New Theory of the Mean-Square Approximation of Iterated Ito and Stratonovich Stochastic Integrals: Method of Generalized Multiple Fourier Series

Application to Numerical Integration of Ito SDEs and semilinear SPDEs

arXiv.org preprints

11.11.2023

CONTENTS

PREFACE

The book is a collection of 28 articles (arXiv.org), which are devoted to the problem of strong (mean-square) approximation of iterated Ito and Stratonovich stochastic integrals in the context of numerical integration of Ito stochastic differential equations (SDEs) and non-commutative semilinear stochastic partial differential equations (SPDEs) with nonlinear multiplicative trace class noise. The presented monograph open a new direction in researching of iterated stochastic integrals and summarizes the author's research on the mentioned problem carried out in the period 1994–2023 (also see the monograph: Kuznetsov D.F. Strong Approximation of Iterated Ito and Stratonovich Stochastic Integrals. Application to Numerical Solution of Ito SDEs and Semilinear SPDEs. arXiv:2003.14184v46 [math.PR], 2023, 998 pp.).

For the first time we successfully use the generalized multiple Fourier series converging in the sense of norm in Hilbert space $L_2([t,T]^k)$ for the expansion and strong approximation of iterated Ito stochastic integrals of arbitrary multiplicity k, $k \in \mathbb{N}$ (Chapter 1).

This result has been adapted for iterated Stratonovich stochastic integrals of multiplicities 1 to 6 for the Legendre polynomial system and the system of trigonometric functions (Chapter 2) as well as for some other types of iterated stochastic integrals (Chapter 1).

Two theorems on expansions of iterated Stratonovich stochastic integrals of multiplicity k ($k \in \mathbb{N}$) based on generalized iterated Fourier series with the pointwise convergence are formulated and proved (Chapter 2).

The integration order replacement technique for the class of iterated Ito stochastic integrals has been introduced (Chapter 6). This result is generalized for the class of iterated stochastic integrals with respect to martingales.

We derived the exact and approximate expressions for the mean-square approximation error of iterated Ito stochastic integrals of multiplicity k, $k \in \mathbb{N}$ (Chapter 1). Furthermore, we provided a significant practical material (Chapter 3) devoted to the expansions and approximations of specific iterated Ito and Stratonovich stochastic integrals of multiplicities 1 to 6 from the Taylor–Ito and Taylor–Stratonovich expansions (Chapter 4) using the system of Legendre polynomials and the system of trigonometric functions.

The methods formulated in this book have been compared with some existing methods of strong approximation of iterated Ito and Stratonovich stochastic integrals (Chapter 3).

The results of Chapter 1 were applied (Chapter 5) to the approximation of iterated stochastic integrals with respect to the finite-dimensional approximation $\mathbf{W}_t^M$ of the infinite-dimensional Q-Wiener process $\mathbf{W}_t$ (for integrals of arbitrary multiplicity k, $k \in \mathbb{N}$) and to the approximation of iterated stochastic integrals with respect to the infinite-dimensional Q-Wiener process $\mathbf{W}_t$ (for integrals of multiplicities 1 to 3).

Chapter 7 is devoted to the implementation of strong numerical methods with convergence orders 0.5, 1.0, 1.5, 2.0, 2.5, and 3.0 (Chapter 4) for Ito SDEs with multidimensional non-commutative noise based on the unified Taylor–Ito and Taylor–Stratonovich expansions (Chapter 4) and multiple Fourier–Legendre series (Chapter 3). Algorithms for the implementation of these methods are constructed and a package of programs on the Python programming language is presented. An important part of this software package, concerning the mean-square approximation of iterated Ito and Stratonovich stochastic integrals of multiplicities 1 to 6 with respect to components of the multidimensional Wiener process, is based on the method of generalized multiple Fourier series (Chapters 1–3). More precisely, we used the multiple Fourier–Legendre series converging in the sense of norm in Hilbert space $L_2([t,T]^k)$ ($k = 1\ldots,6$) for the mean-square approximation of iterated Ito and Stratonovich stochastic integrals.

The importance of the problem of numerical integration of Ito SDEs and semilinear SPDEs is explained by a wide range of their applications related to the construction of adequate mathematical models of dynamic systems of various physical nature under random disturbances and to the application of these equations for solving various mathematical problems, among which we mention signal filtering in the background of random noise, stochastic optimal control, stochastic stability, evaluating the parameters of stochastic systems, etc.

It is well known that one of the effective and perspective approaches to the numerical integration of Ito SDEs and semilinear SPDEs is an approach based on the stochastic analogues of the Taylor formula for solutions of these equations. This approach uses the finite discretization of temporal variable and performs numerical modeling of solutions of Ito SDEs and semilinear SPDEs in discrete moments of time using stochastic analogues of the Taylor formula.

Speaking about Ito SDEs, note that the most important feature of the mentioned stochastic analogues of the Taylor formula for solutions of Ito SDEs is a presence in them of the so-called iterated Ito and Stratonovich stochastic integrals, which are the functionals of a complex structure with respect to components of the multidimensional Wiener process. These iterated stochastic integrals are subject for study in this book. The mentioned iterated Ito and Stratonovich stochastic integrals are defined by the following formulas

$$\int\limits_t^T \psi_k(t_k)\ldots\int\limits_t^{t_2}\psi_1(t_1)d\mathbf{w}_{t_1}^{(i_1)}\ldots d\mathbf{w}_{t_k}^{(i_k)}\quad \text{(Ito integrals)},$$

$$\int\limits_t^{*T} \psi_k(t_k)\ldots\int\limits_t^{*t_2}\psi_1(t_1)d\mathbf{w}_{t_1}^{(i_1)}\ldots d\mathbf{w}_{t_k}^{(i_k)}\quad \text{(Stratonovich integrals)},$$

where $\psi_l(\tau)$ $(l=1,\ldots,k)$ are nonrandom functions at the interval $[t,T]$ (as a rule, in the applications they are identically equal to 1 or have a binomial form (see Chapter 4)), $\mathbf{w}_\tau$ is a random vector with an $m+1$ components: $\mathbf{w}_\tau^{(i)}=\mathbf{f}_\tau^{(i)}$ for $i=1,\ldots,m$ and $\mathbf{w}_\tau^{(0)}=\tau$, $\mathbf{f}_\tau^{(i)}$ $(i=1,\ldots,m)$ are independent standard Wiener processes, $i_1,\ldots,i_k=0,1,\ldots,m.$

Apparently, one of the first who began the study of such stochastic integrals (the case $k=2$, $m=2$, $\psi_1(\tau),\psi_2(\tau)\equiv 1$, $i_1=1$, $i_2=2$) was Lévy, who introduced the concept of the so-called Lévy stochastic area and studied its properties.

The above iterated stochastic integrals are the specific objects of the theory of stochastic processes. From the one side, nonrandomness of weight functions $\psi_l(\tau)$ $(l=1,\ldots,k)$ is the factor simplifying their structure. From the other side, nonscalarity of the Wiener process $\mathbf{f}_\tau$ with independent components $\mathbf{f}_\tau^{(i)}$ $(i=1,\ldots,m)$ and the fact that the functions $\psi_l(\tau)$ $(l=1,\ldots,k)$ are different for various l $(l=1,\ldots,k)$ are essential complicating factors of the structure of iterated stochastic integrals. Taking into account features mentioned above, we suppose that the systems of iterated Ito and Stratonovich stochastic integrals play the extraordinary and perhaps the key role for solving the problem of numerical integration of Ito SDEs.

A natural question arises: is it possible to construct a numerical scheme for Ito SDE that includes only increments of the Wiener processes $\mathbf{f}_\tau^{(i)}$ $(i=1,\ldots,m)$, but has a higher order of convergence than the Euler method? It is known that this is impossible for $m>1$ in the general case. This fact is called the "Clark–Cameron paradox" and explains the need to use iterated stochastic integrals for constructing high-order numerical methods for Ito SDEs.

We want to mention in short that there are two main criteria of numerical methods convergence for Ito SDEs: a strong or mean-square criterion and a weak criterion where the subject of approximation is not the solution of Ito SDE, simply stated, but the distribution of Ito SDE solution. Both mentioned criteria are independent, i.e. in general it is impossible to state that from the execution of strong criterion follows the execution of weak criterion and vice versa. Each of two convergence criteria is oriented on the solution of specific classes of mathematical problems connected with Ito SDEs.

Numerical integration of Ito SDEs based on the strong convergence criterion of approximation is widely used for the numerical simulation of sample trajectories of solutions to Ito SDEs (which is required for constructing new mathematical models based on such equations and for the numerical solution of different mathematical problems connected with Ito SDEs). Among these problems, we note the following: signal filtering under influence of random noises in various statements (linear Kalman–Bucy filtering, nonlinear optimal filtering, filtering of continuous time Markov chains with a finite space of states, etc.), optimal stochastic control (including incomplete data control), testing of estimation procedures of parameters of stochastic systems, stochastic stability and bifurcations analysis.

Exact solutions of Ito SDEs and semilinear SPDEs are known in rather rare cases. Therefore, the need arises to construct numerical procedures for solving these equations.

The problem of effective jointly numerical modeling (with respect to the mean-square convergence criterion) of iterated Ito or Stratonovich stochastic integrals is very important and difficult from theoretical and computing point of view.

Seems that iterated stochastic integrals may be approximated by multiple integral sums. However, this approach implies the partitioning of the interval $[t, T]$ of integration for iterated stochastic integrals. The length $T-t$ of this interval is already fairly small (because it is a step of integration of numerical methods for Ito SDEs) and does not need to be partitioned. Computational experiments show that the application of numerical simulation for iterated stochastic integrals (in which the interval of integration is partitioned) leads to unacceptably high computational cost and accumulation of computation errors.

The problem of effective decreasing of the mentioned cost (in several times or even in several orders) is very difficult and requires new complex investigations. The only exception is connected with a narrow particular case, when $i_1 = \ldots = i_k \neq 0$ and $\psi_1(\tau), \ldots, \psi_k(\tau) \equiv \psi(\tau)$. This case allows the investigation with using of the Ito formula. In the more general case, when not all numbers $i_1, \ldots, i_k$ are equal, the mentioned problem turns out to be more complex (it cannot be solved using the Ito formula and requires more deep and complex investigation). Note that even for the case $i_1 = \ldots = i_k \neq 0$, but for different functions $\psi_1(\tau), \ldots, \psi_k(\tau)$ the mentioned difficulties persist and simple sets of iterated Ito and Stratonovich stochastic integrals, which can be often met in the applications, cannot be expressed effectively in a finite form (with respect to the mean-square approximation) using the system of standard Gaussian random variables. The Ito formula is also useless in this case and as a result we need to use more complex but effective expansions.

Why the problem of the mean-square approximation of iterated stochastic integrals is so complex?

Firstly, the mentioned stochastic integrals (in the case of fixed limits of integration) are the random variables, whose density functions are unknown in the general case. The exception is connected with the narrow particular case which is the simplest iterated Ito stochastic integral with multiplicity 2 and $\psi_1(\tau), \psi_2(\tau) \equiv 1$; $i_1, i_2 = 1, \ldots, m$. Nevertheless, the knowledge of this density function not gives a simple way for approximation of iterated Ito stochastic integral of multiplicity 2.

Secondly, we need to approximate not only one stochastic integral, but several iterated stochastic integrals that are complexly dependent in a probabilistic sense.

Often, the problem of combined mean-square approximation of iterated Ito and Stratonovich stochastic integrals occurs even in cases when the exact solution of Ito SDE is known. It means that even if you know the solution of Ito SDE exactly, you cannot model it numerically without the combined numerical modeling of iterated stochastic integrals.

Note that for a number of special types of Ito SDEs the problem of approximation of iterated stochastic integrals may be simplified but cannot be solved. Equations with additive vector noise, with non-additive scalar noise, with additive scalar noise, with a small parameter are related to such types of equations. In these cases, simplifications are connected to the fact that some members from stochastic Taylor expansions are equal to zero or we may neglect some members from these expansions due to the presence of a small parameter.

Furthermore, the problem of combined numerical modeling (with respect to the mean-square convergence criterion) of iterated Ito and Stratonovich stochastic integrals is rather new.

One of the main and unexpected achievements of this book is the successful usage of functional analysis methods (more concretely, we mean generalized multiple and iterated Fourier series (convergence in $L_2([t,T]^k)$ and pointwise correspondently) through various systems of basis functions) in this scientific field.

The problem of combined numerical modeling (with respect to the mean-square convergence criterion) of systems of iterated Ito and Stratonovich stochastic integrals was systematically analyzed in the context of the problem of numerical integration of Ito SDEs in the following monographs:

We also mention the monograph:

[V] Kuznetsov D.F. Strong Approximation of Iterated Ito and Stratonovich Stochastic Integrals. Application to Numerical Solution of Ito SDEs and Semilinear SPDEs. arXiv:2003.14184v46 [math.PR], 2023, 998 pp.

The books [I] and [III] analyze the problem of the mean-square approximation of iterated stochastic integrals only for two simplest iterated Ito stochastic integrals of 1st and 2nd multiplicities ($k=1$ and 2, $\psi_1(\tau)$ and $\psi_2(\tau)\equiv 1$) for the multidimensional case: $i_1,i_2=0,1,\ldots,m$. In addition, the main idea is based on the expansion of the so-called Brownian bridge process into the trigonometric Fourier series (version of the so-called Karhunen–Loève expansion). This method is called in [I] and [III] as the Fourier method.

In [II] using the Fourier method [I], the attempt was made to obtain the mean-square approximation of elementary iterated stochastic integrals of multiplicities 1 to 3 ($k = 1, \ldots, 3$, $\psi_1(\tau), \ldots, \psi_3(\tau) \equiv 1$) for the multidimensional case: $i_1, \ldots, i_3 = 0, 1, \ldots, m$. However, as we can see in the presented book, the results of the monograph [II], related to the mean-square approximation of iterated stochastic integrals of 3rd multiplicity, cause a number of critical remarks (see discussion in Sect. 2.8).

The main purpose of this book is to construct and develop newer and more effective methods (than presented in the books [I]–[III]) of combined mean-square approximation of iterated Ito and Stratonovich stochastic integrals.

Talking about the history of solving the problem of combined mean-square approximation of iterated stochastic integrals, we note that the idea to find a basis of random variables using which we may represent iterated stochastic integrals turned out to be useful. This idea was transformed several times during last decades.

Attempts to approximate the iterated stochastic integrals using various integral sums were made until 1980s and later, i.e. the interval of integration $[t, T]$ of the stochastic integral was divided into n parts and the iterated stochastic integral was represented approximately by the multiple integral sum, which included the system of independent standard Gaussian random variables whose numerical modeling is not a problem.

However, as we noted above, it is obvious that the length $T - t$ of integration interval $[t, T]$ of the iterated stochastic integrals is a step of integration of numerical methods for Ito SDEs, which is already a rather small value even without the additional splitting. Numerical experiments demonstrate that such approach results in drastic increasing of computational costs accompanied by the growth of multiplicity of the stochastic integrals (beginning from 2nd and 3rd multiplicity) that is necessary for construction of high-order strong numerical methods for Ito SDEs or in the case of decrease of integration step of numerical methods, and thereby it is almost useless for practice.

The new step for solution of the problem of combined mean-square approximation of iterated stochastic integrals was made by Milstein G.N. in his monograph [I] (1988). He proposed to use the trigonometric Fourier expansion of the Brownian bridge process (version of the so-called Karhunen–Loève expansion) for expansion of iterated stochastic integrals. Using this method, the expansions of two simplest iterated Ito stochastic integrals of 1st and 2nd multiplicities into the series of products of standard Gaussian random variables were obtained and their mean-square convergence was proved [I].

As we noted above, the attempt to develop this idea together with the Wong–Zakai approximation was made in the monograph [II] (1992), where the expansions of simplest iterated Stratonovich stochastic integrals of multiplicities 1 to 3 were obtained. However, due to a number of limitations and technical difficulties which are typical for the method [I], in [II] and following publications this problem was not solved more completely. In addition, the author has reasonable doubts about application of the Wong–Zakai approximation for the iterated stochastic integrals of 3rd multiplicity in the monograph [II] (see discussion in Sect. 2.8).

It is necessary to note that the computational cost for the method [I] is significantly less than for the method of multiple integral sums.

Regardless of the method [I] positive features, the number of its limitations are also outlined. Among them let us mention the following.

1. The absence of explicit formula for calculation of expansion coefficients for iterated stochastic integrals.

2. The practical impossibility of exact calculation of the mean-square approximation error of iterated stochastic integrals with the exception of simplest integrals of 1st and 2nd multiplicity (as a result, it is necessary to consider redundant terms of expansions and it results to the growth of computational cost and complication of the numerical methods for Ito SDEs).

3. There is a hard limitation on the system of basis functions — it may be only the trigonometric functions.

4. There are some technical problems if we use this method for iterated stochastic integrals whose multiplicity is greater than 2nd.

Nevertheless, it should be noted that the analyzed method is a concrete step forward in this scientific field.

The author thinks that the method presented by him in [IV], [V] (for the first time this method is appeared in the final form in [IV*] (2006)) and in this book (hereafter this method is reffered to as the method of generalized multiple Fourier series) is a breakthrough in solution of the problem of combined mean-square approximation of iterated Ito stochastic integrals.

The idea of this method is as follows: the iterated Ito stochastic integral of multiplicity k ($k \in \mathbb{N}$) is represented as the multiple stochastic integral from the certain discontinuous nonrandom function of k variables defined on the hypercube $[t, T]^k$, where $[t, T]$ is the interval of integration of the iterated Ito stochastic integral. Then, the mentioned nonrandom function of k variables is expanded in the hypercube $[t, T]^k$ into the generalized multiple Fourier series converging in the mean-square sense in the space $L_2([t, T]^k)$. After a number of nontrivial transformations we come to the mean-square converging expansion of the iterated Ito stochastic integral into the multiple series of products of standard Gaussian random variables. The coefficients of this series are the coefficients of generalized multiple Fourier series for the mentioned nonrandom function of k variables, which can be calculated using the explicit formula regardless of the multiplicity k of the iterated Ito stochastic integral.

As a result, we obtain the following new possibilities and advantages in comparison with the Fourier method [I].

1. There is an explicit formula for calculation of expansion coefficients of iterated Ito stochastic integral with any fixed multiplicity k. In other words, we can calculate (without any preliminary and additional work) the expansion coefficient with any fixed number in the expansion of iterated Ito stochastic integral of the preset fixed multiplicity. At that, we do not need any knowledge about coefficients with other numbers or about other iterated Ito stochastic integrals included in the considered set.

2. We have new possibilies for obtainment the exact and approximate expressions for the mean-square approximation errors of iterated Ito stochastic integrals. These possibilities are realized by the exact and estimate formulas for the mentioned mean-square approximation errors. As a result, we would not need to consider redundant terms of expansions that may complicate approximations of iterated Ito stochastic integrals.

3. Since the used multiple Fourier series is a generalized in the sense that it is built using various complete orthonormal systems of functions in the space $L_2([t, T]^k)$, we have new possibilities for approximation — we can use not only the trigonometric functions as in [I] but the Legendre polynomials as well as the systems of Haar and Rademacher–Walsh functions.

4. As it turned out, it is more convenient to work with Legendre polynomials for approximation of iterated Ito stochastic integrals. The approximations themselves are simpler than their analogues based on the system of trigonometric functions. For the systems of Haar and Rademacher–Walsh functions the expansions of iterated stochastic integrals become too complex and ineffective for practice [IV].

5. The question about what kind of functions (polynomial or trigonometric) is more convenient in the context of computational costs for approximation turns out to be nontrivial, since it is necessary to compare approximations not for one stochastic integral but for several stochastic integrals at the same time. At that there is a possibility that computational costs for some integrals will be smaller for the system of Legendre polynomials and for others — for the system of trigonometric functions. The author proved (see Sect. 3.2 in this book) that the computational costs are significantly less for the system of Legendre polynomials at least in the case of approximation of the special set of iterated Ito stochastic integrals, which are necessary for the implementation of strong numerical methods for Ito SDEs with the order of convergence $\gamma = 1.5$. In addition, the author supposes that this effect will be more impressive when analyzing more complex sets of iterated Ito stochastic integrals ($\gamma = 2.0$, 2.5, 3.0, ...). This supposition is based on the fact that the polynomial system of functions has the

significant advantage (in comparison with the trigonometric system of functions) in approximation of iterated Ito stochastic integrals for which not all weight functions are equal to 1.

6. The Milstein approach [I] for approximation of iterated Ito stochastic integrals leads to iterated applicaton of the operation of limit transition (in contrast with the method of generalized multiple Fourier series, for which the operation of limit transition is implemented only once) starting at least from the second or third multiplicity of iterated Ito stochastic integrals (we mean at least double or triple integration with respect to components of the multidimensional Wiener process). Multiple series are more preferential for approximation than the iterated ones, since the partial sums of multiple series converge for any possible case of joint converging to infinity of their upper limits of summation (let us denote them as $p_1,\ldots,p_k$). For example, when $p_1=\ldots=p_k=p\to\infty$. For iterated series, the condition $p_1=\ldots=p_k=p\to\infty$ obviously does not guarantee the convergence of this series. However, in [II] the authors use (without rigorous proof) the condition $p_1=p_2=p_3=p\to\infty$ within the frames of the Milstein approach [I] together with the Wong–Zakai approximation (see discussion in Sect. 2.8).

7. The convergence in the mean of degree $2n$ ($n\in\mathbb{N}$) as well as the convergence with probability 1 of approximations from the method of generalized multiple Fourier series are proved.

8. The method of generalized multiple Fourier series has been applied for some other types of iterated stochastic integrals (iterated stochastic integrals with respect to martingale Poisson random measures and iterated stochastic integrals with respect to martingales) as well as for approximation of iterated stochastic integrals with respect to the infinite-dimensional Q-Wiener process.

9. Another modification of the method of generalized multiple Fourier series is connected with the application of complete orthonormal with weight $r(t_1)\ldots r(t_k)\ge 0$ systems of functions in the space $L_2([t,T]^k)$.

10. As it turned out, the method of generalized multiple Fourier series can be adapted for iterated Stratonovich stochastic integrals of multiplicities 1 to 6 (see Chapter 2).

11. The results of Chapters 1 and 2 can be considered from the point of view of the Wong–Zakai approximation for the case of a multidimensional Wiener process and the Wiener process approximation based on its series expansion using Legendre polynomials and trigonometric functions (see discussion in Sect. 2.8). These results overcome a number of difficulties that were noted above and relate to the Fourier method [I].

Iterated stochastic integrals are a fundamental tool for describing and studying the dynamics of various types of stochastic equations. In recent years and decades, numerical methods of high orders of accuracy have been constructed using iterated stochastic integrals not only for Ito SDEs, but also for SDEs with jumps, SPDEs with multiplicative trace class noise, McKean SDEs, SDEs with switchings, mean-field SDEs, Ito–Volterra stochastic integral equations, etc.

Basic Notations

$\mathbb{N}$	set of natural numbers
$\mathbb{R}$, $\mathbb{R}^1$	set of real numbers
$\mathbb{R}^n$	n-dimensional Euclidean space
$n!$	$1 \cdot 2 \cdot \ldots \cdot n$ for $n \in \mathbb{N}$ $(0! = 1)$
$(2n-1)!!$	$1 \cdot 3 \cdot \ldots \cdot (2n-1)$ for $n \in \mathbb{N}$
$\stackrel{\text{def}}{=}$	equal by definition
$\equiv$	identically equal to
C_n^m	binomial coefficient $n!/(m!(n-m)!)$
$\emptyset$	empty set
$\mathbf{1}_{\mathcal{A}}$	indicator of the set A
$x \in X$	x is an element of the set X
$X \bigcup Y$	union of sets X and Y
$X \times Y$	Cartesian product of sets X and Y
$\overline{\lim\limits_{n\to\infty}}$	$\limsup\limits_{n\to\infty}$
$\underline{\lim\limits_{n\to\infty}}$	$\liminf\limits_{n\to\infty}$
$x \ll y$	x much less than y
$[x]$	largest integer number not exceeding x
$\|x\|$	absolute value of the real number x
$F:\ X \to Y$	function F from X into Y
$A^{(ij)}$	ijth element of the matrix A
A_i	ith colomn of the matrix A
$\mathbf{x}^{(i)}$	ith component of the vector $\mathbf{x} \in \mathbb{R}^n$

$O(x)$	expression being divided by x remains bounded as $x \to 0$
$\sum\limits_{(i_1,\ldots,i_k)}$	sum with respect to all possible permutations $(i_1,\ldots,i_k)$
$\mathsf{M}\{\xi\}$	expectation of ξ
$\mathsf{M}\{\xi\vert\mathrm{F}\}$	conditional expectation of ξ with respect to F
$\xi \sim \mathrm{N}(m,\sigma^2)$	Gaussian random variable ξ with expectation m and variance σ^2
$\underset{n\to\infty}{\text{l.i.m.}}$	limit in the mean square sense
$\mathcal{B}(X)$	σ-algebra of Borel subsets of X
f_t	scalar standard Wiener process
$\mathbf{f}_t$	vector standard Wiener process with independent components $\mathbf{f}_t^{(i)}$, $i=1,\ldots,m$
w. p. 1	with probability 1
$\mathbf{w}_t$	vector with components $\mathbf{w}_t^{(i)}$, $i=0,1,\ldots,m$ and property $\mathbf{w}_t^{(i)}=\mathbf{f}_t^{(i)}$ for $i=1,\ldots,m$ and $\mathbf{w}_t^{(0)}=t$
$\dfrac{\partial F}{\partial \mathbf{x}^{(i)}}$	partial derivative of $F:\mathbb{R}^n\to\mathbb{R}$
$\dfrac{\partial^2 F}{\partial \mathbf{x}^{(i)}\partial \mathbf{x}^{(j)}}$	2nd order partial derivative of $F:\mathbb{R}^n\to\mathbb{R}$
$\int\limits_t^T \ldots d\mathbf{w}_\tau^{(i)}$	Ito stochastic integral
$\int\limits_t^{*T} \ldots d\mathbf{w}_\tau^{(i)}$	Stratonovich stochastic integral
$\mathbf{W}_t$	Q-Wiener process
$J[\psi^{(k)}]_{T,t}$, $I_{(l_1\ldots l_k)T,t}^{(i_1\ldots i_k)}$	iterated Ito stochastic integrals
$J^*[\psi^{(k)}]_{T,t}$, $I_{(l_1\ldots l_k)T,t}^{*(i_1\ldots i_k)}$	iterated Stratonovich stochastic integrals
$J[\psi^{(k)}]_{T,t}^{p_1,\ldots,p_k}$, $I_{(l_1\ldots l_k)T,t}^{(i_1\ldots i_k)p}$	approximations of iterated Ito stochastic integrals
$J^*[\psi^{(k)}]_{T,t}^{p}$, $I_{(l_1\ldots l_k)T,t}^{*(i_1\ldots i_k)p}$	approximations of iterated Stratonovich stochastic integrals
$L_2(D)$	Hilbert space of square integrable functions on D

$\|\cdot\|_{L_2(D)}$	norm in the Hilbert space $L_2(D)$
$\mathrm{tr}\ A$	trace of the operator A
$\|\cdot\|_H$	norm in the Hilbert space H
$\langle u, v\rangle_H$	scalar product in the Hilbert space H
$L_{HS}(U, H)$	space of Hilbert–Schmidt operators from U to H
$\|\cdot\|_{L_{HS}(U,H)}$	operator norm in the space of Hilbert–Schmidt operators from U to H
$\int\limits_t^T \ldots d\mathbf{W}_\tau$	stochastic integral with respect to the Q-Wiener process
$J'[\Phi]_{T,t}^{(k)},\quad J'[\Phi]_{T,t}^{(i_1\ldots i_k)}$	multiple Wiener stochastic integrals
$J[\Phi]_{T,t}^{(k)},\quad J[\Phi]_{T,t}^{(i_1\ldots i_k)}$	multiple Stratonovich stochastic integrals
$P_n(x)$	Legendre polynomials
$H_n(x),\ h_n(x)$	Hermite polynomials
$H_n(x, y)$	polynomials related to the Hermite polynomials
$(a_1, \ldots, a_n)$	ordered set with elements $a_1, \ldots, a_n$
$\{a_1, \ldots, a_n\}$	unordered set with elements $a_1, \ldots, a_n$

Chapter 1.

Method of Expansion and Approximation of Iterated Ito Stochastic Integrals Based on Generalized Multiple Fourier Series

EXPANSION OF ITERATED ITO STOCHASTIC INTEGRALS OF ARBITRARY MULTIPLICITY BASED ON GENERALIZED MULTIPLE FOURIER SERIES CONVERGING IN THE MEAN

DMITRIY F. KUZNETSOV

Abstract. The article is devoted to the expansions of iterated Ito stochastic integrals based on generalized multiple Fourier series converging in the sense of norm in the space $L_2([t,T]^k)$, $k \in \mathbb{N}$. The method of generalized multiple Fourier series for expansion and mean-square approximation of iterated Ito stochastic integrals of arbitrary multiplicity k ($k \in \mathbb{N}$) with respect to components of the multidimensional Wiener process is proposed and developed. The obtained expansions contain only one operation of the limit transition in contrast to its existing analogues. In the article it is also obtained the generalization of the proposed method for an arbitrary complete orthonormal systems of functions in the space $L_2([t,T]^k)$, $k \in \mathbb{N}$ as well as for complete orthonormal with weight $r(t_1)\ldots r(t_k)$ systems of functions in the space $L_2([t,T]^k)$, $k \in \mathbb{N}$. The comparison of the considered method with the well-known expansions of iterated Ito stochastic integrals based on the Ito formula and Hermite polynomials is given. The convergence in the mean of degree $2n$ ($n \in \mathbb{N}$) and with probability 1 of the proposed method is proved.

Keywords: Iterated Ito stochastic integral, Iterated Stratonovich stochastic integral, Generalized Multiple Fourier series, Multiple Fourier–Legendre series, Multiple trigonometric Fourier series, Parseval equality, , Mean-square convergence, Convergence in the mean of degree n ($n\mathbb{N}$), Convergence with probability 1, Expansion.

1. Introduction

The idea of representing of iterated Ito and Stratonovich stochastic integrals in the form of multiple stochastic integrals from specific discontinuous nonrandom functions of several variables and following expansion of these functions using multiple Fourier series in order to get effective mean-square approximations of the mentioned stochastic integrals was proposed and developed in a lot of publications of the author [1]-[59] (also see related publications [60], [61]). Note that another approaches to expansions of iterated stochastic integrals can be found in [62]-[76]. Specifically, the approach [1]-[59] appeared for the first time in [1] (1994), [2] (1996). In these works the mentioned idea is formulated more likely at the level of guess (without any satisfactory grounding), and as a result the papers [1], [2] contain rather fuzzy formulations and a number of incorrect conclusions. Note that in [1], [2] we used the trigonometric multiple Fourier series converging in the sence of norm in the space $L_2([t,T]^k)$, $k=1,2,3$. In the final form the approach from [1], [2] has been formulated and proved for the first time in the monograph [7] (2006) (see Theorem 1 below). It should be noted that the results of [1], [2] are correct for a sufficiently narrow particular case when the numbers $i_1,...,i_k$ are pairwise different, $i_1,\ldots,i_k=1,\ldots,m$ (see Sect. 2 for detail).

Usage of Fourier series with respect to the system of Legendre polynomials for approximation of iterated stochastic integrals took place for the first time in [3] (1997) [4] (1998), [5] (2000) [6] (2001) (also see [7]-[61]).

The question about what integrals (Ito or Stratonovich) are more suitable for expansions within the frames of the considered direction of researches has turned out to be rather interesting and difficult.

On the one side, Theorem 1 (see Sect. 2) conclusively demonstrates that the structure of iterated Ito stochastic integrals is rather convenient for expansions into multiple series with respect to the system of standard Gaussian random variables regardless of the multiplicity k of iterated Ito stochastic integrals.

On the other side, the results of [3]-[6], [11]-[25], [27]-[33], [35], [37]-[39], [41]-[44], [50]-[55] convincingly testify that there is a doubtless relation between multiplier factor 1/2, which is typical for Stratonovich stochastic integral and included into the sum, connecting Stratonovich and Ito stochastic integrals, and the fact that in the point of finite discontinuity of piecewise smooth function $f(x)$ its Fourier series converges to the value $(f(x-0)+f(x+0))/2$. In addition, as it is demonstrated in [12]-[25], [27]-[33], [35], [37]-[39], [41]-[44], [50]-[55] the final formulas for expansions of iterated Stratonovich stochastic integrals (of mutiplicities 1 to 5 in the general case and of multiplicity 6 in particular case but for the case of a multidimentional Wiener process) are more compact than their analogues for iterated Ito stochastic integrals.

2. Theorem on Expansion of Iterated Ito Stochastic Integrals of Arbitrary Multiplicity k ($k \in \mathbb{N}$)

Let $(\Omega, \mathrm{F}, \mathsf{P})$ be a complete probability space, let $\{\mathrm{F}_t, t \in [0,T]\}$ be a nondecreasing right-continous family of σ-algebras of F, and let $\mathbf{f}_t$ be a standard m-dimensional Wiener stochastic process, which is F_t-measurable for any $t \in [0,T]$. We assume that the components $\mathbf{f}_t^{(i)}$ $(i=1,\ldots,m)$ of this process are independent.

Let us consider the following iterated Ito stochastic integrals

$$J[\psi^{(k)}]_{T,t} = \int\limits_t^T \psi_k(t_k)\ldots\int\limits_t^{t_2}\psi_1(t_1)d\mathbf{w}_{t_1}^{(i_1)}\ldots d\mathbf{w}_{t_k}^{(i_k)}, \tag{1}$$

where every $\psi_l(\tau)$ $(l=1,\ldots,k)$ is a nonrandom function on $[t,T]$, $\mathbf{w}_\tau^{(i)}=\mathbf{f}_\tau^{(i)}$ for $i=1,\ldots,m$ and $\mathbf{w}_\tau^{(0)}=\tau$, $i_1,\ldots,i_k=0,1,\ldots,m.$

Suppose that every $\psi_l(\tau)$ $(l=1,\ldots,k)$ is a continuous nonrandom function on the interval $[t,T]$ (the case $\psi_1(\tau),\ldots,\psi_k(\tau)\in L_2([t,T])$ will be considered in Sect. 15).

Define the following function on the hypercube $[t,T]^k$

$$K(t_1,\ldots,t_k)=\begin{cases}\psi_1(t_1)\ldots\psi_k(t_k), & t_1<\ldots<t_k\\ \\ 0, & \text{otherwise}\end{cases} = \prod_{l=1}^k\psi_l(t_l)\ \prod_{l=1}^{k-1}\mathbf{1}_{\{t_l<t_{l+1}\}}, \tag{2}$$

where $t_1,\ldots,t_k\in[t,T]$ $(k\ge 2)$ and $K(t_1)\equiv\psi_1(t_1)$ for $t_1\in[t,T]$. Here $\mathbf{1}_A$ denotes the indicator of the set A.

Suppose that $\{\phi_j(x)\}_{j=0}^{\infty}$ is a complete orthonormal system of functions in the space $L_2([t,T])$.

The function $K(t_1,\ldots,t_k)$ is piecewise continuous in the hypercube $[t,T]^k$. At this situation it is well known that the generalized multiple Fourier series of $K(t_1,\ldots,t_k)\in L_2([t,T]^k)$ is converging to $K(t_1,\ldots,t_k)$ in the hypercube $[t,T]^k$ in the mean-square sense, i.e.

$$\lim_{p_1,\ldots,p_k\to\infty}\left\|K(t_1,\ldots,t_k)-\sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k}C_{j_k\ldots j_1}\prod_{l=1}^k\phi_{j_l}(t_l)\right\|_{L_2([t,T]^k)}=0, \tag{3}$$

where

$$C_{j_k\ldots j_1}=\int\limits_{[t,T]^k}K(t_1,\ldots,t_k)\prod_{l=1}^k\phi_{j_l}(t_l)dt_1\ldots dt_k \tag{4}$$

is the Fourier coefficient and

$$\|f\|_{L_2([t,T]^k)}=\left(\int\limits_{[t,T]^k}f^2(t_1,\ldots,t_k)dt_1\ldots dt_k\right)^{1/2}.$$

Consider the partition $\{\tau_j\}_{j=0}^N$ of the interval $[t,T]$ such that

$$t=\tau_0<\ldots<\tau_N=T,\quad \Delta_N=\max_{0\le j\le N-1}\Delta\tau_j\to 0\ \text{ if }\ N\to\infty,\quad \Delta\tau_j=\tau_{j+1}-\tau_j. \tag{5}$$

Theorem 1 [7] (2006) [8]-[59]. *Suppose that every $\psi_l(\tau)$ $(l=1,\ldots,k)$ is a continuous nonrandom function on the interval $[t,T]$ and $\{\phi_j(x)\}_{j=0}^\infty$ is a complete orthonormal system of continuous functions in the space $L_2([t,T])$. Then*

$$J[\psi^{(k)}]_{T,t}=\underset{p_1,\ldots,p_k\to\infty}{\text{l.i.m.}}\sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k}C_{j_k\ldots j_1}\Biggl(\prod_{l=1}^k\zeta_{j_l}^{(i_l)}-$$

$$-\underset{N\to\infty}{\text{l.i.m.}}\sum_{(l_1,\ldots,l_k)\in\mathrm{G}_k}\phi_{j_1}(\tau_{l_1})\Delta\mathbf{w}_{\tau_{l_1}}^{(i_1)}\ldots\phi_{j_k}(\tau_{l_k})\Delta\mathbf{w}_{\tau_{l_k}}^{(i_k)}\Biggr), \tag{6}$$

where

$$\mathrm{G}_k=\mathrm{H}_k\backslash\mathrm{L}_k,\quad \mathrm{H}_k=\{(l_1,\ldots,l_k):\ l_1,\ldots,l_k=0,\ 1,\ldots,N-1\},$$

$$\mathrm{L}_k=\{(l_1,\ldots,l_k):\ l_1,\ldots,l_k=0,\ 1,\ldots,N-1;\ l_g\ne l_r\ (g\ne r);\ g,r=1,\ldots,k\},$$

l.i.m. *is a limit in the mean-square sense, $i_1,\ldots,i_k=0,1,\ldots,m$,*

$$\zeta_j^{(i)}=\int\limits_t^T\phi_j(s)d\mathbf{w}_s^{(i)} \tag{7}$$

are independent standard Gaussian random variables for various i or j (if $i\ne 0$), $C_{j_k\ldots j_1}$ is the Fourier coefficient (4), *$\Delta\mathbf{w}_{\tau_j}^{(i)}=\mathbf{w}_{\tau_{j+1}}^{(i)}-\mathbf{w}_{\tau_j}^{(i)}$ $(i=0,\ 1,\ldots,m)$, $\{\tau_j\}_{j=0}^N$ is a partition of the interval $[t,T]$ satisfying the condition* (5).

Proof. At first, let us prove preparatory lemmas.

Lemma 1. *Suppose that every $\psi_l(\tau)$ $(l=1,\ldots,k)$ is a continuous nonrandom function on the interval $[t,T]$. Then*

$$J[\psi^{(k)}]_{T,t} = \underset{N\to\infty}{\text{l.i.m.}} \sum_{j_k=0}^{N-1} \ldots \sum_{j_1=0}^{j_2-1} \prod_{l=1}^{k} \psi_l(\tau_{j_l}) \Delta \mathbf{w}_{\tau_{j_l}}^{(i_l)} \quad \text{w. p. 1}, \tag{8}$$

where $\Delta\mathbf{w}_{\tau_j}^{(i)} = \mathbf{w}_{\tau_{j+1}}^{(i)} - \mathbf{w}_{\tau_j}^{(i)}$ $(i = 0, 1, \ldots, m)$, $\{\tau_j\}_{j=0}^{N}$ *is a partition of the interval* $[t, T]$ *satisfying the condition* (5), *hereinafter w. p. 1 means "with probability 1".*

Proof. It is easy to notice that using the additive property of stochastic integrals, we can write

$$J[\psi^{(k)}]_{T,t} = \sum_{j_k=0}^{N-1} \ldots \sum_{j_1=0}^{j_2-1} \prod_{l=1}^{k} J[\psi_l]_{\tau_{j_l+1},\tau_{j_l}} + \varepsilon_N \qquad \text{w. p. 1}, \tag{9}$$

where

$$\varepsilon_N = \sum_{j_k=0}^{N-1} \int\limits_{\tau_{j_k}}^{\tau_{j_k+1}} \psi_k(s) \int\limits_{\tau_{j_k}}^{s} \psi_{k-1}(\tau) J[\psi^{(k-2)}]_{\tau,t} d\mathbf{w}_{\tau}^{(i_{k-1})} d\mathbf{w}_{s}^{(i_k)} +$$

$$+ \sum_{r=1}^{k-3} G[\psi_{k-r+1}^{(k)}]_N \sum_{j_{k-r}=0}^{j_{k-r+1}-1} \int\limits_{\tau_{j_{k-r}}}^{\tau_{j_{k-r}+1}} \psi_{k-r}(s) \int\limits_{\tau_{j_{k-r}}}^{s} \psi_{k-r-1}(\tau) J[\psi^{(k-r-2)}]_{\tau,t} d\mathbf{w}_{\tau}^{(i_{k-r-1})} d\mathbf{w}_{s}^{(i_{k-r})} +$$

$$+ G[\psi_3^{(k)}]_N \sum_{j_2=0}^{j_3-1} J[\psi^{(2)}]_{\tau_{j_2+1},\tau_{j_2}},$$

$$G[\psi_m^{(k)}]_N = \sum_{j_k=0}^{N-1} \sum_{j_{k-1}=0}^{j_k-1} \ldots \sum_{j_m=0}^{j_{m+1}-1} \prod_{l=m}^{k} J[\psi_l]_{\tau_{j_l+1},\tau_{j_l}},$$

$$J[\psi_l]_{s,\theta} = \int\limits_{\theta}^{s} \psi_l(\tau) d\mathbf{w}_{\tau}^{(i_l)},$$

$$(\psi_m, \psi_{m+1}, \ldots, \psi_k) \stackrel{\text{def}}{=} \psi_m^{(k)}, \quad (\psi_1, \ldots, \psi_k) \stackrel{\text{def}}{=} \psi_1^{(k)} = \psi^{(k)}.$$

Using the standard estimates (22) for moments of stochastic integrals, we obtain w. p. 1

$$\underset{N\to\infty}{\text{l.i.m.}}\ \varepsilon_N = 0. \tag{10}$$

Comparing (9) and (10), we get

$$J[\psi^{(k)}]_{T,t} = \underset{N\to\infty}{\text{l.i.m.}} \sum_{j_k=0}^{N-1} \ldots \sum_{j_1=0}^{j_2-1} \prod_{l=1}^{k} J[\psi_l]_{\tau_{j_l+1},\tau_{j_l}} \quad \text{w. p. 1}. \tag{11}$$

Let us rewrite $J[\psi_l]_{\tau_{j_l+1},\tau_{j_l}}$ in the form

$$J[\psi_l]_{\tau_{j_l+1},\tau_{j_l}} = \psi_l(\tau_{j_l})\Delta\mathbf{w}_{\tau_{j_l}}^{(i_l)} + \int\limits_{\tau_{j_l}}^{\tau_{j_l+1}} (\psi_l(\tau) - \psi_l(\tau_{j_l}))d\mathbf{w}_{\tau}^{(i_l)}$$

and substitute it into (11). Then, due to the moment properties of stochastic integrals and continuity (which means uniform continuity) of the functions $\psi_l(s)$ $(l = 1, \ldots, k)$ it is easy to see that the prelimit expression on the right-hand side of (11) is a sum of the prelimit expression on the right-hand side of (8) and the value which tends to zero in the mean-square sense if $N \to \infty$. Lemma 1 is proved.

Remark 1. *It is easy to see that if $\Delta\mathbf{w}_{\tau_{j_l}}^{(i_l)}$ in (8) for some $l \in \{1, \ldots, k\}$ is replaced with $\left(\Delta\mathbf{w}_{\tau_{j_l}}^{(i_l)}\right)^p$ $(p = 2,\ i_l \neq 0)$, then the differential $d\mathbf{w}_{t_l}^{(i_l)}$ in the integral $J[\psi^{(k)}]_{T,t}$ will be replaced with dt_l. If $p = 3, 4, \ldots,$ then the right-hand side of the formula (8) will become zero w. p. 1. If we replace $\Delta\mathbf{w}_{\tau_{j_l}}^{(i_l)}$ in (8) for some $l \in \{1, \ldots, k\}$ with $(\Delta\tau_{j_l})^p$ $(p = 2, 3, \ldots)$, then the right-hand side of the formula (8) also will be equal to zero w. p. 1.*

Let us define the following multiple stochastic integral

$$\underset{N\to\infty}{\text{l.i.m.}} \sum_{j_1,\ldots,j_k=0}^{N-1} \Phi\left(\tau_{j_1}, \ldots, \tau_{j_k}\right) \prod_{l=1}^{k} \Delta\mathbf{w}_{\tau_{j_l}}^{(i_l)} \stackrel{\text{def}}{=} J[\Phi]_{T,t}^{(k)}. \tag{12}$$

Denote

$$D_k = \{(t_1, \ldots, t_k) :\ t \le t_1 < \ldots < t_k \le T\}. \tag{13}$$

We will use the same symbol D_k to denote the open and closed domains corresponding to the domain D_k defined by (13). However, we always specify what domain we consider (open or closed).

Also we will write $\Phi(t_1, \ldots, t_k) \in C(D_k)$ if $\Phi(t_1, \ldots, t_k)$ is a continuous nonrandom function of k variables in the closed domain D_k.

Let us consider the iterated Ito stochastic integral

$$I[\Phi]_{T,t}^{(k)} \stackrel{\text{def}}{=} \int\limits_t^T \ldots \int\limits_t^{t_2} \Phi(t_1, \ldots, t_k)d\mathbf{w}_{t_1}^{(i_1)} \ldots d\mathbf{w}_{t_k}^{(i_k)}, \tag{14}$$

where $\Phi(t_1, \ldots, t_k) \in C(D_k)$.

