t_k)\phi_{j_k}(t_k)\ldots\int\limits_t^{t_2}\psi_1(t_1)\phi_{j_1}(t_1)dt_1\ldots dt_k$$

is the Fourier coefficient.

To best of our knowledge [61]-[63] the approximations of the Wiener process in the Wong–Zakai approximation must satisfy fairly strong restrictions [63] (see Definition 7.1, pp. 480–481). Moreover, approximations of the Wiener process that are similar to (114) were not considered in [61], [62] (also see [63], Theorems 7.1, 7.2). Therefore, the proof of analogs of Theorems 7.1 and 7.2 [63] for approximations of the Wiener process based on its series expansion (113) should be carried out separately. Thus, the mean-square convergence of the right-hand side of (118) to the iterated Stratonovich stochastic integral (3) does not follow from the results of the papers [61], [62] (also see [63], Theorems 7.1, 7.2).

Nevetheless, the authors of the publications [2] (Sect. 5.8, pp. 202–204), [4] (pp. 82-84), [57] (pp. 438-439), [60] (pp. 263-264) use (without rigorous proof) the Wong–Zakai approximation [61]-[63] based on the series expansion of the Brownian bridge process [3].

From the other hand, Theorems 2–9 from this paper can be considered as the proof of the Wong–Zakai approximation for the iterated Stratonovich stochastic integrals (3) of multiplicities 1 to 6 based on the approximation (114) of the Wiener process. At that, the Riemann–Stieltjes integrals (116) converge (according to Theorems 2–9) to the appropriate Stratonovich stochastic integrals (3). Recall that $\{\phi_j(x)\}_{j=0}^{\infty}$ (see (113), (114), and Theorems 5–9) is a complete orthonormal system of Legendre polynomials or trigonometric functions in the space $L_2([t,T])$.

To illustrate the above reasoning, consider two examples for the case $k=2$, $\psi_1(s)$, $\psi_2(s)\equiv 1$; $i_1,i_2=1,\ldots,m$.

The first example relates to the piecewise linear approximation of the multidimensional Wiener process (these approximations were considered in [61]-[63]).

Let $\mathbf{b}_{\Delta}^{(i)}(t)$, $t\in[0,T]$ be the piecewise linear approximation of the ith component $\mathbf{f}_t^{(i)}$ of the multidimensional standard Wiener process $\mathbf{f}_t$, $t\in[0,T]$ with independent components $\mathbf{f}_t^{(i)}$, $i=1,\ldots,m$, i.e.

$$\mathbf{b}_{\Delta}^{(i)}(t)=\mathbf{f}_{k\Delta}^{(i)}+\frac{t-k\Delta}{\Delta}\Delta\mathbf{f}_{k\Delta}^{(i)},$$

where

$$\Delta\mathbf{f}_{k\Delta}^{(i)}=\mathbf{f}_{(k+1)\Delta}^{(i)}-\mathbf{f}_{k\Delta}^{(i)},\quad t\in[k\Delta,(k+1)\Delta),\quad k=0,1,\ldots,N-1.$$

Note that w. p. 1

$$\frac{d\mathbf{b}_{\Delta}^{(i)}}{dt}(t)=\frac{\Delta\mathbf{f}_{k\Delta}^{(i)}}{\Delta},\quad t\in[k\Delta,(k+1)\Delta),\quad k=0,1,\ldots,N-1. \tag{119}$$

Consider the following iterated Riemann–Stieltjes integral

$$\int\limits_0^T\int\limits_0^s d\mathbf{b}_{\Delta}^{(i_1)}(\tau)d\mathbf{b}_{\Delta}^{(i_2)}(s),\quad i_1,i_2=1,\ldots,m.$$

Using (119) and additive property of Riemann–Stieltjes integrals, we can write w. p. 1

$$\int\limits_0^T\int\limits_0^s d\mathbf{b}_{\Delta}^{(i_1)}(\tau)d\mathbf{b}_{\Delta}^{(i_2)}(s)=\int\limits_0^T\int\limits_0^s \frac{d\mathbf{b}_{\Delta}^{(i_1)}}{d\tau}(\tau)d\tau\frac{d\mathbf{b}_{\Delta}^{(i_2)}}{ds}(s)ds=$$

$$=\sum_{l=0}^{N-1}\int\limits_{l\Delta}^{(l+1)\Delta}\left(\sum_{q=0}^{l-1}\int\limits_{q\Delta}^{(q+1)\Delta}\frac{\Delta\mathbf{f}_{q\Delta}^{(i_1)}}{\Delta}d\tau+\int\limits_{l\Delta}^{s}\frac{\Delta\mathbf{f}_{l\Delta}^{(i_1)}}{\Delta}d\tau\right)\frac{\Delta\mathbf{f}_{l\Delta}^{(i_2)}}{\Delta}ds=$$

$$=\sum_{l=0}^{N-1}\sum_{q=0}^{l-1}\Delta\mathbf{f}_{q\Delta}^{(i_1)}\Delta\mathbf{f}_{l\Delta}^{(i_2)}+\frac{1}{\Delta^2}\sum_{l=0}^{N-1}\Delta\mathbf{f}_{l\Delta}^{(i_1)}\Delta\mathbf{f}_{l\Delta}^{(i_2)}\int\limits_{l\Delta}^{(l+1)\Delta}\int\limits_{l\Delta}^{s}d\tau ds=$$

$$=\sum_{l=0}^{N-1}\sum_{q=0}^{l-1}\Delta\mathbf{f}_{q\Delta}^{(i_1)}\Delta\mathbf{f}_{l\Delta}^{(i_2)}+\frac{1}{2}\sum_{l=0}^{N-1}\Delta\mathbf{f}_{l\Delta}^{(i_1)}\Delta\mathbf{f}_{l\Delta}^{(i_2)}. \tag{120}$$

Using (120) and standard relation between Stratonovich and Ito stochastic integrals, it is not difficult to show that

$$\underset{N\to\infty}{\text{l.i.m.}}\int\limits_0^T\int\limits_0^s d\mathbf{b}_{\Delta}^{(i_1)}(\tau)d\mathbf{b}_{\Delta}^{(i_2)}(s)=\int\limits_0^T\int\limits_0^s d\mathbf{f}_{\tau}^{(i_1)}d\mathbf{f}_{s}^{(i_2)}+\frac{1}{2}\mathbf{1}_{\{i_1=i_2\}}\int\limits_0^T ds=$$

$$=\int\limits_0^{*T}\int\limits_0^{*s} d\mathbf{f}_{\tau}^{(i_1)}d\mathbf{f}_{s}^{(i_2)}, \tag{121}$$

where $\Delta\to 0$ if $N\to\infty$ $(N\Delta=T)$.

Obviously, (121) agrees with Theorem 7.1 (see [63], p. 486).

The next example relates to the approximation of the Wiener process based on its series expansion (113) for $t=0$, where $\{\phi_j(x)\}_{j=0}^{\infty}$ is a complete orthonormal system of Legendre polynomials or trigonometric functions in the space $L_2([0,T])$.

Consider the following iterated Riemann–Stieltjes integral

$$\int\limits_0^T\int\limits_0^s d\mathbf{f}_{\tau}^{(i_1)p}d\mathbf{f}_{s}^{(i_2)p},\quad i_1,i_2=1,\ldots,m, \tag{122}$$

where $d\mathbf{f}_{\tau}^{(i)p}$ is defined by the relation (115).

Let us substitute (115) into (122)

$$\int\limits_0^T\int\limits_0^s d\mathbf{f}_{\tau}^{(i_1)p}d\mathbf{f}_{s}^{(i_2)p}=\sum_{j_1,j_2=0}^{p}C_{j_2j_1}\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}, \tag{123}$$

where

$$C_{j_2j_1}=\int\limits_0^T\phi_{j_2}(s)\int\limits_0^s\phi_{j_1}(\tau)d\tau ds$$

is the Fourier coefficient; another notations are the same as in (118).

As we noted above, approximations of the Wiener process that are similar to (114) were not considered in [61], [62] (also see Theorems 7.1, 7.2 in [63]). Furthermore, the extension of the results of Theorems 7.1 and 7.2 [63] to the case under consideration is not obvious.

On the other hand, we can apply the theory built in Chapters 1 and 2 of the monographs [24]-[26]. More precisely, using Theorem 5 for the case $k = 2$, we obtain from (123) the desired result

$$\underset{p\to\infty}{\text{l.i.m.}} \int\limits_0^T \int\limits_0^s d\mathbf{f}_\tau^{(i_1)p} d\mathbf{f}_s^{(i_2)p} = \underset{p\to\infty}{\text{l.i.m.}} \sum_{j_1,j_2=0}^{p} C_{j_2 j_1} \zeta_{j_1}^{(i_1)} \zeta_{j_2}^{(i_2)} =$$

$$= \int\limits_0^{*T} \int\limits_0^{*s} d\mathbf{f}_\tau^{(i_1)} d\mathbf{f}_s^{(i_2)}. \tag{124}$$

From the other hand, by Theorems 2, 4 (see (23)) for the case $k = 2$ we obtain from (123) the following relation

$$\underset{p\to\infty}{\text{l.i.m.}} \int\limits_0^T \int\limits_0^s d\mathbf{f}_\tau^{(i_1)p} d\mathbf{f}_s^{(i_2)p} = \underset{p\to\infty}{\text{l.i.m.}} \sum_{j_1,j_2=0}^{p} C_{j_2 j_1} \zeta_{j_1}^{(i_1)} \zeta_{j_2}^{(i_2)} =$$

$$= \underset{p\to\infty}{\text{l.i.m.}} \sum_{j_1,j_2=0}^{p} C_{j_2 j_1} \left(\zeta_{j_1}^{(i_1)} \zeta_{j_2}^{(i_2)} - \mathbf{1}_{\{i_1=i_2\}} \mathbf{1}_{\{j_1=j_2\}} \right) + \mathbf{1}_{\{i_1=i_2\}} \sum_{j_1=0}^{\infty} C_{j_1 j_1} =$$

$$= \int\limits_0^T \int\limits_0^s d\mathbf{f}_\tau^{(i_1)} d\mathbf{f}_s^{(i_2)} + \mathbf{1}_{\{i_1=i_2\}} \sum_{j_1=0}^{\infty} C_{j_1 j_1}. \tag{125}$$

Since

$$\sum_{j_1=0}^{\infty} C_{j_1 j_1} = \frac{1}{2} \sum_{j_1=0}^{\infty} \left(\int\limits_0^T \phi_j(\tau) d\tau \right)^2 = \frac{1}{2} \left(\int\limits_0^T \phi_0(\tau) d\tau \right)^2 = \frac{1}{2} \int\limits_0^T ds,$$

then from (125) and standard relation between Stratonovich and Ito stochastic integrals we obtain (124).

EXPANSIONS OF ITERATED STRATONOVICH STOCHASTIC INTEGRALS FROM THE TAYLOR–STRATONOVICH EXPANSION BASED ON MULTIPLE TRIGONOMETRIC FOURIER SERIES. COMPARISON WITH THE MILSTEIN EXPANSION

DMITRIY F. KUZNETSOV

Abstract. The article is devoted to comparison of the Milstein expansion of iterated Stratonovich stochastic integrals with the method of expansion of iterated stochastic integrals based on generalized multiple Fourier series. We consider the practical material connected with the expansions of iterated Stratonovich stochastic integrals from the Taylor–Stratonovich expansion based on multiple trigonometric Fourier series. The comparison of effectiveness of the Fourier–Legendre series as well as the trigonomertic Fourier series for expansions of iterated Stratonovich stochastic integrals is considered.

Contents

1. Introduction

Let $(\Omega, \mathrm{F}, \mathsf{P})$ be a complete probability space, let $\{\mathrm{F}_t, t \in [0,T]\}$ be a nondecreasing right-continous family of σ-algebras of F, and let $\mathbf{f}_t$ be a standard m-dimensional Wiener stochastic process, which is F_t-measurable for any $t \in [0,T]$. We assume that the components $\mathbf{f}_t^{(i)}$ $(i = 1, \ldots, m)$ of this process are independent. Consider an Ito stochastic differential equation (SDE) in the integral form

Mathematics Subject Classification: 60H05, 60H10, 42B05, 42C10.

Keywords: Iterated Stratonovich stochastic integral, Iterated Ito stochastic integral, Milstein expansion, Multiple Fourier–Legendre series, Multiple trigonometric Fourier series, Mean-square approximation, Expansion.

$$\mathbf{x}_t = \mathbf{x}_0 + \int\limits_0^t \mathbf{a}(\mathbf{x}_\tau, \tau) d\tau + \int\limits_0^t B(\mathbf{x}_\tau, \tau) d\mathbf{f}_\tau, \quad \mathbf{x}_0 = \mathbf{x}(0, \omega). \tag{1}$$

Here $\mathbf{x}_t$ is some n-dimensional stochastic process satisfying the equation (1). The nonrandom functions $\mathbf{a}: \mathbb{R}^n \times [0,T] \to \mathbb{R}^n$, $B: \mathbb{R}^n \times [0,T] \to \mathbb{R}^{n\times m}$ guarantee the existence and uniqueness up to stochastic equivalence of a solution of the equation (1) [1]. The second integral on the right-hand side of (1) is interpreted as an Ito stochastic integral. Let $\mathbf{x}_0$ be an n-dimensional random variable, which is F_0-measurable and $\mathsf{M}\left\{|\mathbf{x}_0|^2\right\} < \infty$ (M denotes a mathematical expectation). We assume that $\mathbf{x}_0$ and $\mathbf{f}_t - \mathbf{f}_0$ are independent when $t > 0$.

It is well known that one of the effective approaches to the numerical integration of Ito SDEs is an approach based on the Taylor–Ito and Taylor–Stratonovich expansions [2]-[7]. The most important feature of such expansions is a presence in them of the so-called iterated Ito and Stratonovich stochastic integrals, which play the key role for solving the problem of numerical integration of Ito SDEs and have the following form

$$J[\psi^{(k)}]_{T,t} = \int\limits_t^T \psi_k(t_k) \ldots \int\limits_t^{t_2} \psi_1(t_1) d\mathbf{w}_{t_1}^{(i_1)} \ldots d\mathbf{w}_{t_k}^{(i_k)}, \tag{2}$$

$$J^*[\psi^{(k)}]_{T,t} = \int\limits_t^{*T} \psi_k(t_k) \ldots \int\limits_t^{*t_2} \psi_1(t_1) d\mathbf{w}_{t_1}^{(i_1)} \ldots d\mathbf{w}_{t_k}^{(i_k)}, \tag{3}$$

where every $\psi_l(\tau)$ $(l = 1, \ldots, k)$ is a nonrandom function on $[t, T]$, $\mathbf{w}_\tau^{(i)} = \mathbf{f}_\tau^{(i)}$ for $i = 1, \ldots, m$ and $\mathbf{w}_\tau^{(0)} = \tau$; $i_1, \ldots, i_k = 0, 1, \ldots, m$;

$$\int \ \text{and} \ \int\limits^{*}$$

denote Ito and Stratonovich stochastic integrals, respectively (in this paper, we use the definition of the Stratonovich stochastic integral from [3]).

Note that $\psi_l(\tau) \equiv 1$ $(l = 1, \ldots, k)$ and $i_1, \ldots, i_k = 0, 1, \ldots, m$ for the classical Taylor–Ito and Taylor–Stratonovich expansions [2]-[7] and $\psi_l(\tau) \equiv (t - \tau)^{q_l}$ $(l = 1, \ldots, k;\ q_1, \ldots, q_k = 0, 1, 2, \ldots)$ and $i_1, \ldots, i_k = 1, \ldots, m$ for the unified Taylor–Ito and Taylor–Stratonovich expansions [8]-[24].

2. Milstein Expansion and Method of Generatized Multiple Fourier Series

Milstein G.N. proposed [2] (1988) an approach to the expansion of iterated stochastic integrals based on the trigonometric Fourier expansion of the Brownian bridge process (version of the so-called Karhunen–Loeve expansion).

Let us consider the Brownian bridge process [2]

$$\mathbf{f}_t - \frac{t}{\Delta}\mathbf{f}_\Delta, \quad t \in [0, \Delta], \quad \Delta > 0, \tag{4}$$

where $\mathbf{f}_t$ is a standard m-dimensional Wiener process with independent components $\mathbf{f}_t^{(i)}$ $(i = 1, \ldots, m)$.

Consider the componentwise Karhunen–Loeve expansion of the process (4) [2]

$$\mathbf{f}_t^{(i)}-\frac{t}{\Delta}\mathbf{f}_{\Delta}^{(i)}=\frac{1}{2}a_{i,0}+\sum_{r=1}^{\infty}\left(a_{i,r}\cos\frac{2\pi rt}{\Delta}+b_{i,r}\sin\frac{2\pi rt}{\Delta}\right) \tag{5}$$

converging in the mean-square sense, where

$$a_{i,r}=\frac{2}{\Delta}\int\limits_0^{\Delta}\left(\mathbf{f}_s^{(i)}-\frac{s}{\Delta}\mathbf{f}_{\Delta}^{(i)}\right)\cos\frac{2\pi rs}{\Delta}ds,$$

$$b_{i,r}=\frac{2}{\Delta}\int\limits_0^{\Delta}\left(\mathbf{f}_s^{(i)}-\frac{s}{\Delta}\mathbf{f}_{\Delta}^{(i)}\right)\sin\frac{2\pi rs}{\Delta}ds,$$

where $r=0,1,\ldots;\ i=1,\ldots,m.$

It is easy to demonstrate [2] that the random variables $a_{i,r}, b_{i,r}$ are Gaussian ones and they satisfy the following relations

$$\mathsf{M}\left\{a_{i,r}b_{i,r}\right\}=\mathsf{M}\left\{a_{i,r}b_{i,k}\right\}=0,\quad \mathsf{M}\left\{a_{i,r}a_{i,k}\right\}=\mathsf{M}\left\{b_{i,r}b_{i,k}\right\}=0,$$

$$\mathsf{M}\left\{a_{i_1,r}a_{i_2,r}\right\}=\mathsf{M}\left\{b_{i_1,r}b_{i_2,r}\right\}=0,\quad \mathsf{M}\left\{a_{i,r}^2\right\}=\mathsf{M}\left\{b_{i,r}^2\right\}=\frac{\Delta}{2\pi^2r^2},$$

where $i,i_1,i_2=1,\ldots,m;\ r\neq k;\ i_1\neq i_2.$

According to (5), we have

$$\mathbf{f}_t^{(i)}=\mathbf{f}_{\Delta}^{(i)}\frac{t}{\Delta}+\frac{1}{2}a_{i,0}+\sum_{r=1}^{\infty}\left(a_{i,r}\cos\frac{2\pi rt}{\Delta}+b_{i,r}\sin\frac{2\pi rt}{\Delta}\right), \tag{6}$$

where the series converges in the mean-square sense.

Note that the trigonometric functions are the eigenfunctions of the covariance operator of the Brownian bridge process. That is why the basis functions are the trigonometric functions in the considered approach.

In [2] Milstein G.N. proposed to expand (2) or (3) (for the case $k=2$ and $\psi_1(s),\psi_2(s)\equiv 1$) into iterated series of products of standard Gaussian random variables by representing the Wiener process as the series (6). To obtain the Milstein expansion of (2) or (3), the truncated expansions (6) of components of the Wiener process $\mathbf{f}_s$ must be iteratively substituted in the single integrals, and the integrals must be calculated, starting from the innermost integral. This is a complicated procedure that obviously does not lead to a general expansion of (2) or (3) valid for an arbitrary multiplicity k. For this reason, only expansions of simplest single, double, and triple integrals (2), (3) were obtained (see [2]-[7]).

At that, in [2], [7] the case $\psi_1(s),\psi_2(s)\equiv 1$ and $i_1,i_2=0,1,\ldots,m$ is considered. In [3]-[6] the attempt to consider the case $\psi_1(s),\psi_2(s),\psi_3(s)\equiv 1$ and $i_1,i_2,i_3=0,1,\ldots,m$ is realized.

It should be noted that the authors of the works [3] (Sect. 5.8, pp. 202–204), [4] (pp. 82-84), [5] (pp. 438-439), [6] (pp. 263-264) use the Wong–Zakai approximation [38]-[40] (without rigorous proof) within the frames of the Milstein approach [2] based on the series expansion of the Brownian bridge process. See discussion in Sect. 7 of this paper for details.

Let us consider an another approach to the expansion of iterated stochastic integrals [10]-[37], which is reffered to as the method of generalized multiple Fourier series.

Suppose that every $\psi_l(\tau)$ $(l=1,\ldots,k)$ is a nonrandom function from the space $L_2([t,T])$. Define the following function on the hypercube $[t,T]^k$

$$K(t_1,\ldots,t_k)=\begin{cases}\psi_1(t_1)\ldots\psi_k(t_k),\ t_1<\ldots<t_k\\ \\ 0,\ \text{otherwise}\end{cases}=\prod_{l=1}^{k}\psi_l(t_l)\ \prod_{l=1}^{k-1}\mathbf{1}_{\{t_l<t_{l+1}\}}, \tag{7}$$

where $t_1,\ldots,t_k\in[t,T]$ $(k\ge 2)$ and $K(t_1)\equiv\psi_1(t_1)$ for $t_1\in[t,T]$. Here $\mathbf{1}_A$ denotes the indicator of the set A.

Suppose that $\{\phi_j(x)\}_{j=0}^{\infty}$ is a complete orthonormal system of functions in the space $L_2([t,T])$.

The function $K(t_1,\ldots,t_k)$ belongs to the space $L_2([t,T]^k)$. At this situation it is well known that the generalized multiple Fourier series of $K(t_1,\ldots,t_k)\in L_2([t,T]^k)$ is converging to $K(t_1,\ldots,t_k)$ in the hypercube $[t,T]^k$ in the mean-square sense, i.e.

$$\lim_{p_1,\ldots,p_k\to\infty}\left\|K(t_1,\ldots,t_k)-\sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k}C_{j_k\ldots j_1}\prod_{l=1}^{k}\phi_{j_l}(t_l)\right\|_{L_2([t,T]^k)}=0, \tag{8}$$

where

$$C_{j_k\ldots j_1}=\int\limits_{[t,T]^k}K(t_1,\ldots,t_k)\prod_{l=1}^{k}\phi_{j_l}(t_l)dt_1\ldots dt_k \tag{9}$$

is the Fourier coefficient and

$$\|f\|_{L_2([t,T]^k)}=\left(\int\limits_{[t,T]^k}f^2(t_1,\ldots,t_k)dt_1\ldots dt_k\right)^{1/2}.$$

Consider the partition $\{\tau_j\}_{j=0}^{N}$ of $[t,T]$ such that

$$t=\tau_0<\ldots<\tau_N=T,\quad \Delta_N=\max_{0\le j\le N-1}\Delta\tau_j\to 0\ \text{ if }\ N\to\infty,\quad \Delta\tau_j=\tau_{j+1}-\tau_j. \tag{10}$$

Theorem 1 [10] (2006), [11]-[37]. *Suppose that every $\psi_l(\tau)$ $(l=1,\ldots,k)$ is a continuous nonrandom function on $[t,T]$ and $\{\phi_j(x)\}_{j=0}^{\infty}$ is a complete orthonormal system of continuous functions in the space $L_2([t,T])$. Then*

$$J[\psi^{(k)}]_{T,t}=\underset{p_1,\ldots,p_k\to\infty}{\text{l.i.m.}}\sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k}C_{j_k\ldots j_1}\left(\prod_{l=1}^{k}\zeta_{j_l}^{(i_l)}-\right.$$

$$\left.-\underset{N\to\infty}{\text{l.i.m.}}\sum_{(l_1,\ldots,l_k)\in\mathrm{G}_k}\phi_{j_1}(\tau_{l_1})\Delta\mathbf{w}_{\tau_{l_1}}^{(i_1)}\ldots\phi_{j_k}(\tau_{l_k})\Delta\mathbf{w}_{\tau_{l_k}}^{(i_k)}\right), \tag{11}$$

where

$$\mathrm{G}_k = \mathrm{H}_k \backslash \mathrm{L}_k, \quad \mathrm{H}_k = \{(l_1, \ldots, l_k) : \ l_1, \ldots, l_k = 0, \ 1, \ldots, N-1\},$$

$$\mathrm{L}_k = \{(l_1, \ldots, l_k) : \ l_1, \ldots, l_k = 0, \ 1, \ldots, N-1; \ l_g \neq l_r \ (g \neq r); \ g, r = 1, \ldots, k\},$$

l.i.m. *is a limit in the mean-square sense,* $i_1, \ldots, i_k = 0, 1, \ldots, m,$

$$\zeta_j^{(i)} = \int\limits_t^T \phi_j(s) d\mathbf{w}_s^{(i)} \tag{12}$$

are independent standard Gaussian random variables for various i *or* j *(if* $i \neq 0$*),* $C_{j_k \ldots j_1}$ *is the Fourier coefficient* (9)*,* $\Delta \mathbf{w}_{\tau_j}^{(i)} = \mathbf{w}_{\tau_{j+1}}^{(i)} - \mathbf{w}_{\tau_j}^{(i)}$ $(i = 0, 1, \ldots, m)$*,* $\{\tau_j\}_{j=0}^N$ *is the partition of* $[t, T]$*, which satisfies the condition* (10)*.*

In order to evaluate the significance of Theorem 1 for practice we will demonstrate its transformed particular cases for $k = 1, \ldots, 6$ [10]-[37]

$$J[\psi^{(1)}]_{T,t} = \underset{p_1 \to \infty}{\text{l.i.m.}} \sum_{j_1=0}^{p_1} C_{j_1} \zeta_{j_1}^{(i_1)}, \tag{13}$$

\end{aligned}
\tag{18}
$$

where $\mathbf{1}_A$ is the indicator of the set A.

For further consideration, let us consider the generalization of formulas (13)–(18) for the case of an arbitrary multiplicity k $(k\in\mathbb{N})$ of the iterated Ito stochastic integral $J[\psi^{(k)}]_{T,t}$ defined by (2). In order to do this, let us introduce some notations. Consider the unordered set $\{1,2,\ldots,k\}$ and separate it into two parts: the first part consists of r unordered pairs (sequence order of these pairs is also unimportant) and the second one consists of the remaining $k-2r$ numbers. So, we have

$$(\{\underbrace{\{g_1,g_2\},\ldots,\{g_{2r-1},g_{2r}\}}_{\text{part 1}}\},\{\underbrace{q_1,\ldots,q_{k-2r}}_{\text{part 2}}\}), \tag{19}$$

where

$$\{g_1,g_2,\ldots,g_{2r-1},g_{2r},q_1,\ldots,q_{k-2r}\}=\{1,2,\ldots,k\},$$

braces mean an unordered set, and parentheses mean an ordered set.

We will say that (19) is a partition and consider the sum with respect to all possible partitions

$$\sum_{\substack{(\{\{g_1,g_2\},\ldots,\{g_{2r-1},g_{2r}\}\},\{q_1,\ldots,q_{k-2r}\})\\ \{g_1,g_2,\ldots,g_{2r-1},g_{2r},q_1,\ldots,q_{k-2r}\}=\{1,2,\ldots,k\}}} a_{g_1g_2,\ldots,g_{2r-1}g_{2r},q_1\ldots q_{k-2r}}. \tag{20}$$

Below there are several examples of sums in the form (20)

$$\sum_{\substack{(\{g_1,g_2\})\\ \{g_1,g_2\}=\{1,2\}}} a_{g_1g_2}=a_{12},$$

$$\sum_{\substack{(\{\{g_1,g_2\},\{g_3,g_4\}\})\\ \{g_1,g_2,g_3,g_4\}=\{1,2,3,4\}}} a_{g_1g_2g_3g_4}=a_{1234}+a_{1324}+a_{2314},$$

$$\sum_{\substack{(\{g_1,g_2\},\{q_1,q_2\})\\ \{g_1,g_2,q_1,q_2\}=\{1,2,3,4\}}} a_{g_1g_2,q_1q_2}=$$

$$=a_{12,34}+a_{13,24}+a_{14,23}+a_{23,14}+a_{24,13}+a_{34,12},$$

$$\sum_{\substack{(\{g_1,g_2\},\{q_1,q_2,q_3\})\\ \{g_1,g_2,q_1,q_2,q_3\}=\{1,2,3,4,5\}}} a_{g_1g_2,q_1q_2q_3}=$$

$$=a_{12,345}+a_{13,245}+a_{14,235}+a_{15,234}+a_{23,145}+a_{24,135}+$$
$$+a_{25,134}+a_{34,125}+a_{35,124}+a_{45,123},$$

$$\sum_{\substack{(\{\{g_1,g_2\},\{g_3,g_4\}\},\{q_1\})\\ \{g_1,g_2,g_3,g_4,q_1\}=\{1,2,3,4,5\}}} a_{g_1g_2,g_3g_4,q_1}=$$

$$=a_{12,34,5}+a_{13,24,5}+a_{14,23,5}+a_{12,35,4}+a_{13,25,4}+a_{15,23,4}+$$
$$+a_{12,54,3}+a_{15,24,3}+a_{14,25,3}+a_{15,34,2}+a_{13,54,2}+a_{14,53,2}+$$
$$+a_{52,34,1}+a_{53,24,1}+a_{54,23,1}.$$

Now we can write (11) as

$$J[\psi^{(k)}]_{T,t}=\underset{p_1,\ldots,p_k\to\infty}{\text{l.i.m.}}\sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k}C_{j_k\ldots j_1}\Biggl(\prod_{l=1}^{k}\zeta_{j_l}^{(i_l)}+\sum_{r=1}^{[k/2]}(-1)^r\times$$

$$\times\sum_{\substack{(\{\{g_1,g_2\},\ldots,\{g_{2r-1},g_{2r}\}\},\{q_1,\ldots,q_{k-2r}\})\\ \{g_1,g_2,\ldots,g_{2r-1},g_{2r},q_1,\ldots,q_{k-2r}\}=\{1,2,\ldots,k\}}}\prod_{s=1}^{r}\mathbf{1}_{\{i_{g_{2s-1}}=\,i_{g_{2s}}\ne 0\}}\mathbf{1}_{\{j_{g_{2s-1}}=\,j_{g_{2s}}\}}\prod_{l=1}^{k-2r}\zeta_{j_{q_l}}^{(i_{q_l})}\Biggr),\qquad(21)$$

where $[x]$ is an integer part of a real number x; another notations are the same as in Theorem **1**.

In particular, from (21) for $k=5$ we obtain

$$J[\psi^{(5)}]_{T,t}=\underset{p_1,\ldots,p_5\to\infty}{\text{l.i.m.}}\sum_{j_1=0}^{p_1}\ldots\sum_{j_5=0}^{p_5}C_{j_5\ldots j_1}\Biggl(\prod_{l=1}^{5}\zeta_{j_l}^{(i_l)}-$$

$$-\sum_{\substack{(\{g_1,g_2\},\{q_1,q_2,q_3\})\\ \{g_1,g_2,q_1,q_2,q_3\}=\{1,2,3,4,5\}}}\mathbf{1}_{\{i_{g_1}=\,i_{g_2}\ne 0\}}\mathbf{1}_{\{j_{g_1}=\,j_{g_2}\}}\prod_{l=1}^{3}\zeta_{j_{q_l}}^{(i_{q_l})}+$$

$$+\sum_{\substack{(\{\{g_1,g_2\},\{g_3,g_4\}\},\{q_1\})\\ \{g_1,g_2,g_3,g_4,q_1\}=\{1,2,3,4,5\}}}\mathbf{1}_{\{i_{g_1}=\,i_{g_2}\ne 0\}}\mathbf{1}_{\{j_{g_1}=\,j_{g_2}\}}\mathbf{1}_{\{i_{g_3}=\,i_{g_4}\ne 0\}}\mathbf{1}_{\{j_{g_3}=\,j_{g_4}\}}\zeta_{j_{q_1}}^{(i_{q_1})}\Biggr).$$

The last equality obviously agrees with (17).

Let us consider a generalization of Theorem 1 for the case of an arbitrary complete orthonormal systems of functions in the space $L_2([t,T])$ and $\psi_1(\tau),\ldots,\psi_k(\tau)\in L_2([t,T])$.

Theorem 2 [22] (Sect. 1.11), [29] (Sect. 15). *Suppose that* $\psi_1(\tau),\ldots,\psi_k(\tau)\in L_2([t,T])$ *and* $\{\phi_j(x)\}_{j=0}^{\infty}$ *is an arbitrary complete orthonormal system of functions in the space* $L_2([t,T])$. *Then the following expansion*

$$J[\psi^{(k)}]_{T,t}=\underset{p_1,\ldots,p_k\to\infty}{\text{l.i.m.}}\sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k}C_{j_k\ldots j_1}\Biggl(\prod_{l=1}^{k}\zeta_{j_l}^{(i_l)}+\sum_{r=1}^{[k/2]}(-1)^r\times$$

$$\times\sum_{\substack{(\{\{g_1,g_2\},\ldots,\{g_{2r-1},g_{2r}\}\},\{q_1,\ldots,q_{k-2r}\})\\ \{g_1,g_2,\ldots,g_{2r-1},g_{2r},q_1,\ldots,q_{k-2r}\}=\{1,2,\ldots,k\}}}\prod_{s=1}^{r}\mathbf{1}_{\{i_{g_{2s-1}}=\,i_{g_{2s}}\ne 0\}}\mathbf{1}_{\{j_{g_{2s-1}}=\,j_{g_{2s}}\}}\prod_{l=1}^{k-2r}\zeta_{j_{q_l}}^{(i_{q_l})}\Biggr)\qquad(22)$$

converging in the mean-square sense is valid, where $[x]$ *is an integer part of a real number* x; *another notations are the same as in Theorem* 1.

It should be noted that an analogue of Theorem 2 was considered in [41]. Note that we use another notations [22] (Sect. 1.11), [29] (Sect. 15) in comparison with [41]. Moreover, the proof of an analogue of Theorem 2 from [41] is somewhat different from the proof given in [22] (Sect. 1.11), [29] (Sect. 15).

3. Expansions of Iterated Stratonovich Stochastic Integrals of Multiplicities 2 to 6

In a number of works of the author [15]-[24], [30] Theorems 1, 2 have been adapted for the iterated Stratonovich stochastic integrals (3) of multiplicities 2 to 6. Let us first present some old results as the following theorem.

Theorem 3 [15]-[24], [30]. *Suppose that* $\{\phi_j(x)\}_{j=0}^{\infty}$ *is a complete orthonormal system of Legendre polynomials or trigonometric functions in the space* $L_2([t,T])$. *At the same time* $\psi_2(\tau)$ *is a continuously differentiable function on* $[t,T]$ *and* $\psi_1(\tau), \psi_3(\tau)$ *are twice continuously differentiable functions on* $[t,T]$. *Then*

$$J^*[\psi^{(2)}]_{T,t} = \underset{p_1,p_2\to\infty}{\text{l.i.m.}} \sum_{j_1=0}^{p_1}\sum_{j_2=0}^{p_2} C_{j_2j_1}\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)} \quad (i_1,i_2=1,\ldots,m), \tag{23}$$

$$J^*[\psi^{(3)}]_{T,t} = \underset{p_1,p_2,p_3\to\infty}{\text{l.i.m.}} \sum_{j_1=0}^{p_1}\sum_{j_2=0}^{p_2}\sum_{j_3=0}^{p_3} C_{j_3j_2j_1}\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}\zeta_{j_3}^{(i_3)} \quad (i_1,i_2,i_3=0,1,\ldots,m), \tag{24}$$

$$J^*[\psi^{(3)}]_{T,t} = \underset{p\to\infty}{\text{l.i.m.}} \sum_{j_1,j_2,j_3=0}^{p} C_{j_3j_2j_1}\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}\zeta_{j_3}^{(i_3)} \quad (i_1,i_2,i_3=1,\ldots,m), \tag{25}$$

$$J^*[\psi^{(4)}]_{T,t} = \underset{p\to\infty}{\text{l.i.m.}} \sum_{j_1,j_2,j_3,j_4=0}^{p} C_{j_4j_3j_2j_1}\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}\zeta_{j_3}^{(i_3)}\zeta_{j_4}^{(i_4)} \quad (i_1,i_2,i_3,i_4=0,1,\ldots,m), \tag{26}$$

where $J^*[\psi^{(k)}]_{T,t}$ *is defined by* (3) *and* $\psi_l(\tau)\equiv 1$ $(l=1,\ldots,4)$ *in* (24), (26); *another notations are the same as in Theorems* 1, 2.

Recently, a new approach to the expansion and mean-square approximation of iterated Stratonovich stochastic integrals has been obtained [22] (Sect. 2.10–2.16), [30] (Sect. 13–19), [33] (Sect. 7–13), [34] (Sect. 5–11), [54] (Sect. 4–9), [55]. Let us formulate four theorems that were obtained using this approach.

Theorem 4 [22], [30], [33], [34], [54]. *Suppose that* $\{\phi_j(x)\}_{j=0}^{\infty}$ *is a complete orthonormal system of Legendre polynomials or trigonometric functions in the space* $L_2([t,T])$. *Furthermore, let* $\psi_1(\tau), \psi_2(\tau)$, $\psi_3(\tau)$ *are continuously differentiable nonrandom functions on* $[t,T]$. *Then, for the iterated Stratonovich stochastic integral of third multiplicity*

$$J^*[\psi^{(3)}]_{T,t} = \int\limits_t^{*T}\psi_3(t_3)\int\limits_t^{*t_3}\psi_2(t_2)\int\limits_t^{*t_2}\psi_1(t_1)d\mathbf{w}_{t_1}^{(i_1)}d\mathbf{w}_{t_2}^{(i_2)}d\mathbf{w}_{t_3}^{(i_3)} \quad (i_1,i_2,i_3=0,1,\ldots,m)$$

the following relations

$$J^*[\psi^{(3)}]_{T,t} = \underset{p\to\infty}{\text{l.i.m.}} \sum_{j_1,j_2,j_3=0}^{p} C_{j_3j_2j_1}\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}\zeta_{j_3}^{(i_3)}, \tag{27}$$

$$
\mathsf{M}\left\{\left(J^*[\psi^{(3)}]_{T,t}-\sum_{j_1,j_2,j_3=0}^{p}C_{j_3j_2j_1}\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}\zeta_{j_3}^{(i_3)}\right)^2\right\}\le\frac{C}{p} \tag{28}
$$

are fulfilled, where $i_1,i_2,i_3=0,1,\ldots,m$ *in* (27) *and* $i_1,i_2,i_3=1,\ldots,m$ *in* (28)*, constant* C *is independent of* p*,*

$$
C_{j_3j_2j_1}=\int\limits_t^T\psi_3(t_3)\phi_{j_3}(t_3)\int\limits_t^{t_3}\psi_2(t_2)\phi_{j_2}(t_2)\int\limits_t^{t_2}\psi_1(t_1)\phi_{j_1}(t_1)dt_1dt_2dt_3
$$

and

$$
\zeta_j^{(i)}=\int\limits_t^T\phi_j(\tau)d\mathbf{f}_\tau^{(i)}
$$

are independent standard Gaussian random variables for various i *or* j *(in the case when* $i\ne 0$*); another notations are the same as in Theorems* 1, 2*.*

Theorem 5 [22], [30], [33], [34], [54]. *Let* $\{\phi_j(x)\}_{j=0}^{\infty}$ *be a complete orthonormal system of Legendre polynomials or trigonometric functions in the space* $L_2([t,T])$*. Furthermore, let* $\psi_1(\tau),\ldots,\psi_4(\tau)$ *be continuously differentiable nonrandom functions on* $[t,T]$*. Then, for the iterated Stratonovich stochastic integral of fourth multiplicity*

$$
J^*[\psi^{(4)}]_{T,t}=\int\limits_t^{*T}\psi_4(t_4)\int\limits_t^{*t_4}\psi_3(t_3)\int\limits_t^{*t_3}\psi_2(t_2)\int\limits_t^{*t_2}\psi_1(t_1)d\mathbf{w}_{t_1}^{(i_1)}d\mathbf{w}_{t_2}^{(i_2)}d\mathbf{w}_{t_3}^{(i_3)}d\mathbf{w}_{t_4}^{(i_4)} \tag{29}
$$

the following relations

$$
J^*[\psi^{(4)}]_{T,t}=\underset{p\to\infty}{\text{l.i.m.}}\sum_{j_1,j_2,j_3,j_4=0}^{p}C_{j_4j_3j_2j_1}\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}\zeta_{j_3}^{(i_3)}\zeta_{j_4}^{(i_4)}, \tag{30}
$$

$$
\mathsf{M}\left\{\left(J^*[\psi^{(4)}]_{T,t}-\sum_{j_1,j_2,j_3,j_4=0}^{p}C_{j_4j_3j_2j_1}\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}\zeta_{j_3}^{(i_3)}\zeta_{j_4}^{(i_4)}\right)^2\right\}\le\frac{C}{p^{1-\varepsilon}} \tag{31}
$$

are fulfilled, where $i_1,\ldots,i_4=0,1,\ldots,m$ *in* (29), (30) *and* $i_1,\ldots,i_4=1,\ldots,m$ *in* (31)*, constant* C *does not depend on* p*,* ε *is an arbitrary small positive real number for the case of complete orthonormal system of Legendre polynomials in the space* $L_2([t,T])$ *and* $\varepsilon=0$ *for the case of complete orthonormal system of trigonometric functions in the space* $L_2([t,T])$*,*

$$
C_{j_4j_3j_2j_1}=
$$

$$
=\int\limits_t^T\psi_4(t_4)\phi_{j_4}(t_4)\int\limits_t^{t_4}\psi_3(t_3)\phi_{j_3}(t_3)\int\limits_t^{t_3}\psi_2(t_2)\phi_{j_2}(t_2)\int\limits_t^{t_2}\psi_1(t_1)\phi_{j_1}(t_1)dt_1dt_2dt_3dt_4;
$$

another notations are the same as in Theorem 4.

the following expansion

$$J_{T,t}^{*(i_1\ldots i_6)}=\underset{p\to\infty}{\text{l.i.m.}}\sum_{j_1,\ldots,j_6=0}^{p}C_{j_6\ldots j_1}\zeta_{j_1}^{(i_1)}\ldots\zeta_{j_6}^{(i_6)}$$

that converges in the mean-square sense is valid, where $i_1,\ldots,i_6=0,1,\ldots,m$,

$$C_{j_6\ldots j_1}=\int\limits_t^{T}\phi_{j_6}(t_6)\ldots\int\limits_t^{t_2}\phi_{j_1}(t_1)dt_1\ldots dt_6;$$

another notations are the same as in Theorems 4–6.

4. Exact Calculation of the Mean-Square Error in Theorems 1, 2

Theorems 1 and 2 allow us to accurately calculate the mean-square approximation error for iterated Ito stochastic integrals (see Theorem 8 below).

Assume that $J[\psi^{(k)}]_{T,t}^{p_1\ldots p_k}$ is the approximation of (2), which is the expression on the right-hand side of (22) before passing to the limit

$$J[\psi^{(k)}]_{T,t}^{p_1\ldots p_k} = \sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k} C_{j_k\ldots j_1}\Biggl(\prod_{l=1}^{k}\zeta_{j_l}^{(i_l)} + \sum_{r=1}^{[k/2]}(-1)^r\times$$

$$\times\sum_{\substack{(\{\{g_1,g_2\},\ldots,\{g_{2r-1},g_{2r}\}\},\{q_1,\ldots,q_{k-2r}\})\\ \{g_1,g_2,\ldots,g_{2r-1},g_{2r},q_1,\ldots,q_{k-2r}\}=\{1,2,\ldots,k\}}}\prod_{s=1}^{r}\mathbf{1}_{\{i_{g_{2s-1}}=\,i_{g_{2s}}\neq 0\}}\mathbf{1}_{\{j_{g_{2s-1}}=\,j_{g_{2s}}\}}\prod_{l=1}^{k-2r}\zeta_{j_{q_l}}^{(i_{q_l})}\Biggr),$$

where $[x]$ is an integer part of a real number x; another notations are the same as in Theorems 1, 2.

Let us denote

$$E_k^{p_1,\ldots,p_k} \stackrel{\rm def}{=} {\sf M}\left\{\left(J[\psi^{(k)}]_{T,t} - J[\psi^{(k)}]_{T,t}^{p_1,\ldots,p_k}\right)^2\right\},$$

$$E_k^{p_1,\ldots,p_k} \stackrel{\rm def}{=} E_k^p \quad \text{if} \quad p_1=\ldots=p_k=p,$$

$$I_k \stackrel{\rm def}{=} \|K\|^2_{L_2([t,T]^k)} = \int\limits_{[t,T]^k} K^2(t_1,\ldots,t_k)dt_1\ldots dt_k.$$

In [10]-[24], [29] it was shown that

$$E_k^{p_1,\ldots,p_k} \le k!\left(I_k - \sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k} C^2_{j_k\ldots j_1}\right) \tag{36}$$

if $i_1,\ldots,i_k=1,\ldots,m$ and $0<T-t<\infty$ or $i_1,\ldots,i_k=0,1,\ldots,m$ and $0<T-t<1$.

Moreover, in [12]-[24], [29] the following estimate

$${\sf M}\left\{\left(J[\psi^{(k)}]_{T,t} - J[\psi^{(k)}]_{T,t}^{p_1,\ldots,p_k}\right)^{2n}\right\} \le$$

$$\le (k!)^{2n}(n(2n-1))^{n(k-1)}(2n-1)!!\left(I_k - \sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k} C^2_{j_k\ldots j_1}\right)^n \tag{37}$$

is obtained, where $n\in\mathbb{N}$.

The value E_k^p can be calculated exactly.

Theorem 8 [22] (Sect. 1.12), [35] (Sect. 6). *Suppose that $\{\phi_j(x)\}_{j=0}^{\infty}$ is an arbitrary complete orthonormal system of functions in the space $L_2([t,T])$ and $\psi_1(\tau),\ldots,\psi_k(\tau)\in L_2([t,T])$, $i_1,\ldots,i_k=1,\ldots,m$. Then*

$$E_k^p = I_k - \sum_{j_1,\ldots,j_k=0}^{p} C_{j_k\ldots j_1}\mathsf{M}\left\{J[\psi^{(k)}]_{T,t}\sum_{(j_1,\ldots,j_k)}\int\limits_t^T \phi_{j_k}(t_k)\ldots\int\limits_t^{t_2}\phi_{j_1}(t_1)d\mathbf{f}_{t_1}^{(i_1)}\ldots d\mathbf{f}_{t_k}^{(i_k)}\right\}, \tag{38}$$

where $i_1,\ldots,i_k=1,\ldots,m$; the expression

$$\sum_{(j_1,\ldots,j_k)}$$

means the sum with respect to all possible permutations $(j_1,\ldots,j_k)$. At the same time if j_r swapped with j_q in the permutation $(j_1,\ldots,j_k)$, then i_r swapped with i_q in the permutation $(i_1,\ldots,i_k)$; another notations are the same as in Theorems 1, 2.

Note that

$$\mathsf{M}\left\{J[\psi^{(k)}]_{T,t}\int\limits_t^T \phi_{j_k}(t_k)\ldots\int\limits_t^{t_2}\phi_{j_1}(t_1)d\mathbf{f}_{t_1}^{(i_1)}\ldots d\mathbf{f}_{t_k}^{(i_k)}\right\} = C_{j_k\ldots j_1}.$$

Then from Theorem 8 for pairwise different $i_1,\ldots,i_k$ and for $i_1=\ldots=i_k$ we obtain

$$E_k^p = I_k - \sum_{j_1,\ldots,j_k=0}^{p} C_{j_k\ldots j_1}^2,$$

$$E_k^p = I_k - \sum_{j_1,\ldots,j_k=0}^{p} C_{j_k\ldots j_1}\left(\sum_{(j_1,\ldots,j_k)} C_{j_k\ldots j_1}\right).$$

Consider some examples of the application of Theorem 8 ($i_1,i_2,i_3=1,\ldots,m$)

$$E_2^p = I_2 - \sum_{j_1,j_2=0}^{p} C_{j_2j_1}^2 - \sum_{j_1,j_2=0}^{p} C_{j_2j_1}C_{j_1j_2}\quad (i_1=i_2),$$

$$E_3^p = I_3 - \sum_{j_3,j_2,j_1=0}^{p} C_{j_3j_2j_1}^2 - \sum_{j_3,j_2,j_1=0}^{p} C_{j_3j_1j_2}C_{j_3j_2j_1}\quad (i_1=i_2\neq i_3),$$

$$E_3^p = I_3 - \sum_{j_3,j_2,j_1=0}^{p} C_{j_3j_2j_1}^2 - \sum_{j_3,j_2,j_1=0}^{p} C_{j_2j_3j_1}C_{j_3j_2j_1}\quad (i_1\neq i_2=i_3),$$

$$E_3^p = I_3 - \sum_{j_3,j_2,j_1=0}^{p} C_{j_3j_2j_1}^2 - \sum_{j_3,j_2,j_1=0}^{p} C_{j_3j_2j_1}C_{j_1j_2j_3}\quad (i_1=i_3\neq i_2),$$

$$E_4^p = I_4 - \sum_{j_1,\ldots,j_4=0}^{p} C_{j_4\ldots j_1}\left(\sum_{(j_1,j_2)} C_{j_4\ldots j_1}\right) \quad (i_1 = i_2 \neq i_3, i_4;\ i_3 \neq i_4),$$

$$E_4^p = I_4 - \sum_{j_1,\ldots,j_4=0}^{p} C_{j_4\ldots j_1}\left(\sum_{(j_1,j_3)} C_{j_4\ldots j_1}\right) \quad (i_1 = i_3 \neq i_2, i_4;\ i_2 \neq i_4),$$

$$E_4^p = I_4 - \sum_{j_1,\ldots,j_4=0}^{p} C_{j_4\ldots j_1}\left(\sum_{(j_1,j_4)} C_{j_4\ldots j_1}\right) \quad (i_1 = i_4 \neq i_2, i_3;\ i_2 \neq i_3),$$

$$E_4^p = I_4 - \sum_{j_1,\ldots,j_4=0}^{p} C_{j_4\ldots j_1}\left(\sum_{(j_2,j_3)} C_{j_4\ldots j_1}\right) \quad (i_2 = i_3 \neq i_1, i_4;\ i_1 \neq i_4),$$

$$E_4^p = I_4 - \sum_{j_1,\ldots,j_4=0}^{p} C_{j_4\ldots j_1}\left(\sum_{(j_2,j_4)} C_{j_4\ldots j_1}\right) \quad (i_2 = i_4 \neq i_1, i_3;\ i_1 \neq i_3),$$

$$E_4^p = I_4 - \sum_{j_1,\ldots,j_4=0}^{p} C_{j_4\ldots j_1}\left(\sum_{(j_3,j_4)} C_{j_4\ldots j_1}\right) \quad (i_3 = i_4 \neq i_1, i_2;\ i_1 \neq i_2),$$

$$E_4^p = I_4 - \sum_{j_1,\ldots,j_4=0}^{p} C_{j_4\ldots j_1}\left(\sum_{(j_1,j_2,j_3)} C_{j_4\ldots j_1}\right) \quad (i_1 = i_2 = i_3 \neq i_4),$$

$$E_4^p = I_4 - \sum_{j_1,\ldots,j_4=0}^{p} C_{j_4\ldots j_1}\left(\sum_{(j_2,j_3,j_4)} C_{j_4\ldots j_1}\right) \quad (i_2 = i_3 = i_4 \neq i_1),$$

$$E_4^p = I_4 - \sum_{j_1,\ldots,j_4=0}^{p} C_{j_4\ldots j_1}\left(\sum_{(j_1,j_2,j_4)} C_{j_4\ldots j_1}\right) \quad (i_1 = i_2 = i_4 \neq i_3),$$

$$E_4^p = I_4 - \sum_{j_1,\ldots,j_4=0}^{p} C_{j_4\ldots j_1}\left(\sum_{(j_1,j_3,j_4)} C_{j_4\ldots j_1}\right) \quad (i_1 = i_3 = i_4 \neq i_2),$$

$$E_4^p = I_4 - \sum_{j_1,\ldots,j_4=0}^{p} C_{j_4\ldots j_1}\left(\sum_{(j_1,j_2)}\left(\sum_{(j_3,j_4)} C_{j_4\ldots j_1}\right)\right) \quad (i_1 = i_2 \neq i_3 = i_4),$$

$$E_4^p = I_4 - \sum_{j_1,\ldots,j_4=0}^{p} C_{j_4\ldots j_1}\left(\sum_{(j_1,j_3)}\left(\sum_{(j_2,j_4)} C_{j_4\ldots j_1}\right)\right) \quad (i_1 = i_3 \neq i_2 = i_4),$$

$$E_4^p = I_4 - \sum_{j_1,\ldots,j_4=0}^{p} C_{j_4\ldots j_1}\left(\sum_{(j_1,j_4)}\left(\sum_{(j_2,j_3)} C_{j_4\ldots j_1}\right)\right) \quad (i_1 = i_4 \neq i_2 = i_3),$$

$$E_5^p = I_5 - \sum_{j_1,\ldots,j_5=0}^{p} C_{j_5\ldots j_1}\left(\sum_{(j_2,j_4)}\left(\sum_{(j_3,j_5)} C_{j_5\ldots j_1}\right)\right) \quad (i_1 \neq i_2 = i_4 \neq i_3 = i_5 \neq i_1).$$

5. Some Technical Problems of the Milstein Approach

Let us denote

$$I^{*(i_1\ldots i_k)}_{(l_1\ldots l_k)T,t} = \int\limits_t^{*T} (t-t_k)^{l_k} \ldots \int\limits_t^{*t_2} (t-t_1)^{l_1} d\mathbf{f}_{t_1}^{(i_1)} \ldots d\mathbf{f}_{t_k}^{(i_k)}, \tag{39}$$

where $i_1,\ldots,i_k = 1,\ldots,m$; $l_1,\ldots,l_k = 0,1,\ldots$.

Consider the Milstein expansions for the simplest iterated Stratonovich stochastic integrals (39)

$$I^{*(i_1)}_{(0)T,t} = \sqrt{T-t}\zeta_0^{(i_1)}, \tag{40}$$

$$I^{*(i_1)}_{(1)T,t} = -\frac{(T-t)^{3/2}}{2}\left(\zeta_0^{(i_1)} - \frac{\sqrt{2}}{\pi}\sum_{r=1}^{\infty}\frac{1}{r}\zeta_{2r-1}^{(i_1)}\right), \tag{41}$$

$$I^{*(i_1 i_2)}_{(00)T,t} = \frac{1}{2}(T-t)\Biggl(\zeta_0^{(i_1)}\zeta_0^{(i_2)} + \frac{1}{\pi}\sum_{r=1}^{\infty}\frac{1}{r}\left(\zeta_{2r}^{(i_1)}\zeta_{2r-1}^{(i_2)} - \zeta_{2r-1}^{(i_1)}\zeta_{2r}^{(i_2)} + \right.$$

$$\left. + \sqrt{2}\left(\zeta_{2r-1}^{(i_1)}\zeta_0^{(i_2)} - \zeta_0^{(i_1)}\zeta_{2r-1}^{(i_2)}\right)\right)\Biggr), \tag{42}$$

$$I^{*(i_1)}_{(2)T,t} = (T-t)^{5/2}\left(\frac{1}{3}\zeta_0^{(i_1)} + \frac{1}{\sqrt{2}\pi^2}\sum_{r=1}^{\infty}\frac{1}{r^2}\zeta_{2r}^{(i_1)} - \frac{1}{\sqrt{2}\pi}\sum_{r=1}^{\infty}\frac{1}{r}\zeta_{2r-1}^{(i_1)}\right), \tag{43}$$

where $i_1, i_2 = 1,\ldots,m$;

$$\zeta_j^{(i)} = \int\limits_t^T \phi_j(s)d\mathbf{f}_s^{(i)}$$

are independent standard Gaussian random variables for various i or j, and

$$\phi_j(s) = \frac{1}{\sqrt{T-t}}\begin{cases} 1 & \text{when } j=0 \\ \sqrt{2}\sin(2\pi r(s-t)/(T-t)) & \text{when } j=2r-1 \\ \sqrt{2}\cos(2\pi r(s-t)/(T-t)) & \text{when } j=2r \end{cases}, \tag{44}$$

where $r=1,2,\ldots$

Obviously, that $I_{(1)T,t}^{*(i_1)}$, $I_{(2)T,t}^{*(i_1)}$ have Gaussian distribution and the expansions (41), (43) are too complex for such simple stochastic integrals as $I_{(1)T,t}^{*(i_1)}$, $I_{(2)T,t}^{*(i_1)}$.

Milstein G.N. proposed [2] the following mean-square approximations on the base of the expansions (41), (42)

$$I_{(1)T,t}^{*(i_1)q}=-\frac{(T-t)^{3/2}}{2}\left(\zeta_0^{(i_1)}-\frac{\sqrt{2}}{\pi}\left(\sum_{r=1}^{q}\frac{1}{r}\zeta_{2r-1}^{(i_1)}+\sqrt{\alpha_q}\xi_q^{(i_1)}\right)\right), \tag{45}$$

$$I_{(00)T,t}^{*(i_1i_2)q}=\frac{1}{2}(T-t)\left(\zeta_0^{(i_1)}\zeta_0^{(i_2)}+\frac{1}{\pi}\sum_{r=1}^{q}\frac{1}{r}\left(\zeta_{2r}^{(i_1)}\zeta_{2r-1}^{(i_2)}-\zeta_{2r-1}^{(i_1)}\zeta_{2r}^{(i_2)}+\right.\right.$$

$$\left.\left.+\sqrt{2}\left(\zeta_{2r-1}^{(i_1)}\zeta_0^{(i_2)}-\zeta_0^{(i_1)}\zeta_{2r-1}^{(i_2)}\right)\right)+\frac{\sqrt{2}}{\pi}\sqrt{\alpha_q}\left(\xi_q^{(i_1)}\zeta_0^{(i_2)}-\zeta_0^{(i_1)}\xi_q^{(i_2)}\right)\right), \tag{46}$$

where

$$\xi_q^{(i)}=\frac{1}{\sqrt{\alpha_q}}\sum_{r=q+1}^{\infty}\frac{1}{r}\,\zeta_{2r-1}^{(i)},\quad \alpha_q=\frac{\pi^2}{6}-\sum_{r=1}^{q}\frac{1}{r^2}, \tag{47}$$

where $\zeta_0^{(i)}$, $\zeta_{2r}^{(i)}$, $\zeta_{2r-1}^{(i)}$, $\xi_q^{(i)}$; $r=1,\ldots,q$; $i=1,\ldots,m$ are independent standard Gaussian random variables.

The approximation $I_{(2)T,t}^{*(i_1)q}$, which corresponds to (45), (46) has the form [3]

$$I_{(2)T,t}^{*(i_1)q}=(T-t)^{5/2}\left(\frac{1}{3}\zeta_0^{(i_1)}+\frac{1}{\sqrt{2}\pi^2}\left(\sum_{r=1}^{q}\frac{1}{r^2}\zeta_{2r}^{(i_1)}+\sqrt{\beta_q}\mu_q^{(i_1)}\right)-\right.$$

$$\left.-\frac{1}{\sqrt{2}\pi}\left(\sum_{r=1}^{q}\frac{1}{r}\zeta_{2r-1}^{(i_1)}+\sqrt{\alpha_q}\xi_q^{(i_1)}\right)\right), \tag{48}$$

where $\xi_q^{(i)}$, α_q has the form (47) and

$$\mu_q^{(i)}=\frac{1}{\sqrt{\beta_q}}\sum_{r=q+1}^{\infty}\frac{1}{r^2}\,\zeta_{2r}^{(i)},\quad \beta_q=\frac{\pi^4}{90}-\sum_{r=1}^{q}\frac{1}{r^4},$$

$\phi_j(s)$ is defined by (44); $\zeta_0^{(i)}$, $\zeta_{2r}^{(i)}$, $\zeta_{2r-1}^{(i)}$, $\xi_q^{(i)}$, $\mu_q^{(i)}$; $r=1,\ldots,q$; $i=1,\ldots,m$ are independent standard Gaussian random variables; $i=1,\ldots,m$.

Nevetheless, the expansions (45), (48) are too complex for the approximation of two Gaussian random variables $I_{(1)T,t}^{*(i_1)}$, $I_{(2)T,t}^{*(i_1)}$.

Using Theorems 1–3 and complete orthonormal system of Legendre polynomials in the space $L_2([t,T])$, we obtain for $i_1,i_2=1,\ldots,m$ [10]-[37]

(49) $$I^{*(i_1)}_{(0)T,t}=\sqrt{T-t}\zeta_0^{(i_1)},$$

(50) $$I^{*(i_1)}_{(1)T,t}=-\frac{(T-t)^{3/2}}{2}\left(\zeta_0^{(i_1)}+\frac{1}{\sqrt{3}}\zeta_1^{(i_1)}\right),$$

(51) $$I^{*(i_1)}_{(2)T,t}=\frac{(T-t)^{5/2}}{3}\left(\zeta_0^{(i_1)}+\frac{\sqrt{3}}{2}\zeta_1^{(i_1)}+\frac{1}{2\sqrt{5}}\zeta_2^{(i_1)}\right),$$

(52) $$I^{*(i_1 i_2)}_{(00)T,t}=\frac{T-t}{2}\left(\zeta_0^{(i_1)}\zeta_0^{(i_2)}+\sum_{i=1}^{\infty}\frac{1}{\sqrt{4i^2-1}}\left(\zeta_{i-1}^{(i_1)}\zeta_i^{(i_2)}-\zeta_i^{(i_1)}\zeta_{i-1}^{(i_2)}\right)\right),$$

$$\zeta_j^{(i)}=\int\limits_t^T\phi_j(s)d\mathbf{f}_s^{(i)}$$

are independent standard Gaussian random variables for various i or j, where

(53) $$\phi_j(x)=\sqrt{\frac{2j+1}{T-t}}P_j\left(\left(x-\frac{T+t}{2}\right)\frac{2}{T-t}\right);\ j=0,1,2,\ldots,$$

where $P_j(x)$ is the Legendre polynomial.

It is not difficult to see that the expansions (50), (51) are much simpler than the expansions (45), (48).

Obviously that the Milstein approach [2] leads to iterated series (iterated application of the operation of limit transitions) in contradiction to multiple series (the operation of limit transition is implemented only once) from Theorems 1–7.

For the case of simplest stochastic integral $I^{*(i_1 i_2)}_{(00)T,t}$ of second multiplicity this problem was avoided as we saw earlier. However, the situation is not the same for the simplest iterated stochastic integral $I^{*(i_1 i_2 i_3)}_{(000)T,t}$ of third multiplicity.

Let us denote

$$J^{*(i_1\ldots i_k)}_{(\lambda_1\ldots\lambda_k)T,t}=\int\limits_t^{*T}\ldots\int\limits_t^{*t_2}d\mathbf{w}_{t_1}^{(i_1)}\ldots d\mathbf{w}_{t_k}^{(i_k)},$$

where $\lambda_l=1$ if $i_l=1,\ldots,m$ and $\lambda_l=0$ if $i_l=0$; $l=1,\ldots,k$ ($\mathbf{w}_\tau^{(i)}=\mathbf{f}_\tau^{(i)}$ for $i=1,\ldots,m$ and $\mathbf{w}_\tau^{(0)}=\tau$).

Consider the expansion of iterated Stratonovich stochastic integral of third multiplicity obtained in [3]-[6] by the Milstein approach

$$J^{*(i_1 i_2 i_3)}_{(111)\Delta,0}=\frac{1}{\Delta}J^{*(i_1)}_{(1)\Delta,0}J^{*(0 i_2 i_3)}_{(011)\Delta,0}+\frac{1}{2}a_{i_1,0}J^{*(i_2 i_3)}_{(11)\Delta,0}+\frac{1}{2\pi}b_{i_1}J^{(i_2)}_{(1)\Delta,0}J^{*(i_3)}_{(1)\Delta,0}-$$

(54) $$-\Delta J^{*(i_2)}_{(1)\Delta,0}B_{i_1 i_3}+\Delta J^{*(i_3)}_{(1)\Delta,0}\left(\frac{1}{2}A_{i_1 i_2}-C_{i_2 i_1}\right)+\Delta^{3/2}D_{i_1 i_2 i_3},$$

where

$$J_{(011)\Delta,0}^{*(0i_2i_3)}=\frac{1}{6}J_{(1)\Delta,0}^{*(i_2)}J_{(1)\Delta,0}^{*(i_3)}-\frac{1}{\pi}\Delta J_{(1)\Delta,0}^{*(i_3)}b_{i_2}+$$

$$+\Delta^2 B_{i_2i_3}-\frac{1}{4}\Delta a_{i_3,0}J_{(1)\Delta,0}^{*(i_2)}+\frac{1}{2\pi}\Delta b_{i_3}J_{(1)\Delta,0}^{*(i_2)}+\Delta^2 C_{i_2i_3}+\frac{1}{2}\Delta^2 A_{i_2i_3},$$

$$A_{i_2i_3}=\frac{\pi}{\Delta}\sum_{r=1}^{\infty}r\left(a_{i_2,r}b_{i_3,r}-b_{i_2,r}a_{i_3,r}\right),$$

$$C_{i_2i_3}=-\frac{1}{\Delta}\sum_{l=1}^{\infty}\sum_{r=1(r\neq l)}^{\infty}\frac{r}{r^2-l^2}\left(ra_{i_2,r}a_{i_3,l}+lb_{i_2,r}b_{i_3,l}\right),$$

$$B_{i_2i_3}=\frac{1}{2\Delta}\sum_{r=1}^{\infty}\left(a_{i_2,r}a_{i_3,r}+b_{i_2,r}b_{i_3,r}\right),\ b_i=\sum_{r=1}^{\infty}\frac{1}{r}b_{i,r},$$

$$D_{i_1i_2i_3}=-\frac{\pi}{2\Delta^{3/2}}\sum_{l=1}^{\infty}\sum_{r=1}^{\infty}l\Biggl(a_{i_2,l}\left(a_{i_3,l+r}b_{i_1,r}-a_{i_1,r}b_{i_3,l+r}\right)+$$

$$+b_{i_2,l}\left(a_{i_1,r}a_{i_3,r+l}+b_{i_1,r}b_{i_3,l+r}\right)\Biggr)+$$

$$+\frac{\pi}{2\Delta^{3/2}}\sum_{l=1}^{\infty}\sum_{r=1}^{l-1}l\Biggl(a_{i_2,l}\left(a_{i_1,r}b_{i_3,l-r}+a_{i_3,l-r}b_{i_1,r}\right)-$$

$$-b_{i_2,l}\left(a_{i_1,r}a_{i_3,l-r}-b_{i_1,r}b_{i_3,l-r}\right)\Biggr)+$$

$$+\frac{\pi}{2\Delta^{3/2}}\sum_{l=1}^{\infty}\sum_{r=l+1}^{\infty}l\Biggl(a_{i_2,l}\left(a_{i_3,r-l}b_{i_1,r}-a_{i_1,r}b_{i_3,r-l}\right)+$$

$$+b_{i_2,l}\left(a_{i_1,r}a_{i_3,r-l}+b_{i_1,r}b_{i_3,r-l}\right)\Biggr).$$

From the form of expansion (54) and expansion of the stochastic integral $J_{(011)\Delta,0}^{*(0i_2i_3)}$ we can conclude that they include iterated (double) series. Moreover, for approximation of the considered stochastic integral $J_{(111)\Delta,0}^{*(i_1i_2i_3)}$ in the works [3] (Sect. 5.8, pp. 202–204), [4] (pp. 82-84), [5] (pp. 438-439), [6] (pp. 263-264) it is proposed to put upper limits of summation by equal q (on the base of the Wong–Zakai approximation [38]-[40], but without rigorous proof; also see discussion in Sect. 7).

For example, the value $D_{i_1i_2i_3}$ is approximated in [3] (Sect. 5.8, pp. 202–204), [4] (pp. 82-84), [5] (pp. 438-439), [6] (pp. 263-264) by the double sums of the form

$$D_{i_1i_2i_3}^{(q)}=-\frac{\pi}{2\Delta^{3/2}}\sum_{l=1}^{q}\sum_{r=1}^{q}l\Biggl(a_{i_2,l}\left(a_{i_3,l+r}b_{i_1,r}-a_{i_1,r}b_{i_3,l+r}\right)+$$

$$+b_{i_2,l}\left(a_{i_1,r}a_{i_3,r+l}+b_{i_1,r}b_{i_3,l+r}\right)\Biggr)+$$

$$+\frac{\pi}{2\Delta^{3/2}}\sum_{l=1}^{q}\sum_{r=1}^{l-1}l\Biggl(a_{i_2,l}\left(a_{i_1,r}b_{i_3,l-r}+a_{i_3,l-r}b_{i_1,r}\right)-$$

$$-b_{i_2,l}\left(a_{i_1,r}a_{i_3,l-r}-b_{i_1,r}b_{i_3,l-r}\right)\Biggr)+$$

$$+\frac{\pi}{2\Delta^{3/2}}\sum_{l=1}^{q}\sum_{r=l+1}^{2q}l\Biggl(a_{i_2,l}\left(a_{i_3,r-l}b_{i_1,r}-a_{i_1,r}b_{i_3,r-l}\right)+$$

$$+b_{i_2,l}\left(a_{i_1,r}a_{i_3,r-l}+b_{i_1,r}b_{i_3,r-l}\right)\Biggr).$$

Obviously, we can avoid this problem (iterated application of the operation of limit transition) using the method based on Theorems 1–7.

If we prove that the terms of the expansion (54) coincide with the terms of its analogue obtained using Theorems 1–3 (this fact is proved in [10]-[24] for the simplest stochastic integrals $I_{(1)T,t}^{*(i_1)}$, $I_{(00)T,t}^{*(i_1i_2)}$ of first and second multiplicity), then we can replace the iterated (double) series in (54) by the multiple ones, as in Theorems 1–3 (as was made formally in [3]-[6]). However, it requires a separate argumentation.

6. Approximation of Specific Iterated Stochastic Integrals of Multiplicities 1 to 3 Using Theorem 3 and Trigonometric System of Functions

In [10]-[24] on the base of Theorems 1–3 the author of this paper obtained the following expansions of the iterated Stratonovich stochastic integrals (39) (independently from the papers [2]-[7] excepting the method in which additional random variables $\xi_q^{(i)}$ and $\mu_q^{(i)}$) are introduced)

$$I_{(0)T,t}^{*(i_1)}=\sqrt{T-t}\zeta_0^{(i_1)}, \tag{55}$$

$$I_{(1)T,t}^{*(i_1)q}=-\frac{(T-t)^{3/2}}{2}\left(\zeta_0^{(i_1)}-\frac{\sqrt{2}}{\pi}\left(\sum_{r=1}^{q}\frac{1}{r}\zeta_{2r-1}^{(i_1)}+\sqrt{\alpha_q}\xi_q^{(i_1)}\right)\right), \tag{56}$$

$$I_{(00)T,t}^{*(i_1i_2)q}=\frac{1}{2}(T-t)\Biggl(\zeta_0^{(i_1)}\zeta_0^{(i_2)}+\frac{1}{\pi}\sum_{r=1}^{q}\frac{1}{r}\left(\zeta_{2r}^{(i_1)}\zeta_{2r-1}^{(i_2)}-\zeta_{2r-1}^{(i_1)}\zeta_{2r}^{(i_2)}+\right.$$

$$\left.+\sqrt{2}\left(\zeta_{2r-1}^{(i_1)}\zeta_0^{(i_2)}-\zeta_0^{(i_1)}\zeta_{2r-1}^{(i_2)}\right)\right)+\frac{\sqrt{2}}{\pi}\sqrt{\alpha_q}\left(\xi_q^{(i_1)}\zeta_0^{(i_2)}-\zeta_0^{(i_1)}\xi_q^{(i_2)}\right)\Biggr), \tag{57}$$

$$
I_{(000)T,t}^{*(i_1i_2i_3)q}=(T-t)^{3/2}\Biggl(\frac{1}{6}\zeta_0^{(i_1)}\zeta_0^{(i_2)}\zeta_0^{(i_3)}+\frac{\sqrt{\alpha_q}}{2\sqrt{2}\pi}\left(\xi_q^{(i_1)}\zeta_0^{(i_2)}\zeta_0^{(i_3)}-\xi_q^{(i_3)}\zeta_0^{(i_2)}\zeta_0^{(i_1)}\right)+
$$

$$
+\frac{1}{2\sqrt{2}\pi^2}\sqrt{\beta_q}\left(\mu_q^{(i_1)}\zeta_0^{(i_2)}\zeta_0^{(i_3)}-2\mu_q^{(i_2)}\zeta_0^{(i_1)}\zeta_0^{(i_3)}+\mu_q^{(i_3)}\zeta_0^{(i_1)}\zeta_0^{(i_2)}\right)+
$$

$$
+\frac{1}{2\sqrt{2}}\sum_{r=1}^{q}\Biggl(\frac{1}{\pi r}\left(\zeta_{2r-1}^{(i_1)}\zeta_0^{(i_2)}\zeta_0^{(i_3)}-\zeta_{2r-1}^{(i_3)}\zeta_0^{(i_2)}\zeta_0^{(i_1)}\right)+
$$

$$
+\frac{1}{\pi^2r^2}\left(\zeta_{2r}^{(i_1)}\zeta_0^{(i_2)}\zeta_0^{(i_3)}-2\zeta_{2r}^{(i_2)}\zeta_0^{(i_3)}\zeta_0^{(i_1)}+\zeta_{2r}^{(i_3)}\zeta_0^{(i_2)}\zeta_0^{(i_1)}\right)\Biggr)+
$$

$$
+\sum_{r=1}^{q}\Biggl(\frac{1}{4\pi r}\left(\zeta_{2r}^{(i_1)}\zeta_{2r-1}^{(i_2)}\zeta_0^{(i_3)}-\zeta_{2r-1}^{(i_1)}\zeta_{2r}^{(i_2)}\zeta_0^{(i_3)}-\zeta_{2r-1}^{(i_2)}\zeta_{2r}^{(i_3)}\zeta_0^{(i_1)}+\zeta_{2r-1}^{(i_3)}\zeta_{2r}^{(i_2)}\zeta_0^{(i_1)}\right)+
$$

$$
+\frac{1}{8\pi^2r^2}\Bigl(3\zeta_{2r-1}^{(i_1)}\zeta_{2r-1}^{(i_2)}\zeta_0^{(i_3)}+\zeta_{2r}^{(i_1)}\zeta_{2r}^{(i_2)}\zeta_0^{(i_3)}-6\zeta_{2r-1}^{(i_1)}\zeta_{2r-1}^{(i_3)}\zeta_0^{(i_2)}+
$$

$$
+3\zeta_{2r-1}^{(i_2)}\zeta_{2r-1}^{(i_3)}\zeta_0^{(i_1)}-2\zeta_{2r}^{(i_1)}\zeta_{2r}^{(i_3)}\zeta_0^{(i_2)}+\zeta_{2r}^{(i_3)}\zeta_{2r}^{(i_2)}\zeta_0^{(i_1)}\Bigr)\Biggr)+D_{T,t}^{(i_1i_2i_3)q}\Biggr), \tag{58}
$$

where

$$
D_{T,t}^{(i_1i_2i_3)q}=\frac{1}{2\pi^2}\sum_{\substack{r,l=1\\ r\ne l}}^{q}\Biggl(\frac{1}{r^2-l^2}\Biggl(\zeta_{2r}^{(i_1)}\zeta_{2l}^{(i_2)}\zeta_0^{(i_3)}-\zeta_{2r}^{(i_2)}\zeta_0^{(i_1)}\zeta_{2l}^{(i_3)}+
$$

$$
+\frac{r}{l}\zeta_{2r-1}^{(i_1)}\zeta_{2l-1}^{(i_2)}\zeta_0^{(i_3)}-\frac{l}{r}\zeta_0^{(i_1)}\zeta_{2r-1}^{(i_2)}\zeta_{2l-1}^{(i_3)}\Biggr)-\frac{1}{rl}\zeta_{2r-1}^{(i_1)}\zeta_0^{(i_2)}\zeta_{2l-1}^{(i_3)}\Biggr)+
$$

$$
+\frac{1}{4\sqrt{2}\pi^2}\Biggl(\sum_{r,m=1}^{q}\Biggl(\frac{2}{rm}\Bigl(-\zeta_{2r-1}^{(i_1)}\zeta_{2m-1}^{(i_2)}\zeta_{2m}^{(i_3)}+\zeta_{2r-1}^{(i_1)}\zeta_{2r}^{(i_2)}\zeta_{2m-1}^{(i_3)}+
$$

$$
+\zeta_{2r-1}^{(i_1)}\zeta_{2m}^{(i_2)}\zeta_{2m-1}^{(i_3)}-\zeta_{2r}^{(i_1)}\zeta_{2r-1}^{(i_2)}\zeta_{2m-1}^{(i_3)}\Bigr)+
$$

$$
+\frac{1}{m(r+m)}\Bigl(-\zeta_{2(m+r)}^{(i_1)}\zeta_{2r}^{(i_2)}\zeta_{2m}^{(i_3)}-\zeta_{2(m+r)-1}^{(i_1)}\zeta_{2r-1}^{(i_2)}\zeta_{2m}^{(i_3)}-
$$

$$
-\zeta_{2(m+r)-1}^{(i_1)}\zeta_{2r}^{(i_2)}\zeta_{2m-1}^{(i_3)}+\zeta_{2(m+r)}^{(i_1)}\zeta_{2r-1}^{(i_2)}\zeta_{2m-1}^{(i_3)}\Bigr)\Biggr)+
$$

$$
+\sum_{m=1}^{q}\sum_{l=m+1}^{q}\Biggl(\frac{1}{m(l-m)}\Bigl(\zeta_{2(l-m)}^{(i_1)}\zeta_{2l}^{(i_2)}\zeta_{2m}^{(i_3)}+\zeta_{2(l-m)-1}^{(i_1)}\zeta_{2l-1}^{(i_2)}\zeta_{2m}^{(i_3)}-
$$

$$
-\zeta_{2(l-m)-1}^{(i_1)}\zeta_{2l}^{(i_2)}\zeta_{2m-1}^{(i_3)}+\zeta_{2(l-m)}^{(i_1)}\zeta_{2l-1}^{(i_2)}\zeta_{2m-1}^{(i_3)}\Bigr)+
$$

$$
+\frac{1}{l(l-m)}\Bigl(-\zeta_{2(l-m)}^{(i_1)}\zeta_{2m}^{(i_2)}\zeta_{2l}^{(i_3)}+\zeta_{2(l-m)-1}^{(i_1)}\zeta_{2m-1}^{(i_2)}\zeta_{2l}^{(i_3)}-
$$

$$
-\zeta_{2(l-m)-1}^{(i_1)}\zeta_{2m}^{(i_2)}\zeta_{2l-1}^{(i_3)}-\zeta_{2(l-m)}^{(i_1)}\zeta_{2m-1}^{(i_2)}\zeta_{2l-1}^{(i_3)}\Bigr)\Biggr)\Biggr),
$$

$$I_{(10)T,t}^{*(i_1 i_2)q} = -(T-t)^2 \Biggl(\frac{1}{6}\zeta_0^{(i_1)}\zeta_0^{(i_2)} - \frac{1}{2\sqrt{2}\pi}\sqrt{\alpha_q}\xi_q^{(i_2)}\zeta_0^{(i_1)} +$$

$$+ \frac{1}{2\sqrt{2}\pi^2}\sqrt{\beta_q}\Biggl(\mu_q^{(i_2)}\zeta_0^{(i_1)} - 2\mu_q^{(i_1)}\zeta_0^{(i_2)}\Biggr) +$$

$$+ \frac{1}{2\sqrt{2}}\sum_{r=1}^{q}\Biggl(-\frac{1}{\pi r}\zeta_{2r-1}^{(i_2)}\zeta_0^{(i_1)} + \frac{1}{\pi^2 r^2}\left(\zeta_{2r}^{(i_2)}\zeta_0^{(i_1)} - 2\zeta_{2r}^{(i_1)}\zeta_0^{(i_2)}\right)\Biggr) -$$

$$- \frac{1}{2\pi^2}\sum_{\substack{r,l=1\\ r\neq l}}^{q}\frac{1}{r^2-l^2}\Biggl(\zeta_{2r}^{(i_1)}\zeta_{2l}^{(i_2)} + \frac{l}{r}\zeta_{2r-1}^{(i_1)}\zeta_{2l-1}^{(i_2)}\Biggr) +$$

$$+ \sum_{r=1}^{q}\Biggl(\frac{1}{4\pi r}\left(\zeta_{2r}^{(i_1)}\zeta_{2r-1}^{(i_2)} - \zeta_{2r-1}^{(i_1)}\zeta_{2r}^{(i_2)}\right) + \frac{1}{8\pi^2 r^2}\left(3\zeta_{2r-1}^{(i_1)}\zeta_{2r-1}^{(i_2)} + \zeta_{2r}^{(i_2)}\zeta_{2r}^{(i_1)}\right)\Biggr)\Biggr), \tag{59}$$

$$I_{(01)T,t}^{*(i_1 i_2)q} = (T-t)^2 \Biggl(-\frac{1}{3}\zeta_0^{(i_1)}\zeta_0^{(i_2)} - \frac{1}{2\sqrt{2}\pi}\sqrt{\alpha_q}\left(\xi_q^{(i_1)}\zeta_0^{(i_2)} - 2\xi_q^{(i_2)}\zeta_0^{(i_1)}\right) +$$

$$+ \frac{1}{2\sqrt{2}\pi^2}\sqrt{\beta_q}\Biggl(\mu_q^{(i_1)}\zeta_0^{(i_2)} - 2\mu_q^{(i_2)}\zeta_0^{(i_1)}\Biggr) -$$

$$- \frac{1}{2\sqrt{2}}\sum_{r=1}^{q}\Biggl(\frac{1}{\pi r}\left(\zeta_{2r-1}^{(i_1)}\zeta_0^{(i_2)} - 2\zeta_{2r-1}^{(i_2)}\zeta_0^{(i_1)}\right) - \frac{1}{\pi^2 r^2}\left(\zeta_{2r}^{(i_1)}\zeta_0^{(i_2)} - 2\zeta_{2r}^{(i_2)}\zeta_0^{(i_1)}\right)\Biggr) +$$

$$+ \frac{1}{2\pi^2}\sum_{\substack{r,l=1\\ r\neq l}}^{q}\frac{1}{r^2-l^2}\Biggl(\frac{r}{l}\zeta_{2r-1}^{(i_1)}\zeta_{2l-1}^{(i_2)} + \zeta_{2r}^{(i_1)}\zeta_{2l}^{(i_2)}\Biggr) -$$

$$- \sum_{r=1}^{q}\Biggl(\frac{1}{4\pi r}\left(\zeta_{2r}^{(i_1)}\zeta_{2r-1}^{(i_2)} - \zeta_{2r-1}^{(i_1)}\zeta_{2r}^{(i_2)}\right) - \frac{1}{8\pi^2 r^2}\left(3\zeta_{2r-1}^{(i_1)}\zeta_{2r-1}^{(i_2)} + \zeta_{2r}^{(i_1)}\zeta_{2r}^{(i_2)}\right)\Biggr)\Biggr), \tag{60}$$

$$I_{(2)T,t}^{*(i_1)q} = (T-t)^{5/2}\Biggl(\frac{1}{3}\zeta_0^{(i_1)} + \frac{1}{\sqrt{2}\pi^2}\Biggl(\sum_{r=1}^{q}\frac{1}{r^2}\zeta_{2r}^{(i_1)} + \sqrt{\beta_q}\mu_q^{(i_1)}\Biggr) -$$

$$- \frac{1}{\sqrt{2}\pi}\Biggl(\sum_{r=1}^{q}\frac{1}{r}\zeta_{2r-1}^{(i_1)} + \sqrt{\alpha_q}\xi_q^{(i_1)}\Biggr)\Biggr), \tag{61}$$

where

$$\xi_q^{(i)} = \frac{1}{\sqrt{\alpha_q}}\sum_{r=q+1}^{\infty}\frac{1}{r}\ \zeta_{2r-1}^{(i)}, \quad \alpha_q = \frac{\pi^2}{6} - \sum_{r=1}^{q}\frac{1}{r^2}, \quad \mu_q^{(i)} = \frac{1}{\sqrt{\beta_q}}\sum_{r=q+1}^{\infty}\frac{1}{r^2}\ \zeta_{2r}^{(i)},$$

$$\beta_q = \frac{\pi^4}{90} - \sum_{r=1}^{q}\frac{1}{r^4}, \quad \zeta_j^{(i)} = \int\limits_t^T \phi_j(s)d\mathbf{f}_s^{(i)},$$

where $\phi_j(s)$ has the form (44); $\zeta_0^{(i)}$, $\zeta_{2r}^{(i)}$, $\zeta_{2r-1}^{(i)}$, $\xi_q^{(i)}$, $\mu_q^{(i)}$; $r=1,\ldots,q$; $i=1,\ldots,m$ are independent standard Gaussian random variables; $i_1,i_2,i_3=1,\ldots,m$.

Note that from (59), (60) it follows that

$$\sum_{j=0}^{\infty} C_{jj}^{10}=\sum_{j=0}^{\infty} C_{jj}^{01}=-\frac{(T-t)^2}{4}, \tag{62}$$

where

$$C_{jj}^{10}=\int\limits_t^T \phi_j(x)\int\limits_t^x \phi_j(y)(t-y)dydx,$$

$$C_{jj}^{01}=\int\limits_t^T \phi_j(x)(t-x)\int\limits_t^x \phi_j(y)dydx.$$

The formulas (62) are particular cases of the more general relation, which we applied for the proof of Theorem 3 for the case $k=2$ (see [15]-[24]).

Let us consider the mean-square errors of approximations (57)–(60). From the relations (57)–(60) when $i_1\ne i_2$, $i_2\ne i_3$, $i_1\ne i_3$ we obtain by direct calculation

$$\mathsf{M}\left\{\left(I_{(00)T,t}^{*(i_1i_2)}-I_{(00)T,t}^{*(i_1i_2)q}\right)^2\right\}=\frac{(T-t)^2}{2\pi^2}\left(\frac{\pi^2}{6}-\sum_{r=1}^{q}\frac{1}{r^2}\right), \tag{63}$$

$$\mathsf{M}\left\{\left(I_{(000)T,t}^{*(i_1i_2i_3)}-I_{(000)T,t}^{*(i_1i_2i_3)q}\right)^2\right\}=(T-t)^3\left(\frac{1}{4\pi^2}\left(\frac{\pi^2}{6}-\sum_{r=1}^{q}\frac{1}{r^2}\right)+\right.$$

$$\left.+\frac{55}{32\pi^4}\left(\frac{\pi^4}{90}-\sum_{r=1}^{q}\frac{1}{r^4}\right)+\frac{1}{4\pi^4}\left(\sum_{\substack{r,l=1\\ r\ne l}}^{\infty}-\sum_{\substack{r,l=1\\ r\ne l}}^{q}\right)\frac{5l^4+4r^4-3l^2r^2}{r^2l^2(r^2-l^2)^2}\right), \tag{64}$$

$$\mathsf{M}\left\{\left(I_{(01)T,t}^{*(i_1i_2)}-I_{(01)T,t}^{*(i_1i_2)q}\right)^2\right\}=(T-t)^4\left(\frac{1}{8\pi^2}\left(\frac{\pi^2}{6}-\sum_{r=1}^{q}\frac{1}{r^2}\right)+\right.$$

$$\left.+\frac{5}{32\pi^4}\left(\frac{\pi^4}{90}-\sum_{r=1}^{q}\frac{1}{r^4}\right)+\frac{1}{4\pi^4}\left(\sum_{\substack{k,l=1\\ k\ne l}}^{\infty}-\sum_{\substack{k,l=1\\ k\ne l}}^{q}\right)\frac{l^2+k^2}{k^2(l^2-k^2)^2}\right), \tag{65}$$

$$\mathsf{M}\left\{\left(I_{(10)T,t}^{*(i_1i_2)}-I_{(10)T,t}^{*(i_1i_2)q}\right)^2\right\}=(T-t)^4\left(\frac{1}{8\pi^2}\left(\frac{\pi^2}{6}-\sum_{r=1}^{q}\frac{1}{r^2}\right)+\right.$$

$$\left.+\frac{5}{32\pi^4}\left(\frac{\pi^4}{90}-\sum_{r=1}^{q}\frac{1}{r^4}\right)+\frac{1}{4\pi^4}\left(\sum_{\substack{k,l=1\\ k\ne l}}^{\infty}-\sum_{\substack{k,l=1\\ k\ne l}}^{q}\right)\frac{l^2+k^2}{l^2(l^2-k^2)^2}\right). \tag{66}$$

It is easy to demonstrate that the relations (64), (65), and (66) can be represented using Theorem 8 in the following form

$$\mathsf{M}\left\{\left(I_{(000)T,t}^{*(i_1 i_2 i_3)}-I_{(000)T,t}^{*(i_1 i_2 i_3)q}\right)^2\right\}=(T-t)^3\left(\frac{4}{45}-\frac{1}{4\pi^2}\sum_{r=1}^{q}\frac{1}{r^2}-\right.$$

(67)
$$\left.-\frac{55}{32\pi^4}\sum_{r=1}^{q}\frac{1}{r^4}-\frac{1}{4\pi^4}\sum_{\substack{r,l=1\\ r\neq l}}^{q}\frac{5l^4+4r^4-3r^2l^2}{r^2l^2\left(r^2-l^2\right)^2}\right),$$

$$\mathsf{M}\left\{\left(I_{(10)T,t}^{*(i_1 i_2)}-I_{(10)T,t}^{*(i_1 i_2)q}\right)^2\right\}=\frac{(T-t)^4}{4}\left(\frac{1}{9}-\frac{1}{2\pi^2}\sum_{r=1}^{q}\frac{1}{r^2}-\right.$$

(68)
$$\left.-\frac{5}{8\pi^4}\sum_{r=1}^{q}\frac{1}{r^4}-\frac{1}{\pi^4}\sum_{\substack{k,l=1\\ k\neq l}}^{q}\frac{k^2+l^2}{l^2\left(l^2-k^2\right)^2}\right),$$

$$\mathsf{M}\left\{\left(I_{(01)T,t}^{*(i_1 i_2)}-I_{(01)T,t}^{*(i_1 i_2)q}\right)^2\right\}=\frac{(T-t)^4}{4}\left(\frac{1}{9}-\frac{1}{2\pi^2}\sum_{r=1}^{q}\frac{1}{r^2}-\right.$$

(69)
$$\left.-\frac{5}{8\pi^4}\sum_{r=1}^{q}\frac{1}{r^4}-\frac{1}{\pi^4}\sum_{\substack{k,l=1\\ k\neq l}}^{q}\frac{l^2+k^2}{k^2\left(l^2-k^2\right)^2}\right).$$

Comparing (67)–(69) and (64)–(66), we obtain

(70)
$$\sum_{\substack{k,l=1\\ k\neq l}}^{\infty}\frac{l^2+k^2}{k^2\left(l^2-k^2\right)^2}=\sum_{\substack{k,l=1\\ k\neq l}}^{\infty}\frac{l^2+k^2}{l^2\left(l^2-k^2\right)^2}=\frac{\pi^4}{48},$$

(71)
$$\sum_{\substack{r,l=1\\ r\neq l}}^{\infty}\frac{5l^4+4r^4-3r^2l^2}{r^2l^2\left(r^2-l^2\right)^2}=\frac{9\pi^4}{80}.$$

Let us consider approximations of the stochastic integrals $I_{(10)T,t}^{*(i_1 i_1)}$, $I_{(01)T,t}^{*(i_1 i_1)}$ and conditions for selecting the number q using the trigonometric system of functions

$$I_{(10)T,t}^{*(i_1 i_1)q}=-(T-t)^2\left(\frac{1}{6}\left(\zeta_0^{(i_1)}\right)^2-\frac{1}{2\sqrt{2}\pi}\sqrt{\alpha_q}\xi_q^{(i_1)}\zeta_0^{(i_1)}-\right.$$

$$-\frac{1}{2\sqrt{2}\pi^2}\sqrt{\beta_q}\mu_q^{(i_1)}\zeta_0^{(i_1)}-\frac{1}{2\sqrt{2}}\sum_{r=1}^{q}\left(\frac{1}{\pi r}\zeta_{2r-1}^{(i_1)}\zeta_0^{(i_1)}+\frac{1}{\pi^2r^2}\zeta_{2r}^{(i_1)}\zeta_0^{(i_1)}\right)-$$

$$
-\frac{1}{2\pi^2}\sum_{\substack{r,l=1\\ r\neq l}}^{q}\frac{1}{r^2-l^2}\left(\zeta_{2r}^{(i_1)}\zeta_{2l}^{(i_1)}+\frac{l}{r}\zeta_{2r-1}^{(i_1)}\zeta_{2l-1}^{(i_1)}\right)+
$$

$$
+\frac{1}{8\pi^2}\sum_{r=1}^{q}\frac{1}{r^2}\left(3\left(\zeta_{2r-1}^{(i_1)}\right)^2+\left(\zeta_{2r}^{(i_1)}\right)^2\right)\Biggr),
$$

$$
I_{(01)T,t}^{*(i_1i_1)q}=(T-t)^2\Biggl(-\frac{1}{3}\left(\zeta_0^{(i_1)}\right)^2+\frac{1}{2\sqrt{2}\pi}\sqrt{\alpha_q}\xi_q^{(i_1)}\zeta_0^{(i_1)}-
$$

$$
-\frac{1}{2\sqrt{2}\pi^2}\sqrt{\beta_q}\mu_q^{(i_1)}\zeta_0^{(i_1)}+\frac{1}{2\sqrt{2}}\sum_{r=1}^{q}\left(\frac{1}{\pi r}\zeta_{2r-1}^{(i_1)}\zeta_0^{(i_1)}-\frac{1}{\pi^2r^2}\zeta_{2r}^{(i_1)}\zeta_0^{(i_1)}\right)+
$$

$$
+\frac{1}{2\pi^2}\sum_{\substack{r,l=1\\ r\neq l}}^{q}\frac{1}{r^2-l^2}\left(\zeta_{2r}^{(i_1)}\zeta_{2l}^{(i_1)}+\frac{r}{l}\zeta_{2r-1}^{(i_1)}\zeta_{2l-1}^{(i_1)}\right)+
$$

$$
+\frac{1}{8\pi^2}\sum_{r=1}^{q}\frac{1}{r^2}\left(3\left(\zeta_{2r-1}^{(i_1)}\right)^2+\left(\zeta_{2r}^{(i_1)}\right)^2\right)\Biggr).
$$

Then, we obtain

$$
\mathsf{M}\left\{\left(I_{(01)T,t}^{*(i_1i_1)}-I_{(01)T,t}^{*(i_1i_1)q}\right)^2\right\}=\mathsf{M}\left\{\left(I_{(10)T,t}^{*(i_1i_1)}-I_{(10)T,t}^{*(i_1i_1)q}\right)^2\right\}=
$$

$$
=\frac{(T-t)^4}{4}\Biggl(\frac{2}{\pi^4}\left(\frac{\pi^4}{90}-\sum_{r=1}^{q}\frac{1}{r^4}\right)+\frac{1}{\pi^4}\left(\frac{\pi^2}{6}-\sum_{r=1}^{q}\frac{1}{r^2}\right)^2+
$$

(72)
$$
+\frac{1}{\pi^4}\left(\sum_{\substack{k,l=1\\ k\neq l}}^{\infty}-\sum_{\substack{k,l=1\\ k\neq l}}^{q}\right)\frac{l^2+k^2}{k^2(l^2-k^2)^2}\Biggr).
$$

Using (70), we write the relation (72) in the following form

$$
\mathsf{M}\left\{\left(I_{(01)T,t}^{*(i_1i_1)}-I_{(01)T,t}^{*(i_1i_1)q}\right)^2\right\}=\mathsf{M}\left\{\left(I_{(10)T,t}^{*(i_1i_1)}-I_{(10)T,t}^{*(i_1i_1)q}\right)^2\right\}=
$$

$$

In Tables 1–3, we confirm numerically the formulas (67)–(69), (73) for various values q. In Tables 1–3, the number ε means the right-hand sides of the mentioned formulas.