Using the arguments which similar to the arguments used for the proof of Lemma 1 it is easy to demonstrate that if $\Phi(t_1, \ldots, t_k) \in C(D_k)$, then the following equality is fulfilled

$$I[\Phi]_{T,t}^{(k)} = \underset{N\to\infty}{\text{l.i.m.}} \sum_{j_k=0}^{N-1} \ldots \sum_{j_1=0}^{j_2-1} \Phi(\tau_{j_1}, \ldots, \tau_{j_k}) \prod_{l=1}^{k} \Delta\mathbf{w}_{\tau_{j_l}}^{(i_l)} \quad \text{w. p. 1.} \tag{15}$$

In order to explain, let us check the correctness of the equality (15) when $k = 3$. For definiteness we will suggest that $i_1, i_2, i_3 = 1, \ldots, m$. We have

$$I[\Phi]_{T,t}^{(3)} \stackrel{\text{def}}{=} \int\limits_t^T \int\limits_t^{t_3} \int\limits_t^{t_2} \Phi(t_1, t_2, t_3)d\mathbf{w}_{t_1}^{(i_1)} d\mathbf{w}_{t_2}^{(i_2)} d\mathbf{w}_{t_3}^{(i_3)} =$$

$$
= \underset{N\to\infty}{\text{l.i.m.}} \sum_{j_3=0}^{N-1} \int\limits_t^{\tau_{j_3}} \int\limits_t^{t_2} \Phi(t_1,t_2,\tau_{j_3}) d\mathbf{w}_{t_1}^{(i_1)} d\mathbf{w}_{t_2}^{(i_2)} \Delta\mathbf{w}_{\tau_{j_3}}^{(i_3)} =
$$

$$
= \underset{N\to\infty}{\text{l.i.m.}} \sum_{j_3=0}^{N-1} \sum_{j_2=0}^{j_3-1} \int\limits_{\tau_{j_2}}^{\tau_{j_2+1}} \int\limits_t^{t_2} \Phi(t_1,t_2,\tau_{j_3}) d\mathbf{w}_{t_1}^{(i_1)} d\mathbf{w}_{t_2}^{(i_2)} \Delta\mathbf{w}_{\tau_{j_3}}^{(i_3)} =
$$

$$
= \underset{N\to\infty}{\text{l.i.m.}} \sum_{j_3=0}^{N-1} \sum_{j_2=0}^{j_3-1} \int\limits_{\tau_{j_2}}^{\tau_{j_2+1}} \left(\int\limits_t^{\tau_{j_2}} + \int\limits_{\tau_{j_2}}^{t_2} \right) \Phi(t_1,t_2,\tau_{j_3}) d\mathbf{w}_{t_1}^{(i_1)} d\mathbf{w}_{t_2}^{(i_2)} \Delta\mathbf{w}_{\tau_{j_3}}^{(i_3)} =
$$

$$
= \underset{N\to\infty}{\text{l.i.m.}} \sum_{j_3=0}^{N-1} \sum_{j_2=0}^{j_3-1} \sum_{j_1=0}^{j_2-1} \int\limits_{\tau_{j_2}}^{\tau_{j_2+1}} \int\limits_{\tau_{j_1}}^{\tau_{j_1+1}} \Phi(t_1,t_2,\tau_{j_3}) d\mathbf{w}_{t_1}^{(i_1)} d\mathbf{w}_{t_2}^{(i_2)} \Delta\mathbf{w}_{\tau_{j_3}}^{(i_3)} +
$$

$$
+ \underset{N\to\infty}{\text{l.i.m.}} \sum_{j_3=0}^{N-1} \sum_{j_2=0}^{j_3-1} \int\limits_{\tau_{j_2}}^{\tau_{j_2+1}} \int\limits_{\tau_{j_2}}^{t_2} \Phi(t_1,t_2,\tau_{j_3}) d\mathbf{w}_{t_1}^{(i_1)} d\mathbf{w}_{t_2}^{(i_2)} \Delta\mathbf{w}_{\tau_{j_3}}^{(i_3)}. \tag{16}
$$

Let us demonstrate that the second limit on the right-hand side of (16) equals to zero. Actually, the second moment of its prelimit expression equals to

$$
\sum_{j_3=0}^{N-1} \sum_{j_2=0}^{j_3-1} \int\limits_{\tau_{j_2}}^{\tau_{j_2+1}} \int\limits_{\tau_{j_2}}^{t_2} \Phi^2(t_1,t_2,\tau_{j_3}) dt_1 dt_2 \Delta\tau_{j_3} \le M^2 \sum_{j_3=0}^{N-1} \sum_{j_2=0}^{j_3-1} \frac{1}{2} \left(\Delta\tau_{j_2}\right)^2 \Delta\tau_{j_3} \to 0
$$

if $N \to \infty$. Here M is a constant, which restricts the module of function $\Phi(t_1,t_2,t_3)$ due to its continuity, $\Delta\tau_j = \tau_{j+1} - \tau_j$.

Considering the obtained conclusions, we have

$$
I[\Phi]_{T,t}^{(3)} \stackrel{\text{def}}{=} \int\limits_t^T \int\limits_t^{t_3} \int\limits_t^{t_2} \Phi(t_1,t_2,t_3) d\mathbf{w}_{t_1}^{(i_1)} d\mathbf{w}_{t_2}^{(i_2)} d\mathbf{w}_{t_3}^{(i_3)} =
$$

$$
= \underset{N\to\infty}{\text{l.i.m.}} \sum_{j_3=0}^{N-1} \sum_{j_2=0}^{j_3-1} \sum_{j_1=0}^{j_2-1} \int\limits_{\tau_{j_2}}^{\tau_{j_2+1}} \int\limits_{\tau_{j_1}}^{\tau_{j_1+1}} \Phi(t_1,t_2,\tau_{j_3}) d\mathbf{w}_{t_1}^{(i_1)} d\mathbf{w}_{t_2}^{(i_2)} \Delta\mathbf{w}_{\tau_{j_3}}^{(i_3)} =
$$

$$
= \underset{N\to\infty}{\text{l.i.m.}} \sum_{j_3=0}^{N-1} \sum_{j_2=0}^{j_3-1} \sum_{j_1=0}^{j_2-1} \int\limits_{\tau_{j_2}}^{\tau_{j_2+1}} \int\limits_{\tau_{j_1}}^{\tau_{j_1+1}} \left(\Phi(t_1,t_2,\tau_{j_3}) - \Phi(t_1,\tau_{j_2},\tau_{j_3})\right) d\mathbf{w}_{t_1}^{(i_1)} d\mathbf{w}_{t_2}^{(i_2)} \Delta\mathbf{w}_{\tau_{j_3}}^{(i_3)} +
$$

$$
+ \underset{N\to\infty}{\text{l.i.m.}} \sum_{j_3=0}^{N-1} \sum_{j_2=0}^{j_3-1} \sum_{j_1=0}^{j_2-1} \int\limits_{\tau_{j_2}}^{\tau_{j_2+1}} \int\limits_{\tau_{j_1}}^{\tau_{j_1+1}} \left(\Phi(t_1,\tau_{j_2},\tau_{j_3}) - \Phi(\tau_{j_1},\tau_{j_2},\tau_{j_3})\right) d\mathbf{w}_{t_1}^{(i_1)} d\mathbf{w}_{t_2}^{(i_2)} \Delta\mathbf{w}_{\tau_{j_3}}^{(i_3)} +
$$

$$+\underset{N\to\infty}{\text{l.i.m.}}\sum_{j_3=0}^{N-1}\sum_{j_2=0}^{j_3-1}\sum_{j_1=0}^{j_2-1}\Phi(\tau_{j_1},\tau_{j_2},\tau_{j_3})\Delta\mathbf{w}_{\tau_{j_1}}^{(i_1)}\Delta\mathbf{w}_{\tau_{j_2}}^{(i_2)}\Delta\mathbf{w}_{\tau_{j_3}}^{(i_3)}. \tag{17}$$

In order to get the sought result, we just have to demonstrate that the first two limits on the right-hand side of (17) equal to zero. Let us prove that the first one of them equals to zero (proof for the second limit is similar).

The second moment of a prelimit expression of the first limit on the right-hand side of (17) equals to the following expression

$$\sum_{j_3=0}^{N-1}\sum_{j_2=0}^{j_3-1}\sum_{j_1=0}^{j_2-1}\int\limits_{\tau_{j_2}}^{\tau_{j_2+1}}\int\limits_{\tau_{j_1}}^{\tau_{j_1+1}}\left(\Phi(t_1,t_2,\tau_{j_3})-\Phi(t_1,\tau_{j_2},\tau_{j_3})\right)^2dt_1dt_2\Delta\tau_{j_3}. \tag{18}$$

Since the function $\Phi(t_1,t_2,t_3)$ is continuous in the closed bounded domain D_3, then it is uniformly continuous in this domain. Therefore, if the distance between two points of the domain D_3 is less than $\delta(\varepsilon)$ ($\delta(\varepsilon)>0$ exists for any $\varepsilon>0$ and it does not depend on mentioned points), then the corresponding oscillation of the function $\Phi(t_1,t_2,t_3)$ for these two points of the domain D_3 is less than ε.

If we assume that $\Delta\tau_j<\delta(\varepsilon)$ $(j=0,1,\ldots,N-1)$, then the distance between points (t_1,t_2,τ_{j_3}), $(t_1,\tau_{j_2},\tau_{j_3})$ is obviously less than $\delta(\varepsilon)$. In this case

$$|\Phi(t_1,t_2,\tau_{j_3})-\Phi(t_1,\tau_{j_2},\tau_{j_3})|<\varepsilon.$$

Consequently, when $\Delta\tau_j<\delta(\varepsilon)$ $(j=0,\ 1,\ldots,N-1)$ the expression (18) is evaluated by the following value

$$\varepsilon^2\sum_{j_3=0}^{N-1}\sum_{j_2=0}^{j_3-1}\sum_{j_1=0}^{j_2-1}\Delta\tau_{j_1}\Delta\tau_{j_2}\Delta\tau_{j_3}<\varepsilon^2\frac{(T-t)^3}{6}.$$

Therefore, the first limit on the right-hand side of (17) equals to zero. Similarly we can prove equality to zero of the second limit on the right-hand side of (17).

Consequently, the equality (15) is proved for $k=3$. The cases $k=2$ and $k>3$ are analyzed absolutely similarly.

It is necessary to note that the proof of correctness of (15) is similar when the nonrandom function $\Phi(t_1,\ldots,t_k)$ is continuous in the open domain D_k and bounded at its boundary.

Let us consider the following multiple stochastic integral

$$\underset{N\to\infty}{\text{l.i.m.}}\sum_{\substack{j_1,\ldots,j_k=0\\ j_q\ne j_r;\ q\ne r;\ q,r=1,\ldots,k}}^{N-1}\Phi\left(\tau_{j_1},\ldots,\tau_{j_k}\right)\prod_{l=1}^{k}\Delta\mathbf{w}_{\tau_{j_l}}^{(i_l)}\stackrel{\text{def}}{=}J'[\Phi]_{T,t}^{(k)}. \tag{19}$$

Then, according to (15) we will get the following

$$J'[\Phi]_{T,t}^{(k)}=\int\limits_t^T\ldots\int\limits_t^{t_2}\sum_{(t_1,\ldots,t_k)}\Bigl(\Phi(t_1,\ldots,t_k)d\mathbf{w}_{t_1}^{(i_1)}\ldots d\mathbf{w}_{t_k}^{(i_k)}\Bigr), \tag{20}$$

where

$$\sum_{(t_1,\ldots,t_k)}$$

means the sum with respect to all possible permutations $(t_1,\ldots,t_k)$. At the same time permutations $(t_1,\ldots,t_k)$ when summing are performed in (20) only in the expression, which is enclosed in parentheses. Moreover, the nonrandom function $\Phi(t_1,\ldots,t_k)$ is assumed to be continuous in the corresponding closed domains of integration. The case when the nonrandom function $\Phi(t_1,\ldots,t_k)$ is continuous in the open domains of integration and bounded at their boundaries is also possible.

It is not difficult to see that (20) can be rewritten in the form

$$J'[\Phi]_{T,t}^{(k)} = \sum_{(t_1,\ldots,t_k)} \int\limits_t^T \ldots \int\limits_t^{t_2} \Phi(t_1,\ldots,t_k) d\mathbf{w}_{t_1}^{(i_1)} \ldots d\mathbf{w}_{t_k}^{(i_k)}, \tag{21}$$

where permutations $(t_1,\ldots,t_k)$ when summing are performed only in the values $d\mathbf{w}_{t_1}^{(i_1)} \ldots d\mathbf{w}_{t_k}^{(i_k)}$. At the same time the indexes near upper limits of integration in the iterated stochastic integrals are changed correspondently and if t_r swapped with t_q in the permutation $(t_1,\ldots,t_k)$, then i_r swapped with i_q in the permutation $(i_1,\ldots,i_k)$.

Let us consider the class $\mathrm{M}_2([0,T])$ of functions $\xi : [0,T]\times\Omega \to \mathbb{R}$, which are measurable in accordance with the collection of variables (t,ω) and F_t-measurable for all $t\in[0,T]$. Moreover, $\xi(\tau,\omega)$ is independent with increments $\mathbf{f}_{t+\Delta}-\mathbf{f}_t$ for $t\ge\tau$ $(\Delta>0)$,

$$\int\limits_0^T \mathsf{M}\left\{\xi^2(t,\omega)\right\} dt < \infty,$$

and $\mathsf{M}\{\xi^2(t,\omega)\}<\infty$ for all $t\in[0,T]$.

It is well known [77] that the Ito stochastic integral exists in the mean-square sence for any $\xi\in\mathrm{M}_2([0,T])$. Further, we will denote $\xi(\tau,\omega)$ as ξ_τ.

Lemma 2. *Suppose that $\Phi(t_1,\ldots,t_k)\in C(D_k)$ or $\Phi(t_1,\ldots,t_k)$ is a continuous nonrandom function in the open domain D_k and bounded at its boundary. Then*

$$\mathsf{M}\left\{\left|I[\Phi]_{T,t}^{(k)}\right|^2\right\} \le C_k \int\limits_t^T \ldots \int\limits_t^{t_2} \Phi^2(t_1,\ldots,t_k)dt_1\ldots dt_k, \quad C_k<\infty,$$

where $I[\Phi]_{T,t}^{(k)}$ is defined by the formula (14).

Proof. Using standard properties and moments estimates of stochastic integrals, we have for $\xi_\tau\in\mathrm{M}_2([t,T])$ [77]

$$\mathsf{M}\left\{\left|\int\limits_t^T \xi_\tau df_\tau\right|^2\right\} = \int\limits_t^T \mathsf{M}\{|\xi_\tau|^2\}d\tau, \quad \mathsf{M}\left\{\left|\int\limits_t^T \xi_\tau d\tau\right|^2\right\} \le (T-t)\int\limits_t^T \mathsf{M}\{|\xi_\tau|^2\}d\tau. \tag{22}$$

Let us denote

$$\xi[\Phi]^{(l)}_{t_{l+1},\ldots,t_k,t}=\int\limits_t^{t_{l+1}}\ldots\int\limits_t^{t_2}\Phi(t_1,\ldots,t_k)d\mathbf{w}_{t_1}^{(i_1)}\ldots d\mathbf{w}_{t_l}^{(i_l)},$$

where $l=1,\ldots,\ k-1$ and

$$\xi[\Phi]^{(0)}_{t_1,\ldots,t_k,t}\stackrel{\rm def}{=}\Phi(t_1,\ldots,t_k).$$

In accordance with the induction it is easy to demonstrate that

$$\xi[\Phi]^{(l)}_{t_{l+1},\ldots,t_k,t}\in {\rm M}_2([t,T])$$

with respect to the variable t_{l+1}. Further, using the estimates (22) repeatedly we obtain the statement of Lemma 2.

It is not difficult to see that in the case $i_1,\ldots,i_k=1,\ldots,m$ from the proof of Lemma 2 we obtain

$$\mathsf{M}\left\{\left|I[\Phi]^{(k)}_{T,t}\right|^2\right\}=\int\limits_t^T\ldots\int\limits_t^{t_2}\Phi^2(t_1,\ldots,t_k)dt_1\ldots dt_k. \tag{23}$$

Lemma 3. *Suppose that every $\varphi_l(s)$ $(l=1,\ldots,k)$ is a continuous nonrandom function on the interval $[t,T]$. Then*

$$\prod_{l=1}^k J[\varphi_l]_{T,t}=J[\Phi]^{(k)}_{T,t}\quad \hbox{w. p. 1}, \tag{24}$$

where

$$J[\varphi_l]_{T,t}=\int\limits_t^T\varphi_l(s)d\mathbf{w}_s^{(i_l)},\quad \Phi(t_1,\ldots,t_k)=\prod_{l=1}^k\varphi_l(t_l)$$

and the integral $J[\Phi]^{(k)}_{T,t}$ is defined by the equality (12).

Proof. Let at first $i_l\ne 0,\ l=1,\ldots,k$. Denote

$$J[\varphi_l]_N\stackrel{\rm def}{=}\sum_{j=0}^{N-1}\varphi_l(\tau_j)\Delta\mathbf{w}_{\tau_j}^{(i_l)}.$$

Since

$$\prod_{l=1}^k J[\varphi_l]_N-\prod_{l=1}^k J[\varphi_l]_{T,t}=$$

$$=\sum_{l=1}^k\left(\prod_{g=1}^{l-1}J[\varphi_g]_{T,t}\right)\left(J[\varphi_l]_N-J[\varphi_l]_{T,t}\right)\left(\prod_{g=l+1}^k J[\varphi_g]_N\right), \tag{25}$$

then because of the Minkowski inequality and the inequality of Cauchy-Bunyakovsky we obtain

$$\left(\mathsf{M}\left\{\left|\prod_{l=1}^{k} J[\varphi_l]_N - \prod_{l=1}^{k} J[\varphi_l]_{T,t}\right|^2\right\}\right)^{1/2} \le C_k \sum_{l=1}^{k}\left(\mathsf{M}\left\{\left|J[\varphi_l]_N - J[\varphi_l]_{T,t}\right|^4\right\}\right)^{1/4}, \tag{26}$$

where C_k is a constant.

Note that

$$J[\varphi_l]_N - J[\varphi_l]_{T,t} = \sum_{j=0}^{N-1} J[\Delta\varphi_l]_{\tau_{j+1},\tau_j}, \quad J[\Delta\varphi_l]_{\tau_{j+1},\tau_j} = \int\limits_{\tau_j}^{\tau_{j+1}} (\varphi_l(\tau_j) - \varphi_l(s))\, d\mathbf{w}_s^{(i_l)}.$$

Since $J[\Delta\varphi_l]_{\tau_{j+1},\tau_j}$ are independent for various j, then [78]

$$\mathsf{M}\left\{\left|\sum_{j=0}^{N-1} J[\Delta\varphi_l]_{\tau_{j+1},\tau_j}\right|^4\right\} = \sum_{j=0}^{N-1}\mathsf{M}\left\{\left|J[\Delta\varphi_l]_{\tau_{j+1},\tau_j}\right|^4\right\} +$$

$$+6\sum_{j=0}^{N-1}\mathsf{M}\left\{\left|J[\Delta\varphi_l]_{\tau_{j+1},\tau_j}\right|^2\right\}\sum_{q=0}^{j-1}\mathsf{M}\left\{\left|J[\Delta\varphi_l]_{\tau_{q+1},\tau_q}\right|^2\right\}. \tag{27}$$

It is obviously that $J[\Delta\varphi_l]_{\tau_{j+1},\tau_j}$ are Gaussian random variables. Then we have

$$\mathsf{M}\left\{\left|J[\Delta\varphi_l]_{\tau_{j+1},\tau_j}\right|^2\right\} = \int\limits_{\tau_j}^{\tau_{j+1}} (\varphi_l(\tau_j) - \varphi_l(s))^2 ds,$$

$$\mathsf{M}\left\{\left|J[\Delta\varphi_l]_{\tau_{j+1},\tau_j}\right|^4\right\} = 3\left(\int\limits_{\tau_j}^{\tau_{j+1}} (\varphi_l(\tau_j) - \varphi_l(s))^2 ds\right)^2.$$

Using this relations and continuity (which means uniform continuity) of the functions $\varphi_l(s)$, we get

$$\mathsf{M}\left\{\left|\sum_{j=0}^{N-1} J[\Delta\varphi_l]_{\tau_{j+1},\tau_j}\right|^4\right\} \le \varepsilon^4\left(3\sum_{j=0}^{N-1}(\Delta\tau_j)^2 + 6\sum_{j=0}^{N-1}\Delta\tau_j\sum_{q=0}^{j-1}\Delta\tau_q\right) <$$

$$< 3\varepsilon^4\left(\delta(\varepsilon)(T-t) + (T-t)^2\right),$$

where $\Delta\tau_j < \delta(\varepsilon)$, $j = 0, 1, \ldots, N-1$ ($\delta(\varepsilon) > 0$ exists for any $\varepsilon > 0$ and it does not depend on points of the interval $[t, T]$). Then the right-hand side of the formula (27) tends to zero when $N \to \infty$.

Considering this fact as well as (26), we come to (24).

If $\mathbf{w}_{t_l}^{(i_l)} = t_l$ for some $l \in \{1, \ldots, k\}$, then the proof of Lemma 3 becomes obviously simpler and it is performed similarly. Lemma 3 is proved.

Remark 2. *It is easy to see that if* $\Delta\mathbf{w}_{\tau_{j_l}}^{(i_l)}$ *in* (24) *for some* $l\in\{1,\ldots,k\}$ *is replaced with* $\left(\Delta\mathbf{w}_{\tau_{j_l}}^{(i_l)}\right)^p$ $(p=2,\ i_l\ne 0)$, *then the differential* $d\mathbf{w}_{t_l}^{(i_l)}$ *in the integral* $J[\Phi^{(k)}]_{T,t}$ *will be replaced with* dt_l. *If* $p=3,4,\ldots,$ *then the right-hand side of the formula* (24) *will become zero w. p. 1.*

Let us consider the case $p=2$ in detail. Let $\Delta\mathbf{w}_{\tau_{j_l}}^{(i_l)}$ in (24) for some $l\in\{1,\ldots,k\}$ is replaced with $\left(\Delta\mathbf{w}_{\tau_{j_l}}^{(i_l)}\right)^2$ $(i_l\ne 0)$ and

$$J[\varphi_l]_N\ \stackrel{\rm def}{=}\ \sum_{j=0}^{N-1}\varphi_l(\tau_j)\left(\Delta\mathbf{w}_{\tau_j}^{(i_l)}\right)^2,\quad J[\varphi_l]_{T,t}\ \stackrel{\rm def}{=}\ \int\limits_t^T\varphi_l(s)ds.$$

We have

$$\left(\mathsf{M}\left\{\left|J[\varphi_l]_N-J[\varphi_l]_{T,t}\right|^4\right\}\right)^{1/4}=\left(\mathsf{M}\left\{\left|\sum_{j=0}^{N-1}\varphi_l(\tau_j)\left(\Delta\mathbf{w}_{\tau_j}^{(i_l)}\right)^2-\int\limits_t^T\varphi_l(s)ds\right|^4\right\}\right)^{1/4}=$$

$$=\left(\mathsf{M}\left\{\left|\sum_{j=0}^{N-1}\left(\varphi_l(\tau_j)\left(\Delta\mathbf{w}_{\tau_j}^{(i_l)}\right)^2-\int\limits_{\tau_j}^{\tau_{j+1}}\varphi_l(s)ds\right)\right|^4\right\}\right)^{1/4}\le$$

$$\le\left(\mathsf{M}\left\{\left|\sum_{j=0}^{N-1}\varphi_l(\tau_j)\left(\left(\Delta\mathbf{w}_{\tau_j}^{(i_l)}\right)^2-\Delta\tau_j\right)\right|^4\right\}\right)^{1/4}+\left|\sum_{j=0}^{N-1}\int\limits_{\tau_j}^{\tau_{j+1}}\left(\varphi_l(\tau_j)-\varphi_l(s)\right)ds\right|. \tag{28}$$

From the relation, which is similar to (27), we obtain

$$\mathsf{M}\left\{\left|\sum_{j=0}^{N-1}\varphi_l(\tau_j)\left(\left(\Delta\mathbf{w}_{\tau_j}^{(i_l)}\right)^2-\Delta\tau_j\right)\right|^4\right\}=\sum_{j=0}^{N-1}\left(\varphi_l(\tau_j)\right)^4\mathsf{M}\left\{\left(\left(\Delta\mathbf{w}_{\tau_j}^{(i_l)}\right)^2-\Delta\tau_j\right)^4\right\}+$$

$$+6\sum_{j=0}^{N-1}\left(\varphi_l(\tau_j)\right)^2\mathsf{M}\left\{\left(\left(\Delta\mathbf{w}_{\tau_j}^{(i_l)}\right)^2-\Delta\tau_j\right)^2\right\}\sum_{q=0}^{j-1}\left(\varphi_l(\tau_q)\right)^2\mathsf{M}\left\{\left(\left(\Delta\mathbf{w}_{\tau_q}^{(i_l)}\right)^2-\Delta\tau_q\right)^2\right\}=$$

$$=60\sum_{j=0}^{N-1}\left(\varphi_l(\tau_j)\right)^4\left(\Delta\tau_j\right)^4+24\sum_{j=0}^{N-1}\left(\varphi_l(\tau_j)\right)^2\left(\Delta\tau_j\right)^2\sum_{q=0}^{j-1}\left(\varphi_l(\tau_q)\right)^2\left(\Delta\tau_q\right)^2\le C\left(\Delta_N\right)^2\ \to 0$$

if $N\to\infty$, where constant C does not depend on N.

The second term on the right-hand side of (28) tends to zero if $N\to\infty$ due to continuity (which means uniform continuity) of the function $\varphi_l(s)$ on the interval $[t,T]$. Then, taking into account (25), (26), we come to the affirmation of Remark 2.

Let us prove Theorem 1. According to Lemma 1, we have

$$J[\psi^{(k)}]_{T,t}=$$

$$=\underset{N\to\infty}{\text{l.i.m.}}\sum_{l_k=0}^{N-1}\ldots\sum_{l_1=0}^{l_2-1}\psi_1(\tau_{l_1})\ldots\psi_k(\tau_{l_k})\Delta\mathbf{w}_{\tau_{l_1}}^{(i_1)}\ldots\Delta\mathbf{w}_{\tau_{l_k}}^{(i_k)}=$$

$$=\underset{N\to\infty}{\text{l.i.m.}}\sum_{l_k=0}^{N-1}\ldots\sum_{l_1=0}^{l_2-1}K(\tau_{l_1},\ldots,\tau_{l_k})\Delta\mathbf{w}_{\tau_{l_1}}^{(i_1)}\ldots\Delta\mathbf{w}_{\tau_{l_k}}^{(i_k)}=$$

$$=\underset{N\to\infty}{\text{l.i.m.}}\sum_{l_k=0}^{N-1}\ldots\sum_{l_1=0}^{N-1}K(\tau_{l_1},\ldots,\tau_{l_k})\Delta\mathbf{w}_{\tau_{l_1}}^{(i_1)}\ldots\Delta\mathbf{w}_{\tau_{l_k}}^{(i_k)}=$$

$$=\underset{N\to\infty}{\text{l.i.m.}}\sum_{\substack{l_1,\ldots,l_k=0\\ l_q\ne l_r;\ q\ne r;\ q,r=1,\ldots,k}}^{N-1}K(\tau_{l_1},\ldots,\tau_{l_k})\Delta\mathbf{w}_{\tau_{l_1}}^{(i_1)}\ldots\Delta\mathbf{w}_{\tau_{l_k}}^{(i_k)}=$$

$$=\int\limits_t^T\ldots\int\limits_t^{t_2}\sum_{(t_1,\ldots,t_k)}\Bigl(K(t_1,\ldots,t_k)d\mathbf{w}_{t_1}^{(i_1)}\ldots d\mathbf{w}_{t_k}^{(i_k)}\Bigr),\tag{29}$$

where permutations $(t_1,\ldots,t_k)$ when summing are performed only in the expression, which is enclosed in parentheses.

It is easy to see that (29) can be rewritten in the form

$$J[\psi^{(k)}]_{T,t}=\sum_{(t_1,\ldots,t_k)}\int\limits_t^T\ldots\int\limits_t^{t_2}K(t_1,\ldots,t_k)d\mathbf{w}_{t_1}^{(i_1)}\ldots d\mathbf{w}_{t_k}^{(i_k)},$$

where permutations $(t_1,\ldots,t_k)$ when summing are performed only in the values $d\mathbf{w}_{t_1}^{(i_1)}\ldots d\mathbf{w}_{t_k}^{(i_k)}$. At the same time the indexes near upper limits of integration in the iterated stochastic integrals are changed correspondently and if t_r swapped with t_q in the permutation $(t_1,\ldots,t_k)$, then i_r swapped with i_q in the permutation $(i_1,\ldots,i_k)$.

Since the integration of a bounded function with respect to the set of measure zero for Riemann or Lebesgue integrals gives zero result, then the following formula is correct for these integrals

$$\int\limits_{[t,T]^k}|G(t_1,\ldots,t_k)|dt_1\ldots dt_k=$$

$$=\sum_{(t_1,\ldots,t_k)}\int\limits_t^T\ldots\int\limits_t^{t_2}|G(t_1,\ldots,t_k)|dt_1\ldots dt_k,\tag{30}$$

where permutations $(t_1,\ldots,t_k)$ when summing are performed only in the values $dt_1,\ldots,dt_k$. At the same time the indexes near upper limits of integration are changed correspondently and the function $|G(t_1,\ldots,t_k)|$ is assumed to be integrable in the hypercube $[t,T]^k$.

According to Lemmas 1, 3 and (20), (29), we get the following representation w. p. 1

$$J[\psi^{(k)}]_{T,t} =$$

$$= \sum_{j_1=0}^{p_1} \ldots \sum_{j_k=0}^{p_k} C_{j_k\ldots j_1} \int\limits_t^T \ldots \int\limits_t^{t_2} \sum_{(t_1,\ldots,t_k)} \left(\phi_{j_1}(t_1)\ldots\phi_{j_k}(t_k) d\mathbf{w}_{t_1}^{(i_1)} \ldots d\mathbf{w}_{t_k}^{(i_k)}\right) +$$

$$+R_{T,t}^{p_1,\ldots,p_k} =$$

$$= \sum_{j_1=0}^{p_1} \ldots \sum_{j_k=0}^{p_k} C_{j_k\ldots j_1} \underset{N\to\infty}{\text{l.i.m.}} \sum_{\substack{l_1,\ldots,l_k=0\\ l_q\ne l_r;\ q\ne r;\ q,r=1,\ldots,k}}^{N-1} \phi_{j_1}(\tau_{l_1})\ldots\phi_{j_k}(\tau_{l_k}) \Delta\mathbf{w}_{\tau_{l_1}}^{(i_1)} \ldots \Delta\mathbf{w}_{\tau_{l_k}}^{(i_k)} + \tag{31}$$

$$+R_{T,t}^{p_1,\ldots,p_k} =$$

$$= \sum_{j_1=0}^{p_1} \ldots \sum_{j_k=0}^{p_k} C_{j_k\ldots j_1} \left(\underset{N\to\infty}{\text{l.i.m.}} \sum_{l_1,\ldots,l_k=0}^{N-1} \phi_{j_1}(\tau_{l_1})\ldots\phi_{j_k}(\tau_{l_k}) \Delta\mathbf{w}_{\tau_{l_1}}^{(i_1)} \ldots \Delta\mathbf{w}_{\tau_{l_k}}^{(i_k)} - \right.$$

$$\left. - \underset{N\to\infty}{\text{l.i.m.}} \sum_{(l_1,\ldots,l_k)\in \mathrm{G}_k} \phi_{j_1}(\tau_{l_1}) \Delta\mathbf{w}_{\tau_{l_1}}^{(i_1)} \ldots \phi_{j_k}(\tau_{l_k}) \Delta\mathbf{w}_{\tau_{l_k}}^{(i_k)} \right) +$$

$$+R_{T,t}^{p_1,\ldots,p_k} =$$

$$= \sum_{j_1=0}^{p_1} \ldots \sum_{j_k=0}^{p_k} C_{j_k\ldots j_1} \left(\prod_{l=1}^{k} \zeta_{j_l}^{(i_l)} - \underset{N\to\infty}{\text{l.i.m.}} \sum_{(l_1,\ldots,l_k)\in \mathrm{G}_k} \phi_{j_1}(\tau_{l_1}) \Delta\mathbf{w}_{\tau_{l_1}}^{(i_1)} \ldots \phi_{j_k}(\tau_{l_k}) \Delta\mathbf{w}_{\tau_{l_k}}^{(i_k)} \right) +$$

$$+R_{T,t}^{p_1,\ldots,p_k}, \tag{32}$$

where

$$R_{T,t}^{p_1,\ldots,p_k} = \sum_{(t_1,\ldots,t_k)} \int\limits_t^T \ldots \int\limits_t^{t_2} \left(K(t_1,\ldots,t_k) - \sum_{j_1=0}^{p_1} \ldots \sum_{j_k=0}^{p_k} C_{j_k\ldots j_1} \prod_{l=1}^{k} \phi_{j_l}(t_l) \right) \times$$

$$\times d\mathbf{w}_{t_1}^{(i_1)} \ldots d\mathbf{w}_{t_k}^{(i_k)}, \tag{33}$$

where permutations $(t_1,\ldots,t_k)$ when summing are performed only in the values $d\mathbf{w}_{t_1}^{(i_1)}\ldots d\mathbf{w}_{t_k}^{(i_k)}$. At the same time the indexes near upper limits of integration in the iterated stochastic integrals are changed correspondently and if t_r swapped with t_q in the permutation $(t_1,\ldots,t_k)$, then i_r swapped with i_q in the permutation $(i_1,\ldots,i_k)$.

Let us estimate the remainder $R_{T,t}^{p_1,\ldots,p_k}$ of the series.

According to Lemma 2 and (30), we have

$$\mathsf{M}\left\{\left(R_{T,t}^{p_1,\ldots,p_k}\right)^2\right\}\le C_k\sum_{(t_1,\ldots,t_k)}\int\limits_t^T\ldots\int\limits_t^{t_2}\left(K(t_1,\ldots,t_k)-\sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k}C_{j_k\ldots j_1}\prod_{l=1}^k\phi_{j_l}(t_l)\right)^2 dt_1\ldots dt_k=$$

$$=C_k\int\limits_{[t,T]^k}\left(K(t_1,\ldots,t_k)-\sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k}C_{j_k\ldots j_1}\prod_{l=1}^k\phi_{j_l}(t_l)\right)^2 dt_1\ldots dt_k\to 0 \qquad (34)$$

if $p_1,\ldots,p_k\to\infty$, where constant C_k depends only on the multiplicity k of the iterated Ito stochastic integral. Theorem 1 is proved.

Note that (6) can be written as (see (31))

$$J[\psi^{(k)}]_{T,t}=\underset{p_1,\ldots,p_k\to\infty}{\text{l.i.m.}}\sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k}C_{j_k\ldots j_1}J'[\phi_{j_1}\ldots\phi_{j_k}]_{T,t}^{(i_1\ldots i_k)}, \qquad (35)$$

where $J'[\phi_{j_1}\ldots\phi_{j_k}]_{T,t}^{(i_1\ldots i_k)}$ is defined by (19).

It is not difficult to see that for the case of pairwise different numbers $i_1,\ldots,i_k=1,\ldots,m$ from Theorem 1 we obtain

$$J[\psi^{(k)}]_{T,t}=\underset{p_1,\ldots,p_k\to\infty}{\text{l.i.m.}}\sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k}C_{j_k\ldots j_1}\zeta_{j_1}^{(i_1)}\ldots\zeta_{j_k}^{(i_k)}.$$

In order to evaluate the significance of Theorem 1 for practice we will demonstrate its transformed particular cases (see Remark 2) for $k=1,\ldots,7$ [7]-[59]

$$J[\psi^{(1)}]_{T,t}=\underset{p_1\to\infty}{\text{l.i.m.}}\sum_{j_1=0}^{p_1}C_{j_1}\zeta_{j_1}^{(i_1)}, \qquad (36)$$

$$J[\psi^{(2)}]_{T,t}=\underset{p_1,p_2\to\infty}{\text{l.i.m.}}\sum_{j_1=0}^{p_1}\sum_{j_2=0}^{p_2}C_{j_2j_1}\left(\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}-\mathbf{1}_{\{i_1=i_2\ne 0\}}\mathbf{1}_{\{j_1=j_2\}}\right), \qquad (37)$$

$$J[\psi^{(3)}]_{T,t}=\underset{p_1,\ldots,p_3\to\infty}{\text{l.i.m.}}\sum_{j_1=0}^{p_1}\sum_{j_2=0}^{p_2}\sum_{j_3=0}^{p_3}C_{j_3j_2j_1}\Biggl(\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}\zeta_{j_3}^{(i_3)}-$$

$$-\mathbf{1}_{\{i_1=i_2\ne 0\}}\mathbf{1}_{\{j_1=j_2\}}\zeta_{j_3}^{(i_3)}-\mathbf{1}_{\{i_2=i_3\ne 0\}}\mathbf{1}_{\{j_2=j_3\}}\zeta_{j_1}^{(i_1)}-\mathbf{1}_{\{i_1=i_3\ne 0\}}\mathbf{1}_{\{j_1=j_3\}}\zeta_{j_2}^{(i_2)}\Biggr), \qquad (38)$$

$$
\begin{aligned}
J[\psi^{(4)}]_{T,t} = \underset{p_1,\ldots,p_4\to\infty}{\text{l.i.m.}} \sum_{j_1=0}^{p_1}\ldots\sum_{j_4=0}^{p_4} C_{j_4\ldots j_1}\Biggl(\prod_{l=1}^{4}\zeta_{j_l}^{(i_l)}-\\
-\mathbf{1}_{\{i_1=i_2\ne 0\}}\mathbf{1}_{\{j_1=j_2\}}\zeta_{j_3}^{(i_3)}\zeta_{j_4}^{(i_4)}-\mathbf{1}_{\{i_1=i_3\ne 0\}}\mathbf{1}_{\{j_1=j_3\}}\zeta_{j_2}^{(i_2)}\zeta_{j_4}^{(i_4)}-\\
-\mathbf{1}_{\{i_1=i_4\ne 0\}}\mathbf{1}_{\{j_1=j_4\}}\zeta_{j_2}^{(i_2)}\zeta_{j_3}^{(i_3)}-\mathbf{1}_{\{i_2=i_3\ne 0\}}\mathbf{1}_{\{j_2=j_3\}}\zeta_{j_1}^{(i_1)}\zeta_{j_4}^{(i_4)}-\\
-\mathbf{1}_{\{i_2=i_4\ne 0\}}\mathbf{1}_{\{j_2=j_4\}}\zeta_{j_1}^{(i_1)}\zeta_{j_3}^{(i_3)}-\mathbf{1}_{\{i_3=i_4\ne 0\}}\mathbf{1}_{\{j_3=j_4\}}\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}+\\
+\mathbf{1}_{\{i_1=i_2\ne 0\}}\mathbf{1}_{\{j_1=j_2\}}\mathbf{1}_{\{i_3=i_4\ne 0\}}\mathbf{1}_{\{j_3=j_4\}}+\mathbf{1}_{\{i_1=i_3\ne 0\}}\mathbf{1}_{\{j_1=j_3\}}\mathbf{1}_{\{i_2=i_4\ne 0\}}\mathbf{1}_{\{j_2=j_4\}}+\\
+\mathbf{1}_{\{i_1=i_4\ne 0\}}\mathbf{1}_{\{j_1=j_4\}}\mathbf{1}_{\{i_2=i_3\ne 0\}}\mathbf{1}_{\{j_2=j_3\}}\Biggr),
\end{aligned}
\tag{39}
$$

$$
\begin{aligned}

$$+\mathbf{1}_{\{i_4=i_1\ne 0, j_4=j_1, i_2=i_6\ne 0, j_2=j_6, i_3=i_5\ne 0, j_3=j_5\}}+\mathbf{1}_{\{i_5=i_1\ne 0, j_5=j_1, i_2=i_3\ne 0, j_2=j_3, i_4=i_6\ne 0, j_4=j_6\}}+$$

$$+\mathbf{1}_{\{i_5=i_1\ne 0, j_5=j_1, i_2=i_4\ne 0, j_2=j_4, i_3=i_6\ne 0, j_3=j_6\}}+\mathbf{1}_{\{i_5=i_1\ne 0, j_5=j_1, i_2=i_6\ne 0, j_2=j_6, i_3=i_4\ne 0, j_3=j_4\}}+$$

$$+\mathbf{1}_{\{i_6=i_1\ne 0, j_6=j_1, i_2=i_3\ne 0, j_2=j_3, i_4=i_5\ne 0, j_4=j_5\}}+\mathbf{1}_{\{i_6=i_1\ne 0, j_6=j_1, i_2=i_4\ne 0, j_2=j_4, i_3=i_5\ne 0, j_3=j_5\}}+$$

$$+\mathbf{1}_{\{i_6=i_1\ne 0, j_6=j_1, i_2=i_5\ne 0, j_2=j_5, i_3=i_4\ne 0, j_3=j_4\}}\Biggr)\zeta_{j_7}^{(i_7)}\Biggr), \tag{42}$$

where $\mathbf{1}_A$ is the indicator of the set A.

Consider the generalization of the formulas (36)–(42) for the case of arbitrary multiplicity k of $J[\psi^{(k)}]_{T,t}$. In order to do this, let us consider the unordered set $\{1,2,\ldots,k\}$ and separate it into two parts: the first part consists of r unordered pairs (sequence order of these pairs is also unimportant) and the second one consists of the remaining $k-2r$ numbers. So, we have

$$(\{\underbrace{\{g_1,g_2\},\ldots,\{g_{2r-1},g_{2r}\}}_{\text{part 1}}\},\{\underbrace{q_1,\ldots,q_{k-2r}}_{\text{part 2}}\}), \tag{43}$$

where

$$\{g_1,g_2,\ldots,g_{2r-1},g_{2r},q_1,\ldots,q_{k-2r}\}=\{1,2,\ldots,k\},$$

braces mean an unordered set, and parentheses mean an ordered set.

We will say that (43) is the partition and consider the sum with respect to all possible partitions

$$\sum_{\substack{(\{\{g_1,g_2\},\ldots,\{g_{2r-1},g_{2r}\}\},\{q_1,\ldots,q_{k-2r}\})\\ \{g_1,g_2,\ldots,g_{2r-1},g_{2r},q_1,\ldots,q_{k-2r}\}=\{1,2,\ldots,k\}}} a_{g_1g_2,\ldots,g_{2r-1}g_{2r},q_1\ldots q_{k-2r}}, \tag{44}$$

where $a_{g_1g_2,\ldots,g_{2r-1}g_{2r},q_1\ldots q_{k-2r}}\in\mathbb{R}$.

Below there are several examples of sums in the form (44)

$$\sum_{\substack{(\{g_1,g_2\})\\ \{g_1,g_2\}=\{1,2\}}} a_{g_1g_2}=a_{12},$$

$$\sum_{\substack{(\{\{g_1,g_2\},\{g_3,g_4\}\})\\ \{g_1,g_2,g_3,g_4\}=\{1,2,3,4\}}} a_{g_1g_2g_3g_4}=a_{12,34}+a_{13,24}+a_{23,14},$$

$$\sum_{\substack{(\{g_1,g_2\},\{q_1,q_2\})\\ \{g_1,g_2,q_1,q_2\}=\{1,2,3,4\}}} a_{g_1g_2,q_1q_2} =$$

$$= a_{12,34} + a_{13,24} + a_{14,23} + a_{23,14} + a_{24,13} + a_{34,12},$$

$$\sum_{\substack{(\{g_1,g_2\},\{q_1,q_2,q_3\})\\ \{g_1,g_2,q_1,q_2,q_3\}=\{1,2,3,4,5\}}} a_{g_1g_2,q_1q_2q_3} =$$

$$= a_{12,345} + a_{13,245} + a_{14,235} + a_{15,234} + a_{23,145} + a_{24,135}+$$

$$+a_{25,134} + a_{34,125} + a_{35,124} + a_{45,123},$$

$$\sum_{\substack{(\{\{g_1,g_2\},\{g_3,g_4\}\},\{q_1\})\\ \{g_1,g_2,g_3,g_4,q_1\}=\{1,2,3,4,5\}}} a_{g_1g_2,g_3g_4,q_1} =$$

$$= a_{12,34,5} + a_{13,24,5} + a_{14,23,5} + a_{12,35,4} + a_{13,25,4} + a_{15,23,4}+$$

$$+a_{12,54,3} + a_{15,24,3} + a_{14,25,3} + a_{15,34,2} + a_{13,54,2} + a_{14,53,2}+$$

$$+a_{52,34,1} + a_{53,24,1} + a_{54,23,1}.$$

Now, we can formulate Theorem 1 (see (6)) using the alternative form.

Theorem 2 [10] (2009) (also see [11]-[17], [20]-[26], [34], [46]-[51]). *Under the conditions of Theorem* 1 *the following expansion*

$$J[\psi^{(k)}]_{T,t} = \underset{p_1,\ldots,p_k\to\infty}{\text{l.i.m.}} \sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k} C_{j_k\ldots j_1}\Biggl(\prod_{l=1}^{k}\zeta_{j_l}^{(i_l)} + \sum_{r=1}^{[k/2]}(-1)^r\times$$

$$\times \sum_{\substack{(\{\{g_1,g_2\},\ldots,\{g_{2r-1},g_{2r}\}\},\{q_1,\ldots,q_{k-2r}\})\\ \{g_1,g_2,\ldots,g_{2r-1},g_{2r},q_1,\ldots,q_{k-2r}\}=\{1,2,\ldots,k\}}} \prod_{s=1}^{r}\mathbf{1}_{\{i_{g_{2s-1}}=\ i_{g_{2s}}\neq 0\}}\mathbf{1}_{\{j_{g_{2s-1}}=\ j_{g_{2s}}\}}\prod_{l=1}^{k-2r}\zeta_{j_{q_l}}^{(i_{q_l})}\Biggr) \qquad (45)$$

converging in the mean-square sense is valid, where $i_1,\ldots,i_k = 0,1,\ldots,m$, $[x]$ *is an integer part of a real number* x, $\prod_{\emptyset} \stackrel{\sf def}{=} 1$, $\sum_{\emptyset} \stackrel{\sf def}{=} 0$; *another notations are the same as in Theorem* 1.

Proof. The equality (45) will be proved by induction in Sect. 18 (see the proof of Theorem 21).

In particular, from (45) for $k = 5$ we obtain

$$J[\psi^{(5)}]_{T,t} = \underset{p_1,\ldots,p_5\to\infty}{\text{l.i.m.}} \sum_{j_1=0}^{p_1}\ldots\sum_{j_5=0}^{p_5} C_{j_5\ldots j_1}\Biggl(\prod_{l=1}^{5}\zeta_{j_l}^{(i_l)} -$$

$$
-\sum_{\substack{(\{g_1,g_2\},\{q_1,q_2,q_3\})\\ \{g_1,g_2,q_1,q_2,q_3\}=\{1,2,3,4,5\}}} \mathbf{1}_{\{i_{g_1}=\ i_{g_2}\ne 0\}}\mathbf{1}_{\{j_{g_1}=\ j_{g_2}\}}\prod_{l=1}^{3}\zeta_{j_{q_l}}^{(i_{q_l})}+
$$

$$
\left.+\sum_{\substack{(\{\{g_1,g_2\},\{g_3,g_4\}\},\{q_1\})\\ \{g_1,g_2,g_3,g_4,q_1\}=\{1,2,3,4,5\}}} \mathbf{1}_{\{i_{g_1}=\ i_{g_2}\ne 0\}}\mathbf{1}_{\{j_{g_1}=\ j_{g_2}\}}\mathbf{1}_{\{i_{g_3}=\ i_{g_4}\ne 0\}}\mathbf{1}_{\{j_{g_3}=\ j_{g_4}\}}\zeta_{j_{q_1}}^{(i_{q_1})}\right).
$$

The last equality obviously agrees with (40).

3. Comparison of Theorem 2 With Representations of Iterated Ito Stochastic Integrals Based on Hermite Polynomials

Note that the correctness of the formulas (36)–(42) can be verified by the fact that if $i_1=\ldots=i_7=i=1,\ldots,m$ and $\psi_1(s),\ldots,\psi_7(s)\equiv\psi(s)$, then we can derive from (36)–(42) [9] (2007) (also see [10]-[17], [20]-[26]) the well-known equalities

$$
J[\psi^{(1)}]_{T,t}=\frac{1}{1!}\delta_{T,t},
$$

$$
J[\psi^{(2)}]_{T,t}=\frac{1}{2!}\left(\delta_{T,t}^2-\Delta_{T,t}\right),
$$

$$
J[\psi^{(3)}]_{T,t}=\frac{1}{3!}\left(\delta_{T,t}^3-3\delta_{T,t}\Delta_{T,t}\right),
$$

$$
J[\psi^{(4)}]_{T,t}=\frac{1}{4!}\left(\delta_{T,t}^4-6\delta_{T,t}^2\Delta_{T,t}+3\Delta_{T,t}^2\right),
$$

$$
J[\psi^{(5)}]_{T,t}=\frac{1}{5!}\left(\delta_{T,t}^5-10\delta_{T,t}^3\Delta_{T,t}+15\delta_{T,t}\Delta_{T,t}^2\right),
$$

$$
J[\psi^{(6)}]_{T,t}=\frac{1}{6!}\left(\delta_{T,t}^6-15\delta_{T,t}^4\Delta_{T,t}+45\delta_{T,t}^2\Delta_{T,t}^2-15\Delta_{T,t}^3\right),
$$

$$
J[\psi^{(7)}]_{T,t}=\frac{1}{7!}\left(\delta_{T,t}^7-21\delta_{T,t}^5\Delta_{T,t}+105\delta_{T,t}^3\Delta_{T,t}^2-105\delta_{T,t}\Delta_{T,t}^3\right),
$$

which fulfilled w. p. 1, where

$$
\delta_{T,t}=\int\limits_t^T\psi(s)d\mathbf{f}_s^{(i)},\qquad \Delta_{T,t}=\int\limits_t^T\psi^2(s)ds.
$$

The above equalities can be independently obtained using the Ito formula and Hermite polynomials.

When $k=1$ everything is evident. Let us consider the cases $k=2,\ 3$. When $k=2$ for the case $p_1=p_2=p$ we obtain

$$
J[\psi^{(2)}]_{T,t}=\underset{p\to\infty}{\text{l.i.m.}}\left(\sum_{j_1,j_2=0}^{p}C_{j_2j_1}\zeta_{j_1}^{(i)}\zeta_{j_2}^{(i)}-\sum_{j_1=0}^{p}C_{j_1j_1}\right)=
$$

$$= \underset{p\to\infty}{\text{l.i.m.}} \left(\sum_{j_1=0}^{p}\sum_{j_2=0}^{j_1-1}\Bigl(C_{j_2j_1}+C_{j_1j_2}\Bigr)\zeta_{j_1}^{(i)}\zeta_{j_2}^{(i)}+\sum_{j_1=0}^{p}C_{j_1j_1}\left(\left(\zeta_{j_1}^{(i)}\right)^2-1\right)\right)=$$

$$= \underset{p\to\infty}{\text{l.i.m.}} \left(\sum_{j_1=0}^{p}\sum_{j_2=0}^{j_1-1}C_{j_1}C_{j_2}\zeta_{j_1}^{(i)}\zeta_{j_2}^{(i)}+\frac{1}{2}\sum_{j_1=0}^{p}C_{j_1}^2\left(\left(\zeta_{j_1}^{(i)}\right)^2-1\right)\right)=$$

$$= \underset{p\to\infty}{\text{l.i.m.}} \left(\frac{1}{2}\sum_{\substack{j_1,j_2=0\\ j_1\ne j_2}}^{p}C_{j_1}C_{j_2}\zeta_{j_1}^{(i)}\zeta_{j_2}^{(i)}+\frac{1}{2}\sum_{j_1=0}^{p}C_{j_1}^2\left(\left(\zeta_{j_1}^{(i)}\right)^2-1\right)\right)=$$

$$= \underset{p\to\infty}{\text{l.i.m.}} \left(\frac{1}{2}\left(\sum_{j_1=0}^{p}C_{j_1}\zeta_{j_1}^{(i)}\right)^2-\frac{1}{2}\sum_{j_1=0}^{p}C_{j_1}^2\right)=$$

$$= \frac{1}{2!}\left(\delta_{T,t}^2-\Delta_{T,t}\right). \tag{46}$$

Let us explain the last step in (46). For the Ito stochastic integrals the following estimate is valid [77]

$$\mathsf{M}\left\{\left|\int_t^T \xi_\tau df_\tau\right|^q\right\}\le K_q\mathsf{M}\left\{\left(\int_t^T|\xi_\tau|^2d\tau\right)^{q/2}\right\}, \tag{47}$$

where $q>0$ is a fixed number, f_τ is a scalar standard Wiener process, $\xi_\tau\in \text{M}_2([t,T])$, K_q is a constant depending only on q,

$$\int_t^T|\xi_\tau|^2d\tau<\infty\quad \text{w. p. 1},$$

$$\mathsf{M}\left\{\left(\int_t^T|\xi_\tau|^2d\tau\right)^{q/2}\right\}<\infty.$$

Since

$$\delta_{T,t}-\sum_{j_1=0}^{p}C_{j_1}\zeta_{j_1}^{(i)}=\int_t^T\Bigl(\psi(s)-\sum_{j_1=0}^{p}C_{j_1}\phi_{j_1}(s)\Bigr)d\mathbf{f}_s^{(i)},$$

then using the estimate (47) to the right-hand side of this expression and considering that

$$\int_t^T\Bigl(\psi(s)-\sum_{j_1=0}^{p}C_{j_1}\phi_{j_1}(s)\Bigr)^2ds\ \to 0$$

if $p\to\infty$, we obtain

$$\int\limits_t^T \psi(s)d\mathbf{f}_s^{(i)} = q\text{ - }\underset{p\to\infty}{\text{l.i.m.}} \sum_{j_1=0}^{p} C_{j_1}\zeta_{j_1}^{(i)}, \quad q>0, \tag{48}$$

where $q\text{ - }\underset{p\to\infty}{\text{l.i.m.}}$ is a limit in the mean of degree q. Hence, if $q=4$, then it is easy to conclude that

$$\underset{p\to\infty}{\text{l.i.m.}} \left(\sum_{j_1=0}^{p} C_{j_1}\zeta_{j_1}^{(i)}\right)^2 = \delta_{T,t}^2.$$

This equality as well as Parseval's equality were used in the last transition of the formula (46).
If $k=3$ for the case $p_1=p_2=p_3=p$ we have

$$J[\psi^{(3)}]_{T,t} =$$

$$= \underset{p\to\infty}{\text{l.i.m.}} \left(\sum_{j_1,j_2,j_3=0}^{p} C_{j_3j_2j_1}\zeta_{j_1}^{(i)}\zeta_{j_2}^{(i)}\zeta_{j_3}^{(i)} - \sum_{j_1,j_3=0}^{p} C_{j_3j_1j_1}\zeta_{j_3}^{(i)} - \sum_{j_1,j_2=0}^{p} C_{j_2j_2j_1}\zeta_{j_1}^{(i)} - \sum_{j_1,j_2=0}^{p} C_{j_1j_2j_1}\zeta_{j_2}^{(i)}\right) =$$

$$= \underset{p\to\infty}{\text{l.i.m.}} \left(\sum_{j_1,j_2,j_3=0}^{p} C_{j_3j_2j_1}\zeta_{j_1}^{(i)}\zeta_{j_2}^{(i)}\zeta_{j_3}^{(i)} - \sum_{j_1,j_3=0}^{p} \Bigl(C_{j_3j_1j_1} + C_{j_1j_1j_3} + C_{j_1j_3j_1}\Bigr)\zeta_{j_3}^{(i)}\right) =$$

$$= \underset{p\to\infty}{\text{l.i.m.}} \left(\sum_{j_1=0}^{p}\sum_{j_2=0}^{j_1-1}\sum_{j_3=0}^{j_2-1} \Bigl(C_{j_3j_2j_1} + C_{j_3j_1j_2} + C_{j_2j_1j_3} + C_{j_2j_3j_1} + C_{j_1j_2j_3} + C_{j_1j_3j_2}\Bigr)\zeta_{j_1}^{(i)}\zeta_{j_2}^{(i)}\zeta_{j_3}^{(i)} + \right.$$

$$+ \sum_{j_1=0}^{p}\sum_{j_3=0}^{j_1-1} \Bigl(C_{j_3j_1j_3} + C_{j_1j_3j_3} + C_{j_3j_3j_1}\Bigr)\left(\zeta_{j_3}^{(i)}\right)^2\zeta_{j_1}^{(i)} +$$

$$+ \sum_{j_1=0}^{p}\sum_{j_3=0}^{j_1-1} \Bigl(C_{j_3j_1j_1} + C_{j_1j_1j_3} + C_{j_1j_3j_1}\Bigr)\left(\zeta_{j_1}^{(i)}\right)^2\zeta_{j_3}^{(i)} +$$

$$\left. + \sum_{j_1=0}^{p} C_{j_1j_1j_1}\left(\zeta_{j_1}^{(i)}\right)^3 - \sum_{j_1,j_3=0}^{p} \left(C_{j_3j_1j_1} + C_{j_1j_1j_3} + C_{j_1j_3j_1}\right)\zeta_{j_3}^{(i)}\right) =$$

$$= \underset{p\to\infty}{\text{l.i.m.}} \left(\sum_{j_1=0}^{p}\sum_{j_2=0}^{j_1-1}\sum_{j_3=0}^{j_2-1} C_{j_1}C_{j_2}C_{j_3}\zeta_{j_1}^{(i)}\zeta_{j_2}^{(i)}\zeta_{j_3}^{(i)} + \right.$$

$$+\frac{1}{2}\sum_{j_1=0}^{p}\sum_{j_3=0}^{j_1-1}C_{j_3}^2 C_{j_1}\left(\zeta_{j_3}^{(i)}\right)^2\zeta_{j_1}^{(i)}+\frac{1}{2}\sum_{j_1=0}^{p}\sum_{j_3=0}^{j_1-1}C_{j_1}^2 C_{j_3}\left(\zeta_{j_1}^{(i)}\right)^2\zeta_{j_3}^{(i)}+$$

$$\left.+\frac{1}{6}\sum_{j_1=0}^{p}C_{j_1}^3\left(\zeta_{j_1}^{(i)}\right)^3-\frac{1}{2}\sum_{j_1,j_3=0}^{p}C_{j_1}^2 C_{j_3}\zeta_{j_3}^{(i)}\right)=$$

$$=\underset{p\to\infty}{\text{l.i.m.}}\left(\frac{1}{6}\sum_{\substack{j_1,j_2,j_3=0\\ j_1\ne j_2,j_2\ne j_3,j_1\ne j_3}}^{p}C_{j_1}C_{j_2}C_{j_3}\zeta_{j_1}^{(i)}\zeta_{j_2}^{(i)}\zeta_{j_3}^{(i)}+\right.$$

$$+\frac{1}{2}\sum_{j_1=0}^{p}\sum_{j_3=0}^{j_1-1}C_{j_3}^2 C_{j_1}\left(\zeta_{j_3}^{(i)}\right)^2\zeta_{j_1}^{(i)}+\frac{1}{2}\sum_{j_1=0}^{p}\sum_{j_3=0}^{j_1-1}C_{j_1}^2 C_{j_3}\left(\zeta_{j_1}^{(i)}\right)^2\zeta_{j_3}^{(i)}+$$

$$\left.+\frac{1}{6}\sum_{j_1=0}^{p}C_{j_1}^3\left(\zeta_{j_1}^{(i)}\right)^3-\frac{1}{2}\sum_{j_1,j_3=0}^{p}C_{j_1}^2 C_{j_3}\zeta_{j_3}^{(i)}\right)=$$

$$=\underset{p\to\infty}{\text{l.i.m.}}\left(\frac{1}{6}\sum_{j_1,j_2,j_3=0}^{p}C_{j_1}C_{j_2}C_{j_3}\zeta_{j_1}^{(i)}\zeta_{j_2}^{(i)}\zeta_{j_3}^{(i)}-\right.$$

$$-\frac{1}{6}\left(3\sum_{j_1=0}^{p}\sum_{j_3=0}^{j_1-1}C_{j_3}^2 C_{j_1}\left(\zeta_{j_3}^{(i)}\right)^2\zeta_{j_1}^{(i)}+3\sum_{j_1=0}^{p}\sum_{j_3=0}^{j_1-1}C_{j_1}^2 C_{j_3}\left(\zeta_{j_1}^{(i)}\right)^2\zeta_{j_3}^{(i)}+\sum_{j_1=0}^{p}C_{j_1}^3\left(\zeta_{j_1}^{(i)}\right)^3\right)+$$

$$+\frac{1}{2}\sum_{j_1=0}^{p}\sum_{j_3=0}^{j_1-1}C_{j_3}^2 C_{j_1}\left(\zeta_{j_3}^{(i)}\right)^2\zeta_{j_1}^{(i)}+\frac{1}{2}\sum_{j_1=0}^{p}\sum_{j_3=0}^{j_1-1}C_{j_1}^2 C_{j_3}\left(\zeta_{j_1}^{(i)}\right)^2\zeta_{j_3}^{(i)}+$$

$$\left.+\frac{1}{6}\sum_{j_1=0}^{p}C_{j_1}^3\left(\zeta_{j_1}^{(i)}\right)^3-\frac{1}{2}\sum_{j_1,j_3=0}^{p}C_{j_1}^2 C_{j_3}\zeta_{j_3}^{(i)}\right)=$$

$$=\underset{p\to\infty}{\text{l.i.m.}}\left(\frac{1}{6}\left(\sum_{j_1=0}^{p}C_{j_1}\zeta_{j_1}^{(i)}\right)^3-\frac{1}{2}\sum_{j_1=0}^{p}C_{j_1}^2\sum_{j_3=0}^{p}C_{j_3}\zeta_{j_3}^{(i)}\right)=$$

$$=\frac{1}{3!}\left(\delta_{T,t}^3-3\delta_{T,t}\Delta_{T,t}\right). \qquad (49)$$

The last step in (49) follows from the Parseval equality, Theorem 1 for $k=1$, and the equality

$$\underset{p\to\infty}{\text{l.i.m.}}\ \left(\sum_{j_1=0}^{p} C_{j_1}\zeta_{j_1}^{(i)}\right)^3=\delta_{T,t}^3,$$

which can be obtained easily when $q=8$ (see (48)).

In addition, we used the following relations between Fourier coefficients for the considered case

$$C_{j_1j_2}+C_{j_2j_1}=C_{j_1}C_{j_2},\quad 2C_{j_1j_1}=C_{j_1}^2,$$

$$C_{j_1j_2j_3}+C_{j_1j_3j_2}+C_{j_2j_3j_1}+C_{j_2j_1j_3}+C_{j_3j_2j_1}+C_{j_3j_1j_2}=C_{j_1}C_{j_2}C_{j_3},$$

$$2\left(C_{j_1j_1j_3}+C_{j_1j_3j_1}+C_{j_3j_1j_1}\right)=C_{j_1}^2C_{j_3},$$

$$6C_{j_1j_1j_1}=C_{j_1}^3.$$

4. On Usage of Discontinuous Complete Orthonormal Systems of Functions in Theorem 1

Analyzing the proof of Theorem 1, we can ask a natural question: can we weaken the condition of continuity of the functions $\phi_j(x)$, $j=1,2,\ldots$?

We will say that the function $f(x):[t,T]\to\mathbb{R}$ satisfies the condition $(\star)$ if it is continuous on the interval $[t,T]$ except may be for the finite number of points of the finite discontinuity as well as it is right-continuous on the interval $[t,T]$.

Furthermore, let us suppose that $\{\phi_j(x)\}_{j=0}^{\infty}$ is a complete orthonormal system of functions in the space $L_2([t,T])$, each function $\phi_j(x)$ of which for $j<\infty$ satisfies the condition $(\star)$.

It is easy to see that continuity of the functions $\phi_j(x)$ was used substantially in the proof of Theorem 1 in two places: Lemma 3 and the formula (15). It is clear that without the loss of generality the partition $\{\tau_j\}_{j=0}^{N}$ of the interval $[t,T]$ in Lemma 3 and in the formula (15) can be taken so "dense" that among the points τ_j of this partition will be all points of jumps of the functions $\varphi_1(\tau)=\phi_{j_1}(\tau)$, $\ldots$, $\varphi_k(\tau)=\phi_{j_k}(\tau)$ $(j_1,\ldots,j_k<\infty)$ and among the points $(\tau_{j_1},\ldots,\tau_{j_k})$ for which $0\le j_1<\ldots<j_k\le N-1$ there will be all points of jumps of the function $\Phi(t_1,\ldots,t_k)$.

Let us demonstrate how to modify the proofs of Lemma 3 and the formula (15) in the case when $\{\phi_j(x)\}_{j=0}^{\infty}$ is a complete orthonormal system of functions in the space $L_2([t,T])$, each function $\phi_j(x)$ of which for $j<\infty$ satisfies the condition $(\star)$.

At first, consider Lemma 3. In the proof of this lemma we obtained the following relations

$$\mathsf{M}\left\{\left|\sum_{j=0}^{N-1}J[\Delta\varphi_l]_{\tau_{j+1},\tau_j}\right|^4\right\}=\sum_{j=0}^{N-1}\mathsf{M}\left\{\left|J[\Delta\varphi_l]_{\tau_{j+1},\tau_j}\right|^4\right\}+$$

$$+6\sum_{j=0}^{N-1}\mathsf{M}\left\{\left|J[\Delta\varphi_l]_{\tau_{j+1},\tau_j}\right|^2\right\}\sum_{q=0}^{j-1}\mathsf{M}\left\{\left|J[\Delta\varphi_l]_{\tau_{q+1},\tau_q}\right|^2\right\},\qquad(50)$$

$$\mathsf{M}\left\{\left|J[\Delta\varphi_l]_{\tau_{j+1},\tau_j}\right|^2\right\} = \int\limits_{\tau_j}^{\tau_{j+1}} (\varphi_l(\tau_j) - \varphi_l(s))^2 ds,$$

$$\mathsf{M}\left\{\left|J[\Delta\varphi_l]_{\tau_{j+1},\tau_j}\right|^4\right\} = 3\left(\int\limits_{\tau_j}^{\tau_{j+1}} (\varphi_l(\tau_j) - \varphi_l(s))^2 ds\right)^2.$$

Suppose that the functions $\varphi_l(s)$ $(l = 1, \ldots, k)$ satisfy the condition $(\star)$ and the partition $\{\tau_j\}_{j=0}^N$ includes all points of jumps of the functions $\varphi_l(s)$ $(l = 1, \ldots, k)$. It means that for the integral

$$\int\limits_{\tau_j}^{\tau_{j+1}} (\varphi_l(\tau_j) - \varphi_l(s))^2 ds$$

the integrand function is continuous at the interval $[\tau_j, \tau_{j+1}]$, except possibly the point τ_{j+1} of finite discontinuity.

Let $\mu \in (0, \Delta\tau_j)$ be fixed. Then, due to continuity (which means uniform continuity) of the functions $\varphi_l(s)$ $(l = 1, \ldots, k)$ on the interval $[\tau_j, \tau_{j+1} - \mu]$ we have

$$\int\limits_{\tau_j}^{\tau_{j+1}} (\varphi_l(\tau_j) - \varphi_l(s))^2 ds =$$

$$= \int\limits_{\tau_j}^{\tau_{j+1}-\mu} (\varphi_l(\tau_j) - \varphi_l(s))^2 ds + \int\limits_{\tau_{j+1}-\mu}^{\tau_{j+1}} (\varphi_l(\tau_j) - \varphi_l(s))^2 ds < \varepsilon^2(\Delta\tau_j - \mu) + M^2\mu. \tag{51}$$

Obtaining the inequality (51), we proposed that $\Delta\tau_j < \delta(\varepsilon)$ for $j = 0,\ 1, \ldots, N-1$ $(\delta(\varepsilon) > 0$ exists for any $\varepsilon > 0$ and it does not depend on $s)$,

$$|\varphi_l(\tau_j) - \varphi_l(s)| < \varepsilon$$

if $s \in [\tau_j, \tau_{j+1} - \mu]$ (due to uniform continuity of the functions $\varphi_l(s)$ $(l = 1, \ldots, k)$),

$$|\varphi_l(\tau_j) - \varphi_l(s)| < M$$

if $s \in [\tau_{j+1} - \mu, \tau_{j+1}]$, M is a constant (potential point of discontinuity of the function $\varphi_l(s)$ is supposed in the point τ_{j+1}).

Performing the passage to the limit in the inequality (51) when $\mu \to +0$, we get

$$\int\limits_{\tau_j}^{\tau_{j+1}} (\varphi_l(\tau_j) - \varphi_l(s))^2 ds \le \varepsilon^2 \Delta\tau_j.$$

Using this estimate for the right-hand side of (50), we obtain

$$\mathsf{M}\left\{\left|\sum_{j=0}^{N-1} J[\Delta\varphi_l]_{\tau_{j+1},\tau_j}\right|^4\right\} \le \varepsilon^4\left(3\sum_{j=0}^{N-1}(\Delta\tau_j)^2+6\sum_{j=0}^{N-1}\Delta\tau_j\sum_{q=0}^{j-1}\Delta\tau_q\right) <$$

$$< 3\varepsilon^4\left(\delta(\varepsilon)(T-t)+(T-t)^2\right). \tag{52}$$

This implies that

$$\mathsf{M}\left\{\left|\sum_{j=0}^{N-1} J[\Delta\varphi_l]_{\tau_{j+1}\tau_j}\right|^4\right\} \to 0$$

if $N\to\infty$. So, Lemma 3 remains valid.

Now, let us present explanations concerning the correctness of the formula (15) when $\{\phi_j(x)\}_{j=0}^{\infty}$ is a complete orthonormal system of functions in the space $L_2([t,T])$, each function $\phi_j(x)$ of which for $j<\infty$ satisfies the condition $(\star)$.

Let us consider the case $k=3$ and the representation (17). We can demonstrate that in the studied case the first limit on the right-hand side of (17) equals to zero (similarly we demonstrate that the second limit on the right-hand side of (17) equals to zero; proof of the second limit equality to zero on the right-hand side of the formula (16) is the same as for the case of continuous functions $\phi_j(x)$, $j=0,1,\ldots$).

The second moment of the prelimit expression of first limit on the right-hand side of (17) looks as follows

$$\sum_{j_3=0}^{N-1}\sum_{j_2=0}^{j_3-1}\sum_{j_1=0}^{j_2-1}\int\limits_{\tau_{j_2}}^{\tau_{j_2+1}}\int\limits_{\tau_{j_1}}^{\tau_{j_1+1}}\left(\Phi(t_1,t_2,\tau_{j_3})-\Phi(t_1,\tau_{j_2},\tau_{j_3})\right)^2 dt_1dt_2\Delta\tau_{j_3}.$$

Further, for the fixed $\mu\in(0,\Delta\tau_{j_2})$ and $\rho\in(0,\Delta\tau_{j_1})$ we have

$$\int\limits_{\tau_{j_2}}^{\tau_{j_2+1}}\int\limits_{\tau_{j_1}}^{\tau_{j_1+1}}\left(\Phi(t_1,t_2,\tau_{j_3})-\Phi(t_1,\tau_{j_2},\tau_{j_3})\right)^2 dt_1dt_2 =$$

$$=\left(\int\limits_{\tau_{j_2}}^{\tau_{j_2+1}-\mu}+\int\limits_{\tau_{j_2+1}-\mu}^{\tau_{j_2+1}}\right)\left(\int\limits_{\tau_{j_1}}^{\tau_{j_1+1}-\rho}+\int\limits_{\tau_{j_1+1}-\rho}^{\tau_{j_1+1}}\right)\left(\Phi(t_1,t_2,\tau_{j_3})-\Phi(t_1,\tau_{j_2},\tau_{j_3})\right)^2 dt_1dt_2 =$$

$$=\left(\int\limits_{\tau_{j_2}}^{\tau_{j_2+1}-\mu}\int\limits_{\tau_{j_1}}^{\tau_{j_1+1}-\rho}+\int\limits_{\tau_{j_2}}^{\tau_{j_2+1}-\mu}\int\limits_{\tau_{j_1+1}-\rho}^{\tau_{j_1+1}}+\int\limits_{\tau_{j_2+1}-\mu}^{\tau_{j_2+1}}\int\limits_{\tau_{j_1}}^{\tau_{j_1+1}-\rho}+\int\limits_{\tau_{j_2+1}-\mu}^{\tau_{j_2+1}}\int\limits_{\tau_{j_1+1}-\rho}^{\tau_{j_1+1}}\right)\times$$

$$\times\left(\Phi(t_1,t_2,\tau_{j_3})-\Phi(t_1,\tau_{j_2},\tau_{j_3})\right)^2 dt_1dt_2 <$$

$$<\varepsilon^2\left(\Delta\tau_{j_2}-\mu\right)\left(\Delta\tau_{j_1}-\rho\right)+M^2\rho\left(\Delta\tau_{j_2}-\mu\right)+M^2\mu\left(\Delta\tau_{j_1}-\rho\right)+M^2\mu\rho, \tag{53}$$

where M is a constant, $\Delta\tau_j < \delta(\varepsilon)$ for $j = 0, 1, \ldots, N-1$ ($\delta(\varepsilon) > 0$ exists for any $\varepsilon > 0$ and it does not depend on points (t_1, t_2, τ_{j_3}), $(t_1, \tau_{j_2}, \tau_{j_3})$). We suppose here that the partition $\{\tau_j\}_{j=0}^N$ contains all discontinuity points of the function $\Phi(t_1, t_2, t_3)$ as points τ_j (for every variable). When obtaining (53), we also supposed that potential discontinuity points of this function (for every variable) are contained among the points $\tau_{j_1+1}, \tau_{j_2+1}, \tau_{j_3+1}$.

Let us explain in detail how we obtained the inequality (53). Since the function $\Phi(t_1, t_2, t_3)$ is continuous on the closed bounded set

$$Q_3 = \left\{ (t_1, t_2, t_3) : t_1 \in [\tau_{j_1}, \tau_{j_1+1} - \rho], t_2 \in [\tau_{j_2}, \tau_{j_2+1} - \mu], t_3 \in [\tau_{j_3}, \tau_{j_3+1} - \nu] \right\},$$

where ρ, μ, ν are fixed small positive numbers such that

$$\nu \in (0, \Delta\tau_{j_3}), \quad \mu \in (0, \Delta\tau_{j_2}), \quad \rho \in (0, \Delta\tau_{j_1}),$$

then this function is also uniformly continous on this set and bounded on the closed set D_3.

Since the distance between the points (t_1, t_2, τ_{j_3}), $(t_1, \tau_{j_2}, \tau_{j_3}) \in Q_3$ is obviously less than $\delta(\varepsilon)$ ($\Delta\tau_j < \delta(\varepsilon)$ for $j = 0, 1, \ldots, N-1$), then

$$|\Phi(t_1, t_2, \tau_{j_3}) - \Phi(t_1, \tau_{j_2}, \tau_{j_3})| < \varepsilon.$$

This inequality was used to estimate the first double integral in (53). Estimating the three remaining double integrals, we used the property of boundedness of the function $\Phi(t_1, t_2, t_3)$ in form of inequality

$$|\Phi(t_1, t_2, \tau_{j_3}) - \Phi(t_1, \tau_{j_2}, \tau_{j_3})| < M.$$

Performing the passage to the limit in the inequality (53) if $\mu, \rho \to +0$, we obtain the estimate

$$\int\limits_{\tau_{j_2}}^{\tau_{j_2+1}} \int\limits_{\tau_{j_1}}^{\tau_{j_1+1}} \left(\Phi(t_1, t_2, \tau_{j_3}) - \Phi(t_1, \tau_{j_2}, \tau_{j_3})\right)^2 dt_1 dt_2 \le \varepsilon^2 \Delta\tau_{j_2} \Delta\tau_{j_1}.$$

Usage of this estimate provides

$$\sum_{j_3=0}^{N-1} \sum_{j_2=0}^{j_3-1} \sum_{j_1=0}^{j_2-1} \int\limits_{\tau_{j_2}}^{\tau_{j_2+1}} \int\limits_{\tau_{j_1}}^{\tau_{j_1+1}} \left(\Phi(t_1, t_2, \tau_{j_3}) - \Phi(t_1, \tau_{j_2}, \tau_{j_3})\right)^2 dt_1 dt_2 \Delta\tau_{j_3} \le$$

$$\le \varepsilon^2 \sum_{j_3=0}^{N-1} \sum_{j_2=0}^{j_3-1} \sum_{j_1=0}^{j_2-1} \Delta\tau_{j_1} \Delta\tau_{j_2} \Delta\tau_{j_3} < \varepsilon^2 \frac{(T-t)^3}{6}.$$

The last estimate means that in the considered case the first limit on the right-hand side of (17) equals to zero (similarly we can demonstrate that the second limit on the right-hand side of (17) equals to zero).

Consequently, the formula (15) is correct when $k = 3$ in the considered case. Similarly, we perform argumentation for the cases $k = 2$ and $k > 3$.

Consequently, in Theorem 1 we can use complete orthonormal systems of functions $\{\phi_j(x)\}_{j=0}^{\infty}$ in the space $L_2([t, T])$, each function $\phi_j(x)$ of which for $j < \infty$ satisfies the condition $(\star)$.

One of the examples of such systems of functions is a complete orthonormal system of Haar functions in the space $L_2([t, T])$

$$\phi_0(x)=\frac{1}{\sqrt{T-t}},\qquad \phi_{nj}(x)=\frac{1}{\sqrt{T-t}}\varphi_{nj}\left(\frac{x-t}{T-t}\right),$$

where $n=0,1,\ldots,$ $j=1,2,\ldots,2^n$, and the functions $\varphi_{nj}(x)$ have the following form

$$\varphi_{nj}(x)=\begin{cases}2^{n/2}, & x\in[(j-1)/2^n,\ (j-1)/2^n+1/2^{n+1})\\ \\ -2^{n/2}, & x\in[(j-1)/2^n+1/2^{n+1},\ j/2^n)\\ \\ 0, & \text{otherwise}\end{cases},$$

where $n=0,1,\ldots,$ $j=1,2,\ldots,2^n$ (we choose the values of Haar functions in the points of discontinuity in such a way that these functions will be right-continuous).

The other example of similar system of functions is a complete orthonormal system of Rademacher–Walsh functions in the space $L_2([t,T])$

$$\phi_0(x)=\frac{1}{\sqrt{T-t}},$$

$$\phi_{m_1\ldots m_k}(x)=\frac{1}{\sqrt{T-t}}\varphi_{m_1}\left(\frac{x-t}{T-t}\right)\ldots\varphi_{m_k}\left(\frac{x-t}{T-t}\right),$$

where $0<m_1<\ldots<m_k$, $m_1,\ldots,m_k=1,2,\ldots,$ $k=1,2,\ldots,$

$$\varphi_m(x)=(-1)^{[2^m x]},$$

$x\in[0,1]$, $m=1,2,\ldots,$ $[y]$ is an integer part of a real number y.

5. Remark on Usage of Complete Orthonormal Systems of Functions in Theorem 1

Note that actually the functions $\phi_j(s)$ of complete orthonormal system of functions $\{\phi_j(s)\}_{j=0}^{\infty}$ in the space $L_2([t,T])$ depend not only on s, but on t and T.

For example, the complete orthonormal systems of Legendre polynomials and trigonometric functions in the space $L_2([t,T])$ have the following form

$$\phi_j(s,t,T)=\sqrt{\frac{2j+1}{T-t}}P_j\left(\left(s-\frac{T+t}{2}\right)\frac{2}{T-t}\right),$$

where $P_j(s)$ $(j=0,1,2,\ldots)$ is the Legendre polynomial,

$$\phi_j(s,t,T)=\frac{1}{\sqrt{T-t}}\begin{cases}1, & j=0\\ \sqrt{2}\sin\left(2\pi r(s-t)/(T-t)\right), & j=2r-1,\\ \sqrt{2}\cos\left(2\pi r(s-t)/(T-t)\right), & j=2r\end{cases}$$

where $r=1,2,\ldots$

Note that the specified systems of functions are assumed to be used in the context of implementing of numerical methods for Ito stochastic differential equations for the sequences of time intervals

$$[T_0,T_1],\ [T_1,T_2],\ [T_2,T_3],\ \ldots\ ,$$

and spaces

$$L_2([T_0,T_1]),\ L_2([T_1,T_2]),\ L_2([T_2,T_3]),\ \ldots$$

We can explain that the dependence of functions $\phi_j(s,t,T)$ from t and T (hereinafter these constants will mean fixed moments of time) will not affect the main properties of independence of the random variables

$$\zeta_{(j)T,t}^{(i)}=\int\limits_t^T\phi_j(s,t,T)d\mathbf{w}_s^{(i)}, \tag{54}$$

where $i=1,\ldots,m$ and $j=0,1,2,\ldots$

Indeed, for fixed t and T due to orthonormality of the mentioned systems of functions we have

$$\mathsf{M}\left\{\zeta_{(j)T,t}^{(i)}\zeta_{(g)T,t}^{(r)}\right\}=\mathbf{1}_{\{i=r\}}\mathbf{1}_{\{j=g\}}, \tag{55}$$

where

$$\zeta_{(j)T,t}^{(i)}=\int\limits_t^T\phi_j(s,t,T)d\mathbf{w}_s^{(i)},\quad i,r=1,\ldots,m,\quad j,g=0,1,2,\ldots$$

Note that (55) means the independence of random variables (54) for various i or j.

On the other side, the random variables

$$\zeta_{(j)T_1,t_1}^{(i)}=\int\limits_{t_1}^{T_1}\phi_j(s,t_1,T_1)d\mathbf{w}_s^{(i)},\quad \zeta_{(j)T_2,t_2}^{(i)}=\int\limits_{t_2}^{T_2}\phi_j(s,t_2,T_2)d\mathbf{w}_s^{(i)}$$

are independent if $[t_1,T_1]\cap[t_2,T_2]=\emptyset$ (the case $T_1=t_2$ is possible) according to the property of the Ito stochastic integral.

Therefore, two important characteristics of random variables $\zeta_{(j)T,t}^{(i)}$, which are the basic motive of their usage, are saved.

6. Convergence in the Mean of Degree $2n$ ($n \in \mathbb{N}$) of Expansion of Iterated Ito Stochastic Integrals From Theorem 1

This section is written on the base of the following paper [8] (2007) (also see [9]-[17], [20]-[26]).

Constructing the expansions of iterated Ito stochastic integrals from Theorem 1 we saved all information about these integrals. That is why it is natural to expect that the mentioned expansions will be convergent not only in the mean-square sense but in the stronger probabilistic senses.

We will obtain the general estimate which proves the convergence in the mean of degree $2n$ ($n \in \mathbb{N}$) of expansions from Theorem 1.

According to the notations of Theorem 1 (see (33)), we have

$$R_{T,t}^{p_1,\ldots,p_k} = \sum_{(t_1,\ldots,t_k)} \int\limits_t^T \ldots \int\limits_t^{t_2} R_{p_1\ldots p_k}(t_1,\ldots,t_k) d\mathbf{f}_{t_1}^{(i_1)} \ldots d\mathbf{f}_{t_k}^{(i_k)}, \tag{56}$$

$$R_{p_1\ldots p_k}(t_1,\ldots,t_k) \stackrel{\rm def}{=} K(t_1,\ldots,t_k) - \sum_{j_1=0}^{p_1} \ldots \sum_{j_k=0}^{p_k} C_{j_k\ldots j_1} \prod_{l=1}^{k} \phi_{j_l}(t_l),$$

where $i_1,\ldots,i_k = 1,\ldots,m$.

For definiteness we will consider in this section the case $i_1,\ldots,i_k = 1,\ldots,m$ (it is obviously quite enough for the unified Taylor–Ito expansions [38] (also see [7]-[25]) of solutions of Ito stochastic differential equations). Another notations from this section are the same as in the formulation and proof of Theorem 1.

Proving Theorem 1, we obtained that (see (33))

$$\mathsf{M}\left\{\left(R_{T,t}^{p_1,\ldots,p_k}\right)^2\right\} \le C_k \int\limits_{[t,T]^k} R_{p_1\ldots p_k}^2(t_1,\ldots,t_k) dt_1\ldots dt_k,$$

where C_k is a constant.

In the next section we will show that

$$C_k = k!$$

for the following cases

1. $i_1,\ldots,i_k = 1,\ldots,m$ and $0 < T-t < \infty$,
2. $i_1,\ldots,i_k = 0,1,\ldots,m$, $i_1^2+\ldots+i_k^2 > 0$, and $0 < T-t < 1$.

Assume that

$$\eta_{t_l,t}^{(l-1)} \stackrel{\rm def}{=} \int\limits_t^{t_l} \ldots \int\limits_t^{t_2} R_{p_1\ldots p_k}(t_1,\ldots,t_k) d\mathbf{f}_{t_1}^{(i_1)} \ldots d\mathbf{f}_{t_{l-1}}^{(i_{l-1})}, \quad l = 2,\ 3,\ldots,k+1,$$

$$\eta_{t_{k+1},t}^{(k)} \stackrel{\rm def}{=} \eta_{T,t}^{(k)},$$

$$\eta_{T,t}^{(k)} \stackrel{\rm def}{=} \int\limits_t^T \ldots \int\limits_t^{t_2} R_{p_1\ldots p_k}(t_1,\ldots,t_k)d\mathbf{f}_{t_1}^{(i_1)}\ldots d\mathbf{f}_{t_k}^{(i_k)}.$$

Using the Ito formula it is easy to demonstrate that [77]

$$\mathsf{M}\left\{\left(\int\limits_{t_0}^t \xi_\tau df_\tau\right)^{2n}\right\} = n(2n-1)\int\limits_{t_0}^t \mathsf{M}\left\{\left(\int\limits_{t_0}^s \xi_u df_u\right)^{2n-2}\xi_s^2\right\}ds.$$

Using the Holder inequality (under the sign of integration on the right-hand side of the last equality) for $p = n/(n-1)$, $q = n$ and using the increasing of the value

$$\mathsf{M}\left\{\left(\int\limits_{t_0}^t \xi_\tau df_\tau\right)^{2n}\right\}$$

with the growth of t, we get

$$\mathsf{M}\left\{\left(\int\limits_{t_0}^t \xi_\tau df_\tau\right)^{2n}\right\} \le n(2n-1)\left(\mathsf{M}\left\{\left(\int\limits_{t_0}^t \xi_\tau df_\tau\right)^{2n}\right\}\right)^{(n-1)/n}\int\limits_{t_0}^t \left(\mathsf{M}\left\{\xi_s^{2n}\right\}\right)^{1/n}ds.$$

Raising to power n the obtained inequality and dividing it on

$$\left(\mathsf{M}\left\{\left(\int\limits_{t_0}^t \xi_\tau df_\tau\right)^{2n}\right\}\right)^{n-1},$$

we get the following estimate

$$\mathsf{M}\left\{\left(\int\limits_{t_0}^t \xi_\tau df_\tau\right)^{2n}\right\} \le (n(2n-1))^n\left(\int\limits_{t_0}^t \left(\mathsf{M}\left\{\xi_s^{2n}\right\}\right)^{1/n}ds\right)^n. \tag{57}$$

Using the estimate (57), we have

$$\mathsf{M}\left\{\left(\eta_{T,t}^{(k)}\right)^{2n}\right\} \le (n(2n-1))^n\left(\int\limits_t^T \left(\mathsf{M}\left\{\left(\eta_{t_k,t}^{(k-1)}\right)^{2n}\right\}\right)^{1/n}dt_k\right)^n \le$$

$$
\le (n(2n-1))^n \left(\int\limits_t^T \left((n(2n-1))^n \left(\int\limits_t^{t_k} \left(\mathsf{M}\left\{ \left(\eta_{t_{k-1},t}^{(k-2)} \right)^{2n} \right\} \right)^{1/n} dt_{k-1} \right)^n \right)^{1/n} dt_k \right)^n =
$$

$$
= (n(2n-1))^{2n} \left(\int\limits_t^T \int\limits_t^{t_k} \left(\mathsf{M}\left\{ \left(\eta_{t_{k-1},t}^{(k-2)} \right)^{2n} \right\} \right)^{1/n} dt_{k-1} dt_k \right)^n \le \ldots
$$

$$
\ldots \le (n(2n-1))^{n(k-1)} \left(\int\limits_t^T \int\limits_t^{t_k} \ldots \int\limits_t^{t_3} \left(\mathsf{M}\left\{ \left(\eta_{t_2,t}^{(1)} \right)^{2n} \right\} \right)^{1/n} dt_3 \ldots dt_{k-1} dt_k \right)^n =
$$

$$
= (n(2n-1))^{n(k-1)} (2n-1)!! \left(\int\limits_t^T \ldots \int\limits_t^{t_2} R_{p_1\ldots p_k}^2 (t_1,\ldots,t_k) dt_1 \ldots dt_k \right)^n \le
$$

$$
\le (n(2n-1))^{n(k-1)} (2n-1)!! \left(\int\limits_{[t,T]^k} R_{p_1\ldots p_k}^2 (t_1,\ldots,t_k) dt_1 \ldots dt_k \right)^n .
$$

The penultimate step was obtained using the formula

$$
\mathsf{M}\left\{ \left(\eta_{t_2,t}^{(1)} \right)^{2n} \right\} = (2n-1)!! \left(\int\limits_t^{t_2} R_{p_1\ldots p_k}^2 (t_1,\ldots,t_k) dt_1 \right)^n ,
$$

which follows from the Gaussianity of

$$
\eta_{t_2,t}^{(1)} = \int\limits_t^{t_2} R_{p_1\ldots p_k}(t_1,\ldots,t_k) d\mathbf{f}_{t_1}^{(i_1)}.
$$

Similarly, we estimate the each summand on the right-hand side of (56). Then, from (56) using the Minkowski inequality we finally get

$$
\mathsf{M}\left\{ \left(R_{T,t}^{p_1,\ldots,p_k} \right)^{2n} \right\} \le
$$

$$
\le \left(k! \left((n(2n-1))^{n(k-1)} (2n-1)!! \left(\int\limits_{[t,T]^k} R_{p_1\ldots p_k}^2 (t_1,\ldots,t_k) dt_1 \ldots dt_k \right)^n \right)^{1/2n} \right)^{2n} =
$$

$$= (k!)^{2n}(n(2n-1))^{n(k-1)}(2n-1)!! \left(\int\limits_{[t,T]^k} R^2_{p_1\ldots p_k}(t_1,\ldots,t_k)dt_1\ldots dt_k \right)^n. \tag{58}$$

Due to orthonormality of the functions $\phi_j(s)$ $(j = 0, 1, 2, \ldots)$ we obtain

$$\int\limits_{[t,T]^k} R^2_{p_1\ldots p_k}(t_1,\ldots,t_k)dt_1\ldots dt_k =$$

$$= \int\limits_{[t,T]^k} K^2(t_1,\ldots,t_k)dt_1\ldots dt_k - \sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k} C^2_{j_k\ldots j_1}. \tag{59}$$

Let us substitute (59) into (58)

$$\mathsf{M}\left\{\left(R_{T,t}^{p_1,\ldots,p_k}\right)^{2n}\right\} \le$$

$$\le (k!)^{2n}(n(2n-1))^{n(k-1)}(2n-1)!! \times$$

$$\times \left(\int\limits_{[t,T]^k} K^2(t_1,\ldots,t_k)dt_1\ldots dt_k - \sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k} C^2_{j_k\ldots j_1} \right)^n. \tag{60}$$

The inequality (58) (or (60)) means that the expansions of iterated Ito stochastic integrals, obtained using Theorem 1, converge in the mean of degree $2n$ $(n \in \mathbb{N})$, as according to the Parseval equality

$$\int\limits_{[t,T]^k} R^2_{p_1\ldots p_k}(t_1,\ldots,t_k)dt_1\ldots dt_k =$$

$$= \int\limits_{[t,T]^k} K^2(t_1,\ldots,t_k)dt_1\ldots dt_k - \sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k} C^2_{j_k\ldots j_1} \ \to\ 0$$

if $p_1,\ldots,p_k \to \infty$.

7. Estimate for the Mean-Square Error of Approximation of Iterated Ito Stochastic Integrals Based on Theorem 1

In this section, we prove the useful estimate for the mean-square error of approximation in Theorem 1.

Theorem 3 [20]-[25], [34]. *Suppose that every $\psi_l(\tau)$ $(l=1,\ldots,k)$ is a continuous nonrandom function on the interval $[t,T]$ and $\{\phi_j(x)\}_{j=0}^{\infty}$ is a complete orthonormal system of functions in the space $L_2([t,T])$, each function of which for finite j satisfies the condition $(\star)$ (see Sect. 4). Then the estimate*

$$
\mathsf{M}\left\{\left(J[\psi^{(k)}]_{T,t}-J[\psi^{(k)}]_{T,t}^{p_1,\ldots,p_k}\right)^2\right\}\le
$$

$$
\le k!\left(\int\limits_{[t,T]^k}K^2(t_1,\ldots,t_k)dt_1\ldots dt_k-\sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k}C_{j_k\ldots j_1}^2\right) \tag{61}
$$

is valid for the following cases:

1. $i_1,\ldots,i_k=1,\ldots,m$ *and* $0<T-t<\infty$,
2. $i_1,\ldots,i_k=0,1,\ldots,m,$ $i_1^2+\ldots+i_k^2>0,$ *and* $0<T-t<1$,

where $J[\psi^{(k)}]_{T,t}$ is the stochastic integral (1), $J[\psi^{(k)}]_{T,t}^{p_1,\ldots,p_k}$ is the expression on the right-hand side of (6) before passing to the limit $\underset{p_1,\ldots,p_k\to\infty}{\text{l.i.m.}}$; another notations are the same as in Theorem 1.