The formulas (70), (71) appear to be interesting. Let us confirm numerically their correctness in Tables 4 and 5 (the number ε_q is the absolute deviation of multiple partial sums with the upper limit of summation q for the series (70), (71) from the right-hand sides of the formulas (70), (71); convergence of multiple series is regarded here when $p_1 = p_2 = q \to \infty$, which is acceptable according to Theorems 1, 2).

Using the trigonometric system of functions, let us consider the approximations of iterated stochastic integrals of the following form

$$J^{*(i_1\ldots i_k)}_{(\lambda_1\ldots\lambda_k)T,t} = \int\limits_t^{*T} \ldots \int\limits_t^{*t_2} d\mathbf{w}^{(i_1)}_{t_1} \ldots d\mathbf{w}^{(i_k)}_{t_k},$$

where $\lambda_l = 1$ if $i_l = 1,\ldots,m$ and $\lambda_l = 0$ if $i_l = 0$; $l = 1,\ldots,k$ ($\mathbf{w}^{(i)}_\tau = \mathbf{f}^{(i)}_\tau$ for $i = 1,\ldots,m$ and $\mathbf{w}^{(0)}_\tau = \tau$).

It is easy to see that the approximations

$$J^{*(i_1 i_2)q}_{(\lambda_1\lambda_2)T,t}, \quad J^{*(i_1 i_2 i_3)q}_{(\lambda_1\lambda_2\lambda_3)T,t}$$

of the stochastic integrals

$$J^{*(i_1 i_2)}_{(\lambda_1\lambda_2)T,t}, \quad J^{*(i_1 i_2 i_3)}_{(\lambda_1\lambda_2\lambda_3)T,t}$$

are defined by the right-hand sides of the formulas (57), (58), where it is necessary to take

TABLE 5. Confirmation of the formula (71)

ε_q	10.9585	1.8836	0.1968	0.0197	0.0020
q	1	10	100	1000	10000

$$\zeta_j^{(i)}=\int\limits_t^T \phi_j(s)d\mathbf{w}_s^{(i)} \tag{74}$$

and $i_1,i_2,i_3=0,1,\ldots,m$.

Since

$$\int\limits_t^T \phi_j(s)d\mathbf{w}_s^{(0)}=\begin{cases}\sqrt{T-t} & \text{if } j=0\\ \\ 0 & \text{if } j\neq 0\end{cases},$$

then it is easy to get from (57) and (58), considering that in these equalities $\zeta_j^{(i)}$ has the form (74) and $i_1,i_2,i_3=0,1,\ldots,m$, the following family of formulas

$$J_{(10)T,t}^{(i_1 0)q}=\frac{1}{2}(T-t)^{3/2}\left(\zeta_0^{(i_1)}+\frac{\sqrt{2}}{\pi}\left(\sum_{r=1}^{q}\frac{1}{r}\zeta_{2r-1}^{(i_1)}+\sqrt{\alpha_q}\xi_q^{(i_1)}\right)\right),$$

$$J_{(01)T,t}^{(0 i_2)q}=\frac{1}{2}(T-t)^{3/2}\left(\zeta_0^{(i_2)}-\frac{\sqrt{2}}{\pi}\left(\sum_{r=1}^{q}\frac{1}{r}\zeta_{2r-1}^{(i_2)}+\sqrt{\alpha_q}\xi_q^{(i_2)}\right)\right),$$

$$J_{(001)T,t}^{(00 i_3)q}=(T-t)^{5/2}\left(\frac{1}{6}\zeta_0^{(i_3)}+\frac{1}{2\sqrt{2}\pi^2}\left(\sum_{r=1}^{q}\frac{1}{r^2}\zeta_{2r}^{(i_3)}+\sqrt{\beta_q}\mu_q^{(i_3)}\right)-\right.$$
$$\left.-\frac{1}{2\sqrt{2}\pi}\left(\sum_{r=1}^{q}\frac{1}{r}\zeta_{2r-1}^{(i_3)}+\sqrt{\alpha_q}\xi_q^{(i_3)}\right)\right),$$

$$J_{(010)T,t}^{(0 i_2 0)q}=(T-t)^{5/2}\left(\frac{1}{6}\zeta_0^{(i_2)}-\frac{1}{\sqrt{2}\pi^2}\left(\sum_{r=1}^{q}\frac{1}{r^2}\zeta_{2r}^{(i_2)}+\sqrt{\beta_q}\mu_q^{(i_2)}\right)\right),$$

$$J_{(100)T,t}^{(i_1 00)q}=(T-t)^{5/2}\left(\frac{1}{6}\zeta_0^{(i_1)}+\frac{1}{2\sqrt{2}\pi^2}\left(\sum_{r=1}^{q}\frac{1}{r^2}\zeta_{2r}^{(i_1)}+\sqrt{\beta_q}\mu_q^{(i_1)}\right)+\right.$$
$$\left.+\frac{1}{2\sqrt{2}\pi}\left(\sum_{r=1}^{q}\frac{1}{r}\zeta_{2r-1}^{(i_1)}+\sqrt{\alpha_q}\xi_q^{(i_1)}\right)\right),$$

$$J_{(011)T,t}^{*(0i_2i_3)q}=(T-t)^2\Biggl(\frac{1}{6}\zeta_0^{(i_2)}\zeta_0^{(i_3)}-\frac{1}{2\sqrt{2}\pi}\sqrt{\alpha_q}\xi_q^{(i_3)}\zeta_0^{(i_2)}+$$

$$+\frac{1}{2\sqrt{2}\pi^2}\sqrt{\beta_q}\Biggl(\mu_q^{(i_3)}\zeta_0^{(i_2)}-2\mu_q^{(i_2)}\zeta_0^{(i_3)}\Biggr)+$$

$$

7. Theorems 1–7 from Point of View of the Wong–Zakai Approximation

The iterated Ito stochastic integrals and solutions of Ito SDEs are complex and important functionals from the independent components $\mathbf{f}_s^{(i)}$, $i=1,\ldots,m$ of the multidimensional Wiener process $\mathbf{f}_s$, $s\in[0,T]$. Let $\mathbf{f}_s^{(i)p}$, $p\in\mathbb{N}$ be some approximation of $\mathbf{f}_s^{(i)}$, $i=1,\ldots,m$. Suppose that $\mathbf{f}_s^{(i)p}$ converges to $\mathbf{f}_s^{(i)}$, $i=1,\ldots,m$ if $p\to\infty$ in some sense and has differentiable sample trajectories.

A natural question arises: if we replace $\mathbf{f}_s^{(i)}$ by $\mathbf{f}_s^{(i)p}$, $i=1,\ldots,m$ in the functionals mentioned above, will the resulting functionals converge to the original functionals from the components $\mathbf{f}_s^{(i)}$, $i=1,\ldots,m$ of the multidimentional Wiener process $\mathbf{f}_s$? The answere to this question is negative in the general case. However, in the pioneering works of Wong E. and Zakai M. [38], [39], it was shown that under the special conditions and for some types of approximations of the Wiener process the answere is affirmative with one peculiarity: the convergence takes place to the iterated Stratonovich stochastic integrals and solutions of Stratonovich SDEs and not to iterated Ito stochastic integrals and solutions of Ito SDEs. The piecewise linear approximation as well as the regularization by convolution [38]-[40] relate the mentioned types of approximations of the Wiener process. The above approximation of stochastic integrals and solutions of SDEs is often called the Wong–Zakai approximation.

Let $\mathbf{f}_s$, $s\in[0,T]$ be an m-dimensional standard Wiener process with independent components $\mathbf{f}_s^{(i)}$, $i=1,\ldots,m$. It is well known that the following representation takes place [42], [43]

$$
\mathbf{f}_\tau^{(i)}-\mathbf{f}_t^{(i)}=\sum_{j=0}^{\infty}\int\limits_t^{\tau}\phi_j(s)ds\ \zeta_j^{(i)},\quad \zeta_j^{(i)}=\int\limits_t^{T}\phi_j(s)d\mathbf{f}_s^{(i)}, \tag{76}
$$

where $\tau\in[t,T]$, $t\ge 0$, $\{\phi_j(x)\}_{j=0}^{\infty}$ is an arbitrary complete orthonormal system of functions in the space $L_2([t,T])$, and $\zeta_j^{(i)}$ are independent standard Gaussian random variables for various i or j. Moreover, the series (76) converges for any $\tau\in[t,T]$ in the mean-square sense.

Let $\mathbf{f}_\tau^{(i)p}-\mathbf{f}_t^{(i)p}$ be the mean-square approximation of the process $\mathbf{f}_\tau^{(i)}-\mathbf{f}_t^{(i)}$, which has the following form

$$
\mathbf{f}_\tau^{(i)p}-\mathbf{f}_t^{(i)p}=\sum_{j=0}^{p}\int\limits_t^{\tau}\phi_j(s)ds\ \zeta_j^{(i)}. \tag{77}
$$

From (77) we obtain

$$
d\mathbf{f}_\tau^{(i)p}=\sum_{j=0}^{p}\phi_j(\tau)\zeta_j^{(i)}d\tau. \tag{78}
$$

Consider the following iterated Riemann–Stieltjes integral

$$\int\limits_t^T \psi_k(t_k)\ldots\int\limits_t^{t_2}\psi_1(t_1)d\mathbf{w}_{t_1}^{(i_1)p_1}\ldots d\mathbf{w}_{t_k}^{(i_k)p_k}, \tag{79}$$

where $p_1,\ldots,p_k\in\mathbb{N},\ \ i_1,\ldots,i_k=0,1,\ldots,m,$

$$d\mathbf{w}_{\tau}^{(i)p}=\begin{cases} d\mathbf{f}_{\tau}^{(i)p} & \text{for}\quad i=1,\ldots,m\\ \\ d\tau & \text{for}\quad i=0\end{cases}, \tag{80}$$

and $d\mathbf{f}_{\tau}^{(i)p}$ in defined by the relation (78).

Let us substitute (78) into (79)

$$\int\limits_t^T \psi_k(t_k)\ldots\int\limits_t^{t_2}\psi_1(t_1)d\mathbf{w}_{t_1}^{(i_1)p_1}\ldots d\mathbf{w}_{t_k}^{(i_k)p_k}=\sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k}C_{j_k\ldots j_1}\prod_{l=1}^{k}\zeta_{j_l}^{(i_l)}, \tag{81}$$

where

$$\zeta_j^{(i)}=\int\limits_t^T\phi_j(s)d\mathbf{w}_s^{(i)}$$

are independent standard Gaussian random variables for various i or j (in the case when $i\ne 0$), $\mathbf{w}_s^{(i)}=\mathbf{f}_s^{(i)}$ for $i=1,\ldots,m$ and $\mathbf{w}_s^{(0)}=s$,

$$C_{j_k\ldots j_1}=\int\limits_t^T\psi_k(t_k)\phi_{j_k}(t_k)\ldots\int\limits_t^{t_2}\psi_1(t_1)\phi_{j_1}(t_1)dt_1\ldots dt_k$$

is the Fourier coefficient.

To best of our knowledge [38]-[40] the approximations of the Wiener process in the Wong–Zakai approximation must satisfy fairly strong restrictions [40] (see Definition 7.1, pp. 480–481). Moreover, approximations of the Wiener process that are similar to (77) were not considered in [38], [39] (also see [40], Theorems 7.1, 7.2). Therefore, the proof of analogs of Theorems 7.1 and 7.2 [40] for approximations of the Wiener process based on its series expansion (76) should be carried out separately. Thus, the mean-square convergence of the right-hand side of (81) to the iterated Stratonovich stochastic integral (3) does not follow from the results of the papers [38], [39] (also see [40], Theorems 7.1, 7.2).

From the other hand, Theorems 1–7 from this paper can be considered as the proof of the Wong–Zakai approximation for the iterated Stratonovich stochastic integrals (3) of multiplicities 1 to 6 based on the approximation (77) of the Wiener process. At that, the iterated Riemann–Stieltjes integrals (79) converge (according to Theorems 1–7) to the appropriate iterated Stratonovich stochastic integrals (3). Recall that $\{\phi_j(x)\}_{j=0}^{\infty}$ (see (76), (77), and Theorems 3–7) is a complete orthonormal system of Legendre polynomials or trigonometric functions in the space $L_2([t,T])$.

To illustrate the above reasoning, consider two examples for the case $k=2,\ \psi_1(s),\ \psi_2(s)\equiv 1;$ $i_1,i_2=1,\ldots,m.$

The first example relates to the piecewise linear approximation of the multidimensional Wiener process (these approximations were considered in [38]-[40]).

Let $\mathbf{b}_{\Delta}^{(i)}(t),\ t\in[0,T]$ be the piecewise linear approximation of the ith component $\mathbf{f}_t^{(i)}$ of the multidimensional standard Wiener process $\mathbf{f}_t,\ t\in[0,T]$ with independent components $\mathbf{f}_t^{(i)},\ i=1,\ldots,m,$ i.e.

$$
\mathbf{b}_{\Delta}^{(i)}(t)=\mathbf{f}_{k\Delta}^{(i)}+\frac{t-k\Delta}{\Delta}\Delta\mathbf{f}_{k\Delta}^{(i)},
$$

where

$$
\Delta\mathbf{f}_{k\Delta}^{(i)}=\mathbf{f}_{(k+1)\Delta}^{(i)}-\mathbf{f}_{k\Delta}^{(i)},\quad t\in[k\Delta,(k+1)\Delta),\quad k=0,1,\ldots,N-1.
$$

Note that w. p. 1

$$
\frac{d\mathbf{b}_{\Delta}^{(i)}}{dt}(t)=\frac{\Delta\mathbf{f}_{k\Delta}^{(i)}}{\Delta},\quad t\in[k\Delta,(k+1)\Delta),\quad k=0,1,\ldots,N-1. \tag{82}
$$

Consider the following iterated Riemann–Stieltjes integral

$$
\int\limits_0^T\int\limits_0^s d\mathbf{b}_{\Delta}^{(i_1)}(\tau)d\mathbf{b}_{\Delta}^{(i_2)}(s),\quad i_1,i_2=1,\ldots,m.
$$

Using (82) and additive property of the Riemann–Stieltjes integral, we can write w. p. 1

$$
\int\limits_0^T\int\limits_0^s d\mathbf{b}_{\Delta}^{(i_1)}(\tau)d\mathbf{b}_{\Delta}^{(i_2)}(s)=\int\limits_0^T\int\limits_0^s \frac{d\mathbf{b}_{\Delta}^{(i_1)}}{d\tau}(\tau)d\tau\frac{d\mathbf{b}_{\Delta}^{(i_2)}}{ds}(s)ds=
$$

$$
=\sum_{l=0}^{N-1}\int\limits_{l\Delta}^{(l+1)\Delta}\left(\sum_{q=0}^{l-1}\int\limits_{q\Delta}^{(q+1)\Delta}\frac{\Delta\mathbf{f}_{q\Delta}^{(i_1)}}{\Delta}d\tau+\int\limits_{l\Delta}^{s}\frac{\Delta\mathbf{f}_{l\Delta}^{(i_1)}}{\Delta}d\tau\right)\frac{\Delta\mathbf{f}_{l\Delta}^{(i_2)}}{\Delta}ds=
$$

$$
=\sum_{l=0}^{N-1}\sum_{q=0}^{l-1}\Delta\mathbf{f}_{q\Delta}^{(i_1)}\Delta\mathbf{f}_{l\Delta}^{(i_2)}+\frac{1}{\Delta^2}\sum_{l=0}^{N-1}\Delta\mathbf{f}_{l\Delta}^{(i_1)}\Delta\mathbf{f}_{l\Delta}^{(i_2)}\int\limits_{l\Delta}^{(l+1)\Delta}\int\limits_{l\Delta}^{s}d\tau ds=
$$

$$
=\sum_{l=0}^{N-1}\sum_{q=0}^{l-1}\Delta\mathbf{f}_{q\Delta}^{(i_1)}\Delta\mathbf{f}_{l\Delta}^{(i_2)}+\frac{1}{2}\sum_{l=0}^{N-1}\Delta\mathbf{f}_{l\Delta}^{(i_1)}\Delta\mathbf{f}_{l\Delta}^{(i_2)}. \tag{83}
$$

Using (83), it is not difficult to show that

$$\underset{N\to\infty}{\text{l.i.m.}} \int\limits_0^T \int\limits_0^s d\mathbf{b}_{\Delta}^{(i_1)}(\tau) d\mathbf{b}_{\Delta}^{(i_2)}(s) = \int\limits_0^T \int\limits_0^s d\mathbf{f}_{\tau}^{(i_1)} d\mathbf{f}_{s}^{(i_2)} + \frac{1}{2}\mathbf{1}_{\{i_1=i_2\}} \int\limits_0^T ds =$$

$$= \int\limits_0^{*T} \int\limits_0^{*s} d\mathbf{f}_{\tau}^{(i_1)} d\mathbf{f}_{s}^{(i_2)}, \tag{84}$$

where $\Delta \to 0$ if $N \to \infty$ ($N\Delta = T$).

Obviously, (84) agrees with Theorem 7.1 (see [40], p. 486).

The next example relates to the approximation (77) of the Wiener process based on its series expansion (76) for $t = 0$, where $\{\phi_j(x)\}_{j=0}^{\infty}$ is a complete orthonormal system of Legendre polynomials or trigonometric functions in the space $L_2([0, T])$.

Consider the following iterated Riemann–Stieltjes integral

$$\int\limits_0^T \int\limits_0^s d\mathbf{f}_{\tau}^{(i_1)p} d\mathbf{f}_{s}^{(i_2)p}, \quad i_1, i_2 = 1, \ldots, m, \tag{85}$$

where $d\mathbf{f}_{\tau}^{(i)p}$ is defined by the relation (78).

Let us substitute (78) into (85)

$$\int\limits_0^T \int\limits_0^s d\mathbf{f}_{\tau}^{(i_1)p} d\mathbf{f}_{s}^{(i_2)p} = \sum_{j_1,j_2=0}^{p} C_{j_2 j_1} \zeta_{j_1}^{(i_1)} \zeta_{j_2}^{(i_2)}, \tag{86}$$

where

$$C_{j_2 j_1} = \int\limits_0^T \phi_{j_2}(s) \int\limits_0^s \phi_{j_1}(\tau) d\tau ds$$

is the Fourier coefficient; another notations are the same as in (81).

As we noted above, approximations of the Wiener process that are similar to (77) were not considered in [38], [39] (also see Theorems 7.1, 7.2 in [40]). Furthermore, the extension of the results of Theorems 7.1 and 7.2 [40] to the case under consideration is not obvious.

On the other hand, we can apply the theory built in Chapters 1 and 2 of the monographs [22]-[24]. More precisely, using Theorem 3, we obtain from (86) the desired result

$$\underset{p\to\infty}{\text{l.i.m.}} \int\limits_0^T \int\limits_0^s d\mathbf{f}_{\tau}^{(i_1)p} d\mathbf{f}_{s}^{(i_2)p} = \underset{p\to\infty}{\text{l.i.m.}} \sum_{j_1,j_2=0}^{p} C_{j_2 j_1} \zeta_{j_1}^{(i_1)} \zeta_{j_2}^{(i_2)} =$$

$$= \int\limits_0^{*T} \int\limits_0^{*s} d\mathbf{f}_{\tau}^{(i_1)} d\mathbf{f}_{s}^{(i_2)}. \tag{87}$$

From the other hand, by Theorems 1, 2 (see (14)) for the case $k = 2$ we obtain from (86) the following relation

$$\underset{p\to\infty}{\text{l.i.m.}} \int\limits_0^T \int\limits_0^s d\mathbf{f}_\tau^{(i_1)p} d\mathbf{f}_s^{(i_2)p} = \underset{p\to\infty}{\text{l.i.m.}} \sum_{j_1,j_2=0}^{p} C_{j_2 j_1} \zeta_{j_1}^{(i_1)} \zeta_{j_2}^{(i_2)} =$$

$$= \underset{p\to\infty}{\text{l.i.m.}} \sum_{j_1,j_2=0}^{p} C_{j_2 j_1} \left(\zeta_{j_1}^{(i_1)} \zeta_{j_2}^{(i_2)} - \mathbf{1}_{\{i_1=i_2\}} \mathbf{1}_{\{j_1=j_2\}} \right) + \mathbf{1}_{\{i_1=i_2\}} \sum_{j_1=0}^{\infty} C_{j_1 j_1} =$$

$$= \int\limits_0^T \int\limits_0^s d\mathbf{f}_\tau^{(i_1)} d\mathbf{f}_s^{(i_2)} + \mathbf{1}_{\{i_1=i_2\}} \sum_{j_1=0}^{\infty} C_{j_1 j_1}. \tag{88}$$

Since

$$\sum_{j_1=0}^{\infty} C_{j_1 j_1} = \frac{1}{2} \sum_{j_1=0}^{\infty} \left(\int\limits_0^T \phi_j(\tau) d\tau \right)^2 = \frac{1}{2} \left(\int\limits_0^T \phi_0(\tau) d\tau \right)^2 = \frac{1}{2} \int\limits_0^T ds,$$

then from (88) we obtain (87).

NEW SIMPLE METHOD OF EXPANSION OF ITERATED ITO STOCHASTIC INTEGRALS OF MULTIPLICITY 2 BASED ON EXPANSION OF THE BROWNIAN MOTION USING LEGENDRE POLYNOMIALS AND TRIGONOMETRIC FUNCTIONS

DMITRIY F. KUZNETSOV

Abstract. The article is devoted to the expansion of iterated Ito stochastic integrals of second multiplicity based on expansion of the Brownian motion (standard Wiener process) using complete orthonormal systems of functions in the space $L_2([t,T])$. The cases of Legendre polynomials and trigonometric functions are considered in details. We obtained a new representation of the Levy stochastic area based on the Legendre polynomials. This representation was first derived in the author's work [1] (1997). In this article, we obtain the mentioned representation by a simpler method compared to [1] (1997). Also, we get the polynomial representation of the Levy stochastic area using the method of expansion of iterated Ito stochastic integrals based on generalized multple Fourier series. The polynomial representation of the Levy stochastic area has more simple form in comparison with the classical trigonometric representation of the Levy stochastic area. The convergence in the mean of degree $2n$ ($n \in \mathbb{N}$) as well as the convergence with probability 1 for approximations of the Levy stochastic area are proved. The results of the article can be applied to the numerical solution of Ito stochastic differential equations as well as to the numerical approximation of mild solution for non-commutative semilinear stochastic partial differential equations.

Keywords: Iterated Ito stochastic integral, Generalized multiple Fourier series, Multiple Fourier–Legendre series, Levy stochastic area, Mean square-convergence, Milstein method, Ito stochastic differential equation, Approximation, Expansion.

1. Introduction

Let $(\Omega, \mathrm{F}, \mathsf{P})$ be a complete probability space, let $\{\mathrm{F}_t, t \in [0,T]\}$ be a nondecreasing right-continous family of σ-algebras of F, and let $\mathbf{w}_t$ be a standard m-dimensional Wiener stochastic process, which is F_t-measurable for any $t \in [0,T]$. We assume that the components $\mathbf{w}_t^{(i)}$ $(i = 1, \ldots, m)$ of this process are independent. Consider an Ito stochastic differential equation in the integral form

$$\mathbf{x}_t = \mathbf{x}_0 + \int\limits_0^t \mathbf{a}(\mathbf{x}_\tau, \tau) d\tau + \int\limits_0^t B(\mathbf{x}_\tau, \tau) d\mathbf{w}_\tau, \quad \mathbf{x}_0 = \mathbf{x}(0, \omega), \quad \omega \in \Omega. \tag{1}$$

Here $\mathbf{x}_t$ is some n-dimensional stochastic process satisfying the equation (1). The nonrandom functions $\mathbf{a} : \mathbb{R}^n \times [0,T] \to \mathbb{R}^n$, $B : \mathbb{R}^n \times [0,T] \to \mathbb{R}^{n \times m}$ guarantee the existence and uniqueness up to stochastic equivalence of a solution of the equation (1) [2]. The second integral on the right-hand side of (1) is interpreted as an Ito stochastic integral. Let $\mathbf{x}_0$ be an n-dimensional random variable, which is F_0-measurable and $\mathsf{M}\{|\mathbf{x}_0|^2\} < \infty$ (M denotes a mathematical expectation). We assume that $\mathbf{x}_0$ and $\mathbf{w}_t - \mathbf{w}_0$ are independent when $t > 0$.

One of the effective approaches to the numerical integration of Ito stochastic differential equations is an approach based on the Taylor–Ito expansion [3]-[5]. The most important feature of the Taylor–Ito expansion is a presence in this expansion of the so-called iterated Ito stochastic integrals, which play the key role for solving the problem of numerical integration of Ito stochastic differential equations and have the following form

$$J[\psi^{(k)}]_{T,t} = \int\limits_t^T \psi_k(t_k) \ldots \int\limits_t^{t_2} \psi_1(t_1) d\mathbf{w}_{t_1}^{(i_1)} \ldots d\mathbf{w}_{t_k}^{(i_k)} \quad (i_1, \ldots, i_k = 0, 1, \ldots, m), \tag{2}$$

where $\psi_1(\tau), \ldots, \psi_k(\tau)$ are nonrandom functions on $[t,T]$, $\mathbf{w}_\tau^{(i)}$ $(i = 1, \ldots, m)$ are independent standard Wiener processes, and $\mathbf{w}_\tau^{(0)} = \tau$.

In this article, we pay a special attention to the case $k = 2$, $i_1, i_2 = 1, \ldots, m$, $\psi_1(\tau), \psi_2(\tau) \equiv 1$. This case corresponds to the so-called Milstein method [4], [5] for the numerical integration of Ito stochastic differential equations. It is well known that the Milstein method has the order 1.0 of strong convergence under the specific conditions [4], [5].

The Milstein method has the following form [4], [5]

$$\mathbf{y}_{p+1} = \mathbf{y}_p + \sum_{i_1=1}^m B_{i_1} I_{\tau_{p+1},\tau_p}^{(i_1)} + \Delta \mathbf{a} + \sum_{i_1,i_2=1}^m G_{i_1} B_{i_2} \hat{I}_{\tau_{p+1},\tau_p}^{(i_1 i_2)},$$

where $\Delta = T/N$ $(N > 1)$ is a constant (for simplicity) step of integration, $\tau_p = p\Delta$ $(p = 0, 1, \ldots, N)$,

$$G_i = \sum_{j=1}^n B_{ji}(\mathbf{x}, t) \frac{\partial}{\partial \mathbf{x}_j} \quad (i = 1, \ldots, m),$$

B_i is the ith column of the matrix function B and B_{ij} is the ijth element of the matrix function B, $\mathbf{a}_i$ is the ith element of the vector function $\mathbf{a}$, and $\mathbf{x}_i$ is the ith element of the column $\mathbf{x}$, the columns B_{i_1}, $\mathbf{a}$, $G_{i_1} B_{i_2}$ are calculated in the point $(\mathbf{y}_p, p)$,

$$I_{\tau_{p+1},\tau_p}^{(i_1)}=\int\limits_{\tau_p}^{\tau_{p+1}} d\mathbf{w}_{\tau}^{(i_1)},$$

$\hat{I}_{\tau_{p+1},\tau_p}^{(i_1 i_2)}$ is an approximation of the following iterated Ito stochastic integral

$$I_{\tau_{p+1},\tau_p}^{(i_1 i_2)}=\int\limits_{\tau_p}^{\tau_{p+1}}\int\limits_{\tau_p}^{s} d\mathbf{w}_{\tau}^{(i_1)}d\mathbf{w}_{s}^{(i_2)}.$$

The Levy stochastic area $A_{T,t}^{(i_1 i_2)}$ is defined as follows [6]

$$A_{T,t}^{(i_1 i_2)}=\frac{1}{2}\left(I_{T,t}^{(i_1 i_2)}-I_{T,t}^{(i_2 i_1)}\right).$$

It is clear that

$$I_{T,t}^{(i_1 i_2)}=\frac{1}{2}I_{T,t}^{(i_1)}I_{T,t}^{(i_2)}+A_{T,t}^{(i_1 i_2)}\quad \text{w. p. 1,} \tag{3}$$

where w. p. 1 means with probability 1, $i_1\ne i_2$.

The relation (3) implies that the problem of numerical simulation of the iterated Ito stochastic integral $I_{T,t}^{(i_1 i_2)}$ is equivalent to the problem of numerical simulation of the Levy stochastic area.

There are some methods for representation of the Levy stochastic area (see, for example, [3]–[5]). In this article, we consider a new representation of the Levy stochastic area based on the Legendre polynomials. This representation is simpler than its existing analogue based on the Karhunen–Loeve expansion of the Brownian bridge process [4] (also see [3]).

2. Method of Expansion of Iterated Ito stochastic integrals Based on Generalized Multiple Fourier Series

Consider the iterated Ito stochastic integrals (2) and define the following function on the hypercube $[t,T]^k$

$$K(t_1,\ldots,t_k)=\begin{cases}\psi_1(t_1)\ldots\psi_k(t_k), & t_1<\ldots<t_k\\ & \\ 0, & \text{otherwise}\end{cases},\quad t_1,\ldots,t_k\in[t,T],\quad k\ge 2,$$

and $K(t_1)\equiv\psi_1(t_1)$ for $t_1\in[t,T]$. Here we suppose that $\psi_1(\tau),\ldots,\psi_k(\tau)\in L_2([t,T])$.

Assume that $\{\phi_j(x)\}_{j=0}^{\infty}$ is a complete orthonormal system of functions in the space $L_2([t,T])$. The function $K(t_1,\ldots,t_k)$ belongs to the space $L_2([t,T]^k)$. At this situation it is well known that the generalized multiple Fourier series of $K(t_1,\ldots,t_k)\in L_2([t,T]^k)$ is converging to $K(t_1,\ldots,t_k)$ in the hypercube $[t,T]^k$ in the mean-square sense, i.e.

$$\lim_{p_1,\ldots,p_k\to\infty}\left\|K(t_1,\ldots,t_k)-\sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k}C_{j_k\ldots j_1}\prod_{l=1}^{k}\phi_{j_l}(t_l)\right\|_{L_2([t,T]^k)}=0, \tag{4}$$

where

$$C_{j_k\ldots j_1}=\int\limits_{[t,T]^k}K(t_1,\ldots,t_k)\prod_{l=1}^{k}\phi_{j_l}(t_l)dt_1\ldots dt_k \tag{5}$$

is the Fourier coefficient and

$$\|f\|_{L_2([t,T]^k)}=\left(\int\limits_{[t,T]^k}f^2(t_1,\ldots,t_k)dt_1\ldots dt_k\right)^{1/2}.$$

Consider the partition $\{\tau_j\}_{j=0}^{N}$ of $[t,T]$ such that

$$t=\tau_0<\ldots<\tau_N=T,\qquad \Delta_N=\max_{0\le j\le N-1}\Delta\tau_j\to 0\ \text{ if }\ N\to\infty,\qquad \Delta\tau_j=\tau_{j+1}-\tau_j. \tag{6}$$

Theorem 1 [7] (2006), [8]-[52]. *Suppose that every $\psi_l(\tau)$ $(l=1,\ldots,k)$ is a continuous nonrandom function on $[t,T]$ and $\{\phi_j(x)\}_{j=0}^{\infty}$ is a complete orthonormal system of continous functions in $L_2([t,T])$. Then*

$$J[\psi^{(k)}]_{T,t}=\underset{p_1,\ldots,p_k\to\infty}{\text{l.i.m.}}\sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k}C_{j_k\ldots j_1}\Biggl(\prod_{l=1}^{k}\zeta_{j_l}^{(i_l)}-$$

$$-\underset{N\to\infty}{\text{l.i.m.}}\sum_{(l_1,\ldots,l_k)\in\mathrm{G}_k}\phi_{j_1}(\tau_{l_1})\Delta\mathbf{w}_{\tau_{l_1}}^{(i_1)}\ldots\phi_{j_k}(\tau_{l_k})\Delta\mathbf{w}_{\tau_{l_k}}^{(i_k)}\Biggr), \tag{7}$$

where

$$\mathrm{G}_k=\mathrm{H}_k\backslash\mathrm{L}_k,\quad \mathrm{H}_k=\{(l_1,\ldots,l_k):\ l_1,\ldots,l_k=0,\ 1,\ldots,N-1\},$$

$$\mathrm{L}_k=\{(l_1,\ldots,l_k):\ l_1,\ldots,l_k=0,\ 1,\ldots,N-1;\ l_g\ne l_r\ (g\ne r);\ g,r=1,\ldots,k\},$$

l.i.m. *is a limit in the mean-square sense, $i_1,\ldots,i_k=0,1,\ldots,m$, $C_{j_k\ldots j_1}$ is the Fourier coefficient* (5),

$$\zeta_j^{(i)}=\int\limits_t^T\phi_j(s)d\mathbf{w}_s^{(i)} \tag{8}$$

are independent standard Gaussian random variables for various i or j (in the case when $i\ne 0$), $\Delta\mathbf{w}_{\tau_j}^{(i)}=\mathbf{w}_{\tau_{j+1}}^{(i)}-\mathbf{w}_{\tau_j}^{(i)}$ $(i=0,1,\ldots,m)$, $\{\tau_j\}_{j=0}^{N}$ is a partition of $[t,T]$, which satisfies the condition (6).

In order to evaluate the significance of Theorem 1 for practice we will demonstrate its transformed particular cases for $k=1,\ldots,5$ [7]-[52]

$$J[\psi^{(1)}]_{T,t}=\underset{p_1\to\infty}{\text{l.i.m.}}\sum_{j_1=0}^{p_1}C_{j_1}\zeta_{j_1}^{(i_1)}, \tag{9}$$

$$J[\psi^{(2)}]_{T,t}=\underset{p_1,p_2\to\infty}{\text{l.i.m.}}\sum_{j_1=0}^{p_1}\sum_{j_2=0}^{p_2}C_{j_2j_1}\Biggl(\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}-\mathbf{1}_{\{i_1=i_2\ne 0\}}\mathbf{1}_{\{j_1=j_2\}}\Biggr), \tag{10}$$

$$+\mathbf{1}_{\{i_2=i_5\ne 0\}}\mathbf{1}_{\{j_2=j_5\}}\mathbf{1}_{\{i_3=i_4\ne 0\}}\mathbf{1}_{\{j_3=j_4\}}\zeta_{j_1}^{(i_1)}\Biggr), \tag{13}$$

where $\mathbf{1}_A$ is the indicator of the set A.

It was shown that Theorem 1 is valid for convergence w. p. 1 [12]-[14], [32], [44] (the cases of Legendre polynomials and trigonometric functions) and for convergence in the mean of degree $2n$ ($n\in\mathbb{N}$) [12]-[14], [16]-[21], [32]. Moreover, the complete orthonormal systems of Haar and Rademacher–Walsh functions in the space $L_2([t,T])$ can also be applied in Theorem 1 [7]-[21]. The modification of Theorem 1 for complete orthonormal with weigth $r(x)\ge 0$ systems of functions in the space $L_2([t,T])$ can be found in [11]-[14], [42]. Recently, Theorem 1 and Theorem 2 (see below) has been applied to the expansion and mean-square approximation of iterated stochastic integrals with respect to the infinite-dmensional Q-Wiener process [12]-[14] (Chapter 7), [28], [29], [45]-[47]. These results can be directly applied to construction of high-order strong numerical methods for non-commutative semilinear stochastic partial differential equations with multiplicative trace class noise [12]-[14] (Chapter 7), [29], [47].

Note that we obtain the following useful possibilities of the approach based on Theorem 1.

1. There is the explicit formula (5) for calculation of expansion coefficients of the iterated Ito stochastic integral (2) with any fixed multiplicity k.

2. We have new possibilities for exact calculation of the mean-square approximation error of iterated Ito stochastic integral (2) [9]-[14], [22], [33] (also see Theorem 3 below).

3. Since the used multiple Fourier series is a generalized in the sense that it is built using various complete orthonormal systems of functions in the space $L_2([t,T])$, then we have new possibilities for approximation — we can use not only trigonometric functions as in [3]-[5] but Legendre polynomials.

4. As it turned out [7]-[43] it is more convenient to work with Legendre polynomials for approximation of the iterated Ito stochastic integrals (2). Approximations based on the Legendre polynomials are much simpler than their analogues based on the trigonometric functions. Another advantages of the application of Legendre polynomials in the framework of the mentioned problem are considered in [12]-[14], [26], [30].

5. The approach to expansion of iterated Ito and Stratonovich stochastic integrals based on the Karhunen–Loeve expansion of the Brownian bridge process [4] (also see [3], [5]) as well as the approach from [53] lead to iterated application of the operation of limit transition (the operation of limit transition is implemented only once in Theorem 1 and Theorem 2 (see below)) starting from the second multiplicity (in the general case) and third multiplicity (for the case $\psi_1(s),\psi_2(s),\psi_3(s)\equiv 1$; $i_1,i_2,i_3=1,\ldots,m$) of iterated stochastic integrals. Multiple series from Theorems 1, 2 (the operation of limit transition is implemented only once) are more convenient for approximation than the iterated ones (iterated application of the operation of limit transition), since partial sums of multiple series converge for any possible case of convergence to infinity of their upper limits of summation (let us denote them as $p_1,\ldots,p_k$). For example, when $p_1=\ldots=p_k=p\to\infty$. For iterated series, the condition $p_1=\ldots=p_k=p\to\infty$ obviously does not guarantee the convergence of this series. However, the authors of the works [3] (Sect. 5.8, pp. 202–204), [54] (pp. 82-84), [55] (pp. 438-439), [56] (pp. 263-264) use the Wong–Zakai approximation [57]-[59] (without rigorous proof) within the frames of the method of expansion of iterated stochastic integrals [4] (1988) based on the series expansion of the Brownian bridge process (version of the so-called Karhunen-Loeve expansion). See discussions in [12] (Sect. 2.16, 6.2), [13] (Sect. 2.6.2, 6.2), [14] (Sect. 2.6.2, 6.2), [32] (Sect. 11), [34] (Sect. 8), [36] (Sect. 6) for detail.

Note that the correctness of the formulas (9)–(13) can be verified by the fact that if $i_1 = \ldots = i_5 = i = 1, \ldots, m$ and $\psi_1(s), \ldots, \psi_5(s) \equiv \psi(s)$ in (9)–(13), then we can obtain from (9)–(13) the following equalities

$$J[\psi^{(1)}]_{T,t} = \frac{1}{1!}\delta_{T,t},$$

$$J[\psi^{(2)}]_{T,t} = \frac{1}{2!}\left(\delta^2_{T,t} - \Delta_{T,t}\right),$$

$$J[\psi^{(3)}]_{T,t} = \frac{1}{3!}\left(\delta^3_{T,t} - 3\delta_{T,t}\Delta_{T,t}\right),$$

$$J[\psi^{(4)}]_{T,t} = \frac{1}{4!}\left(\delta^4_{T,t} - 6\delta^2_{T,t}\Delta_{T,t} + 3\Delta^2_{T,t}\right),$$

$$J[\psi^{(5)}]_{T,t} = \frac{1}{5!}\left(\delta^5_{T,t} - 10\delta^3_{T,t}\Delta_{T,t} + 15\delta_{T,t}\Delta^2_{T,t}\right)$$

w. p. 1, where

$$\delta_{T,t} = \int\limits_t^T \psi(s)d\mathbf{w}_s^{(i)}, \quad \Delta_{T,t} = \int\limits_t^T \psi^2(s)ds.$$

The above formulas can be independently obtained using the Ito formula and Hermite polynomials. Note that the cases $k = 2, 3$ and $p_1 = p_2 = p_3 = p$ are considered in detail in [8]-[21], [32].

Consider the generalization of formulas (9)–(13) for the case of an arbitrary multiplicity k of the stochastic integral $J[\psi^{(k)}]_{T,t}$ as well as for the case of an arbitrary complete orthonormal systems of functions in the space $L_2([t, T])$ and $\psi_1(\tau), \ldots, \psi_k(\tau) \in L_2([t, T])$. In order to do this, let us consider the unordered set $\{1, 2, \ldots, k\}$ and separate it into two parts: the first part consists of r unordered pairs (sequence order of these pairs is also unimportant) and the second one consists of the remaining $k - 2r$ numbers. So, we have

$$(\{\underbrace{\{g_1, g_2\}, \ldots, \{g_{2r-1}, g_{2r}\}}_{\text{part 1}}\}, \{\underbrace{q_1, \ldots, q_{k-2r}}_{\text{part 2}}\}), \tag{14}$$

where $\{g_1, g_2, \ldots, g_{2r-1}, g_{2r}, q_1, \ldots, q_{k-2r}\} = \{1, 2, \ldots, k\}$, braces mean an unordered set, and parentheses mean an ordered set.

We will say that (14) is a partition and consider the sum with respect to all possible partitions

$$\sum_{\substack{(\{\{g_1, g_2\}, \ldots, \{g_{2r-1}, g_{2r}\}\}, \{q_1, \ldots, q_{k-2r}\}) \\ \{g_1, g_2, \ldots, g_{2r-1}, g_{2r}, q_1, \ldots, q_{k-2r}\} = \{1, 2, \ldots, k\}}} a_{g_1 g_2, \ldots, g_{2r-1} g_{2r}, q_1 \ldots q_{k-2r}}. \tag{15}$$

Below there are several examples of sums in the form (15)

$$\sum_{\substack{(\{g_1, g_2\}) \\ \{g_1, g_2\} = \{1, 2\}}} a_{g_1 g_2} = a_{12},$$

$$\sum_{\substack{(\{\{g_1, g_2\}, \{g_3, g_4\}\}) \\ \{g_1, g_2, g_3, g_4\} = \{1, 2, 3, 4\}}} a_{g_1 g_2 g_3 g_4} = a_{1234} + a_{1324} + a_{2314},$$

$$\sum_{\substack{(\{g_1,g_2\},\{q_1,q_2\})\\ \{g_1,g_2,q_1,q_2\}=\{1,2,3,4\}}} a_{g_1g_2,q_1q_2} = a_{12,34} + a_{13,24} + a_{14,23} + a_{23,14} + a_{24,13} + a_{34,12},$$

$$\sum_{\substack{(\{g_1,g_2\},\{q_1,q_2,q_3\})\\ \{g_1,g_2,q_1,q_2,q_3\}=\{1,2,3,4,5\}}} a_{g_1g_2,q_1q_2q_3} = a_{12,345} + a_{13,245} + a_{14,235} + a_{15,234} + a_{23,145} + a_{24,135}+$$

$$+a_{25,134} + a_{34,125} + a_{35,124} + a_{45,123},$$

$$\sum_{\substack{(\{\{g_1,g_2\},\{g_3,g_4\}\},\{q_1\})\\ \{g_1,g_2,g_3,g_4,q_1\}=\{1,2,3,4,5\}}} a_{g_1g_2,g_3g_4,q_1} = a_{12,34,5} + a_{13,24,5} + a_{14,23,5} + a_{12,35,4} + a_{13,25,4} + a_{15,23,4}+$$

$$+a_{12,54,3} + a_{15,24,3} + a_{14,25,3} + a_{15,34,2} + a_{13,54,2} + a_{14,53,2} + a_{52,34,1} + a_{53,24,1} + a_{54,23,1}.$$

Now we can generalize Theorem 1.

Theorem 2 [12] (Sect. 1.11), [32] (Sect. 15). *Suppose that* $\psi_1(\tau),\ldots,\psi_k(\tau) \in L_2([t,T])$ *and* $\{\phi_j(x)\}_{j=0}^{\infty}$ *is an arbitrary complete orthonormal system of functions in the space* $L_2([t,T])$. *Then the following expansion*

$$J[\psi^{(k)}]_{T,t} = \underset{p_1,\ldots,p_k\to\infty}{\text{l.i.m.}} \sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k} C_{j_k\ldots j_1}\Biggl(\prod_{l=1}^{k}\zeta_{j_l}^{(i_l)} + \sum_{r=1}^{[k/2]}(-1)^r\times$$

$$\times \sum_{\substack{(\{\{g_1,g_2\},\ldots,\{g_{2r-1},g_{2r}\}\},\{q_1,\ldots,q_{k-2r}\})\\ \{g_1,g_2,\ldots,g_{2r-1},g_{2r},q_1,\ldots,q_{k-2r}\}=\{1,2,\ldots,k\}}} \prod_{s=1}^{r}\mathbf{1}_{\{i_{g_{2s-1}}=\ i_{g_{2s}}\neq 0\}}\mathbf{1}_{\{j_{g_{2s-1}}=\ j_{g_{2s}}\}}\prod_{l=1}^{k-2r}\zeta_{j_{q_l}}^{(i_{q_l})}\Biggr) \qquad (16)$$

that converges in the mean-square sense is valid, where $[x]$ *is an integer part of a real number* x*; another notations are the same as in Theorem* 1.

In particular from (16) for $k=5$ we obtain

$$J[\psi^{(5)}]_{T,t} = \underset{p_1,\ldots,p_5\to\infty}{\text{l.i.m.}} \sum_{j_1=0}^{p_1}\ldots\sum_{j_5=0}^{p_5} C_{j_5\ldots j_1}\Biggl(\zeta_{j_1}^{(i_1)}\ldots\zeta_{j_5}^{(i_5)} -$$

$$- \sum_{\substack{(\{g_1,g_2\},\{q_1,q_2,q_3\})\\ \{g_1,g_2,q_1,q_2,q_3\}=\{1,2,3,4,5\}}} \mathbf{1}_{\{i_{g_1}=\ i_{g_2}\neq 0\}}\mathbf{1}_{\{j_{g_1}=\ j_{g_2}\}}\prod_{l=1}^{3}\zeta_{j_{q_l}}^{(i_{q_l})} +$$

$$+ \sum_{\substack{(\{\{g_1,g_2\},\{g_3,g_4\}\},\{q_1\})\\ \{g_1,g_2,g_3,g_4,q_1\}=\{1,2,3,4,5\}}} \mathbf{1}_{\{i_{g_1}=\ i_{g_2}\neq 0\}}\mathbf{1}_{\{j_{g_1}=\ j_{g_2}\}}\mathbf{1}_{\{i_{g_3}=\ i_{g_4}\neq 0\}}\mathbf{1}_{\{j_{g_3}=\ j_{g_4}\}}\zeta_{j_{q_1}}^{(i_{q_1})}\Biggr).$$

The last equality obviously agrees with (13).

It should be noted that an analogue of Theorem 2 for multiple Ito stochastic integrals was considered in [60]. Note that we use another notations in comparison with [60]. Moreover, the proof of an analogue of Theorem 2 from [60] is somewhat different from the proof given in [12] (Sect. 1.11), [32] (Sect. 15).

Let us denote

$$E_k^{p_1,\ldots,p_k} \stackrel{\rm def}{=} {\sf M}\left\{\left(J[\psi^{(k)}]_{T,t}-J[\psi^{(k)}]_{T,t}^{p_1,\ldots,p_k}\right)^2\right\},\quad E_k^p \stackrel{\rm def}{=} E_k^{p_1,\ldots,p_k}\Bigg|_{p_1=\ldots=p_k=p},$$

$$I_k \stackrel{\rm def}{=} \|K\|^2_{L_2([t,T]^k)} = \int\limits_{[t,T]^k} K^2(t_1,\ldots,t_k)dt_1\ldots dt_k,$$

where $J[\psi^{(k)}]_{T,t}^{p_1,\ldots,p_k}$ is the expression on the right-hand side of (16) before passing to the limit $\underset{p_1,\ldots,p_k\to\infty}{\hbox{l.i.m.}}$, i.e.

$$J[\psi^{(k)}]_{T,t}^{p_1,\ldots,p_k} = \sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k} C_{j_k\ldots j_1}\Biggl(\prod_{l=1}^k \zeta_{j_l}^{(i_l)} + \sum_{r=1}^{[k/2]}(-1)^r\times$$

$$\times \sum_{\substack{(\{\{g_1,g_2\},\ldots,\{g_{2r-1},g_{2r}\}\},\{q_1,\ldots,q_{k-2r}\})\\ \{g_1,g_2,\ldots,g_{2r-1},g_{2r},q_1,\ldots,q_{k-2r}\}=\{1,2,\ldots,k\}}} \prod_{s=1}^r {\bf 1}_{\{i_{g_{2s-1}}=\ i_{g_{2s}}\ne 0\}}{\bf 1}_{\{j_{g_{2s-1}}=\ j_{g_{2s}}\}}\prod_{l=1}^{k-2r}\zeta_{j_{q_l}}^{(i_{q_l})}\Biggr).$$

In [12]-[14], [32] it was shown that

$$E_k^{p_1,\ldots,p_k} \le k!\left(I_k - \sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k} C^2_{j_k\ldots j_1}\right)$$

if $i_1,\ldots,i_k=1,\ldots,m$ and $0<T-t<\infty$ or $i_1,\ldots,i_k=0,1,\ldots,m$ and $0<T-t<1$.

Moreover, in [12]-[14], [32] the following estimate is obtained

$$E_k^{p_1,\ldots,p_k} \le (k!)^{2n}(n(2n-1))^{n(k-1)}(2n-1)!!\times$$

$$\times\left(I_k - \sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k} C^2_{j_k\ldots j_1}\right)^n, \tag{17}$$

where $n\in\mathbb{N}$.

The value E_k^p can be calculated exactly.

Theorem 3 [12] (Sect. 1.12), [33] (Sect. 6). *Suppose that $\{\phi_j(x)\}_{j=0}^\infty$ is an arbitrary complete orthonormal system of functions in the space $L_2([t,T])$ and $\psi_1(\tau),\ldots,\psi_k(\tau)\in L_2([t,T])$. Then*

$$E_k^p = I_k - \sum_{j_1,\ldots,j_k=0}^{p} C_{j_k\ldots j_1}{\sf M}\left\{J[\psi^{(k)}]_{T,t}\sum_{(j_1,\ldots,j_k)}\int\limits_t^T\phi_{j_k}(t_k)\ldots\int\limits_t^{t_2}\phi_{j_1}(t_1)d{\bf f}_{t_1}^{(i_1)}\ldots d{\bf f}_{t_k}^{(i_k)}\right\}, \tag{18}$$

where $i_1,\ldots,i_k=1,\ldots,m$; the expression

$$\sum_{(j_1,\ldots,j_k)}$$

means the sum with respect to all possible permutations $(j_1,\ldots,j_k)$. *At the same time if* j_r *swapped with* j_q *in the permutation* $(j_1,\ldots,j_k)$, *then* i_r *swapped with* i_q *in the permutation* $(i_1,\ldots,i_k)$; *another notations are the same as in Theorems* 1, 2.

Note that

$$\mathsf{M}\left\{J[\psi^{(k)}]_{T,t}\int\limits_t^T\phi_{j_k}(t_k)\ldots\int\limits_t^{t_2}\phi_{j_1}(t_1)d\mathbf{f}_{t_1}^{(i_1)}\ldots d\mathbf{f}_{t_k}^{(i_k)}\right\}=C_{j_k\ldots j_1}.$$

Then from Theorem 3 for pairwise different $i_1,\ldots,i_k$ and for $i_1=\ldots=i_k$ we obtain

$$E_k^p=I_k-\sum_{j_1,\ldots,j_k=0}^{p}C_{j_k\ldots j_1}^2,$$

$$E_k^p=I_k-\sum_{j_1,\ldots,j_k=0}^{p}C_{j_k\ldots j_1}\left(\sum_{(j_1,\ldots,j_k)}C_{j_k\ldots j_1}\right).$$

3. New Representation of the Levy Stochastic Area Based on the Legendre Polynomials

Let us consider (10) for the case $i_1\ne i_2$, $\psi_1(s),\ \psi_2(s)\equiv 1$. At that we suppose that $\{\phi_j(x)\}_{j=0}^{\infty}$ is the complete orthonormal system of Legendre polynomials in the space $L_2([t,T])$. Then

$$I_{T,t}^{(i_1 i_2)}=\frac{T-t}{2}\left(\zeta_0^{(i_1)}\zeta_0^{(i_2)}+\sum_{i=1}^{\infty}\frac{1}{\sqrt{4i^2-1}}\left(\zeta_{i-1}^{(i_1)}\zeta_i^{(i_2)}-\zeta_i^{(i_1)}\zeta_{i-1}^{(i_2)}\right)\right), \tag{19}$$

where

$$I_{T,t}^{(i_1 i_2)}=\int\limits_t^T\int\limits_t^s d\mathbf{w}_\tau^{(i_1)}d\mathbf{w}_s^{(i_2)}\quad (i_1,i_2=1,\ldots,m), \tag{20}$$

$\zeta_j^{(i)}$ are independent standard Gaussian random variables (for various i or j), which have the following form

$$\zeta_j^{(i)}=\int\limits_t^T\phi_j(s)d\mathbf{w}_s^{(i)},$$

where

$$\phi_i(s)=\sqrt{\frac{2i+1}{T-t}}P_i\left(\left(s-t-\frac{T-t}{2}\right)\frac{2}{T-t}\right),\quad i=0,1,2,\ldots, \tag{21}$$

and $P_i(x)$ $(i=0,1,2,\ldots)$ is the Legendre polynomial.

Note that the representation (19) was first obtained in the author's works [1] (1997), [61] (1998).

From (19) we obtain

$$\frac{T-t}{2}\sum_{i=1}^{\infty}\frac{1}{\sqrt{4i^2-1}}\left(\zeta_{i-1}^{(i_1)}\zeta_{i}^{(i_2)}-\zeta_{i}^{(i_1)}\zeta_{i-1}^{(i_2)}\right)=\frac{1}{2}\left(I_{T,t}^{(i_1 i_2)}-I_{T,t}^{(i_2 i_1)}\right).$$

Then, a new representation of the Levy stochastic area based on the Legendre polynomials has the following form

$$A_{T,t}^{(i_1 i_2)}=\frac{T-t}{2}\sum_{i=1}^{\infty}\frac{1}{\sqrt{4i^2-1}}\left(\zeta_{i-1}^{(i_1)}\zeta_{i}^{(i_2)}-\zeta_{i}^{(i_1)}\zeta_{i-1}^{(i_2)}\right). \tag{22}$$

4. The Classical Representation of the Levy Stochastic Area

Let us consider (10) for the case $i_1 \neq i_2,\ \ \psi_1(s),\ \psi_2(s)\equiv 1$. At that we suppose that $\{\phi_j(x)\}_{j=0}^{\infty}$ is the complete orthonormal system of trigonometric functions in $L_2([t,T])$. Then

$$I_{T,t}^{(i_1 i_2)}=\frac{1}{2}(T-t)\Biggl(\zeta_0^{(i_1)}\zeta_0^{(i_2)}+\frac{1}{\pi}\sum_{r=1}^{\infty}\frac{1}{r}\Biggl(\zeta_{2r}^{(i_1)}\zeta_{2r-1}^{(i_2)}-\zeta_{2r-1}^{(i_1)}\zeta_{2r}^{(i_2)}+$$

$$+\sqrt{2}\left(\zeta_{2r-1}^{(i_1)}\zeta_0^{(i_2)}-\zeta_0^{(i_1)}\zeta_{2r-1}^{(i_2)}\right)\Biggr)\Biggr), \tag{23}$$

where we use the same notations as in (19), but $\phi_j(s)$ has the following form

$$\phi_j(s)=\frac{1}{\sqrt{T-t}}\begin{cases}1, & \text{if } j=0\\ \sqrt{2}\sin(2\pi r(s-t)/(T-t)), & \text{if } j=2r-1\ ,\quad r=1,\ 2,\ldots\\ \sqrt{2}\cos(2\pi r(s-t)/(T-t)), & \text{if } j=2r\end{cases} \tag{24}$$

From (23) we obtain

$$\frac{T-t}{2\pi}\sum_{r=1}^{\infty}\frac{1}{r}\left(\zeta_{2r}^{(i_1)}\zeta_{2r-1}^{(i_2)}-\zeta_{2r-1}^{(i_1)}\zeta_{2r}^{(i_2)}+\sqrt{2}\left(\zeta_{2r-1}^{(i_1)}\zeta_0^{(i_2)}-\zeta_0^{(i_1)}\zeta_{2r-1}^{(i_2)}\right)\right)=$$

$$=\frac{1}{2}\left(I_{T,t}^{(i_1 i_2)}-I_{T,t}^{(i_2 i_1)}\right).$$

Then, the representation of the Levy stochastic area based on the trigonometric functions has the following form

$$\hat{A}_{T,t}^{(i_1 i_2)}=\frac{T-t}{2\pi}\sum_{r=1}^{\infty}\frac{1}{r}\left(\zeta_{2r}^{(i_1)}\zeta_{2r-1}^{(i_2)}-\zeta_{2r-1}^{(i_1)}\zeta_{2r}^{(i_2)}+\sqrt{2}\left(\zeta_{2r-1}^{(i_1)}\zeta_0^{(i_2)}-\zeta_0^{(i_1)}\zeta_{2r-1}^{(i_2)}\right)\right). \tag{25}$$

As we mentioned above, Milstein G.N. proposed [4] the method of expansion of iterated Ito stochastic integrals of multiplicity 2 based on the trigonometric Fourier expansion of the following Brownian bridge process

$$\mathbf{w}_t - \frac{t}{\Delta}\mathbf{w}_{\Delta}, \quad t \in [0, \Delta], \quad \Delta > 0,$$

where $\mathbf{w}_t$ is a standard multidimensional Wiener process with independent components $\mathbf{w}_t^{(i)}$, $i = 1, \ldots, m$.

The trigonometric Fourier expansion of the Brownian bridge process (version of the so-called Karunen–Loeve expansion) has the form [4]

$$\mathbf{w}_t^{(i)} - \frac{t}{\Delta}\mathbf{w}_{\Delta}^{(i)} = \frac{1}{2}a_{i,0} + \sum_{r=1}^{\infty}\left(a_{i,r}\cos\frac{2\pi rt}{\Delta} + b_{i,r}\sin\frac{2\pi rt}{\Delta}\right), \tag{26}$$

where

$$a_{i,r} = \frac{2}{\Delta}\int\limits_0^{\Delta}\left(\mathbf{w}_s^{(i)} - \frac{s}{\Delta}\mathbf{w}_{\Delta}^{(i)}\right)\cos\frac{2\pi rs}{\Delta}ds,$$

$$b_{i,r} = \frac{2}{\Delta}\int\limits_0^{\Delta}\left(\mathbf{w}_s^{(i)} - \frac{s}{\Delta}\mathbf{w}_{\Delta}^{(i)}\right)\sin\frac{2\pi rs}{\Delta}ds,$$

$r = 0, 1, \ldots,\ \ i = 1, \ldots, m.$

It is easy to demonstrate [4] that the random variables $a_{i,r}, b_{i,r}$ are Gaussian ones and they satisfy the following relations

$$\mathsf{M}\left\{a_{i,r}b_{i,r}\right\} = \mathsf{M}\left\{a_{i,r}b_{i,k}\right\} = 0,$$

$$\mathsf{M}\left\{a_{i,r}a_{i,k}\right\} = \mathsf{M}\left\{b_{i,r}b_{i,k}\right\} = 0,$$

$$\mathsf{M}\left\{a_{i_1,r}a_{i_2,r}\right\} = \mathsf{M}\left\{b_{i_1,r}b_{i_2,r}\right\} = 0,$$

$$\mathsf{M}\left\{a_{i,r}^2\right\} = \mathsf{M}\left\{b_{i,r}^2\right\} = \frac{\Delta}{2\pi^2 r^2},$$

where $i,\ i_1, i_2 = 1, \ldots, m,\ \ r \ne k,\ \ i_1 \ne i_2$.

According to (26), we have

$$\mathbf{w}_t^{(i)} = \mathbf{w}_{\Delta}^{(i)}\frac{t}{\Delta} + \frac{1}{2}a_{i,0} + \sum_{r=1}^{\infty}\left(a_{i,r}\cos\frac{2\pi rt}{\Delta} + b_{i,r}\sin\frac{2\pi rt}{\Delta}\right), \tag{27}$$

where the series converges in the mean-square sense.

The expansion (23) has been obtained in [4] using (27).

5. New Simple Method for Obtainment of Representation of the Levy Stochastic Area

It is well known that the idea of representing of the Wiener process as a functional series with random coefficients using the complete orthonormal system of trigonometric functions in $L_2([0,T])$ goes back to the works of Wiener [62] (1924) and Levy [63] (1951). The specified series was used in [62] and [63] for construction of the Brownian motion process (Wiener process). A little later, Ito and McKean in [64] (1965) used for this purpose the complete orthonormal system of Haar functions in $L_2([0,T])$.

Let $\mathbf{w}_\tau$, $\tau\in[0,T]$ be an m-dimestional standard Wiener process with independent components $\mathbf{w}_\tau^{(i)}$ $(i=1,\ldots,m)$. We have

$$\mathbf{w}_s^{(i)}-\mathbf{w}_t^{(i)}=\int\limits_t^s d\mathbf{w}_\tau^{(i)}=\int\limits_t^T \mathbf{1}_{\{\tau<s\}}d\mathbf{w}_\tau^{(i)},$$

where

$$\mathbf{1}_{\{\tau<s\}}=\begin{cases}1, & \tau<s\\ \\ 0, & \text{otherwise}\end{cases},\quad \tau,s\in[t,T],\quad 0\le t<T.$$

Consider the Fourier expansion of $\mathbf{1}_{\{\tau<s\}}$ at the interval $[t,T]$ (see, for example, [65])

$$\mathbf{1}_{\{\tau<s\}}=\sum_{j=0}^{\infty}\int\limits_t^T \mathbf{1}_{\{\tau<s\}}\phi_j(\tau)d\tau\cdot\phi_j(\tau)=\sum_{j=0}^{\infty}\int\limits_t^s \phi_j(\tau)d\tau\cdot\phi_j(\tau), \tag{28}$$

where $\{\phi_j(\tau)\}_{j=0}^{\infty}$ is a complete orthonormal system of functions in the space $L_2([t,T])$ and the series on the right-hand side of (28) converges in the mean-square sence, i.e.

$$\int\limits_t^T\left(\mathbf{1}_{\{\tau<s\}}-\sum_{j=0}^{q}\int\limits_t^s \phi_j(\tau)d\tau\cdot\phi_j(\tau)\right)^2 d\tau\to 0\quad\text{if}\quad q\to\infty.$$

Let $\left(\mathbf{w}_s^{(i)}-\mathbf{w}_t^{(i)}\right)^{(q)}$ be the mean-square approximation of the process $\mathbf{w}_s^{(i)}-\mathbf{w}_t^{(i)}$, which has the following form

$$\left(\mathbf{w}_s^{(i)}-\mathbf{w}_t^{(i)}\right)^{(q)}=\int\limits_t^T\left(\sum_{j=0}^{q}\int\limits_t^s \phi_j(\tau)d\tau\cdot\phi_j(\tau)\right)d\mathbf{w}_\tau^{(i)}=\sum_{j=0}^{q}\int\limits_t^s \phi_j(\tau)d\tau\cdot\int\limits_t^T \phi_j(\tau)d\mathbf{w}_\tau^{(i)}. \tag{29}$$

Moreover,

$$\mathsf{M}\left\{\left(\mathbf{w}_s^{(i)}-\mathbf{w}_t^{(i)}-\left(\mathbf{w}_s^{(i)}-\mathbf{w}_t^{(i)}\right)^{(q)}\right)^2\right\}=$$

$$= \mathsf{M}\left\{\left(\int\limits_t^T \left(\mathbf{1}_{\{\tau<s\}} - \sum_{j=0}^{q}\int\limits_t^s \phi_j(\tau)d\tau\cdot\phi_j(\tau)\right)d\mathbf{w}_\tau^{(i)}\right)^2\right\} =$$

$$= \int\limits_t^T \left(\mathbf{1}_{\{\tau<s\}} - \sum_{j=0}^{q}\int\limits_t^s \phi_j(\tau)d\tau\cdot\phi_j(\tau)\right)^2 d\tau \to 0 \quad \text{if } q\to\infty. \tag{30}$$

In [53] it was proposed to use the expansion similar to (29) for construction of expansion of the iterated Ito stochastic integral (20) of multiplicity 2. At that, to obtain the mentioned expansion of (20), the truncated expansions (29) of components of the Wiener process $\mathbf{w}_s$ have been iteratively substituted in the single integrals [53]. This procedure leads to the calculation of coefficients of the double Fourier series, which is a time-consuming task for not too complex problem of expansion of the iterated Ito stochastic integral (20).

In contrast to [53] we subsitute the truncated expansion (29) only one time and only into the innermost integral in (20). This procedure leads to the simple calculation of the coefficients

$$\int\limits_t^s \phi_j(\tau)d\tau \quad (j=0,1,2,\ldots)$$

of the usual (not double) Fourier series.

Moreover, we use the Legendre polynomials for construction of the expansion of (20). For the first time the Legendre polynomials have been applied in the framework of the mentioned problem in the author's papers [1] (1997), [61] (1998), [66] (2000), [67] (2001) (also see [7]-[52], [68], [69]). At the same time in the papers of other author's these polynomials have not been considered as the basis functions for construction of expansions of iterated Ito and Stratonovich stochastic integrals.

Theorem 4 [12]-[14], [68], [69]. *Let $\phi_j(\tau)$ $(j=0,1,\ldots)$ be an arbitrary complete orthonormal system of functions in the space $L_2([t,T])$. Let*

$$\int\limits_t^T \left(\mathbf{w}_s^{(i_1)} - \mathbf{w}_t^{(i_1)}\right)^{(q)} d\mathbf{w}_s^{(i_2)} = \sum_{j=0}^{q}\int\limits_t^T \phi_j(\tau)d\mathbf{w}_\tau^{(i_1)}\int\limits_t^T\int\limits_t^s \phi_j(\tau)d\tau d\mathbf{w}_s^{(i_2)} \tag{31}$$

be the approximation of the iterated Ito stochastic integral

$$\int\limits_t^T\int\limits_t^s d\mathbf{w}_\tau^{(i_1)}d\mathbf{w}_s^{(i_2)} \quad (i_1\ne i_2),$$

where $i_1, i_2 = 1,\ldots,m$. Then

$$\int\limits_t^T\int\limits_t^s d\mathbf{w}_\tau^{(i_1)}d\mathbf{w}_s^{(i_2)} = \underset{q\to\infty}{\text{l.i.m.}}\ \int\limits_t^T \left(\mathbf{w}_s^{(i_1)} - \mathbf{w}_t^{(i_1)}\right)^{(q)} d\mathbf{w}_s^{(i_2)} =$$

$$= \underset{q\to\infty}{\text{l.i.m.}}\ \sum_{j=0}^{q}\int\limits_t^T \phi_j(\tau)d\mathbf{w}_\tau^{(i_1)}\int\limits_t^T\int\limits_t^s \phi_j(\tau)d\tau d\mathbf{w}_s^{(i_2)},$$

where $i_1 \neq i_2$ $(i_1, i_2 = 1, \ldots, m)$.

Proof. Using standard properties of the Ito stochastic integral as well as (30) and the property of orthonormality of the functions $\phi_j(\tau)$ $(j = 0, 1, \ldots)$ at the interval $[t, T]$, we obtain

$$
\mathsf{M}\left\{\left(\int_t^T\int_t^s d\mathbf{w}_\tau^{(i_1)}d\mathbf{w}_s^{(i_2)} - \int_t^T\left(\mathbf{w}_s^{(i_1)} - \mathbf{w}_t^{(i_1)}\right)^{(q)} d\mathbf{w}_s^{(i_2)}\right)^2\right\} =
$$

$$
= \int_t^T \mathsf{M}\left\{\left(\mathbf{w}_s^{(i_1)} - \mathbf{w}_t^{(i_1)} - \left(\mathbf{w}_s^{(i_1)} - \mathbf{w}_t^{(i_1)}\right)^{(q)}\right)^2\right\} ds =
$$

$$
= \int_t^T\int_t^T\left(\mathbf{1}_{\{\tau<s\}} - \sum_{j=0}^{q}\int_t^s \phi_j(\tau)d\tau\cdot\phi_j(\tau)\right)^2 d\tau ds =
$$

$$
= \int_t^T\left((s-t) - \sum_{j=0}^{q}\left(\int_t^s \phi_j(\tau)d\tau\right)^2\right) ds. \tag{32}
$$

Applying the continuity of the functions $u_q(s)$ (see below), the nondecreasing property of the functional sequence

$$
u_q(s) = \sum_{j=0}^{q}\left(\int_t^s \phi_j(\tau)d\tau\right)^2,
$$

and the continuity of the limit function $u(s) = s - t$ according to Dini's Theorem, we have the uniform convergence $u_q(s)$ to $u(s)$ at the interval $[t, T]$.

Then from this fact as well as from (32) we obtain

$$
\int_t^T\int_t^s d\mathbf{w}_\tau^{(i_1)}d\mathbf{w}_s^{(i_2)} = \underset{q\to\infty}{\text{l.i.m.}} \int_t^T\left(\mathbf{w}_s^{(i_1)} - \mathbf{w}_t^{(i_1)}\right)^{(q)} d\mathbf{w}_s^{(i_2)}. \tag{33}
$$

Theorem 4 is proved.

Let $\{\phi_j(\tau)\}_{j=0}^{\infty}$ be the complete orthonormal system of Legendre polynomials in the space $L_2([t, T])$, which has the form (21). Then

$$
\int_t^s \phi_j(\tau)d\tau = \frac{T-t}{2}\left(\frac{\phi_{j+1}(s)}{\sqrt{(2j+1)(2j+3)}} - \frac{\phi_{j-1}(s)}{\sqrt{4j^2-1}}\right) \quad \text{for} \quad j \geq 1. \tag{34}
$$

Denote (see Theorem 1)

$$
\zeta_j^{(i)} = \int_t^T \phi_j(\tau)d\mathbf{w}_\tau^{(i)} \quad (i = 1, \ldots, m).
$$

From (31) and (34) we get

$$\int\limits_t^T \left(\mathbf{w}_s^{(i_1)}-\mathbf{w}_t^{(i_1)}\right)^{(q)} d\mathbf{w}_s^{(i_2)} = \frac{1}{\sqrt{T-t}}\zeta_0^{(i_1)}\int\limits_t^T (s-t)\mathbf{w}_s^{(i_2)}+$$

$$+\frac{T-t}{2}\sum_{j=1}^{q}\zeta_j^{(i_1)}\left(\frac{1}{\sqrt{(2j+1)(2j+3)}}\zeta_{j+1}^{(i_2)}-\frac{1}{\sqrt{4j^2-1}}\zeta_{j-1}^{(i_2)}\right)=$$

$$=\frac{T-t}{2}\zeta_0^{(i_1)}\left(\zeta_0^{(i_2)}+\frac{1}{\sqrt{3}}\zeta_1^{(i_2)}\right)+$$

$$+\frac{T-t}{2}\sum_{j=1}^{q}\zeta_j^{(i_1)}\left(\frac{1}{\sqrt{(2j+1)(2j+3)}}\zeta_{j+1}^{(i_2)}-\frac{1}{\sqrt{4j^2-1}}\zeta_{j-1}^{(i_2)}\right)=$$

$$=\frac{T-t}{2}\left(\zeta_0^{(i_1)}\zeta_0^{(i_2)}+\sum_{j=1}^{q}\frac{1}{\sqrt{4j^2-1}}\left(\zeta_{j-1}^{(i_1)}\zeta_j^{(i_2)}-\zeta_j^{(i_1)}\zeta_{j-1}^{(i_2)}\right)\right)+$$

$$+\frac{T-t}{2}\zeta_q^{(i_1)}\zeta_{q+1}^{(i_2)}\frac{1}{\sqrt{(2q+1)(2q+3)}}. \tag{35}$$

Then from (33) and (35) we obtain

$$\int\limits_t^T\int\limits_t^s d\mathbf{w}_\tau^{(i_1)}d\mathbf{w}_s^{(i_2)} = \underset{q\to\infty}{\text{l.i.m.}}\int\limits_t^T \left(\mathbf{w}_s^{(i_1)}-\mathbf{w}_t^{(i_1)}\right)^{(q)} d\mathbf{w}_s^{(i_2)} =$$

$$=\frac{T-t}{2}\left(\zeta_0^{(i_1)}\zeta_0^{(i_2)}+\sum_{j=1}^{\infty}\frac{1}{\sqrt{4j^2-1}}\left(\zeta_{j-1}^{(i_1)}\zeta_j^{(i_2)}-\zeta_j^{(i_1)}\zeta_{j-1}^{(i_2)}\right)\right). \tag{36}$$

From (36) it follows that the equality (22) is fulfilled. It is not difficult to see that the relation (25) can also be obtained using the approach from this section.

Let $\{\phi_j(\tau)\}_{j=0}^{\infty}$ be the complete orthonormal system of trigonomertic functions in the space $L_2([t,T])$, which has the form (24).

We have

$$\int\limits_t^s \phi_j(\tau)d\tau = \frac{T-t}{2\pi r}\begin{cases}\phi_{2r-1}(s), & j=2r\\ \\ \sqrt{2}\phi_0(s)-\phi_{2r}(s), & j=2r-1\end{cases}, \tag{37}$$

where $j\ge 1$ and $r=1,2,\ldots$.

From (31) and (37) we obtain

$$\int\limits_t^T \left(\mathbf{w}_s^{(i_1)}-\mathbf{w}_t^{(i_1)}\right)^{(q)} d\mathbf{w}_s^{(i_2)}=\frac{1}{\sqrt{T-t}}\zeta_0^{(i_1)}\int\limits_t^T (s-t)\mathbf{w}_s^{(i_2)}+$$

$$+\frac{T-t}{2}\sum_{r=1}^{q}\frac{1}{\pi r}\left(\left(\zeta_{2r}^{(i_1)}\zeta_{2r-1}^{(i_2)}-\zeta_{2r-1}^{(i_1)}\zeta_{2r}^{(i_2)}\right)+\sqrt{2}\zeta_0^{(i_2)}\zeta_{2r-1}^{(i_1)}\right)=$$

$$=\frac{1}{\sqrt{T-t}}\zeta_0^{(i_1)}\frac{(T-t)^{3/2}}{2}\left(\zeta_0^{(i_2)}-\frac{\sqrt{2}}{\pi}\sum_{r=1}^{\infty}\frac{1}{r}\zeta_{2r-1}^{(i_2)}\right)+$$

$$+\frac{T-t}{2}\sum_{r=1}^{q}\frac{1}{\pi r}\left(\left(\zeta_{2r}^{(i_1)}\zeta_{2r-1}^{(i_2)}-\zeta_{2r-1}^{(i_1)}\zeta_{2r}^{(i_2)}\right)+\sqrt{2}\zeta_0^{(i_2)}\zeta_{2r-1}^{(i_1)}\right)=$$

$$=\frac{1}{2}(T-t)\Biggl(\zeta_0^{(i_1)}\zeta_0^{(i_2)}+\frac{1}{\pi}\sum_{r=1}^{q}\frac{1}{r}\Biggl(\zeta_{2r}^{(i_1)}\zeta_{2r-1}^{(i_2)}-\zeta_{2r-1}^{(i_1)}\zeta_{2r}^{(i_2)}+$$

$$+\sqrt{2}\left(\zeta_{2r-1}^{(i_1)}\zeta_0^{(i_2)}-\zeta_0^{(i_1)}\zeta_{2r-1}^{(i_2)}\right)\Biggr)\Biggr)-$$

$$-\frac{T-t}{\pi\sqrt{2}}\zeta_0^{(i_1)}\sum_{r=q+1}^{\infty}\frac{1}{r}\zeta_{2r-1}^{(i_2)}. \tag{38}$$

From (38) and (33) we obviously get (23).

6. Convergence in the Mean of Degree $2n$ and With Probability 1

Let us denote

$$A_{T,t}^{(i_1i_2)q}=\frac{T-t}{2}\sum_{i=1}^{q}\frac{1}{\sqrt{4i^2-1}}\left(\zeta_{i-1}^{(i_1)}\zeta_i^{(i_2)}-\zeta_i^{(i_1)}\zeta_{i-1}^{(i_2)}\right), \tag{39}$$

$$\hat{A}_{T,t}^{(i_1i_2)q}=\frac{T-t}{2\pi}\sum_{r=1}^{q}\frac{1}{r}\left(\zeta_{2r}^{(i_1)}\zeta_{2r-1}^{(i_2)}-\zeta_{2r-1}^{(i_1)}\zeta_{2r}^{(i_2)}+\sqrt{2}\left(\zeta_{2r-1}^{(i_1)}\zeta_0^{(i_2)}-\zeta_0^{(i_1)}\zeta_{2r-1}^{(i_2)}\right)\right). \tag{40}$$

Then, from (3) we get

$$I_{T,t}^{(i_1i_2)q}=\frac{T-t}{2}\zeta_0^{(i_1)}\zeta_0^{(i_2)}+A_{T,t}^{(i_1i_2)q}, \tag{41}$$

$$I_{T,t}^{(i_1i_2)q}=\frac{T-t}{2}\zeta_0^{(i_1)}\zeta_0^{(i_2)}+\hat{A}_{T,t}^{(i_1i_2)q}. \tag{42}$$

It is not difficult to demonstrate [4] that from (23) we can get an another representation for the Levy stochastic area

$$
\frac{T-t}{2\pi}\left(\sum_{r=1}^{q}\frac{1}{r}\left(\zeta_{2r}^{(i_1)}\zeta_{2r-1}^{(i_2)}-\zeta_{2r-1}^{(i_1)}\zeta_{2r}^{(i_2)}+\right.\right.
$$

$$
\left.\left.+\sqrt{2}\left(\zeta_{2r-1}^{(i_1)}\zeta_{0}^{(i_2)}-\zeta_{0}^{(i_1)}\zeta_{2r-1}^{(i_2)}\right)\right)+\sqrt{2}\left(\frac{\pi^2}{6}-\sum_{r=1}^{q}\frac{1}{r^2}\right)^{1/2}\left(\xi_q^{(i_1)}\zeta_0^{(i_2)}-\zeta_0^{(i_1)}\xi_q^{(i_2)}\right)\right),
$$

where

$$
\xi_q^{(i)}=\left(\frac{\pi^2}{6}-\sum_{r=1}^{q}\frac{1}{r^2}\right)^{-1/2}\sum_{r=q+1}^{\infty}\frac{1}{r}\zeta_{2r-1}^{(i)},
$$

and $\zeta_0^{(i)},\ \zeta_{2r}^{(i)},\ \zeta_{2r-1}^{(i)},\ \xi_q^{(i)}$ $(r=1,\ldots,q,\ i=1,\ldots,m)$ are independent standard Gaussian random variables.

From (39) and (40) we obtain

$$
\mathsf{M}\left\{\left(A_{T,t}^{(i_1i_2)}-A_{T,t}^{(i_1i_2)q}\right)^2\right\}=\frac{(T-t)^2}{2}\left(\frac{1}{2}-\sum_{i=1}^{q}\frac{1}{4i^2-1}\right)=
$$

$$
=\frac{(T-t)^2}{2}\sum_{i=q+1}^{\infty}\frac{1}{4i^2-1}\le\frac{(T-t)^2}{2}\int\limits_{q}^{\infty}\frac{1}{4x^2-1}dx=
$$

$$
=-\frac{(T-t)^2}{8}\ln\left|1-\frac{2}{2q+1}\right|\le C_1\frac{(T-t)^2}{q}, \tag{43}
$$

$$
\mathsf{M}\left\{\left(\hat A_{T,t}^{(i_1i_2)}-\hat A_{T,t}^{(i_1i_2)q}\right)^2\right\}=\frac{3(T-t)^2}{2\pi^2}\left(\frac{\pi^2}{6}-\sum_{r=1}^{q}\frac{1}{r^2}\right)=
$$

$$
=\frac{3(T-t)^2}{2\pi^2}\sum_{r=q+1}^{\infty}\frac{1}{r^2}\le\frac{3(T-t)^2}{2\pi^2}\int\limits_{q}^{\infty}\frac{dx}{x^2}=
$$

$$
=\frac{3(T-t)^2}{2\pi^2 q}\le C_2\frac{(T-t)^2}{q}, \tag{44}
$$

where constants $C_1,\ C_2$ does not depend on q.

For the case $k=2,\ i_1\ne i_2$, and $\psi_1(s),\ \psi_2(s)\equiv 1$ from (17) we obtain

$$
\mathsf{M}\left\{\left(I_{T,t}^{(i_1i_2)}-I_{T,t}^{(i_1i_2)q}\right)^{2n}\right\}\le C_{n,2}\left(\frac{(T-t)^2}{2}\left(\frac{1}{2}-\sum_{i=1}^{q}\frac{1}{4i^2-1}\right)\right)^n\to 0\quad\text{if } q\to\infty, \tag{45}
$$

$$\mathsf{M}\left\{\left(I_{T,t}^{(i_1i_2)}-I_{T,t}^{(i_1i_2)q}\right)^{2n}\right\}\le C_{n,2}\left(\frac{3(T-t)^2}{2\pi^2}\left(\frac{\pi^2}{6}-\sum_{r=1}^{q}\frac{1}{r^2}\right)\right)^n\to 0\quad \text{if } q\to\infty, \tag{46}$$

where $C_{n,k}=(k!)^{2n}\bigl(n(2n-1)\bigr)^{n\cdot(k-1)}(2n-1)!!$, $I_{T,t}^{(i_1i_2)q}$ has the form (41) in the inequality (45), and $I_{T,t}^{(i_1i_2)q}$ has the form (42) in the inequality (46),

From (43)–(46) we get

$$\mathsf{M}\left\{\left(A_{T,t}^{(i_1i_2)}-A_{T,t}^{(i_1i_2)q}\right)^{2n}\right\}\to 0\quad \text{if}\quad q\to\infty,$$

$$\mathsf{M}\left\{\left(\hat{A}_{T,t}^{(i_1i_2)}-\hat{A}_{T,t}^{(i_1i_2)q}\right)^{2n}\right\}\to 0\quad \text{if}\quad q\to\infty.$$

Let us address now to the convergence w. p. 1 for $A_{T,t}^{(i_1i_2)q}$. First, note the well known fact.

Lemma 1. *If for the sequence of random variables ξ_q and for some $\alpha>0$ the number series*

$$\sum_{q=1}^{\infty}\mathsf{M}\left\{|\xi_q|^{\alpha}\right\}$$

converges, then the sequence ξ_q converges to zero w. p. 1.

From (43) and (45) $(n=2)$ we obtain

$$\mathsf{M}\left\{\left(I_{T,t}^{(i_1i_2)}-I_{T,t}^{(i_1i_2)q}\right)^{4}\right\}=\mathsf{M}\left\{\left(A_{T,t}^{(i_1i_2)}-A_{T,t}^{(i_1i_2)q}\right)^{4}\right\}\le\frac{K}{q^2},$$

where constant K does not depend on q.

Since the series

$$\sum_{q=1}^{\infty}\frac{K}{q^2}$$

converges, then according to Lemma 1 we obtain that $A_{T,t}^{(i_1i_2)}-A_{T,t}^{(i_1i_2)q}\to 0$ if $q\to\infty$ w. p. 1. Then $A_{T,t}^{(i_1i_2)q}\to A_{T,t}^{(i_1i_2)}$ if $q\to\infty$ w. p. 1.

In addition, using (44) and (46) $(n=2)$, we get $\hat{A}_{T,t}^{(i_1i_2)q}\to\hat{A}_{T,t}^{(i_1i_2)}$ if $q\to\infty$ w. p. 1.

Chapter 4.

Application to the High-Order Strong Numerical Methods for Ito SDEs

FOUR NEW FORMS OF THE TAYLOR–ITO AND TAYLOR–STRATONOVICH EXPANSIONS AND ITS APPLICATION TO THE HIGH-ORDER STRONG NUMERICAL METHODS FOR ITO STOCHASTIC DIFFERENTIAL EQUATIONS

DMITRIY F. KUZNETSOV

Abstract. The problem of the Taylor–Ito and Taylor–Stratonovich expansions of the Ito stochastic processes in a neighborhood of a fixed moment of time is considered. The classical forms of the Taylor–Ito and Taylor–Stratonovich expansions are transformed to the four new representations, which includes the minimal sets of different types of iterated Ito and Stratonovich stochastic integrals. Therefore, these representations (the so-called unified Taylor–Ito and Taylor–Stratonovich expansions) are more convenient for constructing of high-order strong numerical methods for Ito stochastic differential equations. Explicit one-step strong numerical schemes with the orders of convergence 1.0, 1.5, 2.0, 2.5, and 3.0 based on the unified Taylor–Ito and Taylor–Stratonovich expansions are derived. Effective mean-square approximations of iterated Ito and Stratonovich stochastic integrals from these numerical schemes are constructed on the base of the multiple Fourier–Legendre series with multiplicities 1 to 6.

Keywords: Taylor–Ito expansion, Taylor–Stratonovich expansion, Unified Taylor–Ito expansion, Unified Taylor–Stratonovich expansion, Ito stochastic differential equation, High-order strong numerical method for Ito SDEs, Iterated Ito stochastic integral, Iterated Stratonovich stochastic integral, Generalized multiple Fourier series, Multiple Fourier–Legendre series, Mean-square approximation, Expansion.

1. Introduction

Let $(\Omega,\ \mathrm{F},\ \mathsf{P})$ be a complete probability space, let $\{\mathrm{F}_t, t\in[0,T]\}$ be a nondecreasing right-continuous family of σ-subfields of F, and let $\mathbf{f}_t$ be a standard m-dimensional Wiener stochastic process, which is F_t-measurable for any $t\in[0,T]$. We assume that the components $\mathbf{f}_t^{(i)}$ $(i=1,\ldots,m)$ of this process are independent. Consider an Ito stochastic differential equation (SDE) in the integral form

$$\mathbf{x}_t=\mathbf{x}_0+\int\limits_0^t \mathbf{a}(\mathbf{x}_\tau,\tau)d\tau+\int\limits_0^t B(\mathbf{x}_\tau,\tau)d\mathbf{f}_\tau,\quad \mathbf{x}_0=\mathbf{x}(0,\omega). \tag{1}$$

Here $\mathbf{x}_t$ is some n-dimensional stochastic process satisfying to Ito SDE (1). The nonrandom functions $\mathbf{a}:\mathbb{R}^n\times[0,T]\to\mathbb{R}^n$, $B:\mathbb{R}^n\times[0,T]\to\mathbb{R}^{n\times m}$ guarantee the existence and uniqueness up to stochastic equivalence of a solution of (1) [1]. The second integral on the right-hand side of (1) is interpreted as an Ito stochastic integral. Let $\mathbf{x}_0$ be an n-dimensional random variable, which is F_0-measurable and $\mathsf{M}\{|\mathbf{x}_0|^2\}<\infty$ (M denotes a mathematical expectation). Also we assume that $\mathbf{x}_0$ and $\mathbf{f}_t-\mathbf{f}_0$ are independent when $t>0$.