Proof. Prooving Theorem 1, we obtained w. p. 1 the following representation (see (32), (33))

$$
J[\psi^{(k)}]_{T,t}=J[\psi^{(k)}]_{T,t}^{p_1,\ldots,p_k}+R_{T,t}^{p_1,\ldots,p_k},
$$

where $J[\psi^{(k)}]_{T,t}^{p_1,\ldots,p_k}$ is the expression on the right-hand side of (6) before passing to the limit $\underset{p_1,\ldots,p_k\to\infty}{\text{l.i.m.}}$ and

$$
R_{T,t}^{p_1,\ldots,p_k}=\sum_{(t_1,\ldots,t_k)}\int\limits_t^T\ldots\int\limits_t^{t_2}\left(K(t_1,\ldots,t_k)-\sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k}C_{j_k\ldots j_1}\prod_{l=1}^k\phi_{j_l}(t_l)\right)\times
$$

$$
\times d\mathbf{w}_{t_1}^{(i_1)}\ldots d\mathbf{w}_{t_k}^{(i_k)}, \tag{62}
$$

where

$$
\sum_{(t_1,\ldots,t_k)}
$$

means the sum with respect to all possible permutations $(t_1,\ldots,t_k)$, which are performed only in the values $d\mathbf{w}_{t_1}^{(i_1)}\ldots d\mathbf{w}_{t_k}^{(i_k)}$. At the same time the indexes near upper limits of integration in the iterated stochastic integrals are changed correspondently and if t_r swapped with t_q in the permutation $(t_1,\ldots,t_k)$, then i_r swapped with i_q in the permutation $(i_1,\ldots,i_k)$.

In the case of any fixed k and numbers $i_1,\ldots,i_k=1,\ldots,m$ the integrals on the right-hand side of (62) will be dependent in a stochastic sense. Let us estimate the second moment of $R_{T,t}^{p_1,\ldots,p_k}$. From (22), (62) and elementary inequality

$$(a_1+a_2+\ldots+a_p)^2\le p\left(a_1^2+a_2^2+\ldots+a_p^2\right),\quad p\in\mathbb{N}, \tag{63}$$

we obtain the following estimate for the case $i_1,\ldots,i_k=1,\ldots,m$ $(0<T-t<\infty)$

$$\mathsf{M}\left\{\left(R_{T,t}^{p_1,\ldots,p_k}\right)^2\right\}\le$$

$$\le k!\left(\sum_{(t_1,\ldots,t_k)}\int\limits_t^T\ldots\int\limits_t^{t_2}\left(K(t_1,\ldots,t_k)-\sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k}C_{j_k\ldots j_1}\prod_{l=1}^k\phi_{j_l}(t_l)\right)^2dt_1\ldots dt_k\right)=$$

$$=k!\int\limits_{[t,T]^k}\left(K(t_1,\ldots,t_k)-\sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k}C_{j_k\ldots j_1}\prod_{l=1}^k\phi_{j_l}(t_l)\right)^2dt_1\ldots dt_k=$$

$$=k!\left(\int\limits_{[t,T]^k}K^2(t_1,\ldots,t_k)dt_1\ldots dt_k-\sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k}C_{j_k\ldots j_1}^2\right). \tag{64}$$

For the case of any fixed k and numbers $i_1,\ldots,i_k=0,1,\ldots,m$ $(i_1^2+\ldots+i_k^2>0)$ from (22), (62), (63) we obtain

$$\mathsf{M}\left\{\left(R_{T,t}^{p_1,\ldots,p_k}\right)^2\right\}\le$$

$$\le C_k\sum_{(t_1,\ldots,t_k)}\int\limits_t^T\ldots\int\limits_t^{t_2}\left(K(t_1,\ldots,t_k)-\sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k}C_{j_k\ldots j_1}\prod_{l=1}^k\phi_{j_l}(t_l)\right)^2dt_1\ldots dt_k=$$

$$=C_k\int\limits_{[t,T]^k}\left(K(t_1,\ldots,t_k)-\sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k}C_{j_k\ldots j_1}\prod_{l=1}^k\phi_{j_l}(t_l)\right)^2dt_1\ldots dt_k=$$

$$=C_k\left(\int\limits_{[t,T]^k}K^2(t_1,\ldots,t_k)dt_1\ldots dt_k-\sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k}C_{j_k\ldots j_1}^2\right),$$

where C_k is a constant.

It is not difficult to see that the constant C_k depends on k (k is the multiplicity of the iterated Ito stochastic integral) and $T-t$ ($T-t$ is the length of integration interval of the iterated Ito stochastic integral). Moreover, C_k has the following form

$$C_k = k! \cdot \max\Bigl\{(T-t)^{\alpha_1},\ (T-t)^{\alpha_2},\ \ldots,\ (T-t)^{\alpha_{k!}}\Bigr\},$$

where $\alpha_1, \alpha_2, \ldots, \alpha_{k!} = 0, 1, \ldots, k-1$.

However, $T-t$ is supposed as an integration step of numerical procedures for Ito stochastic differential equations, which is a rather small value. For example $0 < T-t < 1$. Then $C_k \le k!$

It means, that for the case of any fixed k and $i_1, \ldots, i_k = 0, 1, \ldots, m$, $i_1^2 + \ldots + i_k^2 > 0$ $(0 < T-t < 1)$ we can write (61). Theorem 3 is proved.

8. Expansion of Iterated Ito Stochastic Integrals Based on Generalized Multiple Fourier Series. The Case of Complete Orthonormal With Weight $r(t_1)\ldots r(t_k) \ge 0$ Systems of Functions in the Space $L_2([t,T]^k)$

In this section, we consider the modification of Theorem 1 for the case of complete orthonormal with weight $r(t_1)\ldots r(t_k) \ge 0$ systems of functions in the space $L_2([t,T]^k)$ $(k \in \mathbb{N})$.

Let $\{\Psi_j(x)\}_{j=0}^{\infty}$ be a complete orthonormal with weight $r(x) \ge 0$ system of functions in the space $L_2([t,T])$. It is well known that the Fourier series with respect to the system $\{\Psi_j(x)\}_{j=0}^{\infty}$ of function

$$f(x) \quad \Bigl(f(x)\sqrt{r(x)} \in L_2([t,T])\Bigr)$$

converges to the function $f(x)$ in the mean-square sense with weight $r(x)$, i.e.

$$\lim_{p\to\infty} \int\limits_t^T \Biggl(f(x) - \sum_{j=0}^{p} \tilde{C}_j \Psi_j(x)\Biggr)^2 r(x)dx = 0, \tag{65}$$

where

$$\tilde{C}_j = \int\limits_t^T f(x)\Psi_j(x)r(x)dx \tag{66}$$

is the Fourier coefficient.

Obviously, the relation (65) can be obtained if we will expand the function $f(x)\sqrt{r(x)} \in L_2([t,T])$ into a usual Fourier series with respect to the complete orthonormal with weight 1 system of functions

$$\Bigl\{\Psi_j(x)\sqrt{r(x)}\Bigr\}_{j=0}^{\infty}$$

in the space $L_2([t,T])$. Then

$$\lim_{p\to\infty} \int\limits_t^T \Biggl(f(x)\sqrt{r(x)} - \sum_{j=0}^{p} \tilde{C}_j \Psi_j(x)\sqrt{r(x)}\Biggr)^2 dx =$$

$$= \lim_{p\to\infty} \int\limits_t^T \left(f(x) - \sum_{j=0}^{p} \tilde{C}_j \Psi_j(x) \right)^2 r(x) dx = 0, \tag{67}$$

where $\tilde{C}_j$ has the form (66).

Let us consider an obvious generalization of this approach to the case of several variables. Let us expand the function $K(t_1, \ldots, t_k)$ such that

$$K(t_1, \ldots, t_k) \prod_{l=1}^{k} \sqrt{r(t_l)} \in L_2([t, T]^k)$$

using the complete orthonormal system of functions

$$\prod_{l=1}^{k} \Psi_{j_l}(t_l) \sqrt{r(t_l)}, \quad j_l = 0, 1, 2, \ldots, \quad l = 1, \ldots, k$$

in the space $L_2([t, T]^k)$ into the generalized multiple Fourier series.

It is well known that the mentioned generalized multiple Fourier series converges in the mean-square sense, i.e.

$$\lim_{p_1,\ldots,p_k\to\infty} \int\limits_{[t,T]^k} \left(K(t_1, \ldots, t_k) \prod_{l=1}^{k} \sqrt{r(t_l)} - \sum_{j_1=0}^{p_1} \ldots \sum_{j_k=0}^{p_k} \tilde{C}_{j_k \ldots j_1} \prod_{l=1}^{k} \Psi_{j_l}(t_l) \sqrt{r(t_l)} \right)^2 dt_1 \ldots dt_k =$$

(68)

$$= \lim_{p_1,\ldots,p_k\to\infty} \int\limits_{[t,T]^k} \left(K(t_1, \ldots, t_k) - \sum_{j_1=0}^{p_1} \ldots \sum_{j_k=0}^{p_k} \tilde{C}_{j_k \ldots j_1} \prod_{l=1}^{k} \Psi_{j_l}(t_l) \right)^2 \left(\prod_{l=1}^{k} r(t_l) \right) dt_1 \ldots dt_k = 0,$$

where

$$\tilde{C}_{j_k \ldots j_1} = \int\limits_{[t,T]^k} K(t_1, \ldots, t_k) \prod_{l=1}^{k} \Bigl(\Psi_{j_l}(t_l) r(t_l) \Bigr) dt_1 \ldots dt_k.$$

Let us consider the following iterated Ito stochastic integrals

$$\tilde{J}[\psi^{(k)}]_{T,t} = \int\limits_t^T \psi_k(t_k) \sqrt{r(t_k)} \ldots \int\limits_t^{t_2} \psi_1(t_1) \sqrt{r(t_1)} d\mathbf{w}_{t_1}^{(i_1)} \ldots d\mathbf{w}_{t_k}^{(i_k)}, \tag{69}$$

where every $\psi_l(\tau)$ $(l = 1, \ldots, k)$ is a nonrandom function on $[t, T]$, $\mathbf{w}_\tau^{(i)} = \mathbf{f}_\tau^{(i)}$ for $i = 1, \ldots, m$ and $\mathbf{w}_\tau^{(0)} = \tau$, $i_1, \ldots, i_k = 0, 1, \ldots, m$.

So, we obtain the following version of Theorem 1.

Theorem 4 [22]-[25] (also see [21], [36]). *Suppose that every $\psi_l(\tau)$ $(l = 1, \ldots, k)$ is a continuous nonrandom function on the interval $[t, T]$. Moreover, let $\{\Psi_j(x)\sqrt{r(x)}\}_{j=0}^{\infty}$ $(r(x) \geq 0)$ is a complete* *orthonormal system of functions in the space* $L_2([t,T])$*, each function* $\Psi_j(x)\sqrt{r(x)}$ *of which for finite* j *satisfies the condition* $(\star)$ *(see Sect. 4). Then*

$$\tilde{J}[\psi^{(k)}]_{T,t}=\underset{p_1,\ldots,p_k\to\infty}{\text{l.i.m.}}\sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k}\tilde{C}_{j_k\ldots j_1}\Biggl(\prod_{l=1}^{k}\tilde{\zeta}_{j_l}^{(i_l)}-$$

$$-\underset{N\to\infty}{\text{l.i.m.}}\sum_{(l_1,\ldots,l_k)\in\mathrm{G}_k}\Psi_{j_1}(\tau_{l_1})\sqrt{r(\tau_{l_1})}\Delta\mathbf{w}_{\tau_{l_1}}^{(i_1)}\ldots\Psi_{j_k}(\tau_{l_k})\sqrt{r(\tau_{l_k})}\Delta\mathbf{w}_{\tau_{l_k}}^{(i_k)}\Biggr), \tag{70}$$

where

$$\mathrm{G}_k=\mathrm{H}_k\backslash\mathrm{L}_k,\quad \mathrm{H}_k=\{(l_1,\ldots,l_k):\ l_1,\ldots,l_k=0,\ 1,\ldots,N-1\},$$

$$\mathrm{L}_k=\{(l_1,\ldots,l_k):\ l_1,\ldots,l_k=0,\ 1,\ldots,N-1;\ l_g\ne l_r\ (g\ne r);\ g,r=1,\ldots,k\},$$

l.i.m. *is a limit in the mean-square sense,* $i_1,\ldots,i_k=0,1,\ldots,m$*,*

$$\tilde{\zeta}_j^{(i)}=\int\limits_t^T\Psi_j(s)\sqrt{r(s)}d\mathbf{w}_s^{(i)}$$

are independent standard Gaussian random variables for various i *or* j *(in the case when* $i\ne 0$*),* $\Delta\mathbf{w}_{\tau_j}^{(i)}=\mathbf{w}_{\tau_{j+1}}^{(i)}-\mathbf{w}_{\tau_j}^{(i)}$ $(i=0,1,\ldots,m)$*,* $\{\tau_j\}_{j=0}^{N}$ *is a partition of the interval* $[t,T]$*, which satisfies the condition* (5)*,*

$$\tilde{C}_{j_k\ldots j_1}=\int\limits_{[t,T]^k}K(t_1,\ldots,t_k)\prod_{l=1}^{k}\Bigl(\Psi_{j_l}(t_l)r(t_l)\Bigr)dt_1\ldots dt_k$$

is the Fourier coefficient,

$$K(t_1,\ldots,t_k)=\begin{cases}\psi_1(t_1)\ldots\psi_k(t_k), & t_1<\ldots<t_k\\ \\ 0, & \text{otherwise}\end{cases},\quad t_1,\ldots,t_k\in[t,T],\quad k\ge 2,$$

and $K(t_1)\equiv\psi_1(t_1)$ *for* $t_1\in[t,T]$*.*

Proof. According to Lemmas 1, 3 and (20), (29), we get the following representation w. p. 1

$$\tilde{J}[\psi^{(k)}]_{T,t}=\sum_{(t_1,\ldots,t_k)}\int\limits_t^T\ldots\int\limits_t^{t_2}K(t_1,\ldots,t_k)\prod_{l=1}^{k}\sqrt{r(t_l)}d\mathbf{w}_{t_1}^{(i_1)}\ldots d\mathbf{w}_{t_k}^{(i_k)}=$$

$$
=\sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k}\tilde{C}_{j_k\ldots j_1}\int\limits_t^T\ldots\int\limits_t^{t_2}\sum_{(t_1,\ldots,t_k)}\left(\prod_{l=1}^k\left(\Psi_{j_l}(t_l)\sqrt{r(t_l)}\right)d\mathbf{w}_{t_1}^{(i_1)}\ldots d\mathbf{w}_{t_k}^{(i_k)}\right)\tilde{R}_{T,t}^{p_1,\ldots,p_k}=
$$

$$
=\sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k}\tilde{C}_{j_k\ldots j_1}\underset{N\to\infty}{\text{l.i.m.}}\sum_{\substack{l_1,\ldots,l_k=0\\ l_q\ne l_r;\ q\ne r;\ q,r=1,\ldots,k}}^{N-1}\Psi_{j_1}(\tau_{l_1})\sqrt{r(\tau_{l_1})}\Delta\mathbf{w}_{\tau_{l_1}}^{(i_1)}\ldots\Psi_{j_k}(\tau_{l_k})\sqrt{(\tau_{l_k})}\Delta\mathbf{w}_{\tau_{l_k}}^{(i_k)}+
$$

$$
+\tilde{R}_{T,t}^{p_1,\ldots,p_k}=
$$

$$
=\sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k}\tilde{C}_{j_k\ldots j_1}\left(\underset{N\to\infty}{\text{l.i.m.}}\sum_{l_1,\ldots,l_k=0}^{N-1}\Psi_{j_1}(\tau_{l_1})\sqrt{r(\tau_{l_1})}\Delta\mathbf{w}_{\tau_{l_1}}^{(i_1)}\ldots\Psi_{j_k}(\tau_{l_k})\sqrt{(\tau_{l_k})}\Delta\mathbf{w}_{\tau_{l_k}}^{(i_k)}-\right.
$$

$$
\left.-\underset{N\to\infty}{\text{l.i.m.}}\sum_{(l_1,\ldots,l_k)\in\mathrm{G}_k}\Psi_{j_1}(\tau_{l_1})\sqrt{r(\tau_{l_1})}\Delta\mathbf{w}_{\tau_{l_1}}^{(i_1)}\ldots\Psi_{j_k}(\tau_{l_k})\sqrt{(\tau_{l_k})}\Delta\mathbf{w}_{\tau_{l_k}}^{(i_k)}\right)+\tilde{R}_{T,t}^{p_1,\ldots,p_k}=
$$

$$
=\sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k}\tilde{C}_{j_k\ldots j_1}\times
$$

$$
\times\left(\prod_{l=1}^k\tilde{\zeta}_{j_l}^{(i_l)}-\underset{N\to\infty}{\text{l.i.m.}}\sum_{(l_1,\ldots,l_k)\in\mathrm{G}_k}\Psi_{j_1}(\tau_{l_1})\sqrt{r(\tau_{l_1})}\Delta\mathbf{w}_{\tau_{l_1}}^{(i_1)}\ldots\Psi_{j_k}(\tau_{l_k})\sqrt{(\tau_{l_k})}\Delta\mathbf{w}_{\tau_{l_k}}^{(i_k)}\right)+\tilde{R}_{T,t}^{p_1,\ldots,p_k}, \tag{71}
$$

where

$$
\tilde{R}_{T,t}^{p_1,\ldots,p_k}=\sum_{(t_1,\ldots,t_k)}\int\limits_t^T\ldots\int\limits_t^{t_2}\left(K(t_1,\ldots,t_k)\prod_{l=1}^k\sqrt{r(t_l)}-\right.
$$

$$
\left.-\sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k}\tilde{C}_{j_k\ldots j_1}\prod_{l=1}^k\left(\Psi_{j_l}(t_l)\sqrt{r(t_l)}\right)\right)d\mathbf{w}_{t_1}^{(i_1)}\ldots d\mathbf{w}_{t_k}^{(i_k)}, \tag{72}
$$

where permutations $(t_1,\ldots,t_k)$ when summing are performed only in the values $d\mathbf{w}_{t_1}^{(i_1)}\ldots d\mathbf{w}_{t_k}^{(i_k)}$. At the same time the indexes near upper limits of integration in the iterated stochastic integrals are changed correspondently and if t_r swapped with t_q in the permutation $(t_1,\ldots,t_k)$, then i_r swapped with i_q in the permutation $(i_1,\ldots,i_k)$.

Let us evaluate the remainder $\tilde{R}_{T,t}^{p_1,\ldots,p_k}$ of the series.

According to Lemma 2 and (30), we have

$$\mathsf{M}\left\{\left(\tilde{R}_{T,t}^{p_1,\ldots,p_k}\right)^2\right\} \le C_k \sum_{(t_1,\ldots,t_k)} \int\limits_t^T \ldots \int\limits_t^{t_2} \left(K(t_1,\ldots,t_k)\prod_{l=1}^k \sqrt{r(t_l)} - \right.$$

$$\left. - \sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k} \tilde{C}_{j_k\ldots j_1}\prod_{l=1}^k \left(\Psi_{j_l}(t_l)\sqrt{r(t_l)}\right)\right)^2 dt_1\ldots dt_k =$$

$$= C_k \int\limits_{[t,T]^k} \left(K(t_1,\ldots,t_k) - \sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k} \tilde{C}_{j_k\ldots j_1}\prod_{l=1}^k \Psi_{j_l}(t_l)\right)^2 \left(\prod_{l=1}^k r(t_l)\right) dt_1\ldots dt_k \to 0 \tag{73}$$

if $p_1,\ldots,p_k\to\infty$, where constant C_k depends only on the multiplicity k of the iterated Ito stochastic integral (69). Theorem 4 is proved.

Let us formulate the version of Theorem 3.

Theorem 5 [22]-[25], [36]. *Suppose that every $\psi_l(\tau)$ $(l=1,\ldots,k)$ is a continuous nonrandom function on $[t,T]$. Moreover, let $\{\Psi_j(x)\sqrt{r(x)}\}_{j=0}^{\infty}$ $(r(x)\ge 0)$ is a complete orthonormal system of functions in the space $L_2([t,T])$, each function $\Psi_j(x)\sqrt{r(x)}$ of which for finite j satisfies the condition $(\star)$ (see Sect. 4). Then the estimate*

$$\mathsf{M}\left\{\left(\tilde{J}[\psi^{(k)}]_{T,t} - \tilde{J}[\psi^{(k)}]_{T,t}^{p_1,\ldots,p_k}\right)^2\right\} \le$$

$$\le k!\left(\int\limits_{[t,T]^k} K^2(t_1,\ldots,t_k)\left(\prod_{l=1}^k r(t_l)\right)dt_1\ldots dt_k - \sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k}\tilde{C}_{j_k\ldots j_1}^2\right) \tag{74}$$

is valid for the following cases:

1. $i_1,\ldots,i_k=1,\ldots,m$ *and* $0<T-t<\infty$,
2. $i_1,\ldots,i_k=0,1,\ldots,m,$ $i_1^2+\ldots+i_k^2>0,$ *and* $0<T-t<1$,

where $\tilde{J}[\psi^{(k)}]_{T,t}$ is the stochastic integral (69), $\tilde{J}[\psi^{(k)}]_{T,t}^{p_1,\ldots,p_k}$ is the expression on the right-hand side of (70) before passing to the limit $\underset{p_1,\ldots,p_k\to\infty}{\text{l.i.m.}}$; another notations are the same as in Theorem 4.

9. Convergence With Probability 1 of Expansion of Iterated Ito Stochastic Integrals in Theorem 1 for the Case of Multiplicity k $(k\in\mathbb{N})$

This section is written on the base of Sect. 1.7.2 from [22]-[25] and Sect. 6 from [28]. Remind that in a lot of author's publications [7]-[17], [20]-[25] the convergence in Theorem 1 has been considered in different probabilistic senses. For example, the mean-square convergence [7] (2006) (also see [8]-[17], [20]-[25]) and convergence in the mean of degree $2n$ $(n\in\mathbb{N})$ [8] (2007) (also see [9]-[17], [20]-[25]) have been proved. On the examples of specific iterated Ito stochastic integrals of mutiplicities 1 and 2 the convergence with probability 1 has been considered in [8] (2007) (also see [9]-[17], [20]-[25]). However, these examples are narrow particular cases of the iterated Ito stochastic integrals (1).

In this section, we formulate and prove the theorem [22]-[25], [28] on convergence with probability 1 (w. p. 1) of the expansions of iterated Ito stochastic integrals from Theorem 1.

Let us remind the well-known fact from the mathematical analysis, which is connected to existence of iterated limits.

Proposition 1. *Let* $\left\{x_{n,m}\right\}_{n,m=1}^{\infty}$ *be a double sequence and let there exists the limit*

$$\lim_{n,m\to\infty} x_{n,m} = a < \infty.$$

Moreover, let there exist the limits

$$\lim_{n\to\infty} x_{n,m} < \infty \quad \textit{for any} \quad m, \qquad \lim_{m\to\infty} x_{n,m} < \infty \quad \textit{for any} \quad n.$$

Then, there exist the iterated limits

$$\lim_{n\to\infty}\lim_{m\to\infty} x_{n,m}, \qquad \lim_{m\to\infty}\lim_{n\to\infty} x_{n,m}$$

and moreover,

$$\lim_{n\to\infty}\lim_{m\to\infty} x_{n,m} = \lim_{m\to\infty}\lim_{n\to\infty} x_{n,m} = a.$$

Theorem 6 [22]-[25], [28]. *Let* $\psi_l(\tau)$ $(l=1,\ldots,k)$ *are continuously differentiable nonrandom functions on the interval* $[t,T]$ *and* $\{\phi_j(x)\}_{j=0}^{\infty}$ *is a complete orthonormal system of Legendre polynomials or trigonometric functions in the space* $L_2([t,T])$. *Then*

$$J[\psi^{(k)}]_{T,t}^{p,\ldots,p} \ \to \ J[\psi^{(k)}]_{T,t} \quad \textit{if} \quad p\to\infty$$

w. p. 1, *where* $J[\psi^{(k)}]_{T,t}^{p,\ldots,p}$ *is the expression on the right-hand side of* (6) *before passing to the limit* $\underset{p_1,\ldots,p_k\to\infty}{\text{l.i.m.}}$ *for the case* $p_1=\ldots=p_k=p$, *i.e.* (*see Theorem* 1)

$$J[\psi^{(k)}]_{T,t}^{p,\ldots,p} = \sum_{j_1=0}^{p}\ldots\sum_{j_k=0}^{p} C_{j_k\ldots j_1}\Biggl(\prod_{l=1}^{k}\zeta_{j_l}^{(i_l)} -$$

$$-\ \underset{N\to\infty}{\text{l.i.m.}}\sum_{(l_1,\ldots,l_k)\in \mathrm{G}_k}\phi_{j_1}(\tau_{l_1})\Delta\mathbf{w}_{\tau_{l_1}}^{(i_1)}\ldots\phi_{j_k}(\tau_{l_k})\Delta\mathbf{w}_{\tau_{l_k}}^{(i_k)}\Biggr),$$

where $i_1,\ldots,i_k=1,\ldots,m$.

Proof. Let us consider the Parseval equality

$$\int\limits_{[t,T]^k} K^2(t_1,\ldots,t_k)dt_1\ldots dt_k = \lim_{p_1,\ldots,p_k\to\infty}\sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k} C_{j_k\ldots j_1}^2, \tag{75}$$

where

$$K(t_1,\ldots,t_k)=\begin{cases}\psi_1(t_1)\ldots\psi_k(t_k), & t_1<\ldots<t_k\\ \\ 0, & \text{otherwise}\end{cases}\ =\ \prod_{l=1}^{k}\psi_l(t_l)\ \prod_{l=1}^{k-1}\mathbf{1}_{\{t_l<t_{l+1}\}}, \tag{76}$$

where $t_1,\ldots,t_k\in[t,T]$ for $k\ge 2$ and $K(t_1)\equiv\psi_1(t_1)$ for $t_1\in[t,T]$, $\mathbf{1}_A$ denotes the indicator of the set A,

$$C_{j_k\ldots j_1}=\int\limits_{[t,T]^k}K(t_1,\ldots,t_k)\prod_{l=1}^{k}\phi_{j_l}(t_l)dt_1\ldots dt_k \tag{77}$$

is the Fourier coefficient.

Using (76), we obtain

$$C_{j_k\ldots j_1}=\int\limits_t^T\phi_{j_k}(t_k)\psi_k(t_k)\ldots\int\limits_t^{t_2}\phi_{j_1}(t_1)\psi_1(t_1)dt_1\ldots dt_k.$$

Further, we denote

$$\lim_{p_1,\ldots,p_k\to\infty}\sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k}C^2_{j_k\ldots j_1}\stackrel{\sf def}{=}\sum_{j_1,\ldots,j_k=0}^{\infty}C^2_{j_k\ldots j_1}.$$

If $p_1=\ldots=p_k=p$, then we also write

$$\lim_{p\to\infty}\sum_{j_1=0}^{p}\ldots\sum_{j_k=0}^{p}C^2_{j_k\ldots j_1}\stackrel{\sf def}{=}\sum_{j_1,\ldots,j_k=0}^{\infty}C^2_{j_k\ldots j_1}.$$

From the other hand, for iterated limits we write

$$\lim_{p_1\to\infty}\ldots\lim_{p_k\to\infty}\sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k}C^2_{j_k\ldots j_1}\stackrel{\sf def}{=}\sum_{j_1=0}^{\infty}\ldots\sum_{j_k=0}^{\infty}C^2_{j_k\ldots j_1},$$

$$\lim_{p_1\to\infty}\lim_{p_2,\ldots,p_k\to\infty}\sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k}C^2_{j_k\ldots j_1}\stackrel{\sf def}{=}\sum_{j_1=0}^{\infty}\sum_{j_2,\ldots,j_k=0}^{\infty}C^2_{j_k\ldots j_1}$$

and so on.

Let us consider the following lemma.

Lemma 4. *The following equalities are fulfilled*

$$\sum_{j_1,\ldots,j_k=0}^{\infty}C^2_{j_k\ldots j_1}=\sum_{j_1=0}^{\infty}\ldots\sum_{j_k=0}^{\infty}C^2_{j_k\ldots j_1}=$$

$$=\sum_{j_k=0}^{\infty}\ldots\sum_{j_1=0}^{\infty}C^2_{j_k\ldots j_1}=\sum_{j_{q_1}=0}^{\infty}\ldots\sum_{j_{q_k}=0}^{\infty}C^2_{j_k\ldots j_1} \tag{78}$$

for any permutation $(q_1,\ldots,q_k)$ *such that* $\{q_1,\ldots,q_k\}=\{1,\ldots,k\}$.

Proof. Let us consider the value

$$\sum_{j_{q_l}=0}^{p}\ldots\sum_{j_{q_k}=0}^{p}C_{j_k\ldots j_1}^2 \tag{79}$$

for any permutation $(q_l,\ldots,q_k)$, where $l=1,2,\ldots,k$, $\{q_1,\ldots,q_k\}=\{1,\ldots,k\}$.

Obviously, (79) is the non-decreasing sequence with respect to p. Moreover,

$$\sum_{j_{q_l}=0}^{p}\ldots\sum_{j_{q_k}=0}^{p}C_{j_k\ldots j_1}^2\le\sum_{j_{q_1}=0}^{p}\sum_{j_{q_2}=0}^{p}\ldots\sum_{j_{q_k}=0}^{p}C_{j_k\ldots j_1}^2\le$$

$$\le\sum_{j_1,\ldots,j_k=0}^{\infty}C_{j_k\ldots j_1}^2<\infty.$$

Then, the following limit

$$\lim_{p\to\infty}\sum_{j_{q_l}=0}^{p}\ldots\sum_{j_{q_k}=0}^{p}C_{j_k\ldots j_1}^2=\sum_{j_{q_l},\ldots,j_{q_k}=0}^{\infty}C_{j_k\ldots j_1}^2$$

exists.

Let $p_l,\ldots,p_k$ simultaneously tend to infinity. Then $g,r\to\infty$, where $g=\min\{p_l,\ldots,p_k\}$ and $r=\max\{p_l,\ldots,p_k\}$. Moreover,

$$\sum_{j_{q_l}=0}^{g}\ldots\sum_{j_{q_k}=0}^{g}C_{j_k\ldots j_1}^2\le\sum_{j_{q_l}=0}^{p_l}\ldots\sum_{j_{q_k}=0}^{p_k}C_{j_k\ldots j_1}^2\le\sum_{j_{q_l}=0}^{r}\ldots\sum_{j_{q_k}=0}^{r}C_{j_k\ldots j_1}^2.$$

This means that the existence of the limit

$$\lim_{p\to\infty}\sum_{j_{q_l}=0}^{p}\ldots\sum_{j_{q_k}=0}^{p}C_{j_k\ldots j_1}^2 \tag{80}$$

implies the existence of the limit

$$\lim_{p_l,\ldots,p_k\to\infty}\sum_{j_{q_l}=0}^{p_l}\ldots\sum_{j_{q_k}=0}^{p_k}C_{j_k\ldots j_1}^2 \tag{81}$$

and equality of the limits (80) and (81).

Taking into account the above reasoning, we have

$$\lim_{p,q\to\infty}\sum_{j_{q_l}=0}^{q}\sum_{j_{q_{l+1}}=0}^{p}\ldots\sum_{j_{q_k}=0}^{p}C_{j_k\ldots j_1}^2=\lim_{p\to\infty}\sum_{j_{q_l}=0}^{p}\ldots\sum_{j_{q_k}=0}^{p}C_{j_k\ldots j_1}^2=$$

$$=\lim_{p_l,\ldots,p_k\to\infty}\sum_{j_{q_l}=0}^{p_l}\ldots\sum_{j_{q_k}=0}^{p_k}C_{j_k\ldots j_1}^2. \tag{82}$$

Since the limit

$$\sum_{j_1,\ldots,j_k=0}^{\infty} C^2_{j_k\ldots j_1}$$

exists (see the Parseval equality (75)), then from Proposition 1 we have

$$\sum_{j_{q_1}=0}^{\infty}\ \sum_{j_{q_2},\ldots,j_{q_k}=0}^{\infty} C^2_{j_k\ldots j_1} = \lim_{q\to\infty}\lim_{p\to\infty}\sum_{j_{q_1}=0}^{q}\sum_{j_{q_2}=0}^{p}\ldots\sum_{j_{q_k}=0}^{p} C^2_{j_k\ldots j_1} =$$

$$= \lim_{q,p\to\infty}\sum_{j_{q_1}=0}^{q}\sum_{j_{q_2}=0}^{p}\ldots\sum_{j_{q_k}=0}^{p} C^2_{j_k\ldots j_1} = \sum_{j_1,\ldots,j_k=0}^{\infty} C^2_{j_k\ldots j_1}. \tag{83}$$

Using (82) and Proposition 1, we obtain

$$\sum_{j_{q_2}=0}^{\infty}\ \sum_{j_{q_3},\ldots,j_{q_k}=0}^{\infty} C^2_{j_k\ldots j_1} = \lim_{q\to\infty}\lim_{p\to\infty}\sum_{j_{q_2}=0}^{q}\sum_{j_{q_3}=0}^{p}\ldots\sum_{j_{q_k}=0}^{p} C^2_{j_k\ldots j_1} =$$

$$= \lim_{q,p\to\infty}\sum_{j_{q_2}=0}^{q}\sum_{j_{q_3}=0}^{p}\ldots\sum_{j_{q_k}=0}^{p} C^2_{j_k\ldots j_1} = \sum_{j_{q_2},\ldots,j_{q_k}=0}^{\infty} C^2_{j_k\ldots j_1}. \tag{84}$$

Combining (84) and (83), we get

$$\sum_{j_{q_1}=0}^{\infty}\sum_{j_{q_2}=0}^{\infty}\ \sum_{j_{q_3},\ldots,j_{q_k}=0}^{\infty} C^2_{j_k\ldots j_1} = \sum_{j_1,\ldots,j_k=0}^{\infty} C^2_{j_k\ldots j_1}.$$

Repeating the above steps, we complete the proof of Lemma 4.
Further, let us show that for $s=1,\ldots,k$

$$\sum_{j_1=0}^{\infty}\ldots\sum_{j_{s-1}=0}^{\infty}\sum_{j_s=p+1}^{\infty}\sum_{j_{s+1}=0}^{\infty}\ldots\sum_{j_k=0}^{\infty} C^2_{j_k\ldots j_1} =$$

$$= \sum_{j_s=p+1}^{\infty}\sum_{j_{s-1}=0}^{\infty}\ldots\sum_{j_1=0}^{\infty}\sum_{j_{s+1}=0}^{\infty}\ldots\sum_{j_k=0}^{\infty} C^2_{j_k\ldots j_1}. \tag{85}$$

Using the arguments which we used when proving Lemma 4, we have

$$\lim_{n\to\infty}\sum_{j_1=0}^{n}\ldots\sum_{j_{s-1}=0}^{n}\sum_{j_s=0}^{p}\sum_{j_{s+1}=0}^{n}\ldots\sum_{j_k=0}^{n} C^2_{j_k\ldots j_1} =$$

$$= \sum_{j_s=0}^{p}\ \sum_{j_1,\ldots,j_{s-1},j_{s+1},\ldots,j_k=0}^{\infty} C^2_{j_k\ldots j_1} = \sum_{j_s=0}^{p}\sum_{j_{q_1}=0}^{\infty}\ldots\sum_{j_{q_{k-1}}=0}^{\infty} C^2_{j_k\ldots j_1} \tag{86}$$

for any permutation $(q_1,\ldots,q_{k-1})$ such that $\{q_1,\ldots,q_{k-1}\}=\{1,\ldots,s-1,s+1,\ldots,k\}$, where p is a fixed natural number.

Obviously, we have

$$\sum_{j_s=0}^{p}\sum_{j_{q_1}=0}^{\infty}\ldots\sum_{j_{q_{k-1}}=0}^{\infty}C_{j_k\ldots j_1}^2=\sum_{j_{q_1}=0}^{\infty}\ldots\sum_{j_s=0}^{p}\ldots\sum_{j_{q_{k-1}}=0}^{\infty}C_{j_k\ldots j_1}^2=\ldots=$$

$$=\sum_{j_{q_1}=0}^{\infty}\ldots\sum_{j_{q_{k-1}}=0}^{\infty}\sum_{j_s=0}^{p}C_{j_k\ldots j_1}^2. \tag{87}$$

Using (86), (87), and Lemma 4, we obtain

$$\sum_{j_1=0}^{\infty}\ldots\sum_{j_{s-1}=0}^{\infty}\sum_{j_s=p+1}^{\infty}\sum_{j_{s+1}=0}^{\infty}\ldots\sum_{j_k=0}^{\infty}C_{j_k\ldots j_1}^2=\sum_{j_1=0}^{\infty}\ldots\sum_{j_{s-1}=0}^{\infty}\sum_{j_s=0}^{\infty}\sum_{j_{s+1}=0}^{\infty}\ldots\sum_{j_k=0}^{\infty}C_{j_k\ldots j_1}^2-$$

$$-\sum_{j_1=0}^{\infty}\ldots\sum_{j_{s-1}=0}^{\infty}\sum_{j_s=0}^{p}\sum_{j_{s+1}=0}^{\infty}\ldots\sum_{j_k=0}^{\infty}C_{j_k\ldots j_1}^2=$$

$$=\sum_{j_s=0}^{\infty}\sum_{j_{s-1}=0}^{\infty}\ldots\sum_{j_1=0}^{\infty}\sum_{j_{s+1}=0}^{\infty}\ldots\sum_{j_k=0}^{\infty}C_{j_k\ldots j_1}^2-\sum_{j_s=0}^{p}\sum_{j_{s-1}=0}^{\infty}\ldots\sum_{j_1=0}^{\infty}\sum_{j_{s+1}=0}^{\infty}\ldots\sum_{j_k=0}^{\infty}C_{j_k\ldots j_1}^2=$$

$$=\sum_{j_s=p+1}^{\infty}\sum_{j_{s-1}=0}^{\infty}\ldots\sum_{j_1=0}^{\infty}\sum_{j_{s+1}=0}^{\infty}\ldots\sum_{j_k=0}^{\infty}C_{j_k\ldots j_1}^2.$$

The equality (85) is proved.

Using the Parseval equality and Lemma 4, we obtain

$$\int\limits_{[t,T]^k}K^2(t_1,\ldots,t_k)dt_1\ldots dt_k-\sum_{j_1=0}^{p}\ldots\sum_{j_k=0}^{p}C_{j_k\ldots j_1}^2=$$

$$=\sum_{j_1,\ldots,j_k=0}^{\infty}C_{j_k\ldots j_1}^2-\sum_{j_1=0}^{p}\ldots\sum_{j_k=0}^{p}C_{j_k\ldots j_1}^2=$$

$$=\sum_{j_1=0}^{\infty}\ldots\sum_{j_k=0}^{\infty}C_{j_k\ldots j_1}^2-\sum_{j_1=0}^{p}\ldots\sum_{j_k=0}^{p}C_{j_k\ldots j_1}^2=$$

$$=\sum_{j_1=0}^{p}\sum_{j_2=0}^{\infty}\ldots\sum_{j_k=0}^{\infty}C_{j_k\ldots j_1}^2+\sum_{j_1=p+1}^{\infty}\sum_{j_2=0}^{\infty}\ldots\sum_{j_k=0}^{\infty}C_{j_k\ldots j_1}^2-\sum_{j_1=0}^{p}\ldots\sum_{j_k=0}^{p}C_{j_k\ldots j_1}^2=$$

$$= \sum_{j_1=0}^{p} \sum_{j_2=0}^{p} \sum_{j_3=0}^{\infty} \ldots \sum_{j_k=0}^{\infty} C_{j_k \ldots j_1}^2 + \sum_{j_1=0}^{p} \sum_{j_2=p+1}^{\infty} \sum_{j_3=0}^{\infty} \ldots \sum_{j_k=0}^{\infty} +$$

$$+ \sum_{j_1=p+1}^{\infty} \sum_{j_2=0}^{\infty} \ldots \sum_{j_k=0}^{\infty} C_{j_k \ldots j_1}^2 - \sum_{j_1=0}^{p} \ldots \sum_{j_k=0}^{p} C_{j_k \ldots j_1}^2 = \ldots =$$

$$= \sum_{j_1=p+1}^{\infty} \sum_{j_2=0}^{\infty} \ldots \sum_{j_k=0}^{\infty} C_{j_k \ldots j_1}^2 + \sum_{j_1=0}^{p} \sum_{j_2=p+1}^{\infty} \sum_{j_2=0}^{\infty} \ldots \sum_{j_k=0}^{\infty} C_{j_k \ldots j_1}^2 +$$

$$+ \sum_{j_1=0}^{p} \sum_{j_2=0}^{p} \sum_{j_3=p+1}^{\infty} \sum_{j_4=0}^{\infty} \ldots \sum_{j_k=0}^{\infty} C_{j_k \ldots j_1}^2 + \ldots + \sum_{j_1=0}^{p} \ldots \sum_{j_{k-1}=0}^{p} \sum_{j_k=p+1}^{\infty} C_{j_k \ldots j_1}^2 \le$$

$$\le \sum_{j_1=p+1}^{\infty} \sum_{j_2=0}^{\infty} \ldots \sum_{j_k=0}^{\infty} C_{j_k \ldots j_1}^2 + \sum_{j_1=0}^{\infty} \sum_{j_2=p+1}^{\infty} \sum_{j_2=0}^{\infty} \ldots \sum_{j_k=0}^{\infty} C_{j_k \ldots j_1}^2 +$$

$$+ \sum_{j_1=0}^{\infty} \sum_{j_2=0}^{\infty} \sum_{j_3=p+1}^{\infty} \sum_{j_4=0}^{\infty} \ldots \sum_{j_k=0}^{\infty} C_{j_k \ldots j_1}^2 + \ldots + \sum_{j_1=0}^{\infty} \ldots \sum_{j_{k-1}=0}^{\infty} \sum_{j_k=p+1}^{\infty} C_{j_k \ldots j_1}^2 =$$

$$= \sum_{s=1}^{k} \left(\sum_{j_1=0}^{\infty} \ldots \sum_{j_{s-1}=0}^{\infty} \sum_{j_s=p+1}^{\infty} \sum_{j_{s+1}=0}^{\infty} \ldots \sum_{j_k=0}^{\infty} C_{j_k \ldots j_1}^2 \right). \tag{88}$$

Note that deriving (88) we use the following

$$\sum_{j_1=0}^{p} \ldots \sum_{j_{s-1}=0}^{p} \sum_{j_s=p+1}^{\infty} \sum_{j_{s+1}=0}^{\infty} \ldots \sum_{j_k=0}^{\infty} C_{j_k \ldots j_1}^2 \le$$

$$\le \sum_{j_1=0}^{m_1} \ldots \sum_{j_{s-1}=0}^{m_{s-1}} \sum_{j_s=p+1}^{\infty} \sum_{j_{s+1}=0}^{\infty} \ldots \sum_{j_k=0}^{\infty} C_{j_k \ldots j_1}^2 \le$$

$$\le \lim_{m_{s-1} \to \infty} \sum_{j_1=0}^{m_1} \ldots \sum_{j_{s-1}=0}^{m_{s-1}} \sum_{j_s=p+1}^{\infty} \sum_{j_{s+1}=0}^{\infty} \ldots \sum_{j_k=0}^{\infty} C_{j_k \ldots j_1}^2 =$$

$$= \sum_{j_1=0}^{m_1} \ldots \sum_{j_{s-2}=0}^{m_{s-2}} \sum_{j_{s-1}=0}^{\infty} \sum_{j_s=p+1}^{\infty} \sum_{j_{s+1}=0}^{\infty} \ldots \sum_{j_k=0}^{\infty} C_{j_k \ldots j_1}^2 \le$$

$$\le \ldots \le$$

$$\leq \sum_{j_1=0}^{\infty}\ldots\sum_{j_{s-1}=0}^{\infty}\sum_{j_s=p+1}^{\infty}\sum_{j_{s+1}=0}^{\infty}\ldots\sum_{j_k=0}^{\infty}C_{j_k\ldots j_1}^2,$$

where $m_1,\ldots,m_{s-1}>p$.

Denote

$$C_{j_s\ldots j_1}(\tau)=\int\limits_t^{\tau}\phi_{j_s}(t_s)\psi_s(t_s)\ldots\int\limits_t^{t_2}\phi_{j_1}(t_1)\psi_1(t_1)dt_1\ldots dt_s,$$

where $s=1,\ldots,k-1$.

Let us remind the Dini Theorem, which we will use further.

Theorem (Dini). *Let the functional sequence $u_n(x)$ be non-decreasing at each point of the interval $[a,b]$. In addition, all the functions $u_n(x)$ of this sequence and the limit function $u(x)$ are continuous on the interval $[a,b]$. Then the convergence $u_n(x)$ to $u(x)$ is uniform on the interval $[a,b]$.*

For $s<k$ due to the Parseval equality and Dini Theorem as well as (85) we obtain

$$\sum_{j_1=0}^{\infty}\ldots\sum_{j_{s-1}=0}^{\infty}\sum_{j_s=p+1}^{\infty}\sum_{j_{s+1}=0}^{\infty}\ldots\sum_{j_k=0}^{\infty}C_{j_k\ldots j_1}^2=$$

$$\stackrel{(85)}{=}\sum_{j_s=p+1}^{\infty}\sum_{j_{s-1}=0}^{\infty}\ldots\sum_{j_1=0}^{\infty}\sum_{j_{s+1}=0}^{\infty}\ldots\sum_{j_k=0}^{\infty}C_{j_k\ldots j_1}^2=$$

$$\stackrel{\text{(Parseval Eq.)}}{=}\sum_{j_s=p+1}^{\infty}\sum_{j_{s-1}=0}^{\infty}\ldots\sum_{j_1=0}^{\infty}\sum_{j_{s+1}=0}^{\infty}\ldots\sum_{j_{k-1}=0}^{\infty}\int\limits_t^T\psi_k^2(t_k)\left(C_{j_{k-1}\ldots j_1}(t_k)\right)^2dt_k=$$

$$\stackrel{\text{(Dini Th.)}}{=}\sum_{j_s=p+1}^{\infty}\sum_{j_{s-1}=0}^{\infty}\ldots\sum_{j_1=0}^{\infty}\sum_{j_{s+1}=0}^{\infty}\ldots\sum_{j_{k-2}=0}^{\infty}\int\limits_t^T\psi_k^2(t_k)\sum_{j_{k-1}=0}^{\infty}\left(C_{j_{k-1}\ldots j_1}(t_k)\right)^2dt_k=$$

$$\stackrel{\text{(Parseval Eq.)}}{=}\sum_{j_s=p+1}^{\infty}\sum_{j_{s-1}=0}^{\infty}\ldots\sum_{j_1=0}^{\infty}\sum_{j_{s+1}=0}^{\infty}\ldots\sum_{j_{k-2}=0}^{\infty}\int\limits_t^T\psi_k^2(t_k)\int\limits_t^{t_k}\psi_{k-1}^2(t_{k-1})\left(C_{j_{k-2}\ldots j_1}(t_{k-1})\right)^2\times$$

$$\times dt_{k-1}dt_k\leq$$

$$\leq C\sum_{j_s=p+1}^{\infty}\sum_{j_{s-1}=0}^{\infty}\ldots\sum_{j_1=0}^{\infty}\sum_{j_{s+1}=0}^{\infty}\ldots\sum_{j_{k-2}=0}^{\infty}\int\limits_t^T\left(C_{j_{k-2}\ldots j_1}(\tau)\right)^2d\tau=$$

$$\stackrel{\text{(Dini Th.)}}{=} C\sum_{j_s=p+1}^{\infty}\sum_{j_{s-1}=0}^{\infty}\ldots\sum_{j_1=0}^{\infty}\sum_{j_{s+1}=0}^{\infty}\ldots\sum_{j_{k-3}=0}^{\infty}\int\limits_t^T\sum_{j_{k-2}=0}^{\infty}\left(C_{j_{k-2}\ldots j_1}(\tau)\right)^2 d\tau =$$

$$\stackrel{\text{(Parseval Eq.)}}{=} C\sum_{j_s=p+1}^{\infty}\sum_{j_{s-1}=0}^{\infty}\ldots\sum_{j_1=0}^{\infty}\sum_{j_{s+1}=0}^{\infty}\ldots\sum_{j_{k-3}=0}^{\infty}\int\limits_t^T\int\limits_t^{\tau}\psi_{k-2}^2(\theta)\left(C_{j_{k-3}\ldots j_1}(\theta)\right)^2 d\theta d\tau \le$$

$$\le K\sum_{j_s=p+1}^{\infty}\sum_{j_{s-1}=0}^{\infty}\ldots\sum_{j_1=0}^{\infty}\sum_{j_{s+1}=0}^{\infty}\ldots\sum_{j_{k-3}=0}^{\infty}\int\limits_t^T\left(C_{j_{k-3}\ldots j_1}(\tau)\right)^2 d\tau \le$$

$$\le \ldots \le$$

$$\le C_k\sum_{j_s=p+1}^{\infty}\sum_{j_{s-1}=0}^{\infty}\ldots\sum_{j_1=0}^{\infty}\int\limits_t^T\left(C_{j_s\ldots j_1}(\tau)\right)^2 d\tau =$$

$$\stackrel{\text{(Dini Th.)}}{=} C_k\sum_{j_s=p+1}^{\infty}\sum_{j_{s-1}=0}^{\infty}\ldots\sum_{j_2=0}^{\infty}\int\limits_t^T\sum_{j_1=0}^{\infty}\left(C_{j_s\ldots j_1}(\tau)\right)^2 d\tau, \qquad (89)$$

where constants C, K depend on $T-t$ and constant C_k depends on k and $T-t$.

Let us explane more precisely how we obtain (89). For any function $g(s)\in L_2([t,T])$ we have the following Parseval equality

$$\sum_{j=0}^{\infty}\left(\int\limits_t^{\tau}\phi_j(s)g(s)ds\right)^2=\sum_{j=0}^{\infty}\left(\int\limits_t^{T}\mathbf{1}_{\{s<\tau\}}\phi_j(s)g(s)ds\right)^2=$$

$$=\int\limits_t^T\left(\mathbf{1}_{\{s<\tau\}}\right)^2 g^2(s)ds=\int\limits_t^{\tau}g^2(s)ds. \qquad (90)$$

The equality (90) has been applied repeatedly when we obtaining (89).

Using the replacement of integrating order in Riemann integrals, we have

$$C_{j_s\ldots j_1}(\tau)=\int\limits_t^{\tau}\phi_{j_s}(t_s)\psi_s(t_s)\ldots\int\limits_t^{t_2}\phi_{j_1}(t_1)\psi_1(t_1)dt_1\ldots dt_s=$$

$$=\int\limits_t^{\tau}\phi_{j_1}(t_1)\psi_1(t_1)\int\limits_{t_1}^{\tau}\phi_{j_2}(t_2)\psi_2(t_2)\ldots\int\limits_{t_{s-1}}^{\tau}\phi_{j_s}(t_s)\psi_s(t_s)dt_s\ldots dt_2dt_1\stackrel{\text{def}}{=}$$

$$\stackrel{\sf def}{=} \tilde{C}_{j_s\ldots j_1}(\tau).$$

For $l=1,\ldots,s$ we will use the following notation

$$\tilde{C}_{j_s\ldots j_l}(\tau,\theta)=\int\limits_{\theta}^{\tau}\phi_{j_l}(t_l)\psi_l(t_l)\int\limits_{t_l}^{\tau}\phi_{j_{l+1}}(t_{l+1})\psi_{l+1}(t_{l+1})\ldots\int\limits_{t_{s-1}}^{\tau}\phi_{j_s}(t_s)\psi_s(t_s)dt_s\ldots dt_{l+1}dt_l.$$

Using the Parseval equality and Dini Theorem, from (89) we obtain

$$\sum_{j_1=0}^{\infty}\ldots\sum_{j_{s-1}=0}^{\infty}\sum_{j_s=p+1}^{\infty}\sum_{j_{s+1}=0}^{\infty}\ldots\sum_{j_k=0}^{\infty}C_{j_k\ldots j_1}^2\le$$

$$\le C_k\sum_{j_s=p+1}^{\infty}\sum_{j_{s-1}=0}^{\infty}\ldots\sum_{j_2=0}^{\infty}\int\limits_t^T\sum_{j_1=0}^{\infty}\left(C_{j_s\ldots j_1}(\tau)\right)^2d\tau=$$

$$=C_k\sum_{j_s=p+1}^{\infty}\sum_{j_{s-1}=0}^{\infty}\ldots\sum_{j_2=0}^{\infty}\int\limits_t^T\sum_{j_1=0}^{\infty}\left(\tilde{C}_{j_s\ldots j_1}(\tau)\right)^2d\tau=$$

$$\stackrel{\text{(Parseval Eq.)}}{=}\quad C_k\sum_{j_s=p+1}^{\infty}\sum_{j_{s-1}=0}^{\infty}\ldots\sum_{j_2=0}^{\infty}\int\limits_t^T\int\limits_t^{\tau}\psi_1^2(t_1)\left(\tilde{C}_{j_s\ldots j_2}(\tau,t_1)\right)^2dt_1d\tau= \tag{91}$$

$$\stackrel{\text{(Dini Th.)}}{=}\quad C_k\sum_{j_s=p+1}^{\infty}\sum_{j_{s-1}=0}^{\infty}\ldots\sum_{j_3=0}^{\infty}\int\limits_t^T\int\limits_t^{\tau}\psi_1^2(t_1)\sum_{j_2=0}^{\infty}\left(\tilde{C}_{j_s\ldots j_2}(\tau,t_1)\right)^2dt_1d\tau= \tag{92}$$

$$\stackrel{\text{(Parseval Eq.)}}{=}\quad C_k\sum_{j_s=p+1}^{\infty}\sum_{j_{s-1}=0}^{\infty}\ldots\sum_{j_3=0}^{\infty}\int\limits_t^T\int\limits_t^{\tau}\psi_1^2(t_1)\int\limits_{t_1}^{\tau}\psi_2^2(t_2)\left(\tilde{C}_{j_s\ldots j_3}(\tau,t_2)\right)^2dt_2dt_1d\tau\le$$

$$\le C_k\sum_{j_s=p+1}^{\infty}\sum_{j_{s-1}=0}^{\infty}\ldots\sum_{j_3=0}^{\infty}\int\limits_t^T\int\limits_t^{\tau}\psi_1^2(t_1)\int\limits_{t}^{\tau}\psi_2^2(t_2)\left(\tilde{C}_{j_s\ldots j_3}(\tau,t_2)\right)^2dt_2dt_1d\tau\le$$

$$\le C_k'\sum_{j_s=p+1}^{\infty}\sum_{j_{s-1}=0}^{\infty}\ldots\sum_{j_3=0}^{\infty}\int\limits_t^T\int\limits_t^{\tau}\psi_2^2(t_2)\left(\tilde{C}_{j_s\ldots j_3}(\tau,t_2)\right)^2dt_2d\tau\le$$

$$\le \ldots \le$$

$$\le C_k^{''} \sum_{j_s=p+1}^{\infty} \int\limits_t^T \int\limits_t^{\tau} \psi_{s-1}^2(t_{s-1}) \left(\tilde{C}_{j_s}(\tau, t_{s-1})\right)^2 dt_{s-1} d\tau \le$$

$$\le \tilde{C}_k \sum_{j_s=p+1}^{\infty} \int\limits_t^T \int\limits_t^{\tau} \left(\int\limits_u^{\tau} \phi_{j_s}(\theta)\psi_s(\theta) d\theta \right)^2 du d\tau, \tag{93}$$

where constants $C_k^{'}$, $C_k^{''}$, $\tilde{C}_k$ depend on k and $T-t$.

Let us explane more precisely how we obtain (93). For any function $g(s) \in L_2([t,T])$ we have the following Parseval equality

$$\sum_{j=0}^{\infty} \left(\int\limits_{\theta}^{\tau} \phi_j(s) g(s) ds \right)^2 = \sum_{j=0}^{\infty} \left(\int\limits_t^T \mathbf{1}_{\{\theta < s < \tau\}} \phi_j(s) g(s) ds \right)^2 =$$

$$= \int\limits_t^T \left(\mathbf{1}_{\{\theta < s < \tau\}}\right)^2 g^2(s) ds = \int\limits_{\theta}^{\tau} g^2(s) ds. \tag{94}$$

The equality (94) has been applied repeatedly when we obtaining (93).

Let us explane more precisely the passing from (91) to (92) (the same steps have been used when we deriving (93)).

We have

$$\int\limits_t^T \int\limits_t^{\tau} \psi_1^2(t_1) \sum_{j_2=0}^{\infty} \left(\tilde{C}_{j_s \ldots j_2}(\tau, t_1)\right)^2 dt_1 d\tau - \sum_{j_2=0}^{n} \int\limits_t^T \int\limits_t^{\tau} \psi_1^2(t_1) \left(\tilde{C}_{j_s \ldots j_2}(\tau, t_1)\right)^2 dt_1 d\tau =$$

$$= \int\limits_t^T \int\limits_t^{\tau} \psi_1^2(t_1) \sum_{j_2=n+1}^{\infty} \left(\tilde{C}_{j_s \ldots j_2}(\tau, t_1)\right)^2 dt_1 d\tau =$$

$$= \lim_{N \to \infty} \sum_{j=0}^{N-1} \int\limits_t^{\tau_j} \psi_1^2(t_1) \sum_{j_2=n+1}^{\infty} \left(\tilde{C}_{j_s \ldots j_2}(\tau_j, t_1)\right)^2 dt_1 \Delta\tau_j, \tag{95}$$

where $\{\tau_j\}_{j=0}^{N}$ is the partition of the interval $[t,T]$, which satisfies the condition (5).

Since the non-decreasing functional sequence $u_n(\tau_j, t_1)$ and its limit function $u(\tau_j, t_1)$ are continuous on the interval $[t, \tau_j] \subseteq [t,T]$ with respect to t_1, where

$$u_n(\tau_j, t_1) = \sum_{j_2=0}^{n} \left(\tilde{C}_{j_s \ldots j_2}(\tau_j, t_1)\right)^2,$$

$$u(\tau_j,t_1)=\sum_{j_2=0}^{\infty}\left(\tilde C_{j_s\ldots j_2}(\tau_j,t_1)\right)^2=\int\limits_{t_1}^{\tau_j}\psi_2^2(t_2)\left(\tilde C_{j_s\ldots j_3}(\tau_j,t_2)\right)^2dt_2,$$

then by Dini Theorem we have the uniform convergence of $u_n(\tau_j,t_1)$ to $u(\tau_j,t_1)$ at the interval $[t,\tau_j]\subseteq[t,T]$ with respect to t_1. As a result, we obtain

$$\sum_{j_2=n+1}^{\infty}\left(\tilde C_{j_s\ldots j_2}(\tau_j,t_1)\right)^2<\varepsilon,\quad t_1\in[t,\tau_j] \tag{96}$$

for $n>N(\varepsilon)$ ($N(\varepsilon)$ exists for any $\varepsilon>0$ and it does not depend on t_1).

From (95) and (96) we obtain

$$\lim_{N\to\infty}\sum_{j=0}^{N-1}\int\limits_t^{\tau_j}\psi_1^2(t_1)\sum_{j_2=n+1}^{\infty}\left(\tilde C_{j_s\ldots j_2}(\tau_j,t_1)\right)^2dt_1\Delta\tau_j\le\varepsilon\lim_{N\to\infty}\sum_{j=0}^{N-1}\int\limits_t^{\tau_j}\psi_1^2(t_1)dt_1\Delta\tau_j=$$

$$=\varepsilon\int\limits_t^T\int\limits_t^{\tau}\psi_1^2(t_1)dt_1d\tau. \tag{97}$$

From (97) we get

$$\lim_{n\to\infty}\int\limits_t^T\int\limits_t^{\tau}\psi_1^2(t_1)\sum_{j_2=n+1}^{\infty}\left(\tilde C_{j_s\ldots j_2}(\tau,t_1)\right)^2dt_1d\tau=0.$$

This fact completes the proof of passing from (91) to (92).

Let us estimate the integral

$$\int\limits_u^{\tau}\phi_{j_s}(\theta)\psi_s(\theta)d\theta \tag{98}$$

from (93) for the cases when $\{\phi_j(s)\}_{j=0}^{\infty}$ is a complete orthonormal system of Legendre polynomials or trigonometric functions in the space $L_2([t,T])$.

Note that the estimates for the integral

$$\int\limits_t^{\tau}\phi_j(\theta)\psi(\theta)d\theta,\quad j\ge p+1, \tag{99}$$

where $\psi(\theta)$ is a continuously differentiable function on the interval $[t,T]$, have been obtained in [35] (see the formulas (54) (55), (60)) or in [27] (see the formulas (57), (58), (63)). The same estimates also can be found in early publications [16], [17], [20], [21] and in [22]-[25] (2020, 2021, 2023).

Let us estimate the integral (98) using the approach from [27], [35].

First, consider the case of Legendre polynomials. Then $\phi_j(s)$ looks as follows

$$\phi_j(\theta) = \sqrt{\frac{2j+1}{T-t}} P_j\left(\left(\theta - \frac{T+t}{2}\right)\frac{2}{T-t}\right), \quad j \ge 0, \tag{100}$$

where $P_j(x)$ $(j = 0, 1, 2\ldots)$ is a complete orthonormal system of Legendre polynomials in the space $L_2([-1, 1])$.

Further, we have

$$\int\limits_v^x \phi_j(\theta)\psi(\theta)d\theta = \frac{\sqrt{T-t}\sqrt{2j+1}}{2}\int\limits_{z(v)}^{z(x)} P_j(y)\psi(u(y))dy =$$

$$= \frac{\sqrt{T-t}}{2\sqrt{2j+1}}\Biggl((P_{j+1}(z(x)) - P_{j-1}(z(x)))\psi(x) - (P_{j+1}(z(v)) - P_{j-1}(z(v)))\psi(v) -$$

$$-\frac{T-t}{2}\int\limits_{z(v)}^{z(x)} ((P_{j+1}(y) - P_{j-1}(y))\psi'(u(y))dy\Biggr), \tag{101}$$

where $x, v \in (t, T)$, $j \ge p + 1$, $u(y)$ and $z(x)$ are defined by the following relations

$$u(y) = \frac{T-t}{2}y + \frac{T+t}{2}, \quad z(x) = \left(x - \frac{T+t}{2}\right)\frac{2}{T-t},$$

ψ' is a derivative of the function $\psi(\theta)$ with respect to the variable $u(y)$.

Note that in (101) we used the following well-known property of the Legendre polynomials

$$\frac{dP_{j+1}}{dx}(x) - \frac{dP_{j-1}}{dx}(x) = (2j+1)P_j(x), \quad j = 1, 2, \ldots$$

From (101) and the well-known estimate for the Legendre polynomials

$$|P_j(y)| < \frac{K}{\sqrt{j+1}(1-y^2)^{1/4}}, \quad y \in (-1, 1), \quad j \in \mathbb{N}, \tag{102}$$

where constant K does not depend on y and j, it follows that

$$\left|\int\limits_v^x \phi_j(\theta)\psi(\theta)d\theta\right| < \frac{C}{j}\left(\frac{1}{(1-(z(x))^2)^{1/4}} + \frac{1}{(1-(z(v))^2)^{1/4}} + C_1\right), \tag{103}$$

where $j \in \mathbb{N}$, $z(x), z(v) \in (-1, 1)$, $x, v \in (t, T)$, constants C, C_1 do not depend on j.

From (103) we obtain

$$\left(\int\limits_v^x \phi_j(\theta)\psi(\theta)d\theta\right)^2 < \frac{C_2}{j^2}\left(\frac{1}{(1-(z(x))^2)^{1/2}} + \frac{1}{(1-(z(v))^2)^{1/2}} + C_3\right), \tag{104}$$

where $j \in \mathbb{N}$, constants C_2, C_3 do not depend on j.

Let us apply (104) for the estimate of the right-hand side of (93). We have

$$\int\limits_t^T\int\limits_t^\tau\left(\int\limits_u^\tau \phi_{j_s}(\theta)\psi_s(\theta)d\theta\right)^2 dud\tau \le$$

$$\le \frac{K_1}{j_s^2}\left(\int\limits_{-1}^1 \frac{dy}{(1-y^2)^{1/2}} + \int\limits_{-1}^1\int\limits_{-1}^x \frac{dy}{(1-y^2)^{1/2}}dx + K_2\right) \le$$

$$\le \frac{K_3}{j_s^2}, \tag{105}$$

where $j_s \in \mathbb{N}$, constants K_1, K_2, K_3 are independent of j_s.

Now consider the trigonometric case. The complete orthonormal system of trigonometric functions in the space $L_2([t,T])$ has the following form

$$\phi_j(\theta) = \frac{1}{\sqrt{T-t}}\begin{cases} 1, & j=0\\ \sqrt{2}\sin\left(2\pi r(\theta-t)/(T-t)\right), & j=2r-1,\\ \sqrt{2}\cos\left(2\pi r(\theta-t)/(T-t)\right), & j=2r \end{cases} \tag{106}$$

where $r = 1, 2, \ldots$

Using the system of functions (106), we have

$$\int\limits_v^x \phi_{2r-1}(\theta)\psi(\theta)d\theta = \sqrt{\frac{2}{T-t}}\int\limits_v^x \sin\frac{2\pi r(\theta-t)}{T-t}\psi(\theta)d\theta =$$

$$= -\sqrt{\frac{T-t}{2}}\frac{1}{\pi r}\left(\psi(x)\cos\frac{2\pi r(x-t)}{T-t} - \psi(v)\cos\frac{2\pi r(v-t)}{T-t} - \right.$$

$$\left. - \int\limits_v^x \cos\frac{2\pi r(\theta-t)}{T-t}\psi'(\theta)d\theta\right), \tag{107}$$

$$\int\limits_v^x \phi_{2r}(\theta)\psi(\theta)d\theta = \sqrt{\frac{2}{T-t}}\int\limits_v^x \cos\frac{2\pi r(\theta-t)}{T-t}\psi(\theta)d\theta =$$

$$= \sqrt{\frac{T-t}{2}}\frac{1}{\pi r}\left(\psi(x)\sin\frac{2\pi r(x-t)}{T-t} - \psi(v)\sin\frac{2\pi r(v-t)}{T-t} - \right.$$

$$-\int\limits_{v}^{x}\sin\frac{2\pi r(\theta-t)}{T-t}\psi'(\theta)d\theta\Biggr), \tag{108}$$

where $\psi'(\theta)$ is a derivative of the function $\psi(\theta)$ with respect to the variable θ.

Combining (107) and (108), we obtain for the trigonometric case

$$\left(\int\limits_{v}^{x}\phi_j(\theta)\psi(\theta)d\theta\right)^2 \le \frac{C_4}{j^2}, \tag{109}$$

where $j\in\mathbb{N}$, constant C_4 is independent of j.

From (109) we finally have

$$\int\limits_{t}^{T}\int\limits_{t}^{\tau}\left(\int\limits_{u}^{\tau}\phi_{j_s}(\theta)\psi_s(\theta)d\theta\right)^2 dud\tau \le \frac{K_4}{j_s^2}, \tag{110}$$

where $j_s\in\mathbb{N}$, constant K_4 does not depend on j_s.

Combibing (93), (105) and (110), we obtain

$$\sum_{j_1=0}^{\infty}\ldots\sum_{j_{s-1}=0}^{\infty}\sum_{j_s=p+1}^{\infty}\sum_{j_{s+1}=0}^{\infty}\ldots\sum_{j_k=0}^{\infty}C_{j_k\ldots j_1}^2 \le$$

$$\le L_k\sum_{j_s=p+1}^{\infty}\frac{1}{j_s^2}\le\frac{L_k}{p}, \tag{111}$$

where constant L_k depends on k and $T-t$.

Obviously, the case $s=k$ can be considered absolutely analogously to the case $s<k$. Then from (88) and (111) we obtain

$$\int\limits_{[t,T]^k}K^2(t_1,\ldots,t_k)dt_1\ldots dt_k-\sum_{j_1=0}^{p}\ldots\sum_{j_k=0}^{p}C_{j_k\ldots j_1}^2\le\frac{G_k}{p}, \tag{112}$$

where constant G_k depends on k and $T-t$.

For the further consideration we will use the estimate (60). Using (112) and the estimate (60) for the case $p_1=\ldots=p_k=p$ and $n=2$, we obtain

$$\mathsf{M}\left\{\left(J[\psi^{(k)}]_{T,t}-J[\psi^{(k)}]_{T,t}^{p,\ldots,p}\right)^4\right\}\le$$

$$\le C_{2,k}\left(\int\limits_{[t,T]^k}K^2(t_1,\ldots,t_k)dt_1\ldots dt_k-\sum_{j_1=0}^{p}\ldots\sum_{j_k=0}^{p}C_{j_k\ldots j_1}^2\right)^2\le\frac{H_{2,k}}{p^2}, \tag{113}$$

where

$$C_{n,k} = (k!)^{2n}(n(2n-1))^{n(k-1)}(2n-1)!!$$

and $H_{2,k} = G_k^2 C_{2,k}$.

Note the well known fact.

Lemma 5. *If for the sequence of random variables ξ_p and for some $\alpha > 0$ the number series*

$$\sum_{p=1}^{\infty} \mathsf{M}\left\{|\xi_p|^{\alpha}\right\}$$

converges, then the sequence ξ_p converges to zero w. p. 1.

Let α and ξ_p in Lemma 5 be chosen as follows

$$\alpha = 4, \quad \xi_p = \left| J[\psi^{(k)}]_{T,t} - J[\psi^{(k)}]_{T,t}^{p,\ldots,p} \right|.$$

Then from (113) we obtain

$$\sum_{p=1}^{\infty} \mathsf{M}\left\{ \left(J[\psi^{(k)}]_{T,t} - J[\psi^{(k)}]_{T,t}^{p,\ldots,p} \right)^4 \right\} \le H_{2,k} \sum_{p=1}^{\infty} \frac{1}{p^2} < \infty. \tag{114}$$

Using Lemma 5, from (114) we obtain

$$J[\psi^{(k)}]_{T,t}^{p,\ldots,p} \ \to \ J[\psi^{(k)}]_{T,t} \quad \text{if} \quad p \to \infty$$

w. p. 1, where (see Theorem 1)

$$J[\psi^{(k)}]_{T,t}^{p,\ldots,p} = \sum_{j_1=0}^{p} \ldots \sum_{j_k=0}^{p} C_{j_k \ldots j_1} \Biggl(\prod_{l=1}^{k} \zeta_{j_l}^{(i_l)} -$$

$$- \underset{N\to\infty}{\text{l.i.m.}} \sum_{(l_1,\ldots,l_k)\in \mathrm{G}_k} \phi_{j_1}(\tau_{l_1}) \Delta \mathbf{w}_{\tau_{l_1}}^{(i_1)} \ldots \phi_{j_k}(\tau_{l_k}) \Delta \mathbf{w}_{\tau_{l_k}}^{(i_k)} \Biggr) \tag{115}$$

or (see Theorem 2)

$$J[\psi^{(k)}]_{T,t}^{p,\ldots,p} = \sum_{j_1=0}^{p} \ldots \sum_{j_k=0}^{p} C_{j_k \ldots j_1} \Biggl(\prod_{l=1}^{k} \zeta_{j_l}^{(i_l)} + \sum_{r=1}^{[k/2]} (-1)^r \times$$

$$\times \sum_{\substack{(\{\{g_1,g_2\},\ldots,\{g_{2r-1},g_{2r}\}\},\{q_1,\ldots,q_{k-2r}\}) \\ \{g_1,g_2,\ldots,g_{2r-1},g_{2r},q_1,\ldots,q_{k-2r}\}=\{1,2,\ldots,k\}}} \prod_{s=1}^{r} \mathbf{1}_{\{i_{g_{2s-1}} = \, i_{g_{2s}} \ne 0\}} \mathbf{1}_{\{j_{g_{2s-1}} = \, j_{g_{2s}}\}} \prod_{l=1}^{k-2r} \zeta_{j_{q_l}}^{(i_{q_l})} \Biggr), \tag{116}$$

where $i_1,\ldots,i_k=1,\ldots,m$ in (115) and (116). Theorem 6 is proved.

Remark 3. *From Theorem* 3 *and Lemma* 4 *we obtain*

$$\lim_{p_{q_1}\to\infty}\overline{\lim_{p_{q_2}\to\infty}}\ldots\overline{\lim_{p_{q_k}\to\infty}}\ \mathsf{M}\left\{\left(J[\psi^{(k)}]_{T,t}-J[\psi^{(k)}]_{T,t}^{p_1,\ldots,p_k}\right)^2\right\}\le$$

$$\le k!\cdot\lim_{p_{q_1}\to 0}\ldots\lim_{p_{q_k}\to\infty}\left(\int\limits_{[t,T]^k}K^2(t_1,\ldots,t_k)dt_1\ldots dt_k-\sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k}C_{j_k\ldots j_1}^2\right)=$$

$$=k!\left(\int\limits_{[t,T]^k}K^2(t_1,\ldots,t_k)dt_1\ldots dt_k-\sum_{j_{q_1}=0}^{\infty}\ldots\sum_{j_{q_k}=0}^{\infty}C_{j_k\ldots j_1}^2\right)=0$$

for the following cases:

1. $i_1,\ldots,i_k=1,\ldots,m$ *and* $0<T-t<\infty$,
2. $i_1,\ldots,i_k=0,1,\ldots,m,\ \ i_1^2+\ldots+i_k^2>0,$ *and* $0<T-t<1$.

At that, $(q_1,\ldots,q_k)$ *is any permutation such that* $\{q_1,\ldots,q_k\}=\{1,\ldots,k\}$, $J[\psi^{(k)}]_{T,t}$ *is the stochastic integral* (1), $J[\psi^{(k)}]_{T,t}^{p_1,\ldots,p_k}$ *is the expression on the right-hand side of* (6) *before passing to the limit* $\underset{p_1,\ldots,p_k\to\infty}{\text{l.i.m.}}$, $\overline{\lim}$ *means* lim sup; *another notations are the same as in Theorem* 1.

Remark 4. *Taking into account Theorem* 3 *and the estimate* (112)*, we obtain the following inequality*

$$\mathsf{M}\left\{\left(J[\psi^{(k)}]_{T,t}-J[\psi^{(k)}]_{T,t}^{p,\ldots,p}\right)^2\right\}\le\frac{k!P_k(T-t)^k}{p},\tag{117}$$

where $i_1,\ldots,i_k=1,\ldots,m$ *and constant* P_k *depends only on* k.

Remark 5. *The estimates* (60) *and* (112) *imply the following inequality*

$$\mathsf{M}\left\{\left(J[\psi^{(k)}]_{T,t}-J[\psi^{(k)}]_{T,t}^{p,\ldots,p}\right)^{2n}\right\}\le$$

$$\le (k!)^{2n}(n(2n-1))^{n(k-1)}(2n-1)!!\ \frac{(P_k)^n\,(T-t)^{nk}}{p^n},\tag{118}$$

where $i_1,\ldots,i_k=1,\ldots,m,\ \ n\in\mathbb{N}$*, and constant* P_k *depends only on* k.

Remark 6. *Consider the question on the rate of convergence w. p.* 1 *in Theorem* 6*. Using the inequality* (118)*, we obtain*

$$\left(\mathsf{M}\left\{\left(J[\psi^{(k)}]_{T,t}-J[\psi^{(k)}]_{T,t}^{p,\ldots,p}\right)^{2n}\right\}\right)^{1/2n}\le\frac{Q_{n,k}}{\sqrt{p}},\tag{119}$$

where $i_1,\ldots,i_k=1,\ldots,m,\ \ n\in\mathbb{N},$ *and*

$$Q_{n,k}=k!\ (n(2n-1))^{(k-1)/2}\,((2n-1)!!)^{1/2n}\ \sqrt{P_k}\ (T-t)^{k/2}.$$

According to the Lyapunov inequality, we have

$$\left(\mathsf{M}\left\{\left(J[\psi^{(k)}]_{T,t}-J[\psi^{(k)}]_{T,t}^{p,\ldots,p}\right)^n\right\}\right)^{1/n}\le\frac{Q_{n,k}}{\sqrt{p}}\tag{120}$$

for all $n\in\mathbb{N}$. *Following* [79] (*Lemma* 2.1), *we get*

$$\left|J[\psi^{(k)}]_{T,t}-J[\psi^{(k)}]_{T,t}^{p,\ldots,p}\right|=\frac{p^{1/2-\varepsilon}}{p^{1/2-\varepsilon}}\left|J[\psi^{(k)}]_{T,t}-J[\psi^{(k)}]_{T,t}^{p,\ldots,p}\right|\le$$

$$\le\frac{1}{p^{1/2-\varepsilon}}\sup_{p\in\mathbb{N}}\left(p^{1/2-\varepsilon}\left|J[\psi^{(k)}]_{T,t}-J[\psi^{(k)}]_{T,t}^{p,\ldots,p}\right|\right)=\frac{\eta_\varepsilon}{p^{1/2-\varepsilon}}\tag{121}$$

w. p. 1, *where*

$$\eta_\varepsilon=\sup_{p\in\mathbb{N}}\left(p^{1/2-\varepsilon}\left|J[\psi^{(k)}]_{T,t}-J[\psi^{(k)}]_{T,t}^{p,\ldots,p}\right|\right)$$

and $\varepsilon>0$ *is fixed.*

For $q>1/\varepsilon,\ q\in\mathbb{N}$ *we obtain* [79] (*see* (120))

$$\mathsf{M}\left\{|\eta_\varepsilon|^q\right\}=\mathsf{M}\left\{\left(\sup_{p\in\mathbb{N}}\left(p^{1/2-\varepsilon}\left|J[\psi^{(k)}]_{T,t}-J[\psi^{(k)}]_{T,t}^{p,\ldots,p}\right|\right)\right)^q\right\}=$$

$$=\mathsf{M}\left\{\sup_{p\in\mathbb{N}}\left(p^{(1/2-\varepsilon)q}\left|J[\psi^{(k)}]_{T,t}-J[\psi^{(k)}]_{T,t}^{p,\ldots,p}\right|^q\right)\right\}\le$$

$$\le\mathsf{M}\left\{\sum_{p=1}^{\infty}p^{(1/2-\varepsilon)q}\left|J[\psi^{(k)}]_{T,t}-J[\psi^{(k)}]_{T,t}^{p,\ldots,p}\right|^q\right\}=$$

$$=\sum_{p=1}^{\infty}p^{(1/2-\varepsilon)q}\mathsf{M}\left\{\left|J[\psi^{(k)}]_{T,t}-J[\psi^{(k)}]_{T,t}^{p,\ldots,p}\right|^q\right\}\le$$

$$\le\sum_{p=1}^{\infty}p^{(1/2-\varepsilon)q}\frac{(Q_{q,k})^q}{p^{q/2}}=(Q_{q,k})^q\sum_{p=1}^{\infty}\frac{1}{p^{\varepsilon q}}<\infty.\tag{122}$$

From (121) *we obtain that for all* $\varepsilon > 0$ *there exists a random variable* η_ε *such that the inequality* (121) *is fulfilled w. p. 1 for all* $p \in \mathbb{N}$. *Moreover, from the Lyapunov inequality and* (122)*, we obtain* $\mathsf{M}\left\{|\eta_\varepsilon|^q\right\} < \infty$ *for all* $q \geq 1$.

10. Conclusions

Thus, we obtain the following useful possibilities and modifications of the method based on Theorem 1 (in Sect. 15, we will consider the generalization of Theorems 1, 2 to the case of an arbitrary complete orthonormal system of functions in the space $L_2([t,T])$ and $\psi_1(\tau),\ \ldots, \psi_k(\tau) \in L_2([t,T])$).

1. There is an explicit formula (see (4)) for calculation of expansion coefficients of the iterated Ito stochastic integral (1) with any fixed multiplicity k ($k \in \mathbb{N}$).

2. We have possibilities for exact calculation of the mean-square error of approximation of the iterated Ito stochastic integral (1) [34] (also see [20]-[25]).

3. Since the used multiple Fourier series is a generalized in the sense that it is built using various complete orthonormal systems of functions in the space $L_2([t,T])$, then we have new possibilities for approximation — we can use not only trigonometric functions as in [62]-[66] but Legendre polynomials.

4. As it turned out [7]-[55] (also see early publications [3]-[6]) it is more convenient to work with Legendre polynomials for building of approximations of the iterated Ito stochastic integrals (1). Approximations based on the Legendre polynomials essentially simpler than their analogues based on the trigonometric functions [7]-[55] (also see early publications [3]-[6]). Another advantages of the application of Legendre polynomials in the framework of the mentioned problem are considered in [22]-[25], [40], [45].

5. The approach to expansion of iterated stochastic integrals based on the Karhunen–Loeve expansion of the Brownian bridge process [62]-[66], [70], [71], [74], [75] leads to iterated application of the operation of limit transition (the operation of limit transition is implemented only once in Theorem 1) starting from the second multiplicity (in the general case) and third multiplicity (for the case $\psi_1(s), \psi_2(s), \psi_3(s) \equiv 1$; $i_1, i_2, i_3 = 0, 1, \ldots, m$) of the iterated Ito stochastic integrals (1). Multiple series (the operation of limit transition is implemented only once) are more convenient for approximation than the iterated ones (iterated application of the operation of limit transition), since the partial sums of multiple series converge for any possible case of convergence to infinity of their upper limits of summation (let us denote them as $p_1, \ldots, p_k$). For example, when $p_1 = \ldots = p_k = p \to \infty$. For iterated series, the condition $p_1 = \ldots = p_k = p \to \infty$ obviously does not guarantee the convergence of this series. However, in [62] (Sect. 5.8, pp. 202–204), [65] (pp. 438-439), [66] (pp. 82-84), [71] (pp. 263-264) the authors use (without rigorous proof) the condition $p_1 = p_2 = p_3 = p \to \infty$ within the frames of the mentioned approach based on the Karhunen–Loeve expansion of the Brownian bridge process [63] together with the Wong–Zakai approximation [80]-[82] (see discussion in Sect. 11 of this paper for detail).

6. As we mentioned above, constructing the expansions of iterated Ito stochastic integrals from Theorem 1 we saved all information about these integrals. That is why it is natural to expect that the mentioned expansions will converge w. p. 1 and in the mean of degree $2n$ ($n \in \mathbb{N}$) (see Sect. 6 and 9 from this article).

7. The modification of Theorem 1 for complete orthonormal with weight $r(t_1)\ldots r(t_k) \geq 0$ systems of functions in the space $L_2([t,T]^k)$ ($k \in \mathbb{N}$) (Theorems 4, 18) as well as for some other types of

iterated stochastic integrals (iterated stochastic integrals with respect to martingale Poisson measures and iterated stochastic integrals with respect to martingales) were obtained in [21], [22]-[25], [36].

8. The adaptation of Theorem 1 for iterated Stratonovich stochastic integrals of multiplicities 1 to 6 was realized in [12]-[17], [20]-[25], [27]-[30], [32], [33], [35], [37], [39]-[44].

9. Application of Theorem 1 and Theorem 12 (see below) for the mean-square approximation of iterated stochastic integrals with respect to the infinite-dimensional Q-Wiener process can be found in the monographs [22]-[25] (Chapter 7) and in [46]-[49].

11. Theorem 1 from Point of View of the Wong–Zakai Approximation

The iterated Ito stochastic integrals and solutions of Ito stochastic differential equations are complex and important functionals from the independent components $\mathbf{f}_s^{(i)}$, $i=1,\ldots,m$ of the multidimensional Wiener process $\mathbf{f}_s$, $s\in[0,T]$. Let $\mathbf{f}_s^{(i)p}$, $p\in\mathbb{N}$ be some approximation of $\mathbf{f}_s^{(i)}$, $i=1,\ldots,m$. Suppose that $\mathbf{f}_s^{(i)p}$ converges to $\mathbf{f}_s^{(i)}$, $i=1,\ldots,m$ if $p\to\infty$ in some sense and has differentiable sample trajectories.

A natural question arises: if we replace $\mathbf{f}_s^{(i)}$ by $\mathbf{f}_s^{(i)p}$, $i=1,\ldots,m$ in the functionals mentioned above, will the resulting functionals converge to the original functionals from the components $\mathbf{f}_s^{(i)}$, $i=1,\ldots,m$ of the multidimentional Wiener process $\mathbf{f}_s$? The answere to this question is negative in the general case. However, in the pioneering works of Wong E. and Zakai M. [80], [81], it was shown that under the special conditions and for some types of approximations of the Wiener process the answere is affirmative with one peculiarity: the convergence takes place to the iterated Stratonovich stochastic integrals and solutions of Stratonovich stochastic differential equations and not to iterated Ito stochastic integrals and solutions of Ito stochastic differential equations. The piecewise linear approximation as well as the regularization by convolution [80]-[82] relate the mentioned types of approximations of the Wiener process. The above approximation of stochastic integrals and solutions of stochastic differential equations is often called the Wong–Zakai approximation.

Let $\mathbf{f}_s$, $s\in[0,T]$ be an m-dimensional standard Wiener process with independent components $\mathbf{f}_s^{(i)}$, $i=1,\ldots,m$. It is well known that the following representation takes place [83], [84]

$$\mathbf{f}_\tau^{(i)}-\mathbf{f}_t^{(i)}=\sum_{j=0}^{\infty}\int\limits_t^{\tau}\phi_j(s)ds\ \zeta_j^{(i)},\quad \zeta_j^{(i)}=\int\limits_t^{T}\phi_j(s)d\mathbf{f}_s^{(i)}, \tag{123}$$

where $\tau\in[t,T]$, $t\ge 0$, $\{\phi_j(x)\}_{j=0}^{\infty}$ is an arbitrary complete orthonormal system of functions in the space $L_2([t,T])$, and $\zeta_j^{(i)}$ are independent standard Gaussian random variables for various i or j. Moreover, the series (123) converges for any $\tau\in[t,T]$ in the mean-square sense.

Let $\mathbf{f}_\tau^{(i)p}-\mathbf{f}_t^{(i)p}$ be the mean-square approximation of the process $\mathbf{f}_\tau^{(i)}-\mathbf{f}_t^{(i)}$, which has the following form

$$\mathbf{f}_\tau^{(i)p}-\mathbf{f}_t^{(i)p}=\sum_{j=0}^{p}\int\limits_t^{\tau}\phi_j(s)ds\ \zeta_j^{(i)}. \tag{124}$$

From (124) we obtain

$$d\mathbf{f}_\tau^{(i)p}=\sum_{j=0}^{p}\phi_j(\tau)\zeta_j^{(i)}d\tau. \tag{125}$$

Consider the following iterated Riemann–Stieltjes integral

$$\int\limits_t^T\psi_k(t_k)\ldots\int\limits_t^{t_2}\psi_1(t_1)d\mathbf{w}_{t_1}^{(i_1)p_1}\ldots d\mathbf{w}_{t_k}^{(i_k)p_k}, \tag{126}$$

where $i_1,\ldots,i_k=0,1,\ldots,m,\ \ p_1,\ldots,p_k\in\mathbb{N}$,

$$d\mathbf{w}_\tau^{(i)p}=\begin{cases}d\mathbf{f}_\tau^{(i)p} & \text{for}\quad i=1,\ldots,m\\ \\ d\tau & \text{for}\quad i=0\end{cases}, \tag{127}$$

and $d\mathbf{f}_\tau^{(i)p}$ in defined by the relation (125).

Let us substitute (125) into (126)

$$\int\limits_t^T\psi_k(t_k)\ldots\int\limits_t^{t_2}\psi_1(t_1)d\mathbf{w}_{t_1}^{(i_1)p_1}\ldots d\mathbf{w}_{t_k}^{(i_k)p_k}=\sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k}C_{j_k\ldots j_1}\prod_{l=1}^{k}\zeta_{j_l}^{(i_l)}, \tag{128}$$

where

$$\zeta_j^{(i)}=\int\limits_t^T\phi_j(s)d\mathbf{w}_s^{(i)}$$

are independent standard Gaussian random variables for various i or j (in the case when $i\neq 0$), $\mathbf{w}_s^{(i)}=\mathbf{f}_s^{(i)}$ for $i=1,\ldots,m$ and $\mathbf{w}_s^{(0)}=s$,

$$C_{j_k\ldots j_1}=\int\limits_t^T\psi_k(t_k)\phi_{j_k}(t_k)\ldots\int\limits_t^{t_2}\psi_1(t_1)\phi_{j_1}(t_1)dt_1\ldots dt_k$$

is the Fourier coefficient.

Consider the following iterated Stratonovich stochastic integral

$$\int\limits_t^{*T}\psi_k(t_k)\ldots\int\limits_t^{*t_2}\psi_1(t_1)d\mathbf{w}_{t_1}^{(i_1)}\ldots d\mathbf{w}_{t_k}^{(i_k)}, \tag{129}$$

where every $\psi_l(\tau)$ $(l=1,\ldots,k)$ is a continuously differentialble nonrandom function on $[t,T]$, $\mathbf{w}_s^{(i)}=\mathbf{f}_s^{(i)}$ for $i=1,\ldots,m$ and $\mathbf{w}_s^{(0)}=\tau$; $i_1,\ldots,i_k=0,1,\ldots,m$.

To best of our knowledge [80]-[82] the approximations of the Wiener process in the Wong–Zakai approximation must satisfy fairly strong restrictions [82] (see Definition 7.1, pp. 480–481). Moreover, approximations of the Wiener process that are similar to (124) were not considered in [80], [81] (also see [82], Theorems 7.1, 7.2). Therefore, the proof of analogs of Theorems 7.1 and 7.2 [82] for approximations of the Wiener process based on its series expansion (123) should be carried out separately. Thus, the mean-square convergence of the right-hand side of (128) to the iterated Stratonovich stochastic integral (129) does not follow from the results of the papers [80], [81] (also see [82], Theorems 7.1, 7.2).

From the other hand, Theorems 1 from this paper and the theory built in Chapters 1 and 2 of the monographs [22]-[25] can be considered as the proof of the Wong–Zakai approximation for the iterated Stratonovich stochastic integrals (129) of multiplicities 1 to 6 based on the iterated Riemann–Stieltjes integrals (126) and approximation (124) of the Wiener process. At that, the Riemann–Stieltjes integrals (126) of multiplicities 1 to 6 converge (according to Theorems 2.1–2.9 from [22]-[25]) to the appropriate Stratonovich stochastic integrals (129). Recall that $\{\phi_j(x)\}_{j=0}^{\infty}$ (see (123), (124)) is a complete orthonormal system of Legendre polynomials or trigonometric functions in the space $L_2([t,T])$.

To illustrate the above reasoning, consider two examples for the case $k=2,\ \psi_1(s),\ \psi_2(s)\equiv 1$; $i_1,i_2=1,\ldots,m$.

The first example relates to the piecewise linear approximation of the multidimensional Wiener process (these approximations were considered in [80]-[82]).

Let $\mathbf{b}_{\Delta}^{(i)}(t),\ t\in[0,T]$ be the piecewise linear approximation of the ith component $\mathbf{f}_t^{(i)}$ of the multidimensional standard Wiener process $\mathbf{f}_t,\ t\in[0,T]$ with independent components $\mathbf{f}_t^{(i)},\ i=1,\ldots,m$, i.e.

$$\mathbf{b}_{\Delta}^{(i)}(t)=\mathbf{f}_{k\Delta}^{(i)}+\frac{t-k\Delta}{\Delta}\Delta\mathbf{f}_{k\Delta}^{(i)},$$

where

$$\Delta\mathbf{f}_{k\Delta}^{(i)}=\mathbf{f}_{(k+1)\Delta}^{(i)}-\mathbf{f}_{k\Delta}^{(i)},\quad t\in[k\Delta,(k+1)\Delta),\quad k=0,1,\ldots,N-1.$$

Note that w. p. 1

$$\frac{d\mathbf{b}_{\Delta}^{(i)}}{dt}(t)=\frac{\Delta\mathbf{f}_{k\Delta}^{(i)}}{\Delta},\quad t\in[k\Delta,(k+1)\Delta),\quad k=0,1,\ldots,N-1. \tag{130}$$

Consider the following iterated Riemann–Stieltjes integral

$$\int\limits_0^T\int\limits_0^s d\mathbf{b}_{\Delta}^{(i_1)}(\tau)d\mathbf{b}_{\Delta}^{(i_2)}(s),\quad i_1,i_2=1,\ldots,m.$$

Using (130) and additive property of Riemann–Stieltjes integrals, we can write w. p. 1

$$\int\limits_0^T\int\limits_0^s d\mathbf{b}_{\Delta}^{(i_1)}(\tau)d\mathbf{b}_{\Delta}^{(i_2)}(s)=\int\limits_0^T\int\limits_0^s \frac{d\mathbf{b}_{\Delta}^{(i_1)}}{d\tau}(\tau)d\tau\frac{d\mathbf{b}_{\Delta}^{(i_2)}}{ds}(s)ds=$$

$$=\sum_{l=0}^{N-1}\int\limits_{l\Delta}^{(l+1)\Delta}\left(\sum_{q=0}^{l-1}\int\limits_{q\Delta}^{(q+1)\Delta}\frac{\Delta\mathbf{f}_{q\Delta}^{(i_1)}}{\Delta}d\tau+\int\limits_{l\Delta}^{s}\frac{\Delta\mathbf{f}_{l\Delta}^{(i_1)}}{\Delta}d\tau\right)\frac{\Delta\mathbf{f}_{l\Delta}^{(i_2)}}{\Delta}ds=$$

$$
= \sum_{l=0}^{N-1} \sum_{q=0}^{l-1} \Delta \mathbf{f}_{q\Delta}^{(i_1)} \Delta \mathbf{f}_{l\Delta}^{(i_2)} + \frac{1}{\Delta^2} \sum_{l=0}^{N-1} \Delta \mathbf{f}_{l\Delta}^{(i_1)} \Delta \mathbf{f}_{l\Delta}^{(i_2)} \int\limits_{l\Delta}^{(l+1)\Delta} \int\limits_{l\Delta}^{s} d\tau ds =
$$

$$
= \sum_{l=0}^{N-1} \sum_{q=0}^{l-1} \Delta \mathbf{f}_{q\Delta}^{(i_1)} \Delta \mathbf{f}_{l\Delta}^{(i_2)} + \frac{1}{2} \sum_{l=0}^{N-1} \Delta \mathbf{f}_{l\Delta}^{(i_1)} \Delta \mathbf{f}_{l\Delta}^{(i_2)}. \tag{131}
$$

Using (131) it is not difficult to show that

$$
\underset{N\to\infty}{\text{l.i.m.}} \int\limits_0^T \int\limits_0^s d\mathbf{b}_{\Delta}^{(i_1)}(\tau) d\mathbf{b}_{\Delta}^{(i_2)}(s) = \int\limits_0^T \int\limits_0^s d\mathbf{f}_{\tau}^{(i_1)} d\mathbf{f}_{s}^{(i_2)} + \frac{1}{2} \mathbf{1}_{\{i_1=i_2\}} \int\limits_0^T ds =
$$

$$
= \int\limits_0^{*T} \int\limits_0^{*s} d\mathbf{f}_{\tau}^{(i_1)} d\mathbf{f}_{s}^{(i_2)}, \tag{132}
$$

where $\Delta \to 0$ if $N \to \infty$ $(N\Delta = T)$.