It is well known [2]-[5] that Ito SDEs are adequate mathematical models of dynamic systems of different physical origin that are affected by random perturbations. For example, Ito SDEs are used as mathematical models in stochastic mathematical finance, hydrology, seismology, geophysics, chemical kinetics, population dynamics, electrodynamics, medicine and other fields [2]-[5]. Numerical integration of Ito SDEs based on the strong convergence criterion of approximations [2] is widely used for the numerical simulation of sample trajectories of solutions to Ito SDEs (which is required for constructing new mathematical models on the basis of such equations and for the numerical solution of different mathematical problems connected with Ito SDEs). Among these problems, we note the following: filtering of signals under influence of random noises in various statements (linear Kalman–Bucy filtering, nonlinear optimal filtering, filtering of continuous time Markov chains with a finite space of states, etc.), optimal stochastic control (including incomplete data control), testing estimation procedures of parameters of stochastic systems, stochastic stability and bifurcations analysis [2], [3].

Exact solutions of Ito SDEs are known in rather rare cases. It is for this reason that it becomes necessary to construct numerical procedures for solving these equations.

In this paper, a promising approach [2]-[5] to the numerical integration of Ito SDEs based on the stochastic analogues of the Taylor formula (Taylor–Ito and Taylor–Stratonovich expansions) [6]-[9] is used. This approach uses a finite discretization of the time variable and the numerical simulation of the solution to the Ito SDE at discrete instants of time using the stochastic analogues of the Taylor formula mentioned above. A number of works (e.g., [2]-[5]) describe numerical schemes with the strong orders of convergence $1.5, 2.0,$ 2.5, and 3.0 for the Ito SDEs; however, they do not contain efficient procedures of the mean-square approximation of iterated stochastic integrals involved in these schemes for the case of non-commutative noise.

In this paper we consider the unified Taylor–Ito and Taylor–Stratonovich expansions [8], [9] which makes it possible (in contrast with its classical analogues [6], [7]) to use the minimal sets of iterated Ito and Stratonovich stochastic integrals; this is a simplifying factor for the numerical methods implementation. We prove the unified Taylor–Ito expansion [8] with using the slightly different approach (which is taken from [9]) in comparison with the approach from [8]. Moreover, we obtain another (second) version of the unified Taylor–Ito expansion [10], [11]. In addition, we construct two new forms of the Taylor–Stratonovich expansion (the so-called unified Taylor–Stratonovich expansions [9]). Futhermore, in this paper we study methods [12]-[63] of numerical simulation for iterated Ito and Stratonovich stochastic integrals of multiplicities $1, 2, 3, 4, 5, 6, \ldots$ used in the strong numerical methods for Ito SDEs [2]-[5], [46]-[50], [56]-[61]. To approximate the iterated Ito and Stratonovich stochastic integarls appearing in the numerical schemes with the strong orders of convergence $1.0, 1.5,$ $2.0, 2.5, 3.0$ etc., the method of generalized multiple Fourier series and especially method of multiple Fourier–Legendre series are studied in [12]-[63]. It is important to note that the method of generalized multiple Fourier series [12]-[63] does not lead to the partitioning of the integration interval of the iterated Ito and Stratonovich stochastic integrals under consideration; this interval is the integration step of the numerical methods used to solve Ito SDEs; therefore, it is already fairly small and does not need to be partitioned. Computational experiments [46] show that the application of numerical simulation for iterated stochastic integrals (in which the interval of integration is partitioned) leads to unacceptably high computational cost and accumulation of computation errors. Also note that the Legendre polynomials have essential advantage over the trigonomentric functions (see [23], [39]) in the framework of the method of generalized multiple Fourier series [12]-[63] for the mean-square approximation of iterated Ito and Stratonovich stochastic integrals.

The rest of the article is organized as follows. In the introduction (below) we consider a brief review of the literature on the problem of construction of the Taylor–Ito and Taylor–Stratonovich expansions for the solutions of Ito SDEs. Sect. 2 is devoted to the integration order replacement technique for iterated Ito stochastic integrals. In Sect. 3, we consider the classical Taylor–Ito expansion while Sect. 4 and Sect. 5 are devoted to the first and second forms of the so-called unified Taylor–Ito expansion correspondingly. The classical Taylor–Stratonovich expansion is considered in Sect. 6. The first and second forms of the unified Taylor–Stratonovich expansion are derived in Sect. 7 and Sect. 8. In Sect. 9, we give a comparative analysis of the unified Taylor–Ito and Taylor–Stratonovich expansions with the classical Taylor–Ito and Taylor–Stratonovich expansions. Application of the first form of the unified Taylor–Ito expansion to the high-order strong numerical methods for Ito SDEs is considered in Sect. 10. In Sect. 11, we construct the high-order strong numerical methods for Ito SDEs on the base of the first form of the unified Taylor–Stratonovich expansion. Sect. 12 is devoted to the effective method of the mean-square approximation of iterated Ito and Stratonovich stochastic integrals based on generalized multiple Fourier series. In Sect. 13, we discuss the connection between Theorems 8, 10–13 (see Sect. 12) and Wong–Zakai approximation.

Let us consider the following iterated Ito and Stratonovich stochastic integrals

$$J[\psi^{(k)}]_{s,t}=\int\limits_t^s\psi_k(t_k)\ldots\int\limits_t^{t_2}\psi_1(t_1)d\mathbf{w}_{t_1}^{(i_1)}\ldots d\mathbf{w}_{t_k}^{(i_k)}, \tag{2}$$

$$J^*[\psi^{(k)}]_{s,t}=\int\limits_t^{*s}\psi_k(t_k)\ldots\int\limits_t^{*t_2}\psi_1(t_1)d\mathbf{w}_{t_1}^{(i_1)}\ldots d\mathbf{w}_{t_k}^{(i_k)}, \tag{3}$$

where $0\le t<s\le T$, every $\psi_l(\tau)$ $(l=1,\ldots,k)$ is a nonrandom function at the interval $[t,T]$, $\mathbf{w}_\tau^{(i)}=\mathbf{f}_\tau^{(i)}$ for $i=1,\ldots,m$ and $\mathbf{w}_\tau^{(0)}=\tau,\ \ i_1,\ldots,i_k=0,1,\ldots,m,$

$$\int\ \ \text{and}\ \ \int\limits^{*}$$

denote Ito and Stratonovich stochastic integrals, respectively. In this paper we use the definition of the Stratonovich stochastic integral from [2].

It sould be noted that one of the main problems when constructing the high-order strong numerical methods for Ito SDEs on the base of the Taylor–Ito and Taylor–Stratonovich expansions is the mean-square approximation of iterated Ito and Stratonovich stochastic integrals. Obviously, in the absence of procedures for the numerical simulation of stochastic integrals, the mentioned numerical methods are unrealizable in practice. For this reason, in Sect. 12 we give a brief overview to the effective method of the mean-square approximation of iterated Ito and Stratonovich stochastic integrals (2) and (3) of arbitrary multiplicity k $(k\in\mathbb{N})$, which is proposed and developed by the author of this article in a number of publications [12]-[63]. This method is based on the generalized multiple Fourier series converging in the mean-square sense. The extensive practical material on expansions and mean-square approximations of iterated Ito and Stratonovich stochastic integrals of multiplicities 1 to 6 from the Taylor–Ito and Taylor–Stratonovich expansions is given in Sect. 12. In the mentioned section, the main focus is on approximations based on multiple Fourier–Legendre series. Such approximations is more effective in comparison with the trigonometric approximations [23], [39] at least for the numerical methods with the strong order 1.5 of convergence and higher [23], [39].

Let us give a brief review of the literature on the problem of construction of the Taylor–Ito and Taylor–Stratonovich expansions for the solutions of Ito SDEs. A few variants of a stochastic analog of the Taylor formula have been obtained in [2]-[7] for the stochastic processes in the form $R(\mathbf{x}_s,s)$, where $\mathbf{x}_s$ is a solution of the Ito SDE (1) and $R:\mathbb{R}^n\times[0,T]\to\mathbb{R}^1$ is a nonrandom sufficiently smooth function.

The first result in this direction called the Ito–Taylor expansion has been obtained in [6], [7]. This result gives an expansion of the process $R(\mathbf{x}_s,s)$ into a series such that every term (if $k>0$) contains an iterated Ito stochastic integral

$$\int\limits_t^s\ldots\int\limits_t^{t_2}d\mathbf{w}_{t_1}^{(i_1)}\ldots d\mathbf{w}_{t_k}^{(i_k)} \tag{4}$$

as a factor, where $0 \le t < s \le T$, $i_1, \ldots, i_k = 0, 1, \ldots, m$. Obviously that the iterated Ito stochastic integral (4) is a particular case of (2) for $\psi_1(\tau), \ldots, \psi_k(\tau) \equiv 1$.

In [7], another expansion of the stochastic process $R(\mathbf{x}_s, s)$ in a series has been derived. Instead of the Ito integrals, the iterated Stratonovich stochastic integrals

$$\int\limits_t^{*s} \ldots \int\limits_t^{*t_2} d\mathbf{w}_{t_1}^{(i_1)} \ldots d\mathbf{w}_{t_k}^{(i_k)} \tag{5}$$

were used; the corresponding expansion was called the Stratonovich–Taylor expansion. In the formula (5), the indices $i_1, \ldots, i_k$ take values $0, 1, \ldots, m$.

In [8] the Ito–Taylor expansion from [6], [7] is reduced to the interesting and unexpected form (called the unified Taylor–Ito expansion) with the help of special transformations [66] (also see [33], [67], [68]). Every term of this expansion (if $k > 0$) contains an iterated Ito stochastic integral of the form

$$\int\limits_t^{s} (s - t_k)^{l_k} \ldots \int\limits_t^{t_2} (s - t_1)^{l_1} d\mathbf{f}_{t_1}^{(i_1)} \ldots d\mathbf{f}_{t_k}^{(i_k)}, \tag{6}$$

where $0 \le t < s \le T$, $l_1, \ldots, l_k = 0, 1, 2, \ldots$ and $i_1, \ldots, i_k = 1, \ldots, m$.

It is worth to mention another form of the unified Taylor–Ito expansion [10], [11], [67] (also see [46]-[50], [54]-[61]). Terms of the latter expansion contain iterated Ito stochastic integrals of the form

$$\int\limits_t^{s} (t - t_k)^{l_k} \ldots \int\limits_t^{t_2} (t - t_1)^{l_1} d\mathbf{f}_{t_1}^{(i_1)} \ldots d\mathbf{f}_{t_k}^{(i_k)}, \tag{7}$$

where $l_1, \ldots, l_k = 0, 1, 2, \ldots$ and $i_1, \ldots, i_k = 1, \ldots, m$.

In this paper, we derive two new forms of the Taylor–Ito expansions (the so-called unified Taylor–Ito expansions [10], [11], [67] (also see [46]-[50], [54]-[61])) using an approach which is taken from [9]. Obviously that some of iterated Ito stochastic integrals of the form (4) or (5) are connected by linear relations, while this is not the case for integrals of the form (6), (7). In this sense, the total quantity of stochastic integrals of the form (6) or (7) is minimal. Futhermore, in this article we construct two new forms of the Taylor–Stratonovich expansion (the so-called unified Taylor–Stratonovich expansions [9]) such that every term (if $k > 0$) contains as a multiplier an iterated Stratonovich stochastic integral of one of two types

$$\int\limits_t^{*s} (t - t_k)^{l_k} \ldots \int\limits_t^{*t_2} (t - t_1)^{l_1} d\mathbf{f}_{t_1}^{(i_1)} \ldots d\mathbf{f}_{t_k}^{(i_k)}, \tag{8}$$

$$\int\limits_t^{*s} (s - t_k)^{l_k} \ldots \int\limits_t^{*t_2} (s - t_1)^{l_1} d\mathbf{f}_{t_1}^{(i_1)} \ldots d\mathbf{f}_{t_k}^{(i_k)}, \tag{9}$$

where $l_1, \ldots, l_k = 0, 1, 2, \ldots$, $i_1, \ldots, i_k = 1, \ldots, m$, and $k = 1, 2, \ldots$

It is not difficult to see that for the sets of iterated Stratonovich stochastic integrals (8) and (9) the property of minimality (see above) also holds as for the sets of iterated Ito stochastic integrals (6), (7).

As we noted above, the main problem in implementation of high-order strong numerical methods for Ito SDEs is the mean-square approximation of iterated stochastic integrals (4)–(9). Obviously, these stochastic integrals are particular cases of the stochastic integrals (2), (3).

Taking into account the results of [12]-[65] and the minimality of the sets of stochastic integrals of the forms (6)–(9), we conclude that the unified Taylor–Ito and Taylor–Stratonovich expansions based on the iterated stochastic integrals (6)–(9) may be useful for constructing of high-order strong numerical methods with the orders of convergence 1.5, 2.0, 2.5, 3.0, 3.5, 4.0, 4.5, ... for Ito SDEs.

2. Integration Order Replacement Technique for Iterated Ito Stochastic Integrals

Let $f_\tau, \tau \in [0,T]$ be a scalar standard Wiener process that is F_τ-measurable for every $\tau \in [0,T]$. We introduce a class $\mathfrak{M}_2([t,T])$ $(t \ge 0)$ of random functions $\xi(\tau,\omega) \stackrel{\sf def}{=} \xi_\tau : [t,T] \times \Omega \to \mathbb{R}^1$ having the following properties: these functions are measurable with respect to the pair (τ,ω) of variables, F_τ-measurable for every $\tau \in [t,T]$, and satisfy the conditions

$$\int\limits_t^T \mathsf{M}\left\{\xi_\tau^2\right\} d\tau < \infty$$

and $\mathsf{M}\left\{\xi_\tau^2\right\} < \infty$ for any $\tau \in [t,T]$.

On the class $\mathfrak{M}_2([t,T])$ $(t \ge 0)$, we introduce the Hilbert norm

$$\|\xi\|_{2,T,t} = \left(\int\limits_t^T \mathsf{M}\left\{\xi_\tau^2\right\} d\tau\right)^{1/2}.$$

Let $\left\{\tau_j^{(N)}\right\}_{j=1}^N$ be a partition of the interval $[t,T]$ such that

$$t = \tau_0^{(N)} < \tau_1^{(N)} < \ldots < \tau_N^{(N)} = T, \quad \Delta_N = \max_{0\le j\le N-1} \left|\tau_{j+1}^{(N)} - \tau_j^{(N)}\right| \to 0 \quad \text{as} \quad N \to \infty. \tag{10}$$

Let $\xi^{(N)}(\tau,\omega)$ be a sequence of step functions from the space $\mathfrak{M}_2([t,T])$ defined as follows

$$\xi^{(N)}(\tau,\omega) = \xi_j(\omega) \quad \text{w. p. 1} \quad \text{for} \quad \tau \in \left[\tau_j^{(N)}, \tau_{j+1}^{(N)}\right), \quad j = 0,1,\ldots,N-1,$$

where here and further w. p. 1 means with probability 1.

It is known [1] that for any function $\xi_\tau \in \mathfrak{M}_2([t,T])$ there exists a sequence $\xi^{(N)}(\tau,\omega) \in \mathfrak{M}_2([t,T])$, which converges to the function ξ_τ in the sence of norm $\|\cdot\|_{2,T,t}$.

The mean-square limit

$$\underset{N\to\infty}{\text{l.i.m.}} \sum_{j=0}^{N-1} \xi^{(N)}(\tau_j^{(N)},\omega)\left(f(\tau_{j+1}^{(N)},\omega) - f(\tau_j^{(N)},\omega)\right) \stackrel{\sf def}{=} \int\limits_t^T \xi_\tau df_\tau \tag{11}$$

is called [1] the Ito stochastic integral of a function $\xi_\tau \in \mathfrak{M}_2([t,T])$. Here $\xi^{(N)}(\tau,\omega)$ is an arbitrary sequence of step functions from the class $\mathfrak{M}_2([t,T])$ converging to the function $\xi(\tau,\omega)$ in the sense of norm $\|\cdot\|_{2,T,t}$, i.e.

$$\lim_{N\to\infty} \int\limits_t^T \mathsf{M}\left\{\left|\xi^{(N)}(\tau,\omega) - \xi(\tau,\omega)\right|^2\right\} d\tau = 0. \tag{12}$$

We introduce the class $\mathfrak{Q}_m([t,T])$ $(t \ge 0)$ of Ito processes η_τ, $\tau \in [t,T]$ of the form

$$\eta_\tau = \eta_t + \int\limits_t^\tau a_s ds + \int\limits_t^\tau b_s df_s, \tag{13}$$

where $(a_\tau)^m, (b_\tau)^m \in \mathfrak{M}_2([t,T])$ and

$$\lim_{s\to\tau} \mathsf{M}\left\{|b_s - b_\tau|^4\right\} = 0$$

for all $\tau \in [t,T]$.

Let $C^{2,1}(\mathbb{R}^1 \times [t,T])$ $(t \geq 0)$ be the space of functions $F(x,\tau) : \mathbb{R}^1 \times [t,T] \to \mathbb{R}^1$ with the following property: these functions are twice differentiable in x and have one derivative in τ. Moreover, all these derivatives are bounded.

The mean-square limit

$$\underset{N\to\infty}{\text{l.i.m}} \sum_{j=0}^{N-1} F\left(\frac{1}{2}\left(\eta_{\tau_j^{(N)}} + \eta_{\tau_{j+1}^{(N)}}\right), \tau_j^{(N)}\right)\left(f_{\tau_{j+1}^{(N)}} - f_{\tau_j^{(N)}}\right) \stackrel{\text{def}}{=} \int\limits_t^{*T} F(\eta_\tau, \tau) df_\tau \tag{14}$$

is called [69] the Stratonovich stochastic integral of the process $F(\eta_\tau, \tau)$, $\tau \in [t,T]$ $(t \geq 0)$, where $F(x,\tau) \in C^{2,1}(\mathbb{R}^1 \times [t,T])$. We apply in the formula (14) the same notations as in the formula (11).

It is known [69] (also see [2]) that under proper conditions, the following relation holds

$$\int\limits_t^{*T} F(\eta_\tau, \tau) df_\tau = \int\limits_t^{T} F(\eta_\tau, \tau) df_\tau + \frac{1}{2}\int\limits_t^{T} \frac{\partial F}{\partial x}(\eta_\tau, \tau) b_\tau d\tau \quad \text{w. p. 1.} \tag{15}$$

If the Wiener processes in the formulas (13) and (14) are independent, then

$$\int\limits_t^{*T} F(\eta_\tau, \tau) df_\tau = \int\limits_t^{T} F(\eta_\tau, \tau) df_\tau \quad \text{w. p. 1.} \tag{16}$$

Note that a possible variant of conditions providing the correctness of the formulas (15) and (16) consists of the following conditions

$$\eta_\tau \in \mathfrak{Q}_4([t,T]), \quad F(\eta_\tau, \tau) \in \mathfrak{M}_2([t,T]), \quad \text{and} \quad F(x,\tau) \in C^{2,1}(\mathbb{R}^1 \times [t,T]).$$

Note that if $F(x,\tau) = F_1(x)F_2(\tau)$, then the smoothness condition $F(x,\tau) \in C^{2,1}(\mathbb{R}^1 \times [t,T])$ can be weakened. Namely, it suffices to replace the condition with respect to τ by continuity with respect to this variable.

A theorem allowing the change of order of integration in the iterated Ito stochastic integrals has been proved in [66]-[68] (also see [33]). In what follows, we apply this theorem; let us cite its exact formulation and the notations.

It is well known that the Ito stochastic integral exists in the mean-square sense (see (11)), if the stochastic process $\xi(\tau,\omega) \in \mathfrak{M}_2([0,T])$, that is, perhaps this process does not satisfy the property of the mean-square continuity on the interval $[0,T]$. Let us formulate the theorem on integration order replacement for the special class of iterated Ito stochastic integrals. At the same time, the condition of the mean-square continuity of integrand in the innermost stochastic integral will be significant.

Let $\mathfrak{S}_2([t,T])$ $(t \geq 0)$ be the class of functions $\xi : [t,T] \times \Omega \to \mathbb{R}^1$, which satisfy the conditions:

1. $\xi_\tau \in \mathfrak{M}_2([t,T])$.

2. ξ_τ is the mean-square continuous stochastic process at the interval $[t,T]$.

Let us introduce the following class of iterated Ito stochastic integrals

$$J[\phi,\psi^{(k)}]_{T,t} = \int\limits_t^T \psi_1(t_1)\ldots \int\limits_t^{t_{k-1}} \psi_k(t_k) \int\limits_t^{t_k} \phi_\tau dw_\tau^{(k+1)} dw_{t_k}^{(k)} \ldots dw_{t_1}^{(1)},$$

where $\phi_\tau \in \mathfrak{S}_2([t,T])$, every $\psi_l(\tau)$ $(l=1,\ldots,k)$ is a continuous nonrandom function at the interval $[t,T]$, here and further $w_\tau^{(l)} = f_\tau$ or $w_\tau^{(l)} = \tau$ for $\tau \in [t,T]$ $(l=1,\ldots,k+1)$, $(\psi_1,\ldots,\psi_k) \stackrel{\rm def}{=} \psi^{(k)}$, $\psi^{(1)} \stackrel{\rm def}{=} \psi_1$.

In [69] Stratonovich introduced the definition of the so-called combined stochastic integral for the specific class of integrated processes. Taking this definition as a foundation, let us consider the following construction of stochastic integral

$$\underset{N\to\infty}{\rm l.i.m.} \sum_{j=0}^{N-1} \phi_{\tau_j} \left(f_{\tau_{j+1}} - f_{\tau_j}\right) \theta_{\tau_{j+1}} \stackrel{\rm def}{=} \int\limits_t^T \phi_\tau df_\tau \theta_\tau, \tag{17}$$

where $\phi_\tau,\ \theta_\tau \in \mathfrak{S}_2([t,T])$, $\{\tau_j\}_{j=0}^N$ is the partition of the interval $[t,T]$, which satisfies the condition (10) (for simplicity we write here and sometimes further τ_j instead of $\tau_j^{(N)}$).

Further, we will use integrals of the type (17) ($\phi_\tau \in \mathfrak{S}_2([t,T])$ and θ_τ from a little bit narrower class of stochastic processes than $\mathfrak{S}_2([t,T])$) for formulation the theorem on integration order replacement for iterated Ito stochastic integrals $J[\phi,\psi^{(k)}]_{T,t}$, $k\ge 1$.

Note that under the appropriate conditions the following properties of stochastic integrals defined by the formula (17) can be proved

$$\int\limits_t^T \phi_\tau df_\tau g(\tau) = \int\limits_t^T \phi_\tau g(\tau) df_\tau \quad \text{w. p. 1},$$

where $g(\tau)$ is a continuous nonrandom function at the interval $[t,T]$,

$$\int\limits_t^T \left(\alpha\phi_\tau + \beta\psi_\tau\right) df_\tau \theta_\tau = \alpha \int\limits_t^T \phi_\tau df_\tau \theta_\tau + \beta \int\limits_t^T \psi_\tau df_\tau \theta_\tau \quad \text{w. p. 1},$$

$$\int\limits_t^T \phi_\tau df_\tau \left(\alpha\theta_\tau + \beta\psi_\tau\right) = \alpha \int\limits_t^T \phi_\tau df_\tau \theta_\tau + \beta \int\limits_t^T \phi_\tau df_\tau \psi_\tau \quad \text{w. p. 1},$$

where $\alpha,\ \beta \in \mathbb{R}^1$. At that, we suppose that the stochastic processes ϕ_τ, θ_τ, and ψ_τ are such that all integrals (included in the mentioned properties) exist.

Let us define the stochastic integrals $\hat{I}[\psi^{(k)}]_{T,s}$, $k\ge 1$ of the form

$$\hat{I}[\psi^{(k)}]_{T,s} = \int\limits_s^T \psi_k(t_k) dw_{t_k}^{(k)} \int\limits_{t_k}^T \psi_{k-1}(t_{k-1}) dw_{t_{k-1}}^{(k-1)} \ldots \int\limits_{t_2}^T \psi_1(t_1) dw_{t_1}^{(1)}$$

in accordance with the definition (17) by the following recurrence relation

$$\hat{I}[\psi^{(k)}]_{T,t} \stackrel{\rm def}{=} \underset{N\to\infty}{\text{l.i.m.}} \sum_{l=0}^{N-1} \psi_k(\tau_l)\left(w_{\tau_{l+1}}^{(k)}-w_{\tau_l}^{(k)}\right)\hat{I}[\psi^{(k-1)}]_{T,\tau_{l+1}}, \tag{18}$$

where $k\ge 1,\ \ \hat{I}[\psi^{(0)}]_{T,s}\stackrel{\rm def}{=}1$, and $[s,T]\subseteq[t,T]$.

Then, we will define the iterated stochastic integral $\hat{J}[\phi,\psi^{(k)}]_{T,t},\ k\ge 1$

$$\hat{J}[\phi,\psi^{(k)}]_{T,t}=\int\limits_t^T \phi_s dw_s^{(k+1)}\hat{I}[\psi^{(k)}]_{T,s}$$

similarly in accordance with the definition (17)

$$\hat{J}[\phi,\psi^{(k)}]_{T,t} \stackrel{\rm def}{=} \underset{N\to\infty}{\text{l.i.m.}} \sum_{l=0}^{N-1} \phi_{\tau_l}\left(w_{\tau_{l+1}}^{(k+1)}-w_{\tau_l}^{(k+1)}\right)\hat{I}[\psi^{(k)}]_{T,\tau_{l+1}}.$$

Let us formulate the theorem on integration order replacement for iterated Ito stochastic integrals.

Theorem 1 [66]-[68] (also see [33]). *Suppose that $\phi_\tau\in\mathfrak{S}_2([t,T])$ and every $\psi_l(\tau)$ $(l=1,\ldots,k)$ is a continuous nonrandom function at the interval $[t,T]$. Then, the stochastic integral $\hat{J}[\phi,\psi^{(k)}]_{T,t}$ $(k\ge 1)$ exists and*

$$J[\phi,\psi^{(k)}]_{T,t}=\hat{J}[\phi,\psi^{(k)}]_{T,t}\quad \text{w. p. } 1.$$

Let us consider some propositions related to Theorem 1.

Proposition 1 [66]-[68] (also see [33]). *Let the conditions of Theorem 1 are fulfilled and $h(\tau)$ is a continuous nonrandom function at the interval $[t,T]$. Then*

$$\int\limits_t^T \phi_\tau dw_\tau^{(k+1)}h(\tau)\hat{I}[\psi^{(k)}]_{T,\tau}=\int\limits_t^T \phi_\tau h(\tau)dw_\tau^{(k+1)}\hat{I}[\psi^{(k)}]_{T,\tau}\quad \text{w. p. } 1, \tag{19}$$

and the integrals on the left-hand side of (19) as well as on the right-hand side of (19) exist.

Proposition 2 [66]-[68] (also see [33]). *Under the conditions of Theorem 1 the following equality is satisfied*

$$\int\limits_t^T h(t_1)\int\limits_t^{t_1}\phi_\tau dw_\tau^{(k+2)}dw_{t_1}^{(k+1)}\hat{I}[\psi^{(k)}]_{T,t_1}=$$

$$=\int\limits_t^T \phi_\tau dw_\tau^{(k+2)}\int\limits_\tau^T h(t_1)dw_{t_1}^{(k+1)}\hat{I}[\psi^{(k)}]_{T,t_1}\quad \text{w. p. } 1. \tag{20}$$

Moreover, the stochastic integrals in (20) exist.

Using the integration order replacement technique for iterated Ito stochastic integrals (Theorem 1), we can obtain different equalities for iterated Ito stochastic integrals. At that, the mentioned technique is essentially simpler (for the specific class of Ito processes which are the iterated Ito stochastic integrals) in application than the Ito formula. Let us consider two examples on application of the integration order replacement technique for iterated Ito stochastic integrals.

Example 1. *Using Theorem* 1 *and Proposition* 1, *we obtain*

$$\int\limits_t^T\int\limits_t^{t_3}\int\limits_t^{t_2} df_{t_1}df_{t_2}dt_3=\int\limits_t^T df_{t_1}\int\limits_{t_1}^T df_{t_2}\int\limits_{t_2}^T dt_3=$$

$$=\int\limits_t^T df_{t_1}\int\limits_{t_1}^T df_{t_2}(T-t_2)=\int\limits_t^T df_{t_1}\int\limits_{t_1}^T (T-t_2)df_{t_2}=$$

$$=\int\limits_t^T (T-t_2)\int\limits_t^{t_2} df_{t_1}df_{t_2}\quad \text{w. p. 1.}$$

Example 2. *Using Theorem* 1 *and Proposition* 1, *we obtain*

$$\int\limits_t^T\int\limits_t^{t_4}\int\limits_t^{t_3}\int\limits_t^{t_2} df_{t_1}dt_2df_{t_3}dt_4=\int\limits_t^T df_{t_1}\int\limits_{t_1}^T dt_2\int\limits_{t_2}^T df_{t_3}\int\limits_{t_3}^T dt_4=$$

$$=\int\limits_t^T df_{t_1}\int\limits_{t_1}^T dt_2\int\limits_{t_2}^T df_{t_3}(T-t_3)=\int\limits_t^T df_{t_1}\int\limits_{t_1}^T dt_2\int\limits_{t_2}^T (T-t_3)df_{t_3}=$$

$$=\int\limits_t^T (T-t_3)\int\limits_t^{t_3}\int\limits_t^{t_2} df_{t_1}dt_2df_{t_3}=\int\limits_t^T (T-t_3)\left(\int\limits_t^{t_3}\int\limits_t^{t_2} df_{t_1}dt_2\right)df_{t_3}=$$

$$=\int\limits_t^T (T-t_3)\left(\int\limits_t^{t_3} df_{t_1}\int\limits_{t_1}^{t_3} dt_2\right)df_{t_3}=\int\limits_t^T (T-t_3)\left(\int\limits_t^{t_3} df_{t_1}(t_3-t_1)\right)df_{t_3}=$$

$$=\int\limits_t^T (T-t_3)\left(\int\limits_t^{t_3} (t_3-t_1)df_{t_1}\right)df_{t_3}=\int\limits_t^T (T-t_2)\int\limits_t^{t_2} (t_2-t_1)df_{t_1}df_{t_2}\quad \text{w. p. 1.}$$

Let us apply Theorem 1 to deriving of one propetry for Ito stochastic integrals.

Lemma 1. *Let* $h(\tau), g(\tau), G(\tau) : [t,s]\to\mathbb{R}^1$ *be continuous nonrandom functions at the interval* $[t,s]$ *and let* $G(\tau)$ *be a antiderivative of the function* $g(\tau)$. *Furthermore, let* $\xi_\tau\in\mathfrak{S}_2([t,s])$. *Then*

$$\int\limits_t^s g(\tau)\int\limits_t^\tau h(\theta)\int\limits_t^\theta \xi_u d\mathbf{f}_u^{(i)}d\mathbf{f}_\theta^{(j)}d\tau=\int\limits_t^s (G(s)-G(\theta))h(\theta)\int\limits_t^\theta \xi_u d\mathbf{f}_u^{(i)}d\mathbf{f}_\theta^{(j)} \tag{21}$$

w. p. 1, *where* $i,j=1,2$ *and* $\mathbf{f}_\tau^{(1)}$, $\mathbf{f}_\tau^{(2)}$ *are independent standard Wiener processes that are* F_τ*–measurable for all* $\tau\in[t,s]$.

Proof. Applying Theorem 1 twice and Proposition 1, we get the following relations

$$\int_t^s g(\tau)\int_t^\tau h(\theta)\int_t^\theta \xi_u d\mathbf{f}_u^{(i)}d\mathbf{f}_\theta^{(j)}d\tau = \int_t^s \xi_u d\mathbf{f}_u^{(i)}\int_u^s h(\theta)d\mathbf{f}_\theta^{(j)}\int_\theta^s g(\tau)d\tau =$$

$$= G(s)\int_t^s \xi_u d\mathbf{f}_u^{(i)}\int_u^s h(\theta)d\mathbf{f}_\theta^{(j)} - \int_t^s \xi_u d\mathbf{f}_u^{(i)}\int_u^s G(\theta)h(\theta)d\mathbf{f}_\theta^{(j)} =$$

$$= G(s)\int_t^s h(\theta)\int_t^\theta \xi_u d\mathbf{f}_u^{(i)}d\mathbf{f}_\theta^{(j)} - \int_t^s G(\theta)h(\theta)\int_t^\theta \xi_u d\mathbf{f}_u^{(i)}d\mathbf{f}_\theta^{(j)} =$$

$$= \int_t^s (G(s)-G(\theta))h(\theta)\int_t^\theta \xi_u d\mathbf{f}_u^{(i)}d\mathbf{f}_\theta^{(j)} \quad \text{w. p. 1.} \tag{22}$$

The proof of Lemma 1 is completed. Let us consider an analogue of Lemma 1 for Stratonovich stochastic integrals.

Lemma 2 [9]. *Let $h(\tau), g(\tau), G(\tau) : [t,s] \to \mathbb{R}^1$ be continuous nonrandom functions at the interval $[t,s]$ and let $G(\tau)$ be a antiderivative of the function $g(\tau)$. Let $\xi_\tau^{(l)} \in \mathfrak{Q}_4([t,s])$ and*

$$\xi_\tau^{(l)} = \int_t^\tau a_u du + \int_t^\tau b_u d\mathbf{f}_u^{(l)}, \quad l = 1,2.$$

Then

$$\int_t^s g(\tau)\int_t^{*\tau} h(\theta)\int_t^{*\theta} \xi_u^{(l)}d\mathbf{f}_u^{(i)}d\mathbf{f}_\theta^{(j)}d\tau = \int_t^{*s} (G(s)-G(\theta))h(\theta)\int_t^{*\theta} \xi_u^{(l)}d\mathbf{f}_u^{(i)}d\mathbf{f}_\theta^{(j)} \tag{23}$$

w. p. 1, where $i,j,l = 1,2$ and $\mathbf{f}_\tau^{(1)}$, $\mathbf{f}_\tau^{(2)}$ are independent standard Wiener processes that are F_τ–measurable for all $\tau \in [t,s]$.

Proof. Under the conditions of Lemma 2, we can apply equalities (15) and (16) with $F(x,\theta) \equiv xh(\theta)$,

$$\eta_\theta = \int_t^{*\theta} \xi_u^{(l)}d\mathbf{f}_u^{(i)},$$

since the function $xh(\theta)$ is sufficiently smooth and the following obvious inclusions hold: $\eta_\theta \in \mathfrak{Q}_4([t,s])$ and $\eta_\theta h(\theta) \in \mathfrak{M}_2([t,s])$. Thus, we have the equalities

$$\int_t^{*\tau} h(\theta)\int_t^{*\theta} \xi_u^{(l)}d\mathbf{f}_u^{(i)}d\mathbf{f}_\theta^{(j)} = \int_t^\tau h(\theta)\int_t^{*\theta} \xi_u^{(l)}d\mathbf{f}_u^{(i)}d\mathbf{f}_\theta^{(j)} + \frac{1}{2}\mathbf{1}_{\{i=j\}}\int_t^\tau h(\theta)\xi_\theta^{(l)}d\theta, \tag{24}$$

$$\int_t^{*\theta} \xi_u^{(l)}d\mathbf{f}_u^{(i)} = \int_t^\theta \xi_u^{(l)}d\mathbf{f}_u^{(i)} + \frac{1}{2}\mathbf{1}_{\{l=i\}}\int_t^\theta b_u du \tag{25}$$

w. p. 1, where $\mathbf{1}_A$ is the indicator of a set A. Substituting formulas (24) and (25) into the left-hand side of equality (23) and applying Theorem 1 twice and Proposition 1, we get the following relations

$$\int\limits_t^s g(\tau)\int\limits_t^{*\tau} h(\theta)\int\limits_t^{*\theta} \xi_u^{(l)}d\mathbf{f}_u^{(i)}d\mathbf{f}_\theta^{(j)}d\tau =$$

$$=\int\limits_t^s \xi_u^{(l)}d\mathbf{f}_u^{(i)}\int\limits_u^s h(\theta)d\mathbf{f}_\theta^{(j)}\int\limits_\theta^s g(\tau)d\tau +$$

$$+\frac{1}{2}\mathbf{1}_{\{l=i\}}\int\limits_t^s b_u du\int\limits_u^s h(\theta)d\mathbf{f}_\theta^{(j)}\int\limits_\theta^s g(\tau)d\tau+\frac{1}{2}\mathbf{1}_{\{i=j\}}\int\limits_t^s h(\theta)\xi_\theta^{(l)}d\theta\int\limits_\theta^s g(\tau)d\tau =$$

$$=G(s)\left(\int\limits_t^s \xi_u^{(l)}d\mathbf{f}_u^{(i)}\int\limits_u^s h(\theta)d\mathbf{f}_\theta^{(j)}+\frac{1}{2}\mathbf{1}_{\{i=j\}}\int\limits_t^s h(\theta)\xi_\theta^{(l)}d\theta+\right.$$

$$\left.+\frac{1}{2}\mathbf{1}_{\{l=i\}}\int\limits_t^s b_u du\int\limits_u^s h(\theta)d\mathbf{f}_\theta^{(j)}\right)-$$

$$-\left(\int\limits_t^s \xi_u^{(l)}d\mathbf{f}_u^{(i)}\int\limits_u^s G(\theta)h(\theta)d\mathbf{f}_\theta^{(j)}+\frac{1}{2}\mathbf{1}_{\{i=j\}}\int\limits_t^s G(\theta)h(\theta)\xi_\theta^{(l)}d\theta+\right.$$

$$\left.+\frac{1}{2}\mathbf{1}_{\{l=i\}}\int\limits_t^s b_u du\int\limits_u^s h(\theta)G(\theta)d\mathbf{f}_\theta^{(j)}\right)=$$

$$=G(s)\left(\int\limits_t^s h(\theta)\int\limits_t^\theta \xi_u^{(l)}d\mathbf{f}_u^{(i)}d\mathbf{f}_\theta^{(j)}+\frac{1}{2}\mathbf{1}_{\{i=j\}}\int\limits_t^s h(\theta)\xi_\theta^{(l)}d\theta+\right.$$

$$\left.+\frac{1}{2}\mathbf{1}_{\{l=i\}}\int\limits_t^s h(\theta)\int\limits_t^\theta b_u du d\mathbf{f}_\theta^{(j)}\right)-$$

$$-\left(\int\limits_t^s G(\theta)h(\theta)\int\limits_t^\theta \xi_u^{(l)}d\mathbf{f}_u^{(i)}d\mathbf{f}_\theta^{(j)}+\frac{1}{2}\mathbf{1}_{\{i=j\}}\int\limits_t^s G(\theta)h(\theta)\xi_\theta^{(l)}d\theta+\right.$$

$$\left.+\frac{1}{2}\mathbf{1}_{\{l=i\}}\int\limits_t^s h(\theta)G(\theta)\int\limits_t^\theta b_u du d\mathbf{f}_\theta^{(j)}\right) \tag{26}$$

w. p. 1. Applying successively the formulas (24), (25) together with the formula (24) in which $h(\theta)$ replaced by $G(\theta)h(\theta)$ as well as the relation (26), we obtain the equality (23).

3. The Taylor–Ito Expansion

In this section, we cite the Taylor-Ito expansion [7] and introduce some necessary notations. At that, we will use the original notation introduced by the author of this paper.

Let $\mathfrak{L}$ be the class of functions $R(\mathbf{x},t):\mathbb{R}^n\times[0,T]\to\mathbb{R}^1$ with the following property: these functions are twice continuously differentiable in $\mathbf{x}$ and have one continuous derivative in t. We consider the following operators on the space $\mathfrak{L}$

$$LR(\mathbf{x},t)=\frac{\partial R}{\partial t}(\mathbf{x},t)+\sum_{i=1}^{n}a^{(i)}(\mathbf{x},t)\frac{\partial R}{\partial \mathbf{x}^{(i)}}(\mathbf{x},t)+$$

$$+\frac{1}{2}\sum_{j=1}^{m}\sum_{l,i=1}^{n}B^{(lj)}(\mathbf{x},t)B^{(ij)}(\mathbf{x},t)\frac{\partial^2 R}{\partial \mathbf{x}^{(l)}\partial \mathbf{x}^{(i)}}(\mathbf{x},t), \tag{27}$$

$$G_0^{(i)}R(\mathbf{x},t)=\sum_{j=1}^{n}B^{(ji)}(\mathbf{x},t)\frac{\partial R}{\partial \mathbf{x}^{(j)}}(\mathbf{x},t),\quad i=1,\ldots,m. \tag{28}$$

By the Ito formula, we have the equality

$$R(\mathbf{x}_s,s)=R(\mathbf{x}_t,t)+\int\limits_t^s LR(\mathbf{x}_\tau,\tau)d\tau+\sum_{i=1}^{m}\int\limits_t^s G_0^{(i)}R(\mathbf{x}_\tau,\tau)d\mathbf{f}_\tau^{(i)} \tag{29}$$

w. p. 1, where $0\le t<s\le T$. In the formula (29) it is assumed that the functions $\mathbf{a}(\mathbf{x},t)$, $B(\mathbf{x},t)$, and $R(\mathbf{x},t)$ satisfy the following condition: $LR(\mathbf{x}_\tau,\tau)$, $G_0^{(i)}R(\mathbf{x}_\tau,\tau)\in\mathfrak{M}_2([0,T])$ for $i=1,\ldots,m$.

Introduce the following notation

$${}^{(k)}A=\Biggl\Vert A^{(i_1\ldots i_k)}\Biggr\Vert_{i_1=1,\ldots,i_k=1}^{m_1\ \ldots\ m_k},\quad m_1,\ldots,m_k\ge 1, \tag{30}$$

$${}^{(k+l)}A\stackrel{l}{\cdot}{}^{(l)}B^{(k)}=\begin{cases}\Biggl\Vert \sum\limits_{i_1=1}^{m_1}\ldots\sum\limits_{i_l=1}^{m_l}A^{(i_1\ldots i_{k+l})}B^{(i_1\ldots i_l)}\Biggr\Vert_{i_{l+1}=1,\ldots,i_{l+k}=1}^{m_{l+1}\ \ldots\ m_{l+k}} & \text{for}\quad k\ge 1\\ \sum\limits_{i_1=1}^{m_1}\ldots\sum\limits_{i_l=1}^{m_l}A^{(i_1\ldots i_l)}B^{(i_1\ldots i_l)} & \text{for}\quad k=0\end{cases},$$

$$\Biggl\Vert A_{k+1}D_k^{(i_k)}A_k\ldots A_2D_1^{(i_1)}A_1R(\mathbf{x},t)\Biggr\Vert_{i_1=1,\ldots,i_k=1}^{m_1\ \ldots\ m_k}={}^{(k)}A_{k+1}D_kA_k\ldots A_2D_1A_1R(\mathbf{x},t), \tag{31}$$

where A_p and $D_q^{(i_q)}$ are operators defined on the space $\mathfrak{L}$ for $p=1,\ldots,k+1$, $q=1,\ldots,k$, and $i_q=1,\ldots,m_q$. It is assumed that the left-hand side of (31) exists. The symbol $\stackrel{0}{\cdot}$ is treated as the usual multiplication. If $m_l=0$ in (30) for some $l\in\{1,\ldots,k\}$, then the right-hand side of (30) is treated as

$$\Bigl\Vert A^{(i_1\ldots i_{l-1}i_{l+1}\ldots i_k)}\Bigr\Vert_{i_1=1,\ldots,i_{l-1}=1,i_{l+1}=1,\ldots,i_k=1}^{m_1\ \ldots\ m_{l-1}\ \ m_{l+1}\ \ldots\ m_k},$$

(shortly, ${}^{(k-1)}A$).

We also introduce the following notation

$$\Bigl\Vert Q_{\lambda_l}^{(i_l)}\ldots Q_{\lambda_1}^{(i_1)}R(\mathbf{x},t)\Bigr\Vert_{i_1=\lambda_1,\ldots,i_l=\lambda_l}^{m\lambda_1\ \ldots\ m\lambda_l}\ \stackrel{\sf def}{=}\ {}^{(p_l)}Q_{\lambda_l}\ldots Q_{\lambda_1}R(\mathbf{x},t),$$

$${}^{(p_k)}J_{(\lambda_k\ldots\lambda_1)s,t}=\Bigl\Vert J_{(\lambda_k\ldots\lambda_1)s,t}^{(i_k\ldots i_1)}\Bigr\Vert_{i_1=\lambda_1,\ldots,i_k=\lambda_k}^{m\lambda_1\ \ldots\ m\lambda_k},$$

$$M_k=\Bigl\{(\lambda_k,\ldots,\lambda_1):\lambda_l=1\ \text{or}\ \lambda_l=0;\ l=1,\ldots,k\Bigr\},\quad k\ge 1,$$

$$J_{(\lambda_k\ldots\lambda_1)s,t}^{(i_k\ldots i_1)}=\int\limits_t^s\ldots\int\limits_t^{t_2}d\mathbf{w}_{t_1}^{(i_k)}\ldots d\mathbf{w}_{t_k}^{(i_1)},\quad k\ge 1,$$

where $\lambda_l=1$ or $\lambda_l=0$, $Q_{\lambda_l}^{(i_l)}=L$ and $i_l=0$ for $\lambda_l=0$, $Q_{\lambda_l}^{(i_l)}=G_0^{(i_l)}$ and $i_l=1,\ldots,m$ for $\lambda_l=1$,

$$p_l=\sum_{j=1}^{l}\lambda_j\quad\text{for}\quad l=1,\ldots,r+1,\quad r\in\mathbb{N},$$

$\mathbf{w}_\tau^{(i)}$ $(i=1,\ldots,m)$ are F_τ-measurable for all $\tau\in[0,T]$ independent standard Wiener processes and $\mathbf{w}_\tau^{(0)}=\tau$.

Applying the formula (29) to the process $R(\mathbf{x}_s,s)$ repeatedly, we obtain the following Taylor–Ito expansion [7]

$$R(\mathbf{x}_s,s)=R(\mathbf{x}_t,t)+\sum_{k=1}^{r}\sum_{(\lambda_k,\ldots,\lambda_1)\in M_k}{}^{(p_k)}Q_{\lambda_k}\ldots Q_{\lambda_1}R(\mathbf{x}_t,t)\stackrel{p_k}{\cdot}{}^{(p_k)}J_{(\lambda_k\ldots\lambda_1)s,t}+(D_{r+1})_{s,t}\tag{32}$$

w. p. 1, where

$$(D_{r+1})_{s,t}=\sum_{(\lambda_{r+1},\ldots,\lambda_1)\in M_{r+1}}\int\limits_t^s\ldots\left(\int\limits_t^{t_2}{}^{(p_{r+1})}Q_{\lambda_{r+1}}\ldots Q_{\lambda_1}R(\mathbf{x}_{t_1},t_1)\stackrel{\lambda_{r+1}}{\cdot}d\mathbf{w}_{t_1}\right)\ldots\stackrel{\lambda_1}{\cdot}d\mathbf{w}_{t_{r+1}}.\tag{33}$$

It is assumed that the right-hand sides of (32), (33) exist.

A possible variant of the conditions under which the right-hand sides of (32), (33) exist is as follows

(i) $Q_{\lambda_l}^{(i_l)}\ldots Q_{\lambda_1}^{(i_1)}R(\mathbf{x},t)\in\mathfrak{L}$ for all $(\lambda_l,\ldots,\lambda_1)\in\bigcup\limits_{g=1}^{r}M_g$;

(ii) $Q_{\lambda_l}^{(i_l)}\ldots Q_{\lambda_1}^{(i_1)}R(\mathbf{x}_\tau,\tau)\in\mathfrak{M}_2([0,T])$ for all $(\lambda_l,\ldots,\lambda_1)\in\bigcup\limits_{g=1}^{r+1}M_g$.

Let us write the expansion (32) in the another form

$$R(\mathbf{x}_s,s)=R(\mathbf{x}_t,t)+\sum_{k=1}^{r}\ \sum_{(\lambda_k,\ldots,\lambda_1)\in M_k}\ \sum_{i_1=\lambda_1}^{m\lambda_1}\ldots\sum_{i_k=\lambda_k}^{m\lambda_k}Q_{\lambda_k}^{(i_k)}\ldots Q_{\lambda_1}^{(i_1)}R(\mathbf{x}_t,t)\ J_{(\lambda_k\ldots\lambda_1)s,t}^{(i_k\ldots i_1)}+$$

$$+\left(D_{r+1}\right)_{s,t}\quad \text{w. p. 1.}$$

Denote

$$G_{rk}=\Biggl\{(\lambda_k,\ldots,\lambda_1):\ r+1\le 2k-\lambda_1-\ldots-\lambda_k\le 2r\Biggr\},$$

$$E_{qk}=\Biggl\{(\lambda_k,\ldots,\lambda_1):\ 2k-\lambda_1-\ldots-\lambda_k=q\Biggr\},$$

where $\lambda_l=1$ or $\lambda_l=0$ $(l=1,\ldots,k)$.

The Taylor–Ito expansion ordered according to the order of smallness (in the mean-square sense when $s\downarrow t$) of its terms has the form

$$R(\mathbf{x}_s,s)=R(\mathbf{x}_t,t)+\sum_{q,k=1}^{r}\ \sum_{(\lambda_k,\ldots,\lambda_1)\in \mathrm{E}_{qk}}\ \sum_{i_1=\lambda_1}^{m\lambda_1}\ldots\sum_{i_k=\lambda_k}^{m\lambda_k}Q_{\lambda_k}^{(i_k)}\ldots Q_{\lambda_1}^{(i_1)}R(\mathbf{x}_t,t)\ J_{(\lambda_k\ldots\lambda_1)s,t}^{(i_k\ldots i_1)}+$$

$$+\left(H_{r+1}\right)_{s,t}\quad \text{w. p. 1,} \tag{34}$$

where

$$\left(H_{r+1}\right)_{s,t}=\sum_{k=1}^{r}\ \sum_{(\lambda_k,\ldots,\lambda_1)\in \mathrm{G}_{rk}}\ \sum_{i_1=\lambda_1}^{m\lambda_1}\ldots\sum_{i_k=\lambda_k}^{m\lambda_k}Q_{\lambda_k}^{(i_k)}\ldots Q_{\lambda_1}^{(i_1)}R(\mathbf{x}_t,t)\ J_{(\lambda_k\ldots\lambda_1)s,t}^{(i_k\ldots i_1)}+$$

$$+\left(D_{r+1}\right)_{s,t}.$$

4. The First Form of the Unified Taylor–Ito Expansion

In this section, we transform the right-hand side of (32) with the help of Theorem 1 and Lemma 1 to a representation including iterated Ito stochastic integrals of the form (7).

Denote

$$I_{l_1\ldots l_k s,t}^{(i_1\ldots i_k)}=\int\limits_t^s (t-t_k)^{l_k}\ldots\int\limits_t^{t_2}(t-t_1)^{l_1}d\mathbf{f}_{t_1}^{(i_1)}\ldots d\mathbf{f}_{t_k}^{(i_k)}\quad \text{for}\quad k\ge 1 \tag{35}$$

and

$$I_{l_1\ldots l_k s,t}^{(i_1\ldots i_k)}=1\quad \text{for}\quad k=0,$$

where $i_1,\ldots,i_k=1,\ldots,m$. Moreover, let

$$^{(k)}I_{l_1\ldots l_{k}s,t}=\left\|I_{l_1\ldots l_{k}s,t}^{(i_1\ldots i_k)}\right\|_{i_1,\ldots,i_k=1}^{m},$$

$$G_p^{(i)}\stackrel{\sf def}{=}\frac{1}{p}\left(G_{p-1}^{(i)}L-LG_{p-1}^{(i)}\right),\quad p=1,2,\ldots,\quad i=1,\ldots,m, \tag{36}$$

where L and $G_0^{(i)}$, $i=1,\ldots,m$, are determined by the equalities (27), (28). Denote

$$A_q\stackrel{\sf def}{=}\left\{(k,j,l_1,\ldots,l_k):\ k+j+\sum_{p=1}^{k}l_p=q;\ k,j,l_1,\ldots,l_k=0,1,\ldots\right\},$$

$$\left\|G_{l_1}^{(i_1)}\ldots G_{l_k}^{(i_k)}L^jR(\mathbf{x},t)\right\|_{i_1,\ldots,i_k=1}^{m}\stackrel{\sf def}{=}{}^{(k)}G_{l_1}\ldots G_{l_k}L^jR(\mathbf{x},t),$$

$$L^jR(\mathbf{x},t)\stackrel{\sf def}{=}\begin{cases}\underbrace{L\ldots L}_{j}R(\mathbf{x},t) & \text{for } j\ge 1\\ \\ R(\mathbf{x},t) & \text{for } j=0\end{cases}.$$

Theorem 2. *Let conditions* (i), (ii) *be satisfied. Then for any $s,t\in[0,T]$ such that $s>t$ and for any positive integer r, the following expansion takes place w. p.* 1

$$R(\mathbf{x}_s,s)=R(\mathbf{x}_t,t)+\sum_{q=1}^{r}\sum_{(k,j,l_1,\ldots,l_k)\in{\rm A}_q}\frac{(s-t)^j}{j!}\sum_{i_1,\ldots,i_k=1}^{m}G_{l_1}^{(i_1)}\ldots G_{l_k}^{(i_k)}L^jR(\mathbf{x}_t,t)\ I_{l_1\ldots l_{k}s,t}^{(i_1\ldots i_k)}+$$

$$+\left(D_{r+1}\right)_{s,t}, \tag{37}$$

where $\left(D_{r+1}\right)_{s,t}$ has the form (33).

Proof. We claim that

$$\sum_{(\lambda_q,\ldots,\lambda_1)\in M_q}{}^{(p_q)}Q_{\lambda_q}\ldots Q_{\lambda_1}R(\mathbf{x}_t,t)\stackrel{p_q}{\cdot}{}^{(p_q)}J_{(\lambda_q\ldots\lambda_1)s,t}=$$

$$=\sum_{(k,j,l_1,\ldots,l_k)\in{\rm A}_q}\frac{(s-t)^j}{j!}\sum_{i_1,\ldots,i_k=1}^{m}G_{l_1}^{(i_1)}\ldots G_{l_k}^{(i_k)}L^jR(\mathbf{x}_t,t)\ I_{l_1\ldots l_{k}s,t}^{(i_1\ldots i_k)} \tag{38}$$

w. p. 1. The equality (38) is valid for $q=1$. Assume that (38) is valid for some $q>1$. In this case, using the induction hypothesis, we obtain

$$\sum_{(\lambda_{q+1},\ldots,\lambda_1)\in M_{q+1}} {}^{(p_{q+1})}Q_{\lambda_1}\ldots Q_{\lambda_{q+1}}R(\mathbf{x}_t,t) \overset{p_{q+1}}{\cdot} {}^{(p_{q+1})}J_{(\lambda_1\ldots\lambda_{q+1})s,t} =$$

$$= \sum_{\lambda_{q+1}\in\{1,\ 0\}} \int\limits_t^s \sum_{(\lambda_q,\ldots,\lambda_1)\in M_q} \left({}^{(p_{q+1})}Q_{\lambda_1}\ldots Q_{\lambda_{q+1}}R(\mathbf{x}_t,t) \overset{p_q}{\cdot} {}^{(p_q)}J_{(\lambda_1\ldots\lambda_q)\theta,t}\right) \overset{\lambda_{q+1}}{\cdot} d\mathbf{w}_\theta =$$

$$= \sum_{\lambda_{q+1}\in\{1,\ 0\}} \int\limits_t^s \sum_{(k,j,l_1,\ldots,l_k)\in A_q} \frac{(\theta-t)^j}{j!}\times$$

$$\times\left({}^{(k+\lambda_{q+1})}G_{l_1}\ldots G_{l_k}L^jQ_{\lambda_{q+1}}R(\mathbf{x}_t,t) \overset{k}{\cdot} {}^{(k)}I_{l_1\ldots l_{k\,s,t}}\right) \overset{\lambda_{q+1}}{\cdot} d\mathbf{w}_\theta =$$

$$= \sum_{(k,j,l_1,\ldots,l_k)\in A_q} \left({}^{(k)}G_{l_1}\ldots G_{l_k}L^{j+1}R(\mathbf{x}_t,t) \overset{k}{\cdot} \int\limits_t^s \frac{(\theta-t)^j}{j!}{}^{(k)}I_{l_1\ldots l_{k\,\theta,t}}d\theta + \right.$$

$$\left. + \left({}^{(k+1)}G_{l_1}\ldots G_{l_k}L^jG_0R(\mathbf{x}_t,t) \overset{k}{\cdot} \int\limits_t^s \frac{(\theta-t)^j}{j!}{}^{(k)}I_{l_1\ldots l_{k\,\theta,t}}\right) \overset{1}{\cdot} d\mathbf{f}_\theta\right) \tag{39}$$

w. p. 1.

Using Lemma 1, we obtain

$$\int\limits_t^s \frac{(\theta-t)^j}{j!}{}^{(k)}I_{l_1\ldots l_{k\,\theta,t}}d\theta =$$

$$= \frac{1}{(j+1)!}\begin{cases}(s-t)^{j+1} & \text{for } k=0\\ \\ (s-t)^{j+1}\cdot{}^{(k)}I_{l_1\ldots l_{k\,s,t}} - (-1)^{j+1}\cdot{}^{(k)}I_{l_1\ldots l_{k-1}\ l_k+j+1_{s,t}} & \text{for } k>0\end{cases} \tag{40}$$

w. p. 1. In addition (see (35)), we get

$$\int\limits_t^s \frac{(\theta-t)^j}{j!} I^{(i_1\ldots i_k)}_{l_1\ldots l_{k\,\theta,t}} d\mathbf{f}^{(i_{k+1})}_\theta = \frac{(-1)^j}{j!} I^{(i_1\ldots i_k i_{k+1})}_{l_1\ldots l_k j_{s,t}} \tag{41}$$

in the notations just introduced. Substitute the relations (40) and (41) into the formula (39). Grouping summands of the obtained expression with equal lower indices at iterated Ito stochastic integrals and using (36) and the equality

$$G^{(i)}_pR(\mathbf{x},t) = \frac{1}{p!}\sum_{q=0}^p(-1)^qC^q_pL^qG^{(i)}_0L^{p-q}R(\mathbf{x},t), \quad \text{where} \quad C^q_p = \frac{p!}{q!(p-q)!}, \tag{42}$$

(this equality follows from (36)), we note that the obtained expression is equal to

$$\sum_{(k,j,l_1,\ldots,l_k)\in A_{q+1}} \frac{(s-t)^j}{j!} {}^{(k)}G_{l_1}\ldots G_{l_k}L^j\{\eta_t\} \stackrel{k}{\cdot} {}^{(k)}I_{l_1\ldots l_k s,t}$$

w. p. 1. Summing the equalities (38) for $q=1,2,\ldots,r$ and applying the formula (32), we obtain the expression (37). The proof is completed.

Let us order terms of the expansion (37) according to their smallness orders as $s\downarrow t$ in the mean-square sense

$$R(\mathbf{x}_s,s)=R(\mathbf{x}_t,t)+\sum_{q=1}^{r}\sum_{(k,j,l_1,\ldots,l_k)\in \mathrm{D}_q}\frac{(s-t)^j}{j!}\sum_{i_1,\ldots,i_k=1}^{m}G_{l_1}^{(i_1)}\ldots G_{l_k}^{(i_k)}L^jR(\mathbf{x}_t,t)\ I_{l_1\ldots l_k s,t}^{(i_1\ldots i_k)}+$$

$$+\left(H_{r+1}\right)_{s,t}\quad \text{w. p. 1,} \tag{43}$$

where

$$\left(H_{r+1}\right)_{s,t}=\sum_{(k,j,l_1,\ldots,l_k)\in \mathrm{U}_r}\frac{(s-t)^j}{j!}\sum_{i_1,\ldots,i_k=1}^{m}G_{l_1}^{(i_1)}\ldots G_{l_k}^{(i_k)}L^jR(\mathbf{x}_t,t)\ I_{l_1\ldots l_k s,t}^{(i_1\ldots i_k)}+\left(D_{r+1}\right)_{s,t},$$

$$\mathrm{D}_q=\left\{(k,j,l_1,\ldots,l_k):k+2\left(j+\sum_{p=1}^{k}l_p\right)=q;\ k,j,l_1,\ldots,l_k=0,1,\ldots\right\}, \tag{44}$$

(45)

$$\mathrm{U}_r=\left\{(k,j,l_1,\ldots,l_k):k+j+\sum_{p=1}^{k}l_p\le r,\ k+2\left(j+\sum_{p=1}^{k}l_p\right)\ge r+1;\ k,j,l_1,\ldots,l_k=0,1,\ldots\right\},$$

and $\left(D_{r+1}\right)_{s,t}$ has the form (33). Note that the remainder term $\left(H_{r+1}\right)_{s,t}$ in (43) has a higher order of smallness in the mean-square sense as $s\downarrow t$ than the terms of the main part of expansion (43).

5. The Second Form of the Unified Taylor–Ito Expansion

Consider iterated Ito stochastic integrals of the form

$$J_{l_1\ldots l_k s,t}^{(i_1\ldots i_k)}=\int\limits_t^s(s-t_k)^{l_k}\ldots\int\limits_t^{t_2}(s-t_1)^{l_1}d\mathbf{f}_{t_1}^{(i_1)}\ldots d\mathbf{f}_{t_k}^{(i_k)}\quad \text{for}\quad k\ge 1$$

and

$$J_{l_1\ldots l_k s,t}^{(i_1\ldots i_k)}=1\quad \text{for}\quad k=0,$$

where $i_1,\ldots,i_k=1,\ldots,m$.

The additive property of stochastic integrals and the Newton binomial formula imply the following equality

$$I_{l_1\ldots l_k\,s,t}^{(i_1\ldots i_k)}=\sum_{j_1=0}^{l_1}\ldots\sum_{j_k=0}^{l_k}\prod_{g=1}^{k}C_{l_g}^{j_g}(t-s)^{l_1+\ldots+l_k-j_1-\ldots-j_k}\ J_{j_1\ldots j_k\,s,t}^{(i_1\ldots i_k)}\quad \text{w. p. 1}, \tag{46}$$

where

$$C_l^k=\frac{l!}{k!(l-k)!}$$

is the binomial coefficient. Thus, the Taylor–Ito expansion of the process $\eta_s = R(\mathbf{x}_s, s)$ can be constructed either using the iterated stochastic integrals $I_{l_1\ldots l_k\,s,t}^{(i_1\ldots i_k)}$ similarly to the previous section or using the iterated stochastic integrals $J_{l_1\ldots l_k\,s,t}^{(i_1\ldots i_k)}$. This is the main subject of this section.

Denote

$$\left\|J_{l_1\ldots l_k\,s,t}^{(i_1\ldots i_k)}\right\|_{i_1,\ldots,i_k=1}^{m}\stackrel{\text{def}}{=}{}^{(k)}J_{l_1\ldots l_k\,s,t},$$

$$\left\|L^jG_{l_1}^{(i_1)}\ldots G_{l_k}^{(i_k)}R(\mathbf{x},t)\right\|_{i_1,\ldots,i_k=1}^{m}\stackrel{\text{def}}{=}{}^{(k)}L^jG_{l_1}\ldots G_{l_k}R(\mathbf{x},t).$$

Theorem 3. *Let conditions* (i), (ii) *be satisfied. Then for any $s,t\in[0,T]$ such that $s>t$ and for any positive integer r, the following expansion is valid w. p.* 1

$$R(\mathbf{x}_s,s)=R(\mathbf{x}_t,t)+\sum_{q=1}^{r}\sum_{(k,j,l_1,\ldots,l_k)\in\mathrm{A}_q}\frac{(s-t)^j}{j!}\sum_{i_1,\ldots,i_k=1}^{m}L^jG_{l_1}^{(i_1)}\ldots G_{l_k}^{(i_k)}R(\mathbf{x}_t,t)\ J_{l_1\ldots l_k\,s,t}^{(i_1\ldots i_k)}+$$

$$+\left(D_{r+1}\right)_{s,t}, \tag{47}$$

where $\left(D_{r+1}\right)_{s,t}$ has the form (33).

Proof. To prove the theorem, we check the equalities

$$\sum_{(k,j,l_1,\ldots,l_k)\in\mathrm{A}_q}\frac{(s-t)^j}{j!}\sum_{i_1,\ldots,i_k=1}^{m}L^jG_{l_1}^{(i_1)}\ldots G_{l_k}^{(i_k)}R(\mathbf{x}_t,t)\ J_{l_1\ldots l_k\,s,t}^{(i_1\ldots i_k)}=$$

$$\sum_{(k,j,l_1,\ldots,l_k)\in\mathrm{A}_q}\frac{(s-t)^j}{j!}\sum_{i_1,\ldots,i_k=1}^{m}G_{l_1}^{(i_1)}\ldots G_{l_k}^{(i_k)}L^jR(\mathbf{x}_t,t)\ I_{l_1\ldots l_k\,s,t}^{(i_1\ldots i_k)}\quad\text{w. p. 1} \tag{48}$$

for $q=1,2,\ldots,r$. To check (48), substitute the expression (46) into the right-hand side of (48) and then use the formulas (36), (42).

Let us rank terms of the expansion (47) according to their orders of smallness in the mean-square sense as $s\downarrow t$

$$R(\mathbf{x}_s, s) = R(\mathbf{x}_t, t) + \sum_{q=1}^{r} \sum_{(k,j,l_1,\ldots,l_k)\in \mathrm{D}_q} \frac{(s-t)^j}{j!} \sum_{i_1,\ldots,i_k=1}^{m} L^j G_{l_1}^{(i_1)} \ldots G_{l_k}^{(i_k)} R(\mathbf{x}_t, t)\ J_{l_1\ldots l_k\, s,t}^{(i_1\ldots i_k)} +$$

$$+ \left(H_{r+1}\right)_{s,t} \quad \text{w. p. 1},$$

where

$$\left(H_{r+1}\right)_{s,t} = \sum_{(k,j,l_1,\ldots,l_k)\in \mathrm{U}_r} \frac{(s-t)^j}{j!} \sum_{i_1,\ldots,i_k=1}^{m} L^j G_{l_1}^{(i_1)} \ldots G_{l_k}^{(i_k)} R(\mathbf{x}_t, t)\ J_{l_1\ldots l_k\, s,t}^{(i_1\ldots i_k)} + \left(D_{r+1}\right)_{s,t}.$$

The term $\left(D_{r+1}\right)_{s,t}$ has the form (33); the terms D_q and U_r have the forms (44) and (45), respectively. Finally, we note that the convergence w. p. 1 of the truncated Taylor–Ito expansion (32) (without the remainder term $\left(D_{r+1}\right)_{s,t}$) to the process $R(\mathbf{x}_s, s)$ as $r \to \infty$ for all $s, t \in [0, T]$ such that $s > t$ and $T < \infty$ has been proved in [2] (Proposition 5.9.2). Since expansions (37) and (47) are obtained from the Taylor–Ito expansion (32) without any additional conditions, the truncated expansions (37) and (47) (without the reminder term $\left(D_{r+1}\right)_{s,t}$) under the conditions of [2] (Proposition 5.9.2) converge to the process $R(\mathbf{x}_s, s)$ w. p. 1 as $r \to \infty$ for all $s, t \in [0, T]$ such that $s > t$ and $T < \infty$.

6. The Taylor–Stratonovich Expansion

In this section, we cite the Taylor–Stratonovich expansion [7] and introduce some necessary notations. At that, we will use the original notations introduced by the author of this paper.

Assume that $LR(\mathbf{x}_\tau, \tau)$, $G_0^{(i)} R(\mathbf{x}_\tau, \tau) \in \mathfrak{M}_2([0, T])$ for $i = 1, \ldots, m$, and consider the Ito formula in the form (29).

In addition, suppose that the function $G_0^{(i)} R(\mathbf{x}, t)$ $(i = 1, \ldots, m)$ is such that the formulas (15) and (16) can be applied. In this case, the relations (15) and (16) imply that

$$\int\limits_t^s G_0^{(i)} R(\mathbf{x}_\tau, \tau) d\mathbf{f}_\tau^{(i)} = \int\limits_t^{*s} G_0^{(i)} R(\mathbf{x}_\tau, \tau) d\mathbf{f}_\tau^{(i)} - \frac{1}{2} \int\limits_t^s G_0^{(i)} G_0^{(i)} R(\mathbf{x}_\tau, \tau) d\tau \tag{49}$$

w. p. 1 for $i = 1, \ldots, m$.

Using the relation (49), let us write the formula (29) in the following form

$$R(\mathbf{x}_s, s) = R(\mathbf{x}_t, t) + \int\limits_t^s \bar{L} R(\mathbf{x}_\tau, \tau) d\tau + \sum_{i=1}^{m} \int\limits_t^{*s} G_0^{(i)} R(\mathbf{x}_\tau, \tau) d\mathbf{f}_\tau^{(i)} \quad \text{w. p. 1}, \tag{50}$$

where

$$\bar{L} R(\mathbf{x}, t) = LR(\mathbf{x}, t) - \frac{1}{2} \sum_{i=1}^{m} G_0^{(i)} G_0^{(i)} R(\mathbf{x}, t). \tag{51}$$

Introduce the following notation

$$\left\|D_{\lambda_l}^{(i_l)}\ldots D_{\lambda_1}^{(i_1)}R(\mathbf{x},t)\right\|_{i_1=\lambda_1,\ldots,i_l=\lambda_l}^{m\lambda_1\ \ldots\ m\lambda_l}\ \stackrel{\mathsf{def}}{=}\ {}^{(p_l)}D_{\lambda_l}\ldots D_{\lambda_1}R(\mathbf{x},t),$$

$${}^{(p_k)}J^*_{(\lambda_k\ldots\lambda_1)s,t}=\left\|J^{*(i_k\ldots i_1)}_{(\lambda_k\ldots\lambda_1)s,t}\right\|_{i_1=\lambda_1,\ldots,i_k=\lambda_k}^{m\lambda_1\ \ldots\ m\lambda_k},$$

$$M_k=\Bigl\{(\lambda_k,\ldots,\lambda_1):\lambda_l=1\ \text{or}\ \lambda_l=0;\ l=1,\ldots,k\Bigr\},\quad k\ge 1,$$

$$J^{*(i_k\ldots i_1)}_{(\lambda_k\ldots\lambda_1)s,t}=\int\limits_t^{*s}\ldots\int\limits_t^{*t_2}d\mathbf{w}_{t_1}^{(i_k)}\ldots d\mathbf{w}_{t_k}^{(i_1)},\quad k\ge 1,$$

where $\lambda_l=1$ or $\lambda_l=0$, $D_{\lambda_l}^{(i_l)}=\bar{L}$ and $i_l=0$ for $\lambda_l=0$, $D_{\lambda_l}^{(i_l)}=G_0^{(i_l)}$ and $i_l=1,\ldots,m$ for $\lambda_l=1$,

$$p_l=\sum_{j=1}^{l}\lambda_j\quad\text{for}\quad l=1,\ldots,r+1,\quad r\in\mathbb{N},$$

$\mathbf{w}_\tau^{(i)}$ $(i=1,\ldots,m)$ are F_τ-measurable for all $\tau\in[0,T]$ independent standard Wiener processes and $\mathbf{w}_\tau^{(0)}=\tau$.

Applying the formula (50) to the process $R(\mathbf{x}_s,s)$ repeatedly, we obtain the following Taylor–Stratonovich expansion [7]

$$R(\mathbf{x}_s,s)=R(\mathbf{x}_t,t)+\sum_{k=1}^{r}\sum_{(\lambda_k,\ldots,\lambda_1)\in M_k}{}^{(p_k)}D_{\lambda_k}\ldots D_{\lambda_1}R(\mathbf{x}_t,t)\stackrel{p_k}{\cdot}{}^{(p_k)}J^*_{(\lambda_k\ldots\lambda_1)s,t}+(D_{r+1})_{s,t}\tag{52}$$

w. p. 1, where

(53)

$$(D_{r+1})_{s,t}=\sum_{(\lambda_{r+1},\ldots,\lambda_1)\in M_{r+1}}\int\limits_t^{*s}\ldots\left(\int\limits_t^{*t_2}{}^{(p_{r+1})}D_{\lambda_{r+1}}\ldots D_{\lambda_1}R(\mathbf{x}_{t_1},t_1)\stackrel{\lambda_{r+1}}{\cdot}d\mathbf{w}_{t_1}\right)\ldots\stackrel{\lambda_1}{\cdot}d\mathbf{w}_{t_{r+1}}.$$

It is assumed that the right-hand sides of (52), (53) exist.

A possible variant of the conditions under which the right-hand sides of (52), (53) exist is as follows

(i*) $Q_{\lambda_l}^{(i_l)}\ldots Q_{\lambda_1}^{(i_1)}R(\mathbf{x},t)\in\mathfrak{L}$ for all $(\lambda_l,\ldots,\lambda_1)\in\bigcup\limits_{g=1}^{r}M_g$;

(ii*)

$$\left|Q_{\lambda_l}^{(i_l)}\ldots Q_{\lambda_1}^{(i_1)}R(\mathbf{x},t)-Q_{\lambda_l}^{(i_l)}\ldots Q_{\lambda_1}^{(i_1)}R(\mathbf{y},t)\right|\le K|\mathbf{x}-\mathbf{y}|,\tag{54}$$

$$\left|Q_{\lambda_l}^{(i_l)}\ldots Q_{\lambda_1}^{(i_1)}R(\mathbf{x},t)\right|\le K(1+|\mathbf{x}|),\tag{55}$$

and

$$\left|Q_{\lambda_l}^{(i_l)}\ldots Q_{\lambda_1}^{(i_1)}R(\mathbf{x},t)-Q_{\lambda_l}^{(i_l)}\ldots Q_{\lambda_1}^{(i_1)}R(\mathbf{x},s)\right|\le K|t-s|^{\nu}(1+|\mathbf{x}|)$$

for all $\mathbf{x},\mathbf{y}\in\mathbb{R}^n$, $t,s\in[0,T]$, $(\lambda_l,\ldots,\lambda_1)\in\bigcup\limits_{g=1}^{r+1}M_g$ and for some $\nu>0$, where $K<\infty$ is a constant, $Q_{\lambda_l}^{(i_l)}=L$ and $i_l=0$ for $\lambda_l=0$, $Q_{\lambda_l}^{(i_l)}=G_0^{(i_l)}$ and $i_l=1,\ldots,m$ for $\lambda_l=1$;

(iii*) the functions $\mathbf{a}(\mathbf{x},t)$ and $B(\mathbf{x},t)$ are measurable with respect to all of the variables and satisfy the conditions (54) and (55);

(iv*) $\mathbf{x}_0$ is F_0-measurable and $\mathsf{M}\left\{|\mathbf{x}_0|^8\right\}<\infty$.

Let us write the expansion (52) in the another form

$$R(\mathbf{x}_s,s)=R(\mathbf{x}_t,t)+\sum_{k=1}^{r}\sum_{(\lambda_k,\ldots,\lambda_1)\in M_k}\sum_{i_1=\lambda_1}^{m\lambda_1}\ldots\sum_{i_k=\lambda_k}^{m\lambda_k}D_{\lambda_k}^{(i_k)}\ldots D_{\lambda_1}^{(i_1)}R(\mathbf{x}_t,t)\ J_{(\lambda_k\ldots\lambda_1)s,t}^{*(i_k\ldots i_1)}+$$

$$+\left(D_{r+1}\right)_{s,t}\quad \text{w. p. 1.}$$

Denote

$$G_{rk}=\Biggl\{(\lambda_k,\ldots,\lambda_1):\ r+1\le 2k-\lambda_1-\ldots-\lambda_k\le 2r\Biggr\},$$

$$E_{qk}=\Biggl\{(\lambda_k,\ldots,\lambda_1):\ 2k-\lambda_1-\ldots-\lambda_k=q\Biggr\},$$

where $\lambda_l=1$ or $\lambda_l=0$ $(l=1,\ldots,k)$.

The Taylor–Stratonovich expansion ordered according to the order of smallness (in the mean-square sense when $s\downarrow t$) of its terms has the form

$$R(\mathbf{x}_s,s)=R(\mathbf{x}_t,t)+\sum_{q,k=1}^{r}\sum_{(\lambda_k,\ldots,\lambda_1)\in \mathrm{E}_{qk}}\sum_{i_1=\lambda_1}^{m\lambda_1}\ldots\sum_{i_k=\lambda_k}^{m\lambda_k}D_{\lambda_k}^{(i_k)}\ldots D_{\lambda_1}^{(i_1)}R(\mathbf{x}_t,t)\ J_{(\lambda_k\ldots\lambda_1)s,t}^{*(i_k\ldots i_1)}+$$

$$+\left(H_{r+1}\right)_{s,t}\quad \text{w. p. 1,} \tag{56}$$

where

$$\left(H_{r+1}\right)_{s,t}=\sum_{k=1}^{r}\sum_{(\lambda_k,\ldots,\lambda_1)\in \mathrm{G}_{rk}}\sum_{i_1=\lambda_1}^{m\lambda_1}\ldots\sum_{i_k=\lambda_k}^{m\lambda_k}D_{\lambda_k}^{(i_k)}\ldots D_{\lambda_1}^{(i_1)}R(\mathbf{x}_t,t)\ J_{(\lambda_k\ldots\lambda_1)s,t}^{*(i_k\ldots i_1)}+$$

$$+\left(D_{r+1}\right)_{s,t}.$$

7. The First Form of the Unified Taylor–Stratonovich Expansion

In this section, we transform the right-hand side of (52) with the help of Theorem 1 and Lemma 2 to a representation including iterated Stratonovich stochastic integrals of the form (8).

Denote

$$I_{l_1\ldots l_k s,t}^{*(i_1\ldots i_k)} = \int\limits_t^{*s} (t-t_k)^{l_k} \ldots \int\limits_t^{*t_2} (t-t_1)^{l_1} d\mathbf{f}_{t_1}^{(i_1)} \ldots d\mathbf{f}_{t_k}^{(i_k)} \quad \text{for} \quad k \ge 1 \tag{57}$$

and

$$I_{l_1\ldots l_k s,t}^{*(i_1\ldots i_k)} = 1 \quad \text{for} \quad k = 0,$$

where $i_1, \ldots, i_k = 1, \ldots, m$. Moreover, let

$$^{(k)}I_{l_1\ldots l_k s,t}^{*} = \left\|I_{l_1\ldots l_k s,t}^{*(i_1\ldots i_k)}\right\|_{i_1,\ldots,i_k=1}^{m},$$

$$\bar{G}_p^{(i)} \stackrel{\mathsf{def}}{=} \frac{1}{p}\left(\bar{G}_{p-1}^{(i)}\bar{L} - \bar{L}\bar{G}_{p-1}^{(i)}\right), \quad p = 1, 2, \ldots, \quad i = 1, \ldots, m, \tag{58}$$

where $\bar{G}_0^{(i)} \stackrel{\mathsf{def}}{=} G_0^{(i)}$, $i = 1, \ldots, m$. The operators $\bar{L}$ and $G_0^{(i)}$, $i = 1, \ldots, m$, are determined by the equalities (27), (28), and (51). Denote

$$A_q \stackrel{\mathsf{def}}{=} \left\{(k, j, l_1, \ldots, l_k) : \ k + j + \sum_{p=1}^{k} l_p = q; \ k, j, l_1, \ldots, l_k = 0, 1, \ldots\right\},$$

$$\left\|\bar{G}_{l_1}^{(i_1)} \ldots \bar{G}_{l_k}^{(i_k)} \bar{L}^j R(\mathbf{x}, t)\right\|_{i_1,\ldots,i_k=1}^{m} \stackrel{\mathsf{def}}{=} {}^{(k)}\bar{G}_{l_1} \ldots \bar{G}_{l_k} \bar{L}^j R(\mathbf{x}, t),$$

$$\bar{L}^j R(\mathbf{x}, t) \stackrel{\mathsf{def}}{=} \begin{cases} \underbrace{\bar{L} \ldots \bar{L}}_{j} R(\mathbf{x}, t) & \text{for } j \ge 1 \\ \\ R(\mathbf{x}, t) & \text{for } j = 0 \end{cases}.$$

Theorem 4. *Let conditions* (i*)-(iv*) *be satisfied. Then for any* $s, t \in [0, T]$ *such that* $s > t$ *and for any positive integer* r, *the following expansion takes place w. p.* 1

$$R(\mathbf{x}_s, s) = R(\mathbf{x}_t, t) + \sum_{q=1}^{r} \sum_{(k,j,l_1,\ldots,l_k) \in \mathrm{A}_q} \frac{(s-t)^j}{j!} \sum_{i_1,\ldots,i_k=1}^{m} \bar{G}_{l_1}^{(i_1)} \ldots \bar{G}_{l_k}^{(i_k)} \bar{L}^j R(\mathbf{x}_t, t) \ I_{l_1\ldots l_k s,t}^{*(i_1\ldots i_k)} +$$

$$+ \left(D_{r+1}\right)_{s,t}, \tag{59}$$

where $(D_{r+1})_{s,t}$ *has the form* (53).

Proof. We claim that

$$\sum_{(\lambda_q,\ldots,\lambda_1)\in M_q} {}^{(p_q)}D_{\lambda_q}\ldots D_{\lambda_1}R(\mathbf{x}_t,t) \overset{p_q}{\cdot} {}^{(p_q)}J^*_{(\lambda_q\ldots\lambda_1)s,t} =$$

$$= \sum_{(k,j,l_1,\ldots,l_k)\in \mathrm{A}_q} \frac{(s-t)^j}{j!} \sum_{i_1,\ldots,i_k=1}^{m} \bar{G}_{l_1}^{(i_1)}\ldots\bar{G}_{l_k}^{(i_k)}\bar{L}^j R(\mathbf{x}_t,t)\ I^{*(i_1\ldots i_k)}_{l_1\ldots l_{k\,s,t}} \tag{60}$$

w. p. 1. The equality (60) is valid for $q=1$. Assume that (60) is valid for some $q>1$. In this case, using the induction hypothesis, we obtain

$$\sum_{(\lambda_{q+1},\ldots,\lambda_1)\in M_{q+1}} {}^{(p_{q+1})}D_{\lambda_1}\ldots D_{\lambda_{q+1}}R(\mathbf{x}_t,t) \overset{p_{q+1}}{\cdot} {}^{(p_{q+1})}J^*_{(\lambda_1\ldots\lambda_{q+1})s,t} =$$

$$= \sum_{\lambda_{q+1}\in\{1,\ 0\}} \int\limits_t^{*s} \sum_{(\lambda_q,\ldots,\lambda_1)\in M_q} \left({}^{(p_{q+1})}D_{\lambda_1}\ldots D_{\lambda_{q+1}}R(\mathbf{x}_t,t) \overset{p_q}{\cdot} {}^{(p_q)}J^*_{(\lambda_1\ldots\lambda_q)\theta,t}\right) \overset{\lambda_{q+1}}{\cdot} d\mathbf{w}_\theta =$$

$$= \sum_{\lambda_{q+1}\in\{1,\ 0\}} \int\limits_t^{*s} \sum_{(k,j,l_1,\ldots,l_k)\in A_q} \frac{(\theta-t)^j}{j!}\times$$

$$\times\left({}^{(k+\lambda_{q+1})}\bar{G}_{l_1}\ldots\bar{G}_{l_k}\bar{L}^j D_{\lambda_{q+1}}R(\mathbf{x}_t,t) \overset{k}{\cdot} {}^{(k)}I^*_{l_1\ldots l_{k\,s,t}}\right) \overset{\lambda_{q+1}}{\cdot} d\mathbf{w}_\theta =$$

$$= \sum_{(k,j,l_1,\ldots,l_k)\in A_q} \Biggl({}^{(k)}\bar{G}_{l_1}\ldots\bar{G}_{l_k}\bar{L}^{j+1}R(\mathbf{x}_t,t) \overset{k}{\cdot} \int\limits_t^s \frac{(\theta-t)^j}{j!}\,{}^{(k)}I^*_{l_1\ldots l_{k\,\theta,t}}d\theta +$$

$$+ \left({}^{(k+1)}\bar{G}_{l_1}\ldots\bar{G}_{l_k}\bar{L}^j\bar{G}_0 R(\mathbf{x}_t,t) \overset{k}{\cdot} \int\limits_t^{*s} \frac{(\theta-t)^j}{j!}\,{}^{(k)}I^*_{l_1\ldots l_{k\,\theta,t}}\right) \overset{1}{\cdot} d\mathbf{f}_\theta\Biggr) \tag{61}$$

w. p. 1.

Using Lemma 1, we obtain

$$\int\limits_t^s \frac{(\theta-t)^j}{j!}\,{}^{(k)}I^*_{l_1\ldots l_{k\,\theta,t}}d\theta =$$

$$= \frac{1}{(j+1)!}\begin{cases}(s-t)^{j+1} & \text{for } k=0\\ & \\ (s-t)^{j+1}\cdot{}^{(k)}I^*_{l_1\ldots l_{k\,s,t}} - (-1)^{j+1}\cdot{}^{(k)}I^*_{l_1\ldots l_{k-1}\ l_k+j+1_{s,t}} & \text{for } k>0\end{cases} \tag{62}$$

w. p. 1. In addition (see (57)), we get

$$\int\limits_t^{*s} \frac{(\theta-t)^j}{j!} I^{*(i_1\ldots i_k)}_{l_1\ldots l_{k\,\theta,t}} d\mathbf{f}^{(i_{k+1})}_\theta = \frac{(-1)^j}{j!} I^{*(i_1\ldots i_k i_{k+1})}_{l_1\ldots l_k j_{s,t}} \tag{63}$$

in the notations just introduced. Substitute the relations (62) and (63) into the formula (61). Grouping summands of the obtained expression with equal lower indices at iterated Stratonovich stochastic integrals and using (58) and the equality

$$\bar{G}^{(i)}_p R(\mathbf{x},t) = \frac{1}{p!}\sum_{q=0}^{p}(-1)^q C_p^q \bar{L}^q \bar{G}^{(i)}_0 \bar{L}^{p-q} R(\mathbf{x},t), \quad \text{where} \quad C_p^q = \frac{p!}{q!(p-q)!}, \tag{64}$$

(this equality follows from (58)), we note that the obtained expression is equal to

$$\sum_{(k,j,l_1,\ldots,l_k)\in A_{q+1}} \frac{(s-t)^j}{j!} {}^{(k)}\bar{G}_{l_1}\ldots \bar{G}_{l_k}\bar{L}^j\{\eta_t\} \stackrel{k}{\cdot} {}^{(k)}I^{*}_{l_1\ldots l_{k\,s,t}}$$

w. p. 1. Summing the equalities (60) for $q=1,2,\ldots,r$ and applying the formula (52), we obtain the expression (59). The proof is completed.

Let us order terms of the expansion (59) according to their smallness orders as $s\downarrow t$ in the mean-square sense

$$R(\mathbf{x}_s,s) = R(\mathbf{x}_t,t) + \sum_{q=1}^{r}\sum_{(k,j,l_1,\ldots,l_k)\in \mathrm{D}_q} \frac{(s-t)^j}{j!} \sum_{i_1,\ldots,i_k=1}^{m} \bar{G}^{(i_1)}_{l_1}\ldots \bar{G}^{(i_k)}_{l_k}\bar{L}^j R(\mathbf{x}_t,t)\ I^{*(i_1\ldots i_k)}_{l_1\ldots l_{k\,s,t}} +$$

$$+ \left(H_{r+1}\right)_{s,t} \quad \text{w. p. 1}, \tag{65}$$

where

$$\left(H_{r+1}\right)_{s,t} = \sum_{(k,j,l_1,\ldots,l_k)\in \mathrm{U}_r} \frac{(s-t)^j}{j!} \sum_{i_1,\ldots,i_k=1}^{m} \bar{G}^{(i_1)}_{l_1}\ldots \bar{G}^{(i_k)}_{l_k}\bar{L}^j R(\mathbf{x}_t,t)\ I^{*(i_1\ldots i_k)}_{l_1\ldots l_{k\,s,t}} + \left(D_{r+1}\right)_{s,t},$$

$$\mathrm{D}_q = \left\{(k,j,l_1,\ldots,l_k): k+2\left(j+\sum_{p=1}^{k} l_p\right) = q;\ k,j,l_1,\ldots,l_k = 0,1,\ldots\right\}, \tag{66}$$

(67)

$$\mathrm{U}_r = \left\{(k,j,l_1,\ldots,l_k): k+j+\sum_{p=1}^{k} l_p \le r,\ k+2\left(j+\sum_{p=1}^{k} l_p\right) \ge r+1;\ k,j,l_1,\ldots,l_k = 0,1,\ldots\right\},$$

and $\left(D_{r+1}\right)_{s,t}$ has the form (53). Note that the remainder term $\left(H_{r+1}\right)_{s,t}$ in (65) has a higher order of smallness in the mean-square sense as $s\downarrow t$ than the terms of the main part of expansion (65).

8. The Second Form of the Unified Taylor–Stratonovich Expansion

Consider iterated Stratonovich stochastic integrals of the form

$$J^{*(i_1\ldots i_k)}_{l_1\ldots l_k\,s,t}=\int\limits_t^{*s}(s-t_k)^{l_k}\ldots\int\limits_t^{*t_2}(s-t_1)^{l_1}d\mathbf{f}_{t_1}^{(i_1)}\ldots d\mathbf{f}_{t_k}^{(i_k)}\quad\text{for}\quad k\ge 1$$

and

$$J^{*(i_1\ldots i_k)}_{l_1\ldots l_k\,s,t}=1\quad\text{for}\quad k=0,$$

where $i_1,\ldots,i_k=1,\ldots,m$.

The additive property of stochastic integrals and the Newton binomial formula imply the following equality

$$I^{*(i_1\ldots i_k)}_{l_1\ldots l_k\,s,t}=\sum_{j_1=0}^{l_1}\ldots\sum_{j_k=0}^{l_k}\prod_{g=1}^{k}C_{l_g}^{j_g}(t-s)^{l_1+\ldots+l_k-j_1-\ldots-j_k}\;J^{*(i_1\ldots i_k)}_{j_1\ldots j_k\,s,t}\quad\text{w. p. 1,}\tag{68}$$

where

$$C_l^k=\frac{l!}{k!(l-k)!}$$

is the binomial coefficient. Thus, the Taylor–Stratonovich expansion of the process $\eta_s=R(\mathbf{x}_s,s)$, $s\in[0,T]$ can be constructed either using the iterated stochastic integrals $I^{*(i_1\ldots i_k)}_{l_1\ldots l_k\,s,t}$ similarly to the previous section or using the iterated stochastic integrals $J^{*(i_1\ldots i_k)}_{l_1\ldots l_k\,s,t}$. This is the main subject of this section.

Denote

$$\left\|J^{*(i_1\ldots i_k)}_{l_1\ldots l_k\,s,t}\right\|_{i_1,\ldots,i_k=1}^{m}\stackrel{\sf def}{=}{}^{(k)}J^{*}_{l_1\ldots l_k\,s,t},$$

$$\left\|\bar{L}^j\bar{G}_{l_1}^{(i_1)}\ldots\bar{G}_{l_k}^{(i_k)}R(\mathbf{x},t)\right\|_{i_1,\ldots,i_k=1}^{m}\stackrel{\sf def}{=}{}^{(k)}\bar{L}^j\bar{G}_{l_1}\ldots\bar{G}_{l_k}R(\mathbf{x},t).$$

Theorem 5. *Let conditions* (i*)-(iv*) *be satisfied. Then for any $s,t\in[0,T]$ such that $s>t$ and for any positive integer r, the following expansion is valid w. p.* 1

$$R(\mathbf{x}_s,s)=R(\mathbf{x}_t,t)+\sum_{q=1}^{r}\sum_{(k,j,l_1,\ldots,l_k)\in\mathrm{A}_q}\frac{(s-t)^j}{j!}\sum_{i_1,\ldots,i_k=1}^{m}\bar{L}^j\bar{G}_{l_1}^{(i_1)}\ldots\bar{G}_{l_k}^{(i_k)}R(\mathbf{x}_t,t)\;J^{*(i_1\ldots i_k)}_{l_1\ldots l_k\,s,t}+$$

$$+\left(D_{r+1}\right)_{s,t},\tag{69}$$

where $\left(D_{r+1}\right)_{s,t}$ has the form (53).

Proof. To prove the theorem, we check the equalities

$$\sum_{(k,j,l_1,\ldots,l_k)\in \mathrm{A}_q} \frac{(s-t)^j}{j!} \sum_{i_1,\ldots,i_k=1}^{m} \bar{L}^j \bar{G}_{l_1}^{(i_1)} \ldots \bar{G}_{l_k}^{(i_k)} R(\mathbf{x}_t,t)\ J_{l_1\ldots l_{k\,s,t}}^{*(i_1\ldots i_k)} =$$

$$\sum_{(k,j,l_1,\ldots,l_k)\in \mathrm{A}_q} \frac{(s-t)^j}{j!} \sum_{i_1,\ldots,i_k=1}^{m} \bar{G}_{l_1}^{(i_1)} \ldots \bar{G}_{l_k}^{(i_k)} \bar{L}^j R(\mathbf{x}_t,t)\ I_{l_1\ldots l_{k\,s,t}}^{*(i_1\ldots i_k)} \quad \text{w. p. 1} \tag{70}$$

for $q = 1, 2, \ldots, r$. To check (70), substitute the expression (68) into the right-hand side of (70) and then use the formulas (58), (64).

Let us rank terms of the expansion (69) according to their orders of smallness in the mean-square sense as $s \downarrow t$

$$R(\mathbf{x}_s,s) = R(\mathbf{x}_t,t) + \sum_{q=1}^{r} \sum_{(k,j,l_1,\ldots,l_k)\in \mathrm{D}_q} \frac{(s-t)^j}{j!} \sum_{i_1,\ldots,i_k=1}^{m} \bar{L}^j \bar{G}_{l_1}^{(i_1)} \ldots \bar{G}_{l_k}^{(i_k)} R(\mathbf{x}_t,t)\ J_{l_1\ldots l_{k\,s,t}}^{*(i_1\ldots i_k)} +$$

$$+ \left(H_{r+1}\right)_{s,t} \quad \text{w. p. 1},$$

where

$$\left(H_{r+1}\right)_{s,t} = \sum_{(k,j,l_1,\ldots,l_k)\in \mathrm{U}_r} \frac{(s-t)^j}{j!} \sum_{i_1,\ldots,i_k=1}^{m} \bar{L}^j \bar{G}_{l_1}^{(i_1)} \ldots \bar{G}_{l_k}^{(i_k)} R(\mathbf{x}_t,t)\ J_{l_1\ldots l_{k\,s,t}}^{*(i_1\ldots i_k)} + \left(D_{r+1}\right)_{s,t}.$$

The term $\left(D_{r+1}\right)_{s,t}$ has the form (53); the terms D_q and U_r have the forms (66) and (67), respectively. Finally, we note that the convergence w. p. 1 of the truncated Taylor–Stratonovich expansion (52) (without the remainder term $\left(D_{r+1}\right)_{s,t}$) to the process $R(\mathbf{x}_s,s)$ as $r \to \infty$ for all $s, t \in [0,T]$ such that $s > t$ and $T < \infty$ has been proved in [2] (Proposition 5.10.2). Since the expansions (59) and (69) are obtained from the Taylor–Stratonovich expansion (52) without any additional conditions, the truncated expansions (59) and (69) (without the reminder term $\left(D_{r+1}\right)_{s,t}$) under the conditions of [2] (Proposition 5.10.2) converge to the process $R(\mathbf{x}_s,s)$ w. p. 1 as $r \to \infty$ for all $s, t \in [0,T]$ such that $s > t$ and $T < \infty$.

9. Comparison of the Unified Taylor–Ito and Taylor–Stratonovich Expansions With the Classical Taylor–Ito and Taylor–Stratonovich Expansions

Note that the truncated unified Taylor–Ito and Taylor–Stratonovich expansions contain the less number of various iterated Ito and Stratonovich stochastic integrals (moreover, their major part will have less multiplicity) in comparison with the classical Taylor–Ito and Taylor–Stratonovich expansions [7].

It is easy to notice that the stochastic integrals from the families (4), (5) are connected by linear relations. However, the stochastic integrals from the families (6), (7) cannot be connected by linear relations. This holds for the stochastic integrals from the families (8), (9). Therefore, we will call the families (6)–(9) as the *stochastic bases.*

Let us call the numbers $\mathrm{rank}_{\mathrm{A}}(r)$ and $\mathrm{rank}_{\mathrm{D}}(r)$ of various iterated Ito and Stratonovich stochastic integrals which are included in the families (6)–(9) as the *ranks of stochastic bases* when summation in the stochastic expansions is performed using the sets A_q $(q=1,\ldots,r)$ and D_q $(q=1,\ldots,r)$ correspondently. Here r is a fixed natural number.

At the beginning, let us analyze several examples related to the Taylor–Ito expansions (obviously, the same conclusions will hold for the Taylor–Stratonovich expansions).

Assume that summation in the unified Taylor–Ito expansions is performed using the sets D_q $(q=1,\ldots,r)$. It is easy to see that the truncated unified Taylor–Ito expansion (43), where summation is performed with respect to the sets D_q when $r=3$ includes 4 ($\mathrm{rank}_{\mathrm{D}}(3)=4$) various iterated Ito stochastic integrals

$$I_{0_{s,t}}^{(i_1)},\quad I_{00_{s,t}}^{(i_1i_2)},\quad I_{1_{s,t}}^{(i_1)},\quad I_{000_{s,t}}^{(i_1i_2i_3)}.$$

The same truncated classical Taylor–Ito expansion (34) [2] contains 5 various iterated Ito stochastic integrals

$$J_{(1)s,t}^{(i_1)},\quad J_{(11)s,t}^{(i_1i_2)},\quad J_{(10)s,t}^{(i_10)},\quad J_{(01)s,t}^{(0i_1)},\quad J_{(111)s,t}^{(i_1i_2i_3)}.$$

For $r=4$ we have 7 ($\mathrm{rank}_{\mathrm{D}}(4)=7$) integrals

$$I_{0_{s,t}}^{(i_1)},\quad I_{00_{s,t}}^{(i_1i_2)},\quad I_{1_{s,t}}^{(i_1)},\quad I_{000_{s,t}}^{(i_1i_2i_3)},\quad I_{01_{s,t}}^{(i_1i_2)},\quad I_{10_{s,t}}^{(i_1i_2)},\quad I_{0000_{s,t}}^{(i_1i_2i_3i_4)}$$

against 9 stochastic integrals

$$J_{(1)s,t}^{(i_1)},\quad J_{(11)s,t}^{(i_1i_2)},\quad J_{(10)s,t}^{(i_10)},\quad J_{(01)s,t}^{(0i_1)},\quad J_{(111)s,t}^{(i_1i_2i_3)},\quad J_{(101)s,t}^{(i_10i_3)},\quad J_{(110)s,t}^{(i_1i_20)},\quad J_{(011)s,t}^{(0i_1i_2)},\quad J_{(1111)s,t}^{(i_1i_2i_3i_4)}.$$

For $r=5$ ($\mathrm{rank}_{\mathrm{D}}(5)=12$) we get 12 integrals against 17 integrals and for $r=6$ and $r=7$ we have 20 against 29 and 33 against 50 correspondently.

We will obtain the same results when compare the unified Taylor–Stratonovich expansions [9], [46]-[50], [54]-[61] with their classical analogues [2], [7] (see previous sections).

Note that summation according to the sets D_q is usually used while constructing strong numerical methods (built according to the mean-square criterion of convergence) for Ito SDEs [2], [4], [46]-[50], [56]-[61]. Summation according to the sets A_q is usually used when building weak numerical methods (built in accordance with the weak criterion of convergence) for Ito SDEs [2], [4]. For example, $\mathrm{rank}_{\mathrm{A}}(4)=15$, while the total number of various iterated Ito stochastic integrals (included in the classical Taylor–Ito expansion [2] when $r=4$) equals to 26.

Let us show that [48]-[50], [56]-[61]

$$\mathrm{rank}_{\mathrm{A}}(r)=2^r-1.$$

Let $(l_1,\ldots,l_k)$ be an ordered set such that $l_1,\ldots,\,l_k=0,1,\ldots$ and $k=1,2,\ldots$ Consider $S(k)\stackrel{\mathsf{def}}{=} l_1+\ldots+l_k=p$ (p is a fixed natural number or zero). Let $N(k,p)$ be a number of all ordered combinations $(l_1,\ldots,l_k)$ such that $l_1,\ldots,l_k=0,1,\ldots,\ k=1,2,\ldots,$ and $S(k)=p$. First let us show that

$$N(k,p)=C_{p+k-1}^{k-1},$$

where

$$C_n^m=\frac{n!}{m!(n-m)!}$$

is a binomial coefficient.

It is not difficult to see that

$$N(1,p)=1=C_{p+1-1}^{1-1},$$

$$N(2,p)=p+1=C_{p+2-1}^{2-1},$$

$$N(3,p)=\frac{(p+1)(p+2)}{2}=C_{p+3-1}^{3-1}.$$

Moreover,

$$N(k+1,p)=\sum_{l=0}^{p}N(k,l)=\sum_{l=0}^{p}C_{l+k-1}^{k-1}=C_{p+k}^{k},$$

where we used the induction assumption and the well known property of binomial coefficients.
Then

$$\mathrm{rank}_A(r)=$$

$$=N(1,0)+(N(1,1)+N(2,0))+(N(1,2)+N(2,1)+N(3,0))+\ldots$$

$$\ldots+(N(1,r-1)+N(2,r-2)+\ldots+N(r,0))=$$

$$=C_0^0+(C_1^0+C_1^1)+(C_2^0+C_2^1+C_2^2)+\ldots$$

$$\ldots+(C_{r-1}^0+C_{r-1}^1+C_{r-1}^2+\ldots+C_{r-1}^{r-1})=$$

$$=2^0+2^1+2^2+\ldots+2^{r-1}=2^r-1.$$

Let $n_{\mathrm{M}}(r)$ be the total number of various iterated stochastic integrals included in the classical Taylor–Ito expansion (32) [2], where summation is performed with respect to the set

$$\bigcup_{k=1}^{r}\mathrm{M}_k.$$

If we exclude from the consideration the integrals which are equal to $(s-t)^j/j!$, then

$$n_M(r)=$$

$$=(2^1-1)+(2^2-1)+(2^3-1)+\ldots+(2^r-1)=$$

$$=2(1+2+2^2+\ldots+2^{r-1})-r=2(2^r-1)-r.$$

It means that

$$\lim_{r\to\infty}\frac{n_M(r)}{\mathrm{rank}_A(r)}=2.$$

In Table 1 we can see the numbers

$$\mathrm{rank}_{\mathrm{A}}(r),\quad n_{\mathrm{M}}(r),\quad f(r)=n_{\mathrm{M}}(r)/\mathrm{rank}_{\mathrm{A}}(r)$$

for various values r.
Let us show that [48]-[50], [56]-[61]

Таблица 1. Numbers $\text{rank}_{\text{A}}(r),\ n_{\text{M}}(r),\ f(r)=n_{\text{M}}(r)/\text{rank}_{\text{A}}(r)$

r	1	2	3	4	5	6	7	8	9	10
$\text{rank}_{\text{A}}(r)$	1	3	7	15	31	63	127	255	511	1023
$n_{\text{M}}(r)$	1	4	11	26	57	120	247	502	1013	2036
$f(r)$	1	1.3333	1.5714	1.7333	1.8387	1.9048	1.9449	1.9686	1.9824	1.9902

(71)
$$
\text{rank}_{\text{D}}(r)=\begin{cases}\displaystyle\sum_{s=0}^{r-1}\ \sum_{l=s}^{(r-1)/2+[s/2]} C_l^s & \text{for}\quad r=1,\ 3,\ 5,\ldots\\[2ex] \displaystyle\sum_{s=0}^{r-1}\ \sum_{l=s}^{r/2-1+[(s+1)/2]} C_l^s & \text{for}\quad r=2,\ 4,\ 6,\ldots\end{cases},
$$

where $[x]$ is an integer part of a number x, and C_n^m is a binomial coefficient.

For proving (71) we write the condition

$$
k+2(j+S(k))\le r,
$$

where $S(k)\stackrel{\text{def}}{=}l_1+\ldots+l_k$ $(k,j,l_1,\ldots,l_k=0,1,\ldots)$ in the form $j+S(k)\le(r-k)/2$, and perform the consideration of all possible combinations with respect to $k=1,\ldots,r$. Moreover, we take into account the above reasoning.

Let us calculate the number $n_E(r)$ of all different iterated Ito stochastic integrals from the classical Taylor–Ito expansion (34) [2] if the summation in this expansion is performed with respect to the set

$$
\bigcup_{q,k=1}^{r} E_{qk}.
$$

The summation condition can be written in this case in the form: $0\le p+2q\le r$, where q is a total number of integrations with respect to time while p is a total number of integrations with respect to the Wiener processes in the selected iterated stochastic integral from the Taylor–Ito expansion (34) [2]. At that, the multiplicity of the mentioned stochastic integral equals to $p+q$ and it is not more than r. Let us write the above condition $(0\le p+2q\le r)$ in the form: $0\le q\le(r-p)/2$ $\Leftrightarrow 0\le q\le[(r-p)/2]$, where $[x]$ means an integer part of a real number x. Then, performing the consideration of all possible combinations with respect to $p=1,\ldots,r$ and using the combinatorial reasoning, we obtain the formula

(72)
$$
n_E(r)=\sum_{s=1}^{r}\ \sum_{l=0}^{[(r-s)/2]} C^s_{[(r-s)/2]+s-l},
$$

where $[x]$ means an integer part of a real number x.

In Table 2 we can see the numbers

$$
\text{rank}_{\text{D}}(r),\quad n_{\text{E}}(r),\quad g(r)=n_{\text{E}}(r)/\text{rank}_{\text{D}}(r)
$$

for various values r.

Таблица 2. Numbers $\text{rank}_{\text{D}}(r)$, $n_{\text{E}}(r)$, $g(r)=n_{\text{E}}(r)/\text{rank}_{\text{D}}(r)$

r	1	2	3	4	5	6	7	8	9	10
$\text{rank}_{\text{D}}(r)$	1	2	4	7	12	20	33	54	88	143
$n_{\text{E}}(r)$	1	2	5	9	17	29	50	83	138	261
$g(r)$	1	1	1.2500	1.2857	1.4167	1.4500	1.5152	1.5370	1.5682	1.8252

10. Application of First Form of the Unified Taylor–Ito Expansion to the High-Order Strong Numerical Methods for Ito SDEs

Let us write (43) for all $s,t\in[0,T]$ such that $s>t$ in the following form

$$R(\mathbf{x}_s,s)=R(\mathbf{x}_t,t)+\sum_{q=1}^{r}\sum_{(k,j,l_1,\ldots,l_k)\in\text{D}_q}\frac{(s-t)^j}{j!}\sum_{i_1,\ldots,i_k=1}^{m}G_{l_1}^{(i_1)}\ldots G_{l_k}^{(i_k)}L^jR(\mathbf{x}_t,t)\ I_{l_1\ldots l_{k\,s,t}}^{(i_1\ldots i_k)}+$$

$$+\mathbf{1}_{\{r=2d-1,d\in N\}}\frac{(s-t)^{(r+1)/2}}{((r+1)/2)!}L^{(r+1)/2}R(\mathbf{x}_t,t)+\left(\bar{H}_{r+1}\right)_{s,t}\quad \text{w. p. 1,} \tag{73}$$

where

$$\left(\bar{H}_{r+1}\right)_{s,t}=\left(H_{r+1}\right)_{s,t}-\mathbf{1}_{\{r=2d-1,d\in N\}}\frac{(s-t)^{(r+1)/2}}{((r+1)/2)!}L^{(r+1)/2}R(\mathbf{x}_t,t).$$

Consider the partition $\{\tau_p\}_{p=0}^{N}$ of the interval $[0,T]$ such that

$$0=\tau_0<\tau_1<\ldots<\tau_N=T,\quad \Delta_N=\max_{0\le j\le N-1}|\tau_{j+1}-\tau_j|.$$

From (73) for $s=\tau_{p+1}$, $t=\tau_p$ we obtain the following representation of explicit one-step strong numerical scheme for Ito SDE (1), which is based on the first form of the unified Taylor–Ito expansion

$$\mathbf{y}_{p+1}=\mathbf{y}_p+\sum_{q=1}^{r}\sum_{(k,j,l_1,\ldots,l_k)\in\text{D}_q}\frac{(\tau_{p+1}-\tau_p)^j}{j!}\sum_{i_1,\ldots,i_k=1}^{m}G_{l_1}^{(i_1)}\ldots G_{l_k}^{(i_k)}L^j\,\mathbf{y}_p\ \hat{I}_{l_1\ldots l_{k\,\tau_{p+1},\tau_p}}^{(i_1\ldots i_k)}+$$

$$+\mathbf{1}_{\{r=2d-1,d\in N\}}\frac{(\tau_{p+1}-\tau_p)^{(r+1)/2}}{((r+1)/2)!}L^{(r+1)/2}\,\mathbf{y}_p, \tag{74}$$

where $\hat{I}_{l_1\ldots l_{k\,\tau_{p+1},\tau_p}}^{(i_1\ldots i_k)}$ is an approximation of the iterated Ito stochastic integral $I_{l_1\ldots l_{k\,\tau_{p+1},\tau_p}}^{(i_1\ldots i_k)}$ defined as

$$I_{l_1\ldots l_{k\,s,t}}^{(i_1\ldots i_k)}=\int\limits_t^s(t-t_k)^{l_k}\ldots\int\limits_t^{t_2}(t-t_1)^{l_1}d\mathbf{f}_{t_1}^{(i_1)}\ldots d\mathbf{f}_{t_k}^{(i_k)}.$$

Note that we understand the equality (74) componentwise with respect to the components $\mathbf{y}_p^{(i)}$ of the column $\mathbf{y}_p$. Also for simplicity we put $\tau_p = p\Delta$, $\Delta = T/N$, $T = \tau_N$, $p = 0, 1, \ldots, N$.

It is known [2] that under the appropriate conditions the numerical scheme (74) has strong order of convergence $r/2$ $(r \in \mathbb{N})$.

Let $B_j(\mathbf{x}, t)$ is the j-th column of the matrix function $B(\mathbf{x}, t)$.

Below we consider particular cases of the numerical scheme (74) for $r = 2, 3, 4, 5$, and 6, i.e. explicit one-step strong numerical schemes for Ito SDE (1) with orders $1.0, 1.5, 2.0, 2.5$, and 3.0 of convergence. At that, for simplicity we will write $\mathbf{a}$, $L\mathbf{a}$, B_i, $G_0^{(i)} B_j$ etc. instead of $\mathbf{a}(\mathbf{y}_p, \tau_p)$, $L\mathbf{a}(\mathbf{y}_p, \tau_p)$, $B_i(\mathbf{y}_p, \tau_p)$, $G_0^{(i)} B_j(\mathbf{y}_p, \tau_p)$ etc. correspondingly. Moreover, the operators L and $G_0^{(i)}$, $i = 1, \ldots, m$, are determined by the equalities (27), (28) as before.

Scheme with strong order 1.0

$$\mathbf{y}_{p+1} = \mathbf{y}_p + \sum_{i_1=1}^{m} B_{i_1} \hat{I}_{0_{\tau_{p+1},\tau_p}}^{(i_1)} + \Delta \mathbf{a} + \sum_{i_1,i_2=1}^{m} G_0^{(i_2)} B_{i_1} \hat{I}_{00_{\tau_{p+1},\tau_p}}^{(i_2 i_1)}. \tag{75}$$

Scheme with strong order 1.5

$$\mathbf{y}_{p+1} = \mathbf{y}_p + \sum_{i_1=1}^{m} B_{i_1} \hat{I}_{0_{\tau_{p+1},\tau_p}}^{(i_1)} + \Delta \mathbf{a} + \sum_{i_1,i_2=1}^{m} G_0^{(i_2)} B_{i_1} \hat{I}_{00_{\tau_{p+1},\tau_p}}^{(i_2 i_1)} +$$

$$+ \sum_{i_1=1}^{m} \left[G_0^{(i_1)} \mathbf{a} \left(\Delta \hat{I}_{0_{\tau_{p+1},\tau_p}}^{(i_1)} + \hat{I}_{1_{\tau_{p+1},\tau_p}}^{(i_1)} \right) - L B_{i_1} \hat{I}_{1_{\tau_{p+1},\tau_p}}^{(i_1)} \right] +$$

$$+ \sum_{i_1,i_2,i_3=1}^{m} G_0^{(i_3)} G_0^{(i_2)} B_{i_1} \hat{I}_{000_{\tau_{p+1},\tau_p}}^{(i_3 i_2 i_1)} +$$

$$+ \frac{\Delta^2}{2} L\mathbf{a}. \tag{76}$$

Scheme with strong order 2.0

It is well known [2] that under the standard conditions the numerical schemes (75)–(79) have strong orders of convergence 1.0, 1.5, 2.0, 2.5, and 3.0 correspondingly. Among these conditions we consider only the condition for approximations of iterated Ito stochastic integrals from the numerical schemes (75)–(79) [2], [57]-[61]

$$
\mathsf{M}\left\{\left(I_{l_1\ldots l_k\,\tau_{p+1},\tau_p}^{(i_1\ldots i_k)}-\hat{I}_{l_1\ldots l_k\,\tau_{p+1},\tau_p}^{(i_1\ldots i_k)}\right)^2\right\}\le C\Delta^{r+1},
$$

where $r/2$ are strong orders of convergence for the numerical schemes (75)–(79), i.e. $r/2=1.0, 1.5, 2.0, 2.5$, and 3.0. Moreover, constant C does not depends on Δ.

As we mentioned above, the numerical schemes (75)–(79) are unrealizable in practice without procedures for the numerical simulation of iterated Ito stochastic integrals from (73). In Sect. 12, we give a brief overview to the effective method of the mean-square approximation of iterated Ito and Stratonovich stochastic integrals of arbitrary multiplicity k ($k\in\mathbb{N}$).

11. Application of First Form of the Unified Taylor–Stratonovich Expansion to the High-Order Strong Numerical Methods for Ito SDEs

Let us write (65) for all $s,t\in[0,T]$ such that $s>t$ in the following from

$$
R(\mathbf{x}_s,s)=R(\mathbf{x}_t,t)+\sum_{q=1}^{r}\sum_{(k,j,l_1,\ldots,l_k)\in\mathrm{D}_q}\frac{(s-t)^j}{j!}\sum_{i_1,\ldots,i_k=1}^{m}\bar{G}_{l_1}^{(i_1)}\ldots\bar{G}_{l_k}^{(i_k)}\bar{L}^jR(\mathbf{x}_t,t)\ I_{l_1\ldots l_k\,s,t}^{*(i_1\ldots i_k)}+
$$

$$
+\mathbf{1}_{\{r=2d-1,d\in N\}}\frac{(s-t)^{(r+1)/2}}{((r+1)/2)!}L^{(r+1)/2}R(\mathbf{x}_t,t)+\left(\bar{H}_{r+1}\right)_{s,t}\quad \text{w. p. 1}, \tag{80}
$$

where

$$
\left(\bar{H}_{r+1}\right)_{s,t}=\left(H_{r+1}\right)_{s,t}-\mathbf{1}_{\{r=2d-1,d\in N\}}\frac{(s-t)^{(r+1)/2}}{((r+1)/2)!}L^{(r+1)/2}R(\mathbf{x}_t,t).
$$

Consider the partition $\{\tau_p\}_{p=0}^N$ of the interval $[0,T]$ such that

$$
0=\tau_0<\tau_1<\ldots<\tau_N=T,\quad \Delta_N=\max_{0\le j\le N-1}\left|\tau_{j+1}-\tau_j\right|.
$$

From (80) for $s=\tau_{p+1}$, $t=\tau_p$ we obtain the following representation of explicit one-step strong numerical scheme for Ito SDE (1), which is based on the first form of the unified Taylor–Stratonovich expansion

$$
\mathbf{y}_{p+1}=\mathbf{y}_p+\sum_{q=1}^{r}\sum_{(k,j,l_1,\ldots,l_k)\in\mathrm{D}_q}\frac{(\tau_{p+1}-\tau_p)^j}{j!}\sum_{i_1,\ldots,i_k=1}^{m}\bar{G}_{l_1}^{(i_1)}\ldots\bar{G}_{l_k}^{(i_k)}\bar{L}^j\,\mathbf{y}_p\ \hat{I}_{l_1\ldots l_k\,\tau_{p+1},\tau_p}^{*(i_1\ldots i_k)}+
$$

$$
+\mathbf{1}_{\{r=2d-1,d\in N\}}\frac{(\tau_{p+1}-\tau_p)^{(r+1)/2}}{((r+1)/2)!}L^{(r+1)/2}\mathbf{y}_p, \tag{81}
$$

where $\hat I^{*(i_1\ldots i_k)}_{l_1\ldots l_k\,\tau_{p+1},\tau_p}$ is an approximation of the iterated Stratonovich stochastic integral $I^{*(i_1\ldots i_k)}_{l_1\ldots l_k\,\tau_{p+1},\tau_p}$ defined as

$$I^{*(i_1\ldots i_k)}_{l_1\ldots l_k\,s,t}=\int\limits_t^{*s}(t-t_k)^{l_k}\ldots\int\limits_t^{*t_2}(t-t_1)^{l_1}d\mathbf{f}^{(i_1)}_{t_1}\ldots d\mathbf{f}^{(i_k)}_{t_k}.$$

Note that we understand the equality (81) componentwise with respect to the components $\mathbf{y}_p^{(i)}$ of the column $\mathbf{y}_p$. Also for simplicity we put $\tau_p=p\Delta$, $\Delta=T/N$, $T=\tau_N$, $p=0,1,\ldots,N$.

It is known [2] that under the appropriate conditions the numerical scheme (81) has strong order of convergence $r/2$ ($r\in\mathbb{N}$).

Denote

$$\bar{\mathbf{a}}(\mathbf{x},t)=\mathbf{a}(\mathbf{x},t)-\frac{1}{2}\sum_{j=1}^m G_0^{(j)}B_j(\mathbf{x},t),$$

where $B_j(\mathbf{x},t)$ is the j-th column of the matrix function $B(\mathbf{x},t)$.

Below we consider particular cases of the numerical scheme (81) for $r=2,3,4,5$, and 6, i.e. explicit one-step strong numerical schemes for Ito SDE (1) with orders $1.0, 1.5, 2.0, 2.5$, and 3.0 of convergence. At that for simplicity we will write $\bar{\mathbf{a}}$, $\bar L\bar{\mathbf{a}}$, $L\mathbf{a}$, B_i, $G_0^{(i)}B_j$ etc. instead of $\bar{\mathbf{a}}(\mathbf{y}_p,\tau_p)$, $\bar L\bar{\mathbf{a}}(\mathbf{y}_p,\tau_p)$, $L\mathbf{a}(\mathbf{y}_p,\tau_p)$, $B_i(\mathbf{y}_p,\tau_p)$, $G_0^{(i)}B_j(\mathbf{y}_p,\tau_p)$ etc. correspondingly. Moreover, the operators $\bar L$ and $G_0^{(i)}$, $i=1,\ldots,m$, are determined by the equalities (27), (28), and (51) as before.

Scheme with strong order 1.0

(82)

$$

It is well known [2] that under the standard conditions the numerical schemes (82)–(86) have strong orders of convergence 1.0, 1.5, 2.0, 2.5, and 3.0 correspondingly. Among these conditions we consider only the condition for approximations of iterated Stratonovich stochastic integrals from the numerical schemes (82)–(86) [2], [57]-[61]

$$
\mathsf{M}\left\{\left(I^{*(i_1\ldots i_k)}_{l_1\ldots l_k{}_{\tau_{p+1},\tau_p}}-\hat{I}^{*(i_1\ldots i_k)}_{l_1\ldots l_k{}_{\tau_{p+1},\tau_p}}\right)^2\right\}\le C\Delta^{r+1},
$$

where $r/2$ are strong orders of convergence for the numerical schemes (82)–(86), i.e. $r/2=1.0,1.5,$ $2.0,2.5,$ and 3.0. Moreover, constant C does not depends on Δ.

As we mentioned above, the numerical schemes (82)–(86) are unrealizable in practice without procedures for the numerical simulation of iterated Stratonovich stochastic integrals from (80). In the next section, we give a brief overview to the effective method of the mean-square approximation of iterated Ito and Stratonovich stochastic integrals of arbitrary multiplicity k $(k\in\mathbb{N})$.

12. Method of the Mean-Square Approximation of Iterated Ito and Stratonovich Stochastic Integrals Based on Generalized Multiple Fourier Series

It should be noted that there is an approach to the mean-square approximation of iterated stochastic integrals based on multiple integral sums (see, for example, [4]). This method implies the partitioning of the integration interval of the iterated stochastic integral under consideration; this interval is the integration step of the numerical methods used to solve Ito SDEs; therefore, it is already fairly small and does not need to be partitioned. Computational experiments [46] show that the application of the method [4] to stochastic integrals with multiplicities $k\ge 2$ leads to unacceptably high computational cost and accumulation of computation errors. Another well-known method is based on the Karhunen–Loeve expansion of the Brownian bridge process [4]. This method has no the mentioned drawback (also see [2], [3]) but leads to iterated application of the operation of limit transition. So, the mentioned method may not converge in the mean-square sense to appropriate iterated stochastic integrals for some methods of series summation (see discussion in Sect. 13 for details).

The difficulties noted above can be overcome with a different and more effective method proposed and developed by the author in [46] (also see [12]-[43], [47]-[63]). The idea of this method is as follows: the iterated Ito stochastic integral $J[\psi^{(k)}]_{T,t}$ of the form (2) with multiplicity k is represented as a multiple stochastic integral from the nonrandom discontinuous function $K(t_1,\ldots,t_k)$ of k variables (see (87) below) defined on the hypercube $[t,T]^k$, where here and further $[t,T]$ is an interval of integration of the iterated Ito stochastic integral. Then, the function $K(t_1,\ldots,t_k)$ is expanded in the hypercube $[t,T]^k$ into the generalized multiple Fourier series converging in the mean-square sense in the space $L_2([t,T]^k)$. After a number of nontrivial transformations we come (see Theorems 6, 7 below) to the mean-square convergening expansion of the iterated Ito stochastic integral into the multiple series of products of standard Gaussian random variables. The coefficients of this series are the coefficients of generalized multiple Fourier series for the function $K(t_1,\ldots,t_k)$, which can be calculated using the explicit formula regardless of multiplicity k of the iterated Ito stochastic integral. Hereinafter, this method is referred to as the method of generalized multiple Fourier series.

Suppose that $\{\phi_j(x)\}_{j=0}^{\infty}$ is a complete orthonormal system of functions in the space $L_2([t,T])$. Define the following function on the hypercube $[t,T]^k$

$$K(t_1,\ldots,t_k)=\begin{cases}\psi_1(t_1)\ldots\psi_k(t_k), & t_1<\ldots<t_k\\ \\ 0, & \text{otherwise}\end{cases}\quad=\quad\prod_{l=1}^{k}\psi_l(t_l)\ \prod_{l=1}^{k-1}\mathbf{1}_{\{t_l<t_{l+1}\}},\tag{87}$$

where $t_1,\ldots,t_k\in[t,T]$ $(k\geq 2)$, $K(t_1)\equiv\psi_1(t_1)$ for $t_1\in[t,T]$, $\psi_1(\tau),\ldots,\psi_k(\tau):[t,T]\to\mathbb{R}$ are continuous nonrandom functions (the case $\psi_1(\tau),\ldots,\psi_k(\tau)\in L_2([t,T])$ will be considered below in this section). Here $\mathbf{1}_A$ denotes the indicator of the set A.

The function $K(t_1,\ldots,t_k)$ of the form (87) is piecewise continuous in the hypercube $[t,T]^k$. At this situation it is well known that the generalized multiple Fourier series of $K(t_1,\ldots,t_k)\in L_2([t,T]^k)$ is converging to $K(t_1,\ldots,t_k)$ in the hypercube $[t,T]^k$ in the mean-square sense, i.e.

$$\lim_{p_1,\ldots,p_k\to\infty}\left\|K(t_1,\ldots,t_k)-\sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k}C_{j_k\ldots j_1}\prod_{l=1}^{k}\phi_{j_l}(t_l)\right\|_{L_2([t,T]^k)}=0,\tag{88}$$

where

$$C_{j_k\ldots j_1}=\int\limits_{[t,T]^k}K(t_1,\ldots,t_k)\prod_{l=1}^{k}\phi_{j_l}(t_l)dt_1\ldots dt_k\tag{89}$$

is the Fourier coefficient, and

$$\|f\|_{L_2([t,T]^k)}=\left(\int\limits_{[t,T]^k}f^2(t_1,\ldots,t_k)dt_1\ldots dt_k\right)^{1/2}.$$

Consider the partition $\{\tau_j\}_{j=0}^{N}$ of $[t,T]$ such that

$$t=\tau_0<\ldots<\tau_N=T,\quad \Delta_N=\max_{0\leq j\leq N-1}\Delta\tau_j\to 0\ \text{ if }\ N\to\infty,\quad \Delta\tau_j=\tau_{j+1}-\tau_j.\tag{90}$$

Theorem 6 [46] (2006) (also see [12]-[43], [47]-[62]). *Suppose that every $\psi_l(\tau)$ $(l=1,\ldots,k)$ is a continuous nonrandom function on $[t,T]$ and $\{\phi_j(x)\}_{j=0}^{\infty}$ is a complete orthonormal system of continuous functions in the space $L_2([t,T])$. Then*

$$J[\psi^{(k)}]_{T,t}\ =\ \underset{p_1,\ldots,p_k\to\infty}{\text{l.i.m.}}\ \sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k}C_{j_k\ldots j_1}\left(\prod_{l=1}^{k}\zeta_{j_l}^{(i_l)}\ -\right.$$

$$\left.-\ \underset{N\to\infty}{\text{l.i.m.}}\sum_{(l_1,\ldots,l_k)\in\mathrm{G}_k}\phi_{j_1}(\tau_{l_1})\Delta\mathbf{w}_{\tau_{l_1}}^{(i_1)}\ldots\phi_{j_k}(\tau_{l_k})\Delta\mathbf{w}_{\tau_{l_k}}^{(i_k)}\right),\tag{91}$$

where

$$\mathrm{G}_k = \mathrm{H}_k \backslash \mathrm{L}_k, \quad \mathrm{H}_k = \left\{(l_1,\ldots,l_k):\ l_1,\ldots,l_k = 0,\ 1,\ldots,N-1\right\},$$

$$\mathrm{L}_k = \left\{(l_1,\ldots,l_k):\ l_1,\ldots,l_k = 0,\ 1,\ldots,N-1;\ l_g \ne l_r\ (g\ne r);\ g,r=1,\ldots,k\right\},$$

l.i.m. *is a limit in the mean-square sense,* $i_1,\ldots,i_k = 0,1,\ldots,m$,

$$\zeta_j^{(i)} = \int\limits_t^T \phi_j(s)d\mathbf{w}_s^{(i)} \tag{92}$$

are independent standard Gaussian random variables for various i *or* j *(if* $i\ne 0$*),* $C_{j_k\ldots j_1}$ *is the Fourier coefficient* (89)*,* $\Delta\mathbf{w}_{\tau_j}^{(i)} = \mathbf{w}_{\tau_{j+1}}^{(i)} - \mathbf{w}_{\tau_j}^{(i)}$ $(i=0,\ 1,\ldots,m)$*,* $\{\tau_j\}_{j=0}^N$ *is a partition of* $[t,T]$*, which satisfies the condition* (90)*.*

In order to evaluate the significance of Theorem 6 for practice we will demonstrate its transformed particular cases for $k=1,\ldots,6$ [46] (2006) (also see [12]-[43], [47]-[62])

$$J[\psi^{(1)}]_{T,t} = \underset{p_1\to\infty}{\text{l.i.m.}} \sum_{j_1=0}^{p_1} C_{j_1}\zeta_{j_1}^{(i_1)}, \tag{93}$$

where $\mathbf{1}_A$ is the indicator of the set A.

It was shown in [12], [48]-[61] that Theorem 6 is valid for convergence in the mean of degree $2n$ ($n\in\mathbb{N}$). The convergence w. p. 1 in Theorem 6 is proved in [58]-[61] for the complete orthonormal systems of Legendre polynomials and trigonometric functions in the space $L_2([t,T])$. Moreover, the complete orthonormal systems of Haar and Rademacher–Walsh functions in $L_2([t,T])$ can also be applied in Theorem 6 [12], [48]-[61]. The generalization of Theorem 6 for complete orthonormal with weigth $r(t_1)\ldots r(t_k)\ge 0$ systems of functions in the space $L_2([t,T]^k)$ can be found in [24], [57]-[61]. Another modification of Theorem 6 is connected with the mean-square approximation of iterated stochastic integrals with respect to the infinite-dimensional Q-Wiener process [31], [32], [43]. The latters play the key role for implemetation of the high-order strong numerical methods for non-commutative semilinear stochastic partial differential equations with multiplicative trace class noise [70]-[73].

For further consideration, let us consider the generalization of formulas (93)–(98) for the case of an arbitrary multiplicity k ($k\in\mathbb{N}$) of the iterated Ito stochastic integral $J[\psi^{(k)}]_{T,t}$ defined by (2). In order to do this, let us introduce some notations. Let us consider the unordered set $\{1,2,\ldots,k\}$ and separate it into two parts: the first part consists of r unordered pairs (sequence order of these pairs is also unimportant) and the second one consists of the remaining $k-2r$ numbers. So, we have

$$
(\{\underbrace{\{g_1,g_2\},\ldots,\{g_{2r-1},g_{2r}\}}_{\text{part 1}}\},\{\underbrace{q_1,\ldots,q_{k-2r}}_{\text{part 2}}\}), \tag{99}
$$

where

$$
\{g_1,g_2,\ldots,g_{2r-1},g_{2r},q_1,\ldots,q_{k-2r}\}=\{1,2,\ldots,k\},
$$

braces mean an unordered set, and parentheses mean an ordered set.

We will say that (99) is a partition and consider the sum with respect to all possible partitions

$$
\sum_{\substack{(\{\{g_1,g_2\},\ldots,\{g_{2r-1},g_{2r}\}\},\{q_1,\ldots,q_{k-2r}\})\\ \{g_1,g_2,\ldots,g_{2r-1},g_{2r},q_1,\ldots,q_{k-2r}\}=\{1,2,\ldots,k\}}} a_{g_1g_2,\ldots,g_{2r-1}g_{2r},q_1\ldots q_{k-2r}}, \tag{100}
$$

where $a_{g_1g_2,\ldots,g_{2r-1}g_{2r},q_1\ldots q_{k-2r}}\in\mathbb{R}^1$.

Below there are several examples of sums in the form (100)

$$
\sum_{\substack{(\{g_1,g_2\})\\ \{g_1,g_2\}=\{1,2\}}} a_{g_1g_2}=a_{12},
$$

$$
\sum_{\substack{(\{\{g_1,g_2\},\{g_3,g_4\}\})\\ \{g_1,g_2,g_3,g_4\}=\{1,2,3,4\}}} a_{g_1g_2,g_3g_4}=a_{12,34}+a_{13,24}+a_{23,14},
$$

$$
\sum_{\substack{(\{g_1,g_2\},\{q_1,q_2\})\\ \{g_1,g_2,q_1,q_2\}=\{1,2,3,4\}}} a_{g_1g_2,q_1q_2}=
$$

$$
=a_{12,34}+a_{13,24}+a_{14,23}+a_{23,14}+a_{24,13}+a_{34,12},
$$

$$
\sum_{\substack{(\{g_1,g_2\},\{q_1,q_2,q_3\})\\ \{g_1,g_2,q_1,q_2,q_3\}=\{1,2,3,4,5\}}} a_{g_1g_2,q_1q_2q_3}=
$$

$$
=a_{12,345}+a_{13,245}+a_{14,235}+a_{15,234}+a_{23,145}+a_{24,135}+
$$
$$
+a_{25,134}+a_{34,125}+a_{35,124}+a_{45,123},
$$

$$
\sum_{\substack{(\{\{g_1,g_2\},\{g_3,g_4\}\},\{q_1\})\\ \{g_1,g_2,g_3,g_4,q_1\}=\{1,2,3,4,5\}}} a_{g_1g_2,g_3g_4,q_1} =
$$

$$
= a_{12,34,5} + a_{13,24,5} + a_{14,23,5} + a_{12,35,4} + a_{13,25,4} + a_{15,23,4}+
$$
$$
+a_{12,54,3} + a_{15,24,3} + a_{14,25,3} + a_{15,34,2} + a_{13,54,2} + a_{14,53,2}+
$$
$$
+a_{52,34,1} + a_{53,24,1} + a_{54,23,1}.
$$

Now we can write (91) as

$$
J[\psi^{(k)}]_{T,t} = \underset{p_1,\ldots,p_k\to\infty}{\text{l.i.m.}} \sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k} C_{j_k\ldots j_1}\Biggl(\prod_{l=1}^{k}\zeta_{j_l}^{(i_l)} + \sum_{r=1}^{[k/2]}(-1)^r\times
$$

$$
\times \sum_{\substack{(\{\{g_1,g_2\},\ldots,\{g_{2r-1},g_{2r}\}\},\{q_1,\ldots,q_{k-2r}\})\\ \{g_1,g_2,\ldots,g_{2r-1},g_{2r},q_1,\ldots,q_{k-2r}\}=\{1,2,\ldots,k\}}} \prod_{s=1}^{r} \mathbf{1}_{\{i_{g_{2s-1}}=\ i_{g_{2s}}\neq 0\}}\mathbf{1}_{\{j_{g_{2s-1}}=\ j_{g_{2s}}\}} \prod_{l=1}^{k-2r}\zeta_{j_{q_l}}^{(i_{q_l})}\Biggr), \tag{101}
$$

where $\prod\limits_{\emptyset} \stackrel{\sf def}{=} 1$, $\sum\limits_{\emptyset} \stackrel{\sf def}{=} 0$, $[x]$ is an integer part of a real number x; another notations are the same as in Theorem 6.

In particular, from (101) for $k=5$ we obtain

$$
J[\psi^{(5)}]_{T,t} = \underset{p_1,\ldots,p_5\to\infty}{\text{l.i.m.}} \sum_{j_1=0}^{p_1}\ldots\sum_{j_5=0}^{p_5} C_{j_5\ldots j_1}\Biggl(\prod_{l=1}^{5}\zeta_{j_l}^{(i_l)} -
$$
$$
- \sum_{\substack{(\{g_1,g_2\},\{q_1,q_2,q_3\})\\ \{g_1,g_2,q_1,q_2,q_3\}=\{1,2,3,4,5\}}} \mathbf{1}_{\{i_{g_1}=\ i_{g_2}\neq 0\}}\mathbf{1}_{\{j_{g_1}=\ j_{g_2}\}}\prod_{l=1}^{3}\zeta_{j_{q_l}}^{(i_{q_l})} +
$$
$$
+ \sum_{\substack{(\{\{g_1,g_2\},\{g_3,g_4\}\},\{q_1\})\\ \{g_1,g_2,g_3,g_4,q_1\}=\{1,2,3,4,5\}}} \mathbf{1}_{\{i_{g_1}=\ i_{g_2}\neq 0\}}\mathbf{1}_{\{j_{g_1}=\ j_{g_2}\}}\mathbf{1}_{\{i_{g_3}=\ i_{g_4}\neq 0\}}\mathbf{1}_{\{j_{g_3}=\ j_{g_4}\}}\zeta_{j_{q_1}}^{(i_{q_1})}\Biggr).
$$

The last equality obviously agrees with (97).

Let us consider the generalization of Theorem 6 for the case of an arbitrary complete orthonormal systems of functions in the space $L_2([t,T])$ and $\psi_1(\tau),\ldots,\psi_k(\tau)\in L_2([t,T])$.

Theorem 7 [12] (Sect. 15), [58] (Sect. 1.11), [62]. *Suppose that* $\psi_1(\tau),\ldots,\psi_k(\tau)\in L_2([t,T])$ *and* $\{\phi_j(x)\}_{j=0}^{\infty}$ *is an arbitrary complete orthonormal system of functions in the space* $L_2([t,T])$. *Then the following expansion*

$$
J[\psi^{(k)}]_{T,t} = \underset{p_1,\ldots,p_k\to\infty}{\text{l.i.m.}} \sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k} C_{j_k\ldots j_1}\Biggl(\prod_{l=1}^{k}\zeta_{j_l}^{(i_l)} + \sum_{r=1}^{[k/2]}(-1)^r\times
$$

$$
\times \sum_{\substack{(\{\{g_1,g_2\},\ldots,\{g_{2r-1},g_{2r}\}\},\{q_1,\ldots,q_{k-2r}\})\\ \{g_1,g_2,\ldots,g_{2r-1},g_{2r},q_1,\ldots,q_{k-2r}\}=\{1,2,\ldots,k\}}} \prod_{s=1}^{r} \mathbf{1}_{\{i_{g_{2s-1}}=\ i_{g_{2s}}\neq 0\}}\mathbf{1}_{\{j_{g_{2s-1}}=\ j_{g_{2s}}\}} \prod_{l=1}^{k-2r}\zeta_{j_{q_l}}^{(i_{q_l})}\Biggr) \tag{102}
$$

converging in the mean-square sense is valid, where $\prod\limits_{\emptyset} \stackrel{\sf def}{=} 1,\ \sum\limits_{\emptyset} \stackrel{\sf def}{=} 0,$ $[x]$ *is an integer part of a real number* x; *another notations are the same as in Theorem* 6.

It should be noted that an analogue of Theorem 7 was considered in [74]. Note that we use another notations in comparison with [74]. Moreover, the proof of an analogue of Theorem 7 from [74] is different from the proof given in [12] (Sect. 15), [58] (Sect. 1.11), [62].

In a number of works of the author [16]-[22], [30], [34], [40], [42], [51]-[61], [63] Theorems 6, 7 have been adapted for the iterated Stratonovich stochastic integrals (3). Let us collect some of these results (old results) in the following statement.

Theorem 8 [16]-[22], [30], [34], [40], [42], [51]-[61]. *Suppose that* $\{\phi_j(x)\}_{j=0}^{\infty}$ *is a complete orthonormal system of Legendre polynomials or trigonometric functions in the space* $L_2([t,T])$. *At the same time* $\psi_2(\tau)$ *is a continuously differentiable function on* $[t,T]$ *and* $\psi_1(\tau),\psi_3(\tau)$ *are two times continuously differentiable functions on* $[t,T]$. *Then*

$$J^*[\psi^{(2)}]_{T,t} = \underset{p_1,p_2\to\infty}{\text{l.i.m.}} \sum_{j_1=0}^{p_1}\sum_{j_2=0}^{p_2} C_{j_2j_1}\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)} \quad (i_1,i_2=1,\ldots,m), \tag{103}$$

$$J^*[\psi^{(3)}]_{T,t} = \underset{p_1,p_2,p_3\to\infty}{\text{l.i.m.}} \sum_{j_1=0}^{p_1}\sum_{j_2=0}^{p_2}\sum_{j_3=0}^{p_3} C_{j_3j_2j_1}\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}\zeta_{j_3}^{(i_3)} \quad (i_1,i_2,i_3=0,1,\ldots,m), \tag{104}$$

$$J^*[\psi^{(3)}]_{T,t} = \underset{p\to\infty}{\text{l.i.m.}} \sum_{j_1,j_2,j_3=0}^{p} C_{j_3j_2j_1}\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}\zeta_{j_3}^{(i_3)} \quad (i_1,i_2,i_3=1,\ldots,m), \tag{105}$$

$$J^*[\psi^{(4)}]_{T,t} = \underset{p\to\infty}{\text{l.i.m.}} \sum_{j_1,\ldots,j_4=0}^{p} C_{j_4j_3j_2j_1}\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}\zeta_{j_3}^{(i_3)}\zeta_{j_4}^{(i_4)} \quad (i_1,\ldots,i_4=0,1,\ldots,m), \tag{106}$$

where $J^*[\psi^{(k)}]_{T,t}$ *is defined by* (3) *and* $\psi_l(\tau)\equiv 1$ $(l=1,\ldots,4)$ *in* (104), (106); *another notations are the same as in Theorem* 6.

Note that the formula (103) is generalized to the case of continuous functions $\psi_1(\tau),\psi_2(\tau)$ in [58] (Sect. 2.1.4).

Recently, a new approach to the expansion and mean-square approximation of iterated Stratonovich stochastic integrals has been obtained [16] (Sect. 13–19), [21] (Sect. 5–11), [22] (Sect. 7–13), [58] (Sect. 2.10–2.16), [61] (Sect. 2.10–2.16), [63], [64]. Let us introduce some notations and formulate the main theorem of the approach noted above.

Consider the Fourier coefficient

$$C_{j_k\ldots j_1} = \int\limits_t^T \psi_k(t_k)\phi_{j_k}(t_k)\ldots\int\limits_t^{t_2}\psi_1(t_1)\phi_{j_1}(t_1)dt_1\ldots dt_k$$

corresponding to the function (87), where $\{\phi_j(x)\}_{j=0}^{\infty}$ is a complete orthonormal system of functions in the space $L_2([t,T])$. At that we suppose $\phi_0(x)=1/\sqrt{T-t}$.

Denote

$$C_{j_k\ldots j_{l+1}j_lj_lj_{l-2}\ldots j_1}\Bigg|_{(j_lj_l)\frown(\cdot)} \stackrel{\sf def}{=}$$

$$\stackrel{\mathsf{def}}{=} \int\limits_t^T \psi_k(t_k)\phi_{j_k}(t_k)\ldots \int\limits_t^{t_{l+2}} \psi_{l+1}(t_{l+1})\phi_{j_{l+1}}(t_{l+1}) \int\limits_t^{t_{l+1}} \psi_l(t_l)\psi_{l-1}(t_l)\times$$

$$\times \int\limits_t^{t_l} \psi_{l-2}(t_{l-2})\phi_{j_{l-2}}(t_{l-2})\ldots \int\limits_t^{t_2} \psi_1(t_1)\phi_{j_1}(t_1)dt_1\ldots dt_{l-2}dt_l t_{l+1}\ldots dt_k = \tag{107}$$

$$= \sqrt{T-t}\int\limits_t^T \psi_k(t_k)\phi_{j_k}(t_k)\ldots \int\limits_t^{t_{l+2}} \psi_{l+1}(t_{l+1})\phi_{j_{l+1}}(t_{l+1}) \int\limits_t^{t_{l+1}} \psi_l(t_l)\psi_{l-1}(t_l)\phi_0(t_l)\times$$

$$\times \int\limits_t^{t_l} \psi_{l-2}(t_{l-2})\phi_{j_{l-2}}(t_{l-2})\ldots \int\limits_t^{t_2} \psi_1(t_1)\phi_{j_1}(t_1)dt_1\ldots dt_{l-2}dt_l t_{l+1}\ldots dt_k =$$

$$= \sqrt{T-t}\hat{C}_{j_k\ldots j_{l+1}0j_{l-2}\ldots j_1},$$

i.e. $\sqrt{T-t}\hat{C}_{j_k\ldots j_{l+1}0j_{l-2}\ldots j_1}$ is again the Fourier coefficient of type $C_{j_k\ldots j_1}$ but with a new shorter multi-index $j_k\ldots j_{l+1}0j_{l-2}\ldots j_1$ and new weight functions $\psi_1(\tau),\ \ldots,\ \psi_{l-2}(\tau),\ \sqrt{T-t}\psi_{l-1}(\tau)\psi_l(\tau)$, $\psi_{l+1}(\tau),\ \ldots,\ \psi_k(\tau)$ (also we suppose that $\{l,l-1\}$ is one of the pairs $\{g_1,g_2\},\ldots,\{g_{2r-1},g_{2r}\}$ (see the relation (99)).

Denote

$$\bar{C}^{(p)}_{j_k\ldots j_q\ldots j_1}\Biggr|_{q\ne g_1,g_2,\ldots,g_{2r-1},g_{2r}} \stackrel{\mathsf{def}}{=}$$

$$\stackrel{\mathsf{def}}{=} \sum_{j_{g_{2r-1}}=p+1}^{\infty}\ \sum_{j_{g_{2r-3}}=p+1}^{\infty}\ldots \sum_{j_{g_3}=p+1}^{\infty}\ \sum_{j_{g_1}=p+1}^{\infty} C_{j_k\ldots j_1}\Biggr|_{j_{g_1}=j_{g_2},\ldots,j_{g_{2r-1}}=j_{g_{2r}}}.$$

Introduce the following notation

$$S_l\left\{\bar{C}^{(p)}_{j_k\ldots j_q\ldots j_1}\Biggr|_{q\ne g_1,g_2,\ldots,g_{2r-1},g_{2r}}\right\} \stackrel{\mathsf{def}}{=} \frac{1}{2}\mathbf{1}_{\{g_{2l}=g_{2l-1}+1\}} \sum_{j_{g_{2r-1}}=p+1}^{\infty}\ \sum_{j_{g_{2r-3}}=p+1}^{\infty}\ldots$$

$$\ldots \sum_{j_{g_{2l+1}}=p+1}^{\infty}\ \sum_{j_{g_{2l-3}}=p+1}^{\infty}\ldots \sum_{j_{g_3}=p+1}^{\infty}\ \sum_{j_{g_1}=p+1}^{\infty} C_{j_k\ldots j_1}\Biggr|_{(j_{g_{2l}}j_{g_{2l-1}})\frown(\cdot),j_{g_1}=j_{g_2},\ldots,j_{g_{2r-1}}=j_{g_{2r}}}.$$

Note that the operation S_l $(l=1,2,\ldots,r)$ acts on the value

$$\bar{C}^{(p)}_{j_k\ldots j_q\ldots j_1}\Biggr|_{q\ne g_1,g_2,\ldots,g_{2r-1},g_{2r}} \tag{108}$$

as follows: S_l multiplies (108) by $\mathbf{1}_{\{g_{2l}=g_{2l-1}+1\}}/2$, removes the summation

$$\sum_{j_{g_{2l-1}}=p+1}^{\infty},$$

and replaces

$$C_{j_k\ldots j_1}\Biggl|_{j_{g_1}=j_{g_2},\ldots,j_{g_{2r-1}}=j_{g_{2r}}}$$

with

$$C_{j_k\ldots j_1}\Biggl|_{(j_{g_{2l}}j_{g_{2l-1}})\curvearrowright(\cdot),j_{g_1}=j_{g_2},\ldots,j_{g_{2r-1}}=j_{g_{2r}}}. \tag{109}$$

Note that we write

$$C_{j_k\ldots j_1}\Biggl|_{(j_{g_1}j_{g_2})\curvearrowright(\cdot),j_{g_1}=j_{g_2}}=C_{j_k\ldots j_1}\Biggl|_{(j_{g_1}j_{g_1})\curvearrowright(\cdot),j_{g_1}=j_{g_2}},$$

$$C_{j_k\ldots j_1}\Biggl|_{(j_{g_1}j_{g_2})\curvearrowright(\cdot),(j_{g_3}j_{g_4})\curvearrowright(\cdot),j_{g_1}=j_{g_2},j_{g_3}=j_{g_4}}=C_{j_k\ldots j_1}\Biggl|_{(j_{g_1}j_{g_1})\curvearrowright(\cdot)(j_{g_3}j_{g_3})\curvearrowright(\cdot),j_{g_1}=j_{g_2},j_{g_3}=j_{g_4}},\quad\ldots$$

Since (109) is again the Fourier coefficient, then the action of superposition S_lS_m on (109) is obvious. For example, for $r=3$

$$S_3S_2S_1\left\{\bar{C}^{(p)}_{j_k\ldots j_q\ldots j_1}\Biggl|_{q\ne g_1,g_2,\ldots,g_5,g_6}\right\}=$$

$$=\frac{1}{2^3}\prod_{s=1}^{3}\mathbf{1}_{\{g_{2s}=g_{2s-1}+1\}}C_{j_k\ldots j_1}\Biggl|_{(j_{g_2}j_{g_1})\curvearrowright(\cdot)(j_{g_4}j_{g_3})\curvearrowright(\cdot)(j_{g_6}j_{g_5})\curvearrowright(\cdot),j_{g_1}=j_{g_2},j_{g_3}=j_{g_4},j_{g_5}=j_{g_6}},$$

$$S_3S_1\left\{\bar{C}^{(p)}_{j_k\ldots j_q\ldots j_1}\Biggl|_{q\ne g_1,g_2,\ldots,g_5,g_6}\right\}=$$

$$=\frac{1}{2^2}\mathbf{1}_{\{g_6=g_5+1\}}\mathbf{1}_{\{g_2=g_1+1\}}\sum_{j_{g_3}=p+1}^{\infty}C_{j_k\ldots j_1}\Biggl|_{(j_{g_2}j_{g_1})\curvearrowright(\cdot)(j_{g_6}j_{g_5})\curvearrowright(\cdot),j_{g_1}=j_{g_2},j_{g_3}=j_{g_4},j_{g_5}=j_{g_6}},$$

$$S_2\left\{\bar{C}^{(p)}_{j_k\ldots j_q\ldots j_1}\Biggl|_{q\ne g_1,g_2,\ldots,g_5,g_6}\right\}=$$

$$=\frac{1}{2}\mathbf{1}_{\{g_4=g_3+1\}}\sum_{j_{g_1}=p+1}^{\infty}\sum_{j_{g_5}=p+1}^{\infty}C_{j_k\ldots j_1}\Biggl|_{(j_{g_4}j_{g_3})\curvearrowright(\cdot),j_{g_1}=j_{g_2},j_{g_3}=j_{g_4},j_{g_5}=j_{g_6}}.$$

Theorem 9 [16] (Sect. 13), [21] (Sect. 5), [22] (Sect. 7), [58] (Sect. 2.10), [63] (Sect. 4). *Assume that the continuously differentiable functions* $\psi_1(\tau),\ldots,\psi_k(\tau)$ *and the complete orthonormal system*

$\{\phi_j(x)\}_{j=0}^{\infty}$ *of continuous functions* ($\phi_0(x) = 1/\sqrt{T-t}$) *in the space* $L_2([t,T])$ *are such that the following conditions are satisfied*:

1. *The equality*

$$\frac{1}{2}\int\limits_t^s \Phi_1(t_1)\Phi_2(t_1)dt_1 = \sum_{j_1=0}^{\infty}\int\limits_t^s \Phi_2(t_2)\phi_{j_1}(t_2)\int\limits_t^{t_2}\Phi_1(t_1)\phi_{j_1}(t_1)dt_1dt_2 \tag{110}$$

holds for all $s \in (t,T]$, *where the nonrandom functions* $\Phi_1(\tau)$, $\Phi_2(\tau)$ *are continuously differentiable on* $[t,T]$ *and the series on the right-hand side of* (110) *converges absolutely.*

2. *The estimates*

$$\left|\int\limits_t^s \phi_j(\tau)\Phi_1(\tau)d\tau\right| \le \frac{\Psi_1(s)}{j^{1/2+\alpha}}, \qquad \left|\int\limits_s^T \phi_j(\tau)\Phi_2(\tau)d\tau\right| \le \frac{\Psi_1(s)}{j^{1/2+\alpha}},$$

$$\left|\sum_{j=p+1}^{\infty}\int\limits_t^s \Phi_2(\tau)\phi_j(\tau)\int\limits_t^{\tau}\Phi_1(\theta)\phi_j(\theta)d\theta d\tau\right| \le \frac{\Psi_2(s)}{p^{\beta}}$$

hold for all $s \in (t,T)$ *and for some* $\alpha,\beta > 0$, *where* $\Phi_1(\tau)$, $\Phi_2(\tau)$ *are continuously differentiable nonrandom functions on* $[t,T]$, $j,p \in \mathbb{N}$, *and*

$$\int\limits_t^T \Psi_1^2(\tau)d\tau < \infty, \qquad \int\limits_t^T |\Psi_2(\tau)|\, d\tau < \infty.$$

3. *The condition*

$$\lim_{p\to\infty}\sum_{\substack{j_1,\ldots,j_q,\ldots,j_k=0\\ q\ne g_1,g_2,\ldots,g_{2r-1},g_{2r}}}^{p}\left(S_{l_1}S_{l_2}\ldots S_{l_d}\left\{\bar{C}^{(p)}_{j_k\ldots j_q\ldots j_1}\Bigl|_{q\ne g_1,g_2,\ldots,g_{2r-1},g_{2r}}\right\}\right)^2 = 0$$

holds for all possible $g_1,g_2,\ldots,g_{2r-1},g_{2r}$ (*see* (99)) *and* $l_1,l_2,\ldots,l_d$ *such that* $l_1,l_2,\ldots,l_d \in \{1,2,\ldots,r\}$, $l_1 > l_2 > \ldots > l_d$, $d = 0,1,2,\ldots,r-1$, *where* $r = 1,2,\ldots,[k/2]$ *and*

$$S_{l_1}S_{l_2}\ldots S_{l_d}\left\{\bar{C}^{(p)}_{j_k\ldots j_q\ldots j_1}\Bigl|_{q\ne g_1,g_2,\ldots,g_{2r-1},g_{2r}}\right\} \stackrel{\sf def}{=} \bar{C}^{(p)}_{j_k\ldots j_q\ldots j_1}\Bigl|_{q\ne g_1,g_2,\ldots,g_{2r-1},g_{2r}}$$

for $d = 0$.

Then, for the iterated Stratonovich stochastic integral of arbitrary multiplicity k

$$J^*[\psi^{(k)}]_{T,t} = \int\limits_t^{*T}\psi_k(t_k)\ldots\int\limits_t^{*t_2}\psi_1(t_1)d\mathbf{w}_{t_1}^{(i_1)}\ldots d\mathbf{w}_{t_k}^{(i_k)} \tag{111}$$

the following expansion

$$J^*[\psi^{(k)}]_{T,t} = \underset{p\to\infty}{\text{l.i.m.}}\sum_{j_1,\ldots,j_k=0}^{p} C_{j_k\ldots j_1}\prod_{l=1}^{k}\zeta_{j_l}^{(i_l)} \tag{112}$$

that converges in the mean-square sense is valid, where

$$C_{j_k\ldots j_1}=\int\limits_t^T\psi_k(t_k)\phi_{j_k}(t_k)\ldots\int\limits_t^{t_2}\psi_1(t_1)\phi_{j_1}(t_1)dt_1\ldots dt_k$$

is the Fourier coefficient, l.i.m. *is a limit in the mean-square sense,* $i_1,\ldots,i_k=0,1,\ldots,m,$

$$\zeta_j^{(i)}=\int\limits_t^T\phi_j(\tau)d\mathbf{w}_\tau^{(i)}$$

are independent standard Gaussian random variables for various i *or* j *(in the case when* $i\neq 0$*),* $\mathbf{w}_\tau^{(i)}=\mathbf{f}_\tau^{(i)}$ *for* $i=1,\ldots,m$ *and* $\mathbf{w}_\tau^{(0)}=\tau.$

Note that (110) is fulfilled for the case of an arbitrary complete orthonormal system of functions in $L_2([t,T])$ and $\Phi_1(\tau),\Phi_2(\tau)\in L_2([t,T])$ (see [58], Sect. 2.1.4 or [77]).

Consider the following four theorems, which were proved in [16], [21], [22], [58], [61], [63], [64].

Theorem 10 [16], [21], [22], [58], [63]. *Suppose that* $\{\phi_j(x)\}_{j=0}^{\infty}$ *is a complete orthonormal system of Legendre polynomials or trigonometric functions in the space* $L_2([t,T])$*. Furthermore, let* $\psi_1(\tau),\psi_2(\tau),$ $\psi_3(\tau)$ *are continuously differentiable nonrandom functions on* $[t,T]$*. Then, for the iterated Stratonovich stochastic integral of third multiplicity*

$$J^*[\psi^{(3)}]_{T,t}=\int\limits_t^{*T}\psi_3(t_3)\int\limits_t^{*t_3}\psi_2(t_2)\int\limits_t^{*t_2}\psi_1(t_1)d\mathbf{w}_{t_1}^{(i_1)}d\mathbf{w}_{t_2}^{(i_2)}d\mathbf{w}_{t_3}^{(i_3)}\quad(i_1,i_2,i_3=0,1,\ldots,m)$$

the following relations

$$J^*[\psi^{(3)}]_{T,t}=\underset{p\to\infty}{\text{l.i.m.}}\sum_{j_1,j_2,j_3=0}^{p}C_{j_3j_2j_1}\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}\zeta_{j_3}^{(i_3)},\qquad(113)$$

$$\mathsf{M}\left\{\left(J^*[\psi^{(3)}]_{T,t}-\sum_{j_1,j_2,j_3=0}^{p}C_{j_3j_2j_1}\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}\zeta_{j_3}^{(i_3)}\right)^2\right\}\le\frac{C}{p}\qquad(114)$$

are fulfilled, where $i_1,i_2,i_3=0,1,\ldots,m$ *in* (113) *and* $i_1,i_2,i_3=1,\ldots,m$ *in* (114)*, constant* C *is independent of* p*,*

another notations are the same as in Theorem 10, 11.

Theorem 13 [16], [21], [22], [58], [64]. *Suppose that* $\{\phi_j(x)\}_{j=0}^{\infty}$ *is a complete orthonormal system of Legendre polynomials or trigonometric functions in the space* $L_2([t,T])$. *Then, for the iterated Stratonovich stochastic integral of sixth multiplicity*

$$J_{T,t}^{*(i_1\ldots i_6)}=\int\limits_t^{*T}\ldots\int\limits_t^{*t_2}d\mathbf{w}_{t_1}^{(i_1)}\ldots d\mathbf{w}_{t_6}^{(i_6)} \tag{121}$$

the following expansion

$$J_{T,t}^{*(i_1\ldots i_6)}=\underset{p\to\infty}{\text{l.i.m.}}\sum_{j_1,\ldots,j_6=0}^{p}C_{j_6\ldots j_1}\zeta_{j_1}^{(i_1)}\ldots\zeta_{j_6}^{(i_6)}$$

that converges in the mean-square sense is valid, where $i_1,\ldots,i_6=0,1,\ldots,m$,

$$C_{j_6\ldots j_1}=\int\limits_t^T\phi_{j_6}(t_6)\ldots\int\limits_t^{t_2}\phi_{j_1}(t_1)dt_1\ldots dt_6;$$

another notations are the same as in Theorems 10–12.

On the base of Theorems 8–13 in [22], [55]-[61] the folloing hypothesis was formulated.

Hypothesis 1 [22], [55]-[61]. *Assume that* $\{\phi_j(x)\}_{j=0}^{\infty}$ *is a complete orthonormal system of Legendre polynomials or trigonometric functions in the space* $L_2([t,T])$. *Then, for the iterated Stratonovich stochastic integral of* k*th multiplicity*

$$J^*[\psi^{(k)}]_{T,t}=\int\limits_t^{*T}\psi_k(t_k)\ldots\int\limits_t^{*t_2}\psi_1(t_1)d\mathbf{w}_{t_1}^{(i_1)}\ldots d\mathbf{w}_{t_k}^{(i_k)}\quad (i_1,\ldots,i_k=0,1,\ldots,m) \tag{122}$$

the following converging in the mean-square sense expansion

$$J^*[\psi^{(k)}]_{T,t}=\underset{p\to\infty}{\text{l.i.m.}}\sum_{j_1,\ldots j_k=0}^{p}C_{j_k\ldots j_1}\zeta_{j_1}^{(i_1)}\ldots\zeta_{j_k}^{(i_k)} \tag{123}$$

holds, where the Fourier coefficient $C_{j_k\ldots j_1}$ *has the form*

$$C_{j_k\ldots j_1}=\int\limits_t^T\psi_k(t_k)\phi_{j_k}(t_k)\ldots\int\limits_t^{t_2}\psi_1(t_1)\phi_{j_1}(t_1)dt_1\ldots dt_k,$$

l.i.m. *is a limit in the mean-square sense,*

$$\zeta_j^{(i)}=\int\limits_t^T \phi_j(\tau)d\mathbf{w}_\tau^{(i)}$$

are independent standard Gaussian random variables for various i *or* j *(if* $i\ne 0$*),* $\mathbf{w}_\tau^{(i)}=\mathbf{f}_\tau^{(i)}$ *are independent standard Wiener processes* $(i=1,\ldots,m)$ *and* $\mathbf{w}_\tau^{(0)}=\tau$.

The hypothesis 1 allows to approximate the iterated Stratonovich stochastic integral $J^*[\psi^{(k)}]_{T,t}$ by the sum

$$J^*[\psi^{(k)}]_{T,t}^p=\sum_{j_1,\ldots j_k=0}^{p} C_{j_k\ldots j_1}\zeta_{j_1}^{(i_1)}\ldots\zeta_{j_k}^{(i_k)}, \tag{124}$$

where

$$\lim_{p\to\infty}\mathsf{M}\left\{\left(J^*[\psi^{(k)}]_{T,t}-J^*[\psi^{(k)}]_{T,t}^p\right)^2\right\}=0.$$

The following theorem shows how to calculate exactly the mean-square approximation error for iterated Ito stochastic integrals in Theorems 6, 7.

Theorem 14 [14] (Sect. 6). *Suppose that* $\psi_1(\tau),\ldots,\psi_k(\tau)\in L_2([t,T])$ *and* $\{\phi_j(x)\}_{j=0}^\infty$ *is an arbitrary complete orthonormal system of functions in the space* $L_2([t,T])$*. Then*

$$\mathsf{M}\left\{\left(J[\psi^{(k)}]_{T,t}-J[\psi^{(k)}]_{T,t}^p\right)^2\right\}=\int\limits_{[t,T]^k}K^2(t_1,\ldots,t_k)dt_1\ldots dt_k-$$

$$-\sum_{j_1=0}^{p}\ldots\sum_{j_k=0}^{p}C_{j_k\ldots j_1}\mathsf{M}\left\{J[\psi^{(k)}]_{T,t}\sum_{(j_1,\ldots,j_k)}\int\limits_t^T\phi_{j_k}(t_k)\ldots\int\limits_t^{t_2}\phi_{j_1}(t_1)d\mathbf{f}_{t_1}^{(i_1)}\ldots d\mathbf{f}_{t_k}^{(i_k)}\right\}, \tag{125}$$

where $J[\psi^{(k)}]_{T,t}$ *is the iterated Ito stochastic integral* (2),

$$J[\psi^{(k)}]_{T,t}^p=\sum_{j_1=0}^{p}\ldots\sum_{j_k=0}^{p}C_{j_k\ldots j_1}\left(\prod_{l=1}^{k}\zeta_{j_l}^{(i_l)}+\sum_{r=1}^{[k/2]}(-1)^r\times\right.$$

$$\left.\times\sum_{\substack{(\{\{g_1,g_2\},\ldots,\{g_{2r-1},g_{2r}\}\},\{q_1,\ldots,q_{k-2r}\})\\ \{g_1,g_2,\ldots,g_{2r-1},g_{2r},q_1,\ldots,q_{k-2r}\}=\{1,2,\ldots,k\}}}\prod_{s=1}^{r}\mathbf{1}_{\{i_{g_{2s-1}}=\,i_{g_{2s}}\ne 0\}}\mathbf{1}_{\{j_{g_{2s-1}}=\,j_{g_{2s}}\}}\prod_{l=1}^{k-2r}\zeta_{j_{q_l}}^{(i_{q_l})}\right), \tag{126}$$

$i_1,\ldots,i_k=1,\ldots,m$, *the expression*

$$\sum_{(j_1,\ldots,j_k)}$$

means the sum with respect to all possible permutations $(j_1,\ldots,j_k)$*. At the same time if* j_r *swapped with* j_q *in the permutation* $(j_1,\ldots,j_k)$*, then* i_r *swapped with* i_q *in the permutation* $(i_1,\ldots,i_k)$*; another notations are the same as in Theorems* 6, 7.

Denote

$$E_k^p \stackrel{\sf def}{=} {\sf M}\left\{\left(J[\psi^{(k)}]_{T,t}-J[\psi^{(k)}]_{T,t}^p\right)^2\right\}.$$

Note that

$${\sf M}\left\{J[\psi^{(k)}]_{T,t}\int\limits_t^T\phi_{j_k}(t_k)\ldots\int\limits_t^{t_2}\phi_{j_1}(t_1)d{\bf f}_{t_1}^{(i_1)}\ldots d{\bf f}_{t_k}^{(i_k)}\right\}=$$

$$=\int\limits_t^T\psi_k(t_k)\phi_{j_k}(t_k)\ldots\int\limits_t^{t_2}\psi_1(t_1)\phi_{j_1}(t_1)dt_1\ldots dt_k=C_{j_k\ldots j_1}.$$

Then from Theorem 14 for pairwise different $i_1,\ldots,i_k$ and for $i_1=\ldots=i_k$ we obtain

$$E_k^p=I_k-\sum_{j_1,\ldots,j_k=0}^{p}C_{j_k\ldots j_1}^2, \tag{127}$$

$$E_k^p=I_k-\sum_{j_1,\ldots,j_k=0}^{p}C_{j_k\ldots j_1}\left(\sum_{(j_1,\ldots,j_k)}C_{j_k\ldots j_1}\right)$$

correspondingly.

Consider some examples of application of Theorem 14 ($i_1,\ldots,i_5=1,\ldots,m$)

$$E_2^p=I_2-\sum_{j_1,j_2=0}^{p}C_{j_2j_1}^2-\sum_{j_1,j_2=0}^{p}C_{j_2j_1}C_{j_1j_2}\quad(i_1=i_2), \tag{128}$$

$$E_3^p=I_3-\sum_{j_3,j_2,j_1=0}^{p}C_{j_3j_2j_1}^2-\sum_{j_3,j_2,j_1=0}^{p}C_{j_3j_1j_2}C_{j_3j_2j_1}\quad(i_1=i_2\ne i_3), \tag{129}$$

$$E_3^p=I_3-\sum_{j_3,j_2,j_1=0}^{p}C_{j_3j_2j_1}^2-\sum_{j_3,j_2,j_1=0}^{p}C_{j_2j_3j_1}C_{j_3j_2j_1}\quad(i_1\ne i_2=i_3), \tag{130}$$

$$E_3^p=I_3-\sum_{j_3,j_2,j_1=0}^{p}C_{j_3j_2j_1}^2-\sum_{j_3,j_2,j_1=0}^{p}C_{j_3j_2j_1}C_{j_1j_2j_3}\quad(i_1=i_3\ne i_2),$$

$$E_4^p=I_4-\sum_{j_1,\ldots,j_4=0}^{p}C_{j_4\ldots j_1}\left(\sum_{(j_1,j_2)}C_{j_4\ldots j_1}\right)\quad(i_1=i_2\ne i_3,i_4;\ i_3\ne i_4),$$

$$E_4^p=I_4-\sum_{j_1,\ldots,j_4=0}^{p}C_{j_4\ldots j_1}\left(\sum_{(j_1,j_3)}C_{j_4\ldots j_1}\right)\quad(i_1=i_3\ne i_2,i_4;\ i_2\ne i_4),$$

$$E_4^p=I_4-\sum_{j_1,\ldots,j_4=0}^{p}C_{j_4\ldots j_1}\left(\sum_{(j_1,j_4)}C_{j_4\ldots j_1}\right)\quad(i_1=i_4\ne i_2,i_3;\ i_2\ne i_3),$$

$$E_4^p = I_4 - \sum_{j_1,\ldots,j_4=0}^{p} C_{j_4\ldots j_1}\left(\sum_{(j_2,j_3)} C_{j_4\ldots j_1}\right) \quad (i_2 = i_3 \neq i_1, i_4;\ i_1 \neq i_4),$$

$$E_4^p = I_4 - \sum_{j_1,\ldots,j_4=0}^{p} C_{j_4\ldots j_1}\left(\sum_{(j_2,j_4)} C_{j_4\ldots j_1}\right) \quad (i_2 = i_4 \neq i_1, i_3;\ i_1 \neq i_3),$$

$$E_4^p = I_4 - \sum_{j_1,\ldots,j_4=0}^{p} C_{j_4\ldots j_1}\left(\sum_{(j_3,j_4)} C_{j_4\ldots j_1}\right) \quad (i_3 = i_4 \neq i_1, i_2;\ i_1 \neq i_2),$$

$$E_4^p = I_4 - \sum_{j_1,\ldots,j_4=0}^{p} C_{j_4\ldots j_1}\left(\sum_{(j_1,j_3,j_4)} C_{j_4\ldots j_1}\right) \quad (i_1 = i_3 = i_4 \neq i_2),$$

$$E_5^p = I_5 - \sum_{j_1,\ldots,j_5=0}^{p} C_{j_5\ldots j_1}\left(\sum_{(j_2,j_4)}\left(\sum_{(j_3,j_5)} C_{j_5\ldots j_1}\right)\right) \quad (i_1 \neq i_2 = i_4 \neq i_3 = i_5 \neq i_1),$$

$$E_5^p = I_5 - \sum_{j_1,\ldots,j_5=0}^{p} C_{j_5\ldots j_1}\left(\sum_{(j_4,j_5)}\left(\sum_{(j_1,j_2,j_3)} C_{j_5\ldots j_1}\right)\right) \quad (i_1 = i_2 = i_3 \neq i_4 = i_5),$$

$$E_5^p = I_5 - \sum_{j_1,\ldots,j_5=0}^{p} C_{j_5\ldots j_1}\left(\sum_{(j_1,j_3,j_4,j_5)} C_{j_5\ldots j_1}\right) \quad (i_1 = i_3 = i_4 = i_5 \neq i_2).$$

Let $J[\psi^{(k)}]_{T,t}^{p_1,\ldots,p_k}$ be the expression on the right-hand side of (102) before passing to the limit. Denote

$$I_k \stackrel{\text{def}}{=} \int\limits_{[t,T]^k} K^2(t_1,\ldots,t_k)dt_1\ldots dt_k.$$

In [12], [14], [57]-[61] it was shown that

$$\mathsf{M}\left\{\left(J[\psi^{(k)}]_{T,t} - J[\psi^{(k)}]_{T,t}^{p_1,\ldots,p_k}\right)^2\right\} \le k!\left(I_k - \sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k} C_{j_k\ldots j_1}^2\right), \tag{131}$$

where $i_1,\ldots,i_k = 1,\ldots,m$ and $0 < T-t < \infty$ or $i_1,\ldots,i_k = 0,1,\ldots,m$ and $0 < T-t < 1$.

Moreover [12], [48]-[61],

$$\mathsf{M}\left\{\left(J[\psi^{(k)}]_{T,t} - J[\psi^{(k)}]_{T,t}^{p_1,\ldots,p_k}\right)^{2n}\right\} \le C_{n,k}\left(I_k - \sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k} C_{j_k\ldots j_1}^2\right)^n,$$

where $C_{n,k} = (k!)^{2n}(n(2n-1))^{n(k-1)}(2n-1)!!,\ \ n \in \mathbb{N}$.

Below we provide practical material (based on Theorems 6–8, 10–13) concerning expansions and approximations of iterated Ito and Stratonovich stochastic integrals of multiplicities 1 to 6 (the case of Legendre polynomial system). The question about what kind of functions (polynomial or trigonometric) is more convenient for the mean-square approximation of iterated stochastic integrals is also considered.

Let us introduce more convenient (for further) notations for the iterated Ito and Stratonovich stochastic integrals

$$I_{(l_1\ldots l_k)T,t}^{(i_1\ldots i_k)}=\int\limits_t^T(t-t_k)^{l_k}\ldots\int\limits_t^{t_2}(t-t_1)^{l_1}d\mathbf{f}_{t_1}^{(i_1)}\ldots d\mathbf{f}_{t_k}^{(i_k)}, \tag{132}$$

$$I_{(l_1\ldots l_k)T,t}^{*(i_1\ldots i_k)}=\int\limits_t^{*T}(t-t_k)^{l_k}\ldots\int\limits_t^{*t_2}(t-t_1)^{l_1}d\mathbf{f}_{t_1}^{(i_1)}\ldots d\mathbf{f}_{t_k}^{(i_k)}, \tag{133}$$

where $i_1,\ldots,i_k=1,\ldots,m,\ \ l_1,\ldots,l_k=0,1,\ldots$

The complete orthonormal system of Legendre polynomials in the space $L_2([t,T])$ looks as follows

$$\phi_j(x)=\sqrt{\frac{2j+1}{T-t}}P_j\left(\left(x-\frac{T+t}{2}\right)\frac{2}{T-t}\right),\quad j=0,1,2,\ldots, \tag{134}$$

where $P_j(x)$ is the Legendre polynomial.

Using the system of functions (134) and Theorems 6–8, 10–13, we obtain the following expansions of iterated Ito and Stratonovich stochastic integrals (132), (133) [13], [15], [36]-[39], [46]-[63] (also see early publications [44] (2000), [45] (2001), [65] (1997), [67] (1998))

$$I_{(0)T,t}^{(i_1)}=\sqrt{T-t}\zeta_0^{(i_1)},$$

$$I_{(1)T,t}^{(i_1)}=-\frac{(T-t)^{3/2}}{2}\left(\zeta_0^{(i_1)}+\frac{1}{\sqrt{3}}\zeta_1^{(i_1)}\right), \tag{135}$$

$$I_{(2)T,t}^{(i_1)}=\frac{(T-t)^{5/2}}{3}\left(\zeta_0^{(i_1)}+\frac{\sqrt{3}}{2}\zeta_1^{(i_1)}+\frac{1}{2\sqrt{5}}\zeta_2^{(i_1)}\right), \tag{136}$$

$$I_{(00)T,t}^{*(i_1i_2)}=\frac{T-t}{2}\left(\zeta_0^{(i_1)}\zeta_0^{(i_2)}+\sum_{i=1}^{\infty}\frac{1}{\sqrt{4i^2-1}}\left(\zeta_{i-1}^{(i_1)}\zeta_i^{(i_2)}-\zeta_i^{(i_1)}\zeta_{i-1}^{(i_2)}\right)\right), \tag{137}$$

$$I_{(00)T,t}^{(i_1i_2)}=\frac{T-t}{2}\left(\zeta_0^{(i_1)}\zeta_0^{(i_2)}+\sum_{i=1}^{\infty}\frac{1}{\sqrt{4i^2-1}}\left(\zeta_{i-1}^{(i_1)}\zeta_i^{(i_2)}-\zeta_i^{(i_1)}\zeta_{i-1}^{(i_2)}\right)-\mathbf{1}_{\{i_1=i_2\}}\right),$$

$$I_{(01)T,t}^{*(i_1i_2)}=-\frac{T-t}{2}I_{(00)T,t}^{*(i_1i_2)}-\frac{(T-t)^2}{4}\left(\frac{1}{\sqrt{3}}\zeta_0^{(i_1)}\zeta_1^{(i_2)}+\right.$$

$$\left.+\sum_{i=0}^{\infty}\left(\frac{(i+2)\zeta_i^{(i_1)}\zeta_{i+2}^{(i_2)}-(i+1)\zeta_{i+2}^{(i_1)}\zeta_i^{(i_2)}}{\sqrt{(2i+1)(2i+5)}(2i+3)}-\frac{\zeta_i^{(i_1)}\zeta_i^{(i_2)}}{(2i-1)(2i+3)}\right)\right),$$

$$I_{(10)T,t}^{*(i_1 i_2)} = -\frac{T-t}{2} I_{(00)T,t}^{*(i_1 i_2)} - \frac{(T-t)^2}{4} \left(\frac{1}{\sqrt{3}} \zeta_0^{(i_2)} \zeta_1^{(i_1)} + \right.$$

(138)
$$\left. + \sum_{i=0}^{\infty} \left(\frac{(i+1)\zeta_{i+2}^{(i_2)}\zeta_i^{(i_1)} - (i+2)\zeta_i^{(i_2)}\zeta_{i+2}^{(i_1)}}{\sqrt{(2i+1)(2i+5)}(2i+3)} + \frac{\zeta_i^{(i_1)}\zeta_i^{(i_2)}}{(2i-1)(2i+3)} \right) \right),$$

or

$$I_{(01)T,t}^{*(i_1 i_2)} = \underset{p\to\infty}{\text{l.i.m.}} \sum_{j_1,j_2=0}^{p} C_{j_2 j_1}^{01} \zeta_{j_1}^{(i_1)} \zeta_{j_2}^{(i_2)},$$

$$I_{(10)T,t}^{*(i_1 i_2)} = \underset{p\to\infty}{\text{l.i.m.}} \sum_{j_1,j_2=0}^{p} C_{j_2 j_1}^{10} \zeta_{j_1}^{(i_1)} \zeta_{j_2}^{(i_2)},$$

where

$$C_{j_2 j_1}^{01} = \frac{\sqrt{(2j_1+1)(2j_2+1)}}{8} (T-t)^2 \bar{C}_{j_2 j_1}^{01},$$

$$C_{j_2 j_1}^{10} = \frac{\sqrt{(2j_1+1)(2j_2+1)}}{8} (T-t)^2 \bar{C}_{j_2 j_1}^{10},$$

$$\bar{C}_{j_2 j_1}^{01} = -\int_{-1}^{1} (1+y) P_{j_2}(y) \int_{-1}^{y} P_{j_1}(x) dx dy,$$

$$\bar{C}_{j_2 j_1}^{10} = -\int_{-1}^{1} P_{j_2}(y) \int_{-1}^{y} (1+x) P_{j_1}(x) dx dy;$$

$$I_{(10)T,t}^{(i_1 i_2)} = I_{(10)T,t}^{*(i_1 i_2)} + \frac{1}{4} \mathbf{1}_{\{i_1=i_2\}} (T-t)^2 \quad \text{w. p. } 1,$$

$$I_{(01)T,t}^{(i_1 i_2)} = I_{(01)T,t}^{*(i_1 i_2)} + \frac{1}{4} \mathbf{1}_{\{i_1=i_2\}} (T-t)^2 \quad \text{w. p. } 1,$$

$$I_{(01)T,t}^{(i_1 i_2)} = -\frac{T-t}{2} I_{(00)T,t}^{(i_1 i_2)} - \frac{(T-t)^2}{4} \left(\frac{1}{\sqrt{3}} \zeta_0^{(i_1)} \zeta_1^{(i_2)} + \right.$$

$$

Let us analyze the approximation $I_{(00)T,t}^{*(i_1 i_2)q}$ of the iterated stochastic integral $I_{(00)T,t}^{*(i_1 i_2)}$ obtained from (137) by replacing ∞ on q.

It is easy to prove that

$$\mathsf{M}\left\{\left(I_{(00)T,t}^{*(i_1 i_2)}-I_{(00)T,t}^{*(i_1 i_2)q}\right)^2\right\}=\frac{(T-t)^2}{2}\left(\frac{1}{2}-\sum_{i=1}^{q}\frac{1}{4i^2-1}\right)\quad (i_1\ne i_2). \tag{152}$$

Moreover, using Theorem 14, we obtain for $i_1\ne i_2$

$$\mathsf{M}\left\{\left(I_{(10)T,t}^{*(i_1 i_2)}-I_{(10)T,t}^{*(i_1 i_2)q}\right)^2\right\}=\mathsf{M}\left\{\left(I_{(01)T,t}^{*(i_1 i_2)}-I_{(01)T,t}^{*(i_1 i_2)q}\right)^2\right\}=$$

$$=\frac{(T-t)^4}{16}\left(\frac{5}{9}-2\sum_{i=2}^{q}\frac{1}{4i^2-1}-\sum_{i=1}^{q}\frac{1}{(2i-1)^2(2i+3)^2}-\sum_{i=0}^{q}\frac{(i+2)^2+(i+1)^2}{(2i+1)(2i+5)(2i+3)^2}\right).$$

For the case $i_1=i_2$, using Theorem 14, we have

$$\mathsf{M}\left\{\left(I_{(10)T,t}^{(i_1 i_1)}-I_{(10)T,t}^{(i_1 i_1)q}\right)^2\right\}=\mathsf{M}\left\{\left(I_{(01)T,t}^{(i_1 i_1)}-I_{(01)T,t}^{(i_1 i_1)q}\right)^2\right\}=$$

$$=\frac{(T-t)^4}{16}\left(\frac{1}{9}-\sum_{i=0}^{q}\frac{1}{(2i+1)(2i+5)(2i+3)^2}-2\sum_{i=1}^{q}\frac{1}{(2i-1)^2(2i+3)^2}\right). \tag{153}$$

On the basis of the presented expansions of iterated stochastic integrals we can see that increasing of multiplicities of these integrals or degree indexes of their weight functions leads to noticeable complication of formulas for the mentioned expansions.

However, increasing of the mentioned parameters leads to increasing of orders of smallness with respect to $T-t$ in the mean-square sense for iterated stochastic integrals. This leads to a sharp decrease of member quantities in expansions of iterated stochastic integrals, which are required for achieving the acceptable accuracy of approximation. In the context of it let us consider the approach to approximation of iterated stochastic integrals, which provides a possibility to obtain the mean-square approximations of the required accuracy without using the complex expansions.

Let us analyze the following approximation of triple stochastic integral using (139)

$$I_{(000)T,t}^{(i_1 i_2 i_3)q_1}=\sum_{j_1,j_2,j_3=0}^{q_1}C_{j_3 j_2 j_1}\Biggl(\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}\zeta_{j_3}^{(i_3)}-\mathbf{1}_{\{i_1=i_2\}}\mathbf{1}_{\{j_1=j_2\}}\zeta_{j_3}^{(i_3)}-$$

$$-\mathbf{1}_{\{i_2=i_3\}}\mathbf{1}_{\{j_2=j_3\}}\zeta_{j_1}^{(i_1)}-\mathbf{1}_{\{i_1=i_3\}}\mathbf{1}_{\{j_1=j_3\}}\zeta_{j_2}^{(i_2)}\Biggr), \tag{154}$$

where $C_{j_3 j_2 j_1}$ is defined by (140), (141).