Obviously, (132) agrees with Theorem 7.1 (see [82], p. 486).

The next example relates to the approximation of the Wiener process based on its series expansion (123) for $t = 0$, where $\{\phi_j(x)\}_{j=0}^{\infty}$ is a complete orthonormal system of Legendre polynomials or trigonometric functions in the space $L_2([0, T])$.

Consider the following iterated Riemann–Stieltjes integral

$$
\int\limits_0^T \int\limits_0^s d\mathbf{f}_{\tau}^{(i_1)p} d\mathbf{f}_{s}^{(i_2)p}, \quad i_1, i_2 = 1, \ldots, m, \tag{133}
$$

where $d\mathbf{f}_{\tau}^{(i)p}$ is defined by the relation (125).

Let us substitute (125) into (133)

$$
\int\limits_0^T \int\limits_0^s d\mathbf{f}_{\tau}^{(i_1)p} d\mathbf{f}_{s}^{(i_2)p} = \sum_{j_1, j_2=0}^{p} C_{j_2 j_1} \zeta_{j_1}^{(i_1)} \zeta_{j_2}^{(i_2)}, \tag{134}
$$

where

$$
C_{j_2 j_1} = \int\limits_0^T \phi_{j_2}(s) \int\limits_0^s \phi_{j_1}(\tau) d\tau ds
$$

is the Fourier coefficient; another notations are the same as in (128).

As we noted above, approximations of the Wiener process that are similar to (124) were not considered in [80], [81] (also see Theorems 7.1, 7.2 in [82]). Furthermore, the extension of the results of Theorems 7.1 and 7.2 [82] to the case under consideration is not obvious.

Nevertheless, in [62] (Sect. 5.8, pp. 202–204), [65] (pp. 438-439), [66] (pp. 82-84), [71] (pp. 263-264) the authors use (without rigorous proof) the Wong–Zakai approximation [80]-[82] together with the approximation of the Wiener process based on its series expansion.

On the other hand, we can apply the theory built in Chapters 1 and 2 of the monographs [22]-[25]. More precisely, using Theorems 2.1, 2.2 [22]-[25] we obtain from (134) the desired result

$$\underset{p\to\infty}{\text{l.i.m.}}\int\limits_0^T\int\limits_0^s d\mathbf{f}_\tau^{(i_1)p}d\mathbf{f}_s^{(i_2)p}=\underset{p\to\infty}{\text{l.i.m.}}\sum_{j_1,j_2=0}^{p}C_{j_2j_1}\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}=$$

$$=\int\limits_0^{*T}\int\limits_0^{*s}d\mathbf{f}_\tau^{(i_1)}d\mathbf{f}_s^{(i_2)}. \tag{135}$$

From the other hand, by Theorem 1 from this paper (see (37)) for the case $k=2$ we obtain from (134) the following relation

$$\underset{p\to\infty}{\text{l.i.m.}}\int\limits_0^T\int\limits_0^s d\mathbf{f}_\tau^{(i_1)p}d\mathbf{f}_s^{(i_2)p}=\underset{p\to\infty}{\text{l.i.m.}}\sum_{j_1,j_2=0}^{p}C_{j_2j_1}\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}=$$

$$=\underset{p\to\infty}{\text{l.i.m.}}\sum_{j_1,j_2=0}^{p}C_{j_2j_1}\left(\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}-\mathbf{1}_{\{i_1=i_2\}}\mathbf{1}_{\{j_1=j_2\}}\right)+\mathbf{1}_{\{i_1=i_2\}}\sum_{j_1=0}^{\infty}C_{j_1j_1}=$$

$$=\int\limits_0^T\int\limits_0^s d\mathbf{f}_\tau^{(i_1)}d\mathbf{f}_s^{(i_2)}+\mathbf{1}_{\{i_1=i_2\}}\sum_{j_1=0}^{\infty}C_{j_1j_1}. \tag{136}$$

Since

$$\sum_{j_1=0}^{\infty}C_{j_1j_1}=\frac{1}{2}\sum_{j_1=0}^{\infty}\left(\int\limits_0^T\phi_j(\tau)d\tau\right)^2=\frac{1}{2}\left(\int\limits_0^T\phi_0(\tau)d\tau\right)^2=\frac{1}{2}\int\limits_0^T ds,$$

then from the standard relation between Stratonovich and Ito stochastic integrals and (136) we obtain (135).

12. Modification of Theorem 1 for the Case of the Integration Interval $[t,s]$ $(s\in(t,T])$ of Iterated Ito Stochastic Integrals

Suppose that every $\psi_l(\tau)$ $(l=1,\ldots,k)$ is a continuous nonrandom function on $[t,T]$. Define the following function on the hypercube $[t,T]^k$

$$\bar{K}(t_1,\ldots,t_k,s)=\mathbf{1}_{\{t_k<s\}}K(t_1,\ldots,t_k),$$

where the function $K(t_1,\ldots,t_k)$ is defined by (2), $s\in(t,T]$ (s is fixed), and $\mathbf{1}_A$ is the indicator of the set A. So we have

$$\bar{K}(t_1,\ldots,t_k,s)=\mathbf{1}_{\{t_1<\ldots<t_k<s\}}\psi_1(t_1)\ldots\psi_k(t_k)=$$

$$=\begin{cases}\psi_1(t_1)\ldots\psi_k(t_k), & t_1<\ldots<t_k<s\\ \\ 0, & \text{otherwise}\end{cases}, \tag{137}$$

where $k\ge 1$, $t_1,\ldots,t_k\in[t,T]$, and $s\in(t,T]$.

Suppose that $\{\phi_j(x)\}_{j=0}^{\infty}$ is a complete orthonormal system of functions in the space $L_2([t,T])$.

The function $\bar{K}(t_1,\ldots,t_k,s)$ defined by (137) is piecewise continuous in the hypercube $[t,T]^k$. At this situation it is well known that the generalized multiple Fourier series of $\bar{K}(t_1,\ldots,t_k,s)$ $\in L_2([t,T]^k)$ is converging to $\bar{K}(t_1,\ldots,t_k,s)$ in the hypercube $[t,T]^k$ in the mean-square sense, i.e.

$$\lim_{p_1,\ldots,p_k\to\infty}\left\|\bar{K}(t_1,\ldots,t_k,s)-\sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k}C_{j_k\ldots j_1}(s)\prod_{l=1}^{k}\phi_{j_l}(t_l)\right\|_{L_2([t,T]^k)}=0, \tag{138}$$

where

$$C_{j_k\ldots j_1}(s)=\int\limits_{[t,T]^k}\bar{K}(t_1,\ldots,t_k,s)\prod_{l=1}^{k}\phi_{j_l}(t_l)dt_1\ldots dt_k=$$

$$=\int\limits_t^s\psi_k(t_k)\phi_{j_k}(t_k)\ldots\int\limits_t^{t_2}\psi_1(t_1)\phi_{j_1}(t_1)dt_1\ldots dt_k \tag{139}$$

is the Fourier coefficient, and

$$\|f\|_{L_2([t,T]^k)}=\left(\int\limits_{[t,T]^k}f^2(t_1,\ldots,t_k)dt_1\ldots dt_k\right)^{1/2}.$$

Note that

$$J[\psi^{(k)}]_{s,t}=\int\limits_t^s\psi_k(t_k)\ldots\int\limits_t^{t_2}\psi_1(t_1)d\mathbf{w}_{t_1}^{(i_1)}\ldots d\mathbf{w}_{t_k}^{(i_k)}= \tag{140}$$

$$=\int\limits_t^T\mathbf{1}_{\{t_k<s\}}\psi_k(t_k)\ldots\int\limits_t^{t_2}\psi_1(t_1)d\mathbf{w}_{t_1}^{(i_1)}\ldots d\mathbf{w}_{t_k}^{(i_k)}\quad \text{w. p. 1},$$

where $s\in(t,T]$ (s is fixed), $i_1,\ldots,i_k=0,1,\ldots,m$.

Consider the partition $\{\tau_j\}_{j=0}^{N}$ of $[t,T]$ such that

$$t=\tau_0<\ldots<\tau_N=T,\quad \Delta_N=\max_{0\le j\le N-1}\Delta\tau_j\to 0\ \text{ if }\ N\to\infty,\quad \Delta\tau_j=\tau_{j+1}-\tau_j. \tag{141}$$

Theorem 7 [22], [24], [25]. *Suppose that every $\psi_l(\tau)$ $(l=1,\ldots,k)$ is a continuous nonrandom function on $[t,T]$ and $\{\phi_j(x)\}_{j=0}^{\infty}$ is a complete orthonormal system of functions in the space $L_2([t,T])$, each function $\phi_j(x)$ of which for finite j satisfies the condition $(\star)$ (see Sect. 4). Then*

$$J[\psi^{(k)}]_{s,t}=\underset{p_1,\ldots,p_k\to\infty}{\text{l.i.m.}}\sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k}C_{j_k\ldots j_1}(s)\Biggl(\prod_{l=1}^{k}\zeta_{j_l}^{(i_l)}-$$

$$-\underset{N\to\infty}{\text{l.i.m.}}\sum_{(l_1,\ldots,l_k)\in\mathrm{G}_k}\phi_{j_1}(\tau_{l_1})\Delta\mathbf{w}_{\tau_{l_1}}^{(i_1)}\ldots\phi_{j_k}(\tau_{l_k})\Delta\mathbf{w}_{\tau_{l_k}}^{(i_k)}\Biggr), \tag{142}$$

where $J[\psi^{(k)}]_{s,t}$ is the iterated Ito stochastic integral (140), $s\in(t,T]$ (s is fixed),

$$\mathrm{G}_k=\mathrm{H}_k\backslash\mathrm{L}_k,\quad \mathrm{H}_k=\bigl\{(l_1,\ldots,l_k):\ l_1,\ldots,l_k=0,\ 1,\ldots,N-1\bigr\},$$

$$\mathrm{L}_k=\bigl\{(l_1,\ldots,l_k):\ l_1,\ldots,l_k=0,\ 1,\ldots,N-1;\ l_g\ne l_r\ (g\ne r);\ g,r=1,\ldots,k\bigr\},$$

l.i.m. *is a limit in the mean-square sense, $i_1,\ldots,i_k=0,1,\ldots,m,$*

$$\zeta_j^{(i)}=\int\limits_t^T\phi_j(s)d\mathbf{w}_s^{(i)}$$

are independent standard Gaussian random variables for various i or j (in the case when $i\ne 0$), $C_{j_k\ldots j_1}(s)$ is the Fourier coefficient (139), $\Delta\mathbf{w}_{\tau_j}^{(i)}=\mathbf{w}_{\tau_{j+1}}^{(i)}-\mathbf{w}_{\tau_j}^{(i)}$ $(i=0,\ 1,\ldots,m)$, $\{\tau_j\}_{j=0}^{N}$ is a partition of $[t,T]$, which satisfies the condition (141).

Proof. Let us consider the multiple stochastic integrals (12), (19). We will write $J[\Phi]_{s,t}^{(k)}$ and $J'[\Phi]_{s,t}^{(k)}$ ($s\in(t,T]$, s is fixed) if the function $\Phi(t_1,\ldots,t_k)$ in (12) and (19) is replaced by the function $\mathbf{1}_{\{t_1,\ldots,t_k<s\}}\Phi(t_1,\ldots,t_k)$.

By analogy with (20), we have

$$J'[\Phi]_{s,t}^{(k)}=\int\limits_t^T\ldots\int\limits_t^{t_2}\mathbf{1}_{\{t_k<s\}}\sum_{(t_1,\ldots,t_k)}\biggl(\Phi(t_1,\ldots,t_k)d\mathbf{w}_{t_1}^{(i_1)}\ldots d\mathbf{w}_{t_k}^{(i_k)}\biggr)\quad \text{w. p. 1}, \tag{143}$$

where $J'[\Phi]_{s,t}^{(k)}$ is defined by (19) and

$$\sum_{(t_1,\ldots,t_k)}$$

means the sum with respect to all possible permutations $(t_1,\ldots,t_k)$. At the same time permutations $(t_1,\ldots,t_k)$ when summing are performed in (143) only in the expression, which is enclosed in parentheses. Moreover, the nonrandom function $\Phi(t_1,\ldots,t_k)$ is assumed to be continuous in the corresponding closed domains of integration. The case when the nonrandom function $\Phi(t_1,\ldots,t_k)$ is continuous in the open domains of integration and bounded at their boundaries is also possible.

Let us write (143) as

$$J'[\Phi]^{(k)}_{s,t}=\int\limits_t^T\ldots\int\limits_t^{t_2}\sum\limits_{(t_1,\ldots,t_k)}\left(\mathbf{1}_{\{t_k<s\}}\Phi(t_1,\ldots,t_k)d\mathbf{w}_{t_1}^{(i_1)}\ldots d\mathbf{w}_{t_k}^{(i_k)}\right)\quad \text{w. p. 1,} \tag{144}$$

where permutations $(t_1,\ldots,t_k)$ when summing are performed in (144) only in the expression

$$\Phi(t_1,\ldots,t_k)d\mathbf{w}_{t_1}^{(i_1)}\ldots d\mathbf{w}_{t_k}^{(i_k)}.$$

It is not difficult to notice that (143), (144) can be rewritten in the form (see (21))

$$J'[\Phi]^{(k)}_{s,t}=\sum\limits_{(t_1,\ldots,t_k)}\int\limits_t^T\ldots\int\limits_t^{t_2}\Phi(t_1,\ldots,t_k)\mathbf{1}_{\{t_k<s\}}d\mathbf{w}_{t_1}^{(i_1)}\ldots d\mathbf{w}_{t_k}^{(i_k)}\quad \text{w. p. 1,} \tag{145}$$

where permutations $(t_1,\ldots,t_k)$ when summing are performed only in the values

$$\mathbf{1}_{\{t_k<s\}}d\mathbf{w}_{t_1}^{(i_1)}\ldots d\mathbf{w}_{t_k}^{(i_k)}.$$

At the same time the indices near upper limits of integration in the iterated stochastic integrals are changed correspondently and if t_r swapped with t_q in the permutation $(t_1,\ldots,t_k)$, then i_r swapped with i_q in the permutation $(i_1,\ldots,i_k)$.

According to Lemma 1, we have

$$J[\psi^{(k)}]_{s,t}=\underset{N\to\infty}{\text{l.i.m.}}\sum\limits_{l_k=0}^{N-1}\ldots\sum\limits_{l_1=0}^{l_2-1}\mathbf{1}_{\{\tau_{l_k}<s\}}\psi_1(\tau_{l_1})\ldots\psi_k(\tau_{l_k})\Delta\mathbf{w}_{\tau_{l_1}}^{(i_1)}\ldots\Delta\mathbf{w}_{\tau_{l_k}}^{(i_k)}=$$

$$=\underset{N\to\infty}{\text{l.i.m.}}\sum\limits_{l_k=0}^{N-1}\ldots\sum\limits_{l_1=0}^{N-1}\mathbf{1}_{\{\tau_{l_k}<s\}}K(\tau_{l_1},\ldots,\tau_{l_k})\Delta\mathbf{w}_{\tau_{l_1}}^{(i_1)}\ldots\Delta\mathbf{w}_{\tau_{l_k}}^{(i_k)}=$$

$$=\underset{N\to\infty}{\text{l.i.m.}}\sum\limits_{\substack{l_1,\ldots,l_k=0\\ l_q\ne l_r;\ q\ne r;\ q,r=1,\ldots,k}}^{N-1}\mathbf{1}_{\{\tau_{l_k}<s\}}K(\tau_{l_1},\ldots,\tau_{l_k})\Delta\mathbf{w}_{\tau_{l_1}}^{(i_1)}\ldots\Delta\mathbf{w}_{\tau_{l_k}}^{(i_k)}=$$

$$=\int\limits_t^T\ldots\int\limits_t^{t_2}\sum\limits_{(t_1,\ldots,t_k)}\left(\mathbf{1}_{\{t_k<s\}}K(t_1,\ldots,t_k)d\mathbf{w}_{t_1}^{(i_1)}\ldots d\mathbf{w}_{t_k}^{(i_k)}\right)\quad \text{w. p. 1,} \tag{146}$$

where $K(t_1,\ldots,t_k)$ is defined by (2) and permutations $(t_1,\ldots,t_k)$ when summing are performed only in the expression

$$K(t_1,\ldots,t_k)d\mathbf{w}_{t_1}^{(i_1)}\ldots d\mathbf{w}_{t_k}^{(i_k)}.$$

According to Lemmas 1, 3 and (21), (145), (146), we get the following representation

$$J[\psi^{(k)}]_{s,t} =$$

$$= \sum_{j_1=0}^{p_1} \ldots \sum_{j_k=0}^{p_k} C_{j_k \ldots j_1}(s) \int\limits_t^T \ldots \int\limits_t^{t_2} \sum_{(t_1,\ldots,t_k)} \left(\phi_{j_1}(t_1) \ldots \phi_{j_k}(t_k) d\mathbf{w}_{t_1}^{(i_1)} \ldots d\mathbf{w}_{t_k}^{(i_k)} \right) +$$

$$+ R_{T,t,s}^{p_1,\ldots,p_k} =$$

$$= \sum_{j_1=0}^{p_1} \ldots \sum_{j_k=0}^{p_k} C_{j_k \ldots j_1}(s) \times$$

$$\times \underset{N\to\infty}{\text{l.i.m.}} \sum_{\substack{l_1,\ldots,l_k=0 \\ l_q \ne l_r;\ q\ne r;\ q,r=1,\ldots,k}}^{N-1} \phi_{j_1}(\tau_{l_1}) \ldots \phi_{j_k}(\tau_{l_k}) \Delta \mathbf{w}_{\tau_{l_1}}^{(i_1)} \ldots \Delta \mathbf{w}_{\tau_{l_k}}^{(i_k)} +$$

$$+ R_{T,t,s}^{p_1,\ldots,p_k} =$$

$$= \sum_{j_1=0}^{p_1} \ldots \sum_{j_k=0}^{p_k} C_{j_k \ldots j_1}(s) \left(\underset{N\to\infty}{\text{l.i.m.}} \sum_{l_1,\ldots,l_k=0}^{N-1} \phi_{j_1}(\tau_{l_1}) \ldots \phi_{j_k}(\tau_{l_k}) \Delta \mathbf{w}_{\tau_{l_1}}^{(i_1)} \ldots \Delta \mathbf{w}_{\tau_{l_k}}^{(i_k)} - \right.$$

$$\left. - \underset{N\to\infty}{\text{l.i.m.}} \sum_{(l_1,\ldots,l_k)\in \mathrm{G}_k} \phi_{j_1}(\tau_{l_1}) \Delta \mathbf{w}_{\tau_{l_1}}^{(i_1)} \ldots \phi_{j_k}(\tau_{l_k}) \Delta \mathbf{w}_{\tau_{l_k}}^{(i_k)} \right) +$$

$$+ R_{T,t,s}^{p_1,\ldots,p_k} =$$

$$= \sum_{j_1=0}^{p_1} \ldots \sum_{j_k=0}^{p_k} C_{j_k \ldots j_1}(s) \times$$

$$\times \left(\prod_{l=1}^{k} \zeta_{j_l}^{(i_l)} - \underset{N\to\infty}{\text{l.i.m.}} \sum_{(l_1,\ldots,l_k)\in \mathrm{G}_k} \phi_{j_1}(\tau_{l_1}) \Delta \mathbf{w}_{\tau_{l_1}}^{(i_1)} \ldots \phi_{j_k}(\tau_{l_k}) \Delta \mathbf{w}_{\tau_{l_k}}^{(i_k)} \right) +$$

$$+ R_{T,t,s}^{p_1,\ldots,p_k} \quad \text{w. p. 1},$$

where

$$R_{T,t,s}^{p_1,\ldots,p_k} =$$

$$= \sum_{(t_1,\ldots,t_k)} \int\limits_t^T \ldots \int\limits_t^{t_2} \left(\mathbf{1}_{\{t_k<s\}} K(t_1,\ldots,t_k) - \sum_{j_1=0}^{p_1} \ldots \sum_{j_k=0}^{p_k} C_{j_k\ldots j_1}(s) \prod_{l=1}^k \phi_{j_l}(t_l) \right) \times$$

$$\times d\mathbf{w}_{t_1}^{(i_1)} \ldots d\mathbf{w}_{t_k}^{(i_k)} =$$

$$= \sum_{(t_1,\ldots,t_k)} \int\limits_t^T \ldots \int\limits_t^{t_2} K(t_1,\ldots,t_k) \mathbf{1}_{\{t_k<s\}} d\mathbf{w}_{t_1}^{(i_1)} \ldots d\mathbf{w}_{t_k}^{(i_k)} - \tag{147}$$

$$- \sum_{(t_1,\ldots,t_k)} \int\limits_t^T \ldots \int\limits_t^{t_2} \sum_{j_1=0}^{p_1} \ldots \sum_{j_k=0}^{p_k} C_{j_k\ldots j_1}(s) \prod_{l=1}^k \phi_{j_l}(t_l) d\mathbf{w}_{t_1}^{(i_1)} \ldots d\mathbf{w}_{t_k}^{(i_k)} \tag{148}$$

w. p. 1, where permutations $(t_1,\ldots,t_k)$ when summing in (147) are performed only in the values $\mathbf{1}_{\{t_k<s\}} d\mathbf{w}_{t_1}^{(i_1)} \ldots d\mathbf{w}_{t_k}^{(i_k)}$. At the same time permutations $(t_1,\ldots,t_k)$ when summing in (148) are performed only in the values $d\mathbf{w}_{t_1}^{(i_1)} \ldots d\mathbf{w}_{t_k}^{(i_k)}$. Moreover, the indices near upper limits of integration in the iterated stochastic integrals in (147), (148) are changed correspondently and if t_r swapped with t_q in the permutation $(t_1,\ldots,t_k)$, then i_r swapped with i_q in the permutation $(i_1,\ldots,i_k)$.

Let us estimate the remainder $R_{T,t,s}^{p_1,\ldots,p_k}$ of the series.

According to Lemma 2 and (30), we have

$$\mathsf{M}\left\{\left(R_{T,t,s}^{p_1,\ldots,p_k}\right)^2\right\} \le$$

$$\le C_k \sum_{(t_1,\ldots,t_k)} \int\limits_t^T \ldots \int\limits_t^{t_2} \left(K(t_1,\ldots,t_k) \mathbf{1}_{\{t_k<s\}} - \sum_{j_1=0}^{p_1} \ldots \sum_{j_k=0}^{p_k} C_{j_k\ldots j_1}(s) \prod_{l=1}^k \phi_{j_l}(t_l) \right)^2 \times$$

$$\times dt_1 \ldots dt_k, \tag{149}$$

where constant C_k depends only on the multiplicity k of the iterated Ito stochastic integral $J[\psi^{(k)}]_{s,t}$ and permutations $(t_1,\ldots,t_k)$ when summing in (149) are performed only in the values $\mathbf{1}_{\{t_k<s\}}$ and $dt_1 \ldots dt_k$. At the same time the indices near upper limits of integration in the iterated integrals in (149) are changed correspondently.

Since $K(t_1,\ldots,t_k) \equiv 0$ if the condition $t_1 < \ldots < t_k$ is not fulfilled, then

$$\mathsf{M}\left\{\left(R_{T,t,s}^{p_1,\ldots,p_k}\right)^2\right\} \le$$

$$\le C_k \sum_{(t_1,\ldots,t_k)} \int\limits_t^T \ldots \int\limits_t^{t_2} \left(K(t_1,\ldots,t_k) \mathbf{1}_{\{t_k<s\}} - \sum_{j_1=0}^{p_1} \ldots \sum_{j_k=0}^{p_k} C_{j_k\ldots j_1}(s) \prod_{l=1}^k \phi_{j_l}(t_l) \right)^2 \times$$

$$\times dt_1 \ldots dt_k, \tag{150}$$

where permutations $(t_1,\ldots,t_k)$ when summing in (150) are performed only in the values $dt_1\ldots dt_k$. At the same time the indices near upper limits of integration in the iterated integrals in (150) are changed correspondently.

Then from (30), (138), and (150) we obtain

$$\mathsf{M}\left\{\left(R_{T,t,s}^{p_1,\ldots,p_k}\right)^2\right\}\le$$

$$\le C_k\sum_{(t_1,\ldots,t_k)}\int\limits_t^T\ldots\int\limits_t^{t_2}\left(K(t_1,\ldots,t_k)\mathbf{1}_{\{t_k<s\}}-\sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k}C_{j_k\ldots j_1}(s)\prod_{l=1}^k\phi_{j_l}(t_l)\right)^2\times$$

$$\times dt_1\ldots dt_k=$$

$$=C_k\int\limits_{[t,T]^k}\left(\bar{K}(t_1,\ldots,t_k,s)-\sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k}C_{j_k\ldots j_1}(s)\prod_{l=1}^k\phi_{j_l}(t_l)\right)^2dt_1\ldots dt_k\to 0$$

if $p_1,\ldots,p_k\to\infty$, where constant C_k depends only on the multiplicity k of the iterated Ito stochastic integral $J[\psi^{(k)}]_{s,t}$. Theorem 7 is proved.

Remark 7. *Obviously from Theorem 7 for the case $s=T$ we obtain the variant of Theorem 1.*

It is not difficult to see that for the case of pairwise different numbers $i_1,\ldots,i_k=1,\ldots,m$ from Theorem 7 we obtain

$$J[\psi^{(k)}]_{s,t}=\underset{p_1,\ldots,p_k\to\infty}{\text{l.i.m.}}\sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k}C_{j_k\ldots j_1}(s)\zeta_{j_1}^{(i_1)}\ldots\zeta_{j_k}^{(i_k)}.$$

Consider particular cases of Theorem 7 for $k=1,\ldots,5$

$$J[\psi^{(1)}]_{s,t}=\underset{p_1\to\infty}{\text{l.i.m.}}\sum_{j_1=0}^{p_1}C_{j_1}(s)\zeta_{j_1}^{(i_1)},$$

$$J[\psi^{(2)}]_{s,t}=\underset{p_1,p_2\to\infty}{\text{l.i.m.}}\sum_{j_1=0}^{p_1}\sum_{j_2=0}^{p_2}C_{j_2j_1}(s)\left(\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}-\mathbf{1}_{\{i_1=i_2\ne 0\}}\mathbf{1}_{\{j_1=j_2\}}\right),$$

$$J[\psi^{(3)}]_{s,t}=\underset{p_1,\ldots,p_3\to\infty}{\text{l.i.m.}}\sum_{j_1=0}^{p_1}\sum_{j_2=0}^{p_2}\sum_{j_3=0}^{p_3}C_{j_3j_2j_1}(s)\Biggl(\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}\zeta_{j_3}^{(i_3)}-$$

$$-\mathbf{1}_{\{i_1=i_2\ne 0\}}\mathbf{1}_{\{j_1=j_2\}}\zeta_{j_3}^{(i_3)}-\mathbf{1}_{\{i_2=i_3\ne 0\}}\mathbf{1}_{\{j_2=j_3\}}\zeta_{j_1}^{(i_1)}-\mathbf{1}_{\{i_1=i_3\ne 0\}}\mathbf{1}_{\{j_1=j_3\}}\zeta_{j_2}^{(i_2)}\Biggr),$$

$$
J[\psi^{(4)}]_{s,t}=\underset{p_1,\ldots,p_4\to\infty}{\text{l.i.m.}}\sum_{j_1=0}^{p_1}\ldots\sum_{j_4=0}^{p_4}C_{j_4\ldots j_1}(s)\Biggl(\prod_{l=1}^{4}\zeta_{j_l}^{(i_l)}-

$$

where $\mathbf{1}_A$ is the indicator of the set A, $C_{j_k\ldots j_1}(s)$ $(k=1,\ldots,5)$ has the form (139), $s\in(t,T]$ (s is fixed).

Remark 8. *Note that by analogy with the proof of estimate (112) we obtain the following inequality*

$$\int\limits_{[t,T]^k} \bar{K}^2(t_1,\ldots,t_k,s)dt_1\ldots dt_k - \sum_{j_1=0}^{p}\ldots\sum_{j_k=0}^{p} C^2_{j_k\ldots j_1}(s) \le \frac{G_k(s)}{p}, \tag{151}$$

where $\bar{K}(t_1,\ldots,t_k,s)$ and $C_{j_k\ldots j_1}(s)$ are defined by the equalities (137) and (139), respectively; constant $G_k(s)$ depends on k and $s-t$ ($s\in(t,T]$, s is fixed).

The following obvious modification of Theorem 3 takes place.

Theorem 8 [22], [24], [25]. *Suppose that every $\psi_l(\tau)$ $(l=1,\ldots,k)$ is a continuous nonrandom function on $[t,T]$ and $\{\phi_j(x)\}_{j=0}^{\infty}$ is a complete orthonormal system of functions in the space $L_2([t,T])$, each function $\phi_j(x)$ of which for finite j satisfies the condition $(\star)$ (see Sect. 4). Then the estimate*

$$\mathsf{M}\left\{\left(J[\psi^{(k)}]_{s,t}-J[\psi^{(k)}]_{s,t}^{p_1,\ldots,p_k}\right)^2\right\}\le$$

$$\le k!\left(\int\limits_{[t,T]^k} \bar{K}^2(t_1,\ldots,t_k,s)dt_1\ldots dt_k - \sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k} C^2_{j_k\ldots j_1}(s)\right) \tag{152}$$

is valid for the following cases:

1. $i_1,\ldots,i_k=1,\ldots,m$ *and* $0<T-t<\infty$,
2. $i_1,\ldots,i_k=0,1,\ldots,m,$ $i_1^2+\ldots+i_k^2>0,$ *and* $0<T-t<1$,

where $J[\psi^{(k)}]_{s,t}$ is the stochastic integral (140), $J[\psi^{(k)}]_{s,t}^{p_1,\ldots,p_k}$ is the expression on the right-hand side of (142) before passing to the limit $\underset{p_1,\ldots,p_k\to\infty}{\text{l.i.m.}}$, $\bar{K}(t_1,\ldots,t_k,s)$ and $C_{j_k\ldots j_1}(s)$ are defined by the equalities (137) and (139), respectively; $s\in(t,T]$ (s is fixed); another notations are the same as in Theorem 1.11.

Remark 9. *Combining the estimates (151) and (152), we obtain*

$$\mathsf{M}\left\{\left(J[\psi^{(k)}]_{s,t}-J[\psi^{(k)}]_{s,t}^{p,\ldots,p}\right)^2\right\}\le \frac{k!P_k(s-t)^k}{p}, \tag{153}$$

where $i_1,\ldots,i_k=1,\ldots,m$, constant P_k depends only on k; another notations are the same as in (151) and (152).

Remark 10. *The analogue of the estimate (60) for the iterated Ito stochastic integral (140) has the following form*

$$\mathsf{M}\left\{\left(J[\psi^{(k)}]_{s,t}-J[\psi^{(k)}]_{s,t}^{p_1,\ldots,p_k}\right)^{2n}\right\}\le$$

$$\le (k!)^{2n}(n(2n-1))^{n(k-1)}(2n-1)!!\times$$

$$\times\left(\int\limits_{[t,T]^k}\bar{K}^2(t_1,\ldots,t_k,s)dt_1\ldots dt_k-\sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k}C^2_{j_k\ldots j_1}(s)\right)^n, \tag{154}$$

where $J[\psi^{(k)}]^{p_1,\ldots,p_k}_{s,t}$ *is the expression on the right-hand side of* (142) *before passing to the limit* $\underset{p_1,\ldots,p_k\to\infty}{\text{l.i.m.}}$, $\bar{K}(t_1,\ldots,t_k,s)$ *and* $C_{j_k\ldots j_1}(s)$ *are defined by the equalities* (137) *and* (139)*, respectively;* $s\in(t,T]$ *(s is fixed);* $i_1,\ldots,i_k=1,\ldots,m$*.*

Remark 11. *The estimates* (151) *and* (154) *imply the following inequality*

$$\mathsf{M}\left\{\left(J[\psi^{(k)}]_{s,t}-J[\psi^{(k)}]^{p,\ldots,p}_{s,t}\right)^{2n}\right\}\le$$

$$\le(k!)^{2n}(n(2n-1))^{n(k-1)}(2n-1)!!\ \frac{(P_k)^n\,(s-t)^{nk}}{p^n},$$

where $i_1,\ldots,i_k=1,\ldots,m$, $n\in\mathbb{N}$, *and constant* P_k *depends only on* k*.*

13. Expansion of Multiple Wiener Stochastic Integral Based on Generalized Multiple Fourier Series

Let us consider the multiple stochastic integral (19)

$$\underset{N\to\infty}{\text{l.i.m.}}\sum_{\substack{j_1,\ldots,j_k=0\\ j_q\ne j_r;\ q\ne r;\ q,r=1,\ldots,k}}^{N-1}\Phi\left(\tau_{j_1},\ldots,\tau_{j_k}\right)\prod_{l=1}^k\Delta\mathbf{w}^{(i_l)}_{\tau_{j_l}}\stackrel{\text{def}}{=}J'[\Phi]^{(k)}_{T,t}, \tag{155}$$

where for simplicity we assume that $\Phi(t_1,\ldots,t_k):\ [t,T]^k\to\mathbb{R}$ is a continuous nonrandom function on $[t,T]^k$. Moreover, $\{\tau_j\}_{j=0}^N$ is a partition of $[t,T]$, which satisfies the condition (5).

The stochastic integral with respect to the scalar standard Wiener process ($i_1=\ldots=i_k\ne 0$) and similar to (155) was considered in [85] (1951) and is called the multiple Wiener stochastic integral [85]. The case $\Phi(t_1,\ldots,t_k)\in L_2([t,T]^k)$ [85] will be considered in Sect. 15.

Consider the following theorem on expansion of the multiple Wiener stochastic integral (155) based on generalized multiple Fourier series.

Theorem 9 [22], [24], [25]. *Suppose that* $\Phi(t_1,\ldots,t_k):\ [t,T]^k\to\mathbb{R}$ *is a continuous nonrandom function on* $[t,T]^k$ *and* $\{\phi_j(x)\}_{j=0}^\infty$ *is a complete orthonormal system of functions in the space* $L_2([t,T])$*, each function* $\phi_j(x)$ *of which for finite* j *satisfies the condition* $(\star)$ *(see Sect. 4). Then the following expansions*

$$J'[\Phi]^{(k)}_{T,t}=\underset{p_1,\ldots,p_k\to\infty}{\text{l.i.m.}}\sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k}C_{j_k\ldots j_1}\left(\prod_{l=1}^k\zeta^{(i_l)}_{j_l}-\right.$$

$$\left.-\underset{N\to\infty}{\text{l.i.m.}}\sum_{(l_1,\ldots,l_k)\in\mathrm{G}_k}\phi_{j_1}(\tau_{l_1})\Delta\mathbf{w}^{(i_1)}_{\tau_{l_1}}\ldots\phi_{j_k}(\tau_{l_k})\Delta\mathbf{w}^{(i_k)}_{\tau_{l_k}}\right), \tag{156}$$

$$J'[\Phi]_{T,t}^{(k)} = \underset{p_1,\ldots,p_k\to\infty}{\text{l.i.m.}} \sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k} C_{j_k\ldots j_1}\Biggl(\prod_{l=1}^{k}\zeta_{j_l}^{(i_l)} + \sum_{r=1}^{[k/2]}(-1)^r \times$$

$$\times \sum_{\substack{(\{\{g_1,g_2\},\ldots,\{g_{2r-1},g_{2r}\}\},\{q_1,\ldots,q_{k-2r}\})\\ \{g_1,g_2,\ldots,g_{2r-1},g_{2r},q_1,\ldots,q_{k-2r}\}=\{1,2,\ldots,k\}}} \prod_{s=1}^{r}\mathbf{1}_{\{i_{g_{2s-1}}=\ i_{g_{2s}}\neq 0\}}\mathbf{1}_{\{j_{g_{2s-1}}=\ j_{g_{2s}}\}}\prod_{l=1}^{k-2r}\zeta_{j_{q_l}}^{(i_{q_l})}\Biggr) \tag{157}$$

converging in the mean-square sense are valid, where

$$\mathrm{G}_k = \mathrm{H}_k\backslash\mathrm{L}_k,\quad \mathrm{H}_k = \bigl\{(l_1,\ldots,l_k):\ l_1,\ldots,l_k = 0,\ 1,\ldots,N-1\bigr\},$$

$$\mathrm{L}_k = \bigl\{(l_1,\ldots,l_k):\ l_1,\ldots,l_k = 0,\ 1,\ldots,N-1;\ l_g\neq l_r\ (g\neq r);\ g,r=1,\ldots,k\bigr\},$$

l.i.m. *is a limit in the mean-square sense,* $i_1,\ldots,i_k = 0,1,\ldots,m,$

$$\zeta_j^{(i)} = \int\limits_t^T \phi_j(s)d\mathbf{w}_s^{(i)}$$

are independent standard Gaussian random variables for various i *or* j *(in the case when* $i\neq 0$*),*

$$C_{j_k\ldots j_1} = \int\limits_{[t,T]^k}\Phi(t_1,\ldots,t_k)\prod_{l=1}^{k}\phi_{j_l}(t_l)dt_1\ldots dt_k \tag{158}$$

is the Fourier coefficient, $\Delta\mathbf{w}_{\tau_j}^{(i)} = \mathbf{w}_{\tau_{j+1}}^{(i)} - \mathbf{w}_{\tau_j}^{(i)}$ $(i = 0,\ 1,\ldots,m)$*,* $\{\tau_j\}_{j=0}^{N}$ *is a partition of* $[t,T]$*, which satisfies the condition* (5); $[x]$ *is an integer part of a real number* x; *another notations are the same as in Theorem* 2.

Proof. Using Lemma 3 and (20), (21), we get the following representation

$$J'[\Phi]_{T,t}^{(k)} =$$

$$= \sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k} C_{j_k\ldots j_1}\int\limits_t^T\ldots\int\limits_t^{t_2}\sum_{(t_1,\ldots,t_k)}\Bigl(\phi_{j_1}(t_1)\ldots\phi_{j_k}(t_k)d\mathbf{w}_{t_1}^{(i_1)}\ldots d\mathbf{w}_{t_k}^{(i_k)}\Bigr) +$$

$$+R_{T,t}^{p_1,\ldots,p_k} =$$

$$= \sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k} C_{j_k\ldots j_1}\ \underset{N\to\infty}{\text{l.i.m.}} \sum_{\substack{l_1,\ldots,l_k=0\\ l_q\neq l_r;\ q\neq r;\ q,r=1,\ldots,k}}^{N-1}\phi_{j_1}(\tau_{l_1})\ldots\phi_{j_k}(\tau_{l_k})\Delta\mathbf{w}_{\tau_{l_1}}^{(i_1)}\ldots\Delta\mathbf{w}_{\tau_{l_k}}^{(i_k)}+$$

$$+R_{T,t}^{p_1,\ldots,p_k} =$$

$$=\sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k}C_{j_k\ldots j_1}\left(\underset{N\to\infty}{\text{l.i.m.}}\sum_{l_1,\ldots,l_k=0}^{N-1}\phi_{j_1}(\tau_{l_1})\ldots\phi_{j_k}(\tau_{l_k})\Delta\mathbf{w}_{\tau_{l_1}}^{(i_1)}\ldots\Delta\mathbf{w}_{\tau_{l_k}}^{(i_k)}-\right.$$

$$\left.-\underset{N\to\infty}{\text{l.i.m.}}\sum_{(l_1,\ldots,l_k)\in\mathrm{G}_k}\phi_{j_1}(\tau_{l_1})\Delta\mathbf{w}_{\tau_{l_1}}^{(i_1)}\ldots\phi_{j_k}(\tau_{l_k})\Delta\mathbf{w}_{\tau_{l_k}}^{(i_k)}\right)+$$

$$+R_{T,t}^{p_1,\ldots,p_k}=$$

$$=\sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k}C_{j_k\ldots j_1}\times$$

$$\times\left(\prod_{l=1}^{k}\zeta_{j_l}^{(i_l)}-\underset{N\to\infty}{\text{l.i.m.}}\sum_{(l_1,\ldots,l_k)\in\mathrm{G}_k}\phi_{j_1}(\tau_{l_1})\Delta\mathbf{w}_{\tau_{l_1}}^{(i_1)}\ldots\phi_{j_k}(\tau_{l_k})\Delta\mathbf{w}_{\tau_{l_k}}^{(i_k)}\right)+$$

$$+R_{T,t}^{p_1,\ldots,p_k}\quad \text{w. p. 1},$$

where

$$R_{T,t}^{p_1,\ldots,p_k}=\sum_{(t_1,\ldots,t_k)}\int\limits_t^T\ldots\int\limits_t^{t_2}\left(\Phi(t_1,\ldots,t_k)-\sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k}C_{j_k\ldots j_1}\prod_{l=1}^{k}\phi_{j_l}(t_l)\right)\times$$

$$\times d\mathbf{w}_{t_1}^{(i_1)}\ldots d\mathbf{w}_{t_k}^{(i_k)},$$

where permutations $(t_1,\ldots,t_k)$ when summing are performed only in the values $d\mathbf{w}_{t_1}^{(i_1)}\ldots d\mathbf{w}_{t_k}^{(i_k)}$. At the same time the indices near upper limits of integration in the iterated stochastic integrals are changed correspondently and if t_r swapped with t_q in the permutation $(t_1,\ldots,t_k)$, then i_r swapped with i_q in the permutation $(i_1,\ldots,i_k)$.

Let us estimate the remainder $R_{T,t}^{p_1,\ldots,p_k}$ of the series using Lemma 2 and (30). We have

$$\mathsf{M}\left\{\left(R_{T,t}^{p_1,\ldots,p_k}\right)^2\right\}\le$$

$$\le C_k\sum_{(t_1,\ldots,t_k)}\int\limits_t^T\ldots\int\limits_t^{t_2}\left(\Phi(t_1,\ldots,t_k)-\sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k}C_{j_k\ldots j_1}\prod_{l=1}^{k}\phi_{j_l}(t_l)\right)^2\times$$

$$\times dt_1\ldots dt_k=$$

$$= C_k \int\limits_{[t,T]^k} \left(\Phi(t_1,\ldots,t_k) - \sum_{j_1=0}^{p_1} \ldots \sum_{j_k=0}^{p_k} C_{j_k\ldots j_1} \prod_{l=1}^{k} \phi_{j_l}(t_l) \right)^2 dt_1 \ldots dt_k \to 0$$

if $p_1,\ldots,p_k \to \infty$, where constant C_k depends only on the multiplicity k of the multiple Wiener stochastic integral $J'[\Phi]_{T,t}^{(k)}$. The expansion (156) is proved. Using (156) and Remark 2, we get the expansion (157) (see Theorem 2). Theorem 9 is proved.

Note that particular cases of the expansion (157) are determined by the equalities (36)–(42), in which the Fourier coefficient $C_{j_k\ldots j_1}$ $(k = 1,\ldots,7)$ has the form (158).

14. Reformulation of Theorems 1, 2, and 9 Using Hermite Polynomials

In [86] it was noted that Theorem 3.1 ([85], p. 162) can be applied to the case of multiple Wiener stochastic integral with respect to components of the multidimensional Wiener process. As a result, Theorems 1, 2, and 9 can be reformulated using Hermite polynomials. Consider this approach using our notations. Note that we derive the formula (163) (see below) in two different ways. One of them is not based on Theorem 3.1 [85] (see the proof of Theorem 20 below for details).

We will say that the condition $(\star\star)$ *is fulfilled for the multi-index* $(i_1\ldots i_k)$ $(i_1,\ldots,i_k = 0,1,\ldots,m)$ *if* $m_1,\ldots,m_k$ *are multiplicities of the elements* $i_1,\ldots,i_k$*, respectively, i.e.*

$$\{i_1,\ldots,i_k\} = \{\overbrace{i_1,\ldots,i_1}^{m_1},\overbrace{i_2,\ldots,i_2}^{m_2},\ldots,\overbrace{i_r,\ldots,i_r}^{m_r}\},$$

where $r = 1,\ldots,k$*, braces mean an unordered set, and parentheses mean an ordered set. At that,* $m_1+\ldots+m_k = k$*,* $m_1,\ldots,m_k = 0,1,\ldots,k$*, and all elements with nonzero multiplicities are pairwise different.*

In this section, we consider the case $i_1,\ldots,i_k = 0,1,\ldots,m$. Let the condition $(\star\star)$ is fulfilled for the multi-index $(i_1\ldots i_k)$. Then

$$J'\left[\phi_{j_1}\ldots\phi_{j_k}\right]_{T,t}^{(i_1\ldots i_k)} = J'\Biggl[\underbrace{\phi_{j_{g_1}}\ldots\phi_{j_{g_{m_1}}}}_{m_1}\underbrace{\phi_{j_{g_{m_1+1}}}\ldots\phi_{j_{g_{m_1+m_2}}}}_{m_2}\ldots$$

$$\ldots\underbrace{\phi_{j_{g_{m_1+m_2+\ldots+m_{k-1}+1}}}\ldots\phi_{j_{g_{m_1+m_2+\ldots+m_k}}}}_{m_k}\Biggr]_{T,t}^{(\overbrace{i_1\ldots i_1}^{m_1}\overbrace{i_2\ldots i_2}^{m_2}\ldots\overbrace{i_k\ldots i_k}^{m_k})} \qquad (159)$$

w. p. 1, where $J'\left[\phi_{j_1}\ldots\phi_{j_k}\right]_{T,t}^{(i_1\ldots i_k)}$ is defined by (19) (also see (155)), $\Phi(t_1,\ldots,t_k) = \phi_{j_1}(t_1)\ldots\phi_{j_k}(t_k)$, $\{\phi_j(x)\}_{j=0}^{\infty}$ is a complete orthonormal system of functions in the space $L_2([t,T])$, each function $\phi_j(x)$ of which for finite j satisfies the condition $(\star)$ (see Sect. 4), $\{j_{g_1},\ldots,j_{g_{m_1+m_2+\ldots+m_k}}\} = \{j_1,\ldots,j_k\}$.