In particular, from (154) when $i_1 \neq i_2$, $i_2 \neq i_3$, $i_1 \neq i_3$ we obtain

$$I_{(000)T,t}^{(i_1 i_2 i_3)q_1} = \sum_{j_1,j_2,j_3=0}^{q_1} C_{j_3 j_2 j_1} \zeta_{j_1}^{(i_1)} \zeta_{j_2}^{(i_2)} \zeta_{j_3}^{(i_3)}. \tag{155}$$

Using (127), (129)–(131), we get

$$\mathsf{M}\left\{\left(I_{(000)T,t}^{(i_1 i_2 i_3)} - I_{(000)T,t}^{(i_1 i_2 i_3)q_1}\right)^2\right\} =$$

$$= \frac{(T-t)^3}{6} - \sum_{j_1,j_2,j_3=0}^{q_1} C_{j_3 j_2 j_1}^2 \quad (i_1 \neq i_2, i_1 \neq i_3, i_2 \neq i_3), \tag{156}$$

$$\mathsf{M}\left\{\left(I_{(000)T,t}^{(i_1 i_2 i_3)} - I_{(000)T,t}^{(i_1 i_2 i_3)q_1}\right)^2\right\} =$$

$$= \frac{(T-t)^3}{6} - \sum_{j_1,j_2,j_3=0}^{q_1} C_{j_3 j_2 j_1}^2 - \sum_{j_1,j_2,j_3=0}^{q_1} C_{j_2 j_3 j_1} C_{j_3 j_2 j_1} \quad (i_1 \neq i_2 = i_3), \tag{157}$$

$$\mathsf{M}\left\{\left(I_{(000)T,t}^{(i_1 i_2 i_3)} - I_{(000)T,t}^{(i_1 i_2 i_3)q_1}\right)^2\right\} =$$

$$= \frac{(T-t)^3}{6} - \sum_{j_1,j_2,j_3=0}^{q_1} C_{j_3 j_2 j_1}^2 - \sum_{j_1,j_2,j_3=0}^{q_1} C_{j_3 j_2 j_1} C_{j_1 j_2 j_3} \quad (i_1 = i_3 \neq i_2), \tag{158}$$

$$\mathsf{M}\left\{\left(I_{(000)T,t}^{(i_1 i_2 i_3)} - I_{(000)T,t}^{(i_1 i_2 i_3)q_1}\right)^2\right\} =$$

$$= \frac{(T-t)^3}{6} - \sum_{j_1,j_2,j_3=0}^{q_1} C_{j_3 j_2 j_1}^2 - \sum_{j_1,j_2,j_3=0}^{q_1} C_{j_3 j_1 j_2} C_{j_3 j_2 j_1} \quad (i_1 = i_2 \neq i_3), \tag{159}$$

$$\mathsf{M}\left\{\left(I_{(000)T,t}^{(i_1 i_2 i_3)} - I_{(000)T,t}^{(i_1 i_2 i_3)q_1}\right)^2\right\} \le 6\left(\frac{(T-t)^3}{6} - \sum_{j_1,j_2,j_3=0}^{q_1} C_{j_3 j_2 j_1}^2\right) \quad (i_1, i_2, i_3 = 1, \ldots, m). \tag{160}$$

We may act similarly with more complicated iterated stochastic integrals. For example, for the approximation of stochastic integral $I_{(0000)T,t}^{(i_1 i_2 i_3 i_4)}$ we may write (see (145))

$$
I_{(0000)T,t}^{(i_1i_2i_3i_4)q_2}=\sum_{j_1,j_2,j_3,j_4=0}^{q_2}C_{j_4j_3j_2j_1}\Biggl(\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}\zeta_{j_3}^{(i_3)}\zeta_{j_4}^{(i_4)}-
$$

$$
-\mathbf{1}_{\{i_1=i_2\}}\mathbf{1}_{\{j_1=j_2\}}\zeta_{j_3}^{(i_3)}\zeta_{j_4}^{(i_4)}-\mathbf{1}_{\{i_1=i_3\}}\mathbf{1}_{\{j_1=j_3\}}\zeta_{j_2}^{(i_2)}\zeta_{j_4}^{(i_4)}-
$$

$$
-\mathbf{1}_{\{i_1=i_4\}}\mathbf{1}_{\{j_1=j_4\}}\zeta_{j_2}^{(i_2)}\zeta_{j_3}^{(i_3)}-\mathbf{1}_{\{i_2=i_3\}}\mathbf{1}_{\{j_2=j_3\}}\zeta_{j_1}^{(i_1)}\zeta_{j_4}^{(i_4)}-
$$

$$
-\mathbf{1}_{\{i_2=i_4\}}\mathbf{1}_{\{j_2=j_4\}}\zeta_{j_1}^{(i_1)}\zeta_{j_3}^{(i_3)}-\mathbf{1}_{\{i_3=i_4\}}\mathbf{1}_{\{j_3=j_4\}}\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}+
$$

$$
+\mathbf{1}_{\{i_1=i_2\}}\mathbf{1}_{\{j_1=j_2\}}\mathbf{1}_{\{i_3=i_4\}}\mathbf{1}_{\{j_3=j_4\}}+
$$

$$
+\mathbf{1}_{\{i_1=i_3\}}\mathbf{1}_{\{j_1=j_3\}}\mathbf{1}_{\{i_2=i_4\}}\mathbf{1}_{\{j_2=j_4\}}+
$$

$$
+\mathbf{1}_{\{i_1=i_4\}}\mathbf{1}_{\{j_1=j_4\}}\mathbf{1}_{\{i_2=i_3\}}\mathbf{1}_{\{j_2=j_3\}}\Biggr),
$$

where $C_{j_4j_3j_2j_1}$ is defined by (146), (147). Moreover, according to (131)

$$
\mathsf{M}\left\{\left(I_{(0000)T,t}^{(i_1i_2i_3i_4)}-I_{(0000)T,t}^{(i_1i_2i_3i_4)q_2}\right)^2\right\}\le 24\left(\frac{(T-t)^4}{24}-\sum_{j_1,j_2,j_3,j_4=0}^{q_2}C_{j_4j_3j_2j_1}^2\right)\quad (i_1,i_2,i_3,i_4=1,\ldots,m).
$$

For pairwise different $i_1,i_2,i_3,i_4=1,\ldots,m$ from (127) we obtain

$$
\mathsf{M}\left\{\left(I_{(0000)T,t}^{(i_1i_2i_3i_4)}-I_{(0000)T,t}^{(i_1i_2i_3i_4)q_2}\right)^2\right\}=\frac{(T-t)^4}{24}-\sum_{j_1,j_2,j_3,j_4=0}^{q_2}C_{j_4j_3j_2j_1}^2. \tag{161}
$$

Using Theorem 14, we can calculate exactly the left-hand side of (161) for any possible combinations of i_1,i_2,i_3,i_4. These relations were obtained in [14], [57]-[61].

In Tables 3–5, we have some examples of exact values of the Fourier–Legendre coefficients (here and further the Fourier–Legendre coefficients have been calculated exactly using DERIVE (computer algebra system)). Note that in [75], [76] the database with 270,000 exactly calculated Fourier–Legendre coefficients was described. This database was used in the software package, which is written in the Python programming language for the implementation of the numerical schemes (75)-(79), (82)-(86).

Assume that $q_1=6$. Calculating the value of expression (156) for $q_1=6$, $i_1\ne i_2$, $i_1\ne i_3$, $i_3\ne i_2$, we obtain

$$
\mathsf{M}\left\{\left(I_{(000)T,t}^{(i_1i_2i_3)}-I_{(000)T,t}^{(i_1i_2i_3)q_1}\right)^2\right\}\approx 0.01956(T-t)^3.
$$

Let us choose, for example, $q_2=2$. In the case of pairwise different i_1,i_2,i_3,i_4 we have from (161) the following approximate equality

$$
\mathsf{M}\left\{\left(I_{(0000)T,t}^{(i_1i_2i_3i_4)}-I_{(0000)T,t}^{(i_1i_2i_3i_4)q_2}\right)^2\right\}\approx 0.0236084(T-t)^4. \tag{162}
$$

Let us analyze the approximations

$$I_{(001)T,t}^{(i_1i_2i_3)q_3}, \quad I_{(010)T,t}^{(i_1i_2i_3)q_3}, \quad I_{(100)T,t}^{(i_1i_2i_3)q_3}, \quad I_{(00000)T,t}^{(i_1i_2i_3i_4i_5)q_4}$$

based on the expansions (148)–(151).

Assume that $q_3 = 2$, $q_4 = 1$. In the case of pairwise different $i_1, \ldots, i_5$ we obtain

$$\mathsf{M}\left\{\left(I_{(100)T,t}^{(i_1i_2i_3)} - I_{(100)T,t}^{(i_1i_2i_3)q_3}\right)^2\right\} = \frac{(T-t)^5}{60} - \sum_{j_1,j_2,j_3=0}^{2} \left(C_{j_3j_2j_1}^{100}\right)^2 \approx 0.00815429(T-t)^5,$$

$$\mathsf{M}\left\{\left(I_{(010)T,t}^{(i_1i_2i_3)} - I_{(010)T,t}^{(i_1i_2i_3)q_3}\right)^2\right\} = \frac{(T-t)^5}{20} - \sum_{j_1,j_2,j_3=0}^{2} \left(C_{j_3j_2j_1}^{010}\right)^2 \approx 0.0173903(T-t)^5,$$

$$\mathsf{M}\left\{\left(I_{(001)T,t}^{(i_1i_2i_3)} - I_{(001)T,t}^{(i_1i_2i_3)q_3}\right)^2\right\} = \frac{(T-t)^5}{10} - \sum_{j_1,j_2,j_3=0}^{2} \left(C_{j_3j_2j_1}^{001}\right)^2 \approx 0.0252801(T-t)^5,$$

$$\mathsf{M}\left\{\left(I_{(00000)T,t}^{(i_1i_2i_3i_4i_5)} - I_{(00000)T,t}^{(i_1i_2i_3i_4i_5)q_4}\right)^2\right\} =$$

$$
=\frac{(T-t)^5}{120}-\sum_{j_1,j_2,j_3,j_4,j_5=0}^{1}C_{j_5j_4j_3j_2j_1}^2\approx 0.00759105(T-t)^5.
$$

Note that using (131), we can write

$$
\mathsf{M}\left\{\left(I_{(00000)T,t}^{(i_1i_2i_3i_4i_5)}-I_{(00000)T,t}^{(i_1i_2i_3i_4i_5)q_4}\right)^2\right\}\le 120\left(\frac{(T-t)^5}{120}-\sum_{j_1,j_2,j_3,j_4,j_5=0}^{q_4}C_{j_5j_4j_3j_2j_1}^2\right),
$$

where $i_1,\ldots,i_5=1,\ldots,m$.

Moreover, from (131) we obtain the following useful estimates

$$
\mathsf{M}\left\{\left(I_{(01)T,t}^{(i_1i_2)}-I_{(01)T,t}^{(i_1i_2)q}\right)^2\right\}\le 2\left(\frac{(T-t)^4}{4}-\sum_{j_1,j_2=0}^{q}\left(C_{j_2j_1}^{01}\right)^2\right),
$$

$$
\mathsf{M}\left\{\left(I_{(10)T,t}^{(i_1i_2)}-I_{(10)T,t}^{(i_1i_2)q}\right)^2\right\}\le 2\left(\frac{(T-t)^4}{12}-\sum_{j_1,j_2=0}^{q}\left(C_{j_2j_1}^{10}\right)^2\right),
$$

$$
\mathsf{M}\left\{\left(I_{(100)T,t}^{(i_1i_2i_3)}-I_{(100)T,t}^{(i_1i_2i_3)q}\right)^2\right\}\le 6\left(\frac{(T-t)^5}{60}-\sum_{j_1,j_2,j_3=0}^{q}\left(C_{j_3j_2j_1}^{100}\right)^2\right),
$$

$$
\mathsf{M}\left\{\left(I_{(010)T,t}^{(i_1i_2i_3)}-I_{(010)T,t}^{(i_1i_2i_3)q}\right)^2\right\}\le 6\left(\frac{(T-t)^5}{20}-\sum_{j_1,j_2,j_3=0}^{q}\left(C_{j_3j_2j_1}^{010}\right)^2\right),
$$

$$
\mathsf{M}\left\{\left(I_{(001)T,t}^{(i_1i_2i_3)}-I_{(001)T,t}^{(i_1i_2i_3)q}\right)^2\right\}\le 6\left(\frac{(T-t)^5}{10}-\sum_{j_1,j_2,j_3=0}^{q}\left(C_{j_3j_2j_1}^{001}\right)^2\right),
$$

$$
\mathsf{M}\left\{\left(I_{(20))T,t}^{(i_1i_2)}-I_{(20)T,t}^{(i_1i_2)q}\right)^2\right\}\le 2\left(\frac{(T-t)^6}{30}-\sum_{j_2,j_1=0}^{q}\left(C_{j_2j_1}^{20}\right)^2\right),
$$

$$
\mathsf{M}\left\{\left(I_{(11)T,t}^{(i_1i_2)}-I_{(11)T,t}^{(i_1i_2)q}\right)^2\right\}\le 2\left(\frac{(T-t)^6}{18}-\sum_{j_2,j_1=0}^{q}\left(C_{j_2j_1}^{11}\right)^2\right),
$$

$$
\mathsf{M}\left\{\left(I_{(02)T,t}^{(i_1i_2)}-I_{(02)T,t}^{(i_1i_2)q}\right)^2\right\}\le 2\left(\frac{(T-t)^6}{6}-\sum_{j_2,j_1=0}^{q}\left(C_{j_2j_1}^{02}\right)^2\right),
$$

$$
\mathsf{M}\left\{\left(I_{(1000)T,t}^{(i_1i_2i_3i_4)}-I_{(1000)T,t}^{(i_1i_2i_3i_4)q}\right)^2\right\}\le 24\left(\frac{(T-t)^6}{360}-\sum_{j_1,j_2,j_3,j_4=0}^{q}\left(C_{j_4j_3j_2j_1}^{1000}\right)^2\right),
$$

$$
\mathsf{M}\left\{\left(I_{(0100)T,t}^{(i_1i_2i_3i_4)}-I_{(0100)T,t}^{(i_1i_2i_3i_4)q}\right)^2\right\}\le 24\left(\frac{(T-t)^6}{120}-\sum_{j_1,j_2,j_3,j_4=0}^{q}\left(C_{j_4j_3j_2j_1}^{0100}\right)^2\right),
$$

$$
\mathsf{M}\left\{\left(I_{(0010)T,t}^{(i_1i_2i_3i_4)}-I_{(0010)T,t}^{(i_1i_2i_3i_4)q}\right)^2\right\}\le 24\left(\frac{(T-t)^6}{60}-\sum_{j_1,j_2,j_3,j_4=0}^{q}\left(C_{j_4j_3j_2j_1}^{0010}\right)^2\right),
$$

$$
\mathsf{M}\left\{\left(I_{(0001)T,t}^{(i_1i_2i_3i_4)}-I_{(0001)T,t}^{(i_1i_2i_3i_4)q}\right)^2\right\}\le 24\left(\frac{(T-t)^6}{36}-\sum_{j_1,j_2,j_3,j_4=0}^{q}\left(C_{j_4j_3j_2j_1}^{0001}\right)^2\right),
$$

$$
\mathsf{M}\left\{\left(I_{(000000)T,t}^{(i_1i_2i_3i_4i_5i_6)}-I_{(000000)T,t}^{(i_1i_2i_3i_4i_5i_6)q}\right)^2\right\}\le 720\left(\frac{(T-t)^6}{720}-\sum_{j_1,j_2,j_3,j_4,j_5,j_6=0}^{q}C_{j_6j_5j_4j_3j_2j_1}^2\right).
$$

In addition, from (128) we get

$$
\mathsf{M}\left\{\left(I_{(10)T,t}^{(i_1i_2)}-I_{(10)T,t}^{(i_1i_2)q}\right)^2\right\}=\frac{(T-t)^4}{12}-\sum_{j_1,j_2=0}^{q}\left(C_{j_2j_1}^{10}\right)^2-\sum_{j_1,j_2=0}^{q}C_{j_2j_1}^{10}C_{j_1j_2}^{10}\quad (i_1=i_2),
$$

$$
\mathsf{M}\left\{\left(I_{(10)T,t}^{(i_1i_2)}-I_{(10)T,t}^{(i_1i_2)q}\right)^2\right\}=\frac{(T-t)^4}{12}-\sum_{j_1,j_2=0}^{q}\left(C_{j_2j_1}^{10}\right)^2\quad (i_1\ne i_2),
$$

$$
\mathsf{M}\left\{\left(I_{(01)T,t}^{(i_1i_2)}-I_{(01)T,t}^{(i_1i_2)q}\right)^2\right\}=\frac{(T-t)^4}{4}-\sum_{j_1,j_2=0}^{q}\left(C_{j_2j_1}^{01}\right)^2-\sum_{j_1,j_2=0}^{q}C_{j_2j_1}^{01}C_{j_1j_2}^{01}\quad (i_1=i_2),
$$

$$
\mathsf{M}\left\{\left(I_{(01)T,t}^{(i_1i_2)}-I_{(01)T,t}^{(i_1i_2)q}\right)^2\right\}=\frac{(T-t)^4}{4}-\sum_{j_1,j_2=0}^{q}\left(C_{j_2j_1}^{01}\right)^2\quad (i_1\ne i_2),
$$

$$
\mathsf{M}\left\{\left(I_{(20)T,t}^{(i_1i_2)}-I_{(20)T,t}^{(i_1i_2)q}\right)^2\right\}=\frac{(T-t)^6}{30}-\sum_{j_1,j_2=0}^{q}\left(C_{j_2j_1}^{20}\right)^2-\sum_{j_1,j_2=0}^{q}C_{j_2j_1}^{20}C_{j_1j_2}^{20}\quad (i_1=i_2),
$$

$$
\mathsf{M}\left\{\left(I_{(20)T,t}^{(i_1i_2)}-I_{(20)T,t}^{(i_1i_2)q}\right)^2\right\}=\frac{(T-t)^6}{30}-\sum_{j_1,j_2=0}^{q}\left(C_{j_2j_1}^{20}\right)^2\quad (i_1\ne i_2),
$$

$$
\mathsf{M}\left\{\left(I_{(11)T,t}^{(i_1i_2)}-I_{(11)T,t}^{(i_1i_2)q}\right)^2\right\}=\frac{(T-t)^6}{18}-\sum_{j_1,j_2=0}^{q}\left(C_{j_2j_1}^{11}\right)^2-\sum_{j_1,j_2=0}^{q}C_{j_2j_1}^{11}C_{j_1j_2}^{11}\quad (i_1=i_2),
$$

$$\mathsf{M}\left\{\left(I_{(11)T,t}^{(i_1 i_2)}-I_{(11)T,t}^{(i_1 i_2)q}\right)^2\right\}=\frac{(T-t)^6}{18}-\sum_{j_1,j_2=0}^{q}\left(C_{j_2 j_1}^{11}\right)^2 \quad (i_1\ne i_2),$$

$$\mathsf{M}\left\{\left(I_{(02)}^{(i_1 i_2)}-I_{(02)T,t}^{(i_1 i_2)q}\right)^2\right\}=\frac{(T-t)^6}{6}-\sum_{j_1,j_2=0}^{q}\left(C_{j_2 j_1}^{02}\right)^2-\sum_{j_1,j_2=0}^{q}C_{j_2 j_1}^{02}C_{j_1 j_2}^{02} \quad (i_1=i_2),$$

$$\mathsf{M}\left\{\left(I_{(02)T,t}^{(i_1 i_2)}-I_{(02)T,t}^{(i_1 i_2)q}\right)^2\right\}=\frac{(T-t)^6}{6}-\sum_{j_1,j_2=0}^{q}\left(C_{j_2 j_1}^{02}\right)^2 \quad (i_1\ne i_2),$$

Clearly, expansions for iterated Stratonovich stochastic integrals (see Theorems 8, 10-12) are simpler than expansions for iterated Ito stochastic integrals (see Theorems 6, 7, and (93)–(98)). However, the calculation of the mean-square approximation error for iterated Stratonovich stochastic integrals turns out to be much more difficult than for iterated Ito stochastic integrals (see Theorem 14 and (131)). Below we consider how we can estimate or calculate exactly (for some particular cases) the mean-square approximation error for iterated Stratonovich stochastic integrals (the development of these results is contained in Chapter 5 [58] (also see Theorems 10–13 from this paper).

As we mentioned above, on the basis of the presented approximations of iterated Stratonovich stochastic integrals we can see that increasing of multiplicities of these integrals leads to increasing of orders of smallness with respect to $T-t$ in the mean-square sense for iterated Stratonovich stochastic integrals ($T-t\ll 1$ because the length of integration interval $[t,T]$ of the iterated Stratonovich stochastic integrals plays the role of integration step for the numerical methods for Ito SDEs, so $T-t$ is already fairly small). This leads to a sharp decrease of member quantities in the approximations of iterated Stratonovich stochastic integrals, which are required for achieving the acceptable accuracy of approximation.

From (152) ($i_1\ne i_2$) we obtain

$$\mathsf{M}\left\{\left(I_{(00)T,t}^{*(i_1 i_2)}-I_{(00)T,t}^{*(i_1 i_2)q}\right)^2\right\}=\frac{(T-t)^2}{2}\sum_{i=q+1}^{\infty}\frac{1}{4i^2-1}\le$$

$$\le\frac{(T-t)^2}{2}\int\limits_q^{\infty}\frac{1}{4x^2-1}dx=-\frac{(T-t)^2}{8}\ln\left|1-\frac{2}{2q+1}\right|\le C_1\frac{(T-t)^2}{q}, \tag{163}$$

where C_1 is a constant.

Since $T-t\ll 1$, then it is easy to notice that there exists such a constant C_2 that

$$\mathsf{M}\left\{\left(I_{(l_1\ldots l_k)T,t}^{*(i_1\ldots i_k)}-I_{(l_1\ldots l_k)T,t}^{*(i_1\ldots i_k)q}\right)^2\right\}\le C_2\mathsf{M}\left\{\left(I_{(00)T,t}^{*(i_1 i_2)}-I_{(00)T,t}^{*(i_1 i_2)q}\right)^2\right\}, \tag{164}$$

where $I_{(l_1\ldots l_k)T,t}^{*(i_1\ldots i_k)q}$ is an approximation of the iterated Stratonovich stochastic integral $I_{(l_1\ldots l_k)T,t}^{*(i_1\ldots i_k)}$.

From (163) and (164) we finally obtain

$$\mathsf{M}\left\{\left(I_{(l_1\ldots l_k)T,t}^{*(i_1\ldots i_k)}-I_{(l_1\ldots l_k)T,t}^{*(i_1\ldots i_k)q}\right)^2\right\}\le C\frac{(T-t)^2}{q}, \tag{165}$$

where constant C does not depends on $T-t$. Note that, in contrast to the estimate (165), the constant C in Theorems 10–12 does not depend on q.

The same idea can be found in [2] in the framework of the method based on the trigonometric expansion of the Brownian bridge process.

We can get more information about the numbers q (these numbers are different for different iterated Stratonovich stochastic integrals) using the another approach. Since for pairwise different $i_1,\ldots,i_k=1,\ldots,m$

$$J^*[\psi^{(k)}]_{T,t}=J[\psi^{(k)}]_{T,t}\quad \text{w. p. 1},$$

where $J[\psi^{(k)}]_{T,t},\ J^*[\psi^{(k)}]_{T,t}$ are defined by (2) and (3) correspondingly, then for pairwise different $i_1,\ldots,i_6=1,\ldots,m$ we can write (see (127))

$$\mathsf{M}\left\{\left(I_{(01)T,t}^{*(i_1i_2)}-I_{(01)T,t}^{*(i_1i_2)q}\right)^2\right\}=\frac{(T-t)^4}{4}-\sum_{j_1,j_2=0}^{q}\left(C_{j_2j_1}^{01}\right)^2,$$

$$\mathsf{M}\left\{\left(I_{(10)T,t}^{*(i_1i_2)}-I_{(10)T,t}^{*(i_1i_2)q}\right)^2\right\}=\frac{(T-t)^4}{12}-\sum_{j_1,j_2=0}^{q}\left(C_{j_2j_1}^{10}\right)^2,$$

$$\mathsf{M}\left\{\left(I_{(000)T,t}^{*(i_1i_2i_3)}-I_{(000)T,t}^{*(i_1i_2i_3)q}\right)^2\right\}=\frac{(T-t)^3}{6}-\sum_{j_3,j_2,j_1=0}^{q}C_{j_3j_2j_1}^2,$$

$$\mathsf{M}\left\{\left(I_{(0000)T,t}^{*(i_1i_2i_3i_4)}-I_{(0000)T,t}^{*(i_1i_2i_3i_4)q}\right)^2\right\}=\frac{(T-t)^4}{24}-\sum_{j_1,j_2,j_3,j_4=0}^{q}C_{j_4j_3j_2j_1}^2,$$

$$\mathsf{M}\left\{\left(I_{(100)T,t}^{*(i_1i_2i_3)}-I_{(100)T,t}^{*(i_1i_2i_3)q}\right)^2\right\}=\frac{(T-t)^5}{60}-\sum_{j_1,j_2,j_3=0}^{q}\left(C_{j_3j_2j_1}^{100}\right)^2,$$

$$\mathsf{M}\left\{\left(I_{(010))T,t}^{*(i_1i_2i_3)}-I_{(010)T,t}^{*(i_1i_2i_3)q}\right)^2\right\}=\frac{(T-t)^5}{20}-\sum_{j_1,j_2,j_3=0}^{q}\left(C_{j_3j_2j_1}^{010}\right)^2,$$

$$\mathsf{M}\left\{\left(I_{(001)T,t}^{*(i_1i_2i_3)}-I_{(001)T,t}^{*(i_1i_2i_3)q}\right)^2\right\}=\frac{(T-t)^5}{10}-\sum_{j_1,j_2,j_3=0}^{q}\left(C_{j_3j_2j_1}^{001}\right)^2,$$

$$\mathsf{M}\left\{\left(I_{(00000)T,t}^{*(i_1i_2i_3i_4i_5)}-I_{(00000)T,t}^{*(i_1i_2i_3i_4i_5)q}\right)^2\right\}=\frac{(T-t)^5}{120}-\sum_{j_1,j_2,j_3,j_4,j_5=0}^{q}C_{j_5i_4i_3i_2j_1}^2,$$

$$\mathsf{M}\left\{\left(I_{(20)T,t}^{*(i_1i_2)}-I_{(20)T,t}^{*(i_1i_2)q}\right)^2\right\}=\frac{(T-t)^6}{30}-\sum_{j_2,j_1=0}^{q}\left(C_{j_2j_1}^{20}\right)^2,$$

$$\mathsf{M}\left\{\left(I_{(11)T,t}^{*(i_1i_2)}-I_{(11)T,t}^{*(i_1i_2)q}\right)^2\right\}=\frac{(T-t)^6}{18}-\sum_{j_2,j_1=0}^{q}\left(C_{j_2j_1}^{11}\right)^2,$$

$$
\mathsf{M}\left\{\left(I_{(02)T,t}^{*(i_1 i_2)}-I_{(02)T,t}^{*(i_1 i_2)q}\right)^2\right\}=\frac{(T-t)^6}{6}-\sum_{j_2,j_1=0}^{q}\left(C_{j_2 j_1}^{02}\right)^2,
$$

$$
\mathsf{M}\left\{\left(I_{(1000)T,t}^{*(i_1 i_2 i_3 i_4)}-I_{(1000)T,t}^{*(i_1 i_2 i_3 i_4)q}\right)^2\right\}=\frac{(T-t)^6}{360}-\sum_{j_1,j_2,j_3,j_4=0}^{q}\left(C_{j_4 j_3 j_2 j_1}^{1000}\right)^2,
$$

$$
\mathsf{M}\left\{\left(I_{(0100)T,t}^{*(i_1 i_2 i_3 i_4)}-I_{(0100)T,t}^{*(i_1 i_2 i_3 i_4)q}\right)^2\right\}=\frac{(T-t)^6}{120}-\sum_{j_1,j_2,j_3,j_4=0}^{q}\left(C_{j_4 j_3 j_2 j_1}^{0100}\right)^2,
$$

$$
\mathsf{M}\left\{\left(I_{(0010)T,t}^{*(i_1 i_2 i_3 i_4)}-I_{(0010)T,t}^{*(i_1 i_2 i_3 i_4)q}\right)^2\right\}=\frac{(T-t)^6}{60}-\sum_{j_1,j_2,j_3,j_4=0}^{q}\left(C_{j_4 j_3 j_2 j_1}^{0010}\right)^2,
$$

$$
\mathsf{M}\left\{\left(I_{(0001)T,t}^{*(i_1 i_2 i_3 i_4)}-I_{(0001)T,t}^{*(i_1 i_2 i_3 i_4)q}\right)^2\right\}=\frac{(T-t)^6}{36}-\sum_{j_1,j_2,j_3,j_4=0}^{q}\left(C_{j_4 j_3 j_2 j_1}^{0001}\right)^2,
$$

$$
\mathsf{M}\left\{\left(I_{(000000)T,t}^{*(i_1 i_2 i_3 i_4 i_5 i_6)}-I_{(000000)T,t}^{*(i_1 i_2 i_3 i_4 i_5 i_6)q}\right)^2\right\}=\frac{(T-t)^6}{720}-\sum_{j_1,j_2,j_3,j_4,j_5,j_6=0}^{q}C_{j_6 j_5 j_4 j_3 j_2 j_1}^2.
$$

For example [46] (also see [26]-[29], [38], [47]-[61]),

$$
\mathsf{M}\left\{\left(I_{(000)T,t}^{*(i_1 i_2 i_3)}-I_{(000)T,t}^{*(i_1 i_2 i_3)6}\right)^2\right\}=\frac{(T-t)^3}{6}-\sum_{j_3,j_2,j_1=0}^{6}C_{j_3 j_2 j_1}^2\approx 0.01956000(T-t)^3,
$$

$$
\mathsf{M}\left\{\left(I_{(0000)T,t}^{*(i_1 i_2 i_3 i_4)}-I_{(0000)T,t}^{*(i_1 i_2 i_3 i_4)2}\right)^2\right\}=\frac{(T-t)^4}{24}-\sum_{j_1,j_2,j_3,j_4=0}^{2}C_{j_4 j_3 j_2 j_1}^2\approx 0.02360840(T-t)^4,
$$

$$
\mathsf{M}\left\{\left(I_{(100)T,t}^{*(i_1 i_2 i_3)}-I_{(100)T,t}^{*(i_1 i_2 i_3)2}\right)^2\right\}=\frac{(T-t)^5}{60}-\sum_{j_1,j_2,j_3=0}^{2}\left(C_{j_3 j_2 j_1}^{100}\right)^2\approx 0.00815429(T-t)^5,
$$

$$
\mathsf{M}\left\{\left(I_{(010)T,t}^{*(i_1 i_2 i_3)}-I_{(010)T,t}^{*(i_1 i_2 i_3)2}\right)^2\right\}=\frac{(T-t)^5}{20}-\sum_{j_1,j_2,j_3=0}^{2}\left(C_{j_3 j_2 j_1}^{010}\right)^2\approx 0.0173903(T-t)^5,
$$

$$
\mathsf{M}\left\{\left(I_{(001)T,t}^{*(i_1 i_2 i_3)}-I_{(001)T,t}^{*(i_1 i_2 i_3)2}\right)^2\right\}=\frac{(T-t)^5}{10}-\sum_{j_1,j_2,j_3=0}^{2}\left(C_{j_3 j_2 j_1}^{001}\right)^2\approx 0.0252801(T-t)^5,
$$

$$
\mathsf{M}\left\{\left(I_{(00000)T,t}^{*(i_1 i_2 i_3 i_4 i_5)}-I_{(00000)T,t}^{*(i_1 i_2 i_3 i_4 i_5)1}\right)^2\right\}=
$$

$$
=\frac{(T-t)^5}{120}-\sum_{j_1,j_2,j_3,j_4,j_5=0}^{1} C_{j_5j_4j_3j_2j_1}^2\approx 0.00759105(T-t)^5.
$$

Let us consider expansions of the Ito stochastic integrals $I_{(1)T,t}^{(i_1)}$, $I_{(2)T,t}^{(i_1)}$ based on the approach from [4] (also see [2])

$$
I_{(1)T,t}^{(i_1)q}=-\frac{(T-t)^{3/2}}{2}\left(\zeta_0^{(i_1)}-\frac{\sqrt{2}}{\pi}\left(\sum_{r=1}^{q}\frac{1}{r}\zeta_{2r-1}^{(i_1)}+\sqrt{\alpha_q}\xi_q^{(i_1)}\right)\right), \tag{166}
$$

$$
I_{(2)T,t}^{(i_1)q}=(T-t)^{5/2}\left(\frac{1}{3}\zeta_0^{(i_1)}+\frac{1}{\sqrt{2}\pi^2}\left(\sum_{r=1}^{q}\frac{1}{r^2}\zeta_{2r}^{(i_1)}+\sqrt{\beta_q}\mu_q^{(i_1)}\right)-\right.
$$

$$
\left.-\frac{1}{\sqrt{2}\pi}\left(\sum_{r=1}^{q}\frac{1}{r}\zeta_{2r-1}^{(i_1)}+\sqrt{\alpha_q}\xi_q^{(i_1)}\right)\right), \tag{167}
$$

where $\zeta_j^{(i)}$ is defined by the formula (92), $\phi_j(\tau)$ is a complete orthonormal system of trigonometric functions in the space $L_2([t,T])$, and $\zeta_0^{(i)}$, $\zeta_{2r}^{(i)}$, $\zeta_{2r-1}^{(i)}$, $\xi_q^{(i)}$, $\mu_q^{(i)}$ $(r=1,\ldots,q,\ \ i=1,\ldots,m)$ are independent standard Gaussian random variables, $i_1=1,\ldots,m$,

$$
\xi_q^{(i)}=\frac{1}{\sqrt{\alpha_q}}\sum_{r=q+1}^{\infty}\frac{1}{r}\zeta_{2r-1}^{(i)},\qquad \alpha_q=\frac{\pi^2}{6}-\sum_{r=1}^{q}\frac{1}{r^2},
$$

$$
\mu_q^{(i)}=\frac{1}{\sqrt{\beta_q}}\sum_{r=q+1}^{\infty}\frac{1}{r^2}\ \zeta_{2r}^{(i)},\qquad \beta_q=\frac{\pi^4}{90}-\sum_{r=1}^{q}\frac{1}{r^4}.
$$

It is obvious that (166), (12) significantly more complicated compared to (135), (136).

Another example of obvious advantage of the Legendre polynomials over the trigonometric functions (in the framework of the considered problem) is the truncated expansion of the iterated Stratonovich stochastic integral $I_{(10)T,t}^{*(i_1i_2)}$ obtained by Theorem 8, in which instead of the double Fourier–Legendre series (see (137), (138)) is taken the double trigonometric Fourier series

$$
I_{(10)T,t}^{*(i_1i_2)q}=-(T-t)^2\left(\frac{1}{6}\zeta_0^{(i_1)}\zeta_0^{(i_2)}-\frac{1}{2\sqrt{2}\pi}\sqrt{\alpha_q}\xi_q^{(i_2)}\zeta_0^{(i_1)}+\right.
$$

$$
+\frac{1}{2\sqrt{2}\pi^2}\sqrt{\beta_q}\left(\mu_q^{(i_2)}\zeta_0^{(i_1)}-2\mu_q^{(i_1)}\zeta_0^{(i_2)}\right)+
$$

$$
+\frac{1}{2\sqrt{2}}\sum_{r=1}^{q}\left(-\frac{1}{\pi r}\zeta_{2r-1}^{(i_2)}\zeta_0^{(i_1)}+\frac{1}{\pi^2r^2}\left(\zeta_{2r}^{(i_2)}\zeta_0^{(i_1)}-2\zeta_{2r}^{(i_1)}\zeta_0^{(i_2)}\right)\right)-
$$

$$
-\frac{1}{2\pi^2}\sum_{\substack{r,l=1\\ r\ne l}}^{q}\frac{1}{r^2-l^2}\left(\zeta_{2r}^{(i_1)}\zeta_{2l}^{(i_2)}+\frac{l}{r}\zeta_{2r-1}^{(i_1)}\zeta_{2l-1}^{(i_2)}\right)+
$$

$$
+\sum_{r=1}^{q}\left(\frac{1}{4\pi r}\left(\zeta_{2r}^{(i_1)}\zeta_{2r-1}^{(i_2)}-\zeta_{2r-1}^{(i_1)}\zeta_{2r}^{(i_2)}\right)+\right.
$$

$$
\left.+\frac{1}{8\pi^2 r^2}\left(3\zeta_{2r-1}^{(i_1)}\zeta_{2r-1}^{(i_2)}+\zeta_{2r}^{(i_2)}\zeta_{2r}^{(i_1)}\right)\right)\Biggr), \tag{168}
$$

where the meaning of the notations included in (166), (12) is preserved.

A deep comparative analysis of the efficiency of application of Legendre polynomials and trigonometric functions to the numerical integration of Ito SDEs is given in [23], [39].

13. Theorems 6–8, 10–13 from Point of View of the Wong–Zakai Approximation

The iterated Ito stochastic integrals and solutions of Ito SDEs are complex and important functionals from the independent components $\mathbf{f}_s^{(i)}$, $i=1,\ldots,m$ of the multidimensional Wiener process $\mathbf{f}_s$, $s\in[0,T]$. Let $\mathbf{f}_s^{(i)p}$, $p\in\mathbb{N}$ be some approximation of $\mathbf{f}_s^{(i)}$, $i=1,\ldots,m$. Suppose that $\mathbf{f}_s^{(i)p}$ converges to $\mathbf{f}_s^{(i)}$, $i=1,\ldots,m$ if $p\to\infty$ in some sense and has differentiable sample trajectories.

A natural question arises: if we replace $\mathbf{f}_s^{(i)}$ by $\mathbf{f}_s^{(i)p}$, $i=1,\ldots,m$ in the functionals mentioned above, will the resulting functionals converge to the original functionals from the components $\mathbf{f}_s^{(i)}$, $i=1,\ldots,m$ of the multidimentional Wiener process $\mathbf{f}_s$? The answere to this question is negative in the general case. However, in the pioneering works of Wong E. and Zakai M. [78], [79], it was shown that under the special conditions and for some types of approximations of the Wiener process the answere is affirmative with one peculiarity: the convergence takes place to the iterated Stratonovich stochastic integrals and solutions of Stratonovich SDEs and not to iterated Ito stochastic integrals and solutions of Ito SDEs. The piecewise linear approximation as well as the regularization by convolution [78]-[80] relate the mentioned types of approximations of the Wiener process. The above approximation of stochastic integrals and solutions of SDEs is often called the Wong–Zakai approximation.

Let $\mathbf{f}_s$, $s\in[0,T]$ be an m-dimensional standard Wiener process with independent components $\mathbf{f}_s^{(i)}$, $i=1,\ldots,m$. It is well known that the following representation takes place [81], [82]

$$
\mathbf{f}_\tau^{(i)}-\mathbf{f}_t^{(i)}=\sum_{j=0}^{\infty}\int\limits_t^\tau\phi_j(s)ds\ \zeta_j^{(i)},\quad \zeta_j^{(i)}=\int\limits_t^T\phi_j(s)d\mathbf{f}_s^{(i)}, \tag{169}
$$

where $\tau\in[t,T]$, $t\ge 0$, $\{\phi_j(x)\}_{j=0}^{\infty}$ is an arbitrary complete orthonormal system of functions in the space $L_2([t,T])$, and $\zeta_j^{(i)}$ are independent standard Gaussian random variables for various i or j. Moreover, the series (169) converges for any $\tau\in[t,T]$ in the mean-square sense.

Let $\mathbf{f}_\tau^{(i)p}-\mathbf{f}_t^{(i)p}$ be the mean-square approximation of the process $\mathbf{f}_\tau^{(i)}-\mathbf{f}_t^{(i)}$, which has the following form

$$
\mathbf{f}_\tau^{(i)p}-\mathbf{f}_t^{(i)p}=\sum_{j=0}^{p}\int\limits_t^\tau\phi_j(s)ds\ \zeta_j^{(i)}. \tag{170}
$$

From (170) we obtain

$$d\mathbf{f}_{\tau}^{(i)p}=\sum_{j=0}^{p}\phi_j(\tau)\zeta_j^{(i)}d\tau. \tag{171}$$

Consider the following iterated Riemann–Stieltjes integral

$$\int\limits_t^T\psi_k(t_k)\ldots\int\limits_t^{t_2}\psi_1(t_1)d\mathbf{w}_{t_1}^{(i_1)p_1}\ldots d\mathbf{w}_{t_k}^{(i_k)p_k}, \tag{172}$$

where $p_1,\ldots,p_k\in\mathbb{N},\ \ i_1,\ldots,i_k=0,1,\ldots,m,$

$$d\mathbf{w}_{\tau}^{(i)p}=\begin{cases}d\mathbf{f}_{\tau}^{(i)p}\ \ \ \text{for}\ \ \ i=1,\ldots,m\\ \\ d\tau\ \ \ \ \ \ \ \text{for}\ \ \ i=0\end{cases}, \tag{173}$$

and $d\mathbf{f}_{\tau}^{(i)p}$ in defined by the relation (171).

Let us substitute (171) into (172)

$$\int\limits_t^T\psi_k(t_k)\ldots\int\limits_t^{t_2}\psi_1(t_1)d\mathbf{w}_{t_1}^{(i_1)p_1}\ldots d\mathbf{w}_{t_k}^{(i_k)p_k}=\sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k}C_{j_k\ldots j_1}\prod_{l=1}^{k}\zeta_{j_l}^{(i_l)}, \tag{174}$$

where

$$\zeta_j^{(i)}=\int\limits_t^T\phi_j(s)d\mathbf{w}_s^{(i)}$$

are independent standard Gaussian random variables for various i or j (in the case when $i\neq 0$), $\mathbf{w}_s^{(i)}=\mathbf{f}_s^{(i)}$ for $i=1,\ldots,m$ and $\mathbf{w}_s^{(0)}=s$,

$$C_{j_k\ldots j_1}=\int\limits_t^T\psi_k(t_k)\phi_{j_k}(t_k)\ldots\int\limits_t^{t_2}\psi_1(t_1)\phi_{j_1}(t_1)dt_1\ldots dt_k$$

is the Fourier coefficient.

To best of our knowledge [78]-[80] the approximations of the Wiener process in the Wong–Zakai approximation must satisfy fairly strong restrictions [80] (see Definition 7.1, pp. 480–481). Moreover, approximations of the Wiener process that are similar to (170) were not considered in [78], [79] (also see [80], Theorems 7.1, 7.2). Therefore, the proof of analogs of Theorems 7.1 and 7.2 [80] for approximations of the Wiener process based on its series expansion (169) should be carried out separately. Thus, the mean-square convergence of the right-hand side of (174) to the iterated Stratonovich stochastic integral (3) does not follow from the results of the papers [78], [79] (also see [80], Theorems 7.1, 7.2).

From the other hand, Theorems 8, 10–13 from this paper can be considered as the proof of the Wong–Zakai approximation for the iterated Stratonovich stochastic integrals (3) of multiplicities 2 to 6 based on the approximation (170) of the Wiener process. At that, the Riemann–Stieltjes integrals

(172) converge (according to Theorems 8, 10–13) to the appropriate Stratonovich stochastic integrals (3). Recall that $\{\phi_j(x)\}_{j=0}^{\infty}$ (see (169), (170), and Theorems 8, 10–13) is a complete orthonormal system of Legendre polynomials or trigonometric functions in the space $L_2([t,T])$.

To illustrate the above reasoning, consider two examples for the case $k=2$, $\psi_1(s)$, $\psi_2(s)\equiv 1$; $i_1,i_2=1,\ldots,m$.

The first example relates to the piecewise linear approximation of the multidimensional Wiener process (these approximations were considered in [78]-[80]).

Let $\mathbf{b}_{\Delta}^{(i)}(t)$, $t\in[0,T]$ be the piecewise linear approximation of the ith component $\mathbf{f}_t^{(i)}$ of the multidimensional standard Wiener process $\mathbf{f}_t$, $t\in[0,T]$ with independent components $\mathbf{f}_t^{(i)}$, $i=1,\ldots,m$, i.e.

$$\mathbf{b}_{\Delta}^{(i)}(t)=\mathbf{f}_{k\Delta}^{(i)}+\frac{t-k\Delta}{\Delta}\Delta\mathbf{f}_{k\Delta}^{(i)},$$

where

$$\Delta\mathbf{f}_{k\Delta}^{(i)}=\mathbf{f}_{(k+1)\Delta}^{(i)}-\mathbf{f}_{k\Delta}^{(i)},\quad t\in[k\Delta,(k+1)\Delta),\quad k=0,1,\ldots,N-1.$$

Note that w. p. 1

$$\frac{d\mathbf{b}_{\Delta}^{(i)}}{dt}(t)=\frac{\Delta\mathbf{f}_{k\Delta}^{(i)}}{\Delta},\quad t\in[k\Delta,(k+1)\Delta),\quad k=0,1,\ldots,N-1. \tag{175}$$

Consider the following iterated Riemann–Stieltjes integral

$$\int\limits_0^T\int\limits_0^s d\mathbf{b}_{\Delta}^{(i_1)}(\tau)d\mathbf{b}_{\Delta}^{(i_2)}(s),\quad i_1,i_2=1,\ldots,m.$$

Using (175) and the additive property of Riemann–Stieltjes integrals, we can write w. p. 1

$$\int\limits_0^T\int\limits_0^s d\mathbf{b}_{\Delta}^{(i_1)}(\tau)d\mathbf{b}_{\Delta}^{(i_2)}(s)=\int\limits_0^T\int\limits_0^s \frac{d\mathbf{b}_{\Delta}^{(i_1)}}{d\tau}(\tau)d\tau\frac{d\mathbf{b}_{\Delta}^{(i_2)}}{ds}(s)ds=$$

$$=\sum_{l=0}^{N-1}\int\limits_{l\Delta}^{(l+1)\Delta}\left(\sum_{q=0}^{l-1}\int\limits_{q\Delta}^{(q+1)\Delta}\frac{\Delta\mathbf{f}_{q\Delta}^{(i_1)}}{\Delta}d\tau+\int\limits_{l\Delta}^{s}\frac{\Delta\mathbf{f}_{l\Delta}^{(i_1)}}{\Delta}d\tau\right)\frac{\Delta\mathbf{f}_{l\Delta}^{(i_2)}}{\Delta}ds=$$

$$=\sum_{l=0}^{N-1}\sum_{q=0}^{l-1}\Delta\mathbf{f}_{q\Delta}^{(i_1)}\Delta\mathbf{f}_{l\Delta}^{(i_2)}+\frac{1}{\Delta^2}\sum_{l=0}^{N-1}\Delta\mathbf{f}_{l\Delta}^{(i_1)}\Delta\mathbf{f}_{l\Delta}^{(i_2)}\int\limits_{l\Delta}^{(l+1)\Delta}\int\limits_{l\Delta}^{s}d\tau ds=$$

$$=\sum_{l=0}^{N-1}\sum_{q=0}^{l-1}\Delta\mathbf{f}_{q\Delta}^{(i_1)}\Delta\mathbf{f}_{l\Delta}^{(i_2)}+\frac{1}{2}\sum_{l=0}^{N-1}\Delta\mathbf{f}_{l\Delta}^{(i_1)}\Delta\mathbf{f}_{l\Delta}^{(i_2)}. \tag{176}$$

Using (176) and the standard relation between Stratonovich and Ito stochastic integrals, it is not difficult to show that

$$\underset{N\to\infty}{\text{l.i.m.}} \int\limits_0^T \int\limits_0^s d\mathbf{b}_{\Delta}^{(i_1)}(\tau) d\mathbf{b}_{\Delta}^{(i_2)}(s) = \int\limits_0^T \int\limits_0^s d\mathbf{f}_{\tau}^{(i_1)} d\mathbf{f}_{s}^{(i_2)} + \frac{1}{2}\mathbf{1}_{\{i_1=i_2\}} \int\limits_0^T ds =$$

$$= \int\limits_0^{*T} \int\limits_0^{*s} d\mathbf{f}_{\tau}^{(i_1)} d\mathbf{f}_{s}^{(i_2)}, \tag{177}$$

where $\Delta \to 0$ if $N \to \infty$ $(N\Delta = T)$.

Obviously, (177) agrees with Theorem 7.1 (see [80], p. 486).

The next example relates to the approximation of the Wiener process based on its series expansion (169) for $t = 0$, where $\{\phi_j(x)\}_{j=0}^{\infty}$ is a complete orthonormal system of Legendre polynomials or trigonometric functions in the space $L_2([0,T])$.

Consider the following iterated Riemann–Stieltjes integral

$$\int\limits_0^T \int\limits_0^s d\mathbf{f}_{\tau}^{(i_1)p} d\mathbf{f}_{s}^{(i_2)p}, \quad i_1, i_2 = 1, \ldots, m, \tag{178}$$

where $d\mathbf{f}_{\tau}^{(i)p}$ is defined by the relation (171).

Let us substitute (171) into (178)

$$\int\limits_0^T \int\limits_0^s d\mathbf{f}_{\tau}^{(i_1)p} d\mathbf{f}_{s}^{(i_2)p} = \sum_{j_1,j_2=0}^{p} C_{j_2 j_1} \zeta_{j_1}^{(i_1)} \zeta_{j_2}^{(i_2)}, \tag{179}$$

where

$$C_{j_2 j_1} = \int\limits_0^T \phi_{j_2}(s) \int\limits_0^s \phi_{j_1}(\tau) d\tau ds$$

is the Fourier coefficient; another notations are the same as in (174).

As we noted above, approximations of the Wiener process that are similar to (170) were not considered in [78], [79] (also see Theorems 7.1, 7.2 in [80]). Furthermore, the extension of the results of Theorems 7.1 and 7.2 [80] to the case under consideration is not obvious.

However, the authors of the works [2] (Sect. 5.8, pp. 202–204), [3] (pp. 82-84), [83] (pp. 438-439), [84] (pp. 263-264) use the Wong–Zakai approximation [78]-[80] (without rigorous proof) within the frames of the approach [4] based on the series expansion of the Brownian bridge process.

On the other hand, we can apply the theory built in Chapters 1 and 2 of the monographs [58]-[61]. More precisely, using Theorem 8 from this paper we obtain from (179) the desired result

$$\underset{p\to\infty}{\text{l.i.m.}} \int\limits_0^T \int\limits_0^s d\mathbf{f}_{\tau}^{(i_1)p} d\mathbf{f}_{s}^{(i_2)p} = \underset{p\to\infty}{\text{l.i.m.}} \sum_{j_1,j_2=0}^{p} C_{j_2 j_1} \zeta_{j_1}^{(i_1)} \zeta_{j_2}^{(i_2)} =$$

$$
=\int\limits_0^{*T}\int\limits_0^{*s} d\mathbf{f}_{\tau}^{(i_1)}d\mathbf{f}_s^{(i_2)}. \tag{180}
$$

From the other hand, by Theorem 6 (see (94)) for the case $k=2$ we obtain from (179) the following relation

$$
\underset{p\to\infty}{\text{l.i.m.}}\int\limits_0^T\int\limits_0^s d\mathbf{f}_{\tau}^{(i_1)p}d\mathbf{f}_s^{(i_2)p}=\underset{p\to\infty}{\text{l.i.m.}}\sum_{j_1,j_2=0}^{p}C_{j_2j_1}\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}=
$$

$$
=\underset{p\to\infty}{\text{l.i.m.}}\sum_{j_1,j_2=0}^{p}C_{j_2j_1}\left(\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}-\mathbf{1}_{\{i_1=i_2\}}\mathbf{1}_{\{j_1=j_2\}}\right)+\mathbf{1}_{\{i_1=i_2\}}\sum_{j_1=0}^{\infty}C_{j_1j_1}=
$$

$$
=\int\limits_0^T\int\limits_0^s d\mathbf{f}_{\tau}^{(i_1)}d\mathbf{f}_s^{(i_2)}+\mathbf{1}_{\{i_1=i_2\}}\sum_{j_1=0}^{\infty}C_{j_1j_1}. \tag{181}
$$

Since

$$
\sum_{j_1=0}^{\infty}C_{j_1j_1}=\frac{1}{2}\sum_{j_1=0}^{\infty}\left(\int\limits_0^T\phi_j(\tau)d\tau\right)^2=\frac{1}{2}\left(\int\limits_0^T\phi_0(\tau)d\tau\right)^2=\frac{1}{2}\int\limits_0^T ds,
$$

then from (181) and the standard relation between Stratonovich and Ito stochastic integrals we obtain (180).

TO NUMERICAL MODELING WITH STRONG ORDERS 1.0, 1.5, AND 2.0 OF CONVERGENCE FOR MULTIDIMENSIONAL DYNAMICAL SYSTEMS WITH RANDOM DISTURBANCES

DMITRIY F. KUZNETSOV

Abstract. The article is devoted to explicit one-step numerical methods with strong orders 1.0, 1.5, and 2.0 of convergence for Ito stochastic differential equations with multidimensional and non-commutative noise. For numerical modeling of iterated Ito stochastic integrals with multiplicities 1 to 4 we use the method of multiple Fourier–Legendre series converging in the sense of norm in Hilbert space $L_2([t,T]^k)$, $k = 1,2,3,4$. The article is addressed to engineers who use numerical modeling in stochastic control and for solving the nonlinear filtering problem.

Contents

1. Introduction

The Ito stochastic differential equations (SDEs) are known to be adequate mathematical models of the dynamical systems of various physical nature subjected to random perturbations [2]-[5]. On the assumption of strong convergence criterion [2], the need for numerical integration of Ito SDEs arises

Mathematics Subject Classification: 60H05, 60H10, 42B05, 42C10.

Keywords: Iterated Ito stochastic integral, Iterated Stratonovich stochastic integral, Ito stochastic differential equation, Generalized multiple Fourier series, Multiple Fourier–Legendre series, Numerical method, Strong convergence, Numerical modeling, Mean-square convergence.

at solving the different mathematical problems. Among them we mention the following problems: stochastic optimal control (also with incomplete data) [2], [6], signal filtering in random noise in various formulations [2], [6], estimating the parameters of stochastic systems [2], [3]. It is common knowledge that one of the promising approaches to the numerical integration of Ito SDEs is the approach based on the stochastic analogues of the Taylor formula, the so-called Taylor–Ito and Taylor–Stratonovich expansions [2], [3], [7]-[12]. This approach makes use of finite discretization of the time variable and implies numerical modeling of the solution of Ito SDE at the discrete time instants using the stochastic analogues of the Taylor formula obtained by iterative application of the Ito formula.

Let $(\Omega, \mathrm{F}, \mathsf{P})$ be a complete probability space, let $\{\mathrm{F}_t, t \in [0,T]\}$ be a nondecreasing right-continous family of σ-algebras of F, and let $\mathbf{f}_t$ be a standard m-dimensional Wiener stochastic process, which is F_t-measurable for any $t \in [0,T]$. We assume that the components $\mathbf{f}_t^{(i)}$ $(i = 1,\ldots,m)$ of this process are independent. Consider an Ito SDE in the integral form

$$\mathbf{x}_t = \mathbf{x}_0 + \int\limits_0^t \mathbf{a}(\mathbf{x}_\tau,\tau)d\tau + \int\limits_0^t B(\mathbf{x}_\tau,\tau)d\mathbf{f}_\tau, \quad \mathbf{x}_0 = \mathbf{x}(0,\omega), \quad \omega \in \Omega. \tag{1}$$

Here $\mathbf{x}_t$ is some n-dimensional stochastic process satisfying to the Ito SDE (1). The nonrandom functions $\mathbf{a}: \mathbb{R}^n \times [0,T] \to \mathbb{R}^n$, $B: \mathbb{R}^n \times [0,T] \to \mathbb{R}^{n\times m}$ guarantee the existence and uniqueness up to stochastic equivalence of a solution of the Ito SDE (1) [1]. The second integral on the right-hand side of (1) is interpreted as an Ito stochastic integral. Let $\mathbf{x}_0$ be an n-dimensional random variable, which is F_0-measurable and $\mathsf{M}\{|\mathbf{x}_0|^2\} < \infty$ (M denotes a mathematical expectation). We assume that $\mathbf{x}_0$ and $\mathbf{f}_t - \mathbf{f}_0$ are independent when $t > 0$.

The most important feature of stochastic analogues of the Taylor formula [2], [3], [7]-[12] for solutions of the Ito SDE (1) consists in the presence of iterated Ito and Stratonovich stochastic integrals. These stochastic integrals are complicated functionals from the components of the multidimensional Wiener process. In one of the most general forms of notation of the present paper, the aforementioned iterated Ito and Stratonovich stochastic integrals are given, respectively, by

$$J[\psi^{(k)}]_{T,t} = \int\limits_t^T \psi_k(t_k)\ldots\int\limits_t^{t_2} \psi_1(t_1)d\mathbf{w}_{t_1}^{(i_1)}\ldots d\mathbf{w}_{t_k}^{(i_k)}, \tag{2}$$

$$J^*[\psi^{(k)}]_{T,t} = \int\limits_t^{*T} \psi_k(t_k)\ldots\int\limits_t^{*t_2} \psi_1(t_1)d\mathbf{w}_{t_1}^{(i_1)}\ldots d\mathbf{w}_{t_k}^{(i_k)}, \tag{3}$$

where every $\psi_l(\tau)$ $(l = 1,\ldots,k)$ is a nonrandom function on $[t,T]$, $\mathbf{w}_\tau^{(i)} = \mathbf{f}_\tau^{(i)}$ for $i = 1,\ldots,m$ and $\mathbf{w}_\tau^{(0)} = \tau$,

$$\int \text{ and } \int\limits^{*}$$

denote Ito and Stratonovich stochastic integrals, respectively, $i_1,\ldots,i_k = 0,1,\ldots,m$ (in this paper, we use the definition of the Stratonovich stochastic integral from [2]).

Consequently, the systems of stochastic integrals like (2), (3) play an important part in solving the problem of numerical integration of the Ito SDEs (1). In terms of the mean-square convergence criterion, the problem of efficient joint numerical modeling of the totalities of stochastic integrals of the kind (2), (3) (the case of a multidimensional Wiener process) is not only important, but also sufficiently complex in both the theoretical and computational terms. We note that the aforementioned problem does not arise at using the Euler method for the Ito SDEs (1) [2], [7]. However, despite its simplicity, the Euler method under the standard conditions [2], [7] for coefficients of the Ito SDE (1) has the mean-square convergence order 0.5 [2], [7], and its accuracy is insufficient to solve a number of practical problems. This fact motivates one to construct numerical methods for the Ito SDEs (1) having higher orders of strong convergence.

It may seem at the first glance that the stochastic integrals from the families (2), (3) can be approximated by the multiple integral sums. However, this leads to partitioning of the interval of integration $[t, T]$ of the iterated stochastic integrals. The mentioned interval is already a small value because it represents a step of integration in the numerical methods for Ito SDEs. As the numerical experiments show [13], the above partitioning gives rise to an unacceptably high computing costs.

A number of publications are devoted to methods of numerical modeling of families of stochastic integrals like (2), (3), which do not use partitioning of the aforementioned interval of integration $[t, T]$ and converge in the mean-square sense. It was suggested in [7] to use converging in the mean-square sense trigonometric Fourier expansions of the Wiener processes, which underlie the iterated stochastic integral. By this method, the mean-square approximations of the simplest integrals like (2) of multiplicities 1 and 2 ($k = 2$; $\psi_1(s)$, $\psi_2(s) \equiv 1$; $i_1, i_2 = 0, 1, \ldots, m$) were obtained in [7]. These approximations were used in [7] to construct a numerical method for the Ito SDE (1), which under certain conditions [7] has the order 1.0 of the mean-square convergence and is known as the Milstein method.

A more general method of the mean-square approximation of the stochastic integrals like (3), which based on the generalized iterated Fourier series was proposed in [14], [15]. It enables one to use the complete orthonormal systems of Legendre polynomials and trigonometric functions in the space $L_2([t, T])$. In virtue of its characteristics, the method from [7] admits the application of only trigonometric basis functions.

In [2], [3], [16], [17] an attempt was made to extend the method from [7] to the stochastic integrals like (3) for $k = 3$; $\psi_1(s), \ldots, \psi_3(s) \equiv 1$; $i_1, \ldots, i_3 = 0, 1, \ldots, m$.

We note that the methods [2], [3], [16], [17] ($k = 3$) and [14] ($k \geq 3$) lead to iterated application of the operation of limit transition. As a result, these methods allow us to represent the integrals (3) as iterated series of products of standard Gaussian random variables (the operation of passing to the limit is carried out iteratively). This fact is essential and imposes some constraints related with the method of summation of the aforementioned series [2], [3], [14], [16], [17] if we consider the stochastic integrals like (2), (3) of multiplicities 3 and higher (we mean here at least triple integration over the Wiener processes). Additionally, the aforementioned methods in virtue of their features prevent precise calculation of the mean-square error of approximation with the exception of the simplest iterated stochastic integrals of multiplicity 2. This means that at the stage of realization of the numerical methods for Ito SDEs, possibly, one will need to allow for the redundant terms of the expansions of iterated stochastic integrals, which increases the computing costs and reduces efficiency of the numerical methods.

We notice [2], [13] that to construct numerical methods for the Ito SDE (1) having orders 1.5 and 2.0 of strong convergence one has to approximate (proceeding from the mean-square convergence criterion) the stochastic integrals not only of multiplicities 1 and 2, but also 3 and 4 from the families (2), (3). Some publications [2], [7], [8] contain the aforementioned numerical schemes with orders 1.5 and 2.0 of strong convergence but without the contained in them efficient procedures of the mean-square approximation of iterated stochastic integrals for the case of a multidimensional Wiener process, which corresponds to $i_1, \ldots, i_4 = 1, \ldots, m$ in (2), (3). Part of publications (see, for example, [2], [8]) contain representations of the stochastic integrals of multiplicities 3 and 4 like (2), (3) only for the simplest case $\psi_1(s), \ldots, \psi_4(s) \equiv 1$, $i_1 = \ldots = i_4$ (representations based on the Hermit polynomials). Some publications [8] use other simplifying assumptions about the Ito SDE (1). For example, assumptions are made about additivity of the stochastic perturbation or its smallness, which corresponds, respectively, to $B(\mathbf{x},t) \equiv C(t)$ or $B(\mathbf{x},t) \equiv \varepsilon D(\mathbf{x},t)$. Here, $\varepsilon > 0$ is a fixed small number and $C : [0,T] \to \mathbb{R}^{n\times m}$, $D : \mathbb{R}^n \times [0,T] \to \mathbb{R}^{n\times m}$.

In the case at hand, the problem of efficient joint numerical modeling of the iterated stochastic integrals from the families (2), (3) becomes simpler due to the absence of some terms in the expressions of the numerical methods or the possibility of disregarding some of the aforementioned terms. Also, one may encounter approximation method [18] for iterated stochastic integrals of multiplicity 3 from the familiy (2) for $\psi_1(s)$, $\psi_2(s)$, $\psi_3(s) \equiv 1$ $(i_1, i_2, i_3 = 1, \ldots, m)$ based on partitioning of the interval of integration $[t, T]$ of the iterated stochastic integrals and using multiple integral sums whose disadvantages were mentioned above.

The present paper is devoted to the development of efficient procedures for joint numerical modeling of the iterated stochastic integrals from the families (2), (3) in accordance with the mean-square criterion of convergence. At that we do not use any essential simplifying assumptions, that is, the Wiener process involved in the Ito SDE (1) is assumed to be the multidimensional one which corresponds to the condition $i_1, \ldots, i_k = 0, 1, \ldots, m$ in (2), (3). In addition, it is assumed that the stochastic perturbation is nonadditive (the simplifying assumptions about the function $B : \mathbb{R}^n \times [0,T] \to \mathbb{R}^{n\times m}$ involved in (1) are not introduced). Additionally, the functions $\psi_1(s), \ldots, \psi_k(s)$ in (2), (3) are, generally speaking, assumed to be different. Moreover, the assumption of commutativity [2], [3] of the stochastic perturbation is also not introduced.

More precisely, in this paper we consider the method of the mean-square approximation of iterated Ito stochastic integrals from the family (2), which is based on the generalized multiple (not iterated) Fourier series converging in the sense of norm in Hilbert space $L_2([t,T]^k)$ $(k \in \mathbb{N})$ [13] (2006), [19]-[55]. Multiple series (the operation of limit transition is implemented only once) are more convenient for approximation than the iterated ones (iterated application of the operation of limit transition), since partial sums of multiple series converge for any possible case of convergence to infinity of their upper limits of summation (let us denote them as $p_1, \ldots, p_k$). For example, when $p_1 = \ldots = p_k = p \to \infty$. For iterated series, the condition $p_1 = \ldots = p_k = p \to \infty$ obviously does not guarantee the convergence of this series. However, in [2] (Sect. 5.8, pp. 202–204), [3] (pp. 82-84), [16] (pp. 438-439), [17] (pp. 263-264) the authors use (without rigorous proof) the condition $p_1 = p_2 = p_3 = p \to \infty$ within the frames of the approach based on the Karhunen–Loeve expansion of the Brownian bridge process [7] together with the Wong–Zakai approximation [56]-[58]. See discussions in [32] (Sect. 2.18, 6.2), [33], [34] (Sect. 2.6.2, 6.2) for details.

2. Numerical Schemes With the Orders 1.0, 1.5, and 2.0 of Strong Convergence

Consider the partition $\{\tau_j\}_{j=0}^{N}$ of the segment $[0,T]$ with the partition rank Δ_N such that

$$0 = \tau_0 < \tau_1 < \ldots < \tau_N = T.$$

Denote by $\mathbf{y}_{\tau_j} \stackrel{\sf def}{=} \mathbf{y}_j;\ j = 0, 1, \ldots, N$ the discrete approximation of the process $\mathbf{x}_t$, $t \in [0,T]$ (solution of the Ito SDE (1) corresponding to the maximal step of discretization Δ_N.

Definition 1 [2]. *We will say that the discrete approximation* (*numerical method*) $\mathbf{y}_j;\ j = 0, 1, \ldots, N$ *corresponding to the maximal step of discretization* Δ_N *converges strongly with the order* $\gamma > 0$ *at the time instant* T *to the process* $\mathbf{x}_t$, $t \in [0,T]$ *if there exist a constant* $C > 0$ *independent of* Δ_N *and a number* $\delta > 0$ *such that*

$$\mathsf{M}\left\{|\mathbf{x}_T - \mathbf{y}_T|\right\} \le C(\Delta_N)^{\gamma} \qquad (4)$$

for all $\Delta_N \in (0, \delta)$.

We note that the authors of some publications [7], [8] prefer to consider the mean-square convergence instead of the strong convergence.

Definition 2 [7], [8]. *We will say that the numerical method* $\mathbf{y}_j;\ j=0,1,\ldots,N$ *converges in the mean-square sense with the order* $\gamma>0$ *to the process* $\mathbf{x}_t,\ t\in[0,T]$ *if there exist a constant* $C>0$ *independent of* Δ_N, j *and a number* $\delta>0$ *such that*

$$\left(\mathsf{M}\left\{|\mathbf{x}_j-\mathbf{y}_j|^2\right\}\right)^{1/2}\le C(\Delta_N)^{\gamma}$$

for all $\Delta_N\in(0,\delta)$.

Here, $\mathbf{x}_{\tau_j}\stackrel{\sf def}{=}\mathbf{x}_j;\ j=0,1,\ldots,N$.

We notice that sometimes the condition (4) in Definition 1 is replaced by the condition [2]

$$\mathsf{M}\left\{|\mathbf{x}_j-\mathbf{y}_j|\right\}\le C(\Delta_N)^{\gamma}\quad (j=0,1,\ldots,N)$$

At that, the constant C is independent of Δ_N and j.

Strong convergence follows, obviously, from the mean-square convergence in virtue of the Lyapunov inequality. In what follows, we rely on Definition 1 of strong convergence.

Consider the following explicit one-step numerical method

$$\mathbf{y}_{p+1}=\mathbf{y}_p+\sum_{i=1}^m B_i\hat I^{(i)}_{(0)\tau_{p+1},\tau_p}+\Delta\mathbf{a}+\sum_{i,j=1}^m G_jB_i\hat I^{(ji)}_{(00)\tau_{p+1},\tau_p}+$$
$$+\sum_{i=1}^m\left(G_i\mathbf{a}\left(\Delta\hat I^{(i)}_{(0)\tau_{p+1},\tau_p}+\hat I^{(i)}_{(1)\tau_{p+1},\tau_p}\right)-LB_i\hat I^{(i)}_{(1)\tau_{p+1},\tau_p}\right)+$$
$$+\sum_{i,j,l=1}^m G_lG_jB_i\hat I^{(lji)}_{(000)\tau_{p+1},\tau_p}+\frac{\Delta^2}{2}L\mathbf{a}\tag{5}$$

corresponding to the constant discretization step $\Delta=T/N$ ($\tau_p=p\Delta;\ p=0,1,\ldots,N;\ N>1$), where $\hat I^{(i_1\ldots i_k)}_{(l_1\ldots l_k)s,t}$ denotes approximation of the iterated Ito stochastic integral

$$I^{(i_1\ldots i_k)}_{(l_1\ldots l_k)s,t}=\int\limits_t^s(t-\tau_k)^{l_k}\ldots\int\limits_t^{\tau_2}(t-\tau_1)^{l_1}d\mathbf{f}^{(i_1)}_{\tau_1}\ldots d\mathbf{f}^{(i_k)}_{\tau_k},\tag{6}$$

and

$$L=\frac{\partial}{\partial t}+\sum_{i=1}^n\mathbf{a}_i(\mathbf{x},t)\frac{\partial}{\partial\mathbf{x}_i}+\frac{1}{2}\sum_{j=1}^m\sum_{l,i=1}^n B_{lj}(\mathbf{x},t)B_{ij}(\mathbf{x},t)\frac{\partial^2}{\partial\mathbf{x}_l\partial\mathbf{x}_i},$$

$$G_i=\sum_{j=1}^n B_{ji}(\mathbf{x},t)\frac{\partial}{\partial\mathbf{x}_j}\quad(i=1,\ldots,m),$$

$l_1,\ldots,l_k=0,1,2\ldots;\ i_1,\ldots,i_k=1,\ldots,m;\ k=1,2,\ldots;$ B_i and B_{ij} are, respectively, the ith column and ijth element of the matrix function B; $\mathbf{a}_i$ and $\mathbf{x}_i$ are, respectively, the ith components of the vector function $\mathbf{a}$ and column $\mathbf{x}$; the columns

$$B_i,\quad \mathbf{a},\quad G_jB_i,\quad G_i\mathbf{a},\quad LB_i,\quad G_lG_jB_i,\quad L\mathbf{a}$$

are calculated at the point $(\mathbf{y}_p, p)$.

The numerical scheme (5) can be found, for example, in a somewhat different form in [2], [7], [8]. The difference here lies in that the author of this work used in (5) the relation

$$\Delta I^{(i)}_{(0)\tau_{p+1},\tau_p} + I^{(i)}_{(1)\tau_{p+1},\tau_p} = \int\limits_{\tau_p}^{\tau_{p+1}} \int\limits_{\tau_p}^{\tau} d\mathbf{f}^{(i)}_s d\tau \tag{7}$$

which follows with probability 1 from the Ito formula and enables one to reduce by one the number of iterated Ito stochastic integrals to be approximated. This is due to the fact that the Ito stochastic integral on the right-hand side of (7) is expressed as a linear combination of the Ito stochastic integrals

$$I^{(i)}_{(0)\tau_{p+1},\tau_p} \quad \text{and} \quad I^{(i)}_{(1)\tau_{p+1},\tau_p},$$

whose approximations are already included in the right-hand side of (5).

It is common knowledge that under certain conditions [2] the discrete approximation (numerical method) (5) has the order 1.5 of strong convergence. Among the aforementioned conditions we note only the condition for approximations of the iterated Ito stochastic integrals involved in (5)

$$\mathsf{M}\left\{\left(I^{(i_1\ldots i_k)}_{(l_1\ldots l_k)\tau_{p+1},\tau_p} - \hat{I}^{(i_1\ldots i_k)}_{(l_1\ldots l_k)\tau_{p+1},\tau_p}\right)^2\right\} \le C\Delta^r, \tag{8}$$

where $r = 4$ and the constant C is independent of Δ, because the present paper deals mostly with the approximation of the aforementioned stochastic integrals.

Conditions somewhat different from [2] are given in [8]. Under them the numerical method (5) has the order 1.5 of the mean-square convergence.

Note that the Milstein method [7] (method with the order 1.0 of strong convergence) corresponds to the first line in (5).

Consider the explicit one-step numerical method with the order 2.0 of strong convergence given by

$$\mathbf{y}_{p+1} = \mathbf{y}_p + \sum_{i=1}^{m} B_i \hat{I}^{(i)}_{(0)\tau_{p+1},\tau_p} + \Delta\mathbf{a} + \sum_{i,j=1}^{m} G_j B_i \hat{I}^{(ji)}_{(00)\tau_{p+1},\tau_p} +$$

$$+ \sum_{i=1}^{m}\left(G_i\mathbf{a}\left(\Delta\hat{I}^{(i)}_{(0)\tau_{p+1},\tau_p} + \hat{I}^{(i)}_{(1)\tau_{p+1},\tau_p}\right) - LB_i\hat{I}^{(i)}_{(1)\tau_{p+1},\tau_p}\right) +$$

$$+ \sum_{i,j,l=1}^{m} G_l G_j B_i \hat{I}^{(lji)}_{(000)\tau_{p+1},\tau_p} + \frac{\Delta^2}{2} L\mathbf{a} +$$

$$+ \sum_{i,j=1}^{m}\Biggl(G_0^{(j)} LB_i\left(\hat{I}^{(ji)}_{(10)\tau_{p+1},\tau_p} - \hat{I}^{(ji)}_{(01)\tau_{p+1},\tau_p}\right) - LG_jB_i\hat{I}^{(ji)}_{(10)\tau_{p+1},\tau_p} +$$

$$+ G_jG_i\mathbf{a}\left(\hat{I}^{(ji)}_{(01)\tau_{p+1},\tau_p} + \Delta\hat{I}^{(ji)}_{(00)\tau_{p+1},\tau_p}\right)\Biggr) +$$

$$+ \sum_{i,j,l,r=1}^{m} G_r G_l G_j B_i \hat{I}^{(rlji)}_{(0000)\tau_{p+1},\tau_p}, \tag{9}$$

where notation corresponds to (5).

The numerical scheme (9) can be found in another representation in [2], [8]. In this case the distinctions are due to the fact that along with (7) the author used in (9) the equalities

$$I_{(01)\tau_{p+1},\tau_p}^{(ji)} + \Delta I_{(00)\tau_{p+1},\tau_p}^{(ji)} = \int\limits_{\tau_p}^{\tau_{p+1}} \int\limits_{\tau_p}^{\theta} \int\limits_{\tau_p}^{\tau} d\mathbf{f}_s^{(j)} d\mathbf{f}_\tau^{(i)} d\theta \qquad (10)$$

$$I_{(10)\tau_{p+1},\tau_p}^{(ji)} - I_{(01)\tau_{p+1},\tau_p}^{(ji)} = \int\limits_{\tau_p}^{\tau_{p+1}} \int\limits_{\tau_p}^{\theta} \int\limits_{\tau_p}^{\tau} d\mathbf{f}_s^{(j)} d\tau d\mathbf{f}_\theta^{(i)}, \qquad (11)$$

which follow with probability 1 from the Ito formula and enable one to reduce by one more unit the number of iterated Ito stochastic integrals to be approximated. This is due to the fact that the Ito stochastic integrals on the right-hand sides of (10) and (11) are expressed as linear combinations of the Ito stochastic integrals

$$I_{(01)\tau_{p+1},\tau_p}^{(ji)}, \quad I_{(10)\tau_{p+1},\tau_p}^{(ji)}, \quad I_{(00)\tau_{p+1},\tau_p}^{(ji)},$$

whose approximations are already included in the right-hand side of (9).

We notice that under certain conditions [2] the numerical method (9) has the order 2.0 of strong convergence. Among the aforementioned conditions we mark only the condition (8) for $r = 5$ intended for approximations of the iterated Ito stochastic integrals included in (9).

Some modifications of the numerical methods (5) and (9) were constructed in [2], [8]. Among which there are finite-difference methods of the Runge–Kutta type as well as the implicit and two-step methods (also see [13], [19]-[22], [30]-[34]). In all aforementioned methods, however, a need arises for efficient joint mean-square approximation of the iterated Ito stochastic integrals of multiplicities 1 to 4. The collection of these integrals is the same as in the numerical methods (5) and (9).

3. Expansion of Iterated Ito Stochastic Integrals of Multiplicity k ($k \in \mathbb{N}$) Based on Generalized Multiple Fourier Series

An efficient mean-square approximation method for the iterated Ito stochastic integrals like (2) was proposed and developed by the author of this article in [13], [19]-[55] (see Theorems 1, 2 below). This method based on the generalized multiple Fourier series converging in the mean-square sense in the space $L_2([t,T]^k)$, $k \in \mathbb{N}$. At that the method [13], [19]-[55] allows to use different complete orthonormal systems of functions in the space $L_2([t,T]^k)$, $k \in \mathbb{N}$. In this article, we use the system of Legendre polynomials, which has a series of advantages over the system of trigonometric functions in the framework of the considered problem [43], [44]. Moreover, in this method the passage to the limit is carried out only once, which leads to a correct choice of the lengths of sequences of the standard Gaussian random variables required to approximate the iterated Ito stochastic integrals.

Suppose that every $\psi_l(\tau)$ $(l = 1, \ldots, k)$ is a nonrandom function from the space $L_2([t,T])$. Define the following function on the hypercube $[t,T]^k$

$$K(t_1,\ldots,t_k) = \begin{cases} \psi_1(t_1)\ldots\psi_k(t_k) & \text{for } t_1 < \ldots < t_k \\ & \\ 0 & \text{otherwise} \end{cases}, \quad t_1,\ldots,t_k \in [t,T], \quad k \geq 2, \qquad (12)$$

and $K(t_1) \equiv \psi_1(t_1)$ for $t_1 \in [t,T]$.

Suppose that $\{\phi_j(x)\}_{j=0}^{\infty}$ is a complete orthonormal system of functions in the space $L_2([t,T])$. The function $K(t_1,\ldots,t_k)$ belongs to the space $L_2([t,T]^k)$. At this situation it is well known that the generalized multiple Fourier series of $K(t_1,\ldots,t_k) \in L_2([t,T]^k)$ is converging to $K(t_1,\ldots,t_k)$ in the hypercube $[t,T]^k$ in the mean-square sense, i.e.

$$\lim_{p_1,\ldots,p_k\to\infty} \left\| K(t_1,\ldots,t_k) - \sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k} C_{j_k\ldots j_1}\prod_{l=1}^{k}\phi_{j_l}(t_l)\right\|_{L_2([t,T]^k)} = 0,$$

where

$$C_{j_k\ldots j_1} = \int\limits_{[t,T]^k} K(t_1,\ldots,t_k)\prod_{l=1}^{k}\phi_{j_l}(t_l)dt_1\ldots dt_k \tag{13}$$

is the Fourier coefficient,

$$\|f\|_{L_2([t,T]^k)} = \left(\int\limits_{[t,T]^k} f^2(t_1,\ldots,t_k)dt_1\ldots dt_k\right)^{1/2},$$

and the Parceval equality

$$\int\limits_{[t,T]^k} K^2(t_1,\ldots,t_k)dt_1\ldots dt_k = \lim_{p_1,\ldots,p_k\to\infty}\sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k} C^2_{j_k\ldots j_1} \tag{14}$$

takes place.

Consider the partition $\{\tau_j\}_{j=0}^{N}$ of $[t,T]$ such that

$$t=\tau_0<\ldots<\tau_N=T,\quad \Delta_N=\max_{0\le j\le N-1}\Delta\tau_j\to 0\ \text{ if }\ N\to\infty,\quad \Delta\tau_j=\tau_{j+1}-\tau_j. \tag{15}$$

Theorem 1 [13] (2006), [19]-[55]. *Suppose that every $\psi_l(\tau)$ $(l=1,\ldots,k)$ is a continuous nonrandom function on $[t,T]$ and $\{\phi_j(x)\}_{j=0}^{\infty}$ is a complete orthonormal system of continuous functions in the space $L_2([t,T])$. Then*

$$J[\psi^{(k)}]_{T,t} = \underset{p_1,\ldots,p_k\to\infty}{\text{l.i.m.}}\sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k} C_{j_k\ldots j_1}\left(\prod_{l=1}^{k}\zeta_{j_l}^{(i_l)} - \right.$$

$$\left. - \underset{N\to\infty}{\text{l.i.m.}}\sum_{(l_1,\ldots,l_k)\in \mathrm{G}_k}\phi_{j_1}(\tau_{l_1})\Delta\mathbf{w}_{\tau_{l_1}}^{(i_1)}\ldots\phi_{j_k}(\tau_{l_k})\Delta\mathbf{w}_{\tau_{l_k}}^{(i_k)}\right), \tag{16}$$

where $J[\psi^{(k)}]_{T,t}$ is defined by (2),

$$
\mathrm{G}_k = \mathrm{H}_k \backslash \mathrm{L}_k, \quad \mathrm{H}_k = \{(l_1, \ldots, l_k) : \ l_1, \ldots, l_k = 0, \ 1, \ldots, N-1\},
$$

$$
\mathrm{L}_k = \{(l_1, \ldots, l_k) : \ l_1, \ldots, l_k = 0, \ 1, \ldots, N-1; \ l_g \neq l_r \ (g \neq r); \ g, r = 1, \ldots, k\},
$$

l.i.m. *is a limit in the mean-square sense*, $i_1, \ldots, i_k = 0, 1, \ldots, m$,

$$
\zeta_j^{(i)} = \int\limits_t^T \phi_j(s) d\mathbf{w}_s^{(i)} \tag{17}
$$

are independent standard Gaussian random variables for various i *or* j (*if* $i \neq 0$), $C_{j_k \ldots j_1}$ *is the Fourier coefficient* (13), $\Delta \mathbf{w}_{\tau_j}^{(i)} = \mathbf{w}_{\tau_{j+1}}^{(i)} - \mathbf{w}_{\tau_j}^{(i)}$ $(i = 0, 1, \ldots, m)$, $\{\tau_j\}_{j=0}^N$ *is a partition of the interval* $[t, T]$, *which satisfies the condition* (15).

It was shown in [20]-[27], [30]-[34] that Theorem 1 is valid for convergence in the mean of degree $2n$ ($n \in \mathbb{N}$). Moreover, the convergence with probability 1 in Theorem 1 is proved in [32]-[34], [63]. In addition, the complete orthonormal systems of Haar and Rademacher–Walsh functions in $L_2([t, T])$ also can be applied in Theorem 1 [13], [19]-[27], [30]-[34]. The modification of Theorem 1 for complete orthonormal with weigth $r(x) \geq 0$ systems of functions in the space $L_2([t, T])$ can be found in [31], [32]-[34], [40]. Application of Theorem 1 and Theorem 2 (see below) to the approximation of iterated stochastic integrals with respect to the infinite-dimensional Q-Wiener process contains in [32]-[34] (Chapter 7), [46], [55], [64], [66].

In order to evaluate the significance of Theorem 1 for practice we will demonstrate its transformed particular cases for $k = 1, \ldots, 5$ [13] (2006), [19]-[55] (the cases $k = 6, 7$ and $k > 7$ ($k \in \mathbb{N}$) can also be found in these papers)

$$

$$

where $\mathbf{1}_A$ is the indicator of the set A.

For further consideration, let us consider the generalization of formulas (18)–(22) for the case of an arbitrary multiplicity k ($k\in\mathbb{N}$) of the iterated Ito stochastic integral $J[\psi^{(k)}]_{T,t}$ defined by (2). In order to do this, let us introduce some notations. Consider the unordered set $\{1,2,\ldots,k\}$ and separate it into two parts: the first part consists of r unordered pairs (sequence order of these pairs is also unimportant) and the second one consists of the remaining $k-2r$ numbers. So, we have

$$
(\{\underbrace{\{g_1,g_2\},\ldots,\{g_{2r-1},g_{2r}\}}_{\text{part 1}}\},\{\underbrace{q_1,\ldots,q_{k-2r}}_{\text{part 2}}\}), \tag{23}
$$

where

$$
\{g_1,g_2,\ldots,g_{2r-1},g_{2r},q_1,\ldots,q_{k-2r}\}=\{1,2,\ldots,k\},
$$

braces mean an unordered set, and parentheses mean an ordered set.

We will say that (23) is a partition and consider the sum with respect to all possible partitions

$$\sum_{\substack{(\{\{g_1,g_2\},\ldots,\{g_{2r-1},g_{2r}\}\},\{q_1,\ldots,q_{k-2r}\})\\ \{g_1,g_2,\ldots,g_{2r-1},g_{2r},q_1,\ldots,q_{k-2r}\}=\{1,2,\ldots,k\}}} a_{g_1g_2,\ldots,g_{2r-1}g_{2r},q_1\ldots q_{k-2r}}. \tag{24}$$

Below there are several examples of sums in the form (24)

$$\sum_{\substack{(\{g_1,g_2\})\\ \{g_1,g_2\}=\{1,2\}}} a_{g_1g_2}=a_{12},$$

$$\sum_{\substack{(\{\{g_1,g_2\},\{g_3,g_4\}\})\\ \{g_1,g_2,g_3,g_4\}=\{1,2,3,4\}}} a_{g_1g_2g_3g_4}=a_{1234}+a_{1324}+a_{2314},$$

$$\sum_{\substack{(\{g_1,g_2\},\{q_1,q_2\})\\ \{g_1,g_2,q_1,q_2\}=\{1,2,3,4\}}} a_{g_1g_2,q_1q_2}=$$

$$=a_{12,34}+a_{13,24}+a_{14,23}+a_{23,14}+a_{24,13}+a_{34,12},$$

$$\sum_{\substack{(\{g_1,g_2\},\{q_1,q_2,q_3\})\\ \{g_1,g_2,q_1,q_2,q_3\}=\{1,2,3,4,5\}}} a_{g_1g_2,q_1q_2q_3}=$$

$$=a_{12,345}+a_{13,245}+a_{14,235}+a_{15,234}+a_{23,145}+a_{24,135}+$$
$$+a_{25,134}+a_{34,125}+a_{35,124}+a_{45,123},$$

$$\sum_{\substack{(\{\{g_1,g_2\},\{g_3,g_4\}\},\{q_1\})\\ \{g_1,g_2,g_3,g_4,q_1\}=\{1,2,3,4,5\}}} a_{g_1g_2,g_3g_4,q_1}=$$

$$=a_{12,34,5}+a_{13,24,5}+a_{14,23,5}+a_{12,35,4}+a_{13,25,4}+a_{15,23,4}+$$
$$+a_{12,54,3}+a_{15,24,3}+a_{14,25,3}+a_{15,34,2}+a_{13,54,2}+a_{14,53,2}+$$
$$+a_{52,34,1}+a_{53,24,1}+a_{54,23,1}.$$

Now we can write (16) as

$$J[\psi^{(k)}]_{T,t}=\underset{p_1,\ldots,p_k\to\infty}{\text{l.i.m.}}\sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k}C_{j_k\ldots j_1}\Biggl(\prod_{l=1}^{k}\zeta_{j_l}^{(i_l)}+\sum_{r=1}^{[k/2]}(-1)^r\times$$

$$\times\sum_{\substack{(\{\{g_1,g_2\},\ldots,\{g_{2r-1},g_{2r}\}\},\{q_1,\ldots,q_{k-2r}\})\\ \{g_1,g_2,\ldots,g_{2r-1},g_{2r},q_1,\ldots,q_{k-2r}\}=\{1,2,\ldots,k\}}}\prod_{s=1}^{r}\mathbf{1}_{\{i_{g_{2s-1}}=\,i_{g_{2s}}\neq 0\}}\mathbf{1}_{\{j_{g_{2s-1}}=\,j_{g_{2s}}\}}\prod_{l=1}^{k-2r}\zeta_{j_{q_l}}^{(i_{q_l})}\Biggr), \tag{25}$$

where $[x]$ is an integer part of a real number x; another notations are the same as in Theorem **1**.

In particular, from (25) for $k=5$ we obtain

$$
J[\psi^{(5)}]_{T,t} = \underset{p_1,\ldots,p_5\to\infty}{\text{l.i.m.}} \sum_{j_1=0}^{p_1}\ldots\sum_{j_5=0}^{p_5} C_{j_5\ldots j_1}\Biggl(\prod_{l=1}^{5}\zeta_{j_l}^{(i_l)} -
$$

$$
- \sum_{\substack{(\{g_1,g_2\},\{q_1,q_2,q_3\})\\ \{g_1,g_2,q_1,q_2,q_3\}=\{1,2,3,4,5\}}} \mathbf{1}_{\{i_{g_1}=\,i_{g_2}\ne 0\}}\mathbf{1}_{\{j_{g_1}=\,j_{g_2}\}}\prod_{l=1}^{3}\zeta_{j_{q_l}}^{(i_{q_l})} +
$$

$$
+ \sum_{\substack{(\{\{g_1,g_2\},\{g_3,g_4\}\},\{q_1\})\\ \{g_1,g_2,g_3,g_4,q_1\}=\{1,2,3,4,5\}}} \mathbf{1}_{\{i_{g_1}=\,i_{g_2}\ne 0\}}\mathbf{1}_{\{j_{g_1}=\,j_{g_2}\}}\mathbf{1}_{\{i_{g_3}=\,i_{g_4}\ne 0\}}\mathbf{1}_{\{j_{g_3}=\,j_{g_4}\}}\zeta_{j_{q_1}}^{(i_{q_1})}\Biggr).
$$

The last equality obviously agrees with (22).

Let us consider the generalization of Theorem 1 for the case of an arbitrary complete orthonormal systems of functions in the space $L_2([t,T])$ and $\psi_1(\tau),\ldots,\psi_k(\tau)\in L_2([t,T])$.

Theorem 2 [32] (Sect. 1.11), [39] (Sect. 15). *Suppose that* $\psi_1(\tau),\ldots,\psi_k(\tau)\in L_2([t,T])$ *and* $\{\phi_j(x)\}_{j=0}^{\infty}$ *is an arbitrary complete orthonormal system of functions in the space* $L_2([t,T])$. *Then the following expansion*

$$
J[\psi^{(k)}]_{T,t} = \underset{p_1,\ldots,p_k\to\infty}{\text{l.i.m.}} \sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k} C_{j_k\ldots j_1}\Biggl(\prod_{l=1}^{k}\zeta_{j_l}^{(i_l)} + \sum_{r=1}^{[k/2]}(-1)^r\times
$$

$$
\times \sum_{\substack{(\{\{g_1,g_2\},\ldots,\{g_{2r-1},g_{2r}\}\},\{q_1,\ldots,q_{k-2r}\})\\ \{g_1,g_2,\ldots,g_{2r-1},g_{2r},q_1,\ldots,q_{k-2r}\}=\{1,2,\ldots,k\}}} \prod_{s=1}^{r}\mathbf{1}_{\{i_{g_{2s-1}}=\,i_{g_{2s}}\ne 0\}}\mathbf{1}_{\{j_{g_{2s-1}}=\,j_{g_{2s}}\}}\prod_{l=1}^{k-2r}\zeta_{j_{q_l}}^{(i_{q_l})}\Biggr) \tag{26}
$$

converging in the mean-square sense is valid, where $[x]$ *is an integer part of a real number* x; *another notations are the same as in Theorem* 1.

It should be noted that an analogue of Theorem 2 was considered in [68]. Note that we use another notations [32] (Sect. 1.11), [39] (Sect. 15) in comparison with [68]. Moreover, the proof of an analogue of Theorem 2 from [68] is somewhat different from the proof given in [32] (Sect. 1.11), [39] (Sect. 15).

4. Expansion of Iterated Stratonovich Stochastic Integrals of Multiplicities 1 to 6

As it turned out [23]-[27], [30]-[34], [47], [71], [72] Theorems 1, 2 can be adapted for the iterated Stratonovich stochastic integrals (3). At that the expansions of the integrals (3) turn out to be much simpler than the expansions of the iterated Ito stochastic integrals (2). Let us first present some old results as the following theorem.

Theorem 3 [23]-[27], [30]-[34], [47]. *Assume that the following conditions are fulfilled*:

1. $\{\phi_j(x)\}_{j=0}^{\infty}$ *is the complete orthonormal system of Legendre polynomials or trigonometric functions in the space* $L_2([t,T])$.

2. *The function* $\psi_2(\tau)$ *is continuously differentiable at the interval* $[t,T]$, *and the functions* $\psi_1(\tau)$, $\psi_3(\tau)$ *are twice continuously differentiable at the interval* $[t,T]$ (*in* (27) *and* (29)).

Then, the iterated Stratonovich stochastic integrals (3) *of multiplicities* 2–4 *are expanded into the mean-square converging multiple series*

$$J^*[\psi^{(2)}]_{T,t} = \underset{q_1,q_2\to\infty}{\text{l.i.m.}} \sum_{j_1=0}^{q_1}\sum_{j_2=0}^{q_2} C_{j_2j_1}\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}, \tag{27}$$

$$J^*[\psi^{(3)}]_{T,t} = \underset{q_1,q_2,q_3\to\infty}{\text{l.i.m.}} \sum_{j_1=0}^{q_1}\sum_{j_2=0}^{q_2}\sum_{j_3=0}^{q_3} C_{j_3j_2j_1}\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}\zeta_{j_3}^{(i_3)}, \tag{28}$$

$$J^*[\psi^{(3)}]_{T,t} = \underset{q\to\infty}{\text{l.i.m.}} \sum_{j_1,j_2,j_3=0}^{q} C_{j_3j_2j_1}\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}\zeta_{j_3}^{(i_3)}, \tag{29}$$

$$J^*[\psi^{(4)}]_{T,t} = \underset{q\to\infty}{\text{l.i.m.}} \sum_{j_1,j_2,j_3,j_4=0}^{q} C_{j_4j_3j_2j_1}\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}\zeta_{j_3}^{(i_3)}\zeta_{j_4}^{(i_4)}, \tag{30}$$

where we assume that $i_1, i_2, i_3 = 1, \ldots, m$ *in* (27)–(29) *and* $i_1, \ldots, i_4 = 0, 1, \ldots, m$ *in* (30)*. Additionally, we assume in* (28) *and* (30) *that* $\psi_1(\tau), \ldots, \psi_4(\tau) \equiv 1$*. Another notations are the same as in Theorems* 1, 2*.*

Recently, a new approach to the expansion and mean-square approximation of iterated Stratonovich stochastic integrals has been obtained [32] (Sect. 2.10–2.16), [37] (Sect. 5–11), [47] (Sect. 13–19), [49] (Sect. 7–13), [71] (Sect. 4–9), [72]. Let us formulate four theorems that were obtained using this approach.

Theorem 4 [32], [37], [47], [49], [71]. *Suppose that* $\{\phi_j(x)\}_{j=0}^{\infty}$ *is a complete orthonormal system of Legendre polynomials or trigonometric functions in the space* $L_2([t, T])$*. Furthermore, let* $\psi_1(\tau), \psi_2(\tau)$, $\psi_3(\tau)$ *are continuously differentiable nonrandom functions on* $[t, T]$*. Then, for the iterated Stratonovich stochastic integral of third multiplicity*

$$J^*[\psi^{(3)}]_{T,t} = \int\limits_t^{*T} \psi_3(t_3) \int\limits_t^{*t_3} \psi_2(t_2) \int\limits_t^{*t_2} \psi_1(t_1) d\mathbf{w}_{t_1}^{(i_1)} d\mathbf{w}_{t_2}^{(i_2)} d\mathbf{w}_{t_3}^{(i_3)} \quad (i_1, i_2, i_3 = 0, 1, \ldots, m)$$

the following relations

$$J^*[\psi^{(3)}]_{T,t} = \underset{p\to\infty}{\text{l.i.m.}} \sum_{j_1,j_2,j_3=0}^{p} C_{j_3j_2j_1}\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}\zeta_{j_3}^{(i_3)}, \tag{31}$$

$$\mathsf{M}\left\{\left(J^*[\psi^{(3)}]_{T,t} - \sum_{j_1,j_2,j_3=0}^{p} C_{j_3j_2j_1}\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}\zeta_{j_3}^{(i_3)}\right)^2\right\} \le \frac{C}{p} \tag{32}$$

are fulfilled, where $i_1, i_2, i_3 = 0, 1, \ldots, m$ *in* (31) *and* $i_1, i_2, i_3 = 1, \ldots, m$ *in* (32)*, constant* C *is independent of* p*,*

$$C_{j_3j_2j_1}=\int\limits_t^T\psi_3(t_3)\phi_{j_3}(t_3)\int\limits_t^{t_3}\psi_2(t_2)\phi_{j_2}(t_2)\int\limits_t^{t_2}\psi_1(t_1)\phi_{j_1}(t_1)dt_1dt_2dt_3$$

and

$$\zeta_j^{(i)}=\int\limits_t^T\phi_j(\tau)d\mathbf{f}_\tau^{(i)}$$

are independent standard Gaussian random variables for various i *or* j *(in the case when* $i\ne 0$*); another notations are the same as in Theorems* 1, 2.

Theorem 5 [32], [37], [47], [49], [71]. *Let* $\{\phi_j(x)\}_{j=0}^{\infty}$ *be a complete orthonormal system of Legendre polynomials or trigonometric functions in the space* $L_2([t,T])$. *Furthermore, let* $\psi_1(\tau),\ldots,\psi_4(\tau)$ *be continuously differentiable nonrandom functions on* $[t,T]$. *Then, for the iterated Stratonovich stochastic integral of fourth multiplicity*

$$J^*[\psi^{(4)}]_{T,t}=\int\limits_t^{*T}\psi_4(t_4)\int\limits_t^{*t_4}\psi_3(t_3)\int\limits_t^{*t_3}\psi_2(t_2)\int\limits_t^{*t_2}\psi_1(t_1)d\mathbf{w}_{t_1}^{(i_1)}d\mathbf{w}_{t_2}^{(i_2)}d\mathbf{w}_{t_3}^{(i_3)}d\mathbf{w}_{t_4}^{(i_4)} \tag{33}$$

the following relations

$$J^*[\psi^{(4)}]_{T,t}=\underset{p\to\infty}{\text{l.i.m.}}\sum_{j_1,j_2,j_3,j_4=0}^{p}C_{j_4j_3j_2j_1}\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}\zeta_{j_3}^{(i_3)}\zeta_{j_4}^{(i_4)}, \tag{34}$$

$$\mathsf{M}\left\{\left(J^*[\psi^{(4)}]_{T,t}-\sum_{j_1,j_2,j_3,j_4=0}^{p}C_{j_4j_3j_2j_1}\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}\zeta_{j_3}^{(i_3)}\zeta_{j_4}^{(i_4)}\right)^2\right\}\le\frac{C}{p^{1-\varepsilon}} \tag{35}$$

are fulfilled, where $i_1,\ldots,i_4=0,1,\ldots,m$ *in* (33), (34) *and* $i_1,\ldots,i_4=1,\ldots,m$ *in* (35), *constant* C *does not depend on* p, ε *is an arbitrary small positive real number for the case of complete orthonormal system of Legendre polynomials in the space* $L_2([t,T])$ *and* $\varepsilon=0$ *for the case of complete orthonormal system of trigonometric functions in the space* $L_2([t,T])$,

$$C_{j_4j_3j_2j_1}=$$

$$=\int\limits_t^T\psi_4(t_4)\phi_{j_4}(t_4)\int\limits_t^{t_4}\psi_3(t_3)\phi_{j_3}(t_3)\int\limits_t^{t_3}\psi_2(t_2)\phi_{j_2}(t_2)\int\limits_t^{t_2}\psi_1(t_1)\phi_{j_1}(t_1)dt_1dt_2dt_3dt_4;$$

another notations are the same as in Theorem 4.

Theorem 6 [32], [37], [47], [49], [71]. *Assume that* $\{\phi_j(x)\}_{j=0}^{\infty}$ *is a complete orthonormal system of Legendre polynomials or trigonometric functions in the space* $L_2([t,T])$ *and* $\psi_1(\tau),\ldots,\psi_5(\tau)$ *are continuously differentiable nonrandom functions on* $[t,T]$. *Then, for the iterated Stratonovich stochastic integral of fifth multiplicity*

$$J^*[\psi^{(5)}]_{T,t} = \int\limits_t^{*T} \psi_5(t_5)\ldots \int\limits_t^{*t_2} \psi_1(t_1) d\mathbf{w}_{t_1}^{(i_1)} \ldots d\mathbf{w}_{t_5}^{(i_5)} \tag{36}$$

the following relations

$$J^*[\psi^{(5)}]_{T,t} = \underset{p\to\infty}{\text{l.i.m.}} \sum_{j_1,\ldots,j_5=0}^{p} C_{j_5\ldots j_1} \zeta_{j_1}^{(i_1)} \ldots \zeta_{j_5}^{(i_5)}, \tag{37}$$

$$\mathsf{M}\left\{\left(J^*[\psi^{(5)}]_{T,t} - \sum_{j_1,\ldots,j_5=0}^{p} C_{j_5\ldots j_1} \zeta_{j_1}^{(i_1)} \ldots \zeta_{j_5}^{(i_5)}\right)^2\right\} \le \frac{C}{p^{1-\varepsilon}} \tag{38}$$

are fulfilled, where $i_1,\ldots,i_5 = 0,1,\ldots,m$ *in* (36), (37) *and* $i_1,\ldots,i_5 = 1,\ldots,m$ *in* (38), *constant* C *is independent of* p, ε *is an arbitrary small positive real number for the case of complete orthonormal system of Legendre polynomials in the space* $L_2([t,T])$ *and* $\varepsilon = 0$ *for the case of complete orthonormal system of trigonometric functions in the space* $L_2([t,T])$,

$$C_{j_5\ldots j_1} = \int\limits_t^{T} \psi_5(t_5)\phi_{j_5}(t_5)\ldots \int\limits_t^{t_2} \psi_1(t_1)\phi_{j_1}(t_1) dt_1 \ldots dt_5;$$

another notations are the same as in Theorems 4, 5*.*

Theorem 7 [32], [37], [47], [49], [72]. *Suppose that* $\{\phi_j(x)\}_{j=0}^{\infty}$ *is a complete orthonormal system of Legendre polynomials or trigonometric functions in the space* $L_2([t,T])$*. Then, for the iterated Stratonovich stochastic integral of sixth multiplicity*

$$J_{T,t}^{*(i_1\ldots i_6)} = \int\limits_t^{*T} \ldots \int\limits_t^{*t_2} d\mathbf{w}_{t_1}^{(i_1)} \ldots d\mathbf{w}_{t_6}^{(i_6)} \tag{39}$$

the following expansion

$$J_{T,t}^{*(i_1\ldots i_6)} = \underset{p\to\infty}{\text{l.i.m.}} \sum_{j_1,\ldots,j_6=0}^{p} C_{j_6\ldots j_1} \zeta_{j_1}^{(i_1)} \ldots \zeta_{j_6}^{(i_6)}$$

that converges in the mean-square sense is valid, where $i_1,\ldots,i_6 = 0,1,\ldots,m$,

$$C_{j_6\ldots j_1} = \int\limits_t^{T} \phi_{j_6}(t_6)\ldots \int\limits_t^{t_2} \phi_{j_1}(t_1) dt_1 \ldots dt_6;$$

another notations are the same as in Theorems 4–6*.*

5. Legendre Polynomial-Based Approximation of the Iterated Ito and Stratonovich Stochastic Integrals Used in the Applications

We notice that the collection of iterated Ito stochastic integrals used in the numerical methods (5), (9) is given by

$$I_{(0)T,t}^{(i_1)},\quad I_{(1)T,t}^{(i_1)},\quad I_{(00)T,t}^{(i_1 i_2)},\quad I_{(000)T,t}^{(i_1 i_2 i_3)},\quad I_{(01)T,t}^{(i_1 i_2)},\quad I_{(10)T,t}^{(i_1 i_2)},\quad I_{(0000)T,t}^{(i_1 i_2 i_3 i_4)},\tag{40}$$

where $i_1,\ldots,i_4=1,\ldots,m$.

The functions $K(t_1,\ldots,t_k)$ like (12) for the collection (40) are given, respectively, by

$$K_0(t_1)\equiv 1,\quad K_1(t_1)=t-t_1,\quad K_{00}(t_1,t_2)=\mathbf{1}_{\{t_1<t_2\}},$$

$$K_{000}(t_1,t_2,t_3)=\mathbf{1}_{\{t_1<t_2<t_3\}},\quad K_{01}(t_1,t_2)=(t-t_2)\mathbf{1}_{\{t_1<t_2\}},$$

$$K_{10}(t_1,t_2)=(t-t_1)\mathbf{1}_{\{t_1<t_2\}},\quad K_{0000}(t_1,\ldots,t_4)=\mathbf{1}_{\{t_1<t_2<t_3<t_4\}},$$

where $t_1,\ldots,t_4\in[t,T]$ and $\mathbf{1}_A$ is the indicator of the set A.

For a finite-degree polynomial, the simplest (having a finite number of terms) expansion into Fourier series by the complete orthonormal system of functions in the space $L_2([t,T])$ is the Fourier–Legendre series expansion. The polynomial functions are included in the functions $K_1(t_1)$, $K_{01}(t_1,t_2)$, $K_{10}(t_1,t_2)$ as their components. Therefore, it is logical to expect that the simplest expansions of these functions into multiple Fourier series are their Fourier–Legendre expansions.

The following example illustrates rather well the noticed feature.

Consider the approximation $I_{(1)T,t}^{(i_1)q}$ of the stochastic integral $I_{(1)T,t}^{(i_1)}$ based on the expansion of the Brownian bridge process into the trigonometric Fourier series with random coefficients [7]

$$I_{(1)T,t}^{(i_1)q}=-\frac{(T-t)^{3/2}}{2}\left(\zeta_0^{(i_1)}-\frac{\sqrt{2}}{\pi}\left(\sum_{r=1}^{q}\frac{1}{r}\zeta_{2r-1}^{(i_1)}+\sqrt{\alpha_q}\xi_q^{(i_1)}\right)\right),\tag{41}$$

where

$$\xi_q^{(i_1)}=\frac{1}{\sqrt{\alpha_q}}\sum_{r=q+1}^{\infty}\frac{1}{r}\zeta_{2r-1}^{(i_1)},\quad \alpha_q=\frac{\pi^2}{6}-\sum_{r=1}^{q}\frac{1}{r^2},$$

where $\zeta_0^{(i_1)}$, $\zeta_{2r-1}^{(i_1)}$, $\xi_q^{(i_1)}$; $r=1,\ldots,q$; $i_1=1,\ldots,m$ are independent standard Gaussian random variables.

On the other hand, it is possible to obtain the following equality

$$I_{(1)T,t}^{(i_1)}=-\frac{(T-t)^{3/2}}{2}\left(\zeta_0^{(i_1)}+\frac{1}{\sqrt{3}}\zeta_1^{(i_1)}\right),\tag{42}$$

which is valid with probability 1 and based on the expansion of the function $t-t_1$ into the Fourier–Legendre series at the interval $[t,T]$ (this expansion has just two terms).

The above example demonstrates the advantage of the Legendre polynomials over the trigonometric functions in the context of the issue under consideration. More detailed comparison can be found in [32]-[34], [43], [44].

We notice that, as was established in [13], [19]-[27], [30]-[34], in the Fourier method (Theorem 1) it is also possible to use the Haar and Rademacher–Walsh functions (also see Theorem 2). However, in [13], [19]-[27], [30]-[34] it was shown that the expansions of the iterated Ito stochastic integrals (2) of multiplicities 1 and 2 obtained with the use of Theorem 1 and systems of Haar and Rademacher–Walsh functions are overcomplicated as compared with their analogues obtained on the basis of the Legendre polynomials. In this connection, practical application of such expansions is hindered.

Consider approximations of the remaining stochastic integrals from the family (40) obtained using Theorems 1, 2 and complete orthonormal system of Legendre polynomials in the space $L_2([t,T])$. First, we consider approximations of stochastic integrals of multiplicities 1 and 2

$$I_{(0)T,t}^{(i_1)}=\sqrt{T-t}\zeta_0^{(i_1)}, \tag{43}$$

$$I_{(00)T,t}^{(i_1i_2)q}=I_{(00)T,t}^{*(i_1i_2)q}-\frac{1}{2}\mathbf{1}_{\{i_1=i_2\}}(T-t),$$

$$I_{(00)T,t}^{*(i_1i_2)q}=\frac{T-t}{2}\left(\zeta_0^{(i_1)}\zeta_0^{(i_2)}+\sum_{i=1}^{q}\frac{1}{\sqrt{4i^2-1}}\left(\zeta_{i-1}^{(i_1)}\zeta_i^{(i_2)}-\zeta_i^{(i_1)}\zeta_{i-1}^{(i_2)}\right)\right), \tag{44}$$

$$I_{(10)T,t}^{(i_1i_2)q}=I_{(10)T,t}^{*(i_1i_2)q}+\frac{1}{4}\mathbf{1}_{\{i_1=i_2\}}(T-t)^2,\quad I_{(01)T,t}^{(i_1i_2)q}=I_{(01)T,t}^{*(i_1i_2)q}+\frac{1}{4}\mathbf{1}_{\{i_1=i_2\}}(T-t)^2, \tag{45}$$

$$I_{(01)T,t}^{*(i_1i_2)q}=-\frac{T-t}{2}I_{(00)T,t}^{*(i_1i_2)q}-\frac{(T-t)^2}{4}\Biggl(\frac{1}{\sqrt{3}}\zeta_0^{(i_1)}\zeta_1^{(i_2)}+$$

$$+\sum_{i=0}^{q}\left(\frac{(i+2)\zeta_i^{(i_1)}\zeta_{i+2}^{(i_2)}-(i+1)\zeta_{i+2}^{(i_1)}\zeta_i^{(i_2)}}{\sqrt{(2i+1)(2i+5)}(2i+3)}-\frac{\zeta_i^{(i_1)}\zeta_i^{(i_2)}}{(2i-1)(2i+3)}\right)\Biggr), \tag{46}$$

$$I_{(10)T,t}^{*(i_1i_2)q}=-\frac{T-t}{2}I_{(00)T,t}^{*(i_1i_2)q}-\frac{(T-t)^2}{4}\Biggl(\frac{1}{\sqrt{3}}\zeta_0^{(i_2)}\zeta_1^{(i_1)}+$$

$$+\sum_{i=0}^{q}\left(\frac{(i+1)\zeta_{i+2}^{(i_2)}\zeta_i^{(i_1)}-(i+2)\zeta_i^{(i_2)}\zeta_{i+2}^{(i_1)}}{\sqrt{(2i+1)(2i+5)}(2i+3)}+\frac{\zeta_i^{(i_1)}\zeta_i^{(i_2)}}{(2i-1)(2i+3)}\right)\Biggr), \tag{47}$$

where here and below

$$I_{(l_1\ldots l_k)s,t}^{*(i_1\ldots i_k)q}\quad\text{and}\quad I_{(l_1\ldots l_k)s,t}^{(i_1\ldots i_k)q}$$

are the approximations of the iterated Stratonovich and Ito stochastic integrals like

$$I_{(l_1\ldots l_k)s,t}^{*(i_1\ldots i_k)}=\int\limits_t^{*s}(t-\tau_k)^{l_k}\ldots\int\limits_t^{*\tau_2}(t-\tau_1)^{l_1}d\mathbf{f}_{\tau_1}^{(i_1)}\ldots d\mathbf{f}_{\tau_k}^{(i_k)} \tag{48}$$

and, correspondingly, like (6); $\zeta_j^{(i)}$ are independent standard Gaussian random variables for various i or j; $j=0,1,\ldots,p+2$; $i=1,\ldots,m$.

Calculate the mean-square errors of approximations (44)–(47). A precise formula for pairwise different $i_1,\ldots,i_k=1,\ldots,m$ was established in [13], [31]-[34], [38]

$$\mathsf{M}\left\{\left(J[\psi^{(k)}]_{T,t}-J[\psi^{(k)}]_{T,t}^q\right)^2\right\}=\int\limits_{[t,T]^k}K^2(t_1,\ldots,t_k)dt_1\ldots dt_k-\sum_{j_1,\ldots,j_k=0}^{q}C_{j_k\ldots j_1}^2, \tag{49}$$

where in virtue of the Parseval equality (14) the right-hand side of (49) tends to zero for $q\to\infty$; $J[\psi^{(k)}]_{T,t}$ has the form (2), and $J[\psi^{(k)}]_{T,t}^q$ is the approximation of $J[\psi^{(k)}]_{T,t}$ defined as the prelimit expression in (26) for $p_1=\ldots=p_k=q$ (also see the prelimit expressions in (18)–(22)); the sense of the rest notations is the same as in Theorems 1, 2.

The following formula [13], [31]-[34], [38] takes place

$$\mathsf{M}\left\{\left(J[\psi^{(2)}]_{T,t}-J[\psi^{(2)}]_{T,t}^q\right)^2\right\}=$$

$$=\int\limits_{[t,T]^2}K^2(t_1,t_2)dt_1dt_2-\sum_{j_1,j_2=0}^{q}C_{j_2j_1}^2-\sum_{j_1,j_2=0}^{q}C_{j_1j_2}C_{j_2j_1}\quad(i_1=i_2), \tag{50}$$

where notations are the same as in (49).

The value $\mathsf{M}\left\{\left(J[\psi^{(k)}]_{T,t}-J[\psi^{(k)}]_{T,t}^q\right)^2\right\}$ can be calculated exactly.

Theorem 8 [32] (Sect. 1.12), [38] (Sect. 6). *Suppose that* $\{\phi_j(x)\}_{j=0}^{\infty}$ *is an arbitrary complete orthonormal system of functions in the space* $L_2([t,T])$ *and* $\psi_1(\tau),\ldots,\psi_k(\tau)\in L_2([t,T])$, $i_1,\ldots,i_k=1,\ldots,m$. *Then*

$$\mathsf{M}\left\{\left(J[\psi^{(k)}]_{T,t}-J[\psi^{(k)}]_{T,t}^q\right)^2\right\}=\int\limits_{[t,T]^k}K^2(t_1,\ldots,t_k)dt_1\ldots dt_k-$$

$$-\sum_{j_1,\ldots,j_k=0}^{q}C_{j_k\ldots j_1}\mathsf{M}\left\{J[\psi^{(k)}]_{T,t}\sum_{(j_1,\ldots,j_k)}\int\limits_t^T\phi_{j_k}(t_k)\ldots\int\limits_t^{t_2}\phi_{j_1}(t_1)d\mathbf{f}_{t_1}^{(i_1)}\ldots d\mathbf{f}_{t_k}^{(i_k)}\right\}, \tag{51}$$

where $i_1,\ldots,i_k=1,\ldots,m$; *the expression*

$$\sum_{(j_1,\ldots,j_k)}$$

means the sum with respect to all possible permutations $(j_1,\ldots,j_k)$. *At the same time if* j_r *swapped with* j_q *in the permutation* $(j_1,\ldots,j_k)$, *then* i_r *swapped with* i_q *in the permutation* $(i_1,\ldots,i_k)$; *another notations are the same as in Theorems* 1, 2.

Using (49) and (50), we get

$$\textsf{M}\left\{\left(I_{(00)T,t}^{(i_1 i_2)}-I_{(00)T,t}^{(i_1 i_2)q}\right)^2\right\}=\frac{(T-t)^2}{2}\left(\frac{1}{2}-\sum_{i=1}^{q}\frac{1}{4i^2-1}\right)\quad (i_1\ne i_2), \tag{52}$$

$$\textsf{M}\left\{\left(I_{(10)T,t}^{(i_1 i_2)}-I_{(10)T,t}^{(i_1 i_2)q}\right)^2\right\}=\textsf{M}\left\{\left(I_{(01)T,t}^{(i_1 i_2)}-I_{(01)T,t}^{(i_1 i_2)q}\right)^2\right\}=\frac{(T-t)^4}{16}\times$$

$$\times\left(\frac{5}{9}-2\sum_{i=2}^{q}\frac{1}{4i^2-1}-\sum_{i=1}^{q}\frac{1}{(2i-1)^2(2i+3)^2}-\sum_{i=0}^{q}\frac{(i+2)^2+(i+1)^2}{(2i+1)(2i+5)(2i+3)^2}\right) \tag{53}$$

for $i_1\ne i_2$ and

$$\textsf{M}\left\{\left(I_{(10)T,t}^{(i_1 i_1)}-I_{(10)T,t}^{(i_1 i_1)q}\right)^2\right\}=\textsf{M}\left\{\left(I_{(01)T,t}^{(i_1 i_1)}-I_{(01)T,t}^{(i_1 i_1)q}\right)^2\right\}=$$

$$=\frac{(T-t)^4}{16}\left(\frac{1}{9}-\sum_{i=0}^{q}\frac{1}{(2i+1)(2i+5)(2i+3)^2}-2\sum_{i=1}^{q}\frac{1}{(2i-1)^2(2i+3)^2}\right). \tag{54}$$

Let us consider the numerical modeling of the iterated Ito stochastic integral of multiplicity 3 $I_{(000)T,t}^{(i_1 i_2 i_3)}$. Using Theorems 1, 2 for the case $k=3$ (see (20)), we obtain

$$I_{(000)T,t}^{(i_1 i_2 i_3)q}=\sum_{j_1,j_2,j_3=0}^{q}C_{j_3 j_2 j_1}\Biggl(\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}\zeta_{j_3}^{(i_3)}-\mathbf{1}_{\{i_1=i_2\}}\mathbf{1}_{\{j_1=j_2\}}\zeta_{j_3}^{(i_3)}-$$

$$-\mathbf{1}_{\{i_2=i_3\}}\mathbf{1}_{\{j_2=j_3\}}\zeta_{j_1}^{(i_1)}-\mathbf{1}_{\{i_1=i_3\}}\mathbf{1}_{\{j_1=j_3\}}\zeta_{j_2}^{(i_2)}\Biggr), \tag{55}$$

where $i_1,i_2,i_3=1,\ldots,m$ and

$$C_{j_3 j_2 j_1}=\int\limits_t^T\phi_{j_3}(z)\int\limits_t^z\phi_{j_2}(y)\int\limits_t^y\phi_{j_1}(x)dxdydz=$$

$$=\frac{\sqrt{(2j_1+1)(2j_2+1)(2j_3+1)}}{8}(T-t)^{3/2}\bar{C}_{j_3 j_2 j_1}, \tag{56}$$

$$\bar{C}_{j_3 j_2 j_1}=\int\limits_{-1}^{1}P_{j_3}(z)\int\limits_{-1}^{z}P_{j_2}(y)\int\limits_{-1}^{y}P_{j_1}(x)dxdydz, \tag{57}$$

where $P_i(x)$ $(i=0,1,2,\ldots)$ is the Legendre polynomial.

For the case $i_1 = i_2 = i_3$, one can use the well known equality which follows from the Ito formula and is valid with probability 1 [2]

$$I_{(000)T,t}^{(i_1i_1i_1)} = \frac{1}{6}(T-t)^{3/2}\left(\left(\zeta_0^{(i_1)}\right)^3 - 3\zeta_0^{(i_1)}\right). \tag{58}$$

The procedure of numerical modeling of the iterated Ito stochastic integral $I_{(000)T,t}^{(i_1i_2i_3)}$ may follow (55)–(58). The Fourier–Legendre coefficients $\bar{C}_{j_3j_2j_1}$ of the form (57) being precisely calculable for the given number q by PYTHON, DERIVE or MAPLE. The mean-square error of approximation is checked by (49) for $k = 3$ as well as by the formulas established in [31]-[34], [38]

$$\mathsf{M}\left\{\left(J[\psi^{(3)}]_{T,t} - J[\psi^{(3)}]_{T,t}^q\right)^2\right\} = \int\limits_{[t,T]^3} K^2(t_1,t_2,t_3)dt_1dt_2dt_3-$$

$$-\sum_{j_3,j_2,j_1=0}^{q} C_{j_3j_2j_1}^2 - \sum_{j_3,j_2,j_1=0}^{q} C_{j_3j_1j_2}C_{j_3j_2j_1} \quad (i_1 = i_2 \ne i_3), \tag{59}$$

$$\mathsf{M}\left\{\left(J[\psi^{(3)}]_{T,t} - J[\psi^{(3)}]_{T,t}^q\right)^2\right\} = \int\limits_{[t,T]^3} K^2(t_1,t_2,t_3)dt_1dt_2dt_3-$$

$$-\sum_{j_3,j_2,j_1=0}^{q} C_{j_3j_2j_1}^2 - \sum_{j_3,j_2,j_1=0}^{q} C_{j_2j_3j_1}C_{j_3j_2j_1} \quad (i_1 \ne i_2 = i_3), \tag{60}$$

$$\mathsf{M}\left\{\left(J[\psi^{(3)}]_{T,t} - J[\psi^{(3)}]_{T,t}^q\right)^2\right\} = \int\limits_{[t,T]^3} K^2(t_1,t_2,t_3)dt_1dt_2dt_3-$$

$$-\sum_{j_3,j_2,j_1=0}^{q} C_{j_3j_2j_1}^2 - \sum_{j_3,j_2,j_1=0}^{q} C_{j_3j_2j_1}C_{j_1j_2j_3} \quad (i_1 = i_3 \ne i_2). \tag{61}$$

The following estimate [31]-[34], [38] can also be applied for the case $k = 3$

$$\mathsf{M}\left\{\left(J[\psi^{(k)}]_{T,t} - J[\psi^{(k)}]_{T,t}^q\right)^2\right\} \le$$

$$\le k!\left(\int\limits_{[t,T]^k} K^2(t_1,\ldots,t_k)dt_1\ldots dt_k - \sum_{j_1,\ldots,j_k=0}^{q} C_{j_k\ldots j_1}^2\right) \tag{62}$$

where $i_1,\ldots,i_k = 1,\ldots,m$ and $0 < T-t < \infty$ or $i_1,\ldots,i_k = 0,1,\ldots,m$ and $0 < T-t < 1$.

In particular, for the pairwise different $i_1, i_2, i_3 = 1,\ldots,m$ and $q = 6$ we get from (49)

$$\mathsf{M}\left\{\left(I_{(000)T,t}^{(i_1i_2i_3)}-I_{(000)T,t}^{(i_1i_2i_3)6}\right)^2\right\}\approx 0.01956(T-t)^3. \tag{63}$$

Taking into consideration that $T-t$ is the integration step of numerical methods for the Ito SDE (1) and $T-t$ is a sufficiently small number, we get that already for $q=6$ the mean-square error of approximation of the stochastic integral $I_{000_{T,t}}^{(i_1i_2i_3)}$ is sufficiently small as well (see (63)).

Consider now the iterated Ito stochastic integral $I_{(0000)T,t}^{(i_1i_2i_3i_4)}$ of multiplicity 4. Using Theorems 1, 2, we get the representation

$$\begin{gathered}I_{(0000)T,t}^{(i_1i_2i_3i_4)q}=\sum_{j_1,j_2,j_3,j_4=0}^{q}C_{j_4j_3j_2j_1}\Biggl(\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}\zeta_{j_3}^{(i_3)}\zeta_{j_4}^{(i_4)}-\\
-\mathbf{1}_{\{i_1=i_2\}}\mathbf{1}_{\{j_1=j_2\}}\zeta_{j_3}^{(i_3)}\zeta_{j_4}^{(i_4)}-\mathbf{1}_{\{i_1=i_3\}}\mathbf{1}_{\{j_1=j_3\}}\zeta_{j_2}^{(i_2)}\zeta_{j_4}^{(i_4)}-\\
-\mathbf{1}_{\{i_1=i_4\}}\mathbf{1}_{\{j_1=j_4\}}\zeta_{j_2}^{(i_2)}\zeta_{j_3}^{(i_3)}-\mathbf{1}_{\{i_2=i_3\}}\mathbf{1}_{\{j_2=j_3\}}\zeta_{j_1}^{(i_1)}\zeta_{j_4}^{(i_4)}-\\
-\mathbf{1}_{\{i_2=i_4\}}\mathbf{1}_{\{j_2=j_4\}}\zeta_{j_1}^{(i_1)}\zeta_{j_3}^{(i_3)}-\mathbf{1}_{\{i_3=i_4\}}\mathbf{1}_{\{j_3=j_4\}}\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}+\\
+\mathbf{1}_{\{i_1=i_2\}}\mathbf{1}_{\{j_1=j_2\}}\mathbf{1}_{\{i_3=i_4\}}\mathbf{1}_{\{j_3=j_4\}}+\mathbf{1}_{\{i_1=i_3\}}\mathbf{1}_{\{j_1=j_3\}}\mathbf{1}_{\{i_2=i_4\}}\mathbf{1}_{\{j_2=j_4\}}+\\
+\mathbf{1}_{\{i_1=i_4\}}\mathbf{1}_{\{j_1=j_4\}}\mathbf{1}_{\{i_2=i_3\}}\mathbf{1}_{\{j_2=j_3\}}\Biggr),\end{gathered} \tag{64}$$

where $i_1,i_2,i_3,i_4=1,\ldots,m$ and

$$C_{j_4j_3j_2j_1}=\int\limits_t^T\phi_{j_4}(u)\int\limits_t^u\phi_{j_3}(z)\int\limits_t^z\phi_{j_2}(y)\int\limits_t^y\phi_{j_1}(x)dxdydzdu=$$

$$=\frac{\sqrt{(2j_1+1)(2j_2+1)(2j_3+1)(2j_4+1)}}{16}\Delta^2\bar{C}_{j_4j_3j_2j_1},$$

$$\bar{C}_{j_4j_3j_2j_1}=\int\limits_{-1}^{1}P_{j_4}(u)\int\limits_{-1}^{u}P_{j_3}(z)\int\limits_{-1}^{z}P_{j_2}(y)\int\limits_{-1}^{y}P_{j_1}(x)dxdydzdu,$$

where $P_i(x)$ $(i=0,1,2,\ldots)$ is the Legendre polynomial.

For precise calculation of the Fourier–Legendre coefficients $C_{j_4j_3j_2j_1}$ we can use the previous recommendations and check the mean-square error of approximation of the iterated Ito stochastic integral $I_{(0000)T,t}^{(i_1i_2i_3i_4)}$, for example, using the estimate (62) for $k=4$.

In particular, for pairwise different $i_1,\ldots,i_4=1,\ldots,m$ we get from (49) with regard for smallness of $T-t$ already for $q=2$ a sufficiently good accuracy of the mean-square approximation

$$\mathsf{M}\left\{\left(I_{(0000)T,t}^{(i_1i_2i_3i_4)}-I_{(0000)T,t}^{(i_1i_2i_3i_4)2}\right)^2\right\}\approx 0.0236084(T-t)^4. \tag{65}$$

We notice that at deriving (63) and (65) the coefficients $\bar{C}_{j_3j_2j_1}$ and $\bar{C}_{j_4j_3j_2j_1}$ were precisely calculated using the DERIVE package.

Note that the formulas (27)–(30) are simpler than (19)–(21). However, calculation of the mean-square approximation error for the iterated Stratonovich stochastic integrals (3) turned out more complex than for the iterated Ito stochastic integrals (2) [32]-[34], [42], [52].

6. Algorithms of Numerical Modeling With the Orders 1.5 and 2.0 of Strong Convergence

We formulate in algorithmic form the above formulas and recommendations for the numerical method of the order 1.5 of strong convergence. We assume that the necessary Fourier–Legendre coefficients $\bar{C}_{j_3j_2j_1}$, $\bar{C}_{j_4j_3j_2j_1}$ are already calculated. In particular, several tables of the precisely calculated Fourier–Legendre coefficients $\bar{C}_{j_3j_2j_1}$, $\bar{C}_{j_4j_3j_2j_1}$ were presented in [13], [31]-[34]. These coefficients were calculated by DERIVE. It should be noted that in [61], [62] the database with 270,000 precisely calculated Fourier–Legendre coefficients is presented. In [61], [62] we used the PYTHON programming language.

Algorithm. 1.

Step 1. Given are the initial parameters of the problem such as the interval of integration $[0, T]$, step of integration Δ (for example, constant $\Delta = T/N$, $N \geq 1$, although a variable step of integration is admissible), initial condition $\mathbf{y}_0$, and constant C involved in the condition (8).

Step 2. Assume that $p = 0$.

Step 3. Selection of the minimal natural numbers q and q_1 $(q \ll q_1)$ ensuring the necessary accuracy of approximation of the stochastic integrals

$$I_{(00)\tau_{p+1},\tau_p}^{(i_1i_2)}, \quad I_{(000)\tau_{p+1},\tau_k}^{(i_1i_2i_3)} \quad (\tau_p = p\Delta)$$

and satisfying the conditions

$$\mathsf{M}\left\{\left(I_{(00)\tau_{p+1},\tau_p}^{(i_1i_2)} - I_{(00)\tau_{p+1},\tau_p}^{(i_1i_2)q_1}\right)^2\right\} = \frac{\Delta^2}{2}\left(\frac{1}{2} - \sum_{i=1}^{q_1}\frac{1}{4i^2-1}\right) \leq C\Delta^4, \tag{66}$$

$$\mathsf{M}\left\{\left(I_{(000)\tau_{p+1},\tau_p}^{(i_1i_2i_3)} - I_{(000)\tau_{p+1},\tau_p}^{(i_1i_2i_3)q}\right)^2\right\} \leq 6\left(\frac{\Delta^3}{6} - \sum_{j_3,j_2,j_1=0}^{q} C_{j_3j_2j_1}^2\right) \leq C\Delta^4. \tag{67}$$

Remark 1. *If it is required to check the mean-square approximation error of the iterated Ito stochastic integral* $I_{(000)\tau_{p+1},\tau_p}^{(i_1i_2i_3)}$ *using the precise formulas* (49), (59)–(61), *rather than the estimate* (67) (*see* (62)), *then instead of the condition* (67) *one has to take the following conditions*

$$E_{p,q,\Delta}^{(i_1i_2i_3)} = \frac{\Delta^3}{6} - \sum_{j_3,j_2,j_1=0}^{q} C_{j_3j_2j_1}^2 \leq C\Delta^4 \quad (i_1 \neq i_2,\ i_1 \neq i_3,\ i_2 \neq i_3),$$

$$E_{p,q,\Delta}^{(i_1i_2i_3)} = \frac{\Delta^3}{6} - \sum_{j_3,j_2,j_1=0}^{q} C_{j_3j_2j_1}^2 - \sum_{j_3,j_2,j_1=0}^{q} C_{j_2j_3j_1}C_{j_3j_2j_1} \leq C\Delta^4 \quad (i_1 \neq i_2 = i_3),$$

$$E_{p,q,\Delta}^{(i_1 i_2 i_3)} = \frac{\Delta^3}{6} - \sum_{j_3,j_2,j_1=0}^{q} C_{j_3 j_2 j_1}^2 - \sum_{j_3,j_2,j_1=0}^{q} C_{j_3 j_2 j_1} C_{j_1 j_2 j_3} \le C\Delta^4 \quad (i_1 = i_3 \ne i_2),$$

$$E_{p,q,\Delta}^{(i_1 i_2 i_3)} = \frac{\Delta^3}{6} - \sum_{j_3,j_2,j_1=0}^{q} C_{j_3 j_2 j_1}^2 - \sum_{j_3,j_2,j_1=0}^{q} C_{j_3 j_1 j_2} C_{j_3 j_2 j_1} \le C\Delta^4 \quad (i_1 = i_2 \ne i_3),$$

where

$$\mathsf{M}\left\{\left(I_{(000)\tau_{p+1},\tau_p}^{(i_1 i_2 i_3)} - I_{(000)\tau_{p+1},\tau_p}^{(i_1 i_2 i_3)q}\right)^2\right\} \stackrel{\rm def}{=} E_{p,q,\Delta}^{(i_1 i_2 i_3)}.$$

Step 4. *Modeling of the sequence of independent standard Gaussian random variables* $\zeta_l^{(i)}$ $(l = 0, 1, \ldots, q_1;\ i = 1, \ldots, m)$.

Step 5. *Modeling of the iterated Ito stochastic integrals*

$$I_{(0)\tau_{p+1},\tau_p}^{(i_1)}, \quad I_{(1)\tau_{p+1},\tau_p}^{(i_1)}, \quad I_{(00)\tau_{p+1},\tau_p}^{(i_1 i_2)}, \quad I_{(000)\tau_{p+1},\tau_p}^{(i_1 i_2 i_3)}$$

using the formulas

$$I_{(0)\tau_{k+1},\tau_k}^{(i_1)} = \sqrt{T-t}\zeta_0^{(i_1)},$$

$$I_{(1)\tau_{p+1},\tau_p}^{(i_1)} = -\frac{(T-t)^{3/2}}{2}\left(\zeta_0^{(i_1)} + \frac{1}{\sqrt{3}}\zeta_1^{(i_1)}\right),$$

$$I_{(00)\tau_{p+1},\tau_p}^{(i_1 i_2)q_1} = \frac{T-t}{2}\left(\zeta_0^{(i_1)}\zeta_0^{(i_2)} + \sum_{i=1}^{q_1}\frac{1}{\sqrt{4i^2-1}}\left(\zeta_{i-1}^{(i_1)}\zeta_i^{(i_2)} - \zeta_i^{(i_1)}\zeta_{i-1}^{(i_2)}\right) - \mathbf{1}_{\{i_1=i_2\}}\right),$$

$$I_{(000)\tau_{p+1},\tau_p}^{(i_1 i_2 i_3)q} = \sum_{j_1,j_2,j_3=0}^{q} C_{j_3 j_2 j_1}\Biggl(\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}\zeta_{j_3}^{(i_3)} - \mathbf{1}_{\{i_1=i_2\}}\mathbf{1}_{\{j_1=j_2\}}\zeta_{j_3}^{(i_3)} -$$

$$-\mathbf{1}_{\{i_2=i_3\}}\mathbf{1}_{\{j_2=j_3\}}\zeta_{j_1}^{(i_1)} - \mathbf{1}_{\{i_1=i_3\}}\mathbf{1}_{\{j_1=j_3\}}\zeta_{j_2}^{(i_2)}\Biggr),$$

where $i_1, i_2, i_3 = 1, \ldots, m$.

Remark 2. *In the case of* $i_1 = i_2 = i_3$, *it is advisable to model the stochastic integral* $I_{(000)\tau_{p+1},\tau_p}^{(i_1 i_2 i_3)}$ *using the formula* (58), *where one has to assume that* $T - t = \Delta$.

Step 6. *Calculate* $\mathbf{y}_{p+1}$ *from* (5).

Step 7. *If* $p < N-1$, *then assume that* $p = p+1$ *and go to Step* 4; *otherwise, go to Step* 8.

Step 8. *End.*

We briefly note how to modify the algorithm to enable numerical modeling with the order 2.0 of strong convergence.

At Step 3 one has to take the following three iterated Ito stochastic integrals

$$I_{(10)\tau_{p+1},\tau_p}^{(i_1 i_2)},\quad I_{(01)\tau_{p+1},\tau_p}^{(i_1 i_2)},\quad I_{(0000)\tau_{p+1},\tau_p}^{(i_1 i_2 i_3 i_4)},$$

whose approximations obey (45)–(47), (64) and add to the considered stochastic integrals. Moreover, we replace $C\Delta^4$ by $C\Delta^5$ in (66), (67). At that, one can use the estimate (62) for $k=4$ and the formulas (53), (54) to check the accuracy of modeling of the aforementioned integrals. As the result, we get the following conditions

$$\mathsf{M}\left\{\left(I_{(10)\tau_{p+1},\tau_p}^{(i_1 i_2)}-I_{(10)\tau_{p+1},\tau_p}^{(i_1 i_2)q_2}\right)^2\right\}=\mathsf{M}\left\{\left(I_{(01)\tau_{p+1},\tau_p}^{(i_1 i_2)}-I_{(01)\tau_{p+1},\tau_p}^{(i_1 i_2)q_2}\right)^2\right\}=\frac{\Delta^4}{16}\times$$

$$\times\left(\frac{5}{9}-2\sum_{i=2}^{q_2}\frac{1}{4i^2-1}-\sum_{i=1}^{q_2}\frac{1}{(2i-1)^2(2i+3)^2}-\sum_{i=0}^{q_2}\frac{(i+2)^2+(i+1)^2}{(2i+1)(2i+5)(2i+3)^2}\right)\le C\Delta^5$$

for $i_1\ne i_2$ and

$$\mathsf{M}\left\{\left(I_{(10)\tau_{p+1},\tau_p}^{(i_1 i_1)}-I_{(10)\tau_{p+1},\tau_p}^{(i_1 i_1)q_3}\right)^2\right\}=\mathsf{M}\left\{\left(I_{(01)\tau_{p+1},\tau_p}^{(i_1 i_1)}-I_{(01)\tau_{p+1},\tau_p}^{(i_1 i_1)q_3}\right)^2\right\}=$$

$$=\frac{\Delta^4}{16}\left(\frac{1}{9}-\sum_{i=0}^{q_3}\frac{1}{(2i+1)(2i+5)(2i+3)^2}-2\sum_{i=1}^{q_3}\frac{1}{(2i-1)^2(2i+3)^2}\right)\le C\Delta^5$$

for $i_1=i_2$;

$$\mathsf{M}\left\{\left(I_{(0000)\tau_{p+1},\tau_p}^{(i_1 i_2 i_3 i_4)}-I_{(0000)\tau_{p+1},\tau_p}^{(i_1 i_2 i_3 i_4)q_4}\right)^2\right\}\le 24\left(\frac{\Delta^4}{24}-\sum_{j_1,j_2,j_3,j_4=0}^{q_4}C_{j_4 j_3 j_2 j_1}^2\right)\le C\Delta^5, \tag{68}$$

where $i_1,i_2,i_3,i_4=1,\ldots,m$; $q_2,q_3,q_4<q<q_1$.

Carry out Step 5 with allowance of the stochastic integrals

$$I_{(10)\tau_{p+1},\tau_p}^{(i_1 i_2)},\ I_{(01)\tau_{p+1},\tau_p}^{(i_1 i_2)},\ I_{(0000)\tau_{p+1},\tau_p}^{(i_1 i_2 i_3 i_4)},$$

and calculate $\mathbf{y}_{p+1}$ at Step 6 according to (9).

It should be noted that instead of the estimate (68) we can use the precise relations for the value

$$\mathsf{M}\left\{\left(I_{(0000)\tau_{p+1},\tau_p}^{(i_1 i_2 i_3 i_4)}-I_{(0000)\tau_{p+1},\tau_p}^{(i_1 i_2 i_3 i_4)q_4}\right)^2\right\},$$

which were obtained in [31]-[34], [38] for all possible combinations of $i_1,i_2,i_3,i_4=1,\ldots,m$. Note that the optimization of the mentioned procedure is considered in [69].

7. Conclusions

The present paper provided efficient procedures for the mean-square approximation of iterated Ito and Stratonovich stochastic integrals of multiplicities 1 to 4 based on multiple Fourier–Legendre series. These results can be used for implementation of the numerical methods with the orders 1.0, 1.5, and 2.0 of strong convergence for Ito stochastic differential equations with multidimensional non-commutative noise. The results of the article can be applied for numerical solution of the problems of optimal stochastic control and signal filtering in random noise in different formulations. The development of the approaches from this work can be found in [13], [19]-[55], [61]-[67], [69], [70].

NUMERICAL SIMULATION OF 2.5-SET OF ITERATED ITO STOCHASTIC INTEGRALS OF MULTIPLICITIES 1 TO 5 FROM THE TAYLOR–ITO EXPANSION

DMITRIY F. KUZNETSOV

Abstract. The article is devoted to the construction of effective procedures of the mean-square approximation of iterated Ito stochastic integrals of multiplicities 1 to 5 from the Taylor–Ito expansion based on multiple Fourier–Legendre series. The results of the article can be applied to the implementation of numerical methods with orders 1.5, 2.0, and 2.5 of strong convergence for Ito stochastic differential equations with multidimensional non-commutative noise.

Contents

Keywords: Explicit one-step strong numerical method, Iterated Ito stochastic integral, Iterated Stratonovich stochastic integral, Taylor–Ito expansion, Generalized multiple Fourier series, Multiple Fourier–Legendre series, Multiple trigonometric Fourier series, Ito stochastic differential equation, Numerical integration, Mean-square convergence, Expansion, Approximation.

1. Introduction

This paper is a continuation of the author's research [1], [2] on numerical methods with rather high orders of strong convergence for Ito stochastic differential equations (SDEs). The definition of strong convergence will be given below. The development of such numerical methods is topical due to a wide range of applications for Ito SDEs [3]-[9]. In particular, these equations arise in optimal stochastic control, signal filtering against the background of random noises, parameter estimation for stochastic systems as well as in stochastic stability and bifurcations analysis [3]-[9]. Also the Ito SDEs represent adequate mathematical models for dynamic systems of different physical origin that are affected by random perturbations. They are used as mathematical models in stochastic mathematical finance, hydrology and seismology, geophysics, chemical kinetics and population dynamics, electrodynamics, medicine and other fields (see [3]-[9]). On the other hand, new numerical methods with rather high orders of strong convergence are needed for the Ito SDEs because one of the elementary numerical methods — the Euler scheme has insufficient accuracy for a series of practical problems under standard assumptions; the details can be found in [3].

This paper follows a promising approach to the numerical integration of Ito SDEs [3], [7]-[9] that is based on the stochastic analogs of the Taylor formula (the so-called Taylor–Ito and Taylor–Stratonovich expansions [3], [7]-[14]) for the solutions of Ito SDEs. This approach includes the finite partitioning of the time variable and also the numerical solution of an Ito SDE at discrete moments of time using the stochastic analogs of the Taylor formula. The numerical methods with orders 1.5, 2.0, and 2.5 of strong convergence will be considered in the article.

This paper employs the so-called unified Taylor–Ito expansion [12]-[21] with a minimum set of iterated Ito stochastic integrals, which is a simplifying factor at the implementation stage of numerical methods. The iterated Ito stochastic integrals figuring in the numerical schemes with a strong convergence of orders 1.5, 2.0, and 2.5 are approximated using the method of generalized multiple Fourier series, which was considered in a series of papers of the author [14]-[57]. As was noted in [1], [2], this method does not require the splitting of an integration interval $[t, T]$ of the iterated Ito stochastic integrals; recall that its length $T - t$ gives the integration step of the numerical methods for Ito SDEs and hence is a sufficiently small value. In accordance with experimental results [14], the splitting of the interval $[t, T]$ leads to an inadmissibly high computational cost. As a rule, this splitting is used in the approximation methods of iterated Ito stochastic integrals based on integral sums [7], [8], [58].

As mentioned in [1], [2], in a number of publications [3], [7], [8], numerical schemes with strong convergence of high orders (1.5, 2.0, and 2.5) for the Ito SDEs have been proposed. However, these methods do not contain efficient mean-square approximation procedures for the iterated Ito stochastic integrals in the case of multidimensional non-commutative noises. Generally, the authors [3], [7], [8] introduced some simplifying assumptions on the additivity, commutativity or smallness of the noises, which results in a considerable simplification of the numerical modeling problem of iterated Ito stochastic integrals. Like [1], [2], this paper will partially eliminate this drawback.

Note that the properties of numerical schemes for the Ito SDEs (including the ones with a strong convergence of orders 1.5, 2.0, and 2.5) were well studied in [3], [7], [8]. In particular, their stability was thoroughly analyzed. The goal of this paper is to develop efficient numerical modeling procedures for the iterated Ito stochastic integrals of multiplicities 1 to 5 including the exact calculation and efficient estimation of the mean-square approximation errors of these stochastic integrals.

Let $(\Omega, \mathrm{F}, \mathsf{P})$ be a complete probability space, let $\{\mathrm{F}_t, t \in [0, T]\}$ be a nondecreasing right-continous family of σ-subfields of F, and let $\mathbf{f}_t$ be a standard m-dimensional Wiener stochastic process, which is F_t-measurable for any $t \in [0, T]$. We assume that the components $\mathbf{f}_t^{(i)}$ $(i = 1, \ldots, m)$ of this process are independent. Consider an Ito SDE in the integral form

(1) $$\mathbf{x}_t = \mathbf{x}_0 + \int\limits_0^t \mathbf{a}(\mathbf{x}_\tau, \tau)d\tau + \int\limits_0^t B(\mathbf{x}_\tau, \tau)d\mathbf{f}_\tau, \quad \mathbf{x}_0 = \mathbf{x}(0, \omega).$$

Here $\mathbf{x}_t$ is some n-dimensional stochastic process satisfying the equation (1). The nonrandom functions $\mathbf{a} : \mathbb{R}^n \times [0, T] \to \mathbb{R}^n$, $B : \mathbb{R}^n \times [0, T] \to \mathbb{R}^{n\times m}$ guarantee the existence and uniqueness up to stochastic equivalence of a solution of the equation (1) [59]. The second integral on the right-hand side of (1) is interpreted as an Ito stochastic integral. Let $\mathbf{x}_0$ be an n-dimensional random variable, which is F_0-measurable and $\mathsf{M}\{|\mathbf{x}_0|^2\} < \infty$ (M denotes a mathematical expectation). We assume that $\mathbf{x}_0$ and $\mathbf{f}_t - \mathbf{f}_0$ are independent when $t > 0$.

Consider the following iterated Ito stochastic integrals

(2) $$J[\psi^{(k)}]_{T,t} = \int\limits_t^T \psi_k(t_k) \ldots \int\limits_t^{t_2} \psi_1(t_1) d\mathbf{w}_{t_1}^{(i_1)} \ldots d\mathbf{w}_{t_k}^{(i_k)},$$

where every $\psi_l(\tau)$ $(l = 1, \ldots, k)$ is a non-random function on $[t, T]$, $\mathbf{w}_\tau^{(i)} = \mathbf{f}_\tau^{(i)}$ for $i = 1, \ldots, m$ and $\mathbf{w}_\tau^{(0)} = \tau$, $i_1, \ldots, i_k = 0, 1, \ldots, m$.

Note that $\psi_l(\tau) \equiv 1$ $(l = 1, \ldots, k)$ and $i_1, \ldots, i_k = 0, 1, \ldots, m$ in [3], [7], [8], [10], [11] and $\psi_l(\tau) \equiv (t - \tau)^{q_l}$ $(l = 1, \ldots, k;\ q_1, \ldots, q_k = 0, 1, 2, \ldots)$ and $i_1, \ldots, i_k = 1, \ldots, m$ in [12]-[28].

Effective solution of the problem of combined mean-square approximation of the iterated Ito stochastic integrals (2) of multiplicities 1 to 5 composes the subject of this article.

2. Explicit One-Step Strong Numerical Schemes With Convergence Orders 1.5, 2.0, and 2.5 Based on the Unified Taylor–Ito Expansion

Introduce the definition of a strong convergence of a numerical method for the Ito SDEs.

Consider the partition $\{\tau_p\}_{p=0}^N$ of the interval $[0, T]$ with the maximum step of discretization Δ_N such that

$$0 = \tau_0 < \tau_1 < \ldots < \tau_N = T.$$

Denote by $\mathbf{y}_{\tau_p} \stackrel{\mathsf{def}}{=} \mathbf{y}_p$, $p = 0, 1, \ldots, N$ the discrete approximation of the process $\mathbf{x}_t$, $t \in [0, T]$ (the solution of the Ito SDE (1)) that corresponds to the maximum discretization step Δ_N.

Definition 1 [3]. *The discrete approximation (numerical method) $\mathbf{y}_j$, $j = 0, 1, \ldots, N$ that corresponds to the maximum discretization step Δ_N is said to be strongly converging with an order $\gamma > 0$ to the process $\mathbf{x}_t$, $t \in [0, T]$ if there exist a constant $C > 0$ that is independent of Δ_N and j $(j = 0, 1, \ldots, N)$ and also a value $\delta > 0$ such that*

(3) $$\mathsf{M}\{|\mathbf{x}_j - \mathbf{y}_j|\} \le C(\Delta_N)^\gamma \quad (j = 0, 1, \ldots, N)$$

for all $\Delta_N \in (0, \delta)$.

In a series of publications [7], [8], the authors considered the mean-square convergence instead of the strong convergence, which corresponds to the replacement of the condition (3) with

(4) $$\left(\mathsf{M}\{|\mathbf{x}_j - \mathbf{y}_j|^2\}\right)^{1/2} \le C(\Delta_N)^\gamma \quad (j = 0, 1, \ldots, N).$$

In (3) and (4): $\mathbf{x}_{\tau_j} \stackrel{\mathsf{def}}{=} \mathbf{x}_j$, $j = 0, 1, \ldots, N$.

Obviously, by virtue of the Lyapunov inequality [3] the mean-square convergence implies the strong convergence. As it has appeared, a rather nontrivial question is which iterated stochastic integrals (Ito or Stratonovich) are preferable for the numerical integration of the Ito SDEs with a correct estimation of the mean-square approximation error. By their external view the approximations of the iterated Stratonovich stochastic integrals are simpler than the corresponding approximations of the iterated Ito stochastic integrals; see the details in Sections 3, 5 below. However, the estimation procedure of the mean-square approximation error turns out to be much easier for the iterated Ito stochastic integrals, which motivates the use of these integrals.

Consider the explicit one-step numerical scheme for the Ito SDEs that is based on the unified Taylor–Ito expansion [14]-[18]

$$
\begin{aligned}
\mathbf{y}_{p+1}=\mathbf{y}_p+\sum_{i_1=1}^{m}B_{i_1}\hat{I}_{(0)\tau_{p+1},\tau_p}^{(i_1)}+\Delta\mathbf{a}+\sum_{i_1,i_2=1}^{m}G_{i_2}B_{i_1}\hat{I}_{(00)\tau_{p+1},\tau_p}^{(i_2i_1)}+\\
+\sum_{i_1=1}^{m}\left(G_{i_1}\mathbf{a}\left(\Delta\hat{I}_{(0)\tau_{p+1},\tau_p}^{(i_1)}+\hat{I}_{(1)\tau_{p+1},\tau_p}^{(i_1)}\right)-LB_{i_1}\hat{I}_{(1)\tau_{p+1},\tau_p}^{(i_1)}\right)+\\
+\sum_{i_1,i_2,i_3=1}^{m}G_{i_3}G_{i_2}B_{i_1}\hat{I}_{(000)\tau_{p+1},\tau_p}^{(i_3i_2i_1)}+\frac{\Delta^2}{2}L\mathbf{a}+\\
+\mathbf{v}_{p+1,p}+\mathbf{r}_{p+1,p},
\end{aligned}
\tag{5}
$$

where

$$
\begin{aligned}
\mathbf{v}_{p+1,p}=\sum_{i_1,i_2=1}^{m}\Biggl(G_{i_2}LB_{i_1}\left(\hat{I}_{(10)\tau_{p+1},\tau_p}^{(i_2i_1)}-\hat{I}_{(01)\tau_{p+1},\tau_p}^{(i_2i_1)}\right)-LG_{i_2}B_{i_1}\hat{I}_{(10)\tau_{p+1},\tau_p}^{(i_2i_1)}+\\
+G_{i_2}G_{i_1}\mathbf{a}\left(\hat{I}_{(01)\tau_{p+1},\tau_p}^{(i_2i_1)}+\Delta\hat{I}_{(00)\tau_{p+1},\tau_p}^{(i_2i_1)}\right)\Biggr)+\\
+\sum_{i_1,i_2,i_3,i_4=1}^{m}G_{i_4}G_{i_3}G_{i_2}B_{i_1}\hat{I}_{(0000)\tau_{p+1},\tau_p}^{(i_4i_3i_2i_1)},
\end{aligned}
$$

$$
\begin{aligned}
\mathbf{r}_{p+1,p}=\sum_{i_1=1}^{m}\Biggl(G_{i_1}L\mathbf{a}\left(\frac{1}{2}\hat{I}_{(2)\tau_{p+1},\tau_p}^{(i_1)}+\Delta\hat{I}_{(1)\tau_{p+1},\tau_p}^{(i_1)}+\frac{\Delta^2}{2}\hat{I}_{(0)\tau_{p+1},\tau_p}^{(i_1)}\right)+\\
+\frac{1}{2}LLB_{i_1}\hat{I}_{(2)\tau_{p+1},\tau_p}^{(i_1)}-LG_{i_1}\mathbf{a}\left(\hat{I}_{(2)\tau_{p+1},\tau_p}^{(i_1)}+\Delta\hat{I}_{(1)\tau_{p+1},\tau_p}^{(i_1)}\right)\Biggr)+\\
+\sum_{i_1,i_2,i_3=1}^{m}\Biggl(G_{i_3}LG_{i_2}B_{i_1}\left(\hat{I}_{(100)\tau_{p+1},\tau_p}^{(i_3i_2i_1)}-\hat{I}_{(010)\tau_{p+1},\tau_p}^{(i_3i_2i_1)}\right)+\\
+G_{i_3}G_{i_2}LB_{i_1}\left(\hat{I}_{(010)\tau_{p+1},\tau_p}^{(i_3i_2i_1)}-\hat{I}_{(001)\tau_{p+1},\tau_p}^{(i_3i_2i_1)}\right)+
\end{aligned}
$$

$$+G_{i_3}G_{i_2}G_{i_1}\mathbf{a}\left(\Delta\hat{I}^{(i_3i_2i_1)}_{(000)\tau_{p+1},\tau_p}+\hat{I}^{(i_3i_2i_1)}_{(001)\tau_{p+1},\tau_p}\right)-$$

$$\left.-LG_{i_3}G_{i_2}B_{i_1}\hat{I}^{(i_3i_2i_1)}_{(100)\tau_{p+1},\tau_p}\right)+$$

$$+\sum_{i_1,i_2,i_3,i_4,i_5=1}^{m}G_{i_5}G_{i_4}G_{i_3}G_{i_2}B_{i_1}\hat{I}^{(i_5i_4i_3i_2i_1)}_{(00000)\tau_{p+1},\tau_p}+$$

$$+\frac{\Delta^3}{6}LL\mathbf{a},$$

where $\Delta=T/N$ $(N>1)$ is a constant (for simplicity) integration step, $\tau_p=p\Delta$ $(p=0,1,\ldots,N)$, $\hat{I}^{(i_1\ldots i_k)}_{(l_1\ldots l_k)s,t}$ denotes an approximation of the iterated Ito stochastic integral of multiplicity k

$$I^{(i_1\ldots i_k)}_{(l_1\ldots l_k)s,t}=\int\limits_t^s(t-\tau_k)^{l_k}\ldots\int\limits_t^{\tau_2}(t-\tau_1)^{l_1}d\mathbf{f}^{(i_1)}_{\tau_1}\ldots d\mathbf{f}^{(i_k)}_{\tau_k}, \tag{6}$$

$$L=\frac{\partial}{\partial t}+\sum_{i=1}^{n}\mathbf{a}_i(\mathbf{x},t)\frac{\partial}{\partial\mathbf{x}_i}+\frac{1}{2}\sum_{j=1}^{m}\sum_{l,i=1}^{n}B_{lj}(\mathbf{x},t)B_{ij}(\mathbf{x},t)\frac{\partial^2}{\partial\mathbf{x}_l\partial\mathbf{x}_i},$$

$$G_i=\sum_{j=1}^{n}B_{ji}(\mathbf{x},t)\frac{\partial}{\partial\mathbf{x}_j},\quad i=1,\ldots,m,$$

$l_1,\ldots,l_k=0,1,2,$ $i_1,\ldots,i_k=1,\ldots,m,$ $k=1,2,\ldots,5,$ B_i and B_{ij} are the ith column and the ijth element of the matrix function B, $\mathbf{a}_i$ is the ith element of the vector function $\mathbf{a}$, $\mathbf{x}_i$ is the ith element of the column $\mathbf{x}$, the functions

$$B_{i_1},\ \mathbf{a},\ G_{i_2}B_{i_1},\ G_{i_1}\mathbf{a},\ LB_{i_1},\ G_{i_3}G_{i_2}B_{i_1},\ L\mathbf{a},\ LL\mathbf{a},\ G_{i_2}LB_{i_1},$$

$$LG_{i_2}B_{i_1},\ G_{i_2}G_{i_1}\mathbf{a},\ G_{i_4}G_{i_3}G_{i_2}B_{i_1},\ G_{i_1}L\mathbf{a},\ LLB_{i_1},\ LG_{i_1}\mathbf{a},\ G_{i_3}LG_{i_2}B_{i_1},\ G_{i_3}G_{i_2}LB_{i_1},$$

$$G_{i_3}G_{i_2}G_{i_1}\mathbf{a},\ LG_{i_3}G_{i_2}B_{i_1},\ G_{i_5}G_{i_4}G_{i_3}G_{i_2}B_{i_1}$$

are calculated at the point $(\mathbf{y}_p,p)$.

Under the standard conditions [3], [14] the numerical scheme (5) has order 2.5 of strong convergence. The major emphasis below will be placed on the approximation of the iterated Ito stochastic integrals appearing in (5). Therefore, among the standard conditions, note the approximation condition of these integrals [3], [14], which has the form

$$\mathsf{M}\left\{\left(I^{(i_1\ldots i_k)}_{(l_1\ldots l_k)\tau_{p+1},\tau_p}-\hat{I}^{(i_1\ldots i_k)}_{(l_1\ldots l_k)\tau_{p+1},\tau_p}\right)^2\right\}\le C\Delta^6, \tag{7}$$

where constant C is independent of Δ.

Note that if we exclude $\mathbf{v}_{p+1,p}+\mathbf{r}_{p+1,p}$ from the right-hand side of (5), then we have an explicit one-step strong numerical scheme of order 1.5 [3], [14]-[18]. The right-hand side of (5) but without the value $\mathbf{r}_{p+1,p}$ define an explicit one-step strong numerical scheme of order 2.0 [3], [14]-[18].

Using the numerical scheme (5) or its modification based on the Taylor–Ito expansion [11], the implicit or multistep analogs of (5) can be constructed; see [3]. The set of the iterated Ito stochastic integrals to be approximated for implementing these modifications is the same as for the numerical scheme (5) itself. Interestingly, the truncated unified Taylor–Ito expansion — the foundation of the numerical scheme (5) — contains 12 different iterated Ito stochastic integrals of the form (6), which cannot be interconnected by linear relations [14]-[18]. The analogous Taylor–Ito expansion [3] contains 17 different iterated Ito stochastic integrals, part of which are interconnected by linear relations and part of which have a higher multiplicity than the iterated Ito stochastic integrals (6). This fact well explains the use of the numerical scheme (5).

One of the main problems arising in the implementation of the numerical scheme (5) is the joint numerical modeling of the iterated Ito stochastic integrals figuring in (5). In the next section, we will consider an efficient numerical modeling method for the iterated Ito stochastic integrals and also demonstrate which stochastic integrals (Ito or Stratonovich) are preferable for numerical modeling with a correct estimation of the mean-square approximation error.

3. Method of Numerical Modeling for Iterated Ito Stochastic Integrals Based on Genegalized Multiple Fourier Series

An efficient numerical modeling method for the iterated Ito stochastic integrals based on generalized multiple Fourier series was considered in [14] (2006); also see [15]-[57]. This method rests on an important result presented below (Theorems 1, 2).

Suppose that $\psi_1(\tau),\ldots,\psi_k(\tau)\in L_2([t,T])$. Define the following function on the hypercube $[t,T]^k$

$$K(t_1,\ldots,t_k)=\begin{cases}\psi_1(t_1)\ldots\psi_k(t_k) & \text{for}\ \ t_1<\ldots<t_k\\ \\ 0 & \text{otherwise}\end{cases},\qquad t_1,\ldots,t_k\in[t,T],\qquad k\ge 2, \tag{8}$$

and $K(t_1)\equiv\psi_1(t_1)$ for $t_1\in[t,T]$.

Suppose that $\{\phi_j(x)\}_{j=0}^{\infty}$ is a complete orthonormal system of functions in the space $L_2([t,T])$. The function $K(t_1,\ldots,t_k)$ belongs to the space $L_2([t,T]^k)$. At this situation it is well known that the generalized multiple Fourier series of $K(t_1,\ldots,t_k)\in L_2([t,T]^k)$ is converging to $K(t_1,\ldots,t_k)$ in the hypercube $[t,T]^k$ in the mean-square sense, i.e.

$$\lim_{p_1,\ldots,p_k\to\infty}\left\|K(t_1,\ldots,t_k)-\sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k}C_{j_k\ldots j_1}\prod_{l=1}^{k}\phi_{j_l}(t_l)\right\|_{L_2([t,T]^k)}=0,$$

where

$$C_{j_k\ldots j_1}=\int\limits_{[t,T]^k}K(t_1,\ldots,t_k)\prod_{l=1}^{k}\phi_{j_l}(t_l)dt_1\ldots dt_k, \tag{9}$$

$$\|f\|_{L_2([t,T]^k)}=\left(\int\limits_{[t,T]^k}f^2(t_1,\ldots,t_k)dt_1\ldots dt_k\right)^{1/2}.$$

Consider the partition $\{\tau_j\}_{j=0}^{N}$ of $[t,T]$ such that

$$t=\tau_0<\ldots<\tau_N=T,\quad \Delta_N=\max_{0\le j\le N-1}\Delta\tau_j\to 0\ \text{ if }\ N\to\infty,\quad \Delta\tau_j=\tau_{j+1}-\tau_j. \tag{10}$$

Theorem 1 [14] (2006), [15]-[34], [39]-[49], [51]-[57]. *Suppose that every $\psi_l(\tau)$ $(l=1,\ldots,k)$ is a continuous non-random function on $[t,T]$ and $\{\phi_j(x)\}_{j=0}^{\infty}$ is a complete orthonormal system of continuous functions in the space $L_2([t,T])$. Then*

$$J[\psi^{(k)}]_{T,t}\ =\ \underset{p_1,\ldots,p_k\to\infty}{\text{l.i.m.}}\ \sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k}C_{j_k\ldots j_1}\Biggl(\prod_{l=1}^{k}\zeta_{j_l}^{(i_l)}\ -$$

$$-\ \underset{N\to\infty}{\text{l.i.m.}}\sum_{(l_1,\ldots,l_k)\in \mathrm{G}_k}\phi_{j_1}(\tau_{l_1})\Delta\mathbf{w}_{\tau_{l_1}}^{(i_1)}\ldots\phi_{j_k}(\tau_{l_k})\Delta\mathbf{w}_{\tau_{l_k}}^{(i_k)}\Biggr), \tag{11}$$

where $J[\psi^{(k)}]_{T,t}$ is defined by (2),

$$\mathrm{G}_k=\mathrm{H}_k\backslash\mathrm{L}_k,\quad \mathrm{H}_k=\{(l_1,\ldots,l_k):\ l_1,\ldots,l_k=0,\ 1,\ldots,N-1\},$$

$$\mathrm{L}_k=\{(l_1,\ldots,l_k):\ l_1,\ldots,l_k=0,\ 1,\ldots,N-1;\ l_g\ne l_r\ (g\ne r);\ g,r=1,\ldots,k\},$$

l.i.m. *is a limit in the mean-square sense*, $i_1,\ldots,i_k=0,1,\ldots,m,$

$$\zeta_j^{(i)}=\int\limits_t^T\phi_j(s)d\mathbf{w}_s^{(i)} \tag{12}$$

are independent standard Gaussian random variables for various i or j (if $i\ne 0$), $C_{j_k\ldots j_1}$ is the Fourier coefficient (9), $\Delta\mathbf{w}_{\tau_j}^{(i)}=\mathbf{w}_{\tau_{j+1}}^{(i)}-\mathbf{w}_{\tau_j}^{(i)}$ $(i=0,1,\ldots,m)$, $\{\tau_j\}_{j=0}^{N}$ *is a partition of the interval* $[t,T]$, *which satisfies the condition* (10).

The convergence in the mean of degree $2n$ $(n\in\mathbb{N})$ [19]-[21], [23]-[28] as well as the convergence with probability 1 [19]-[21], [41], [43] of approximations from Theorem 1 (also see Theorem 2 below) are proved. Moreover, the complete orthonormal systems of Haar and Rademacher–Walsh functions in $L_2([t,T])$ can also be applied in Theorems 1 [14]-[28]. The modification of Theorem 1 for complete orthonormal with weigth $r(x)\ge 0$ systems of functions in the space $L_2([t,T])$ can be found in [18]-[21], [52]

In order to evaluate the significance of Theorem 1 for practice we will demonstrate its transformed particular cases for $k=1,\ldots,5$ [14]-[34], [39]-[49], [51]-[57]

$$J[\psi^{(1)}]_{T,t}=\underset{p_1\to\infty}{\text{l.i.m.}}\sum_{j_1=0}^{p_1}C_{j_1}\zeta_{j_1}^{(i_1)}, \tag{13}$$

$$+\mathbf{1}_{\{i_1=i_4\ne 0\}}\mathbf{1}_{\{j_1=j_4\}}\mathbf{1}_{\{i_2=i_3\ne 0\}}\mathbf{1}_{\{j_2=j_3\}}\zeta_{j_5}^{(i_5)} + \mathbf{1}_{\{i_1=i_4\ne 0\}}\mathbf{1}_{\{j_1=j_4\}}\mathbf{1}_{\{i_2=i_5\ne 0\}}\mathbf{1}_{\{j_2=j_5\}}\zeta_{j_3}^{(i_3)} +$$

$$+\mathbf{1}_{\{i_1=i_4\ne 0\}}\mathbf{1}_{\{j_1=j_4\}}\mathbf{1}_{\{i_3=i_5\ne 0\}}\mathbf{1}_{\{j_3=j_5\}}\zeta_{j_2}^{(i_2)} + \mathbf{1}_{\{i_1=i_5\ne 0\}}\mathbf{1}_{\{j_1=j_5\}}\mathbf{1}_{\{i_2=i_3\ne 0\}}\mathbf{1}_{\{j_2=j_3\}}\zeta_{j_4}^{(i_4)} +$$

$$+\mathbf{1}_{\{i_1=i_5\ne 0\}}\mathbf{1}_{\{j_1=j_5\}}\mathbf{1}_{\{i_2=i_4\ne 0\}}\mathbf{1}_{\{j_2=j_4\}}\zeta_{j_3}^{(i_3)} + \mathbf{1}_{\{i_1=i_5\ne 0\}}\mathbf{1}_{\{j_1=j_5\}}\mathbf{1}_{\{i_3=i_4\ne 0\}}\mathbf{1}_{\{j_3=j_4\}}\zeta_{j_2}^{(i_2)} +$$

$$+\mathbf{1}_{\{i_2=i_3\ne 0\}}\mathbf{1}_{\{j_2=j_3\}}\mathbf{1}_{\{i_4=i_5\ne 0\}}\mathbf{1}_{\{j_4=j_5\}}\zeta_{j_1}^{(i_1)} + \mathbf{1}_{\{i_2=i_4\ne 0\}}\mathbf{1}_{\{j_2=j_4\}}\mathbf{1}_{\{i_3=i_5\ne 0\}}\mathbf{1}_{\{j_3=j_5\}}\zeta_{j_1}^{(i_1)} +$$

$$+ \mathbf{1}_{\{i_2=i_5\ne 0\}}\mathbf{1}_{\{j_2=j_5\}}\mathbf{1}_{\{i_3=i_4\ne 0\}}\mathbf{1}_{\{j_3=j_4\}}\zeta_{j_1}^{(i_1)}\Biggr), \tag{17}$$

where $\mathbf{1}_A$ is the indicator of the set A.

We will consider the case $i_1,\ldots,i_5 = 1,\ldots,m$. This case corresponds to the numerical method (5).

For further consideration, let us consider the generalization of formulas (13)–(17) for the case of an arbitrary multiplicity k ($k \in \mathbb{N}$) of the iterated Ito stochastic integral $J[\psi^{(k)}]_{T,t}$ defined by (2). In order to do this, let us introduce some notations. Consider the unordered set $\{1,2,\ldots,k\}$ and separate it into two parts: the first part consists of r unordered pairs (sequence order of these pairs is also unimportant) and the second one consists of the remaining $k-2r$ numbers. So, we have

$$(18)\qquad (\{\underbrace{\{g_1,g_2\},\ldots,\{g_{2r-1},g_{2r}\}}_{\text{part 1}}\},\{\underbrace{q_1,\ldots,q_{k-2r}}_{\text{part 2}}\}),$$

where

$$\{g_1,g_2,\ldots,g_{2r-1},g_{2r},q_1,\ldots,q_{k-2r}\}=\{1,2,\ldots,k\},$$

braces mean an unordered set, and parentheses mean an ordered set.

We will say that (18) is a partition and consider the sum with respect to all possible partitions

$$(19)\qquad \sum_{\substack{(\{\{g_1,g_2\},\ldots,\{g_{2r-1},g_{2r}\}\},\{q_1,\ldots,q_{k-2r}\})\\ \{g_1,g_2,\ldots,g_{2r-1},g_{2r},q_1,\ldots,q_{k-2r}\}=\{1,2,\ldots,k\}}} a_{g_1g_2,\ldots,g_{2r-1}g_{2r},q_1\ldots q_{k-2r}}.$$

Below there are several examples of sums in the form (19)

$$\sum_{\substack{(\{g_1,g_2\})\\ \{g_1,g_2\}=\{1,2\}}} a_{g_1g_2}=a_{12},$$

$$\sum_{\substack{(\{\{g_1,g_2\},\{g_3,g_4\}\})\\ \{g_1,g_2,g_3,g_4\}=\{1,2,3,4\}}} a_{g_1g_2g_3g_4}=a_{1234}+a_{1324}+a_{2314},$$

$$\sum_{\substack{(\{g_1,g_2\},\{q_1,q_2\})\\ \{g_1,g_2,q_1,q_2\}=\{1,2,3,4\}}} a_{g_1g_2,q_1q_2}=$$

$$=a_{12,34}+a_{13,24}+a_{14,23}+a_{23,14}+a_{24,13}+a_{34,12},$$

$$\sum_{\substack{(\{g_1,g_2\},\{q_1,q_2,q_3\})\\ \{g_1,g_2,q_1,q_2,q_3\}=\{1,2,3,4,5\}}} a_{g_1g_2,q_1q_2q_3}=$$

$$=a_{12,345}+a_{13,245}+a_{14,235}+a_{15,234}+a_{23,145}+a_{24,135}+$$
$$+a_{25,134}+a_{34,125}+a_{35,124}+a_{45,123},$$

$$\sum_{\substack{(\{\{g_1,g_2\},\{g_3,g_4\}\},\{q_1\})\\ \{g_1,g_2,g_3,g_4,q_1\}=\{1,2,3,4,5\}}} a_{g_1g_2,g_3g_4,q_1}=$$

$$=a_{12,34,5}+a_{13,24,5}+a_{14,23,5}+a_{12,35,4}+a_{13,25,4}+a_{15,23,4}+$$
$$+a_{12,54,3}+a_{15,24,3}+a_{14,25,3}+a_{15,34,2}+a_{13,54,2}+a_{14,53,2}+$$

$$+a_{52,34,1}+a_{53,24,1}+a_{54,23,1}.$$

Now we can write (11) as

$$J[\psi^{(k)}]_{T,t}=\underset{p_1,\ldots,p_k\to\infty}{\text{l.i.m.}}\sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k}C_{j_k\ldots j_1}\Biggl(\prod_{l=1}^{k}\zeta_{j_l}^{(i_l)}+\sum_{r=1}^{[k/2]}(-1)^r\times$$

$$\times\sum_{\substack{(\{\{g_1,g_2\},\ldots,\{g_{2r-1},g_{2r}\}\},\{q_1,\ldots,q_{k-2r}\})\\ \{g_1,g_2,\ldots,g_{2r-1},g_{2r},q_1,\ldots,q_{k-2r}\}=\{1,2,\ldots,k\}}}\prod_{s=1}^{r}\mathbf{1}_{\{i_{g_{2s-1}}=\,i_{g_{2s}}\neq 0\}}\mathbf{1}_{\{j_{g_{2s-1}}=\,j_{g_{2s}}\}}\prod_{l=1}^{k-2r}\zeta_{j_{q_l}}^{(i_{q_l})}\Biggr), \tag{20}$$

where $[x]$ is an integer part of a real number x; another notations are the same as in Theorem **1**.

In particular, from (20) for $k=5$ we obtain

$$J[\psi^{(5)}]_{T,t}=\underset{p_1,\ldots,p_5\to\infty}{\text{l.i.m.}}\sum_{j_1=0}^{p_1}\ldots\sum_{j_5=0}^{p_5}C_{j_5\ldots j_1}\Biggl(\prod_{l=1}^{5}\zeta_{j_l}^{(i_l)}-$$

$$-\sum_{\substack{(\{g_1,g_2\},\{q_1,q_2,q_3\})\\ \{g_1,g_2,q_1,q_2,q_3\}=\{1,2,3,4,5\}}}\mathbf{1}_{\{i_{g_1}=\,i_{g_2}\neq 0\}}\mathbf{1}_{\{j_{g_1}=\,j_{g_2}\}}\prod_{l=1}^{3}\zeta_{j_{q_l}}^{(i_{q_l})}+$$

$$+\sum_{\substack{(\{\{g_1,g_2\},\{g_3,g_4\}\},\{q_1\})\\ \{g_1,g_2,g_3,g_4,q_1\}=\{1,2,3,4,5\}}}\mathbf{1}_{\{i_{g_1}=\,i_{g_2}\neq 0\}}\mathbf{1}_{\{j_{g_1}=\,j_{g_2}\}}\mathbf{1}_{\{i_{g_3}=\,i_{g_4}\neq 0\}}\mathbf{1}_{\{j_{g_3}=\,j_{g_4}\}}\zeta_{j_{q_1}}^{(i_{q_1})}\Biggr).$$

The last equality obviously agrees with (17).

Let us consider the generalization of Theorem 1 for the case of an arbitrary complete orthonormal systems of functions in the space $L_2([t,T])$ and $\psi_1(\tau),\ldots,\psi_k(\tau)\in L_2([t,T])$.

Theorem 2 [19] (Sect. 1.11), [41] (Sect. 15). *Suppose that* $\psi_1(\tau),\ldots,\psi_k(\tau)\in L_2([t,T])$ *and* $\{\phi_j(x)\}_{j=0}^{\infty}$ *is an arbitrary complete orthonormal system of functions in the space* $L_2([t,T])$*. Then the following expansion*

$$J[\psi^{(k)}]_{T,t}=\underset{p_1,\ldots,p_k\to\infty}{\text{l.i.m.}}\sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k}C_{j_k\ldots j_1}\Biggl(\prod_{l=1}^{k}\zeta_{j_l}^{(i_l)}+\sum_{r=1}^{[k/2]}(-1)^r\times$$

$$\times\sum_{\substack{(\{\{g_1,g_2\},\ldots,\{g_{2r-1},g_{2r}\}\},\{q_1,\ldots,q_{k-2r}\})\\ \{g_1,g_2,\ldots,g_{2r-1},g_{2r},q_1,\ldots,q_{k-2r}\}=\{1,2,\ldots,k\}}}\prod_{s=1}^{r}\mathbf{1}_{\{i_{g_{2s-1}}=\,i_{g_{2s}}\neq 0\}}\mathbf{1}_{\{j_{g_{2s-1}}=\,j_{g_{2s}}\}}\prod_{l=1}^{k-2r}\zeta_{j_{q_l}}^{(i_{q_l})}\Biggr) \tag{21}$$

converging in the mean-square sense is valid, where $[x]$ *is an integer part of a real number* x; *another notations are the same as in Theorem* 1.

It should be noted that an analogue of Theorem 2 was considered in [62]. Note that we use another notations [19] (Sect. 1.11), [41] (Sect. 15) in comparison with [62]. Moreover, the proof of an analogue of Theorem 2 from [62] is somewhat different from the proof given in [19] (Sect. 1.11), [41] (Sect. 15).

4. Calculation of the Mean-Square Approximation Error in the Method of Generalized Multiple Fourier Seires

Note that for the integrals $J[\psi^{(k)}]_{T,t}$ defined by (2) the mean-square approximation error can be exactly calculated and efficiently estimated.

Let $J[\psi^{(k)}]_{T,t}^q$ be the expression on the right-hand side of (21) before passing to the limit $\underset{p_1,\ldots,p_k\to\infty}{\text{l.i.m.}}$ for the case $p_1=\ldots=p_k=q$, i.e.

$$J[\psi^{(k)}]_{T,t}^q=\sum_{j_1,\ldots,j_k=0}^{q} C_{j_k\ldots j_1}\Biggl(\prod_{l=1}^{k}\zeta_{j_l}^{(i_l)}+\sum_{r=1}^{[k/2]}(-1)^r\times$$

$$\times\sum_{\substack{(\{\{g_1,g_2\},\ldots,\{g_{2r-1},g_{2r}\}\},\{q_1,\ldots,q_{k-2r}\})\\ \{g_1,g_2,\ldots,g_{2r-1},g_{2r},q_1,\ldots,q_{k-2r}\}=\{1,2,\ldots,k\}}}\prod_{s=1}^{r}\mathbf{1}_{\{i_{g_{2s-1}}=\,i_{g_{2s}}\neq 0\}}\mathbf{1}_{\{j_{g_{2s-1}}=\,j_{g_{2s}}\}}\prod_{l=1}^{k-2r}\zeta_{j_{q_l}}^{(i_{q_l})}\Biggr) \tag{22}$$

Let us denote

$$\mathsf{M}\left\{\left(J[\psi^{(k)}]_{T,t}-J[\psi^{(k)}]_{T,t}^q\right)^2\right\}\stackrel{\text{def}}{=}E_k^q,$$

$$\int\limits_{[t,T]^k}K^2(t_1,\ldots,t_k)dt_1\ldots dt_k\stackrel{\text{def}}{=}I_k.$$

In [17]-[21], [41], [42] it was shown that

$$E_k^q\le k!\left(I_k-\sum_{j_1,\ldots,j_k=0}^{q}C_{j_k\ldots j_1}^2\right) \tag{23}$$

for the following two cases:

1. $i_1,\ldots,i_k=1,\ldots,m$ and $T-t\in(0,+\infty)$,
2. $i_1,\ldots,i_k=0,1,\ldots,m$ and $T-t\in(0,1)$.

The value E_k^q can be calculated exactly.

Theorem 3 [19] (Sect. 1.12), [42] (Sect. 6). *Suppose that $\{\phi_j(x)\}_{j=0}^{\infty}$ is an arbitrary complete orthonormal system of functions in the space $L_2([t,T])$ and $\psi_1(\tau),\ldots,\psi_k(\tau)\in L_2([t,T])$. Then*

$$E_k^q=I_k-\sum_{j_1,\ldots,j_k=0}^{q}C_{j_k\ldots j_1}\mathsf{M}\left\{J[\psi^{(k)}]_{T,t}\sum_{(j_1,\ldots,j_k)}\int\limits_t^T\phi_{j_k}(t_k)\ldots\int\limits_t^{t_2}\phi_{j_1}(t_1)d\mathbf{f}_{t_1}^{(i_1)}\ldots d\mathbf{f}_{t_k}^{(i_k)}\right\}, \tag{24}$$

where $i_1, \ldots, i_k = 1, \ldots, m$; *the expression*

$$\sum_{(j_1,\ldots,j_k)}$$

means the sum with respect to all possible permutations $(j_1, \ldots, j_k)$. *At the same time if* j_r *swapped with* j_q *in the permutation* $(j_1, \ldots, j_k)$, *then* i_r *swapped with* i_q *in the permutation* $(i_1, \ldots, i_k)$; *another notations are the same as in Theorems* 1, 2.

Note that

$$\mathsf{M}\left\{J[\psi^{(k)}]_{T,t}\int\limits_t^T \phi_{j_k}(t_k)\ldots\int\limits_t^{t_2}\phi_{j_1}(t_1)d\mathbf{f}_{t_1}^{(i_1)}\ldots d\mathbf{f}_{t_k}^{(i_k)}\right\} = C_{j_k\ldots j_1}.$$

Therefore, for the special case of pairwise different numbers $i_1, \ldots, i_k$ as well as for the case $i_1 = \ldots = i_k$ from Theorem 3 it follows that [18]-[21], [29], [42]

$$E_k^q = I_k - \sum_{j_1,\ldots,j_k=0}^{q} C^2_{j_k\ldots j_1}, \tag{25}$$

$$E_k^q = I_k - \sum_{j_1,\ldots,j_k=0}^{q} C_{j_k\ldots j_1}\left(\sum_{(j_1,\ldots,j_k)} C_{j_k\ldots j_1}\right),$$

where

$$\sum_{(j_1,\ldots,j_k)}$$

is a sum with respect to all possible permutations $(j_1, \ldots, j_k)$.

Consider some examples [18]-[21], [29], [42] of application of Theorem 3 $(i_1, i_2, i_3 = 1, \ldots, m)$

$$E_2^q = I_2 - \sum_{j_1,j_2=0}^{q} C^2_{j_2j_1} - \sum_{j_1,j_2=0}^{q} C_{j_2j_1}C_{j_1j_2} \quad (i_1 = i_2), \tag{26}$$

$$E_3^q = I_3 - \sum_{j_3,j_2,j_1=0}^{q} C^2_{j_3j_2j_1} - \sum_{j_3,j_2,j_1=0}^{q} C_{j_3j_1j_2}C_{j_3j_2j_1} \quad (i_1 = i_2 \neq i_3), \tag{27}$$

$$E_3^q = I_3 - \sum_{j_3,j_2,j_1=0}^{q} C^2_{j_3j_2j_1} - \sum_{j_3,j_2,j_1=0}^{q} C_{j_2j_3j_1}C_{j_3j_2j_1} \quad (i_1 \neq i_2 = i_3), \tag{28}$$

$$E_3^q = I_3 - \sum_{j_3,j_2,j_1=0}^{q} C^2_{j_3j_2j_1} - \sum_{j_3,j_2,j_1=0}^{q} C_{j_3j_2j_1}C_{j_1j_2j_3} \quad (i_1 = i_3 \neq i_2). \tag{29}$$

The values E_4^q and E_5^q were calculated exaclty for all possible combinations of $i_1, \ldots, i_5 = 1, \ldots, m$ in [18]-[21], [42].

5. Expansions of Iterated Stratonovich Stochastic Integrals Based on Multiple Fourier–Legendre Series and Multiple Trigonometric Fourier Seires

In contrast to the iterated Ito stochastic integrals, the iterated Stratonovich stochastic integrals have simpler expansions than (11) and (21), but the calculation (or estimation) of the mean-square approximation errors for the latter is a much more difficult problem than for the former. Study this issue in detail.

Introduce the following iterated Stratonovich stochastic integrals

$$J^*[\psi^{(k)}]_{T,t} = \int\limits_t^{*T} \psi_k(t_k) \ldots \int\limits_t^{*t_2} \psi_1(t_1) d\mathbf{w}_{t_1}^{(i_1)} \ldots d\mathbf{w}_{t_k}^{(i_k)}, \tag{30}$$

where the notations are the same as in the formula (2) (in this paper, we use the definition of the Stratonovich stochastic integral from [3]).

Consider a slightly modified and extended theoretical result that adapts Theorems 1, 2 for the iterated Stratonovich stochastic integrals (30) of multiplicities 2 to 4 (some old results).