From (159) we have

$$J'\left[\phi_{j_1}\ldots\phi_{j_k}\right]_{T,t}^{(i_1\ldots i_k)} = J'\left[\phi_{j_{g_1}}\ldots\phi_{j_{g_{m_1}}}\right]_{T,t}^{(\overbrace{i_1\ldots i_1}^{m_1})}\cdot J'\left[\phi_{j_{g_{m_1+1}}}\ldots\phi_{j_{g_{m_1+m_2}}}\right]_{T,t}^{(\overbrace{i_2\ldots i_2}^{m_2})}\ldots$$

$$\ldots \cdot J'\left[\phi_{j_{g_{m_1+m_2+\ldots+m_{k-1}+1}}}\ldots\phi_{j_{g_{m_1+m_2+\ldots+m_k}}}\right]_{T,t}^{(\overbrace{i_k\ldots i_k}^{m_k})} \tag{160}$$

w. p. 1, where we suppose that the condition $(\star\star)$ is fulfilled for the multi-index $(i_1\ldots i_k)$ and

$$J'\left[\phi_{j_{g_{m_1+m_2+\ldots+m_{l-1}+1}}}\ldots\phi_{j_{g_{m_1+m_2+\ldots+m_l}}}\right]_{T,t}^{(\overbrace{i_l\ldots i_l}^{m_l})}\stackrel{\text{def}}{=}1\quad\text{for}\quad m_l=0, \tag{161}$$

braces mean an unordered set, and parentheses mean an ordered set. The detailed proof of the equality (160) will be given in Sect. 18 (see the proof of Theorem 20).

Let us consider the following multiple Wiener stochastic integral

$$J'\left[\phi_{j_{m_1+m_2+\ldots+m_{l-1}+1}}\ldots\phi_{j_{m_1+m_2+\ldots+m_l}}\right]_{T,t}^{(\overbrace{i_l\ldots i_l}^{m_l})}\quad(m_l>0),$$

where we suppose that

(162)
$$\left\{j_{g_{m_1+m_2+\ldots+m_{l-1}+1}},\ldots,j_{g_{m_1+m_2+\ldots+m_l}}\right\}=\left\{\underbrace{j_{h_{1,l}},\ldots,j_{h_{1,l}}}_{n_{1,l}},\underbrace{j_{h_{2,l}},\ldots,j_{h_{2,l}}}_{n_{2,l}},\ldots,\underbrace{j_{h_{d_l,l}},\ldots,j_{h_{d_l,l}}}_{n_{d_l,l}}\right\},$$

where $n_{1,l}+n_{2,l}+\ldots+n_{d_l,l}=m_l$; $n_{1,l},n_{2,l},\ldots,n_{d_l,l}=1,\ldots,m_l$; $d_l=1,\ldots,m_l$; $l=1,\ldots,k$. Note that the numbers $m_1,\ldots,m_k$, $g_1,\ldots,g_k$ depend on $(i_1,\ldots,i_k)$ and the numbers $n_{1,l},\ldots,n_{d_l,l}$, $h_{1,l},\ldots,h_{d_l,l}$, d_l depend on $\{j_1,\ldots,j_k\}$. Moreover, $\{j_{g_1},\ldots,j_{g_k}\}=\{j_1,\ldots,j_k\}$.

Using Theorem 3.1 [85], we get w. p. 1

$$J'\left[\phi_{j_{g_{m_1+m_2+\ldots+m_{l-1}+1}}}\ldots\phi_{j_{g_{m_1+m_2+\ldots+m_l}}}\right]_{T,t}^{(\overbrace{i_l\ldots i_l}^{m_l})}=$$

$$=\begin{cases}H_{n_{1,l}}\left(\zeta_{j_{h_{1,l}}}^{(i_l)}\right)\ldots H_{n_{d_l,l}}\left(\zeta_{j_{h_{d_l,l}}}^{(i_l)}\right), & \text{if}\quad i_l\neq 0\\ \left(\zeta_{j_{h_{1,l}}}^{(0)}\right)^{n_{1,l}}\ldots\left(\zeta_{j_{h_{d_l,l}}}^{(0)}\right)^{n_{d_l,l}}, & \text{if}\quad i_l=0\end{cases}\quad(m_l>0), \tag{163}$$

where $H_n(x)$ is the Hermite polynomial of degree n

$$H_n(x)=(-1)^n e^{x^2/2}\frac{d^n}{dx^n}\left(e^{-x^2/2}\right)$$

or

$$H_n(x)=n!\sum_{m=0}^{[n/2]}\frac{(-1)^m x^{n-2m}}{m!(n-2m)!2^m}\quad(n\in\mathbb{N}), \tag{164}$$

and $\zeta_j^{(i)}$ $(i=0,1,\ldots,m,\ j=0,1,\ldots)$ is defined by (7).

For example,

$$H_0(x)=1,\quad H_1(x)=x,\quad H_2(x)=x^2-1,$$
$$H_3(x)=x^3-3x,\quad H_4(x)=x^4-6x^2+3,$$
$$H_5(x)=x^5-10x^3+15x.$$

From (161) and (163) we obtain w. p. 1

$$J'\left[\phi_{j_{g_{m_1+m_2+\ldots+m_{l-1}+1}}}\ldots\phi_{j_{g_{m_1+m_2+\ldots+m_l}}}\right]_{T,t}^{(\overbrace{i_l\ldots i_l}^{m_l})}=$$

$$=\mathbf{1}_{\{m_l=0\}}+\mathbf{1}_{\{m_l>0\}}\begin{cases}H_{n_{1,l}}\left(\zeta_{j_{h_{1,l}}}^{(i_l)}\right)\ldots H_{n_{d_l,l}}\left(\zeta_{j_{h_{d_l,l}}}^{(i_l)}\right), & \text{if}\quad i_l\ne 0\\ \left(\zeta_{j_{h_{1,l}}}^{(0)}\right)^{n_{1,l}}\ldots\left(\zeta_{j_{h_{d_l,l}}}^{(0)}\right)^{n_{d_l,l}}, & \text{if}\quad i_l=0\end{cases},\tag{165}$$

where $\mathbf{1}_A$ denotes the indicator of the set A.

Using (160) and (165), we get w. p. 1

$$J'\left[\phi_{j_1}\ldots\phi_{j_k}\right]_{T,t}^{(i_1\ldots i_k)}=$$

$$=\prod_{l=1}^{k}\left(\mathbf{1}_{\{m_l=0\}}+\mathbf{1}_{\{m_l>0\}}\begin{cases}H_{n_{1,l}}\left(\zeta_{j_{h_{1,l}}}^{(i_l)}\right)\ldots H_{n_{d_l,l}}\left(\zeta_{j_{h_{d_l,l}}}^{(i_l)}\right), & \text{if}\quad i_l\ne 0\\ \left(\zeta_{j_{h_{1,l}}}^{(0)}\right)^{n_{1,l}}\ldots\left(\zeta_{j_{h_{d_l,l}}}^{(0)}\right)^{n_{d_l,l}}, & \text{if}\quad i_l=0\end{cases}\right),\tag{166}$$

where notations are the same as in (162) and (163).

The equality (166) allows us to reformulate Theorems 1, 2, and 9 using the Hermite polynomials.

Theorem 10 [22], [24], [25] (reformulation of Theorems 1 and 2). *Suppose that the condition* $(\star\star)$ *is fulfilled for the multi-index* $(i_1\ldots i_k)$ *and the condition* (162) *is also fulfilled. Furthermore, let every* $\psi_l(\tau)$ $(l=1,\ldots,k)$ *is a continuous nonrandom function on* $[t,T]$ *and* $\{\phi_j(x)\}_{j=0}^{\infty}$ *is a complete orthonormal system of functions in the space* $L_2([t,T])$, *each function* $\phi_j(x)$ *of which for finite* j *satisfies the condition* $(\star)$ (*see Sect.* 4). *Then the following expansion*

$$J[\psi^{(k)}]_{T,t}^{(i_1\ldots i_k)}=\underset{p_1,\ldots,p_k\to\infty}{\text{l.i.m.}}\sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k}C_{j_k\ldots j_1}\times$$

$$\times\prod_{l=1}^{k}\left(\mathbf{1}_{\{m_l=0\}}+\mathbf{1}_{\{m_l>0\}}\begin{cases}H_{n_{1,l}}\left(\zeta_{j_{h_{1,l}}}^{(i_l)}\right)\ldots H_{n_{d_l,l}}\left(\zeta_{j_{h_{d_l,l}}}^{(i_l)}\right), & \text{if}\quad i_l\ne 0\\ \left(\zeta_{j_{h_{1,l}}}^{(0)}\right)^{n_{1,l}}\ldots\left(\zeta_{j_{h_{d_l,l}}}^{(0)}\right)^{n_{d_l,l}}, & \text{if}\quad i_l=0\end{cases}\right)\tag{167}$$

converging in the mean-square sense is valid, where $J[\psi^{(k)}]_{T,t}^{(i_1\ldots i_k)}$ *is the iterated Itô stochastic integral* (1); $n_{1,l}+n_{2,l}+\ldots+n_{d_l,l}=m_l;$ $n_{1,l},n_{2,l},\ldots,n_{d_l,l}=1,\ldots,m_l;$ $d_l=1,\ldots,m_l;$ $l=1,\ldots,k;$ $m_1+\ldots+m_k=k;$ *the numbers* $m_1,\ldots,m_k,$ $g_1,\ldots,g_k$ *depend on* $(i_1,\ldots,i_k)$ *and the numbers* $n_{1,l},\ldots,n_{d_l,l},$ $h_{1,l},\ldots,h_{d_l,l},$ d_l *depend on* $\{j_1,\ldots,j_k\}$; *moreover,* $\{j_{g_1},\ldots,j_{g_k}\}=\{j_1,\ldots,j_k\}$; $H_n(x)$ *is the Hermite polynomial* (164); *another notations are the same as in Theorem* 1.

Theorem 11 [22], [24], [25] (reformulation of Theorems 9). *Suppose that the condition* $(\star\star)$ *is fulfilled for the multi-index* $(i_1\ldots i_k)$ *and the condition* (162) *is also fulfilled. Furthermore, let* $\Phi(t_1,\ldots,t_k):\ [t,T]^k\to\mathbb{R}$ *is a continuous nonrandom function on* $[t,T]^k$ *and* $\{\phi_j(x)\}_{j=0}^{\infty}$ *is a complete orthonormal system of functions in the space* $L_2([t,T])$, *each function* $\phi_j(x)$ *of which for finite* j *satisfies the condition* $(\star)$ *(see Sect.* 4*). Then the following expansion*

$$J'[\Phi]_{T,t}^{(i_1\ldots i_k)}=\underset{p_1,\ldots,p_k\to\infty}{\text{l.i.m.}}\sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k}C_{j_k\ldots j_1}\times$$

$$\times\prod_{l=1}^{k}\left(\mathbf{1}_{\{m_l=0\}}+\mathbf{1}_{\{m_l>0\}}\begin{cases}H_{n_{1,l}}\left(\zeta_{j_{h_{1,l}}}^{(i_l)}\right)\ldots H_{n_{d_l,l}}\left(\zeta_{j_{h_{d_l,l}}}^{(i_l)}\right), & \text{if}\quad i_l\ne 0\\ \\ \left(\zeta_{j_{h_{1,l}}}^{(0)}\right)^{n_{1,l}}\ldots\left(\zeta_{j_{h_{d_l,l}}}^{(0)}\right)^{n_{d_l,l}}, & \text{if}\quad i_l=0\end{cases}\right)$$

converging in the mean-square sense is valid, where we denote the multiple Wiener stochastic integral (155) *as* $J'[\Phi]_{T,t}^{(i_1\ldots i_k)}$; $n_{1,l}+n_{2,l}+\ldots+n_{d_l,l}=m_l;$ $n_{1,l},n_{2,l},\ldots,n_{d_l,l}=1,\ldots,m_l;$ $d_l=1,\ldots,m_l;$ $l=1,\ldots,k;$ $m_1+\ldots+m_k=k;$ *the numbers* $m_1,\ldots,m_k,$ $g_1,\ldots,g_k$ *depend on* $(i_1,\ldots,i_k)$ *and the numbers* $n_{1,l},\ldots,n_{d_l,l},$ $h_{1,l},\ldots,h_{d_l,l},$ d_l *depend on* $\{j_1,\ldots,j_k\}$; *moreover,* $\{j_{g_1},\ldots,j_{g_k}\}=\{j_1,\ldots,j_k\}$; $H_n(x)$ *is the Hermite polynomial* (164); *another notations are the same as in Theorem* 9.

From (165) we have w. p. 1

$$J'[\underbrace{\phi_{j_1}\ldots\phi_{j_1}}_{k}]_{T,t}^{(\overbrace{i_1\ldots i_1}^{k})}=\begin{cases}H_k\left(\zeta_{j_1}^{(i_1)}\right), & \text{if}\quad i_1\ne 0\\ \\ \left(\zeta_{j_1}^{(0)}\right)^k, & \text{if}\quad i_1=0\end{cases}\qquad (k>0). \tag{168}$$

Let us show how the relation (168) can be obtained from Theorem 2. To prove (168) using Theorem 2 we choose $i_1=\ldots=i_k$ and $j_1=\ldots=j_k$ $(i_1=0,1,\ldots,m)$ in the following formula (this formula follows from a comparison of (35) and (45) or can be obtained using the recurrence relation (289))

$$J'[\phi_{j_1}\ldots\phi_{j_k}]_{T,t}^{(i_1\ldots i_k)}=\prod_{l=1}^{k}\zeta_{j_l}^{(i_l)}+\sum_{r=1}^{[k/2]}(-1)^r\times$$

$$\times\sum_{\substack{(\{\{g_1,g_2\},\ldots,\{g_{2r-1},g_{2r}\}\},\{q_1,\ldots,q_{k-2r}\})\\ \{g_1,g_2,\ldots,g_{2r-1},g_{2r},q_1,\ldots,q_{k-2r}\}=\{1,2,\ldots,k\}}}\prod_{s=1}^{r}\mathbf{1}_{\{i_{g_{2s-1}}=\ i_{g_{2s}}\ne 0\}}\mathbf{1}_{\{j_{g_{2s-1}}=\ j_{g_{2s}}\}}\prod_{l=1}^{k-2r}\zeta_{j_{q_l}}^{(i_{q_l})} \tag{169}$$

w. p. 1, where notations are the same as in Theorem 2.

The case $i_1=0$ of (168) is obvious. Simple combinatorial reasoning shows that

$$\sum_{\substack{(\{\{g_1,g_2\},\ldots,\{g_{2r-1},g_{2r}\}\},\{q_1,\ldots,q_{k-2r}\})\\ \{g_1,g_2,\ldots,g_{2r-1},g_{2r},q_1,\ldots,q_{k-2r}\}=\{1,2,\ldots,k\}}}\prod_{s=1}^{r}\mathbf{1}_{\{i_{g_{2s-1}}=~i_{g_{2s}}\ne 0\}}\mathbf{1}_{\{j_{g_{2s-1}}=~j_{g_{2s}}\}}\prod_{l=1}^{k-2r}\zeta_{j_{q_l}}^{(i_{q_l})}=$$

$$=\frac{C_k^2\cdot C_{k-2}^2\cdot\ldots\cdot C_{k-(r-1)2}^2}{r!}\left(\zeta_{j_1}^{(i_1)}\right)^{k-2r},\tag{170}$$

where $i_1=\ldots=i_k,\ \ j_1=\ldots=j_k\ (i_1=1,\ldots,m)$, and

$$C_k^l=\frac{k!}{l!(k-l)!}$$

is the binomial coefficient.

We have

$$\frac{C_k^2\cdot C_{k-2}^2\cdot\ldots\cdot C_{k-(r-1)2}^2}{r!}=\frac{k!}{r!(k-2r)!2^r}.\tag{171}$$

Combining (169), (170), and (171), we get w. p. 1

$$J'[\underbrace{\phi_{j_1}\ldots\phi_{j_1}}_{k}]_{T,t}^{(\overbrace{i_1\ldots i_1}^{k})}=\left(\zeta_{j_1}^{(i_1)}\right)^k+k!\sum_{r=1}^{[k/2]}\frac{(-1)^r}{r!(k-2r)!2^r}\left(\zeta_{j_1}^{(i_1)}\right)^{k-2r}=$$

$$=k!\sum_{r=0}^{[k/2]}\frac{(-1)^r}{r!(k-2r)!2^r}\left(\zeta_{j_1}^{(i_1)}\right)^{k-2r}=H_k\left(\zeta_{j_1}^{(i_1)}\right).$$

The relation (168) is proved using (169).

From (166) and (169) we obtain the following equality for multiple Wiener stochastic integral

$$J'[\phi_{j_1}\ldots\phi_{j_k}]_{T,t}^{(i_1\ldots i_k)}=\prod_{l=1}^{k}\zeta_{j_l}^{(i_l)}+\sum_{r=1}^{[k/2]}(-1)^r\times$$

$$\times\sum_{\substack{(\{\{g_1,g_2\},\ldots,\{g_{2r-1},g_{2r}\}\},\{q_1,\ldots,q_{k-2r}\})\\ \{g_1,g_2,\ldots,g_{2r-1},g_{2r},q_1,\ldots,q_{k-2r}\}=\{1,2,\ldots,k\}}}\prod_{s=1}^{r}\mathbf{1}_{\{i_{g_{2s-1}}=~i_{g_{2s}}\ne 0\}}\mathbf{1}_{\{j_{g_{2s-1}}=~j_{g_{2s}}\}}\prod_{l=1}^{k-2r}\zeta_{j_{q_l}}^{(i_{q_l})}=$$

$$=\prod_{l=1}^{k}\left(\mathbf{1}_{\{m_l=0\}}+\mathbf{1}_{\{m_l>0\}}\begin{cases}H_{n_{1,l}}\left(\zeta_{j_{h_{1,l}}}^{(i_l)}\right)\ldots H_{n_{d_l,l}}\left(\zeta_{j_{h_{d_l,l}}}^{(i_l)}\right), & \text{if}\quad i_l\ne 0\\ \left(\zeta_{j_{h_{1,l}}}^{(0)}\right)^{n_{1,l}}\ldots\left(\zeta_{j_{h_{d_l,l}}}^{(0)}\right)^{n_{d_l,l}}, & \text{if}\quad i_l=0\end{cases}\right)\tag{172}$$

w. p. 1, where notations are the same as in Theorem 2 and (162), (163).

Let us make a remark about how it is possible to obtain the formula (163) without using Theorem 3.1 [85]. Consider the set of polynomials $H_n(x,y)$, $n=0,1,\ldots$ defined by [88]

(173) $$H_n(x,y)=\left(\frac{d^n}{d\alpha^n}e^{\alpha x-\alpha^2 y/2}\right)\Bigg|_{\alpha=0}\qquad (H_0(x,y)\stackrel{\sf def}{=}1).$$

It is well known that polynomials $H_n(x,y)$ are connected with the Hermite polynomials (164) by the formula [88]

(174) $$H_n(x,y)=y^{n/2}H_n\left(\frac{x}{\sqrt{y}}\right)=n!\sum_{i=0}^{[n/2]}\frac{(-1)^i x^{n-2i}y^i}{i!(n-2i)!2^i}.$$

For example,

$$H_1(x,y)=x,$$
$$H_2(x,y)=x^2-y,$$
$$H_3(x,y)=x^3-3xy,$$
$$H_4(x,y)=x^4-6x^2y+3y^2,$$
$$H_5(x,y)=x^5-10x^3y+15xy^2.$$

From (164) and (174) we get

(175) $$H_n(x,1)=H_n(x).$$

Obviously, without loss of generality, we can write

(176) $$(j_1\ldots j_k)=\bigl(\underbrace{j_1\ldots j_1}_{m_1}\ \underbrace{j_2\ldots j_2}_{m_2}\ \ldots\ \underbrace{j_r\ldots j_r}_{m_r}\bigr),$$

where $m_1+\ldots+m_r=k,\ \ m_1,\ldots,m_r=1,\ldots,k,\ \ r=1,\ldots,k,\ \ k>0$, and $j_1,\ldots,j_r$ are pairwise different.

Analyzing the proof of Theorem 1 and using (236), (259) (see the proof of Theorem 20 below), we can notice that (we suppose that the condition (176) is fulfilled)

$$J'[\phi_{j_1}\ldots\phi_{j_k}]_{T,t}^{(i_1\ldots i_1)}=$$

$$=\underset{N\to\infty}{\text{l.i.m.}}\sum_{\substack{l_1,\ldots,l_k=0\\ l_q\ne l_g;\ q\ne g;\ q,g=1,\ldots,k}}^{N-1}\phi_{j_1}(\tau_{l_1})\ldots\phi_{j_k}(\tau_{l_k})\Delta\mathbf{w}_{\tau_{l_1}}^{(i_1)}\ldots\Delta\mathbf{w}_{\tau_{l_k}}^{(i_1)}=$$

$$=\underset{N\to\infty}{\text{l.i.m.}}\sum_{\substack{l_1,\ldots,l_{m_1}=0\\ l_q\ne l_g;\ q\ne g;\ q,g=1,\ldots,m_1}}^{N-1}\phi_{j_1}(\tau_{l_1})\ldots\phi_{j_1}(\tau_{l_{m_1}})\Delta\mathbf{w}_{\tau_{l_1}}^{(i_1)}\ldots\Delta\mathbf{w}_{\tau_{l_{m_1}}}^{(i_1)}\times$$

$$\times\underset{N\to\infty}{\text{l.i.m.}}\sum_{\substack{l_{m_1+1},\ldots,l_{m_1+m_2}=0\\ l_q\ne l_g;\ q\ne g;\ q,g=m_1+1,\ldots,m_1+m_2}}^{N-1}\phi_{j_2}(\tau_{l_{m_1+1}})\ldots\phi_{j_2}(\tau_{l_{m_1+m_2}})\Delta\mathbf{w}_{\tau_{l_{m_1+1}}}^{(i_1)}\ldots\Delta\mathbf{w}_{\tau_{l_{m_1+m_2}}}^{(i_1)}\times$$

$$\ldots$$

$$\times \underset{N\to\infty}{\text{l.i.m.}} \sum_{\substack{l_{k-m_r+1},\ldots,l_k=0\\ l_q\ne l_g;\ q\ne g;\ q,g=k-m_r+1,\ldots,k}}^{N-1} \phi_{j_r}(\tau_{l_{k-m_r+1}})\ldots\phi_{j_r}(\tau_{l_k})\Delta\mathbf{w}_{\tau_{l_{k-m_r+1}}}^{(i_1)}\ldots\Delta\mathbf{w}_{\tau_{l_k}}^{(i_1)} =$$

$$= \underset{N\to\infty}{\text{l.i.m.}} \left(\sum_{l_1=0}^{N-1}\phi_{j_1}(\tau_{l_1})\Delta\mathbf{w}_{\tau_{l_1}}^{(i_1)}\ldots\sum_{l_{m_1}=0}^{N-1}\phi_{j_1}(\tau_{l_{m_1}})\Delta\mathbf{w}_{\tau_{l_{m_1}}}^{(i_1)} -\right.$$

$$\left. - \sum_{(l_1,\ldots,l_{m_1})\in \mathrm{G}'_{1,m_1}} \phi_{j_1}(\tau_{l_1})\Delta\mathbf{w}_{\tau_{l_1}}^{(i_1)}\ldots\phi_{j_1}(\tau_{l_{m_1}})\Delta\mathbf{w}_{\tau_{l_{m_1}}}^{(i_1)}\right)\times$$

$$\times \underset{N\to\infty}{\text{l.i.m.}} \left(\sum_{l_{m_1+1}=0}^{N-1}\phi_{j_2}(\tau_{l_{m_1}+1})\Delta\mathbf{w}_{\tau_{l_{m_1+1}}}^{(i_1)}\ldots\sum_{l_{m_1+m_2}=0}^{N-1}\phi_{j_2}(\tau_{l_{m_1+m_2}})\Delta\mathbf{w}_{\tau_{l_{m_1+m_2}}}^{(i_1)} -\right.$$

$$\left. - \sum_{(l_{m_1+1},\ldots,l_{m_1+m_2})\in \mathrm{G}'_{m_1+1,m_1+m_2}} \phi_{j_2}(\tau_{l_{m_1}+1})\Delta\mathbf{w}_{\tau_{l_{m_1+1}}}^{(i_1)}\ldots\phi_{j_2}(\tau_{l_{m_1+m_2}})\Delta\mathbf{w}_{\tau_{l_{m_1+m_2}}}^{(i_1)}\right)\times$$

$$\ldots$$

$$\times \underset{N\to\infty}{\text{l.i.m.}} \left(\sum_{l_{k-m_r+1}=0}^{N-1}\phi_{j_r}(\tau_{l_{k-m_r+1}})\Delta\mathbf{w}_{\tau_{l_{k-m_r+1}}}^{(i_1)}\ldots\sum_{l_k=0}^{N-1}\phi_{j_r}(\tau_{l_k})\Delta\mathbf{w}_{\tau_{l_k}}^{(i_1)} -\right.$$

$$\left. - \sum_{(l_{k-m_r+1},\ldots,l_k)\in \mathrm{G}'_{k-m_r+1,k}} \phi_{j_r}(\tau_{l_{k-m_r+1}})\Delta\mathbf{w}_{\tau_{k-m_r+1}}^{(i_1)}\ldots\phi_{j_r}(\tau_{l_k})\Delta\mathbf{w}_{\tau_{l_k}}^{(i_1)}\right),$$

where the set $\mathrm{G}'_{m,n}$ is defined according to the same rule as the set G_k in (6). However, the elements of the set $\mathrm{G}'_{m,n}$ are the numbers $l_m,\ldots,l_n$ $(n>m)$, while the elements of the set G_k are the numbers $l_1,\ldots,l_k$.

We have (see the proof of Theorem 1) w. p. 1 $(i_1\ne 0)$

$$\underset{N\to\infty}{\text{l.i.m.}} \left(\sum_{l_1=0}^{N-1}\phi_{j_1}(\tau_{l_1})\Delta\mathbf{w}_{\tau_{l_1}}^{(i_1)}\ldots\sum_{l_{m_1}=0}^{N-1}\phi_{j_1}(\tau_{l_{m_1}})\Delta\mathbf{w}_{\tau_{l_{m_1}}}^{(i_1)} -\right.$$

$$\left. - \sum_{(l_1,\ldots,l_{m_1})\in \mathrm{G}'_{1,m_1}} \phi_{j_1}(\tau_{l_1})\Delta\mathbf{w}_{\tau_{l_1}}^{(i_1)}\ldots\phi_{j_1}(\tau_{l_{m_1}})\Delta\mathbf{w}_{\tau_{l_{m_1}}}^{(i_1)}\right) =$$

$$= \underset{N\to\infty}{\text{l.i.m.}} \left(\left(\sum_{l_1=0}^{N-1}\phi_{j_1}(\tau_{l_1})\Delta\mathbf{w}_{\tau_{l_1}}^{(i_1)}\right)^{m_1} + \sum_{r=1}^{[m_1/2]}(-1)^r\times\right.$$

$$
\times \sum_{\substack{(\{\{g_1,g_2\},\ldots,\{g_{2r-1},g_{2r}\}\},\{q_1,\ldots,q_{m_1-2r}\})\\ \{g_1,g_2,\ldots,g_{2r-1},g_{2r},q_1,\ldots,q_{m_1-2r}\}=\{1,2,\ldots,m_1\}}} \left(\sum_{l_1=0}^{N-1}\phi_{j_1}^2(\tau_{l_1})\left(\Delta\mathbf{w}_{\tau_{l_1}}^{(i_1)}\right)^2\right)^r \times
$$

$$
\left.\times\left(\sum_{l_1=0}^{N-1}\phi_{j_1}(\tau_{l_1})\Delta\mathbf{w}_{\tau_{l_1}}^{(i_1)}\right)^{m_1-2r}\right) =
$$

$$
= \underset{N\to\infty}{\text{l.i.m.}} \left(\left(\sum_{l_1=0}^{N-1}\phi_{j_1}(\tau_{l_1})\Delta\mathbf{w}_{\tau_{l_1}}^{(i_1)}\right)^{m_1} + \sum_{r=1}^{[m_1/2]}\frac{(-1)^r m_1!}{r!(m_1-2r)!2^r}\left(\sum_{l_1=0}^{N-1}\phi_{j_1}^2(\tau_{l_1})\left(\Delta\mathbf{w}_{\tau_{l_1}}^{(i_1)}\right)^2\right)^r \times\right.
$$

$$
\left.\times\left(\sum_{l_1=0}^{N-1}\phi_{j_1}(\tau_{l_1})\Delta\mathbf{w}_{\tau_{l_1}}^{(i_1)}\right)^{m_1-2r}\right) =
$$

$$
= \underset{N\to\infty}{\text{l.i.m.}} \left(\sum_{r=0}^{[m_1/2]}\frac{(-1)^r m_1!}{r!(m_1-2r)!2^r}\left(\sum_{l_1=0}^{N-1}\phi_{j_1}^2(\tau_{l_1})\left(\Delta\mathbf{w}_{\tau_{l_1}}^{(i_1)}\right)^2\right)^r\left(\sum_{l_1=0}^{N-1}\phi_{j_1}(\tau_{l_1})\Delta\mathbf{w}_{\tau_{l_1}}^{(i_1)}\right)^{m_1-2r}\right) =
$$

$$
= \underset{N\to\infty}{\text{l.i.m.}}\ H_{m_1}\left(\sum_{l_1=0}^{N-1}\phi_{j_1}(\tau_{l_1})\Delta\mathbf{w}_{\tau_{l_1}}^{(i_1)},\ \sum_{l_1=0}^{N-1}\phi_{j_1}^2(\tau_{l_1})\left(\Delta\mathbf{w}_{\tau_{l_1}}^{(i_1)}\right)^2\right),
$$

where notations are the same as in Theorems 1, 2.

Similarly we get w. p. 1

$$
\underset{N\to\infty}{\text{l.i.m.}} \left(\sum_{l_{m_1+1}=0}^{N-1}\phi_{j_2}(\tau_{l_{m_1+1}})\Delta\mathbf{w}_{\tau_{l_{m_1+1}}}^{(i_1)}\ldots\sum_{l_{m_1+m_2}=0}^{N-1}\phi_{j_2}(\tau_{l_{m_1+m_2}})\Delta\mathbf{w}_{\tau_{l_{m_1+m_2}}}^{(i_1)}-\right.
$$

$$
\left.-\sum_{(l_{m_1+1},\ldots,l_{m_1+m_2})\in \mathrm{G}'_{m_1+1,m_1+m_2}}\phi_{j_2}(\tau_{l_{m_1+1}})\Delta\mathbf{w}_{\tau_{l_{m_1+1}}}^{(i_1)}\ldots\phi_{j_2}(\tau_{l_{m_1+m_2}})\Delta\mathbf{w}_{\tau_{l_{m_1+m_2}}}^{(i_1)}\right) =
$$

$$
= \underset{N\to\infty}{\text{l.i.m.}}\ H_{m_2}\left(\sum_{l_1=0}^{N-1}\phi_{j_2}(\tau_{l_1})\Delta\mathbf{w}_{\tau_{l_1}}^{(i_1)},\ \sum_{l_1=0}^{N-1}\phi_{j_2}^2(\tau_{l_1})\left(\Delta\mathbf{w}_{\tau_{l_1}}^{(i_1)}\right)^2\right),
$$

$$
\ldots
$$

$$
\underset{N\to\infty}{\text{l.i.m.}} \left(\sum_{l_{k-m_r+1}=0}^{N-1}\phi_{j_r}(\tau_{l_{k-m_r+1}})\Delta\mathbf{w}_{\tau_{l_{k-m_r+1}}}^{(i_1)}\ldots\sum_{l_k=0}^{N-1}\phi_{j_r}(\tau_{l_k})\Delta\mathbf{w}_{\tau_{l_k}}^{(i_1)}-\right.
$$

$$-\sum_{(l_{k-m_r+1},\ldots,l_k)\in\mathrm{G}'_{k-m_r+1,k}}\phi_{j_r}(\tau_{l_{k-m_r+1}})\Delta\mathbf{w}_{\tau_{k-m_r+1}}^{(i_1)}\ldots\phi_{j_r}(\tau_{l_k})\Delta\mathbf{w}_{\tau_{l_k}}^{(i_1)}\Biggr)=$$

$$=\underset{N\to\infty}{\text{l.i.m.}}\ H_{m_r}\left(\sum_{l_1=0}^{N-1}\phi_{j_r}(\tau_{l_1})\Delta\mathbf{w}_{\tau_{l_1}}^{(i_1)},\ \sum_{l_1=0}^{N-1}\phi_{j_r}^2(\tau_{l_1})\left(\Delta\mathbf{w}_{\tau_{l_1}}^{(i_1)}\right)^2\right).$$

Then

$$J'[\phi_{j_1}\ldots\phi_{j_k}]_{T,t}^{(i_1\ldots i_1)}=$$

$$=\underset{N\to\infty}{\text{l.i.m.}}\ H_{m_1}\left(\sum_{l_1=0}^{N-1}\phi_{j_1}(\tau_{l_1})\Delta\mathbf{w}_{\tau_{l_1}}^{(i_1)},\ \sum_{l_1=0}^{N-1}\phi_{j_1}^2(\tau_{l_1})\left(\Delta\mathbf{w}_{\tau_{l_1}}^{(i_1)}\right)^2\right)\times$$

$$\times\underset{N\to\infty}{\text{l.i.m.}}\ H_{m_2}\left(\sum_{l_1=0}^{N-1}\phi_{j_2}(\tau_{l_1})\Delta\mathbf{w}_{\tau_{l_1}}^{(i_1)},\ \sum_{l_1=0}^{N-1}\phi_{j_2}^2(\tau_{l_1})\left(\Delta\mathbf{w}_{\tau_{l_1}}^{(i_1)}\right)^2\right)\times\ldots$$

$$\ldots\times\underset{N\to\infty}{\text{l.i.m.}}\ H_{m_r}\left(\sum_{l_1=0}^{N-1}\phi_{j_r}(\tau_{l_1})\Delta\mathbf{w}_{\tau_{l_1}}^{(i_1)},\ \sum_{l_1=0}^{N-1}\phi_{j_r}^2(\tau_{l_1})\left(\Delta\mathbf{w}_{\tau_{l_1}}^{(i_1)}\right)^2\right) \tag{177}$$

w. p. 1 for $i_1\ne 0$ and

$$J'[\phi_{j_1}\ldots\phi_{j_k}]_{T,t}^{(0\ldots 0)}=$$

$$=\lim_{N\to\infty}\left(\sum_{l_1=0}^{N-1}\phi_{j_1}(\tau_{l_1})\Delta\tau_{l_1}\right)^{m_1}\ldots\left(\sum_{l_r=0}^{N-1}\phi_{j_r}(\tau_{l_r})\Delta\tau_{l_r}\right)^{m_r}=$$

$$=\left(\int_t^T\phi_{j_1}(s)ds\right)^{m_1}\ldots\left(\int_t^T\phi_{j_r}(s)ds\right)^{m_r}=$$

$$=\left(\zeta_{j_1}^{(0)}\right)^{m_1}\ldots\left(\zeta_{j_r}^{(0)}\right)^{m_r} \tag{178}$$

for $i_1=0$, where we suppose that the condition (176) is fulfilled; also we use in (177) and (178) the same notations as in the proof of Theorem 1.

Applying (174), (175), Lemma 3, and Remark 2 to the right-hand side of (177), we finally obtain w. p. 1

$$J'[\phi_{j_1}\ldots\phi_{j_k}]_{T,t}^{(i_1\ldots i_1)}=H_{m_1}\left(\int_t^T\phi_{j_1}(s)d\mathbf{w}_s^{(i_1)},\int_t^T\phi_{j_1}^2(s)ds\right)\times$$

$$\times H_{m_2}\left(\int\limits_t^T \phi_{j_2}(s)d\mathbf{w}_s^{(i_1)},\int\limits_t^T \phi_{j_2}^2(s)ds\right)\ldots H_{m_r}\left(\int\limits_t^T \phi_{j_r}(s)d\mathbf{w}_s^{(i_1)},\int\limits_t^T \phi_{j_r}^2(s)ds\right)=$$

$$=H_{m_1}\left(\zeta_{j_1}^{(i_1)},1\right)H_{m_2}\left(\zeta_{j_2}^{(i_1)},1\right)\ldots H_{m_r}\left(\zeta_{j_r}^{(i_1)},1\right)=$$

$$=H_{m_1}\left(\zeta_{j_1}^{(i_1)}\right)H_{m_2}\left(\zeta_{j_2}^{(i_1)}\right)\ldots H_{m_r}\left(\zeta_{j_r}^{(i_1)}\right)$$

for $i_1 \neq 0$, where we suppose that the condition (176) is fulfilled. An equality similar to (163) was proved without using Theorem 3.1 [85].

Consider particular cases of the equality (172) for $k = 1,\ldots,4$ and $i_1,\ldots,i_4 = 1,\ldots,m$ (see (36)–(39)). We have w. p. 1

$$J'[\phi_{j_1}]_{T,t}^{(i_1)}=\zeta_{j_1}^{(i_1)}=H_1\left(\zeta_{j_1}^{(i_1)}\right);$$

$$J'[\phi_{j_1}\phi_{j_2}]_{T,t}^{(i_1i_2)}=\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}-\mathbf{1}_{\{i_1=i_2\}}\mathbf{1}_{\{j_1=j_2\}}=$$

$$=\begin{cases}H_2\left(\zeta_{j_1}^{(i_1)}\right)H_0\left(\zeta_{j_2}^{(i_2)}\right), & \text{if}\quad i_1=i_2,\ j_1=j_2\\ H_1\left(\zeta_{j_1}^{(i_1)}\right)H_1\left(\zeta_{j_2}^{(i_2)}\right), & \text{otherwise}\end{cases};\tag{179}$$

$$J'[\phi_{j_1}\phi_{j_2}\phi_{j_3}]_{T,t}^{(i_1i_1i_1)}=\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_1)}\zeta_{j_3}^{(i_1)}-\mathbf{1}_{\{j_1=j_2\}}\zeta_{j_3}^{(i_1)}-\mathbf{1}_{\{j_2=j_3\}}\zeta_{j_1}^{(i_1)}-$$

$$-\mathbf{1}_{\{j_1=j_3\}}\zeta_{j_2}^{(i_1)}=$$

$$=\begin{cases}H_3\left(\zeta_{j_1}^{(i_1)}\right)H_0\left(\zeta_{j_2}^{(i_1)}\right)H_0\left(\zeta_{j_3}^{(i_1)}\right), & \text{if}\quad j_1=j_2=j_3\\ H_2\left(\zeta_{j_1}^{(i_1)}\right)H_0\left(\zeta_{j_2}^{(i_1)}\right)H_1\left(\zeta_{j_3}^{(i_1)}\right), & \text{if}\quad j_1=j_2\neq j_3\\ H_1\left(\zeta_{j_1}^{(i_1)}\right)H_2\left(\zeta_{j_2}^{(i_1)}\right)H_0\left(\zeta_{j_3}^{(i_1)}\right), & \text{if}\quad j_2=j_3\neq j_1\\ H_0\left(\zeta_{j_1}^{(i_1)}\right)H_1\left(\zeta_{j_2}^{(i_1)}\right)H_2\left(\zeta_{j_3}^{(i_1)}\right), & \text{if}\quad j_1=j_3\neq j_2\\ H_1\left(\zeta_{j_1}^{(i_1)}\right)H_1\left(\zeta_{j_2}^{(i_1)}\right)H_1\left(\zeta_{j_3}^{(i_1)}\right), & \text{if}\quad j_1\neq j_2,\ j_2\neq j_3, j_1\neq j_3\end{cases};\tag{180}$$

$$J'[\phi_{j_1}\phi_{j_2}\phi_{j_3}]_{T,t}^{(i_1 i_2 i_3)} = \zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}\zeta_{j_3}^{(i_2)} =$$

$$= H_1\left(\zeta_{j_1}^{(i_1)}\right) H_1\left(\zeta_{j_2}^{(i_2)}\right) H_1\left(\zeta_{j_3}^{(i_3)}\right),$$

where i_1, i_2, i_3 are pairwise different;

$$J'[\phi_{j_1}\phi_{j_2}\phi_{j_3}]_{T,t}^{(i_1 i_1 i_3)} = \zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_1)}\zeta_{j_3}^{(i_3)} - \mathbf{1}_{\{j_1=j_2\}}\zeta_{j_3}^{(i_3)} =$$

$$= \left(\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_1)} - \mathbf{1}_{\{j_1=j_2\}}\right)\zeta_{j_3}^{(i_3)} = J'[\phi_{j_1}\phi_{j_2}]_{T,t}^{(i_1 i_1)} J'[\phi_{j_3}]_{T,t}^{(i_3)} =$$

$$= \begin{cases} H_2\left(\zeta_{j_1}^{(i_1)}\right) H_0\left(\zeta_{j_2}^{(i_1)}\right) H_1\left(\zeta_{j_3}^{(i_3)}\right), & \text{if} \quad j_1 = j_2 \\ \\ H_1\left(\zeta_{j_1}^{(i_1)}\right) H_1\left(\zeta_{j_2}^{(i_1)}\right) H_1\left(\zeta_{j_3}^{(i_3)}\right), & \text{if} \quad j_1 \neq j_2 \end{cases},$$

where $i_1 = i_2 \neq i_3$;

$$J'[\phi_{j_1}\phi_{j_2}\phi_{j_3}]_{T,t}^{(i_1 i_2 i_2)} = \zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}\zeta_{j_3}^{(i_2)} - \mathbf{1}_{\{j_2=j_3\}}\zeta_{j_1}^{(i_1)} =$$

$$= \zeta_{j_1}^{(i_1)}\left(\zeta_{j_2}^{(i_2)}\zeta_{j_3}^{(i_2)} - \mathbf{1}_{\{j_2=j_3\}}\right) = J'[\phi_{j_1}]_{T,t}^{(i_1)} J'[\phi_{j_2}\phi_{j_3}]_{T,t}^{(i_2 i_2)} =$$

$$= \begin{cases} H_1\left(\zeta_{j_1}^{(i_1)}\right) H_2\left(\zeta_{j_2}^{(i_2)}\right) H_0\left(\zeta_{j_3}^{(i_2)}\right), & \text{if} \quad j_2 = j_3 \\ \\ H_1\left(\zeta_{j_1}^{(i_1)}\right) H_1\left(\zeta_{j_2}^{(i_2)}\right) H_1\left(\zeta_{j_3}^{(i_2)}\right), & \text{if} \quad j_1 \neq j_2 \end{cases},$$

where $i_1 \neq i_2 = i_3$;

$$J'[\phi_{j_1}\phi_{j_2}\phi_{j_3}]_{T,t}^{(i_1 i_2 i_1)} = \zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}\zeta_{j_3}^{(i_1)} - \mathbf{1}_{\{j_1=j_3\}}\zeta_{j_2}^{(i_2)} =$$

$$= \zeta_{j_2}^{(i_2)}\left(\zeta_{j_1}^{(i_1)}\zeta_{j_3}^{(i_1)} - \mathbf{1}_{\{j_1=j_3\}}\right) = J'[\phi_{j_2}]_{T,t}^{(i_2)} J'[\phi_{j_1}\phi_{j_3}]_{T,t}^{(i_1 i_1)} =$$

Note that the right-hand sides of (181)–(193) contain multiple Wiener stochastic integrals of multiplicities 2 and 3. These integrals are considered in detail in (179), (180).

It should be noted that the formulas (45) (Theorem 2) and (167) (Theorem 10) are interesting from various points of view. The formulas (36)–(41) (these formulas are particular cases of (45) for $k = 1, \ldots, 6$) are convenient for numerical modeling of iterated Ito stochastic integrals of multiplicities 1 to 6. For example, in [56] and [57], approximations of iterated Ito stochastic integrals of multiplicities 1 to 6 in the Python programming language were successfully implemented using (36)–(41) and Legendre polynomials.

On the other hand, the equality (167) is interesting by a number of reasons. Firstly, this equality connects Ito's results on multiple Wiener stochastic integrals ([85], Theorem 3.1) with the theory of mean-square approximation of iterated Ito stochastic integrals presented in this paper and in the book [22]. Secondly, the equality (167) is based on the Hermite polynomials, which have the orthogonality property on $\mathbb{R}$ with a Gaussian weight. This feature opens up new possibilities in the study of iterated Ito stochastic integrals.

15. A Generalization of Theorems 1, 2, 10, and 11 to the Case of an Arbitrary Complete Orthonormal System of Functions in the Space $L_2([t,T])$ and $\psi_1(\tau), \ldots, \psi_k(\tau) \in L_2([t,T])$, $\Phi(t_1,\ldots,t_k) \in L_2([t,T]^k)$

In this section, we will use the definition of the multiple Wiener stochastic integral from [85], [87] to generalize Theorems 1, 2, 10, and 11 to the case of an arbitrary complete orthonormal system of functions in the space $L_2([t,T])$ and $\psi_1(\tau), \ldots, \psi_k(\tau) \in L_2([t,T])$, $\Phi(t_1,\ldots,t_k) \in L_2([t,T]^k)$.

Consider the following step function on the hypercube $[t,T]^k$

$$\Phi_N(t_1,\ldots,t_k) = \sum_{l_1,\ldots,l_k=0}^{N-1} a_{l_1\ldots l_k} \mathbf{1}_{[\tau_{l_1},\tau_{l_1+1})}(t_1)\ldots \mathbf{1}_{[\tau_{l_k},\tau_{l_k+1})}(t_k), \tag{194}$$

where $a_{l_1\ldots l_k}\in\mathbb{R}$ and such that $a_{l_1\ldots l_k}=0$ if $l_p=l_q$ for some $p\ne q$,

$$\mathbf{1}_A(\tau)=\begin{cases}1 & \text{if } \tau\in A\\ \\ 0 & \text{otherwise}\end{cases},$$

$N\in\mathbb{N}$, $\{\tau_j\}_{j=0}^{N}$ is a partition of $[t,T]$, which satisfies the condition (5):

$$t=\tau_0<\ldots<\tau_N=T,\quad \Delta_N=\max_{0\le j\le N-1}\Delta\tau_j\to 0\ \text{ if }\ N\to\infty,\quad \Delta\tau_j=\tau_{j+1}-\tau_j. \tag{195}$$

Let us define the multiple Wiener stochastic integral for $\Phi_N(t_1,\ldots,t_k)$ [85], [87]

$$J'[\Phi_N]_{T,t}^{(i_1\ldots i_k)}\stackrel{\sf def}{=}\sum_{l_1,\ldots,l_k=0}^{N-1}a_{l_1\ldots l_k}\Delta\mathbf{w}_{\tau_{l_1}}^{(i_1)}\ldots\Delta\mathbf{w}_{\tau_{l_k}}^{(i_k)}, \tag{196}$$

where $\Delta\mathbf{w}_{\tau_j}^{(i)}=\mathbf{w}_{\tau_{j+1}}^{(i)}-\mathbf{w}_{\tau_j}^{(i)}$, $i=0,1,\ldots,m$, $\mathbf{w}_{\tau}^{(0)}=\tau$.