Theorem 4 [15]-[21], [26]-[28], [32], [40], [43]-[47], [53]. *Assume that $\{\phi_j(x)\}_{j=0}^{\infty}$ is a complete orthonormal system of Legendre polynomials or trigonometric functions in $L_2([t,T])$. In addition, assume that $\psi_2(s)$ is a continuously differentiable function on the interval $[t,T]$ and $\psi_1(s)$, $\psi_3(s)$ are twice continuously differentiable functions on the interval $[t,T]$. Then*

$$J^*[\psi^{(k)}]_{T,t} = \underset{q\to\infty}{\text{l.i.m.}} \sum_{j_1,\ldots,j_k=0}^{q} C_{j_k\ldots j_1} \zeta_{j_1}^{(i_1)} \ldots \zeta_{j_k}^{(i_k)}, \tag{31}$$

where $k = 2, 3, 4$. At that $\psi_1(s), \ldots, \psi_k(s) \equiv 1$ and $i_1, \ldots, i_k = 0, 1, \ldots, m$ in (31) for $k = 4$, while $i_1, \ldots, i_k = 1, \ldots, m$ in (31) for $k = 2, 3$; the other notations are the same as in Theorems 1, 2.

Recently, a new approach to the expansion and mean-square approximation of iterated Stratonovich stochastic integrals has been obtained [19] (Sect. 2.10–2.16), [44] (Sect. 7–13), [45] (Sect. 13–19), [53] (Sect. 5–11), [57] (Sect. 4–9). Let us formulate four theorems that were obtained using this approach.

Theorem 5 [19], [44], [45], [53], [57]. *Suppose that $\{\phi_j(x)\}_{j=0}^{\infty}$ is a complete orthonormal system of Legendre polynomials or trigonometric functions in the space $L_2([t,T])$. Furthermore, let $\psi_1(\tau), \psi_2(\tau)$, $\psi_3(\tau)$ are continuously differentiable nonrandom functions on $[t,T]$. Then, for the iterated Stratonovich stochastic integral of third multiplicity*

$$J^*[\psi^{(3)}]_{T,t} = \int\limits_t^{*T} \psi_3(t_3) \int\limits_t^{*t_3} \psi_2(t_2) \int\limits_t^{*t_2} \psi_1(t_1) d\mathbf{w}_{t_1}^{(i_1)} d\mathbf{w}_{t_2}^{(i_2)} d\mathbf{w}_{t_3}^{(i_3)} \quad (i_1, i_2, i_3 = 0, 1, \ldots, m)$$

the following relations

$$J^*[\psi^{(3)}]_{T,t} = \underset{p\to\infty}{\text{l.i.m.}} \sum_{j_1,j_2,j_3=0}^{p} C_{j_3 j_2 j_1} \zeta_{j_1}^{(i_1)} \zeta_{j_2}^{(i_2)} \zeta_{j_3}^{(i_3)}, \tag{32}$$

$$
\mathsf{M}\left\{\left(J^*[\psi^{(3)}]_{T,t}-\sum_{j_1,j_2,j_3=0}^{p}C_{j_3j_2j_1}\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}\zeta_{j_3}^{(i_3)}\right)^2\right\}\le\frac{C}{p} \tag{33}
$$

are fulfilled, where $i_1,i_2,i_3=0,1,\ldots,m$ *in* (32) *and* $i_1,i_2,i_3=1,\ldots,m$ *in* (33), *constant* C *is independent of* p,

$$
C_{j_3j_2j_1}=\int\limits_t^T\psi_3(t_3)\phi_{j_3}(t_3)\int\limits_t^{t_3}\psi_2(t_2)\phi_{j_2}(t_2)\int\limits_t^{t_2}\psi_1(t_1)\phi_{j_1}(t_1)dt_1dt_2dt_3
$$

and

$$
\zeta_j^{(i)}=\int\limits_t^T\phi_j(\tau)d\mathbf{f}_\tau^{(i)}
$$

are independent standard Gaussian random variables for various i *or* j *(in the case when* $i\ne 0$*); another notations are the same as in Theorems* 1, 2.

Theorem 6 [19], [44], [45], [53], [57]. *Let* $\{\phi_j(x)\}_{j=0}^{\infty}$ *be a complete orthonormal system of Legendre polynomials or trigonometric functions in the space* $L_2([t,T])$. *Furthermore, let* $\psi_1(\tau),\ldots,\psi_4(\tau)$ *be continuously differentiable nonrandom functions on* $[t,T]$. *Then, for the iterated Stratonovich stochastic integral of fourth multiplicity*

$$
J^*[\psi^{(4)}]_{T,t}=\int\limits_t^{*T}\psi_4(t_4)\int\limits_t^{*t_4}\psi_3(t_3)\int\limits_t^{*t_3}\psi_2(t_2)\int\limits_t^{*t_2}\psi_1(t_1)d\mathbf{w}_{t_1}^{(i_1)}d\mathbf{w}_{t_2}^{(i_2)}d\mathbf{w}_{t_3}^{(i_3)}d\mathbf{w}_{t_4}^{(i_4)} \tag{34}
$$

the following relations

$$
J^*[\psi^{(4)}]_{T,t}=\underset{p\to\infty}{\text{l.i.m.}}\sum_{j_1,j_2,j_3,j_4=0}^{p}C_{j_4j_3j_2j_1}\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}\zeta_{j_3}^{(i_3)}\zeta_{j_4}^{(i_4)}, \tag{35}
$$

$$
\mathsf{M}\left\{\left(J^*[\psi^{(4)}]_{T,t}-\sum_{j_1,j_2,j_3,j_4=0}^{p}C_{j_4j_3j_2j_1}\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}\zeta_{j_3}^{(i_3)}\zeta_{j_4}^{(i_4)}\right)^2\right\}\le\frac{C}{p^{1-\varepsilon}} \tag{36}
$$

are fulfilled, where $i_1,\ldots,i_4=0,1,\ldots,m$ *in* (34), (35) *and* $i_1,\ldots,i_4=1,\ldots,m$ *in* (36), *constant* C *does not depend on* p, ε *is an arbitrary small positive real number for the case of complete orthonormal system of Legendre polynomials in the space* $L_2([t,T])$ *and* $\varepsilon=0$ *for the case of complete orthonormal system of trigonometric functions in the space* $L_2([t,T])$,

$$
C_{j_4j_3j_2j_1}=
$$

$$
=\int\limits_t^T\psi_4(t_4)\phi_{j_4}(t_4)\int\limits_t^{t_4}\psi_3(t_3)\phi_{j_3}(t_3)\int\limits_t^{t_3}\psi_2(t_2)\phi_{j_2}(t_2)\int\limits_t^{t_2}\psi_1(t_1)\phi_{j_1}(t_1)dt_1dt_2dt_3dt_4;
$$

another notations are the same as in Theorem 5.

Theorem 7 [19], [44], [45], [53], [57]. *Assume that* $\{\phi_j(x)\}_{j=0}^{\infty}$ *is a complete orthonormal system of Legendre polynomials or trigonometric functions in the space* $L_2([t,T])$ *and* $\psi_1(\tau),\ldots,\psi_5(\tau)$ *are continuously differentiable nonrandom functions on* $[t,T]$. *Then, for the iterated Stratonovich stochastic integral of fifth multiplicity*

$$J^*[\psi^{(5)}]_{T,t}=\int\limits_t^{*T}\psi_5(t_5)\ldots\int\limits_t^{*t_2}\psi_1(t_1)d\mathbf{w}_{t_1}^{(i_1)}\ldots d\mathbf{w}_{t_5}^{(i_5)} \tag{37}$$

the following relations

$$J^*[\psi^{(5)}]_{T,t}=\underset{p\to\infty}{\text{l.i.m.}}\sum_{j_1,\ldots,j_5=0}^{p}C_{j_5\ldots j_1}\zeta_{j_1}^{(i_1)}\ldots\zeta_{j_5}^{(i_5)}, \tag{38}$$

$$\mathsf{M}\left\{\left(J^*[\psi^{(5)}]_{T,t}-\sum_{j_1,\ldots,j_5=0}^{p}C_{j_5\ldots j_1}\zeta_{j_1}^{(i_1)}\ldots\zeta_{j_5}^{(i_5)}\right)^2\right\}\le\frac{C}{p^{1-\varepsilon}} \tag{39}$$

are fulfilled, where $i_1,\ldots,i_5=0,1,\ldots,m$ *in* (37), (38) *and* $i_1,\ldots,i_5=1,\ldots,m$ *in* (39), *constant* C *is independent of* p, ε *is an arbitrary small positive real number for the case of complete orthonormal system of Legendre polynomials in the space* $L_2([t,T])$ *and* $\varepsilon=0$ *for the case of complete orthonormal system of trigonometric functions in the space* $L_2([t,T])$,

$$C_{j_5\ldots j_1}=\int\limits_t^T\psi_5(t_5)\phi_{j_5}(t_5)\ldots\int\limits_t^{t_2}\psi_1(t_1)\phi_{j_1}(t_1)dt_1\ldots dt_5;$$

another notations are the same as in Theorems 5, 6.

Theorem 8 [19], [44], [45], [53]. *Suppose that* $\{\phi_j(x)\}_{j=0}^{\infty}$ *is a complete orthonormal system of Legendre polynomials or trigonometric functions in the space* $L_2([t,T])$. *Then, for the iterated Stratonovich stochastic integral of sixth multiplicity*

$$J_{T,t}^{*(i_1\ldots i_6)}=\int\limits_t^{*T}\ldots\int\limits_t^{*t_2}d\mathbf{w}_{t_1}^{(i_1)}\ldots d\mathbf{w}_{t_6}^{(i_6)} \tag{40}$$

the following expansion

$$J_{T,t}^{*(i_1\ldots i_6)}=\underset{p\to\infty}{\text{l.i.m.}}\sum_{j_1,\ldots,j_6=0}^{p}C_{j_6\ldots j_1}\zeta_{j_1}^{(i_1)}\ldots\zeta_{j_6}^{(i_6)}$$

that converges in the mean-square sense is valid, where $i_1,\ldots,i_6=0,1,\ldots,m$,

$$C_{j_6\ldots j_1}=\int\limits_t^T\phi_{j_6}(t_6)\ldots\int\limits_t^{t_2}\phi_{j_1}(t_1)dt_1\ldots dt_6;$$

another notations are the same as in Theorems 5–7.

Clearly, the expansion (31) is simpler than the expansions (11), (21). However, the calculation of the mean-square approximation error for the expansion (31) turns out to be much more difficult than for the expansions (11), (21). We will demonstrate this fact below.

The cases $k=1,2$ are actually not interesting: for $k=1$, the Ito and Stratonovich stochastic integrals of a smooth nonrandom function equal each other with probability 1 (w. p. 1); for $k=2$, the Ito stochastic integrals appearing in the numerical scheme (5) differ w. p. 1 from the corresponding Stratonovich stochastic integrals by constant values by virtue of the standard relations between the Ito and Stratonovich stochastic integrals [3]. Consider the triple Stratonovich stochastic integral defined by

$$I_{(000)T,t}^{*(i_1i_2i_3)}=\int\limits_t^{*T}\int\limits_t^{*t_3}\int\limits_t^{*t_2}d\mathbf{f}_{t_1}^{(i_1)}d\mathbf{f}_{t_2}^{(i_2)}d\mathbf{f}_{t_3}^{(i_3)}\quad(i_1,i_2,i_3=1,\ldots,m).$$

In view of the standard relations between the Ito and Stratonovich stochastic integrals [3] and also Theorems 1, 2, and 4 ($k=3$), we obtain

$$\mathsf{M}\left\{\left(I_{(000)T,t}^{*(i_1i_2i_3)}-I_{(000)T,t}^{*(i_1i_2i_3)q}\right)^2\right\}=$$

$$=\mathsf{M}\left\{\left(I_{(000)T,t}^{(i_1i_2i_3)}+\mathbf{1}_{\{i_1=i_2\}}\frac{1}{2}\int\limits_t^T\int\limits_t^{\tau}dsd\mathbf{f}_{\tau}^{(i_3)}+\mathbf{1}_{\{i_2=i_3\}}\frac{1}{2}\int\limits_t^T\int\limits_t^{\tau}d\mathbf{f}_{s}^{(i_1)}d\tau-I_{(000)T,t}^{*(i_1i_2i_3)q}\right)^2\right\}=$$

$$=\mathsf{M}\Biggl\{\Biggl(I_{(000)T,t}^{(i_1i_2i_3)}-I_{(000)T,t}^{(i_1i_2i_3)q}+I_{(000)T,t}^{(i_1i_2i_3)q}+$$

$$+\mathbf{1}_{\{i_1=i_2\}}\frac{1}{2}\int\limits_t^T\int\limits_t^{\tau}dsd\mathbf{f}_{\tau}^{(i_3)}+\mathbf{1}_{\{i_2=i_3\}}\frac{1}{2}\int\limits_t^T\int\limits_t^{\tau}d\mathbf{f}_{s}^{(i_1)}d\tau-I_{(000)T,t}^{*(i_1i_2i_3)q}\Biggr)^2\Biggr\},\tag{41}$$

$$I_{(000)T,t}^{(i_1i_2i_3)q}=\sum_{j_1,j_2,j_3=0}^{q}C_{j_3j_2j_1}\Biggl(\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}\zeta_{j_3}^{(i_3)}-\mathbf{1}_{\{i_1=i_2\}}\mathbf{1}_{\{j_1=j_2\}}\zeta_{j_3}^{(i_3)}-$$

$$-\mathbf{1}_{\{i_2=i_3\}}\mathbf{1}_{\{j_2=j_3\}}\zeta_{j_1}^{(i_1)}-\mathbf{1}_{\{i_1=i_3\}}\mathbf{1}_{\{j_1=j_3\}}\zeta_{j_2}^{(i_2)}\Biggr),\tag{42}$$

$$I_{(000)T,t}^{*(i_1i_2i_3)q}=\sum_{j_1,j_2,j_3=0}^{q}C_{j_3j_2j_1}\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}\zeta_{j_3}^{(i_3)},\tag{43}$$

where $I_{(000)T,t}^{(i_1 i_2 i_3)q}$ is the approximation defined by (22) (also see (15)) for $k=3$ and $I_{(000)T,t}^{*(i_1 i_2 i_3)q}$ is the approximation based on Theorem 4 for $k=3$.

Substituting (42) and (43) into (41) yields

$$\mathsf{M}\left\{\left(I_{(000)T,t}^{*(i_1 i_2 i_3)}-I_{(000)T,t}^{*(i_1 i_2 i_3)q}\right)^2\right\}=$$

$$=\mathsf{M}\left\{\left(I_{(000)T,t}^{(i_1 i_2 i_3)}-I_{(000)T,t}^{(i_1 i_2 i_3)q}+\mathbf{1}_{\{i_1=i_2\}}\left(\frac{1}{2}\int\limits_t^T\int\limits_t^{\tau}dsd\mathbf{f}_{\tau}^{(i_3)}-\sum_{j_1,j_3=0}^{q}C_{j_3 j_1 j_1}\zeta_{j_3}^{(i_3)}\right)+\right.\right.$$

$$\left.\left.+\mathbf{1}_{\{i_2=i_3\}}\left(\frac{1}{2}\int\limits_t^T\int\limits_t^{\tau}d\mathbf{f}_s^{(i_1)}d\tau-\sum_{j_1,j_3=0}^{q}C_{j_3 j_3 j_1}\zeta_{j_1}^{(i_1)}\right)-\mathbf{1}_{\{i_1=i_3\}}\sum_{j_1,j_2=0}^{q}C_{j_1 j_2 j_1}\zeta_{j_2}^{(i_2)}\right)^2\right\}\le$$

$$\le 4\left(\mathsf{M}\left\{\left(I_{(000)T,t}^{(i_1 i_2 i_3)}-I_{(000)T,t}^{(i_1 i_2 i_3)q}\right)^2\right\}+\mathbf{1}_{\{i_1=i_2\}}F_q^{(i_3)}+\right.$$

$$\left.+\mathbf{1}_{\{i_2=i_3\}}G_q^{(i_1)}+\mathbf{1}_{\{i_1=i_3\}}H_q^{(i_2)}\right),\tag{44}$$

where

$$F_q^{(i_3)}=\mathsf{M}\left\{\left(\frac{1}{2}\int\limits_t^T\int\limits_t^{\tau}dsd\mathbf{f}_{\tau}^{(i_3)}-\sum_{j_1,j_3=0}^{q}C_{j_3 j_1 j_1}\zeta_{j_3}^{(i_3)}\right)^2\right\},$$

$$G_q^{(i_1)}=\mathsf{M}\left\{\left(\frac{1}{2}\int\limits_t^T\int\limits_t^{\tau}d\mathbf{f}_s^{(i_1)}d\tau-\sum_{j_1,j_3=0}^{q}C_{j_3 j_3 j_1}\zeta_{j_1}^{(i_1)}\right)^2\right\},$$

$$H_q^{(i_2)}=\mathsf{M}\left\{\left(\sum_{j_1,j_2=0}^{q}C_{j_1 j_2 j_1}\zeta_{j_2}^{(i_2)}\right)^2\right\}.$$

For the case of Legendre polynomials or trigonometric functions we have the equalities (for details, see the proof of Theorem 4 for $k=3$ in [15]-[21], [26]-[28], [45])

$$\lim_{q\to\infty}F_q^{(i_3)}=0,\quad \lim_{q\to\infty}G_q^{(i_1)}=0,\quad \lim_{q\to\infty}H_q^{(i_2)}=0.$$

However, in accordance with (44) the value

$$\mathsf{M}\left\{\left(I_{(000)T,t}^{*(i_1 i_2 i_3)}-I_{(000)T,t}^{*(i_1 i_2 i_3)q}\right)^2\right\}$$

with a finite q can be estimated by the sum of

$$\mathsf{M}\left\{\left(I_{(000)T,t}^{(i_1i_2i_3)}-I_{(000)T,t}^{(i_1i_2i_3)q}\right)^2\right\}, \tag{45}$$

and three additional terms of a rather complex structure. The value (45) can be calculated exactly using Theorem 3 or estimated using (23) for the case $k=3$.

As is easily observed, this peculiarity will also apply to the iterated Stratonovich stochastic integrals of multiplicities 4 and 5, with the only difference that the number of additional terms like $F_q^{(i_3)}$, $G_q^{(i_1)}$, and $H_q^{(i_2)}$ will be considerably higher and their structure will be more complicated. Therefore, the payment for a relatively simple approximation of the iterated Stratonovich stochastic integrals (Theorems 4–8) in comparison with the iterated Ito stochastic integrals (Theorems 1, 2) is a much more difficult calculation or estimation procedure of their mean-square approximation errors (see Chapter 5 in [19] for detail). This well explains why the main emphasis of the paper is on the approximation of the iterated Ito stochastic integrals figuring in the numerical scheme (5). Their approximation involves Theorems 1, 2 for $k=1,\ldots,5$ and also a complete orthonormal system of Legendre polynomials in the space $L_2([t,T])$. As was established in [19]-[21], [31], [39], the Legendre polynomials have a series of advantages over the trigonometric functions for the approximation of iterated stochastic integrals using Theorems 1, 2.

6. Approximation of Iterated Ito Stochastic Integrals Based on Multiple Fourier–Legendre Series

Consider the approximations of the iterated Ito stochastic integrals that appear in the numerical scheme (5) using Theorems 1, 2 and the complete orthonormal system of Legendre polynomials in the space $L_2([\tau_p,\tau_{p+1}])$ ($\tau_p=p\Delta$, $N\Delta=T$, $p=0,1,\ldots,N$) [14] (also see [15]-[51], [54]-[56])

$$I_{(0)\tau_{p+1},\tau_p}^{(i_1)}=\sqrt{\Delta}\zeta_0^{(i_1)}, \tag{46}$$

$$I_{(00)\tau_{p+1},\tau_p}^{(i_1i_2)q}=\frac{\Delta}{2}\left(\zeta_0^{(i_1)}\zeta_0^{(i_2)}+\sum_{i=1}^{q}\frac{1}{\sqrt{4i^2-1}}\left(\zeta_{i-1}^{(i_1)}\zeta_i^{(i_2)}-\zeta_i^{(i_1)}\zeta_{i-1}^{(i_2)}\right)-\mathbf{1}_{\{i_1=i_2\}}\right), \tag{47}$$

$$I_{(1)\tau_{p+1},\tau_p}^{(i_1)}=-\frac{\Delta^{3/2}}{2}\left(\zeta_0^{(i_1)}+\frac{1}{\sqrt{3}}\zeta_1^{(i_1)}\right), \tag{48}$$

$$I_{(000)\tau_{p+1},\tau_p}^{(i_1i_2i_3)q}=\sum_{j_1,j_2,j_3=0}^{q}C_{j_3j_2j_1}\Biggl(\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}\zeta_{j_3}^{(i_3)}-\mathbf{1}_{\{i_1=i_2\}}\mathbf{1}_{\{j_1=j_2\}}\zeta_{j_3}^{(i_3)}-$$
$$-\mathbf{1}_{\{i_2=i_3\}}\mathbf{1}_{\{j_2=j_3\}}\zeta_{j_1}^{(i_1)}-\mathbf{1}_{\{i_1=i_3\}}\mathbf{1}_{\{j_1=j_3\}}\zeta_{j_2}^{(i_2)}\Biggr), \tag{49}$$

$$I_{(0000)\tau_{p+1},\tau_p}^{(i_1i_2i_3i_4)q}=\sum_{j_1,j_2,j_3,j_4=0}^{q}C_{j_4j_3j_2j_1}\Biggl(\prod_{l=1}^{4}\zeta_{j_l}^{(i_l)}-$$

$$-\mathbf{1}_{\{i_1=i_2\}}\mathbf{1}_{\{j_1=j_2\}}\zeta_{j_3}^{(i_3)}\zeta_{j_4}^{(i_4)}-\mathbf{1}_{\{i_1=i_3\}}\mathbf{1}_{\{j_1=j_3\}}\zeta_{j_2}^{(i_2)}\zeta_{j_4}^{(i_4)}-$$
$$-\mathbf{1}_{\{i_1=i_4\}}\mathbf{1}_{\{j_1=j_4\}}\zeta_{j_2}^{(i_2)}\zeta_{j_3}^{(i_3)}-\mathbf{1}_{\{i_2=i_3\}}\mathbf{1}_{\{j_2=j_3\}}\zeta_{j_1}^{(i_1)}\zeta_{j_4}^{(i_4)}-$$
$$-\mathbf{1}_{\{i_2=i_4\}}\mathbf{1}_{\{j_2=j_4\}}\zeta_{j_1}^{(i_1)}\zeta_{j_3}^{(i_3)}-\mathbf{1}_{\{i_3=i_4\}}\mathbf{1}_{\{j_3=j_4\}}\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}+$$
$$+\mathbf{1}_{\{i_1=i_2\}}\mathbf{1}_{\{j_1=j_2\}}\mathbf{1}_{\{i_3=i_4\}}\mathbf{1}_{\{j_3=j_4\}}+$$
$$+\mathbf{1}_{\{i_1=i_3\}}\mathbf{1}_{\{j_1=j_3\}}\mathbf{1}_{\{i_2=i_4\}}\mathbf{1}_{\{j_2=j_4\}}+$$
$$\left.+\,\mathbf{1}_{\{i_1=i_4\}}\mathbf{1}_{\{j_1=j_4\}}\mathbf{1}_{\{i_2=i_3\}}\mathbf{1}_{\{j_2=j_3\}}\right), \tag{50}$$

$$I_{(01)\tau_{p+1},\tau_p}^{(i_1i_2)q}=-\frac{\Delta}{2}I_{(00)\tau_{p+1},\tau_p}^{(i_1i_2)q}-\frac{\Delta^2}{4}\left(\frac{1}{\sqrt{3}}\zeta_0^{(i_1)}\zeta_1^{(i_2)}+\right.$$
$$\left.+\sum_{i=0}^{q}\left(\frac{(i+2)\zeta_i^{(i_1)}\zeta_{i+2}^{(i_2)}-(i+1)\zeta_{i+2}^{(i_1)}\zeta_i^{(i_2)}}{\sqrt{(2i+1)(2i+5)}(2i+3)}-\frac{\zeta_i^{(i_1)}\zeta_i^{(i_2)}}{(2i-1)(2i+3)}\right)\right), \tag{51}$$

$$I_{(10)\tau_{p+1},\tau_p}^{(i_1i_2)q}=-\frac{\Delta}{2}I_{(00)\tau_{p+1},\tau_p}^{(i_1i_2)q}-\frac{\Delta^2}{4}\left(\frac{1}{\sqrt{3}}\zeta_0^{(i_2)}\zeta_1^{(i_1)}+\right.$$
$$\left.+\sum_{i=0}^{q}\left(\frac{(i+1)\zeta_{i+2}^{(i_2)}\zeta_i^{(i_1)}-(i+2)\zeta_i^{(i_2)}\zeta_{i+2}^{(i_1)}}{\sqrt{(2i+1)(2i+5)}(2i+3)}+\frac{\zeta_i^{(i_1)}\zeta_i^{(i_2)}}{(2i-1)(2i+3)}\right)\right) \tag{52}$$

or

$$I_{(01)\tau_{p+1},\tau_p}^{(i_1i_2)q}=\sum_{j_1,j_2=0}^{q}C_{j_2j_1}^{01}\left(\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}-\mathbf{1}_{\{i_1=i_2\}}\mathbf{1}_{\{j_1=j_2\}}\right),$$

$$I_{(10)\tau_{p+1},\tau_p}^{(i_1i_2)q}=\sum_{j_1,j_2=0}^{q}C_{j_2j_1}^{10}\left(\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}-\mathbf{1}_{\{i_1=i_2\}}\mathbf{1}_{\{j_1=j_2\}}\right);$$

$$I_{(2)\tau_{p+1},\tau_p}^{(i_1)}=\frac{\Delta^{5/2}}{3}\left(\zeta_0^{(i_1)}+\frac{\sqrt{3}}{2}\zeta_1^{(i_1)}+\frac{1}{2\sqrt{5}}\zeta_2^{(i_1)}\right), \tag{53}$$

$$I_{(001)\tau_{p+1},\tau_p}^{(i_1i_2i_3)q}=\sum_{j_1,j_2,j_3=0}^{q}C_{j_3j_2j_1}^{001}\left(\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}\zeta_{j_3}^{(i_3)}-\mathbf{1}_{\{i_1=i_2\}}\mathbf{1}_{\{j_1=j_2\}}\zeta_{j_3}^{(i_3)}-\right.$$
$$\left.-\mathbf{1}_{\{i_2=i_3\}}\mathbf{1}_{\{j_2=j_3\}}\zeta_{j_1}^{(i_1)}-\mathbf{1}_{\{i_1=i_3\}}\mathbf{1}_{\{j_1=j_3\}}\zeta_{j_2}^{(i_2)}\right), \tag{54}$$

$$I_{(010)\tau_{p+1},\tau_p}^{(i_1 i_2 i_3)q}=\sum_{j_1,j_2,j_3=0}^{q}C_{j_3 j_2 j_1}^{010}\Biggl(\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}\zeta_{j_3}^{(i_3)}-\mathbf{1}_{\{i_1=i_2\}}\mathbf{1}_{\{j_1=j_2\}}\zeta_{j_3}^{(i_3)}-$$

$$-\mathbf{1}_{\{i_2=i_3\}}\mathbf{1}_{\{j_2=j_3\}}\zeta_{j_1}^{(i_1)}-\mathbf{1}_{\{i_1=i_3\}}\mathbf{1}_{\{j_1=j_3\}}\zeta_{j_2}^{(i_2)}\Biggr), \tag{55}$$

Let us consider the exact relations and some estimates for the mean-square approximation errors of iterated Ito stochastic integrals.

Using Theorem 3, we get [16]-[28], [43], [51]

$$\text{(58)} \qquad \mathsf{M}\left\{\left(I_{(00)\tau_{p+1},\tau_p}^{(i_1i_2)} - I_{(00)\tau_{p+1},\tau_p}^{(i_1i_2)q}\right)^2\right\} = \frac{\Delta^2}{2}\left(\frac{1}{2} - \sum_{i=1}^{q}\frac{1}{4i^2-1}\right) \quad (i_1 \ne i_2),$$

$$\mathsf{M}\left\{\left(I_{(10)\tau_{p+1},\tau_p}^{(i_1i_2)} - I_{(10)\tau_{p+1},\tau_p}^{(i_1i_2)q}\right)^2\right\} = \mathsf{M}\left\{\left(I_{(01)\tau_{p+1},\tau_p}^{(i_1i_2)} - I_{(01)\tau_{p+1},\tau_p}^{(i_1i_2)q}\right)^2\right\} =$$

$$=\frac{\Delta^4}{16}\left(\frac{5}{9}-2\sum_{i=2}^{q}\frac{1}{4i^2-1}-\sum_{i=1}^{q}\frac{1}{(2i-1)^2(2i+3)^2}-\sum_{i=0}^{q}\frac{(i+2)^2+(i+1)^2}{(2i+1)(2i+5)(2i+3)^2}\right)\quad (i_1\ne i_2), \tag{59}$$

$$\mathsf{M}\left\{\left(I_{(10)\tau_{p+1},\tau_p}^{(i_1i_1)}-I_{(10)\tau_{p+1},\tau_p}^{(i_1i_1)q}\right)^2\right\}=\mathsf{M}\left\{\left(I_{(01)\tau_{p+1},\tau_p}^{(i_1i_1)}-I_{(01)\tau_{p+1},\tau_p}^{(i_1i_1)q}\right)^2\right\}=$$

$$=\frac{\Delta^4}{16}\left(\frac{1}{9}-\sum_{i=0}^{q}\frac{1}{(2i+1)(2i+5)(2i+3)^2}-2\sum_{i=1}^{q}\frac{1}{(2i-1)^2(2i+3)^2}\right). \tag{60}$$

Applying (25)–(29), we obtain

$$\mathsf{M}\left\{\left(I_{(000)\tau_{p+1},\tau_p}^{(i_1i_2i_3)}-I_{(000)\tau_{p+1},\tau_p}^{(i_1i_2i_3)q}\right)^2\right\}=\frac{\Delta^3}{6}-\sum_{j_3,j_2,j_1=0}^{q}C_{j_3j_2j_1}^2\quad (i_1\ne i_2,\ i_1\ne i_3,\ i_2\ne i_3),$$

$$\mathsf{M}\left\{\left(I_{(000)\tau_{p+1},\tau_p}^{(i_1i_2i_3)}-I_{(000)\tau_{p+1},\tau_p}^{(i_1i_2i_3)q}\right)^2\right\}=\frac{\Delta^3}{6}-\sum_{j_3,j_2,j_1=0}^{q}C_{j_3j_2j_1}^2-\sum_{j_3,j_2,j_1=0}^{q}C_{j_2j_3j_1}C_{j_3j_2j_1}\quad (i_1\ne i_2=i_3),$$

$$\mathsf{M}\left\{\left(I_{(000)\tau_{p+1},\tau_p}^{(i_1i_2i_3)}-I_{(000)\tau_{p+1},\tau_p}^{(i_1i_2i_3)q}\right)^2\right\}=\frac{\Delta^3}{6}-\sum_{j_3,j_2,j_1=0}^{q}C_{j_3j_2j_1}^2-\sum_{j_3,j_2,j_1=0}^{q}C_{j_3j_2j_1}C_{j_1j_2j_3}\quad (i_1=i_3\ne i_2),$$

$$\mathsf{M}\left\{\left(I_{(000)\tau_{p+1},\tau_p}^{(i_1i_2i_3)}-I_{(000)\tau_{p+1},\tau_p}^{(i_1i_2i_3)q}\right)^2\right\}=\frac{\Delta^3}{6}-\sum_{j_3,j_2,j_1=0}^{q}C_{j_3j_2j_1}^2-\sum_{j_3,j_2,j_1=0}^{q}C_{j_3j_1j_2}C_{j_3j_2j_1}\quad (i_1=i_2\ne i_3).$$

At the same time using the estimate (23) for $i_1,\ldots,i_5=1,\ldots,m$, we have

$$\mathsf{M}\left\{\left(I_{(01)\tau_{p+1},\tau_p}^{(i_1i_2)}-I_{(01)\tau_{p+1},\tau_p}^{(i_1i_2)q}\right)^2\right\}\le 2\left(\frac{\Delta^4}{4}-\sum_{j_1,j_2=0}^{q}\left(C_{j_2j_1}^{01}\right)^2\right),$$

$$\mathsf{M}\left\{\left(I_{(10)\tau_{p+1},\tau_p}^{(i_1i_2)}-I_{(10)\tau_{p+1},\tau_p}^{(i_1i_2)q}\right)^2\right\}\le 2\left(\frac{\Delta^4}{12}-\sum_{j_1,j_2=0}^{q}\left(C_{j_2j_1}^{10}\right)^2\right),$$

$$\mathsf{M}\left\{\left(I_{(000)\tau_{p+1},\tau_p}^{(i_1i_2i_3)}-I_{(000)\tau_{p+1},\tau_p}^{(i_1i_2i_3)q}\right)^2\right\}\le 6\left(\frac{\Delta^3}{6}-\sum_{j_3,j_2,j_1=0}^{q}C_{j_3j_2j_1}^2\right), \tag{61}$$

$$\mathsf{M}\left\{\left(I_{(0000)\tau_{p+1},\tau_p}^{(i_1i_2i_3i_4)}-I_{(0000)\tau_{p+1},\tau_p}^{(i_1i_2i_3i_4)q}\right)^2\right\}\le 24\left(\frac{\Delta^4}{24}-\sum_{j_1,j_2,j_3,j_4=0}^{q}C_{j_4j_3j_2j_1}^2\right), \tag{62}$$

$$\mathsf{M}\left\{\left(I_{(100)\tau_{p+1},\tau_p}^{(i_1 i_2 i_3)}-I_{(100)\tau_{p+1},\tau_p}^{(i_1 i_2 i_3)q}\right)^2\right\}\le 6\left(\frac{\Delta^5}{60}-\sum_{j_1,j_2,j_3=0}^{q}\left(C_{j_3 j_2 j_1}^{100}\right)^2\right), \tag{63}$$

$$\mathsf{M}\left\{\left(I_{(010)\tau_{p+1},\tau_p}^{(i_1 i_2 i_3)}-I_{(010)\tau_{p+1},\tau_p}^{(i_1 i_2 i_3)q}\right)^2\right\}\le 6\left(\frac{\Delta^5}{20}-\sum_{j_1,j_2,j_3=0}^{q}\left(C_{j_3 j_2 j_1}^{010}\right)^2\right), \tag{64}$$

$$\mathsf{M}\left\{\left(I_{(001)\tau_{p+1},\tau_p}^{(i_1 i_2 i_3)}-I_{(001)\tau_{p+1},\tau_p}^{(i_1 i_2 i_3)q}\right)^2\right\}\le 6\left(\frac{\Delta^5}{10}-\sum_{j_1,j_2,j_3=0}^{q}\left(C_{j_3 j_2 j_1}^{001}\right)^2\right), \tag{65}$$

$$\mathsf{M}\left\{\left(I_{(00000)\tau_{p+1},\tau_p}^{(i_1 i_2 i_3 i_4 i_5)}-I_{(00000)\tau_{p+1},\tau_p}^{(i_1 i_2 i_3 i_4 i_5)q}\right)^2\right\}\le 120\left(\frac{\Delta^5}{120}-\sum_{j_1,j_2,j_3,j_4,j_5=0}^{q}C_{j_5 i_4 i_3 i_2 j_1}^2\right). \tag{66}$$

As was emphasized in [1], [2], [19]-[21], the Fourier–Legendre coefficients $\bar{C}_{j_3 j_2 j_1}$ and $\bar{C}_{j_4 j_3 j_2 j_1}$ (as well as the Fourier–Legendre coefficients $\bar{C}_{j_3 j_2 j_1}^{001}$, $\bar{C}_{j_3 j_2 j_1}^{010}$, $\bar{C}_{j_3 j_2 j_1}^{100}$, $\bar{C}_{j_5 j_4 j_3 j_2 j_1}$) can be exactly calculated using symbolic transformation packages like Derive. The exact values of these Fourier–Legendre coefficients calculated in Derive were presented in tabular form in the monographs [14]-[28]. Note that the mendioned Fourier–Legendre coefficients do not depend on the integration step $\tau_{p+1}-\tau_p$ of the numerical method, which can be variable.

Recently, the database with 270,000 exactly calculated Fourier–Legendre coefficients was described [54]. This database was used in the software package, which is written in the Python programming language for the implementation of explicit one-step strong numerical methods with orders 0.5, 1.0, 1.5, 2.0, 2.5, and 3.0 of convergence for Ito SDEs with non-commutative noise. The optimization of the mean-square approximation procedures for iterated Ito stochastic integrals from these numerical schemes can be found in [56].

Generally speaking, the minimum values q that guarantee the fulfillment of the condition (7) for each of approximations (see above) are different and abruptly decreasing with the growth of orders of smallness with respect to Δ of approximations of iterated Ito stochastic integrals.

For pairwise different $i_1,\ldots,i_5=1,\ldots,m$ Theorem 3 gives

$$\mathsf{M}\left\{\left(I_{(000)\tau_{p+1},\tau_p}^{(i_1 i_2 i_3)}-I_{(000)\tau_{p+1},\tau_p}^{(i_1 i_2 i_3)6}\right)^2\right\}=\frac{\Delta^3}{6}-\sum_{j_1,j_2,j_3=0}^{6}C_{j_3 j_2 j_1}^2\approx 0.01956000\Delta^3, \tag{67}$$

$$\mathsf{M}\left\{\left(I_{(100)\tau_{p+1},\tau_p}^{(i_1 i_2 i_3)}-I_{(100)\tau_{p+1},\tau_p}^{(i_1 i_2 i_3)2}\right)^2\right\}=\frac{\Delta^5}{60}-\sum_{j_1,j_2,j_3=0}^{2}\left(C_{j_3 j_2 j_1}^{100}\right)^2\approx 0.00815429\Delta^5, \tag{68}$$

$$\mathsf{M}\left\{\left(I_{(010)\tau_{p+1},\tau_p}^{(i_1 i_2 i_3)}-I_{(010)\tau_{p+1},\tau_p}^{(i_1 i_2 i_3)2}\right)^2\right\}=\frac{\Delta^5}{20}-\sum_{j_1,j_2,j_3=0}^{2}\left(C_{j_3 j_2 j_1}^{010}\right)^2\approx 0.01739030\Delta^5, \tag{69}$$

$$\mathsf{M}\left\{\left(I_{(001)\tau_{p+1},\tau_p}^{(i_1 i_2 i_3)}-I_{(001)\tau_{p+1},\tau_p}^{(i_1 i_2 i_3)2}\right)^2\right\}=\frac{\Delta^5}{10}-\sum_{j_1,j_2,j_3=0}^{2}\left(C_{j_3 j_2 j_1}^{001}\right)^2\approx 0.02528010\Delta^5, \tag{70}$$

$$\text{(71)}\qquad \mathsf{M}\left\{\left(I_{(0000)\tau_{p+1},\tau_p}^{(i_1i_2i_3i_4)}-I_{(0000)\tau_{p+1},\tau_p}^{(i_1i_2i_3i_4)2}\right)^2\right\}=\frac{\Delta^4}{24}-\sum_{j_1,j_2,j_3,j_4=0}^{2}C_{j_4j_3j_2j_1}^2\approx 0.02360840\Delta^4,$$

$$\text{(72)}\qquad \mathsf{M}\left\{\left(I_{(00000)\tau_{p+1},\tau_p}^{(i_1i_2i_3i_4i_5)}-I_{(00000)\tau_{p+1},\tau_p}^{(i_1i_2i_3i_4i_5)1}\right)^2\right\}=\frac{\Delta^5}{120}-\sum_{j_1,j_2,j_3,j_4,j_5=0}^{1}C_{j_5j_4j_3j_2j_1}^2\approx 0.00759105\Delta^5.$$

Recall that the value Δ acts as the integration step of the numerical method (5) for the Ito SDE (1), thereby being rather small. Hence, even for $q=6,2,$ and 1 the mean-square approximation errors (67)–(72) of the iterated Ito stochastic integrals of multiplicities 3 to 5 are sufficiently small. Note that in [3], [7], [8] the iterated stochastic integrals were approximated using the trigonometric Fourier expansion of the multidimensional Brownian bridge process and the mean-square approximation error of the iterated stochastic integrals were estimated by the value

$$\frac{C_1\Delta^2}{q},$$

where C_1 is a constant and Δ, q have the same meaning as in (47). Clearly, such an approach is rougher than the one involving Theorem 3.

Note that the number q must be the same for all approximations of iterated stochastic integrals from the considered collection in the approach from [3], [7], [8] while the numbers q can be chosen different for different stochastic integrals from the considered collection in the method based on Theorems 1–3.

On the basis of the presented expansions (see above) of iterated Ito stochastic integrals we can see that increasing of multiplicities of these integrals or degree indexes of their weight functions leads to increasing of orders of smallness with respect to Δ in the mean-square sense for iterated stochastic integrals. This leads to a sharp decrease of member quantities (the numbers q) in expansions of iterated Ito stochastic integrals, which are required for achieving the acceptable accuracy of approximation.

7. Numerical Algorithm With the Order 2.5 of Strong Convergence

In this section, we will write the formulas and recommendations on the numerical method (5) with the order 2.5 of strong convergence as an algorithm.

Let the Fourier–Legendre coefficients

$$\bar{C}_{j_3j_2j_1},\quad \bar{C}_{j_4j_3j_2j_1},\quad \bar{C}_{j_3j_2j_1}^{001},\quad \bar{C}_{j_3j_2j_1}^{010},\quad \bar{C}_{j_3j_2j_1}^{100},\quad \bar{C}_{j_5j_4j_3j_2j_1}$$

be precalculated [54].

Algorithm 1.

Step 1. Specify the initial parameters of the problem: the integration interval $[0,T]$, the integration step Δ (e.g., the constant one $\Delta=T/N$, where $N>1$; a variable step is also admissible), the initial condition $\mathbf{y}_0$, and the constant C appearing in the condition (7).

Step 2. Let $p=0$.

Step 3. Choose the minimum values q under which the right-hand sides of (58)–(66) are not exceeding the right-hand side of the inequality (7).

Step 4. Generate a sequence of independent standard Gaussian random variables $\zeta_l^{(i)}$ $(l = 0, 1, \ldots, q+2;\ i = 1, \ldots, m)$. Here the number q is a maximum from the numbers q chosen at Step 3.

Step 5. Model the iterated Ito stochastic integrals

$$I_{(0)\tau_{p+1},\tau_p}^{(i_1)},\ I_{(1)\tau_{p+1},\tau_p}^{(i_1)},\ I_{(2)\tau_{p+1},\tau_p}^{(i_1)},\ I_{(00)\tau_{p+1},\tau_p}^{(i_1 i_2)},\ I_{(10)\tau_{p+1},\tau_p}^{(i_1 i_2)},\ I_{(01)\tau_{p+1},\tau_p}^{(i_1 i_2)},\ I_{(000)\tau_{p+1},\tau_p}^{(i_1 i_2 i_3)},$$

$$I_{(100)\tau_{p+1},\tau_p}^{(i_1 i_2 i_3)},\ I_{(010)\tau_{p+1},\tau_p}^{(i_1 i_2 i_3)},\ I_{(001)\tau_{p+1},\tau_p}^{(i_1 i_2 i_3)},\ I_{(0000)\tau_{p+1},\tau_p}^{(i_1 i_2 i_3 i_4)},\ I_{(00000)\tau_{p+1},\tau_p}^{(i_1 i_2 i_3 i_4 i_5)}$$

using the formulas (46)–(57) with the values q chosen at Step 3.

Step 6. Find $\mathbf{y}_{p+1}$ by the formula (5).

Step 7. If $p < N-1$, then assign $p = p+1$ and go back to Step 4. Otherwise proceed to Step 8.

Step 8. End of the Algorithm 1.

8. Conclusions

In this paper, the efficient mean-square approximation procedures for the iterated Ito stochastic integrals of multiplicities 1 to 5 that are based on the multiple Fourier–Legendre series have been developed. These results can be used for the implementation of the numerical method (5) with the strong order 2.5 of convergence for the Ito SDEs with multidimensional non-commutative noises.

NUMERICAL SIMULATION OF 2.5-SET OF ITERATED STRATONOVICH STOCHASTIC INTEGRALS OF MULTIPLICITIES 1 TO 5 FROM THE TAYLOR–STRATONOVICH EXPANSION

DMITRIY F. KUZNETSOV

Abstract. The article is devoted to construction of effective procedures of the mean-square approximation for iterated Stratonovich stochastic integrals of multiplicities 1 to 5. We apply the method of generalized multiple Fourier series for approximation of iterated stochastic integrals. More precisely, we use multiple Fourier–Legendre series converging in the sense of norm in Hilbert space $L_2([t,T]^k)$, $k \in \mathbb{N}$. Considered iterated Stratonovich stochastic integrals are part of the Taylor–Stratonovich expansion. That is why the results of the article can be applied to implementation of numerical methods with the orders 1.0, 1.5, 2.0 and 2.5 of strong convergence for Ito stochastic differential equations with multidimensional non-commutative noise.

1. Introduction

Let $(\Omega, \mathrm{F}, \mathsf{P})$ be a complete probability space, let $\{\mathrm{F}_t, t \in [0, T]\}$ be a nondecreasing right-continous family of σ-algebras of F, and let $\mathbf{f}_t$ be a standard m-dimensional Wiener stochastic process, which is F_t-measurable for any $t \in [0, T]$. We assume that the components $\mathbf{f}_t^{(i)}$ $(i = 1, \ldots, m)$ of this process are independent. Consider an Ito stochastic differential equation (SDE) in the integral form

$$\mathbf{x}_t = \mathbf{x}_0 + \int\limits_0^t \mathbf{a}(\mathbf{x}_\tau, \tau) d\tau + \int\limits_0^t B(\mathbf{x}_\tau, \tau) d\mathbf{f}_\tau, \quad \mathbf{x}_0 = \mathbf{x}(0, \omega). \tag{1}$$

Here $\mathbf{x}_t$ is some n-dimensional stochastic process satisfying to the equation (1). The nonrandom functions $\mathbf{a} : \mathbb{R}^n \times [0, T] \to \mathbb{R}^n$, $B : \mathbb{R}^n \times [0, T] \to \mathbb{R}^{n \times m}$ guarantee the existence and uniqueness up to stochastic equivalence of a solution of the equation (1) [1]. The second integral on the right-hand side of (1) is interpreted as an Ito stochastic integral. Let $\mathbf{x}_0$ be an n-dimensional random variable, which is F_0-measurable and $\mathsf{M}\{|\mathbf{x}_0|^2\} < \infty$ (M denotes a mathematical expectation). We assume that $\mathbf{x}_0$ and $\mathbf{f}_t - \mathbf{f}_0$ are independent when $t > 0$.

It is well known [2]-[5] that Ito SDEs are adequate mathematical models of dynamic systems under the influence of random disturbances. One of the effective approaches to numerical integration of Ito SDEs is an approach based on the Taylor–Ito and Taylor–Stratonovich expansions [2]-[17]. The most important feature of such expansions is a presence in them of the so-called iterated Ito and Stratonovich stochastic integrals, which play the key role for solving the problem of numerical integration of Ito SDEs and have the following form

$$J[\psi^{(k)}]_{T,t} = \int\limits_t^T \psi_k(t_k) \ldots \int\limits_t^{t_2} \psi_1(t_1) d\mathbf{w}_{t_1}^{(i_1)} \ldots d\mathbf{w}_{t_k}^{(i_k)}, \tag{2}$$

$$J^*[\psi^{(k)}]_{T,t} = \int\limits_t^{*T} \psi_k(t_k) \ldots \int\limits_t^{*t_2} \psi_1(t_1) d\mathbf{w}_{t_1}^{(i_1)} \ldots d\mathbf{w}_{t_k}^{(i_k)}, \tag{3}$$

where $\psi_1(\tau), \ldots, \psi_k(\tau)$ are continuous nonrandom functions on $[t, T]$, $\mathbf{w}_\tau^{(i)} = \mathbf{f}_\tau^{(i)}$ for $i = 1, \ldots, m$ and $\mathbf{w}_\tau^{(0)} = \tau, \;\; i_1, \ldots, i_k = 0, 1, \ldots, m,$

$$\int \text{ and } \int^{*}$$

denote Ito and Stratonovich stochastic integrals, respectively (in this paper, we use the definition of the Stratonovich stochastic integral from [2]).

Note that $\psi_l(\tau) \equiv 1$ $(l = 1, \ldots, k)$ and $i_1, \ldots, i_k = 0, 1, \ldots, m$ in the classical Taylor–Ito and Taylor–Stratonovich expansions [2]-[7]. At the same time $\psi_l(\tau) \equiv (t - \tau)^{q_l}$ $(l = 1, \ldots, k;\; q_1, \ldots, q_k = 0, 1, 2, \ldots)$ and $i_1, \ldots, i_k = 1, \ldots, m$ in the unified Taylor–Ito and Taylor–Stratonovich expansions [8]-[17].

Effective solution of the problem of combined mean-square approximation of collections of the iterated Ito and Stratonovich stochastic integrals (2), (3) of multiplicities 1 to 5 and beyond composes the subject of the article.

We want to mention in short that there are two main criteria of numerical methods convergence for Ito SDEs [2]-[4]: a strong or mean-square criterion and a weak criterion where the subject of approximation is not the solution of Ito SDE, simply stated, but the distribution of Ito SDE solution.

Using the strong numerical methods, we can build sample pathes of Ito SDEs numerically. These methods require the combined mean-square approximation of collections of the iterated Ito and Stratonovich stochastic integrals (2) and (3).

The strong numerical methods are using when constructing new mathematical models on the basis of Ito SDEs, when solving the filtering problem of signal under the influence of random disturbance in various arrangements, when solving the problem of stochastic optimal control, when solving the problem of testing procedures of evaluating parameters of stochastic systems etc. [2]-[5].

The problem of effective jointly numerical modeling (in accordance to the mean-square convergence criterion) of the iterated Ito and Stratonovich stochastic integrals (2) and (3) is difficult from theoretical and computing point of view [2]-[5], [10]-[66].

The only exception is connected with the narrow particular case, when $i_1 = \ldots = i_k \neq 0$ and $\psi_1(s), \ldots, \psi_k(s) \equiv \psi(s)$. This case allows the investigation with using of the Ito formula [2]-[4].

Note that even for the mentioned coincidence ($i_1 = \ldots = i_k \neq 0$), but for different functions $\psi_1(s), \ldots, \psi_k(s)$ the mentioned difficulties persist, and relatively simple families of iterated Ito and Stratonovich stochastic integrals, which can be often met in the applications, cannot be represented effectively in a finite form (for the mean-square approximation) using the system of standard Gaussian random variables.

Note that for a number of special types of Ito SDEs the problem of approximation of iterated stochastic integrals can be simplified but cannot be solved. The equations with additive vector noise, with additive scalar or non-additive scalar noise, with a small parameter are related to such types of equations [2]-[4]. For the mentioned types of equations, simplifications are connected with the fact that either some coefficient functions from stochastic analogues of the Taylor formula (Taylor–Ito and Taylor–Stratonovich expansions) identically equal to zero, or scalar noise has an essential effect, or due to the presence of a small parameter we can neglect some members from stochastic analogues of the Taylor formula, which include difficult for approximation iterated stochastic integrals [2]-[4]. In this article, we consider Ito SDEs with multidimentional and non-additive noise. The conditions of commutativity of the noise [2] are also not used.

Seems that iterated stochastic integrals can be approximated by multiple integral sums of different types [3], [4], [59]. However, this approach implies partitioning of the interval of integration $[t, T]$ of iterated stochastic integrals (the length $T - t$ of this interval is a small value, because it is a step of integration of numerical methods for Ito SDEs) and according to numerical experiments this additional partitioning leads to significant calculating costs [10].

In [3] (also see [2], [4]) Milstein G.N. proposed to expand (2) or (3) into iterated series of products of standard Gaussian random variables by representing the Wiener process as a trigonometric Fourier series with random coefficients (the version of the so-called Karhunen–Loeve expansion for the Brownian bridge process). For example, to obtain the Milstein expansion of (3), the truncated Fourier expansions of components of the Wiener process $\mathbf{f}_s$ must be iteratively substituted in the single integrals, and the integrals must be calculated, starting from the innermost integral. This is a complicated procedure that does not lead to a general expansion of (3) valid for an arbitrary multiplicity k. For this reason, only expansions of single, double, and triple stochastic integrals (2) and (3) were presented in [2] (the integrals (3) for $k = 1, 2, 3$) and in [3], [4] (the integrals (2) for $k = 1, 2$) for the simplest case $\psi_1(s), \psi_2(s), \psi_3(s) \equiv 1$; $i_1, i_2, i_3 = 0, 1, \ldots, m$. Moreover, the Milstein approach [3] leads to iterated application of the operation of limit transition (see above).

It should be noted that the authors of the works [2] (Sect. 5.8, pp. 202–204), [5] (pp. 82-84), [60] (pp. 438-439), [61] (pp. 263-264) use the Wong–Zakai approximation [62]-[64] (without rigorous proof) within the frames of the method of expansion of iterated stochastic integrals [3] (1988) based on the series expansion of the Brownian bridge process (version of the so-called Karhunen-Loeve expansion). See discussions in [15] (Sect. 2.18, 6.2), [17] (Sect. 2.6.2, 6.2) [39] (Sect. 11), [41] (Sect. 8), [42] (Sect. 11), [43] (Sect. 6), [44] (Sect. 6) for detail.

Note that in [65] the method of expansion of iterated (double) Ito stochastic integrals (2) ($k = 2$; $\psi_1(s), \psi_2(s) \equiv 1$; $i_1, i_2 = 1, \ldots, m$) based on expansion of the Wiener process using Haar functions and trigonometric functions has been considered. The restrictions of the method [65] are also connected with iterated application of the operation of limit transition (as in the Milstein approach [3] (1988)) at least starting from the third multiplicity of iterated stochastic integrals.

It is necessary to note that the Milstein approach [3] excelled in several times or even in several orders the methods based on multiple integral sums [3], [4], [59] considering computational costs in the sense of their diminishing.

An alternative strong approximation method was proposed for (3) in [33], [34] (also see [11]-[17], [21]-[24], [47]), where $J^*[\psi^{(k)}]_{T,t}$ was represented as the multiple stochastic integral from the certain discontinuous nonrandom function of k variables, and the function was then expressed as the iterated generalized Fourier series in complete systems of continuous functions that are orthonormal in the space $L_2([t,T])$. In [33], [34] (also see [11]-[17], [21]-[24], [47]) the cases of Legendre polynomials and trigonometric functions are considered in detail. As a result, the general iterated series expansion of (3) in terms of products of standard Gaussian random variables was obtained in [33], [34] (also see [11]-[17], [21]-[24], [47]) for an arbitrary multiplicity k. Hereinafter, this method is referred to as the method of generalized iterated Fourier series.

It was shown in [33], [34] (also see [11]-[17], [21]-[24], [47]) that the method of generalized iterated Fourier series leads to the Milstein expansion [3] of (3) in the case of trigonometric functions and to a substantially simpler expansion of (3) in the case of Legendre polynomials.

Note that the method of generalized iterated Fourier series as well as the Milstein approach [3] lead to iterated application of the operation of limit transition. As mentioned above, this problem appears for iterated (triple) stochastic integrals ($i_1, i_2, i_3 = 1, \ldots, m$) or even for some iterated (double) stochastic integrals in the case, when $\psi_1(s)$, $\psi_2(s) \not\equiv 1$ ($i_1, i_2 = 1, \ldots, m$) [10] (also see [11]-[32], [37]-[46], [48]-[50]). The mentioned problem (iterated application of the operation of limit transition) not appears in the efficient method, which is considered for (2) in Theorems 1, 2 (see below) [10]-[32], [37]-[46], [48]-[58].

The idea of this method is as follows: the iterated Ito stochastic integral (2) of multiplicity k is represented as the multiple stochastic integral from the certain discontinuous nonrandom function of k variables defined on the hypercube $[t,T]^k$, where $[t,T]$ is the interval of integration of the iterated Ito stochastic integral (2). Then, the indicated nonrandom function is expanded in the hypercube $[t,T]^k$ into the generalized multiple Fourier series converging in the mean-square sense in the space $L_2([t,T]^k)$. After a number of nontrivial transformations we come (see Theorems 1, 2 below) to the mean-square convergening expansion of the iterated Ito stochastic integral (2) into the multiple series of products of standard Gaussian random variables. The coefficients of this series are the coefficients of generalized multiple Fourier series for the mentioned nonrandom function of k variables, which can be calculated using the explicit formula regardless of the multiplicity k of the iterated Ito stochastic integral (2). Hereinafter, this method is referred to as the method of generalized multiple Fourier series.

Thus, we obtain the following useful possibilities of the method of generalized multiple Fourier series.

1. There is an explicit formula (see (8) below) for calculation of expansion coefficients of the iterated Ito stochastic integral (2) with any fixed multiplicity k.

2. We have possibilities for exact calculation of the mean-square error of approximation of the iterated Ito stochastic integral (2) [12]-[17], [25], [40].

3. Since the used multiple Fourier series is a generalized in the sense that it is constructed using various complete orthonormal systems of functions in the space $L_2([t,T])$, then we have new possibilities for approximation — we can use not only trigonometric functions as in [2]-[4], but Legendre polynomials.

4. As it turned out [10]-[32], [37]-[46], [48]-[57] it is more convenient to work with Legendre polynomials for constructing of approximations of the iterated Ito stochastic integrals (2). Approximations

based on the Legendre polynomials are essentially simpler than their analogues based on the trigonometric functions. Another advantages of the application of Legendre polynomials in the framework of the mentioned problem are considered in [15]-[17], [29], [37].

5. An approach based on the Karhunen–Loeve expansion of the Brownian bridge process (also see [65]) leads to iterated application of the operation of limit transition (the operation of limit transition is implemented only once in Theorems 1, 2 (see below)) starting from the second multiplicity (in the general case) and third multiplicity (for the case $\psi_1(s), \psi_2(s), \psi_3(s) \equiv 1$; $i_1, i_2, i_3 = 1, \ldots, m$) of iterated Ito stochastic integrals. Multiple series (the operation of limit transition is implemented only once) are more convenient for approximation than the iterated ones (iterated application of the operation of limit transition), since partial sums of multiple series converge for any possible case of convergence to infinity of their upper limits of summation (let us denote them as $p_1, \ldots, p_k$). For example, when $p_1 = \ldots = p_k = p \to \infty$. For iterated series, the condition $p_1 = \ldots = p_k = p \to \infty$ obviously does not guarantee the convergence of this series. However, the authors of the works [2] (Sect. 5.8, pp. 202–204), [5] (pp. 82-84), [60] (pp. 438-439), [61] (pp. 263-264) use the condition $p_1 = p_2 = p_3 = p \to \infty$ together with the Wong–Zakai approximation [62]-[64] (but without rigorous proof) within the frames of the method of expansion of iterated stochastic integrals [3] (1988) based on the series expansion of the Brownian bridge process. See discussions in [15] (Sect. 2.18, 6.2), [17] (Sect. 2.6.2, 6.2), [39] (Sect. 11), [41] (Sect. 8), [42] (Sect. 11), [43] (Sect. 6), [44] (Sect. 6) for detail.

As it turned out, Theorems 1, 2 can be adapted for the iterated Stratonovich stochastic integrals (3) at least for multiplicities 1 to 6 [11]-[17], [22]-[24], [30], [33], [34], [38], [42]-[45], [47], [50], [58]. Expansions of these iterated Stratonovich stochastic integrals turned out much simpler (see Theorems 4–10 below), than the appropriate expansions of the iterated Ito stochastic integrals (2) from Theorems 1, 2.

2. Explicit One-Step Strong Numerical Schemes With Orders 2.0 and 2.5 for Ito SDEs Based on the Unified Taylor–Stratonovich expansion

Consider the partition $\{\tau_j\}_{j=0}^N$ of the interval $[0, T]$ such that

$$0 = \tau_0 < \ldots < \tau_N = T, \quad \Delta_N = \max_{0 \le j \le N-1} \Delta\tau_j, \quad \Delta\tau_j = \tau_{j+1} - \tau_j.$$

Let $\mathbf{y}_{\tau_j} \stackrel{\sf def}{=} \mathbf{y}_j$, $j = 0, 1, \ldots, N$ be a time discrete approximation of the process $\mathbf{x}_t$, $t \in [0, T]$, which is a solution of the Ito SDE (1).

Definiton 1 [2]. *We will say that a time discrete approximation $\mathbf{y}_j$ $(j = 0, 1, \ldots, N)$ corresponding to the maximal step of discretization Δ_N, converges strongly with order $\gamma > 0$ at time moment T to the process $\mathbf{x}_t$, $t \in [0, T]$, if there exists a constant $C > 0$, which does not depend on Δ_N, and a $\delta > 0$ such that*

$$\mathsf{M}\{|\mathbf{x}_T - \mathbf{y}_T|\} \le C(\Delta_N)^\gamma$$

for each $\Delta_N \in (0, \delta)$.

Consider the explicit one-step strong numerical scheme with order 2.5 for Ito SDEs based on the so-called unified Taylor–Stratonovich expansion [9]-[21], [57]

$$\mathbf{y}_{p+1} = \mathbf{y}_p + \sum_{i_1=1}^{m} B_{i_1} \hat{I}_{(0)\tau_{p+1},\tau_p}^{*(i_1)} + \Delta\bar{\mathbf{a}} + \sum_{i_1,i_2=1}^{m} G_{i_2} B_{i_1} \hat{I}_{(00)\tau_{p+1},\tau_p}^{*(i_2 i_1)} +$$

$$+\sum_{i_1=1}^{m}\left(G_{i_1}\bar{\mathbf{a}}\left(\Delta\hat{I}^{*(i_1)}_{(0)\tau_{p+1},\tau_p}+\hat{I}^{*(i_1)}_{(1)\tau_{p+1},\tau_p}\right)-\bar{L}B_{i_1}\hat{I}^{*(i_1)}_{(1)\tau_{p+1},\tau_p}\right)+$$

$$+\sum_{i_1,i_2,i_3=1}^{m}G_{i_3}G_{i_2}B_{i_1}\hat{I}^{*(i_3i_2i_1)}_{(000)\tau_{p+1},\tau_p}+\frac{\Delta^2}{2}\bar{L}\bar{\mathbf{a}}+$$

$$+\sum_{i_1,i_2=1}^{m}\left(G_{i_2}\bar{L}B_{i_1}\left(\hat{I}^{*(i_2i_1)}_{(10)\tau_{p+1},\tau_p}-\hat{I}^{*(i_2i_1)}_{(01)\tau_{p+1},\tau_p}\right)-\bar{L}G_{i_2}B_{i_1}\hat{I}^{*(i_2i_1)}_{(10)\tau_{p+1},\tau_p}+\right.$$

$$\left.+G_{i_2}G_{i_1}\bar{\mathbf{a}}\left(\hat{I}^{*(i_2i_1)}_{(01)\tau_{p+1},\tau_p}+\Delta\hat{I}^{*(i_2i_1)}_{(00)\tau_{p+1},\tau_p}\right)\right)+$$

$$+\sum_{i_1,i_2,i_3,i_4=1}^{m}G_{i_4}G_{i_3}G_{i_2}B_{i_1}\hat{I}^{*(i_4i_3i_2i_1)}_{(0000)\tau_{p+1},\tau_p}+\frac{\Delta^3}{6}LL\mathbf{a}+$$

$$+\sum_{i_1=1}^{m}\left(G_{i_1}\bar{L}\bar{\mathbf{a}}\left(\frac{1}{2}\hat{I}^{*(i_1)}_{(2)\tau_{p+1},\tau_p}+\Delta\hat{I}^{*(i_1)}_{(1)\tau_{p+1},\tau_p}+\frac{\Delta^2}{2}\hat{I}^{*(i_1)}_{(0)\tau_{p+1},\tau_p}\right)+\right.$$

$$\left.+\frac{1}{2}\bar{L}\bar{L}B_{i_1}\hat{I}^{*(i_1)}_{(2)\tau_{p+1},\tau_p}-LG_{i_1}\bar{\mathbf{a}}\left(\hat{I}^{*(i_1)}_{(2)\tau_{p+1},\tau_p}+\Delta\hat{I}^{*(i_1)}_{(1)\tau_{p+1},\tau_p}\right)\right)+$$

$$+\sum_{i_1,i_2,i_3=1}^{m}\left(G_{i_3}\bar{L}G_{i_2}B_{i_1}\left(\hat{I}^{*(i_3i_2i_1)}_{(100)\tau_{p+1},\tau_p}-\hat{I}^{*(i_3i_2i_1)}_{(010)\tau_{p+1},\tau_p}\right)+\right.$$

$$+G_{i_3}G_{i_2}\bar{L}B_{i_1}\left(\hat{I}^{*(i_3i_2i_1)}_{(010)\tau_{p+1},\tau_p}-\hat{I}^{*(i_3i_2i_1)}_{(001)\tau_{p+1},\tau_p}\right)+$$

$$+G_{i_3}G_{i_2}G_{i_1}\bar{\mathbf{a}}\left(\Delta\hat{I}^{*(i_3i_2i_1)}_{(000)\tau_{p+1},\tau_p}+\hat{I}^{*(i_3i_2i_1)}_{(001)\tau_{p+1},\tau_p}\right)-$$

$$\left.-\bar{L}G_{i_3}G_{i_2}B_{i_1}\hat{I}^{*(i_3i_2i_1)}_{(100)\tau_{p+1},\tau_p}\right)+$$

$$+\sum_{i_1,i_2,i_3,i_4,i_5=1}^{m}G_{i_5}G_{i_4}G_{i_3}G_{i_2}B_{i_1}\hat{I}^{*(i_5i_4i_3i_2i_1)}_{(00000)\tau_{p+1},\tau_p}, \tag{4}$$

where $\Delta=T/N$ $(N>1)$ is a constant (for simplicity) step of integration, $\tau_p=p\Delta$ $(p=0,1,\ldots,N)$, $\hat{I}^{*(i_1\ldots i_k)}_{(l_1\ldots l_k)s,t}$ is an approximation of the iterated Stratonovich stochastic integral

$$I^{*(i_1\ldots i_k)}_{(l_1\ldots l_k)s,t}=\int\limits_t^{*s}(t-t_k)^{l_k}\ldots\int\limits_t^{*t_2}(t-t_1)^{l_1}d\mathbf{f}^{(i_1)}_{t_1}\ldots d\mathbf{f}^{(i_k)}_{t_k}, \tag{5}$$

where $i_1,\ldots,i_k=1,\ldots,m,\ \ l_1,\ldots,l_k=0,1,2,\ \ k=1,2,\ldots,5,$

$$\bar{\mathbf{a}}(\mathbf{x},t)=\mathbf{a}(\mathbf{x},t)-\frac{1}{2}\sum_{j=1}^{m}G_jB_j(\mathbf{x},t),$$

$$\bar{L} = L - \frac{1}{2}\sum_{j=1}^{m} G_j G_j,$$

$$L = \frac{\partial}{\partial t} + \sum_{i=1}^{n} \mathbf{a}_i(\mathbf{x},t)\frac{\partial}{\partial \mathbf{x}_i} + \frac{1}{2}\sum_{j=1}^{m}\sum_{l,i=1}^{n} B_{lj}(\mathbf{x},t)B_{ij}(\mathbf{x},t)\frac{\partial^2}{\partial \mathbf{x}_l \partial \mathbf{x}_i},$$

$$G_i = \sum_{j=1}^{n} B_{ji}(\mathbf{x},t)\frac{\partial}{\partial \mathbf{x}_j}\ , \quad i = 1,\ldots,m,$$

B_i and B_{ij} are the ith column and the ijth element of the matrix function B, $\mathbf{a}_i$ is the ith element of the vector function $\mathbf{a}$, $\mathbf{x}_i$ is the ith element of the column $\mathbf{x}$, the functions

$$B_{i_1},\ \bar{\mathbf{a}},\ G_{i_2}B_{i_1},\ G_{i_1}\bar{\mathbf{a}},\ \bar{L}B_{i_1},\ G_{i_3}G_{i_2}B_{i_1},\ \bar{L}\bar{\mathbf{a}},\ LL\mathbf{a},\ G_{i_2}\bar{L}B_{i_1},$$

$$\bar{L}G_{i_2}B_{i_1},\ G_{i_2}G_{i_1}\bar{\mathbf{a}},\ G_{i_4}G_{i_3}G_{i_2}B_{i_1},\ G_{i_1}\bar{L}\bar{\mathbf{a}},\ \bar{L}\bar{L}B_{i_1},\ \bar{L}G_{i_1}\bar{\mathbf{a}},\ G_{i_3}\bar{L}G_{i_2}B_{i_1},\ G_{i_3}G_{i_2}\bar{L}B_{i_1},$$

$$G_{i_3}G_{i_2}G_{i_1}\bar{\mathbf{a}},\ \bar{L}G_{i_3}G_{i_2}B_{i_1},\ G_{i_5}G_{i_4}G_{i_3}G_{i_2}B_{i_1}$$

are calculated at the point $(\mathbf{y}_p, p)$.

It is well known that under the standard conditions [2], [10] the numerical scheme (4) has strong order of convergence 2.5. The major emphasis below will be placed on the approximation of the iterated Stratonovich stochastic integrals appearing in (4). Therefore, among the standard conditions, we note the following approximation condition for these stochastic integrals [2], [10]

$$\mathsf{M}\left\{\left(I^{*(i_1\ldots i_k)}_{(l_1\ldots l_k)\tau_{p+1},\tau_p} - \hat{I}^{*(i_1\ldots i_k)}_{(l_1\ldots l_k)\tau_{p+1},\tau_p}\right)^2\right\} \le C\Delta^6, \tag{6}$$

where constant C is independent of Δ.

Note that if we exclude from (4) the terms starting from the term $\Delta^3 LL\mathbf{a}/6$, then we have the explicit one-step strong numerical scheme with order 2.0 [2], [10], [13]-[21].

Using the numerical scheme (4) or its modifications based on the classical Taylor–Stratonovich expansion [7], the implicit or multistep analogues of (4) can be constructed [2], [10], [13]-[21]. The set of the iterated Stratonovich stochastic integrals to be approximated for implementing these modifications is the same as for the numerical scheme (4) itself. Interestingly, the truncated unified Taylor–Stratonovich expansion [9] (the foundation of the numerical scheme (4)) contains only 12 different types of the iterated Stratonovich stochastic integrals (5), which cannot be interconnected by linear relations [10], [13]-[21]. The analogues classical Taylor–Stratonovich expansion [2], [7] contains 17 different types of iterated Stratonovich stochastic integrals, part of which are interconnected by linear relations and part of which have a higher multiplicity than the iterated Stratonovich stochastic integrals (5). This fact well explains the use of the numerical scheme (4).

One of the main problems arising in the implementation of the numerical scheme (4) is the joint numerical modeling of the iterated Stratonovich stochastic integrals figuring in (4).

3. Expansions of Iterated Ito Stochastic Integrals (Method of Genegalized Multiple Fourier Series)

An efficient numerical modeling method for iterated Ito stochastic integrals based on generalized multiple Fourier series was considered in [10] (also see [11]-[32], [37]-[58]).

This method rests on important results presented below (Theorems 1, 2).

Suppose that every $\psi_l(\tau)$ $(l=1,\ldots,k)$ is a function from the space $L_2([t,T])$. Define the following function on the hypercube $[t,T]^k$

$$K(t_1,\ldots,t_k)=\begin{cases}\psi_1(t_1)\ldots\psi_k(t_k) & \text{for}\ \ t_1<\ldots<t_k\\ & \\ 0 & \text{otherwise}\end{cases},\quad t_1,\ldots,t_k\in[t,T],\quad k\ge 2, \tag{7}$$

and $K(t_1)\equiv\psi_1(t_1)$ for $t_1\in[t,T]$.

Suppose that $\{\phi_j(x)\}_{j=0}^{\infty}$ is a complete orthonormal system of functions in the space $L_2([t,T])$. The function $K(t_1,\ldots,t_k)$ belongs to the space $L_2([t,T]^k)$. At this situation it is well known that the generalized multiple Fourier series of $K(t_1,\ldots,t_k)\in L_2([t,T]^k)$ is converging to $K(t_1,\ldots,t_k)$ in the hypercube $[t,T]^k$ in the mean-square sense, i.e.

$$\lim_{p_1,\ldots,p_k\to\infty}\left\|K(t_1,\ldots,t_k)-\sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k}C_{j_k\ldots j_1}\prod_{l=1}^{k}\phi_{j_l}(t_l)\right\|_{L_2([t,T]^k)}=0,$$

where

$$C_{j_k\ldots j_1}=\int\limits_{[t,T]^k}K(t_1,\ldots,t_k)\prod_{l=1}^{k}\phi_{j_l}(t_l)dt_1\ldots dt_k \tag{8}$$

is the Fourier coefficient,

$$\|f\|_{L_2([t,T]^k)}=\left(\int\limits_{[t,T]^k}f^2(t_1,\ldots,t_k)dt_1\ldots dt_k\right)^{1/2}.$$

Consider the partition $\{\tau_j\}_{j=0}^{N}$ of $[t,T]$ such that

$$t=\tau_0<\ldots<\tau_N=T,\quad \Delta_N=\max_{0\le j\le N-1}\Delta\tau_j\to 0\ \ \text{if}\ \ N\to\infty,\quad \Delta\tau_j=\tau_{j+1}-\tau_j. \tag{9}$$

Theorem 1 [10] (2006), [11]-[32], [37]-[58]. *Suppose that every $\psi_l(\tau)$ $(l=1,\ldots,k)$ is a continuous nonrandom function on $[t,T]$ and $\{\phi_j(x)\}_{j=0}^{\infty}$ is a complete orthonormal system of continuous functions in the space $L_2([t,T])$. Then*

$$J[\psi^{(k)}]_{T,t} = \underset{p_1,\ldots,p_k\to\infty}{\text{l.i.m.}} \sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k} C_{j_k\ldots j_1}\Biggl(\prod_{l=1}^{k}\zeta_{j_l}^{(i_l)} -$$

$$- \underset{N\to\infty}{\text{l.i.m.}} \sum_{(l_1,\ldots,l_k)\in \mathrm{G}_k} \phi_{j_1}(\tau_{l_1})\Delta\mathbf{w}_{\tau_{l_1}}^{(i_1)}\ldots\phi_{j_k}(\tau_{l_k})\Delta\mathbf{w}_{\tau_{l_k}}^{(i_k)}\Biggr), \tag{10}$$

where $J[\psi^{(k)}]_{T,t}$ *is defined by* (2),

$$\mathrm{G}_k = \mathrm{H}_k\backslash\mathrm{L}_k,\quad \mathrm{H}_k = \{(l_1,\ldots,l_k):\ l_1,\ldots,l_k = 0,\ 1,\ldots,N-1\},$$

$$\mathrm{L}_k = \{(l_1,\ldots,l_k):\ l_1,\ldots,l_k = 0,\ 1,\ldots,N-1;\ l_g\neq l_r\ (g\neq r);\ g,r=1,\ldots,k\},$$

l.i.m. *is a limit in the mean-square sense*, $i_1,\ldots,i_k = 0,1,\ldots,m,$

$$\zeta_j^{(i)} = \int\limits_t^T \phi_j(s)d\mathbf{w}_s^{(i)} \tag{11}$$

are independent standard Gaussian random variables for various i *or* j (*in the case when* $i\neq 0$), $C_{j_k\ldots j_1}$ *is the Fourier coefficient* (8), $\Delta\mathbf{w}_{\tau_j}^{(i)} = \mathbf{w}_{\tau_{j+1}}^{(i)} - \mathbf{w}_{\tau_j}^{(i)}$ $(i=0,1,\ldots,m)$, $\{\tau_j\}_{j=0}^{N}$ *is a partition of the interval* $[t,T]$, *which satisfies the condition* (9).

It was shown in [19]-[24] that Theorem 1 is valid for convergence in the mean of degree $2n$ $(n\in\mathbb{N})$. The convergence with probability 1 in Theorem 1 is proved in [15]-[17], [39], [53] for the cases of Legendre polynomials and trigonometric functions. Moreover, the complete orthonormal systems of Haar and Rademacher–Walsh functions in the space $L_2([t,T])$ can also be applied in Theorem 1 [10]-[24]. The modification of Theorem 1 for complete orthonormal with weigth $r(x)\ge 0$ systems of functions in the space $L_2([t,T])$ can be found in [14], [15]-[17], [39], [49]. Application of Theorem 1 and Theorem 2 (see below) for the mean-square approximation of iterated stochastic integrals with respect to the infinite-dimensional Q-Wiener process can be found in the monographs [15]-[17] (Chapter 7) and in [31], [32], [54], [56].

In order to evaluate the significance of Theorem 1 for practice we will demonstrate its transformed particular cases for $k=1,\ldots,5$ [10]-[32], [37]-[58]

$$J[\psi^{(1)}]_{T,t} = \underset{p_1\to\infty}{\text{l.i.m.}} \sum_{j_1=0}^{p_1} C_{j_1}\zeta_{j_1}^{(i_1)}, \tag{12}$$

$$J[\psi^{(2)}]_{T,t} = \underset{p_1,p_2\to\infty}{\text{l.i.m.}} \sum_{j_1=0}^{p_1}\sum_{j_2=0}^{p_2} C_{j_2j_1}\Biggl(\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)} - \mathbf{1}_{\{i_1=i_2\neq 0\}}\mathbf{1}_{\{j_1=j_2\}}\Biggr), \tag{13}$$

$$J[\psi^{(3)}]_{T,t} = \underset{p_1,\ldots,p_3\to\infty}{\text{l.i.m.}} \sum_{j_1=0}^{p_1}\sum_{j_2=0}^{p_2}\sum_{j_3=0}^{p_3} C_{j_3j_2j_1}\Biggl(\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}\zeta_{j_3}^{(i_3)} -$$

$$-\mathbf{1}_{\{i_1=i_2\neq 0\}}\mathbf{1}_{\{j_1=j_2\}}\zeta_{j_3}^{(i_3)}-\mathbf{1}_{\{i_2=i_3\neq 0\}}\mathbf{1}_{\{j_2=j_3\}}\zeta_{j_1}^{(i_1)}-\mathbf{1}_{\{i_1=i_3\neq 0\}}\mathbf{1}_{\{j_1=j_3\}}\zeta_{j_2}^{(i_2)}\Biggr), \tag{14}$$

$$J[\psi^{(4)}]_{T,t}=\underset{p_1,\ldots,p_4\to\infty}{\text{l.i.m.}}\sum_{j_1=0}^{p_1}\ldots\sum_{j_4=0}^{p_4}C_{j_4\ldots j_1}\Biggl(\prod_{l=1}^{4}\zeta_{j_l}^{(i_l)}-$$
$$-\mathbf{1}_{\{i_1=i_2\neq 0\}}\mathbf{1}_{\{j_1=j_2\}}\zeta_{j_3}^{(i_3)}\zeta_{j_4}^{(i_4)}-\mathbf{1}_{\{i_1=i_3\neq 0\}}\mathbf{1}_{\{j_1=j_3\}}\zeta_{j_2}^{(i_2)}\zeta_{j_4}^{(i_4)}-$$

$$-\mathbf{1}_{\{i_2=i_3\neq 0\}}\mathbf{1}_{\{j_2=j_3\}}\zeta_{j_1}^{(i_1)}\zeta_{j_4}^{(i_4)}\zeta_{j_5}^{(i_5)}-\mathbf{1}_{\{i_2=i_4\neq 0\}}\mathbf{1}_{\{j_2=j_4\}}\zeta_{j_1}^{(i_1)}\zeta_{j_3}^{(i_3)}\zeta_{j_5}^{(i_5)}-$$
$$-\mathbf{1}_{\{i_2=i_5\neq 0\}}\mathbf{1}_{\{j_2=j_5\}}\zeta_{j_1}^{(i_1)}\zeta_{j_3}^{(i_3)}\zeta_{j_4}^{(i_4)}-\mathbf{1}_{\{i_3=i_4\neq 0\}}\mathbf{1}_{\{j_3=j_4\}}\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}\zeta_{j_5}^{(i_5)}-$$
$$-\mathbf{1}_{\{i_3=i_5\neq 0\}}\mathbf{1}_{\{j_3=j_5\}}\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}\zeta_{j_4}^{(i_4)}-\mathbf{1}_{\{i_4=i_5\neq 0\}}\mathbf{1}_{\{j_4=j_5\}}\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}\zeta_{j_3}^{(i_3)}+$$
$$+\mathbf{1}_{\{i_1=i_2\neq 0\}}\mathbf{1}_{\{j_1=j_2\}}\mathbf{1}_{\{i_3=i_4\neq 0\}}\mathbf{1}_{\{j_3=j_4\}}\zeta_{j_5}^{(i_5)}+\mathbf{1}_{\{i_1=i_2\neq 0\}}\mathbf{1}_{\{j_1=j_2\}}\mathbf{1}_{\{i_3=i_5\neq 0\}}\mathbf{1}_{\{j_3=j_5\}}\zeta_{j_4}^{(i_4)}+$$
$$+\mathbf{1}_{\{i_1=i_2\neq 0\}}\mathbf{1}_{\{j_1=j_2\}}\mathbf{1}_{\{i_4=i_5\neq 0\}}\mathbf{1}_{\{j_4=j_5\}}\zeta_{j_3}^{(i_3)}+\mathbf{1}_{\{i_1=i_3\neq 0\}}\mathbf{1}_{\{j_1=j_3\}}\mathbf{1}_{\{i_2=i_4\neq 0\}}\mathbf{1}_{\{j_2=j_4\}}\zeta_{j_5}^{(i_5)}+$$
$$+\mathbf{1}_{\{i_1=i_3\neq 0\}}\mathbf{1}_{\{j_1=j_3\}}\mathbf{1}_{\{i_2=i_5\neq 0\}}\mathbf{1}_{\{j_2=j_5\}}\zeta_{j_4}^{(i_4)}+\mathbf{1}_{\{i_1=i_3\neq 0\}}\mathbf{1}_{\{j_1=j_3\}}\mathbf{1}_{\{i_4=i_5\neq 0\}}\mathbf{1}_{\{j_4=j_5\}}\zeta_{j_2}^{(i_2)}+$$
$$+\mathbf{1}_{\{i_1=i_4\neq 0\}}\mathbf{1}_{\{j_1=j_4\}}\mathbf{1}_{\{i_2=i_3\neq 0\}}\mathbf{1}_{\{j_2=j_3\}}\zeta_{j_5}^{(i_5)}+\mathbf{1}_{\{i_1=i_4\neq 0\}}\mathbf{1}_{\{j_1=j_4\}}\mathbf{1}_{\{i_2=i_5\neq 0\}}\mathbf{1}_{\{j_2=j_5\}}\zeta_{j_3}^{(i_3)}+$$
$$+\mathbf{1}_{\{i_1=i_4\neq 0\}}\mathbf{1}_{\{j_1=j_4\}}\mathbf{1}_{\{i_3=i_5\neq 0\}}\mathbf{1}_{\{j_3=j_5\}}\zeta_{j_2}^{(i_2)}+\mathbf{1}_{\{i_1=i_5\neq 0\}}\mathbf{1}_{\{j_1=j_5\}}\mathbf{1}_{\{i_2=i_3\neq 0\}}\mathbf{1}_{\{j_2=j_3\}}\zeta_{j_4}^{(i_4)}+$$
$$+\mathbf{1}_{\{i_1=i_5\neq 0\}}\mathbf{1}_{\{j_1=j_5\}}\mathbf{1}_{\{i_2=i_4\neq 0\}}\mathbf{1}_{\{j_2=j_4\}}\zeta_{j_3}^{(i_3)}+\mathbf{1}_{\{i_1=i_5\neq 0\}}\mathbf{1}_{\{j_1=j_5\}}\mathbf{1}_{\{i_3=i_4\neq 0\}}\mathbf{1}_{\{j_3=j_4\}}\zeta_{j_2}^{(i_2)}+$$
$$+\mathbf{1}_{\{i_2=i_3\neq 0\}}\mathbf{1}_{\{j_2=j_3\}}\mathbf{1}_{\{i_4=i_5\neq 0\}}\mathbf{1}_{\{j_4=j_5\}}\zeta_{j_1}^{(i_1)}+\mathbf{1}_{\{i_2=i_4\neq 0\}}\mathbf{1}_{\{j_2=j_4\}}\mathbf{1}_{\{i_3=i_5\neq 0\}}\mathbf{1}_{\{j_3=j_5\}}\zeta_{j_1}^{(i_1)}+$$
$$+\mathbf{1}_{\{i_2=i_5\neq 0\}}\mathbf{1}_{\{j_2=j_5\}}\mathbf{1}_{\{i_3=i_4\neq 0\}}\mathbf{1}_{\{j_3=j_4\}}\zeta_{j_1}^{(i_1)}\Biggr), \tag{16}$$

where $\mathbf{1}_A$ is the indicator of the set A.

Note that we will consider the case $i_1,\ldots,i_5=1,\ldots,m$. This case corresponds to the numerical scheme (4).

For further consideration, let us consider the generalization of formulas (12)–(16) for the case of an arbitrary multiplicity k ($k\in\mathbb{N}$) of the iterated Ito stochastic integral $J[\psi^{(k)}]_{T,t}$ defined by (2).

In order to do this, let us introduce some notations. Consider the unordered set $\{1, 2, \ldots, k\}$ and separate it into two parts: the first part consists of r unordered pairs (sequence order of these pairs is also unimportant) and the second one consists of the remaining $k - 2r$ numbers. So, we have

$$
(\{\underbrace{\{g_1, g_2\}, \ldots, \{g_{2r-1}, g_{2r}\}}_{\text{part 1}}\}, \{\underbrace{q_1, \ldots, q_{k-2r}}_{\text{part 2}}\}), \tag{17}
$$

where

$$
\{g_1, g_2, \ldots, g_{2r-1}, g_{2r}, q_1, \ldots, q_{k-2r}\} = \{1, 2, \ldots, k\},
$$

braces mean an unordered set, and parentheses mean an ordered set.

We will say that (17) is a partition and consider the sum with respect to all possible partitions

$$
\sum_{\substack{(\{\{g_1,g_2\},\ldots,\{g_{2r-1},g_{2r}\}\},\{q_1,\ldots,q_{k-2r}\}) \\ \{g_1,g_2,\ldots,g_{2r-1},g_{2r},q_1,\ldots,q_{k-2r}\}=\{1,2,\ldots,k\}}} a_{g_1 g_2, \ldots, g_{2r-1} g_{2r}, q_1 \ldots q_{k-2r}}. \tag{18}
$$

Below there are several examples of sums in the form (18)

$$
\sum_{\substack{(\{g_1,g_2\}) \\ \{g_1,g_2\}=\{1,2\}}} a_{g_1 g_2} = a_{12},
$$

$$
\sum_{\substack{(\{\{g_1,g_2\},\{g_3,g_4\}\}) \\ \{g_1,g_2,g_3,g_4\}=\{1,2,3,4\}}} a_{g_1 g_2 g_3 g_4} = a_{1234} + a_{1324} + a_{2314},
$$

$$
\sum_{\substack{(\{g_1,g_2\},\{q_1,q_2\}) \\ \{g_1,g_2,q_1,q_2\}=\{1,2,3,4\}}} a_{g_1 g_2, q_1 q_2} =
$$

$$
= a_{12,34} + a_{13,24} + a_{14,23} + a_{23,14} + a_{24,13} + a_{34,12},
$$

$$
\sum_{\substack{(\{g_1,g_2\},\{q_1,q_2,q_3\}) \\ \{g_1,g_2,q_1,q_2,q_3\}=\{1,2,3,4,5\}}} a_{g_1 g_2, q_1 q_2 q_3} =
$$

$$
= a_{12,345} + a_{13,245} + a_{14,235} + a_{15,234} + a_{23,145} + a_{24,135} +
$$
$$
+ a_{25,134} + a_{34,125} + a_{35,124} + a_{45,123},
$$

$$
\sum_{\substack{(\{\{g_1,g_2\},\{g_3,g_4\}\},\{q_1\}) \\ \{g_1,g_2,g_3,g_4,q_1\}=\{1,2,3,4,5\}}} a_{g_1 g_2, g_3 g_4, q_1} =
$$

$$
= a_{12,34,5} + a_{13,24,5} + a_{14,23,5} + a_{12,35,4} + a_{13,25,4} + a_{15,23,4} +
$$
$$
+ a_{12,54,3} + a_{15,24,3} + a_{14,25,3} + a_{15,34,2} + a_{13,54,2} + a_{14,53,2} +
$$
$$
+ a_{52,34,1} + a_{53,24,1} + a_{54,23,1}.
$$

Now we can write (10) as

$$J[\psi^{(k)}]_{T,t} = \underset{p_1,\ldots,p_k\to\infty}{\text{l.i.m.}} \sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k} C_{j_k\ldots j_1}\Biggl(\prod_{l=1}^{k}\zeta_{j_l}^{(i_l)} + \sum_{r=1}^{[k/2]}(-1)^r\times$$

$$\times \sum_{\substack{(\{\{g_1,g_2\},\ldots,\{g_{2r-1},g_{2r}\}\},\{q_1,\ldots,q_{k-2r}\})\\ \{g_1,g_2,\ldots,g_{2r-1},g_{2r},q_1,\ldots,q_{k-2r}\}=\{1,2,\ldots,k\}}} \prod_{s=1}^{r}\mathbf{1}_{\{i_{g_{2s-1}}=\ i_{g_{2s}}\neq 0\}}\mathbf{1}_{\{j_{g_{2s-1}}=\ j_{g_{2s}}\}}\prod_{l=1}^{k-2r}\zeta_{j_{q_l}}^{(i_{q_l})}\Biggr), \tag{19}$$

where $[x]$ is an integer part of a real number x; another notations are the same as in Theorem **1**.

In particular, from (19) for $k=5$ we obtain

$$J[\psi^{(5)}]_{T,t} = \underset{p_1,\ldots,p_5\to\infty}{\text{l.i.m.}} \sum_{j_1=0}^{p_1}\ldots\sum_{j_5=0}^{p_5} C_{j_5\ldots j_1}\Biggl(\prod_{l=1}^{5}\zeta_{j_l}^{(i_l)} -$$

$$- \sum_{\substack{(\{g_1,g_2\},\{q_1,q_2,q_3\})\\ \{g_1,g_2,q_1,q_2,q_3\}=\{1,2,3,4,5\}}} \mathbf{1}_{\{i_{g_1}=\ i_{g_2}\neq 0\}}\mathbf{1}_{\{j_{g_1}=\ j_{g_2}\}}\prod_{l=1}^{3}\zeta_{j_{q_l}}^{(i_{q_l})} +$$

$$+ \sum_{\substack{(\{\{g_1,g_2\},\{g_3,g_4\}\},\{q_1\})\\ \{g_1,g_2,g_3,g_4,q_1\}=\{1,2,3,4,5\}}} \mathbf{1}_{\{i_{g_1}=\ i_{g_2}\neq 0\}}\mathbf{1}_{\{j_{g_1}=\ j_{g_2}\}}\mathbf{1}_{\{i_{g_3}=\ i_{g_4}\neq 0\}}\mathbf{1}_{\{j_{g_3}=\ j_{g_4}\}}\zeta_{j_{q_1}}^{(i_{q_1})}\Biggr).$$

The last equality obviously agrees with (16).

Let us consider a generalization of Theorem 1 for the case of an arbitrary complete orthonormal systems of functions in the space $L_2([t,T])$ and $\psi_1(\tau),\ldots,\psi_k(\tau)\in L_2([t,T])$.

Theorem 2 [15] (Sect. 1.11), [39] (Sect. 15). *Suppose that $\psi_1(\tau),\ldots,\psi_k(\tau)\in L_2([t,T])$ and $\{\phi_j(x)\}_{j=0}^{\infty}$ is an arbitrary complete orthonormal system of functions in the space $L_2([t,T])$. Then the following expansion*

$$J[\psi^{(k)}]_{T,t} = \underset{p_1,\ldots,p_k\to\infty}{\text{l.i.m.}} \sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k} C_{j_k\ldots j_1}\Biggl(\prod_{l=1}^{k}\zeta_{j_l}^{(i_l)} + \sum_{r=1}^{[k/2]}(-1)^r\times$$

$$\times \sum_{\substack{(\{\{g_1,g_2\},\ldots,\{g_{2r-1},g_{2r}\}\},\{q_1,\ldots,q_{k-2r}\})\\ \{g_1,g_2,\ldots,g_{2r-1},g_{2r},q_1,\ldots,q_{k-2r}\}=\{1,2,\ldots,k\}}} \prod_{s=1}^{r}\mathbf{1}_{\{i_{g_{2s-1}}=\ i_{g_{2s}}\neq 0\}}\mathbf{1}_{\{j_{g_{2s-1}}=\ j_{g_{2s}}\}}\prod_{l=1}^{k-2r}\zeta_{j_{q_l}}^{(i_{q_l})}\Biggr) \tag{20}$$

converging in the mean-square sense is valid, where $[x]$ is an integer part of a real number x; another notations are the same as in Theorem 1.

It should be noted that an analogue of Theorem 2 was considered in [66]. Note that we use another notations [15] (Sect. 1.11), [39] (Sect. 15) in comparison with [66]. Moreover, the proof of an analogue of Theorem 2 from [66] is somewhat different from the proof given in [15] (Sect. 1.11), [39] (Sect. 15).

4. Calculation of the Mean-Square Approximation Error in the Method of Generalized Multiple Fourier Seires

Note that for the integrals $J[\psi^{(k)}]_{T,t}$ defined by (2) the mean-square approximation error can be exactly calculated and efficiently estimated.

Let $J[\psi^{(k)}]_{T,t}^q$ be the expression on the right-hand side of (20) before passing to the limit $\underset{p_1,\ldots,p_k\to\infty}{\text{l.i.m.}}$ for the case $p_1=\ldots=p_k=q$, i.e.

$$J[\psi^{(k)}]_{T,t}^q=\sum_{j_1,\ldots,j_k=0}^{q}C_{j_k\ldots j_1}\Biggl(\prod_{l=1}^{k}\zeta_{j_l}^{(i_l)}+\sum_{r=1}^{[k/2]}(-1)^r\times$$

$$\times\sum_{\substack{(\{\{g_1,g_2\},\ldots,\{g_{2r-1},g_{2r}\}\},\{q_1,\ldots,q_{k-2r}\})\\ \{g_1,g_2,\ldots,g_{2r-1},g_{2r},q_1,\ldots,q_{k-2r}\}=\{1,2,\ldots,k\}}}\prod_{s=1}^{r}\mathbf{1}_{\{i_{g_{2s-1}}=\,i_{g_{2s}}\ne 0\}}\mathbf{1}_{\{j_{g_{2s-1}}=\,j_{g_{2s}}\}}\prod_{l=1}^{k-2r}\zeta_{j_{q_l}}^{(i_{q_l})}\Biggr). \tag{21}$$

Let us denote

$$\mathsf{M}\left\{\left(J[\psi^{(k)}]_{T,t}-J[\psi^{(k)}]_{T,t}^q\right)^2\right\}\stackrel{\text{def}}{=}E_k^q,$$

$$\int\limits_{[t,T]^k}K^2(t_1,\ldots,t_k)dt_1\ldots dt_k\stackrel{\text{def}}{=}I_k.$$

In [13]-[17], [39], [40] it was shown that

$$E_k^q\le k!\Biggl(I_k-\sum_{j_1,\ldots,j_k=0}^{q}C_{j_k\ldots j_1}^2\Biggr) \tag{22}$$

for the following two cases:

1. $i_1,\ldots,i_k=1,\ldots,m$ and $T-t\in(0,+\infty)$,
2. $i_1,\ldots,i_k=0,1,\ldots,m$ and $T-t\in(0,1)$.

The value E_k^q can be calculated exactly.

Theorem 3 [15] (Sect. 1.12), [40] (Sect. 6). *Suppose that $\{\phi_j(x)\}_{j=0}^{\infty}$ is an arbitrary complete orthonormal system of functions in the space $L_2([t,T])$ and $\psi_1(\tau),\ldots,\psi_k(\tau)\in L_2([t,T])$. Then*

$$E_k^q=I_k-\sum_{j_1,\ldots,j_k=0}^{q}C_{j_k\ldots j_1}\mathsf{M}\left\{J[\psi^{(k)}]_{T,t}\sum_{(j_1,\ldots,j_k)}\int\limits_t^T\phi_{j_k}(t_k)\ldots\int\limits_t^{t_2}\phi_{j_1}(t_1)d\mathbf{f}_{t_1}^{(i_1)}\ldots d\mathbf{f}_{t_k}^{(i_k)}\right\}, \tag{23}$$

where $i_1,\ldots,i_k=1,\ldots,m$; the expression

$$\sum_{(j_1,\ldots,j_k)}$$

means the sum with respect to all possible permutations $(j_1,\ldots,j_k)$*. At the same time if* j_r *swapped with* j_q *in the permutation* $(j_1,\ldots,j_k)$*, then* i_r *swapped with* i_q *in the permutation* $(i_1,\ldots,i_k)$*; another notations are the same as in Theorems* 1, 2.

Note that

$$\mathsf{M}\left\{J[\psi^{(k)}]_{T,t}\int\limits_t^T\phi_{j_k}(t_k)\ldots\int\limits_t^{t_2}\phi_{j_1}(t_1)d\mathbf{f}_{t_1}^{(i_1)}\ldots d\mathbf{f}_{t_k}^{(i_k)}\right\}=C_{j_k\ldots j_1}.$$

Therefore, for the case of pairwise different numbers $i_1,\ldots,i_k$ as well as for the case $i_1=\ldots=i_k$ from Theorem 3 it follows that [14], [15]-[17], [25], [40]

$$E_k^q=I_k-\sum_{j_1,\ldots,j_k=0}^{q}C_{j_k\ldots j_1}^2, \tag{24}$$

$$E_k^q=I_k-\sum_{j_1,\ldots,j_k=0}^{q}C_{j_k\ldots j_1}\left(\sum_{(j_1,\ldots,j_k)}C_{j_k\ldots j_1}\right),$$

where

$$\sum_{(j_1,\ldots,j_k)}$$

is a sum with respect to all possible permutations $(j_1,\ldots,j_k)$.

Consider some examples [14], [15]-[17], [25], [40] of application of Theorem 3 $(i_1,i_2,i_3=1,\ldots,m)$

$$E_2^q=I_2-\sum_{j_1,j_2=0}^{q}C_{j_2j_1}^2-\sum_{j_1,j_2=0}^{q}C_{j_2j_1}C_{j_1j_2}\quad (i_1=i_2), \tag{25}$$

$$E_3^q=I_3-\sum_{j_3,j_2,j_1=0}^{q}C_{j_3j_2j_1}^2-\sum_{j_3,j_2,j_1=0}^{q}C_{j_3j_1j_2}C_{j_3j_2j_1}\quad (i_1=i_2\ne i_3), \tag{26}$$

$$E_3^q=I_3-\sum_{j_3,j_2,j_1=0}^{q}C_{j_3j_2j_1}^2-\sum_{j_3,j_2,j_1=0}^{q}C_{j_2j_3j_1}C_{j_3j_2j_1}\quad (i_1\ne i_2=i_3), \tag{27}$$

$$E_3^q=I_3-\sum_{j_3,j_2,j_1=0}^{q}C_{j_3j_2j_1}^2-\sum_{j_3,j_2,j_1=0}^{q}C_{j_3j_2j_1}C_{j_1j_2j_3}\quad (i_1=i_3\ne i_2). \tag{28}$$

The values E_4^q and E_5^q were calculated exaclty for all possible combinations of $i_1,\ldots,i_5=1,\ldots,m$ in [14], [15]-[17], [40].

5. Expansions of Iterated Stratonovich Stochastic Integrals Based on Multiple Fourier–Legendre Series and Multiple Trigonometric Fourier Seires

In contrast to the iterated Ito stochastic integrals (2), the iterated Stratonovich stochastic integrals (3) have simpler expansions (see Theorems 4–10 below) than (10) but the calculation (or estimation) of mean-square approximation errors for the latter is a more difficult problem than for the former. We will study this issue in details below.

As we mentioned above, Theorems 1, 2 can be adapted for the iterated Stratonovich stochastic integrals (3) at least for multiplicities 1 to 6. Expansions of these iterated Stratonovich stochastic integrals turned out much simpler, than the appropriate expansions of the iterated Ito stochastic integrals (2) from Theorems 1, 2. Let us formulate some old results on expansions of the iterated Stratonovich stochastic integrals (3) of multiplicities 2 to 4.

Theorem 4 [11]-[17], [22]-[24], [30], [33], [34], [38], [43], [45], [47]. *Assume that the following conditions are fulfulled*:

1. *The function* $\psi_2(\tau)$ *is continuously differentiable at the interval* $[t,T]$ *and the function* $\psi_1(\tau)$ *is twice continuously differentiable at the interval* $[t,T]$.

2. $\{\phi_j(x)\}_{j=0}^{\infty}$ *is a complete orthonormal system of Legendre polynomials or trigonometric functions in the space* $L_2([t,T])$.

Then, the iterated Stratonovich stochastic integral of second multiplicity

$$\int\limits_t^{*T}\psi_2(t_2)\int\limits_t^{*t_2}\psi_1(t_1)d\mathbf{f}_{t_1}^{(i_1)}d\mathbf{f}_{t_2}^{(i_2)}\quad (i_1,i_2=1,\ldots,m)$$

is expanded into the following series

$$\int\limits_t^{*T}\psi_2(t_2)\int\limits_t^{*t_2}\psi_1(t_1)d\mathbf{f}_{t_1}^{(i_1)}=\underset{p_1,p_2\to\infty}{\text{l.i.m.}}\sum_{j_1=0}^{p_1}\sum_{j_2=0}^{p_2}C_{j_2j_1}\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}$$

converging in the mean-square sense, where

$$C_{j_2j_1}=\int\limits_t^{T}\psi_2(t_2)\phi_{j_2}(t_2)\int\limits_t^{t_2}\psi_1(t_1)\phi_{j_1}(t_1)dt_1dt_2;$$

another notations are the same as in Theorems 1, 2.

Theorem 5 [11]-[17], [22]-[24], [38], [43], [44]. *Assume that* $\{\phi_j(x)\}_{j=0}^{\infty}$ *is a complete orthonormal system of Legendre polynomials or trigonomertic functions in the space* $L_2([t,T])$. *Moreover, the function* $\psi_2(\tau)$ *is continuously differentiable at the interval* $[t,T]$ *and the functions* $\psi_1(\tau)$, $\psi_3(\tau)$ *are twice continuously differentiable at the interval* $[t,T]$.

Then, for the iterated Stratonovich stochastic integral of third multiplicity

$$\int\limits_t^{*T}\psi_3(t_3)\int\limits_t^{*t_3}\psi_2(t_2)\int\limits_t^{*t_2}\psi_1(t_1)d\mathbf{f}_{t_1}^{(i_1)}d\mathbf{f}_{t_2}^{(i_2)}d\mathbf{f}_{t_3}^{(i_3)}\quad (i_1,i_2,i_3=1,\ldots,m)$$

the following expansion

$$\int\limits_t^{*T}\psi_3(t_3)\int\limits_t^{*t_3}\psi_2(t_2)\int\limits_t^{*t_2}\psi_1(t_1)d\mathbf{f}_{t_1}^{(i_1)}d\mathbf{f}_{t_2}^{(i_2)}d\mathbf{f}_{t_3}^{(i_3)}=\underset{q\to\infty}{\text{l.i.m.}}\sum_{j_1,j_2,j_3=0}^{q}C_{j_3j_2j_1}\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}\zeta_{j_3}^{(i_3)} \tag{29}$$

converging in the mean-square sense is valid, where

$$C_{j_3j_2j_1}=\int\limits_t^T\psi_3(t_3)\phi_{j_3}(t_3)\int\limits_t^{t_3}\psi_2(t_2)\phi_{j_2}(t_2)\int\limits_t^{t_2}\psi_1(t_1)\phi_{j_1}(t_1)dt_1dt_2dt_3;$$

another notations are the same as in Theorems 1, 2.

Theorem 6 [11]-[17], [22]-[24], [38], [43], [50]. *Suppose that* $\{\phi_j(x)\}_{j=0}^{\infty}$ *is a complete orthonormal system of Legendre polynomials or trigonometric functions in* $L_2([t,T])$. *Then, for the iterated Stratonovich stochastic integral of multiplicity* 4

$$\int\limits_t^{*T}\int\limits_t^{*t_4}\int\limits_t^{*t_3}\int\limits_t^{*t_2}d\mathbf{w}_{t_1}^{(i_1)}d\mathbf{w}_{t_2}^{(i_2)}d\mathbf{w}_{t_3}^{(i_3)}d\mathbf{w}_{t_4}^{(i_4)}$$

the following expansion

$$\int\limits_t^{*T}\int\limits_t^{*t_4}\int\limits_t^{*t_3}\int\limits_t^{*t_2}d\mathbf{w}_{t_1}^{(i_1)}d\mathbf{w}_{t_2}^{(i_2)}d\mathbf{w}_{t_3}^{(i_3)}d\mathbf{w}_{t_4}^{(i_4)}=\underset{q\to\infty}{\text{l.i.m.}}\sum_{j_1,j_2,j_3,j_4=0}^{q}C_{j_4j_3j_2j_1}\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}\zeta_{j_3}^{(i_3)}\zeta_{j_4}^{(i_4)}$$

converging in the mean-square sense is valid, where $i_1,i_2,i_3,i_4=0,1,\ldots,m$,

$$C_{j_4j_3j_2j_1}=\int\limits_t^T\phi_{j_4}(t_4)\int\limits_t^{t_4}\phi_{j_3}(t_3)\int\limits_t^{t_3}\phi_{j_2}(t_2)\int\limits_t^{t_2}\phi_{j_1}(t_1)dt_1dt_2dt_3dt_4;$$

another notations are the same as in Theorems 1, 2.

Recently, a new approach to the expansion and mean-square approximation of iterated Stratonovich stochastic integrals has been obtained [15] (Sect. 2.10–2.16), [42] (Sect. 7–13), [43] (Sect. 13–19), [50] (Sect. 5–11), [58] (Sect. 4–9). Let us formulate four theorems that were obtained using this approach.

Theorem 7 [15], [42], [43], [50], [58]. *Suppose that* $\{\phi_j(x)\}_{j=0}^{\infty}$ *is a complete orthonormal system of Legendre polynomials or trigonometric functions in the space* $L_2([t,T])$. *Furthermore, let* $\psi_1(\tau),\psi_2(\tau),\psi_3(\tau)$ *are continuously differentiable nonrandom functions on* $[t,T]$. *Then, for the iterated Stratonovich stochastic integral of third multiplicity*

$$J^*[\psi^{(3)}]_{T,t}=\int\limits_t^{*T}\psi_3(t_3)\int\limits_t^{*t_3}\psi_2(t_2)\int\limits_t^{*t_2}\psi_1(t_1)d\mathbf{w}_{t_1}^{(i_1)}d\mathbf{w}_{t_2}^{(i_2)}d\mathbf{w}_{t_3}^{(i_3)}\quad (i_1,i_2,i_3=0,1,\ldots,m)$$

the following relations

$$J^*[\psi^{(3)}]_{T,t} = \underset{p\to\infty}{\text{l.i.m.}} \sum_{j_1,j_2,j_3=0}^{p} C_{j_3j_2j_1}\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}\zeta_{j_3}^{(i_3)}, \tag{30}$$

$$\mathsf{M}\left\{\left(J^*[\psi^{(3)}]_{T,t} - \sum_{j_1,j_2,j_3=0}^{p} C_{j_3j_2j_1}\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}\zeta_{j_3}^{(i_3)}\right)^2\right\} \le \frac{C}{p} \tag{31}$$

are fulfilled, where $i_1, i_2, i_3 = 0, 1, \ldots, m$ *in* (30) *and* $i_1, i_2, i_3 = 1, \ldots, m$ *in* (31), *constant* C *is independent of* p,

$$C_{j_3j_2j_1} = \int\limits_t^T \psi_3(t_3)\phi_{j_3}(t_3)\int\limits_t^{t_3}\psi_2(t_2)\phi_{j_2}(t_2)\int\limits_t^{t_2}\psi_1(t_1)\phi_{j_1}(t_1)dt_1dt_2dt_3$$

and

$$\zeta_j^{(i)} = \int\limits_t^T \phi_j(\tau)d\mathbf{f}_\tau^{(i)}$$

are independent standard Gaussian random variables for various i *or* j *(in the case when* $i \ne 0$*); another notations are the same as in Theorems* 1, 2.

Theorem 8 [15], [42], [43], [50], [58]. *Let* $\{\phi_j(x)\}_{j=0}^{\infty}$ *be a complete orthonormal system of Legendre polynomials or trigonometric functions in the space* $L_2([t,T])$. *Furthermore, let* $\psi_1(\tau), \ldots, \psi_4(\tau)$ *be continuously differentiable nonrandom functions on* $[t,T]$. *Then, for the iterated Stratonovich stochastic integral of fourth multiplicity*

$$J^*[\psi^{(4)}]_{T,t} = \int\limits_t^{*T}\psi_4(t_4)\int\limits_t^{*t_4}\psi_3(t_3)\int\limits_t^{*t_3}\psi_2(t_2)\int\limits_t^{*t_2}\psi_1(t_1)d\mathbf{w}_{t_1}^{(i_1)}d\mathbf{w}_{t_2}^{(i_2)}d\mathbf{w}_{t_3}^{(i_3)}d\mathbf{w}_{t_4}^{(i_4)} \tag{32}$$

the following relations

$$J^*[\psi^{(4)}]_{T,t} = \underset{p\to\infty}{\text{l.i.m.}} \sum_{j_1,j_2,j_3,j_4=0}^{p} C_{j_4j_3j_2j_1}\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}\zeta_{j_3}^{(i_3)}\zeta_{j_4}^{(i_4)}, \tag{33}$$

$$\mathsf{M}\left\{\left(J^*[\psi^{(4)}]_{T,t} - \sum_{j_1,j_2,j_3,j_4=0}^{p} C_{j_4j_3j_2j_1}\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}\zeta_{j_3}^{(i_3)}\zeta_{j_4}^{(i_4)}\right)^2\right\} \le \frac{C}{p^{1-\varepsilon}} \tag{34}$$

are fulfilled, where $i_1, \ldots, i_4 = 0, 1, \ldots, m$ *in* (32), (33) *and* $i_1, \ldots, i_4 = 1, \ldots, m$ *in* (34), *constant* C *does not depend on* p, ε *is an arbitrary small positive real number for the case of complete orthonormal system of Legendre polynomials in the space* $L_2([t,T])$ *and* $\varepsilon = 0$ *for the case of complete orthonormal system of trigonometric functions in the space* $L_2([t,T])$,

$$
C_{j_4j_3j_2j_1}=
$$

$$
=\int\limits_t^T\psi_4(t_4)\phi_{j_4}(t_4)\int\limits_t^{t_4}\psi_3(t_3)\phi_{j_3}(t_3)\int\limits_t^{t_3}\psi_2(t_2)\phi_{j_2}(t_2)\int\limits_t^{t_2}\psi_1(t_1)\phi_{j_1}(t_1)dt_1dt_2dt_3dt_4;
$$

another notations are the same as in Theorem 7.

Theorem 9 [15], [42], [43], [50], [58]. *Assume that* $\{\phi_j(x)\}_{j=0}^{\infty}$ *is a complete orthonormal system of Legendre polynomials or trigonometric functions in the space* $L_2([t,T])$ *and* $\psi_1(\tau),\ldots,\psi_5(\tau)$ *are continuously differentiable nonrandom functions on* $[t,T]$. *Then, for the iterated Stratonovich stochastic integral of fifth multiplicity*

$$
J^*[\psi^{(5)}]_{T,t}=\int\limits_t^{*T}\psi_5(t_5)\ldots\int\limits_t^{*t_2}\psi_1(t_1)d\mathbf{w}_{t_1}^{(i_1)}\ldots d\mathbf{w}_{t_5}^{(i_5)} \tag{35}
$$

the following relations

$$
J^*[\psi^{(5)}]_{T,t}=\underset{p\to\infty}{\text{l.i.m.}}\sum_{j_1,\ldots,j_5=0}^{p}C_{j_5\ldots j_1}\zeta_{j_1}^{(i_1)}\ldots\zeta_{j_5}^{(i_5)}, \tag{36}
$$

$$
\mathsf{M}\left\{\left(J^*[\psi^{(5)}]_{T,t}-\sum_{j_1,\ldots,j_5=0}^{p}C_{j_5\ldots j_1}\zeta_{j_1}^{(i_1)}\ldots\zeta_{j_5}^{(i_5)}\right)^2\right\}\le\frac{C}{p^{1-\varepsilon}} \tag{37}
$$

are fulfilled, where $i_1,\ldots,i_5=0,1,\ldots,m$ *in* (35), (36) *and* $i_1,\ldots,i_5=1,\ldots,m$ *in* (37), *constant* C *is independent of* p, ε *is an arbitrary small positive real number for the case of complete orthonormal system of Legendre polynomials in the space* $L_2([t,T])$ *and* $\varepsilon=0$ *for the case of complete orthonormal system of trigonometric functions in the space* $L_2([t,T])$,

$$
C_{j_5\ldots j_1}=\int\limits_t^T\psi_5(t_5)\phi_{j_5}(t_5)\ldots\int\limits_t^{t_2}\psi_1(t_1)\phi_{j_1}(t_1)dt_1\ldots dt_5;
$$

another notations are the same as in Theorems 7, 8.

Theorem 10 [15], [42], [43], [50], [58]. *Suppose that* $\{\phi_j(x)\}_{j=0}^{\infty}$ *is a complete orthonormal system of Legendre polynomials or trigonometric functions in the space* $L_2([t,T])$. *Then, for the iterated Stratonovich stochastic integral of sixth multiplicity*

$$
J_{T,t}^{*(i_1\ldots i_6)}=\int\limits_t^{*T}\ldots\int\limits_t^{*t_2}d\mathbf{w}_{t_1}^{(i_1)}\ldots d\mathbf{w}_{t_6}^{(i_6)} \tag{38}
$$

the following expansion

$$J_{T,t}^{*(i_1\ldots i_6)}=\underset{p\to\infty}{\text{l.i.m.}}\sum_{j_1,\ldots,j_6=0}^{p}C_{j_6\ldots j_1}\zeta_{j_1}^{(i_1)}\ldots\zeta_{j_6}^{(i_6)}$$

that converges in the mean-square sense is valid, where $i_1,\ldots,i_6=0,1,\ldots,m,$

$$C_{j_6\ldots j_1}=\int\limits_t^T\phi_{j_6}(t_6)\ldots\int\limits_t^{t_2}\phi_{j_1}(t_1)dt_1\ldots dt_6;$$

another notations are the same as in Theorems 7–9.

6. Approximation of Iterated Stratonovich Stochastic Integrals Based on Multiple Fourier–Legendre Series

As was mentioned above, one of the main problems arising in the implementation of the numerical scheme (4) is the joint numerical modeling of the iterated Stratonovich stochastic integrals figuring in (4). Let us consider efficient numerical modeling formulas for the iterated Stratonovich stochastic integrals based on Theorems 4–9.

Using Theorems 1, 2 ($k=1$), Theorems 4–9, and multiple Fourier–Legendre series, we obtain the following approximations of iterated Stratonovich stochastic integrals from (4) [10]-[50]

$$I_{(0)\tau_{p+1},\tau_p}^{*(i_1)}=\sqrt{\Delta}\zeta_0^{(i_1)}, \tag{39}$$

$$I_{(1)\tau_{p+1},\tau_p}^{*(i_1)}=-\frac{\Delta^{3/2}}{2}\left(\zeta_0^{(i_1)}+\frac{1}{\sqrt{3}}\zeta_1^{(i_1)}\right), \tag{40}$$

$$I_{(2)\tau_{p+1},\tau_p}^{*(i_1)}=\frac{\Delta^{5/2}}{3}\left(\zeta_0^{(i_1)}+\frac{\sqrt{3}}{2}\zeta_1^{(i_1)}+\frac{1}{2\sqrt{5}}\zeta_2^{(i_1)}\right), \tag{41}$$

$$I_{(00)\tau_{p+1},\tau_p}^{*(i_1i_2)q}=\frac{\Delta}{2}\left(\zeta_0^{(i_1)}\zeta_0^{(i_2)}+\sum_{i=1}^{q}\frac{1}{\sqrt{4i^2-1}}\left(\zeta_{i-1}^{(i_1)}\zeta_i^{(i_2)}-\zeta_i^{(i_1)}\zeta_{i-1}^{(i_2)}\right)\right), \tag{42}$$

$$I_{(01)\tau_{p+1},\tau_p}^{*(i_1i_2)q}=-\frac{\Delta}{2}I_{(00)\tau_{p+1},\tau_p}^{*(i_1i_2)q}-\frac{\Delta^2}{4}\left(\frac{1}{\sqrt{3}}\zeta_0^{(i_1)}\zeta_1^{(i_2)}+\right.$$

$$\left.+\sum_{i=0}^{q}\left(\frac{(i+2)\zeta_i^{(i_1)}\zeta_{i+2}^{(i_2)}-(i+1)\zeta_{i+2}^{(i_1)}\zeta_i^{(i_2)}}{\sqrt{(2i+1)(2i+5)}(2i+3)}-\frac{\zeta_i^{(i_1)}\zeta_i^{(i_2)}}{(2i-1)(2i+3)}\right)\right), \tag{43}$$

$$I^{*(i_1 i_2)q}_{(10)\tau_{p+1},\tau_p}=-\frac{\Delta}{2}I^{*(i_1 i_2)q}_{(00)\tau_{p+1},\tau_p}-\frac{\Delta^2}{4}\Biggl(\frac{1}{\sqrt{3}}\zeta_0^{(i_2)}\zeta_1^{(i_1)}+$$

(44) $$+\sum_{i=0}^{q}\Biggl(\frac{(i+1)\zeta_{i+2}^{(i_2)}\zeta_i^{(i_1)}-(i+2)\zeta_i^{(i_2)}\zeta_{i+2}^{(i_1)}}{\sqrt{(2i+1)(2i+5)}(2i+3)}+\frac{\zeta_i^{(i_1)}\zeta_i^{(i_2)}}{(2i-1)(2i+3)}\Biggr)\Biggr)$$

or

(45) $$I^{*(i_1 i_2)q}_{(01)\tau_{p+1},\tau_p}=\sum_{j_1,j_2=0}^{q}C^{01}_{j_2 j_1}\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)},$$

(46) $$I^{*(i_1 i_2)q}_{(10)\tau_{p+1},\tau_p}=\sum_{j_1,j_2=0}^{p}C^{10}_{j_2 j_1}\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)};$$

(47) $$I^{*(i_1 i_2 i_3)q}_{(000)\tau_{p+1},\tau_p}=\sum_{j_1,j_2,j_3=0}^{q}C_{j_3 j_2 j_1}\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}\zeta_{j_3}^{(i_3)},$$

(48) $$I^{*(i_1 i_2 i_3)q}_{(100)\tau_{p+1},\tau_p}=\sum_{j_1,j_2,j_3=0}^{q}C^{100}_{j_3 j_2 j_1}\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}\zeta_{j_3}^{(i_3)},$$

(49) $$I^{*(i_1 i_2 i_3)q}_{(010)\tau_{p+1},\tau_p}=\sum_{j_1,j_2,j_3=0}^{q}C^{010}_{j_3 j_2 j_1}\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}\zeta_{j_3}^{(i_3)},$$

(50) $$I^{*(i_1 i_2 i_3)q}_{(001)\tau_{p+1},\tau_p}=\sum_{j_1,j_2,j_3=0}^{q}C^{001}_{j_3 j_2 j_1}\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}\zeta_{j_3}^{(i_3)},$$

(51) $$I^{*(i_1 i_2 i_3 i_4)q}_{(0000)\tau_{p+1},\tau_p}=\sum_{j_1,j_2,j_3,j_4=0}^{q}C_{j_4 j_3 j_2 j_1}\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}\zeta_{j_3}^{(i_3)}\zeta_{j_4}^{(i_4)},$$

(52) $$I^{*(i_1 i_2 i_3 i_4 i_5)q}_{(00000)\tau_{p+1},\tau_p}=\sum_{j_1,j_2,j_3,j_4,j_5=0}^{q}C_{j_5 j_4 j_3 j_2 j_1}\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}\zeta_{j_3}^{(i_3)}\zeta_{j_4}^{(i_4)}\zeta_{j_5}^{(i_5)},$$

where the Fourier–Legendre coefficients have the form

$$C^{01}_{j_2 j_1}=\int\limits_{\tau_p}^{\tau_{p+1}}(\tau_p-y)\phi_{j_3}(y)\int\limits_{\tau_p}^{y}\phi_{j_1}(x)dxdy=\frac{\sqrt{(2j_1+1)(2j_2+1)}}{8}\Delta^2\bar{C}^{01}_{j_2 j_1},$$

$$C_{j_2j_1}^{10}=\int\limits_{\tau_p}^{\tau_{p+1}}\phi_{j_3}(y)\int\limits_{\tau_p}^{y}(\tau_p-x)\phi_{j_1}(x)dxdy=\frac{\sqrt{(2j_1+1)(2j_2+1)}}{8}\Delta^2\bar C_{j_2j_1}^{10},$$

$$C_{j_3j_2j_1}=\int\limits_{\tau_p}^{\tau_{p+1}}\phi_{j_3}(z)\int\limits_{\tau_p}^{z}\phi_{j_2}(y)\int\limits_{\tau_p}^{y}\phi_{j_1}(x)dxdydz=$$

$$=\frac{\sqrt{(2j_1+1)(2j_2+1)(2j_3+1)}}{8}\Delta^{3/2}\bar C_{j_3j_2j_1}, \tag{53}$$

$$C_{j_4j_3j_2j_1}=\int\limits_{\tau_p}^{\tau_{p+1}}\phi_{j_4}(u)\int\limits_{\tau_p}^{u}\phi_{j_3}(z)\int\limits_{\tau_p}^{z}\phi_{j_2}(y)\int\limits_{\tau_p}^{y}\phi_{j_1}(x)dxdydzdu=$$

$$=\frac{\sqrt{(2j_1+1)(2j_2+1)(2j_3+1)(2j_4+1)}}{16}\Delta^2\bar C_{j_4j_3j_2j_1}, \tag{54}$$

$$C_{j_3j_2j_1}^{001}=\int\limits_{\tau_p}^{\tau_{p+1}}(\tau_p-z)\phi_{j_3}(z)\int\limits_{\tau_p}^{z}\phi_{j_2}(y)\int\limits_{\tau_p}^{y}\phi_{j_1}(x)dxdydz=$$

$$=\frac{\sqrt{(2j_1+1)(2j_2+1)(2j_3+1)}}{16}\Delta^{5/2}\bar C_{j_3j_2j_1}^{001}, \tag{55}$$

$$C_{j_3j_2j_1}^{010}=\int\limits_{\tau_p}^{\tau_{p+1}}\phi_{j_3}(z)\int\limits_{\tau_p}^{z}(\tau_p-y)\phi_{j_2}(y)\int\limits_{\tau_p}^{y}\phi_{j_1}(x)dxdydz=$$

$$=\frac{\sqrt{(2j_1+1)(2j_2+1)(2j_3+1)}}{16}\Delta^{5/2}\bar C_{j_3j_2j_1}^{010}, \tag{56}$$

$$C_{j_3j_2j_1}^{100}=\int\limits_{\tau_p}^{\tau_{p+1}}\phi_{j_3}(z)\int\limits_{\tau_p}^{z}\phi_{j_2}(y)\int\limits_{\tau_p}^{y}(\tau_p-x)\phi_{j_1}(x)dxdydz=$$

$$=\frac{\sqrt{(2j_1+1)(2j_2+1)(2j_3+1)}}{16}\Delta^{5/2}\bar C_{j_3j_2j_1}^{100}, \tag{57}$$

$$C_{j_5j_4j_3j_2j_1}=\int\limits_{\tau_p}^{\tau_{p+1}}\phi_{j_5}(v)\int\limits_{\tau_p}^{v}\phi_{j_4}(u)\int\limits_{\tau_p}^{u}\phi_{j_3}(z)\int\limits_{\tau_p}^{z}\phi_{j_2}(y)\int\limits_{\tau_p}^{y}\phi_{j_1}(x)dxdydzdudv=$$

$$= \frac{\sqrt{(2j_1+1)(2j_2+1)(2j_3+1)(2j_4+1)(2j_5+1)}}{32}\Delta^{5/2}\bar{C}_{j_5j_4j_3j_2j_1}, \tag{58}$$

where

$$\bar{C}^{01}_{j_2j_1} = -\int\limits_{-1}^{1}(1+y)P_{j_2}(y)\int\limits_{-1}^{y}P_{j_1}(x)dxdy,$$

$$\bar{C}^{10}_{j_2j_1} = -\int\limits_{-1}^{1}P_{j_2}(y)\int\limits_{-1}^{y}(1+x)P_{j_1}(x)dxdy,$$

$$\bar{C}_{j_3j_2j_1} = \int\limits_{-1}^{1}P_{j_3}(z)\int\limits_{-1}^{z}P_{j_2}(y)\int\limits_{-1}^{y}P_{j_1}(x)dxdydz, \tag{59}$$

$$\bar{C}_{j_4j_3j_2j_1} = \int\limits_{-1}^{1}P_{j_4}(u)\int\limits_{-1}^{u}P_{j_3}(z)\int\limits_{-1}^{z}P_{j_2}(y)\int\limits_{-1}^{y}P_{j_1}(x)dxdydz, \tag{60}$$

$$\bar{C}^{100}_{j_3j_2j_1} = -\int\limits_{-1}^{1}P_{j_3}(z)\int\limits_{-1}^{z}P_{j_2}(y)\int\limits_{-1}^{y}P_{j_1}(x)(x+1)dxdydz, \tag{61}$$

$$\bar{C}^{010}_{j_3j_2j_1} = -\int\limits_{-1}^{1}P_{j_3}(z)\int\limits_{-1}^{z}P_{j_2}(y)(y+1)\int\limits_{-1}^{y}P_{j_1}(x)dxdydz, \tag{62}$$

$$\bar{C}^{001}_{j_3j_2j_1} = -\int\limits_{-1}^{1}P_{j_3}(z)(z+1)\int\limits_{-1}^{z}P_{j_2}(y)\int\limits_{-1}^{y}P_{j_1}(x)dxdydz, \tag{63}$$

$$\bar{C}_{j_5j_4j_3j_2j_1} = \int\limits_{-1}^{1}P_{j_5}(v)\int\limits_{-1}^{v}P_{j_4}(u)\int\limits_{-1}^{u}P_{j_3}(z)\int\limits_{-1}^{z}P_{j_2}(y)\int\limits_{-1}^{y}P_{j_1}(x)dxdydzdudv, \tag{64}$$

where $P_i(x)$ $(i=0,1,2,\ldots)$ is the Legendre polynomial and

$$\phi_i(x) = \sqrt{\frac{2i+1}{\Delta}}P_i\left(\left(x-\tau_p-\frac{\Delta}{2}\right)\frac{2}{\Delta}\right), \quad i=0,1,2,\ldots$$

The Fourier–Legendre coefficients

$$\bar{C}^{01}_{j_2j_1},\ \bar{C}^{10}_{j_2j_1},\ \bar{C}_{j_3j_2j_1},\ \bar{C}_{j_4j_3j_2j_1},\ \bar{C}^{001}_{j_3j_2j_1},\ \bar{C}^{010}_{j_3j_2j_1},\ \bar{C}^{100}_{j_3j_2j_1},\ \bar{C}_{j_5j_4j_3j_2j_1} \tag{65}$$

can be calculated exactly before start of the numerical method (4). The above calculation can be done with Python, Derive or Maple. In [10], [12]-[24], [41] several tables with these coefficients can be found. Moreover, in [51], [52] the database with 270,000 exactly calculated Fourier–Legendre coefficients (including (65)) was described. This database was used in the software package, which is written in the Python programming language for the implementation of high-order strong numerical schemes for Ito SDEs with non-commutative noise [51], [52]. Note that the mentioned Fourier–Legendre coefficients do not depend on the step of integration $\tau_{p+1}-\tau_p$ of the numerical scheme, which can be not a constant in a general case.

On the basis of the presented expansions (see (39)–(52)) of iterated Stratonovich stochastic integrals we can see that increasing of multiplicities of these integrals or degree indexes of their weight functions leads to increasing of smallness orders with respect to Δ in the mean-square sense for iterated stochastic integrals. This leads to a sharp decrease of member quantities (the numbers q) in expansions of iterated Stratonovich stochastic integrals, which are required for achieving the acceptable accuracy of approximation. Generally speaking, the minimal values q that guarantee the condition (6) for each approximation (39)–(52) are various and abruptly decreasing with the growth of smallness orders with respect to Δ in the mean-square sense for iterated stochastic integrals.

Consider in detail the question on calculation and estimation of the mean-square approximation error for the iterated Stratonovich stochastic integrals (5) (see [15], Chapter 5 for details).

Let us consider the following iterated Ito stochastic integrals

$$I_{(l_1\ldots l_k)T,t}^{(i_1\ldots i_k)}=\int\limits_t^T(t-t_k)^{l_k}\ldots\int\limits_t^{t_2}(t-t_1)^{l_1}d\mathbf{f}_{t_1}^{(i_1)}\ldots d\mathbf{f}_{t_k}^{(i_k)},$$

where $i_1,\ldots,i_k=1,\ldots,m,\ \ l_1,\ldots,l_k=0,1,2,\ \ k=1,2,\ldots,5.$

According to the standard relations between iterated Ito and Stratonovich stochastic integrals, we obtain w. p. 1 (with probability 1)

$$I_{(00)\tau_{p+1},\tau_p}^{(i_1i_2)}=I_{(00)\tau_{p+1},\tau_p}^{*(i_1i_2)}-\frac{1}{2}\mathbf{1}_{\{i_1=i_2\}}\Delta,$$

$$I_{(10)\tau_{p+1},\tau_p}^{(i_1i_2)}=I_{(10)\tau_{p+1},\tau_p}^{*(i_1i_2)}+\frac{1}{4}\mathbf{1}_{\{i_1=i_2\}}\Delta^2,$$

$$I_{(01)\tau_{p+1},\tau_p}^{(i_1i_2)}=I_{(01)\tau_{p+1},\tau_p}^{*(i_1i_2)}+\frac{1}{4}\mathbf{1}_{\{i_1=i_2\}}\Delta^2.$$

Moreover, the mean-square approximation error for the iterated Ito stochastic integral

$$I_{(00)\tau_{p+1},\tau_p}^{(i_1i_2)}\quad (i_1\ne i_2)$$

equals to the mean-square approximation error for the iterated Stratonovich stochastic integral (see [15], Sect. 5.1 for details)

$$I_{(00)\tau_{p+1},\tau_p}^{*(i_1i_2)}\quad (i_1\ne i_2).$$

From Theorem 3 we obtain [10]-[32], [37]-[50]

$$
\mathsf{M}\left\{\left(I_{(00)\tau_{p+1},\tau_p}^{(i_1 i_2)}-I_{(00)\tau_{p+1},\tau_p}^{(i_1 i_2)q}\right)^2\right\}=\frac{\Delta^2}{2}\left(\frac{1}{2}-\sum_{i=1}^{q}\frac{1}{4i^2-1}\right)\quad (i_1\ne i_2), \tag{66}
$$

$$
\mathsf{M}\left\{\left(I_{(10)\tau_{p+1},\tau_p}^{(i_1 i_2)}-I_{(10)\tau_{p+1},\tau_p}^{(i_1 i_2)q}\right)^2\right\}=\mathsf{M}\left\{\left(I_{(01)\tau_{p+1},\tau_p}^{(i_1 i_2)}-I_{(01)\tau_{p+1},\tau_p}^{(i_1 i_2)q}\right)^2\right\}=
$$

$$
=\frac{\Delta^4}{16}\left(\frac{5}{9}-2\sum_{i=2}^{q}\frac{1}{4i^2-1}-\sum_{i=1}^{q}\frac{1}{(2i-1)^2(2i+3)^2}-\right.
$$

$$
\left.-\sum_{i=0}^{q}\frac{(i+2)^2+(i+1)^2}{(2i+1)(2i+5)(2i+3)^2}\right)\quad (i_1\ne i_2). \tag{67}
$$

The case $i_1=i_2$ is considered in [15], Sect. 5.1.

Let us estimate the mean-square approximation error for the iterated Stratonovich stochastic integrals (5) of multiplicities $k\ge 3$. From (66) $(i_1\ne i_2)$ we get

$$
\mathsf{M}\left\{\left(I_{(00)\tau_{p+1},\tau_p}^{*(i_1 i_2)}-I_{(00)\tau_{p+1},\tau_p}^{*(i_1 i_2)q}\right)^2\right\}=\frac{\Delta^2}{2}\sum_{i=q+1}^{\infty}\frac{1}{4i^2-1}\le
$$

$$
\le\frac{\Delta^2}{2}\int\limits_q^{\infty}\frac{1}{4x^2-1}dx=-\frac{\Delta^2}{8}\ln\left|1-\frac{2}{2q+1}\right|\le C_1\frac{\Delta^2}{q}, \tag{68}
$$

where constant C_1 does not depend on Δ.

As was mentioned above, the value Δ plays the role of integration step in the numerical procedures for Ito SDEs. Then this value is a sufficiently small. Keeping in mind this circumstance, it is easy to notice that there exists such a constant C_2 that

$$
\mathsf{M}\left\{\left(I_{(l_1\ldots l_k)\tau_{p+1},\tau_p}^{*(i_1\ldots i_k)}-I_{(l_1\ldots l_k)\tau_{p+1},\tau_p}^{*(i_1\ldots i_k)q}\right)^2\right\}\le C_2\mathsf{M}\left\{\left(I_{(00)\tau_{p+1},\tau_p}^{*(i_1 i_2)}-I_{(00)\tau_{p+1},\tau_p}^{*(i_1 i_2)q}\right)^2\right\}, \tag{69}
$$

where $I_{(l_1\ldots l_k)\tau_{p+1},\tau_p}^{*(i_1\ldots i_k)q}$ is the approximation of the iterated Stratonovich stochastic integral (5) for $k\ge 3$.

From (68) and (69) we finally have

$$
\mathsf{M}\left\{\left(I_{(l_1\ldots l_k)\tau_{p+1},\tau_p}^{*(i_1\ldots i_k)}-I_{(l_1\ldots l_k)\tau_{p+1},\tau_p}^{*(i_1\ldots i_k)q}\right)^2\right\}\le K\frac{\Delta^2}{q}, \tag{70}
$$

where constant K does not depend on Δ.

The same idea can be found in [2] for the case of trigonometric functions. Note that, in contrast to the estimate (70), the constant C in Theorems 7–9 does not depend on q.

Essentially more information about numbers q can be obtained by another approach. We have

$$I^{*(i_1\ldots i_k)}_{(l_1\ldots l_k)\tau_{p+1},\tau_p}=I^{(i_1\ldots i_k)}_{(l_1\ldots l_k)\tau_{p+1},\tau_p}\quad \text{w. p. 1}$$

for pairwise different $i_1,\ldots,i_k=1,\ldots,m$.

Then, for pairwise different $i_1,\ldots,i_5=1,\ldots,m$ from ([24]) we obtain

$$\mathsf{M}\left\{\left(I^{*(i_1i_2)}_{(01)\tau_{p+1},\tau_p}-I^{*(i_1i_2)q}_{(01)\tau_{p+1},\tau_p}\right)^2\right\}=\frac{\Delta^4}{4}-\sum_{j_1,j_2=0}^{q}\left(C^{01}_{j_2j_1}\right)^2,$$

$$\mathsf{M}\left\{\left(I^{*(i_1i_2)}_{(10)\tau_{p+1},\tau_p}-I^{*(i_1i_2)q}_{(10)\tau_{p+1},\tau_p}\right)^2\right\}=\frac{\Delta^4}{12}-\sum_{j_1,j_2=0}^{q}\left(C^{10}_{j_2j_1}\right)^2,$$

$$\mathsf{M}\left\{\left(I^{*(i_1i_2i_3)}_{(000)\tau_{p+1},\tau_p}-I^{*(i_1i_2i_3)q}_{(000)\tau_{p+1},\tau_p}\right)^2\right\}=\frac{\Delta^3}{6}-\sum_{j_3,j_2,j_1=0}^{q}C^2_{j_3j_2j_1},$$

$$\mathsf{M}\left\{\left(I^{*(i_1i_2i_3i_4)}_{(0000)\tau_{p+1},\tau_p}-I^{*(i_1i_2i_3i_4)q}_{(0000)\tau_{p+1},\tau_p}\right)^2\right\}=\frac{\Delta^4}{24}-\sum_{j_1,j_2,j_3,j_4=0}^{q}C^2_{j_4j_3j_2j_1},$$

$$\mathsf{M}\left\{\left(I^{*(i_1i_2i_3)}_{(100)\tau_{p+1},\tau_p}-I^{*(i_1i_2i_3)q}_{(100)\tau_{p+1},\tau_p}\right)^2\right\}=\frac{\Delta^5}{60}-\sum_{j_1,j_2,j_3=0}^{q}\left(C^{100}_{j_3j_2j_1}\right)^2,$$

$$\mathsf{M}\left\{\left(I^{*(i_1i_2i_3)}_{(010)\tau_{p+1},\tau_p}-I^{*(i_1i_2i_3)q}_{(010)\tau_{p+1},\tau_p}\right)^2\right\}=\frac{\Delta^5}{20}-\sum_{j_1,j_2,j_3=0}^{q}\left(C^{010}_{j_3j_2j_1}\right)^2,$$

$$\mathsf{M}\left\{\left(I^{*(i_1i_2i_3)}_{(001)\tau_{p+1},\tau_p}-I^{*(i_1i_2i_3)q}_{(001)\tau_{p+1},\tau_p}\right)^2\right\}=\frac{\Delta^5}{10}-\sum_{j_1,j_2,j_3=0}^{q}\left(C^{001}_{j_3j_2j_1}\right)^2,$$

$$\mathsf{M}\left\{\left(I^{*(i_1i_2i_3i_4i_5)}_{(00000)\tau_{p+1},\tau_p}-I^{*(i_1i_2i_3i_4i_5)q}_{(00000)\tau_{p+1},\tau_p}\right)^2\right\}=\frac{\Delta^5}{120}-\sum_{j_1,j_2,j_3,j_4,j_5=0}^{q}C^2_{j_5i_4i_3i_2j_1}.$$

For example [10]-[24],

$$\mathsf{M}\left\{\left(I^{*(i_1i_2i_3)}_{(000)\tau_{p+1},\tau_p}-I^{*(i_1i_2i_3)6}_{(000)\tau_{p+1},\tau_p}\right)^2\right\}=\frac{\Delta^3}{6}-\sum_{j_3,j_2,j_1=0}^{6}C^2_{j_3j_2j_1}\approx 0.01956000\Delta^3,$$

$$\mathsf{M}\left\{\left(I^{*(i_1i_2i_3)}_{(100)\tau_{p+1},\tau_p}-I^{*(i_1i_2i_3)2}_{(100)\tau_{p+1},\tau_p}\right)^2\right\}=\frac{\Delta^5}{60}-\sum_{j_1,j_2,j_3=0}^{2}\left(C^{100}_{j_3j_2j_1}\right)^2\approx 0.00815429\Delta^5,$$

$$\mathsf{M}\left\{\left(I^{*(i_1i_2i_3)}_{(010)\tau_{p+1},\tau_p}-I^{*(i_1i_2i_3)2}_{(010)\tau_{p+1},\tau_p}\right)^2\right\}=\frac{\Delta^5}{20}-\sum_{j_1,j_2,j_3=0}^{2}\left(C^{010}_{j_3j_2j_1}\right)^2\approx 0.01739030\Delta^5,$$

$$\mathsf{M}\left\{\left(I_{(001)\tau_{p+1},\tau_p}^{*(i_1 i_2 i_3)}-I_{(001)\tau_{p+1},\tau_p}^{*(i_1 i_2 i_3)2}\right)^2\right\}=\frac{\Delta^5}{10}-\sum_{j_1,j_2,j_3=0}^{2}\left(C_{j_3 j_2 j_1}^{001}\right)^2\approx 0.02528010\Delta^5,$$

$$\mathsf{M}\left\{\left(I_{(0000)\tau_{p+1},\tau_p}^{*(i_1 i_2 i_3 i_4)}-I_{(0000)\tau_{p+1},\tau_p}^{*(i_1 i_2 i_3 i_4)2}\right)^2\right\}=\frac{\Delta^4}{24}-\sum_{j_1,j_2,j_3,j_4=0}^{2}C_{j_4 j_3 j_2 j_1}^2\approx 0.02360840\Delta^4,$$

$$\mathsf{M}\left\{\left(I_{(00000)\tau_{p+1},\tau_p}^{*(i_1 i_2 i_3 i_4 i_5)}-I_{(00000)\tau_{p+1},\tau_p}^{*(i_1 i_2 i_3 i_4 i_5)1}\right)^2\right\}=\frac{\Delta^5}{120}-\sum_{j_1,j_2,j_3,j_4,j_5=0}^{1}C_{j_5 i_4 i_3 i_2 j_1}^2\approx 0.00759105\Delta^5.$$

EXPLICIT ONE-STEP STRONG NUMERICAL METHODS OF ORDERS 2.0 AND 2.5 FOR ITO STOCHASTIC DIFFERENTIAL EQUATIONS BASED ON THE UNIFIED TAYLOR–ITO AND TAYLOR–STRATONOVICH EXPANSIONS

DMITRIY F. KUZNETSOV

Abstract. The article is devoted to the construction of explicit one-step strong numerical methods with the orders 2.0 and 2.5 of convergence for Ito stochastic differential equations with multidimensional non-commutative noise. We consider numerical methods based on the unified Taylor–Ito and Taylor–Stratonovich expansions. For the numerical modeling of iterated Ito and Stratonovich stochastic integrals of multiplicities 1 to 5 we apply the method of multiple Fourier–Legendre series converging in the sense of norm in Hilbert space $L_2([t,T]^k)$, $k=1,\ldots,5$. The article is addressed to engineers who use numerical modeling in stochastic control and for solving the non-linear filtering problem. The article will be interesting to scientists who working in the field of numerical integration of stochastic differential equations.

Contents

Mathematics Subject Classification: 60H05, 60H10, 42B05, 42C10.

Keywords: Explicit one-step strong numerical method, Ito stochastic differential equation, Iterated Ito stochastic integral, Iterated Stratonovich stochastic integral, Generalized multiple Fourier series, Multiple Fourier–Legendre series, Strong convergence, Mean-square convergence, Approximation, Expansion.

1. Introduction

Let $(\Omega, \mathrm{F}, \mathsf{P})$ be a complete probability space, let $\{\mathrm{F}_t, t \in [0,T]\}$ be a nondecreasing right-continous family of σ-subfields of F, and let $\mathbf{f}_t$ be a standard m-dimensional Wiener stochastic process, which is F_t-measurable for any $t \in [0,T]$. We assume that the components $\mathbf{f}_t^{(i)}$ $(i = 1,\ldots,m)$ of this process are independent. Consider an Ito stochastic differential equation in the integral form

$$\mathbf{x}_t = \mathbf{x}_0 + \int\limits_0^t \mathbf{a}(\mathbf{x}_\tau,\tau)d\tau + \int\limits_0^t B(\mathbf{x}_\tau,\tau)d\mathbf{f}_\tau, \quad \mathbf{x}_0 = \mathbf{x}(0,\omega). \tag{1}$$

Here $\mathbf{x}_t$ is some n-dimensional stochastic process satisfying the equation (1). The nonrandom functions $\mathbf{a} : \mathbb{R}^n \times [0,T] \to \mathbb{R}^n$, $B : \mathbb{R}^n \times [0,T] \to \mathbb{R}^{n\times m}$ guarantee the existence and uniqueness up to stochastic equivalence of a solution of the equation (1) [1]. The second integral on the right-hand side of (1) is interpreted as the Ito stochastic integral. Let $\mathbf{x}_0$ be an n-dimensional random variable, which is F_0-measurable and $\mathsf{M}\{|\mathbf{x}_0|^2\} < \infty$ (M denotes a mathematical expectation). We assume that $\mathbf{x}_0$ and $\mathbf{f}_t - \mathbf{f}_0$ are independent when $t > 0$.

It is well known [2]-[4] that Ito stochastic differential equations are adequate mathematical models of dynamic systems under the influence of random disturbances. One of the effective approaches to numerical integration of Ito stochastic differential equations is an approach based on the Taylor–Ito and Taylor–Stratonovich expansions [2]-[10]. The most important feature of such expansions is a presence in them of the so-called iterated Ito and Stratonovich stochastic integrals, which play the key role for solving the problem of numerical integration of Ito stochastic differential equations and have the following form

$$J[\psi^{(k)}]_{T,t} = \int\limits_t^T \psi_k(t_k)\ldots\int\limits_t^{t_2}\psi_1(t_1)d\mathbf{w}_{t_1}^{(i_1)}\ldots d\mathbf{w}_{t_k}^{(i_k)}, \tag{2}$$

$$J^*[\psi^{(k)}]_{T,t} = \int\limits_t^{*T} \psi_k(t_k)\ldots\int\limits_t^{*t_2}\psi_1(t_1)d\mathbf{w}_{t_1}^{(i_1)}\ldots d\mathbf{w}_{t_k}^{(i_k)}, \tag{3}$$

where every $\psi_l(\tau)$ $(l = 1,\ldots,k)$ is a non-random function on $[t,T]$, $\mathbf{w}_\tau^{(i)} = \mathbf{f}_\tau^{(i)}$ for $i = 1,\ldots,m$ and $\mathbf{w}_\tau^{(0)} = \tau$, $i_1,\ldots,i_k = 0,1,\ldots,m$,

$$\int \text{ and } \int\limits^{*}$$

denote Ito and Stratonovich stochastic integrals, respectively (in this paper, we use the definition of the Stratonovich stochastic integral from [2]).

Note that $\psi_l(\tau) \equiv 1$ $(l = 1,\ldots,k)$ and $i_1,\ldots,i_k = 0,1,\ldots,m$ in [2]-[7]. At the same time $\psi_l(\tau) \equiv (t-\tau)^{q_l}$ $(l = 1,\ldots,k;\ q_1,\ldots,q_k = 0,1,2,\ldots)$ and $i_1,\ldots,i_k = 1,\ldots,m$ in [8]-[10].

We want to mention in short that there are two main criteria of numerical methods convergence for Ito stochastic differential equations: a strong or mean-square criterion and a weak criterion, where the subject of approximation is not the solution of Ito stochastic differential equation, simply stated, but the distribution of Ito stochastic differential equation solution [2]. Both of the above criteria are independent, that is, generally speaking, the fulfillment of a strong criterion does not imply the fulfillment of a weak criterion, and vice versa. Each of two convergence criteria is oriented on solution of specific classes of mathematical problems connected with stochastic differential equations.

Using the strong numerical methods, we may build sample pathes of Ito stochastic differential equation numerically. These methods require the combined mean-square approximation of collections of iterated Ito and Stratonovich stochastic integrals. Effective solution of this problem composes one of the subjects of this article.

The strong numerical methods are used for constructing new mathematical models on the basis of Ito stochastic differential equations and also for solving some mathematical problems connected with Ito stochastic differential equations. Among this problems we mention the following: signal filtering under the influence of random disturbances in various statements, stochastic optimal control, testing estimation procedures of parameters of stochastic systems [2].

2. Explicit One-Step Strong Numerical Schemes of Orders 2.0 and 2.5 Based on the Unified Taylor–Ito expansion

Consider the partition $\{\tau_j\}_{j=0}^N$ of the interval $[0,T]$ such that

$$0=\tau_0<\ldots<\tau_N=T,\quad \Delta_N=\max_{0\le j\le N-1}\Delta\tau_j,\quad \Delta\tau_j=\tau_{j+1}-\tau_j.$$

Let $\mathbf{y}_{\tau_j}\stackrel{\sf def}{=}\mathbf{y}_j,\ j=0,1,\ldots,N$ be a time discrete approximation of the process $\mathbf{x}_t,\ t\in[0,T]$, which is a solution of the Ito stochastic differential equation (1).

Definiton 1 [2]. *We will say that a time discrete approximation* $\mathbf{y}_j,\ j=0,1,\ldots,N$, *corresponding to the maximal step of discretization* Δ_N, *converges strongly with order* $\gamma>0$ *at time moment* T *to the process* $\mathbf{x}_t,\ t\in[0,T]$, *if there exists a constant* $C>0$, *which does not depend on* Δ_N, *and a* $\delta>0$ *such that*

$$\mathsf{M}\{|\mathbf{x}_T-\mathbf{y}_T|\}\le C(\Delta_N)^{\gamma}$$

for each $\Delta_N\in(0,\delta)$.

Consider the explicit one-step strong numerical scheme of order 2.5 based on the so-called unified Taylor–Ito expansion [11], [14]-[22]

$$\mathbf{y}_{p+1}=\mathbf{y}_p+\sum_{i_1=1}^m B_{i_1}\hat I_{(0)\tau_{p+1},\tau_p}^{(i_1)}+\Delta\mathbf{a}+\sum_{i_1,i_2=1}^m G_{i_2}B_{i_1}\hat I_{(00)\tau_{p+1},\tau_p}^{(i_2 i_1)}+$$

$$+\sum_{i_1=1}^m\left(G_{i_1}\mathbf{a}\left(\Delta\hat I_{(0)\tau_{p+1},\tau_p}^{(i_1)}+\hat I_{(1)\tau_{p+1},\tau_p}^{(i_1)}\right)-LB_{i_1}\hat I_{(1)\tau_{p+1},\tau_p}^{(i_1)}\right)+$$

$$+\sum_{i_1,i_2,i_3=1}^m G_{i_3}G_{i_2}B_{i_1}\hat I_{(000)\tau_{p+1},\tau_p}^{(i_3 i_2 i_1)}+\frac{\Delta^2}{2}L\mathbf{a}+$$

$$+\sum_{i_1,i_2=1}^m\left(G_{i_2}LB_{i_1}\left(\hat I_{(10)\tau_{p+1},\tau_p}^{(i_2 i_1)}-\hat I_{(01)\tau_{p+1},\tau_p}^{(i_2 i_1)}\right)-LG_{i_2}B_{i_1}\hat I_{(10)\tau_{p+1},\tau_p}^{(i_2 i_1)}+\right.$$

$$\left.+G_{i_2}G_{i_1}\mathbf{a}\left(\hat I_{(01)\tau_{p+1},\tau_p}^{(i_2 i_1)}+\Delta\hat I_{(00)\tau_{p+1},\tau_p}^{(i_2 i_1)}\right)\right)+$$

$$+\sum_{i_1,i_2,i_3,i_4=1}^{m} G_{i_4}G_{i_3}G_{i_2}B_{i_1}\hat{I}^{(i_4 i_3 i_2 i_1)}_{(0000)\tau_{p+1},\tau_p}+\frac{\Delta^3}{6}LL\mathbf{a}+$$

$$+\sum_{i_1=1}^{m}\Biggl(G_{i_1}L\mathbf{a}\left(\frac{1}{2}\hat{I}^{(i_1)}_{(2)\tau_{p+1},\tau_p}+\Delta\hat{I}^{(i_1)}_{(1)\tau_{p+1},\tau_p}+\frac{\Delta^2}{2}\hat{I}^{(i_1)}_{(0)\tau_{p+1},\tau_p}\right)+$$

$$+\frac{1}{2}LLB_{i_1}\hat{I}^{(i_1)}_{(2)\tau_{p+1},\tau_p}-LG_{i_1}\mathbf{a}\left(\hat{I}^{(i_1)}_{(2)\tau_{p+1},\tau_p}+\Delta\hat{I}^{(i_1)}_{(1)\tau_{p+1},\tau_p}\right)\Biggr)+$$

$$+\sum_{i_1,i_2,i_3=1}^{m}\Biggl(G_{i_3}LG_{i_2}B_{i_1}\left(\hat{I}^{(i_3 i_2 i_1)}_{(100)\tau_{p+1},\tau_p}-\hat{I}^{(i_3 i_2 i_1)}_{(010)\tau_{p+1},\tau_p}\right)+$$

$$+G_{i_3}G_{i_2}LB_{i_1}\left(\hat{I}^{(i_3 i_2 i_1)}_{(010)\tau_{p+1},\tau_p}-\hat{I}^{(i_3 i_2 i_1)}_{(001)\tau_{p+1},\tau_p}\right)+$$

$$+G_{i_3}G_{i_2}G_{i_1}\mathbf{a}\left(\Delta\hat{I}^{(i_3 i_2 i_1)}_{(000)\tau_{p+1},\tau_p}+\hat{I}^{(i_3 i_2 i_1)}_{(001)\tau_{p+1},\tau_p}\right)-$$

$$-LG_{i_3}G_{i_2}B_{i_1}\hat{I}^{(i_3 i_2 i_1)}_{(100)\tau_{p+1},\tau_p}\Biggr)+$$

$$+\sum_{i_1,i_2,i_3,i_4,i_5=1}^{m} G_{i_5}G_{i_4}G_{i_3}G_{i_2}B_{i_1}\hat{I}^{(i_5 i_4 i_3 i_2 i_1)}_{(00000)\tau_{p+1},\tau_p}, \tag{4}$$

where $\Delta = T/N$ $(N > 1)$ is a constant (for simplicity) integration step, $\tau_p = p\Delta$ $(p = 0, 1, \ldots, N)$, $\hat{I}^{(i_1\ldots i_k)}_{(l_1\ldots l_k)s,t}$ denotes an approximation of the iterated Ito stochastic integral of multiplicity k

$$I^{(i_1\ldots i_k)}_{(l_1\ldots l_k)s,t}=\int\limits_t^s (t-\tau_k)^{l_k}\ldots\int\limits_t^{\tau_2}(t-\tau_1)^{l_1}d\mathbf{f}^{(i_1)}_{\tau_1}\ldots d\mathbf{f}^{(i_k)}_{\tau_k}, \tag{5}$$

$$L=\frac{\partial}{\partial t}+\sum_{i=1}^{n}\mathbf{a}_i(\mathbf{x},t)\frac{\partial}{\partial \mathbf{x}_i}+\frac{1}{2}\sum_{j=1}^{m}\sum_{l,i=1}^{n}B_{lj}(\mathbf{x},t)B_{ij}(\mathbf{x},t)\frac{\partial^2}{\partial\mathbf{x}_l\partial\mathbf{x}_i},$$

$$G_i=\sum_{j=1}^{n}B_{ji}(\mathbf{x},t)\frac{\partial}{\partial\mathbf{x}_j},\quad i=1,\ldots,m,$$

$l_1,\ldots,l_k = 0, 1, 2,$ $i_1,\ldots,i_k = 1,\ldots,m,$ $k = 1, 2,\ldots,5,$ B_i and B_{ij} are the ith column and the ijth component of the matrix function B, $\mathbf{a}_i$ is the ith component of the vector function $\mathbf{a}$, $\mathbf{x}_i$ is the ith component of the column $\mathbf{x}$, the functions

$$B_{i_1},\ \mathbf{a},\ G_{i_2}B_{i_1},\ G_{i_1}\mathbf{a},\ LB_{i_1},\ G_{i_3}G_{i_2}B_{i_1},\ L\mathbf{a},\ LL\mathbf{a},\ G_{i_2}LB_{i_1},$$

$$LG_{i_2}B_{i_1},\ G_{i_2}G_{i_1}\mathbf{a},\ G_{i_4}G_{i_3}G_{i_2}B_{i_1},\ G_{i_1}L\mathbf{a},\ LLB_{i_1},\ LG_{i_1}\mathbf{a},\ G_{i_3}LG_{i_2}B_{i_1},\ G_{i_3}G_{i_2}LB_{i_1},$$

$$G_{i_3}G_{i_2}G_{i_1}\mathbf{a},\ LG_{i_3}G_{i_2}B_{i_1},\ G_{i_5}G_{i_4}G_{i_3}G_{i_2}B_{i_1}$$

are calculated at the point $(\mathbf{y}_p, p)$.

Under the standard conditions [2], [11] the numerical scheme (4) has strong order 2.5 of convergence. The major emphasis below will be placed on the approximation of the iterated Ito stochastic integrals appearing in (4). Therefore, among the mentioned conditions, we note only the approximation condition for iterated Ito stochastic integrals [2], [11], which has the form

$$\mathsf{M}\left\{\left(I_{(l_1\ldots l_k)\tau_{p+1},\tau_p}^{(i_1\ldots i_k)}-\hat{I}_{(l_1\ldots l_k)\tau_{p+1},\tau_p}^{(i_1\ldots i_k)}\right)^2\right\}\le C\Delta^6, \tag{6}$$

where constant C is independent of Δ.

Note that if we exclude from (4) the terms starting from the term $\Delta^3 LL\mathbf{a}/6$, then we will have the explicit one-step strong numerical scheme of order 2.0 [2], [11], [14]-[22].

Using the numerical scheme (4) or its modifications based on the Taylor–Ito expansion [7], the implicit or multistep analogues of (4) can be constructed [2], [11], [14]-[22]. The set of the iterated Ito stochastic integrals to be approximated for implementing these modifications is the same as for the numerical scheme (4) itself. Interestingly, the truncated unified Taylor–Ito expansion (the foundation of the numerical scheme (4)) contains 12 different types of iterated Ito stochastic integrals of the form (5), which cannot be interconnected by linear relations [11], [14]-[22]. The analogous Taylor–Ito expansion [2], [7] contains 17 different types of iterated Ito stochastic integrals, part of which are interconnected by linear relations and part of which have a higher multiplicity than the iterated Ito stochastic integrals (5). This fact well explains the use of the numerical scheme (4).

One of the main problems arising in the implementation of the numerical scheme (4) is the joint numerical modeling of the iterated Ito stochastic integrals figuring in (4). In the subsequent sections, we will consider an efficient numerical modeling method for the iterated Ito stochastic integrals and also demonstrate which stochastic integrals (Ito or Stratonovich) are preferable for numerical modeling with a correct estimation of the mean-square approximation error.

3. Method of Numerical Modeling for Iterated Ito Stochastic Integrals Based on Genegalized Multiple Fourier Series. Direct Approach

An efficient numerical modeling method for the iterated Ito stochastic integrals (2) based on generalized multiple Fourier series was proposed in [11] (2006); also see [12]-[57]. This method rests on an important result presented below.

Suppose that every $\psi_l(\tau)$ $(l=1,\ldots,k)$ is a non-random function from the space $L_2([t,T])$. Define the following function on the hypercube $[t,T]^k$

$$K(t_1,\ldots,t_k)=\begin{cases}\psi_1(t_1)\ldots\psi_k(t_k) & \text{for}\ \ t_1<\ldots<t_k\\ \\ 0 & \text{otherwise}\end{cases},\qquad t_1,\ldots,t_k\in[t,T],\qquad k\ge 2, \tag{7}$$

and $K(t_1)\equiv\psi_1(t_1)$ for $t_1\in[t,T]$.

Suppose that $\{\phi_j(x)\}_{j=0}^{\infty}$ is a complete orthonormal system of functions in the space $L_2([t,T])$. The function $K(t_1,\ldots,t_k)$ belongs to the space $L_2([t,T]^k)$. At this situation it is well known that the generalized multiple Fourier series of $K(t_1,\ldots,t_k)\in L_2([t,T]^k)$ is converging to $K(t_1,\ldots,t_k)$ in the hypercube $[t,T]^k$ in the mean-square sense, i.e.

$$\lim_{p_1,\ldots,p_k\to\infty}\left\|K(t_1,\ldots,t_k)-\sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k}C_{j_k\ldots j_1}\prod_{l=1}^{k}\phi_{j_l}(t_l)\right\|_{L_2([t,T]^k)}=0,$$

where

$$C_{j_k\ldots j_1}=\int\limits_{[t,T]^k}K(t_1,\ldots,t_k)\prod_{l=1}^{k}\phi_{j_l}(t_l)dt_1\ldots dt_k, \tag{8}$$

$$\|f\|_{L_2([t,T]^k)}=\left(\int\limits_{[t,T]^k}f^2(t_1,\ldots,t_k)dt_1\ldots dt_k\right)^{1/2}.$$

Consider the partition $\{\tau_j\}_{j=0}^{N}$ of $[t,T]$ such that

$$t=\tau_0<\ldots<\tau_N=T,\quad \Delta_N=\max_{0\le j\le N-1}\Delta\tau_j\to 0\ \text{ if }\ N\to\infty,\quad \Delta\tau_j=\tau_{j+1}-\tau_j. \tag{9}$$

Theorem 1 [11]-[33], [38]-[47], [49]-[57]. *Suppose that every $\psi_l(\tau)$ $(l=1,\ldots,k)$ is a continuous non-random function on $[t,T]$ and $\{\phi_j(x)\}_{j=0}^{\infty}$ is a complete orthonormal system of continuous functions in the space $L_2([t,T])$. Then*

$$J[\psi^{(k)}]_{T,t}=\underset{p_1,\ldots,p_k\to\infty}{\text{l.i.m.}}\sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k}C_{j_k\ldots j_1}\Biggl(\prod_{l=1}^{k}\zeta_{j_l}^{(i_l)}-$$

$$-\underset{N\to\infty}{\text{l.i.m.}}\sum_{(l_1,\ldots,l_k)\in\mathrm{G}_k}\phi_{j_1}(\tau_{l_1})\Delta\mathbf{w}_{\tau_{l_1}}^{(i_1)}\ldots\phi_{j_k}(\tau_{l_k})\Delta\mathbf{w}_{\tau_{l_k}}^{(i_k)}\Biggr), \tag{10}$$

where $J[\psi^{(k)}]_{T,t}$ is defined by (2),

$$\mathrm{G}_k=\mathrm{H}_k\backslash\mathrm{L}_k,\quad \mathrm{H}_k=\{(l_1,\ldots,l_k):\ l_1,\ldots,l_k=0,\ 1,\ldots,N-1\},$$

$$\mathrm{L}_k=\{(l_1,\ldots,l_k):\ l_1,\ldots,l_k=0,\ 1,\ldots,N-1;\ l_g\ne l_r\ (g\ne r);\ g,r=1,\ldots,k\},$$

l.i.m. *is a limit in the mean-square sense,* $i_1,\ldots,i_k=0,1,\ldots,m,$

$$\zeta_j^{(i)}=\int\limits_t^T\phi_j(s)d\mathbf{w}_s^{(i)} \tag{11}$$

are independent standard Gaussian random variables for various i or j (if $i\ne 0$), $C_{j_k\ldots j_1}$ is the Fourier coefficient (8), $\Delta\mathbf{w}_{\tau_j}^{(i)}=\mathbf{w}_{\tau_{j+1}}^{(i)}-\mathbf{w}_{\tau_j}^{(i)}$ $(i=0,1,\ldots,m)$, $\{\tau_j\}_{j=0}^{N}$ *is a partition of the interval $[t,T]$, which satisfies the condition* (9).

The convergence in the mean of degree $2n$ $(n\in\mathbb{N})$ [16]-[25] as well as the convergence with probability 1 [16]-[18], [40], [42] are proved for the approximations from Theorem 1.

Moreover, the complete orthonormal systems of Haar and Rademacher–Walsh functions in the space $L_2([t,T])$ can also be applied in Theorem 1 [11]-[25]. The modification of Theorem 1 for complete orthonormal with weigth $r(x)\ge 0$ systems of functions in the space $L_2([t,T])$ can be found in [15]-[18], [50].

In order to evaluate the significance of Theorem 1 for practice we will demonstrate its transformed particular cases for $k=1,\ldots,5$ [11]-[33], [38]-[47], [49]-[57]

$$J[\psi^{(1)}]_{T,t}=\underset{p_1\to\infty}{\text{l.i.m.}}\sum_{j_1=0}^{p_1}C_{j_1}\zeta_{j_1}^{(i_1)}, \tag{12}$$

$$+\mathbf{1}_{\{i_1=i_5\ne 0\}}\mathbf{1}_{\{j_1=j_5\}}\mathbf{1}_{\{i_2=i_4\ne 0\}}\mathbf{1}_{\{j_2=j_4\}}\zeta_{j_3}^{(i_3)}+\mathbf{1}_{\{i_1=i_5\ne 0\}}\mathbf{1}_{\{j_1=j_5\}}\mathbf{1}_{\{i_3=i_4\ne 0\}}\mathbf{1}_{\{j_3=j_4\}}\zeta_{j_2}^{(i_2)}+$$

$$+\mathbf{1}_{\{i_2=i_3\ne 0\}}\mathbf{1}_{\{j_2=j_3\}}\mathbf{1}_{\{i_4=i_5\ne 0\}}\mathbf{1}_{\{j_4=j_5\}}\zeta_{j_1}^{(i_1)}+\mathbf{1}_{\{i_2=i_4\ne 0\}}\mathbf{1}_{\{j_2=j_4\}}\mathbf{1}_{\{i_3=i_5\ne 0\}}\mathbf{1}_{\{j_3=j_5\}}\zeta_{j_1}^{(i_1)}+$$

$$+\mathbf{1}_{\{i_2=i_5\ne 0\}}\mathbf{1}_{\{j_2=j_5\}}\mathbf{1}_{\{i_3=i_4\ne 0\}}\mathbf{1}_{\{j_3=j_4\}}\zeta_{j_1}^{(i_1)}\Biggr), \tag{16}$$

where $\mathbf{1}_A$ is the indicator of the set A.

We will consider the case $i_1,\ldots,i_5=1,\ldots,m$. Obviously, this case corresponds to the numerical method (4).

For further consideration, let us consider the generalization of formulas (12)–(16) for the case of an arbitrary multiplicity k ($k\in\mathbb{N}$) of the iterated Ito stochastic integral $J[\psi^{(k)}]_{T,t}$ defined by (2). In order to do this, let us introduce some notations. Consider the unordered set $\{1,2,\ldots,k\}$ and separate it into two parts: the first part consists of r unordered pairs (sequence order of these pairs is also unimportant) and the second one consists of the remaining $k-2r$ numbers. So, we have

$$(\{\underbrace{\{g_1,g_2\},\ldots,\{g_{2r-1},g_{2r}\}}_{\text{part 1}}\},\{\underbrace{q_1,\ldots,q_{k-2r}}_{\text{part 2}}\}), \tag{17}$$

where

$$\{g_1,g_2,\ldots,g_{2r-1},g_{2r},q_1,\ldots,q_{k-2r}\}=\{1,2,\ldots,k\},$$

braces mean an unordered set, and parentheses mean an ordered set.

We will say that (17) is a partition and consider the sum with respect to all possible partitions

$$\sum_{\substack{(\{\{g_1,g_2\},\ldots,\{g_{2r-1},g_{2r}\}\},\{q_1,\ldots,q_{k-2r}\})\\ \{g_1,g_2,\ldots,g_{2r-1},g_{2r},q_1,\ldots,q_{k-2r}\}=\{1,2,\ldots,k\}}} a_{g_1g_2,\ldots,g_{2r-1}g_{2r},q_1\ldots q_{k-2r}}. \tag{18}$$

Below there are several examples of sums in the form (18)

$$\sum_{\substack{(\{g_1,g_2\})\\ \{g_1,g_2\}=\{1,2\}}} a_{g_1g_2}=a_{12},$$

$$\sum_{\substack{(\{\{g_1,g_2\},\{g_3,g_4\}\})\\ \{g_1,g_2,g_3,g_4\}=\{1,2,3,4\}}} a_{g_1g_2g_3g_4}=a_{1234}+a_{1324}+a_{2314},$$

$$\sum_{\substack{(\{g_1,g_2\},\{q_1,q_2\})\\ \{g_1,g_2,q_1,q_2\}=\{1,2,3,4\}}} a_{g_1g_2,q_1q_2}=$$

$$=a_{12,34}+a_{13,24}+a_{14,23}+a_{23,14}+a_{24,13}+a_{34,12},$$

$$\sum_{\substack{(\{g_1,g_2\},\{q_1,q_2,q_3\})\\ \{g_1,g_2,q_1,q_2,q_3\}=\{1,2,3,4,5\}}} a_{g_1g_2,q_1q_2q_3} =$$

$$= a_{12,345} + a_{13,245} + a_{14,235} + a_{15,234} + a_{23,145} + a_{24,135} +$$
$$+ a_{25,134} + a_{34,125} + a_{35,124} + a_{45,123},$$

$$\sum_{\substack{(\{\{g_1,g_2\},\{g_3,g_4\}\},\{q_1\})\\ \{g_1,g_2,g_3,g_4,q_1\}=\{1,2,3,4,5\}}} a_{g_1g_2,g_3g_4,q_1} =$$

$$= a_{12,34,5} + a_{13,24,5} + a_{14,23,5} + a_{12,35,4} + a_{13,25,4} + a_{15,23,4} +$$
$$+ a_{12,54,3} + a_{15,24,3} + a_{14,25,3} + a_{15,34,2} + a_{13,54,2} + a_{14,53,2} +$$
$$+ a_{52,34,1} + a_{53,24,1} + a_{54,23,1}.$$

Now we can write (10) as

$$J[\psi^{(k)}]_{T,t} = \underset{p_1,\ldots,p_k\to\infty}{\text{l.i.m.}} \sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k} C_{j_k\ldots j_1}\left(\prod_{l=1}^{k}\zeta_{j_l}^{(i_l)} + \sum_{r=1}^{[k/2]}(-1)^r\times\right.$$

$$\left.\times \sum_{\substack{(\{\{g_1,g_2\},\ldots,\{g_{2r-1},g_{2r}\}\},\{q_1,\ldots,q_{k-2r}\})\\ \{g_1,g_2,\ldots,g_{2r-1},g_{2r},q_1,\ldots,q_{k-2r}\}=\{1,2,\ldots,k\}}} \prod_{s=1}^{r}\mathbf{1}_{\{i_{g_{2s-1}}=\ i_{g_{2s}}\neq 0\}}\mathbf{1}_{\{j_{g_{2s-1}}=\ j_{g_{2s}}\}}\prod_{l=1}^{k-2r}\zeta_{j_{q_l}}^{(i_{q_l})}\right), \tag{19}$$

where $[x]$ is an integer part of a real number x; another notations are the same as in Theorem **1**.

In particular, from (19) for $k=5$ we obtain

$$J[\psi^{(5)}]_{T,t} = \underset{p_1,\ldots,p_5\to\infty}{\text{l.i.m.}} \sum_{j_1=0}^{p_1}\ldots\sum_{j_5=0}^{p_5} C_{j_5\ldots j_1}\left(\prod_{l=1}^{5}\zeta_{j_l}^{(i_l)} - \right.$$

$$- \sum_{\substack{(\{g_1,g_2\},\{q_1,q_2,q_3\})\\ \{g_1,g_2,q_1,q_2,q_3\}=\{1,2,3,4,5\}}} \mathbf{1}_{\{i_{g_1}=\ i_{g_2}\neq 0\}}\mathbf{1}_{\{j_{g_1}=\ j_{g_2}\}}\prod_{l=1}^{3}\zeta_{j_{q_l}}^{(i_{q_l})} +$$

$$\left. + \sum_{\substack{(\{\{g_1,g_2\},\{g_3,g_4\}\},\{q_1\})\\ \{g_1,g_2,g_3,g_4,q_1\}=\{1,2,3,4,5\}}} \mathbf{1}_{\{i_{g_1}=\ i_{g_2}\neq 0\}}\mathbf{1}_{\{j_{g_1}=\ j_{g_2}\}}\mathbf{1}_{\{i_{g_3}=\ i_{g_4}\neq 0\}}\mathbf{1}_{\{j_{g_3}=\ j_{g_4}\}}\zeta_{j_{q_1}}^{(i_{q_1})}\right).$$

The last equality obviously agrees with (16).

Let us consider the generalization of Theorem 1 for the case of an arbitrary complete orthonormal systems of functions in the space $L_2([t,T])$ and $\psi_1(\tau),\ldots,\psi_k(\tau)\in L_2([t,T])$.

Theorem 2 [16] (Sect. 1.11), [40] (Sect. 15). *Suppose that* $\psi_1(\tau),\ldots,\psi_k(\tau)\in L_2([t,T])$ *and* $\{\phi_j(x)\}_{j=0}^{\infty}$ *is an arbitrary complete orthonormal system of functions in the space* $L_2([t,T])$. *Then the following expansion*

$$
J[\psi^{(k)}]_{T,t}=\underset{p_1,\ldots,p_k\to\infty}{\text{l.i.m.}}\sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k}C_{j_k\ldots j_1}\Biggl(\prod_{l=1}^{k}\zeta_{j_l}^{(i_l)}+\sum_{r=1}^{[k/2]}(-1)^r\times
$$

$$
\times\sum_{\substack{(\{\{g_1,g_2\},\ldots,\{g_{2r-1},g_{2r}\}\},\{q_1,\ldots,q_{k-2r}\})\\ \{g_1,g_2,\ldots,g_{2r-1},g_{2r},q_1,\ldots,q_{k-2r}\}=\{1,2,\ldots,k\}}}\prod_{s=1}^{r}\mathbf{1}_{\{i_{g_{2s-1}}=\ i_{g_{2s}}\ne 0\}}\mathbf{1}_{\{j_{g_{2s-1}}=\ j_{g_{2s}}\}}\prod_{l=1}^{k-2r}\zeta_{j_{q_l}}^{(i_{q_l})}\Biggr) \tag{20}
$$

converging in the mean-square sense is valid, where $[x]$ *is an integer part of a real number* x; *another notations are the same as in Theorem* 1.

It should be noted that an analogue of Theorem 2 was considered in [59]. Note that we use another notations [16] (Sect. 1.11), [40] (Sect. 15) in comparison with [59]. Moreover, the proof of an analogue of Theorem 2 from [59] is somewhat different from the proof given in [16] (Sect. 1.11), [40] (Sect. 15).

Note that, for the integrals $J[\psi^{(k)}]_{T,t}$ defined by (2), the mean-square approximation error can be exactly calculated and efficiently estimated.

Let $J[\psi^{(k)}]_{T,t}^q$ be the expression on the right-hand side of (20) before passing to the limit for the case $p_1=\ldots=p_k=q$, i.e.

$$
J[\psi^{(k)}]_{T,t}^q=\sum_{j_1,\ldots,j_k=0}^{q}C_{j_k\ldots j_1}\Biggl(\prod_{l=1}^{k}\zeta_{j_l}^{(i_l)}+\sum_{r=1}^{[k/2]}(-1)^r\times
$$

$$
\times\sum_{\substack{(\{\{g_1,g_2\},\ldots,\{g_{2r-1},g_{2r}\}\},\{q_1,\ldots,q_{k-2r}\})\\ \{g_1,g_2,\ldots,g_{2r-1},g_{2r},q_1,\ldots,q_{k-2r}\}=\{1,2,\ldots,k\}}}\prod_{s=1}^{r}\mathbf{1}_{\{i_{g_{2s-1}}=\ i_{g_{2s}}\ne 0\}}\mathbf{1}_{\{j_{g_{2s-1}}=\ j_{g_{2s}}\}}\prod_{l=1}^{k-2r}\zeta_{j_{q_l}}^{(i_{q_l})}\Biggr), \tag{21}
$$

where $[x]$ is an integer part of a real number x; another notations are the same as in Theorems 1, 2.

Let us denote

$$
\mathsf{M}\left\{\left(J[\psi^{(k)}]_{T,t}-J[\psi^{(k)}]_{T,t}^q\right)^2\right\}\stackrel{\text{def}}{=}E_k^q,
$$

$$
\int\limits_{[t,T]^k}K^2(t_1,\ldots,t_k)dt_1\ldots dt_k\stackrel{\text{def}}{=}I_k.
$$

In [14]-[18], [40], [41] it was shown that

$$
E_k^q\le k!\left(I_k-\sum_{j_1,\ldots,j_k=0}^{q}C_{j_k\ldots j_1}^2\right) \tag{22}
$$

for the following two cases:

1. $i_1,\ldots,i_k=1,\ldots,m$ and $T-t\in(0,+\infty)$,
2. $i_1,\ldots,i_k=0,1,\ldots,m$ and $T-t\in(0,1)$.

The value E_k^q can be calculated exactly.

Theorem 3 [16] (Sect. 1.12), [41] (Sect. 6). *Suppose that* $\{\phi_j(x)\}_{j=0}^{\infty}$ *is an arbitrary complete orthonormal system of functions in the space* $L_2([t,T])$ *and* $\psi_1(\tau),\ldots,\psi_k(\tau)\in L_2([t,T])$, $i_1,\ldots,i_k=1,\ldots,m$. *Then*

$$E_k^p = I_k - \sum_{j_1,\ldots,j_k=0}^{p} C_{j_k\ldots j_1}\mathsf{M}\left\{J[\psi^{(k)}]_{T,t}\sum_{(j_1,\ldots,j_k)}\int\limits_t^T\phi_{j_k}(t_k)\ldots\int\limits_t^{t_2}\phi_{j_1}(t_1)d\mathbf{f}_{t_1}^{(i_1)}\ldots d\mathbf{f}_{t_k}^{(i_k)}\right\}, \tag{23}$$

where $i_1,\ldots,i_k=1,\ldots,m$; *the expression*

$$\sum_{(j_1,\ldots,j_k)}$$

means the sum with respect to all possible permutations $(j_1,\ldots,j_k)$. *At the same time if* j_r *swapped with* j_q *in the permutation* $(j_1,\ldots,j_k)$, *then* i_r *swapped with* i_q *in the permutation* $(i_1,\ldots,i_k)$; *another notations are the same as in Theorems* 1, 2.

Note that

$$\mathsf{M}\left\{J[\psi^{(k)}]_{T,t}\int\limits_t^T\phi_{j_k}(t_k)\ldots\int\limits_t^{t_2}\phi_{j_1}(t_1)d\mathbf{f}_{t_1}^{(i_1)}\ldots d\mathbf{f}_{t_k}^{(i_k)}\right\}=C_{j_k\ldots j_1}.$$

Therefore, for the case of pairwise different numbers $i_1,\ldots,i_k$ as well as for the case $i_1=\ldots=i_k$ from Theorem 3 it follows that [15]-[18], [26], [41]

$$E_k^q = I_k - \sum_{j_1,\ldots,j_k=0}^{q} C_{j_k\ldots j_1}^2, \tag{24}$$

$$E_k^q = I_k - \sum_{j_1,\ldots,j_k=0}^{q} C_{j_k\ldots j_1}\left(\sum_{(j_1,\ldots,j_k)} C_{j_k\ldots j_1}\right),$$

where

$$\sum_{(j_1,\ldots,j_k)}$$

is a sum with respect to all possible permutations $(j_1,\ldots,j_k)$.

Consider some examples [15]-[18], [26], [41] of application of Theorem 3 ($i_1,i_2,i_3=1,\ldots,m$)

$$E_2^q = I_2 - \sum_{j_1,j_2=0}^{q} C_{j_2j_1}^2 - \sum_{j_1,j_2=0}^{q} C_{j_2j_1}C_{j_1j_2}\quad (i_1=i_2), \tag{25}$$

$$E_3^q = I_3 - \sum_{j_3,j_2,j_1=0}^{q} C_{j_3j_2j_1}^2 - \sum_{j_3,j_2,j_1=0}^{q} C_{j_3j_1j_2}C_{j_3j_2j_1}\quad (i_1=i_2\neq i_3), \tag{26}$$

$$E_3^q = I_3 - \sum_{j_3,j_2,j_1=0}^{q} C_{j_3j_2j_1}^2 - \sum_{j_3,j_2,j_1=0}^{q} C_{j_2j_3j_1}C_{j_3j_2j_1}\quad (i_1\neq i_2=i_3), \tag{27}$$

$$E_3^q = I_3 - \sum_{j_3,j_2,j_1=0}^{q} C_{j_3j_2j_1}^2 - \sum_{j_3,j_2,j_1=0}^{q} C_{j_3j_2j_1}C_{j_1j_2j_3} \quad (i_1=i_3\ne i_2). \tag{28}$$

The values E_4^q and E_5^q were calculated exaclty for all possible combinations of $i_1,\ldots,i_5=1,\ldots,m$ in [15]-[18], [41].

4. Approximation of Specific Iterated Ito Stochastic Integrals Based on Multiple Fourier–Legendre Series

Consider approximations of the iterated Ito stochastic integrals that appear in the numerical scheme (4) using Theorems 1, 2 for the case of complete orthonormal system of Legendre polynomials in the space $L_2([\tau_p,\tau_{p+1}])$ ($\tau_p=p\Delta$, $N\Delta=T$, $p=0,1,\ldots,N$) [11] (also see [12]-[49], [52]-[54])

$$I_{(0)\tau_{p+1},\tau_p}^{(i_1)} = \sqrt{\Delta}\zeta_0^{(i_1)}, \tag{29}$$

$$I_{(00)\tau_{p+1},\tau_p}^{(i_1i_2)q} = \frac{\Delta}{2}\left(\zeta_0^{(i_1)}\zeta_0^{(i_2)} + \sum_{i=1}^{q}\frac{1}{\sqrt{4i^2-1}}\left(\zeta_{i-1}^{(i_1)}\zeta_i^{(i_2)} - \zeta_i^{(i_1)}\zeta_{i-1}^{(i_2)}\right) - \mathbf{1}_{\{i_1=i_2\}}\right), \tag{30}$$

$$I_{(1)\tau_{p+1},\tau_p}^{(i_1)} = -\frac{\Delta^{3/2}}{2}\left(\zeta_0^{(i_1)} + \frac{1}{\sqrt{3}}\zeta_1^{(i_1)}\right), \tag{31}$$

$$I_{(000)\tau_{p+1},\tau_p}^{(i_1i_2i_3)q} = \sum_{j_1,j_2,j_3=0}^{q} C_{j_3j_2j_1}\Biggl(\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}\zeta_{j_3}^{(i_3)} - \mathbf{1}_{\{i_1=i_2\}}\mathbf{1}_{\{j_1=j_2\}}\zeta_{j_3}^{(i_3)} -$$
$$-\mathbf{1}_{\{i_2=i_3\}}\mathbf{1}_{\{j_2=j_3\}}\zeta_{j_1}^{(i_1)} - \mathbf{1}_{\{i_1=i_3\}}\mathbf{1}_{\{j_1=j_3\}}\zeta_{j_2}^{(i_2)}\Biggr), \tag{32}$$

$$I_{(0000)\tau_{p+1},\tau_p}^{(i_1i_2i_3i_4)q} = \sum_{j_1,j_2,j_3,j_4=0}^{q} C_{j_4j_3j_2j_1}\Biggl(\prod_{l=1}^{4}\zeta_{j_l}^{(i_l)} -$$