It is known (see [87], Lemma 9.6.4) that for any $\Phi(t_1,\ldots,t_k)\in L_2([t,T]^k)$ there exists a sequence of step functions $\Phi_N(t_1,\ldots,t_k)$ of the form (194) such that

$$\lim_{N\to\infty}\int\limits_{[t,T]^k}\left(\Phi(t_1,\ldots,t_k)-\Phi_N(t_1,\ldots,t_k)\right)^2dt_1\ldots dt_k=0. \tag{197}$$

We have

$$\Phi_N(t_1,\ldots,t_k)=\sum_{l_1,\ldots,l_k=0}^{N-1}a_{l_1\ldots l_k}\mathbf{1}_{[\tau_{l_1},\tau_{l_1+1})}(t_1)\ldots\mathbf{1}_{[\tau_{l_k},\tau_{l_k+1})}(t_k)=$$

$$=\sum_{(l_1,\ldots,l_k)}\sum_{\substack{l_1,\ldots,l_k=0\\ l_1<l_2<\ldots<l_k}}^{N-1}a_{l_1\ldots l_k}\mathbf{1}_{[\tau_{l_1},\tau_{l_1+1})}(t_1)\ldots\mathbf{1}_{[\tau_{l_k},\tau_{l_k+1})}(t_k), \tag{198}$$

where permutations $(l_1,\ldots,l_k)$ when summing are performed only in the expression $l_1<l_2<\ldots<l_k$ (recall that $a_{l_1\ldots l_k}=0$ if $l_p=l_q$ for some $p\ne q$).

Using (198), we get

$$\sum_{(t_1,\ldots,t_k)}\int\limits_t^T\ldots\int\limits_t^{t_2}\Phi_N(t_1,\ldots,t_k)d\mathbf{w}_{t_1}^{(i_1)}\ldots d\mathbf{w}_{t_k}^{(i_k)}= \tag{199}$$

$$=\sum_{(l_1,\ldots,l_k)}\sum_{\substack{l_1,\ldots,l_k=0\\ l_1<l_2<\ldots<l_k}}^{N-1}a_{l_1\ldots l_k}\Delta\mathbf{w}_{\tau_{l_1}}^{(i_1)}\ldots\Delta\mathbf{w}_{\tau_{l_k}}^{(i_k)}=$$

$$= \sum_{\substack{l_1,\ldots,l_k=0\\ l_q\neq l_r;\ q\neq r;\ q,r=1,\ldots,k}}^{N-1} a_{l_1\ldots l_k}\Delta\mathbf{w}_{\tau_{l_1}}^{(i_1)}\ldots\Delta\mathbf{w}_{\tau_{l_k}}^{(i_k)} =$$

(200) $$= J'[\Phi_N]_{T,t}^{(i_1\ldots i_k)} \quad \text{w. p. 1},$$

where permutations $(t_1,\ldots,t_k)$ when summing are performed only in the values $d\mathbf{w}_{t_1}^{(i_1)}\ldots d\mathbf{w}_{t_k}^{(i_k)}$ and permutations $(l_1,\ldots,l_k)$ when summing are performed only in the expression $l_1 < l_2 < \ldots < l_k$. At the same time the indices near upper limits of integration in the iterated stochastic integrals in (199) are changed correspondently and if t_r swapped with t_q in the permutation $(t_1,\ldots,t_k)$, then i_r swapped with i_q in the permutation $(i_1,\ldots,i_k)$ (see (199)). In addition, the multiple Wiener stochastic integral $J'[\Phi_N]_{T,t}^{(i_1\ldots i_k)}$ is defined by (196) and

$$\int\limits_t^T\ldots\int\limits_t^{t_2}\Phi_N(t_1,\ldots,t_k)d\mathbf{w}_{t_1}^{(i_1)}\ldots d\mathbf{w}_{t_k}^{(i_k)}$$

is the iterated Ito stochastic integral.

Using (197), (200), Lemma 2 for $\Phi(t_1,\ldots,t_k)\in L_2(D_k)$, and (30) for Lebesgue integrals, we have

$$\mathsf{M}\left\{\left(J'[\Phi_N]_{T,t}^{(i_1\ldots i_k)} - J'[\Phi_M]_{T,t}^{(i_1\ldots i_k)}\right)^2\right\} \le$$

$$\le C_k\sum_{(t_1,\ldots,t_k)}\int\limits_t^T\ldots\int\limits_t^{t_2}\left(\Phi_N(t_1,\ldots,t_k)-\Phi_M(t_1,\ldots,t_k)\right)^2 dt_1\ldots dt_k =$$

$$= C_k\int\limits_{[t,T]^k}\left(\Phi_N(t_1,\ldots,t_k)-\Phi_M(t_1,\ldots,t_k)\right)^2 dt_1\ldots dt_k =$$

$$= C_k\left\|\Phi_N-\Phi_M\right\|^2_{L_2([t,T]^k)} \le$$

$$\le 2C_k\left(\left\|\Phi_N-\Phi\right\|^2_{L_2([t,T]^k)}+\left\|\Phi-\Phi_M\right\|^2_{L_2([t,T]^k)}\right)^2 \to 0$$

if $N,M\to\infty$, where constant C_k depends only on the multiplicity k of the multiple Wiener stochastic integral.

Thus, there exists the limit

$$\underset{N\to\infty}{\text{l.i.m.}}\ J'[\Phi_N]_{T,t}^{(i_1\ldots i_k)}.$$

We will define the multiple Wiener stochastic integral for $\Phi(t_1,\ldots,t_k)\in L_2([t,T]^k)$ by the formula [85], [87]

(201) $$J'[\Phi]_{T,t}^{(i_1\ldots i_k)} \stackrel{\mathsf{def}}{=} \underset{N\to\infty}{\text{l.i.m.}}\ J'[\Phi_N]_{T,t}^{(i_1\ldots i_k)} = \underset{N\to\infty}{\text{l.i.m.}}\sum_{l_1,\ldots,l_k=0}^{N-1} a_{l_1\ldots l_k}\Delta\mathbf{w}_{\tau_{l_1}}^{(i_1)}\ldots\Delta\mathbf{w}_{\tau_{l_k}}^{(i_k)},$$

where $\Phi_N(t_1,\ldots,t_k)$ is defined by (194), $\Delta\mathbf{w}_{\tau_j}^{(i)}=\mathbf{w}_{\tau_{j+1}}^{(i)}-\mathbf{w}_{\tau_j}^{(i)}$, $i=0,1,\ldots,m$, $\mathbf{w}_{\tau}^{(0)}=\tau$.

It is easy to see that the above definition coincides with (19) if the function $\Phi(t_1,\ldots,t_k):\ [t,T]^k\to\mathbb{R}$ is continuous in the hypercube $[t,T]^k$.

Let us prove the following equality

$$J'[\Phi]_{T,t}^{(i_1\ldots i_k)}=\sum_{(t_1,\ldots,t_k)}\int\limits_t^T\ldots\int\limits_t^{t_2}\Phi(t_1,\ldots,t_k)d\mathbf{w}_{t_1}^{(i_1)}\ldots d\mathbf{w}_{t_k}^{(i_k)}\quad \text{w. p. 1,}\tag{202}$$

where permutations $(t_1,\ldots,t_k)$ when summing are performed only in the values $d\mathbf{w}_{t_1}^{(i_1)}\ldots d\mathbf{w}_{t_k}^{(i_k)}$. At the same time the indices near upper limits of integration in the iterated stochastic integrals are changed correspondently and if t_r swapped with t_q in the permutation $(t_1,\ldots,t_k)$, then i_r swapped with i_q in the permutation $(i_1,\ldots,i_k)$. In addition, the multiple Wiener stochastic integral $J'[\Phi]_{T,t}^{(i_1\ldots i_k)}$ is defined by (201) and

$$\int\limits_t^T\ldots\int\limits_t^{t_2}\Phi(t_1,\ldots,t_k)d\mathbf{w}_{t_1}^{(i_1)}\ldots d\mathbf{w}_{t_k}^{(i_k)}$$

is the iterated Ito stochastic integral.

The equality (202) has already been proved for the case $\Phi(t_1,\ldots,t_k)=\Phi_N(t_1,\ldots,t_k)$ (see (200)). From (200) we have

$$J'[\Phi_N]_{T,t}^{(i_1\ldots i_k)}=\sum_{(t_1,\ldots,t_k)}\int\limits_t^T\ldots\int\limits_t^{t_2}\Phi_N(t_1,\ldots,t_k)d\mathbf{w}_{t_1}^{(i_1)}\ldots d\mathbf{w}_{t_k}^{(i_k)}=$$

$$=\sum_{(t_1,\ldots,t_k)}\int\limits_t^T\ldots\int\limits_t^{t_2}\Phi(t_1,\ldots,t_k)d\mathbf{w}_{t_1}^{(i_1)}\ldots d\mathbf{w}_{t_k}^{(i_k)}+$$

$$+\sum_{(t_1,\ldots,t_k)}\int\limits_t^T\ldots\int\limits_t^{t_2}\left(\Phi_N(t_1,\ldots,t_k)-\Phi(t_1,\ldots,t_k)\right)d\mathbf{w}_{t_1}^{(i_1)}\ldots d\mathbf{w}_{t_k}^{(i_k)}\quad \text{w. p. 1.}\tag{203}$$

Passing to the limit $\underset{N\to\infty}{\text{l.i.m.}}$ in the equality (203), we obtain

$$J'[\Phi]_{T,t}^{(i_1\ldots i_k)}=\sum_{(t_1,\ldots,t_k)}\int\limits_t^T\ldots\int\limits_t^{t_2}\Phi(t_1,\ldots,t_k)d\mathbf{w}_{t_1}^{(i_1)}\ldots d\mathbf{w}_{t_k}^{(i_k)}+$$

$$+\underset{N\to\infty}{\text{l.i.m.}}\sum_{(t_1,\ldots,t_k)}\int\limits_t^T\ldots\int\limits_t^{t_2}\left(\Phi_N(t_1,\ldots,t_k)-\Phi(t_1,\ldots,t_k)\right)d\mathbf{w}_{t_1}^{(i_1)}\ldots d\mathbf{w}_{t_k}^{(i_k)}\quad \text{w. p. 1.}\tag{204}$$

Using Lemma 2 for $\Phi(t_1,\ldots,t_k)\in L_2(D_k)$, (30) for Lebesgue integrals, and (197), we get

$$\mathsf{M}\left\{\left(\sum_{(t_1,\ldots,t_k)}\int\limits_t^T\ldots\int\limits_t^{t_2}\left(\Phi_N(t_1,\ldots,t_k)-\Phi(t_1,\ldots,t_k)\right)d\mathbf{w}_{t_1}^{(i_1)}\ldots d\mathbf{w}_{t_k}^{(i_k)}\right)^2\right\}\le$$

$$\le C_k\sum_{(t_1,\ldots,t_k)}\int\limits_t^T\ldots\int\limits_t^{t_2}\left(\Phi_N(t_1,\ldots,t_k)-\Phi(t_1,\ldots,t_k)\right)^2dt_1\ldots dt_k=$$

$$=C_k\int\limits_{[t,T]^k}\left(\Phi_N(t_1,\ldots,t_k)-\Phi(t_1,\ldots,t_k)\right)^2dt_1\ldots dt_k\ \to 0 \tag{205}$$

if $N\to\infty$, where constant C_k depends only on the multiplicity k of the multiple Wiener stochastic integral.

The relations (204) and (205) prove the equality (202). Using (202) and the isometry property of the Ito stochastic integral, we have

$$J[\psi^{(k)}]_{T,t}^{(i_1\ldots i_k)}=\int\limits_t^T\psi_k(t_k)\ldots\int\limits_t^{t_2}\psi_1(t_1)d\mathbf{w}_{t_1}^{(i_1)}\ldots d\mathbf{w}_{t_k}^{(i_k)}=J'[K]_{T,t}^{(i_1\ldots i_k)}\quad \text{w. p. 1,} \tag{206}$$

where $K=K(t_1,\ldots,t_k)$ is defined by (2), i.e.

$$K(t_1,\ldots,t_k)=\begin{cases}\psi_1(t_1)\ldots\psi_k(t_k), & t_1<\ldots<t_k\\ \\ 0, & \text{otherwise}\end{cases}, \tag{207}$$

where $\psi_1(\tau),\ldots,\psi_k(\tau)\in L_2([t,T])$, $t_1,\ldots,t_k\in[t,T]$ $(k\ge 2)$ and $K(t_1)\equiv\psi_1(t_1)$ for $t_1\in[t,T]$.

Applying (206) and the linearity property of the Ito stochastic integral, we obtain

$$J[\psi^{(k)}]_{T,t}^{(i_1\ldots i_k)}=J'[K]_{T,t}^{(i_1\ldots i_k)}=$$

$$=\sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k}C_{j_k\ldots j_1}J'[\phi_{j_1}\ldots\phi_{j_k}]_{T,t}^{(i_1\ldots i_k)}+J'[R_{p_1\ldots p_k}]_{T,t}^{(i_1\ldots i_k)}\quad \text{w. p. 1,} \tag{208}$$

where

$$R_{p_1\ldots p_k}(t_1,\ldots,t_k)\stackrel{\rm def}{=}K(t_1,\ldots,t_k)-\sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k}C_{j_k\ldots j_1}\prod_{l=1}^k\phi_{j_l}(t_l) \tag{209}$$

and

$$C_{j_k\ldots j_1}=\int\limits_{[t,T]^k}K(t_1,\ldots,t_k)\prod_{l=1}^k\phi_{j_l}(t_l)dt_1\ldots dt_k \tag{210}$$

is the Fourier coefficient corresponding to $K(t_1,\ldots,t_k)$.

Using the Ito formula, we have

$$\sum_{(j_1,\ldots,j_q)}\int\limits_t^T\phi_{j_q}(t_q)\ldots\int\limits_t^{t_2}\phi_{j_1}(t_1)d\mathbf{w}_{t_1}^{(i_1)}\ldots\mathbf{w}_{t_q}^{(i_q)}\times$$

$$\times\sum_{(j_1',\ldots,j_n')}\int\limits_t^T\phi_{j_n'}(t_n')\ldots\int\limits_t^{t_2'}\phi_{j_1'}(t_1')d\mathbf{w}_{t_1'}^{(g)}\ldots\mathbf{w}_{t_n'}^{(g)}=$$

$$=\sum_{(j_1,\ldots,j_q,j_1',\ldots,j_n')}\int\limits_t^T\phi_{j_q}(t_q)\ldots\int\limits_t^{t_2}\phi_{j_1}(t_1)\int\limits_t^{t_1}\phi_{j_n'}(t_n')\ldots\int\limits_t^{t_2'}\phi_{j_1'}(t_1')\times$$

$$\times d\mathbf{w}_{t_1'}^{(g)}\ldots d\mathbf{w}_{t_n'}^{(g)}d\mathbf{w}_{t_1}^{(i_1)}\ldots d\mathbf{w}_{t_q}^{(i_q)} \tag{211}$$

w. p. 1, where $g=0$ or $g=1$, $n,q\in\mathbb{N}$, $i_1,\ldots,i_q\neq 0,\ 1$,

$$\sum_{(j_1,\ldots,j_k)}$$

means the sum with respect to all possible permutations $(j_1,\ldots,j_k)$. At the same time if j_r swapped with j_d in the permutation $(j_1,\ldots,j_k)$, then i_r swapped with i_d in the permutation $(i_1,\ldots,i_k)$.

The detailed proof of (211) will be given in Sect. 18 (see the proof of Theorem 20). The equality (211) means that (see (202))

$$J'[\phi_{j_1}\ldots\phi_{j_q}]_{T,t}^{(i_1\ldots i_q)}\cdot J'[\phi_{j_1'}\ldots\phi_{j_n'}]_{T,t}^{(g\ldots g)}=$$

$$=J'[\phi_{j_1}\ldots\phi_{j_q}\phi_{j_1'}\ldots\phi_{j_n'}]_{T,t}^{(i_1\ldots i_q g\ldots g)} \tag{212}$$

w. p. 1, where $g=0$ or $g=1$, $n,q\in\{0\}\cup\mathbb{N}$, $i_1,\ldots,i_q\neq 0,\ 1$, and $J'[\phi_{j_1}\ldots\phi_{j_q}]_{T,t}^{(i_1\ldots i_q)}\stackrel{\sf def}{=}1$ for $q=0$.

Using the equality (212), we get (160) for the case of an arbitrary complete orthonormal system $\{\phi_j(x)\}_{j=0}^{\infty}$ of functions in $L_2([t,T])$.

Using Theorem 9.6.9 [87] (also see [85], Theorem 3.1) and (172) (also see Theorem 21 below), we get

$$J'[\phi_{j_1}\ldots\phi_{j_k}]_{T,t}^{(i_1\ldots i_k)}=$$

$$=\prod_{l=1}^{k}\left(\mathbf{1}_{\{m_l=0\}}+\mathbf{1}_{\{m_l>0\}}\begin{cases}H_{n_{1,l}}\left(\zeta_{j_{h_{1,l}}}^{(i_l)}\right)\ldots H_{n_{d_l,l}}\left(\zeta_{j_{h_{d_l,l}}}^{(i_l)}\right), & \text{if}\quad i_l\neq 0\\ \left(\zeta_{j_{h_{1,l}}}^{(0)}\right)^{n_{1,l}}\ldots\left(\zeta_{j_{h_{d_l,l}}}^{(0)}\right)^{n_{d_l,l}}, & \text{if}\quad i_l=0\end{cases}\right)=$$

$$
= \prod_{l=1}^{k} \zeta_{j_l}^{(i_l)} + \sum_{r=1}^{[k/2]} (-1)^r \times
$$

$$
\times \sum_{\substack{(\{\{g_1,g_2\},\ldots,\{g_{2r-1},g_{2r}\}\},\{q_1,\ldots,q_{k-2r}\}) \\ \{g_1,g_2,\ldots,g_{2r-1},g_{2r},q_1,\ldots,q_{k-2r}\}=\{1,2,\ldots,k\}}} \prod_{s=1}^{r} \mathbf{1}_{\{i_{g_{2s-1}}=\ i_{g_{2s}}\neq 0\}} \mathbf{1}_{\{j_{g_{2s-1}}=\ j_{g_{2s}}\}} \prod_{l=1}^{k-2r} \zeta_{j_{q_l}}^{(i_{q_l})} \tag{213}
$$

w. p. 1, where notations are the same as in Theorems 2 and 10; the multiple Wiener stochastic integral $J'[\phi_{j_1}\ldots\phi_{j_k}]_{T,t}^{(i_1\ldots i_k)}$ is defined by (201).

Again applying (202), we have

$$
J'[R_{p_1\ldots p_k}]_{T,t}^{(i_1\ldots i_k)} = \sum_{(t_1,\ldots,t_k)} \int_t^T \ldots \int_t^{t_2} \Biggl(K(t_1,\ldots,t_k) -
$$

$$
- \sum_{j_1=0}^{p_1} \ldots \sum_{j_k=0}^{p_k} C_{j_k\ldots j_1} \prod_{l=1}^{k} \phi_{j_l}(t_l) \Biggr) d\mathbf{w}_{t_1}^{(i_1)} \ldots d\mathbf{w}_{t_k}^{(i_k)}, \tag{214}
$$

where permutations $(t_1,\ldots,t_k)$ when summing are performed only in the values $d\mathbf{w}_{t_1}^{(i_1)} \ldots d\mathbf{w}_{t_k}^{(i_k)}$. At the same time the indices near upper limits of integration in the iterated stochastic integrals are changed correspondently and if t_r swapped with t_q in the permutation $(t_1,\ldots,t_k)$, then i_r swapped with i_q in the permutation $(i_1,\ldots,i_k)$. In addition, the multiple Wiener stochastic integral $J'[R_{p_1\ldots p_k}]_{T,t}^{(i_1\ldots i_k)}$ is defined by (201).

According to Lemma 2 for $\Phi(t_1,\ldots,t_k) \in L_2(D_k)$, (3), and (30) for Lebesgue integrals, we have

$$
\mathsf{M}\left\{ \left(J'[R_{p_1\ldots p_k}]_{T,t}^{(i_1\ldots i_k)} \right)^2 \right\} \le
$$

$$
\le C_k \sum_{(t_1,\ldots,t_k)} \int_t^T \ldots \int_t^{t_2} \left(K(t_1,\ldots,t_k) - \sum_{j_1=0}^{p_1} \ldots \sum_{j_k=0}^{p_k} C_{j_k\ldots j_1} \prod_{l=1}^{k} \phi_{j_l}(t_l) \right)^2 dt_1 \ldots dt_k =
$$

$$
= C_k \int_{[t,T]^k} \left(K(t_1,\ldots,t_k) - \sum_{j_1=0}^{p_1} \ldots \sum_{j_k=0}^{p_k} C_{j_k\ldots j_1} \prod_{l=1}^{k} \phi_{j_l}(t_l) \right)^2 dt_1 \ldots dt_k \to 0 \tag{215}
$$

if $p_1,\ldots,p_k \to \infty$, where constant C_k depends only on the multiplicity k of the iterated Ito stochastic integral $J[\psi^{(k)}]_{T,t}^{(i_1\ldots i_k)}$.

Thus, the following theorem is proved.

Theorem 12 [22], [25] (generalization of Theorems 1, 2, and 10). *Suppose that the condition* $(\star\star)$ *is fulfilled for the multi-index* $(i_1\ldots i_k)$ *(see Sect.* 14*) and the condition* (162) *is also fulfilled.*

Furthermore, let $\psi_l(\tau) \in L_2([t,T])$ $(l=1,\ldots,k)$ *and* $\{\phi_j(x)\}_{j=0}^{\infty}$ *is an arbitrary complete orthonormal system of functions in the space* $L_2([t,T])$*. Then the following expansions*

$$J[\psi^{(k)}]_{T,t}^{(i_1\ldots i_k)} = \underset{p_1,\ldots,p_k\to\infty}{\text{l.i.m.}} \sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k} C_{j_k\ldots j_1}\times$$

$$\times\prod_{l=1}^{k}\left(\mathbf{1}_{\{m_l=0\}}+\mathbf{1}_{\{m_l>0\}}\begin{cases} H_{n_{1,l}}\left(\zeta_{j_{h_{1,l}}}^{(i_l)}\right)\ldots H_{n_{d_l,l}}\left(\zeta_{j_{h_{d_l,l}}}^{(i_l)}\right), & \text{if} \quad i_l\ne 0\\ \left(\zeta_{j_{h_{1,l}}}^{(0)}\right)^{n_{1,l}}\ldots\left(\zeta_{j_{h_{d_l,l}}}^{(0)}\right)^{n_{d_l,l}}, & \text{if} \quad i_l=0\end{cases}\right), \tag{216}$$

$$J[\psi^{(k)}]_{T,t}^{(i_1\ldots i_k)} = \underset{p_1,\ldots,p_k\to\infty}{\text{l.i.m.}} \sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k} C_{j_k\ldots j_1}\left(\prod_{l=1}^{k}\zeta_{j_l}^{(i_l)}+\sum_{r=1}^{[k/2]}(-1)^r\times\right.$$

$$\left.\times\sum_{\substack{(\{\{g_1,g_2\},\ldots,\{g_{2r-1},g_{2r}\}\},\{q_1,\ldots,q_{k-2r}\})\\ \{g_1,g_2,\ldots,g_{2r-1},g_{2r},q_1,\ldots,q_{k-2r}\}=\{1,2,\ldots,k\}}}\prod_{s=1}^{r}\mathbf{1}_{\{i_{g_{2s-1}}=\ i_{g_{2s}}\ne 0\}}\mathbf{1}_{\{j_{g_{2s-1}}=\ j_{g_{2s}}\}}\prod_{l=1}^{k-2r}\zeta_{j_{q_l}}^{(i_{q_l})}\right) \tag{217}$$

converging in the mean-square sense are valid, where $[x]$ *is an integer part of a real number* x*;* $n_{1,l}+n_{2,l}+\ldots+n_{d_l,l}=m_l$*;* $n_{1,l},n_{2,l},\ldots,n_{d_l,l}=1,\ldots,m_l$*;* $d_l=1,\ldots,m_l$*;* $l=1,\ldots,k$*;* $m_1+\ldots+m_k=k$*; the numbers* $m_1,\ldots,m_k$*,* $g_1,\ldots,g_k$ *depend on* $(i_1,\ldots,i_k)$ *and the numbers* $n_{1,l},\ldots,n_{d_l,l}$*,* $h_{1,l},\ldots,h_{d_l,l}$*,* d_l *depend on* $\{j_1,\ldots,j_k\}$*; moreover,* $\{j_{g_1},\ldots,j_{g_k}\}=\{j_1,\ldots,j_k\}$*;* $H_n(x)$ *is the Hermite polynomial* (164)*; another notations are the same as in Theorems* 1, 2, and 10.

Replacing the function $K(t_1,\ldots,t_k)$ by $\Phi(t_1,\ldots,t_k)$ we get the following theorem.

Theorem 13 [22], [25] (generalization of Theorem 11). *Suppose that the condition* $(\star\star)$ *is fulfilled for the multi-index* $(i_1\ldots i_k)$ *(see Sect.* 14*) and the condition* (162) *is also fulfilled. Furthermore, let* $\Phi(t_1,\ldots,t_k)\in L_2([t,T]^k)$ *and* $\{\phi_j(x)\}_{j=0}^{\infty}$ *is an arbitrary complete orthonormal system of functions in the space* $L_2([t,T])$*. Then the following expansions*

$$J'[\Phi]_{T,t}^{(i_1\ldots i_k)} = \underset{p_1,\ldots,p_k\to\infty}{\text{l.i.m.}} \sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k} C_{j_k\ldots j_1}\times$$

$$\times\prod_{l=1}^{k}\left(\mathbf{1}_{\{m_l=0\}}+\mathbf{1}_{\{m_l>0\}}\begin{cases} H_{n_{1,l}}\left(\zeta_{j_{h_{1,l}}}^{(i_l)}\right)\ldots H_{n_{d_l,l}}\left(\zeta_{j_{h_{d_l,l}}}^{(i_l)}\right), & \text{if} \quad i_l\ne 0\\ \left(\zeta_{j_{h_{1,l}}}^{(0)}\right)^{n_{1,l}}\ldots\left(\zeta_{j_{h_{d_l,l}}}^{(0)}\right)^{n_{d_l,l}}, & \text{if} \quad i_l=0\end{cases}\right), \tag{218}$$

$$J'[\Phi]_{T,t}^{(i_1\ldots i_k)} = \underset{p_1,\ldots,p_k\to\infty}{\text{l.i.m.}} \sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k} C_{j_k\ldots j_1}\left(\prod_{l=1}^{k}\zeta_{j_l}^{(i_l)}+\sum_{r=1}^{[k/2]}(-1)^r\times\right.$$

$$\times \sum_{\substack{(\{\{g_1,g_2\},\ldots,\{g_{2r-1},g_{2r}\}\},\{q_1,\ldots,q_{k-2r}\})\\ \{g_1,g_2,\ldots,g_{2r-1},g_{2r},q_1,\ldots,q_{k-2r}\}=\{1,2,\ldots,k\}}} \prod_{s=1}^{r} \mathbf{1}_{\{i_{g_{2s-1}}=\ i_{g_{2s}}\neq 0\}} \mathbf{1}_{\{j_{g_{2s-1}}=\ j_{g_{2s}}\}} \prod_{l=1}^{k-2r} \zeta_{j_{q_l}}^{(i_{q_l})}\Biggr)$$

converging in the mean-square sense are valid, where $n_{1,l}+n_{2,l}+\ldots+n_{d_l,l}=m_l$; $n_{1,l},n_{2,l},\ldots,n_{d_l,l}=1,\ldots,m_l$; $d_l=1,\ldots,m_l$; $l=1,\ldots,k$; $m_1+\ldots+m_k=k$; *the numbers* $m_1,\ldots,m_k$, $g_1,\ldots,g_k$ *depend on* $(i_1,\ldots,i_k)$ *and the numbers* $n_{1,l},\ldots,n_{d_l,l}$, $h_{1,l},\ldots,h_{d_l,l}$, d_l *depend on* $\{j_1,\ldots,j_k\}$; *moreover,* $\{j_{g_1},\ldots,j_{g_k}\}=\{j_1,\ldots,j_k\}$; *the multiple Wiener stochastic integral* $J'[\Phi]_{T,t}^{(i_1\ldots i_k)}$ *is defined by* (201); $H_n(x)$ *is the Hermite polynomial* (164); *another notations are the same as in Theorem* 9, 11.

It should be noted that an analogue of the expansion (218) was obtained in [86] for the case $i_1,\ldots,i_k=1,\ldots,m$. The proof in [86] is different from the proof given in this section and Sect. 18. Note that the results of work [86], as well as the results of this article, are based on our idea [7] (2006) on the expansion of the kernel (2) (or $\Phi(t_1,\ldots,t_k)\in L_2([t,T]^k)$) into a generalized multiple Fourier series (see [7], Chapter 5, Theorem 5.1, pp. 235-245 or [22], Sect. 1.1.3 for details).

16. Exact Calculation of the Mean-Square Error in Theorems 1, 2, and 12

In this section, we will use the multiple Wiener stochastic integral with respect to the components of a multidimensional Wiener process to generalize theorem on the exact calculation of the mean-square error in Theorems 1, 2. More precisely, we will generalize the following theorem.

Theorem 14 [22], [25], [34]. *Suppose that every* $\psi_l(\tau)$ $(l=1,\ldots,k)$ *is a continuous nonrandom function on* $[t,T]$ *and* $\{\phi_j(x)\}_{j=0}^{\infty}$ *is a complete orthonormal system of functions in the space* $L_2([t,T])$, *each function* $\phi_j(x)$ *of which for finite* j *satisfies the condition* $(\star)$ *(see Sect.* 4*). Then*

$$\mathsf{M}\left\{\left(J[\psi^{(k)}]_{T,t}-J[\psi^{(k)}]_{T,t}^{p}\right)^2\right\}=\int\limits_{[t,T]^k} K^2(t_1,\ldots,t_k)dt_1\ldots dt_k-$$

$$-\sum_{j_1=0}^{p}\ldots\sum_{j_k=0}^{p} C_{j_k\ldots j_1}\mathsf{M}\left\{J[\psi^{(k)}]_{T,t}\sum_{(j_1,\ldots,j_k)}\int\limits_t^T\phi_{j_k}(t_k)\ldots\int\limits_t^{t_2}\phi_{j_1}(t_1)d\mathbf{f}_{t_1}^{(i_1)}\ldots d\mathbf{f}_{t_k}^{(i_k)}\right\}, \quad (219)$$

where

$$J[\psi^{(k)}]_{T,t}=\int\limits_t^T\psi_k(t_k)\ldots\int\limits_t^{t_2}\psi_1(t_1)d\mathbf{f}_{t_1}^{(i_1)}\ldots d\mathbf{f}_{t_k}^{(i_k)},$$

$$J[\psi^{(k)}]_{T,t}^{p}=\sum_{j_1=0}^{p}\ldots\sum_{j_k=0}^{p}C_{j_k\ldots j_1}\left(\prod_{l=1}^{k}\zeta_{j_l}^{(i_l)}-S_{j_1,\ldots,j_k}^{(i_1\ldots i_k)}\right), \quad (220)$$

$$S_{j_1,\ldots,j_k}^{(i_1\ldots i_k)}=\underset{N\to\infty}{\text{l.i.m.}}\sum_{(l_1,\ldots,l_k)\in\mathrm{G}_k}\phi_{j_1}(\tau_{l_1})\Delta\mathbf{f}_{\tau_{l_1}}^{(i_1)}\ldots\phi_{j_k}(\tau_{l_k})\Delta\mathbf{f}_{\tau_{l_k}}^{(i_k)}, \quad (221)$$

the Fourier coefficient $C_{j_k\ldots j_1}$ *has the form* (4),

$$\zeta_j^{(i)} = \int\limits_t^T \phi_j(s) d\mathbf{f}_s^{(i)} \tag{222}$$

are independent standard Gaussian random variables for various i *or* j $(i = 1, \ldots, m)$,

$$\sum_{(j_1,\ldots,j_k)}$$

means the sum with respect to all possible permutations $(j_1, \ldots, j_k)$. *At the same time if* j_r *swapped with* j_q *in the permutation* $(j_1, \ldots, j_k)$, *then* i_r *swapped with* i_q *in the permutation* $(i_1, \ldots, i_k)$ *(see* (219)); *another notations are the same as in Theorem* 1.

Let us generalize Theorem 14 to the case of an arbitrary complete orthonormal system of functions in the space $L_2([t, T])$ and $\psi_1(\tau), \ldots, \psi_k(\tau) \in L_2([t, T])$.

Theorem 15 [22], [25]. *Suppose that* $\psi_1(\tau), \ldots, \psi_k(\tau) \in L_2([t, T])$ *and* $\{\phi_j(x)\}_{j=0}^{\infty}$ *is an arbitrary complete orthonormal system of functions in the space* $L_2([t, T])$. *Then*

$$\mathsf{M}\left\{\left(J[\psi^{(k)}]_{T,t} - J[\psi^{(k)}]_{T,t}^p\right)^2\right\} = \int\limits_{[t,T]^k} K^2(t_1, \ldots, t_k) dt_1 \ldots dt_k -$$

$$- \sum_{j_1=0}^{p} \ldots \sum_{j_k=0}^{p} C_{j_k \ldots j_1} \mathsf{M}\left\{J[\psi^{(k)}]_{T,t} \sum_{(j_1,\ldots,j_k)} \int\limits_t^T \phi_{j_k}(t_k) \ldots \int\limits_t^{t_2} \phi_{j_1}(t_1) d\mathbf{f}_{t_1}^{(i_1)} \ldots d\mathbf{f}_{t_k}^{(i_k)}\right\}, \tag{223}$$

where

$$J[\psi^{(k)}]_{T,t} = \int\limits_t^T \psi_k(t_k) \ldots \int\limits_t^{t_2} \psi_1(t_1) d\mathbf{f}_{t_1}^{(i_1)} \ldots d\mathbf{f}_{t_k}^{(i_k)},$$

$$J[\psi^{(k)}]_{T,t}^p = \sum_{j_1=0}^{p} \ldots \sum_{j_k=0}^{p} C_{j_k \ldots j_1} J'[\phi_{j_1} \ldots \phi_{j_k}]_{T,t}^{(i_1 \ldots i_k)}, \tag{224}$$

$J'[\phi_{j_1} \ldots \phi_{j_k}]_{T,t}^{(i_1 \ldots i_k)}$ *is the multiple Wiener stochastic integral defined by* (201), *the Fourier coefficient* $C_{j_k \ldots j_1}$ *has the form* (210), $K(t_1, \ldots, t_k)$ *is defined by* (207),

$$\zeta_j^{(i)} = \int\limits_t^T \phi_j(s) d\mathbf{f}_s^{(i)}$$

are independent standard Gaussian random variables for various i *or* j $(i = 1, \ldots, m)$,

$$\sum_{(j_1,\ldots,j_k)}$$

means the sum with respect to all possible permutations $(j_1, \ldots, j_k)$. *At the same time if* j_r *swapped with* j_q *in the permutation* $(j_1, \ldots, j_k)$, *then* i_r *swapped with* i_q *in the permutation* $(i_1, \ldots, i_k)$ *(see* (223)).

Proof. First, note that the formula (224) appears due to the equality (208). Using the equality (202), we get

$$J'[\phi_{j_1}\ldots\phi_{j_k}]_{T,t}^{(i_1\ldots i_k)} = \sum_{(t_1,\ldots,t_k)} \int\limits_t^T \phi_{j_k}(t_k)\ldots\int\limits_t^{t_2}\phi_{j_1}(t_1)d\mathbf{f}_{t_1}^{(i_1)}\ldots d\mathbf{f}_{t_k}^{(i_k)} \quad \text{w. p. 1,} \tag{225}$$

where permutations $(t_1,\ldots,t_k)$ when summing are performed only in the values $d\mathbf{f}_{t_1}^{(i_1)}\ldots d\mathbf{f}_{t_k}^{(i_k)}$. At the same time the indices near upper limits of integration in the iterated stochastic integrals are changed correspondently and if t_r swapped with t_q in the permutation $(t_1,\ldots,t_k)$, then i_r swapped with i_q in the permutation $(i_1,\ldots,i_k)$.

It is easy to see that the equality (225) can be written in the form

$$J'[\phi_{j_1}\ldots\phi_{j_k}]_{T,t}^{(i_1\ldots i_k)} = \sum_{(j_1,\ldots,j_k)} \int\limits_t^T \phi_{j_k}(t_k)\ldots\int\limits_t^{t_2}\phi_{j_1}(t_1)d\mathbf{f}_{t_1}^{(i_1)}\ldots d\mathbf{f}_{t_k}^{(i_k)} \quad \text{w. p. 1,} \tag{226}$$

where

$$\sum_{(j_1,\ldots,j_k)}$$

means the sum with respect to all possible permutations $(j_1,\ldots,j_k)$. At the same time if j_r swapped with j_q in the permutation $(j_1,\ldots,j_k)$, then i_r swapped with i_q in the permutation $(i_1,\ldots,i_k)$.

Further proof of Theorem 15 is based on the equality (226) and is similar to the proof of Theorem 14 in [22], [34]. Theorem 15 is proved.

The equalities (213) and (226) allow us to formulate the following modification of Theorem 12.

Theorem 16. *Suppose that $\psi_1(\tau),\ldots,\psi_k(\tau)\in L_2([t,T])$ and $\{\phi_j(x)\}_{j=0}^{\infty}$ is an arbitrary complete orthonormal system of functions in the space $L_2([t,T])$. Then the following expansion*

$$J[\psi^{(k)}]_{T,t}^{(i_1\ldots i_k)} = \underset{p_1,\ldots,p_k\to\infty}{\text{l.i.m.}} \sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k} C_{j_k\ldots j_1} J'[\phi_{j_1}\ldots\phi_{j_k}]_{T,t}^{(i_1\ldots i_k)} =$$

$$= \underset{p_1,\ldots,p_k\to\infty}{\text{l.i.m.}} \sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k} C_{j_k\ldots j_1} \sum_{(j_1,\ldots,j_k)} \int\limits_t^T \phi_{j_k}(t_k)\ldots\int\limits_t^{t_2}\phi_{j_1}(t_1)d\mathbf{f}_{t_1}^{(i_1)}\ldots d\mathbf{f}_{t_k}^{(i_k)}$$

converging in the mean-square sense is valid, where $i_1,\ldots,i_k=1,\ldots,m$; another notations are the same as in Theorems 1, 12.

Consider the following obvious generalization of Theorem 3.

Theorem 17 [22], [25]. *Suppose that $\psi_1(\tau),\ldots,\psi_k(\tau)\in L_2([t,T])$ and $\{\phi_j(x)\}_{j=0}^{\infty}$ is an arbitrary complete orthonormal system of functions in the space $L_2([t,T])$. Then the estimate*

$$\mathsf{M}\left\{\left(J[\psi^{(k)}]_{T,t} - J[\psi^{(k)}]_{T,t}^{p_1,\ldots,p_k}\right)^2\right\} \le$$

$$
\leq k!\left(\int\limits_{[t,T]^k} K^2(t_1,\ldots,t_k)dt_1\ldots dt_k-\sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k}C^2_{j_k\ldots j_1}\right) \tag{227}
$$

is valid for the following cases:

1. $i_1,\ldots,i_k=1,\ldots,m$ *and* $0<T-t<\infty$,
2. $i_1,\ldots,i_k=0,1,\ldots,m$, $i_1^2+\ldots+i_k^2>0$, *and* $0<T-t<1$,

where $J[\psi^{(k)}]_{T,t}$ *is the stochastic integral* (1), $J[\psi^{(k)}]_{T,t}^{p_1,\ldots,p_k}$ *is the expression on the right-hand side of* (217) *before passing to the limit* $\underset{p_1,\ldots,p_k\to\infty}{\text{l.i.m.}}$; *another notations are the same as in Theorem* 1, 2, 12.

In addition, under the conditions of Theorem 17 we have the estimate (also see (60))

$$
\mathsf{M}\left\{\left(J[\psi^{(k)}]_{T,t}-J[\psi^{(k)}]_{T,t}^{p_1,\ldots,p_k}\right)^{2n}\right\}\leq
$$

$$
\leq (k!)^{2n}(n(2n-1))^{n(k-1)}(2n-1)!!\ \times
$$

$$
\times\left(\int\limits_{[t,T]^k} K^2(t_1,\ldots,t_k)dt_1\ldots dt_k-\sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k}C^2_{j_k\ldots j_1}\right)^n.
$$

17. Generalization of Theorems 4, 5 to the Case of an Arbitrary Complete Orthonormal with Weight $r(x)\geq 0$ System of Functions in the Space $L_2([t,T])$ and $\psi_1(x)\sqrt{r(x)},\ \ldots,\ \psi_k(x)\sqrt{r(x)}\ \in\ L_2([t,T])$

In this section, we will use the multiple Wiener stochastic integral with respect to the components of a multidimensional Wiener process to generalize Theorems 4, 5 to the case of an arbitrary complete orthonormal with weight $r(x)\geq 0$ system of functions in the space $L_2([t,T])$ and $\psi_1(x)\sqrt{r(x)},\ \ldots,$ $\psi_k(x)\sqrt{r(x)}\in L_2([t,T])$. From the results of Sect. 8, 15 we obtain the following two theorems.

Theorem 18 [22], [25]. *Suppose that* $\psi_1(x)\sqrt{r(x)},\ldots,\psi_k(x)\sqrt{r(x)}\in L_2([t,T])$, *where* $r(x)\geq 0$. *Moreover, let*

$$
\left\{\Psi_j(x)\sqrt{r(x)}\right\}_{j=0}^{\infty}
$$

is an arbitrary complete orthonormal system of functions in the space $L_2([t,T])$. *Then, for the iterated Ito stochastic integral*

$$
\tilde J[\psi^{(k)}]_{T,t}=\int\limits_t^T\psi_k(t_k)\sqrt{r(t_k)}\ldots\int\limits_t^{t_2}\psi_1(t_1)\sqrt{r(t_1)}d\mathbf{w}_{t_1}^{(i_1)}\ldots d\mathbf{w}_{t_k}^{(i_k)} \tag{228}
$$

the following expansion

$$\tilde{J}[\psi^{(k)}]_{T,t} = \underset{p_1,\ldots,p_k\to\infty}{\text{l.i.m.}} \sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k} \tilde{C}_{j_k\ldots j_1}\Biggl(\prod_{l=1}^{k}\tilde{\zeta}_{j_l}^{(i_l)} + \sum_{r=1}^{[k/2]}(-1)^r\times$$

$$\times \sum_{\substack{(\{\{g_1,g_2\},\ldots,\{g_{2r-1},g_{2r}\}\},\{q_1,\ldots,q_{k-2r}\})\\ \{g_1,g_2,\ldots,g_{2r-1},g_{2r},q_1,\ldots,q_{k-2r}\}=\{1,2,\ldots,k\}}} \prod_{s=1}^{r}\mathbf{1}_{\{i_{g_{2s-1}}=\ i_{g_{2s}}\ne 0\}}\mathbf{1}_{\{j_{g_{2s-1}}=\ j_{g_{2s}}\}}\prod_{l=1}^{k-2r}\tilde{\zeta}_{j_{q_l}}^{(i_{q_l})}\Biggr) \qquad (229)$$

that converges in the mean-square sense is valid, where $i_1,\ldots,i_k = 0,1,\ldots,m,$

$$\tilde{\zeta}_j^{(i)} = \int_t^T \Psi_j(s)\sqrt{r(s)}d\mathbf{w}_s^{(i)}$$

are independent standard Gaussian random variables for various i *or* j *(in the case when* $i\ne 0$*),*

$$\tilde{C}_{j_k\ldots j_1} = \int_{[t,T]^k} K(t_1,\ldots,t_k)\prod_{l=1}^{k}\Bigl(\Psi_{j_l}(t_l)r(t_l)\Bigr)dt_1\ldots dt_k$$

is the Fourier coefficient, $K(t_1,\ldots,t_k)$ *is defined by* (2)*; another notations are the same as in Theorems* 1, 2, 4.

Theorem 19 [22], [25]. *Under the conditions of Theorem* 18 *the following estimate*

$$\mathsf{M}\left\{\left(\tilde{J}[\psi^{(k)}]_{T,t} - \tilde{J}[\psi^{(k)}]_{T,t}^{p_1,\ldots,p_k}\right)^2\right\} \le$$

$$\le k!\left(\int_{[t,T]^k} K^2(t_1,\ldots,t_k)\left(\prod_{l=1}^{k} r(t_l)\right)dt_1\ldots dt_k - \sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k}\tilde{C}_{j_k\ldots j_1}^2\right)$$

is valid for the following cases:

1. $i_1,\ldots,i_k = 1,\ldots,m$ *and* $0 < T-t < \infty$,
2. $i_1,\ldots,i_k = 0,1,\ldots,m,$ $i_1^2+\ldots+i_k^2 > 0,$ *and* $0 < T-t < 1$,

where $\tilde{J}[\psi^{(k)}]_{T,t}$ *is the stochastic integral* (228), $\tilde{J}[\psi^{(k)}]_{T,t}^{p_1,\ldots,p_k}$ *is the expression on the right-hand side of* (229) *before passing to the limit* $\underset{p_1,\ldots,p_k\to\infty}{\text{l.i.m.}}$ *; another notations are the same as in Theorems* 4, 5, 18.

18. Proof of Theorems 12 and 13 Based on the Ito Formula and Without Explicit Use of the Multiple Wiener Stochastic Integral

Note that Theorems 12 and 13 can also be proved without explicit use of the multiple Wiener stochastic integral. To do this, we introduce the following sum of iterated Ito stochastic integrals

$$J''[\Phi]_{T,t}^{(i_1\ldots i_k)} \stackrel{\mathsf{def}}{=} \sum_{(t_1,\ldots,t_k)} \int\limits_t^T \ldots \int\limits_t^{t_2} \Phi(t_1,\ldots,t_k) d\mathbf{w}_{t_1}^{(i_1)} \ldots d\mathbf{w}_{t_k}^{(i_k)}, \tag{230}$$

where $\Phi(t_1,\ldots,t_k) \in L_2([t,T]^k)$, $i_1,\ldots,i_k = 0,1,\ldots,m$, $d\mathbf{w}_\tau^{(0)} \stackrel{\mathsf{def}}{=} d\tau$; another notations are the same as in (202).

Further, using the isometry property of the Ito stochastic integral as well as the linearity property of this integral, we have

$$J[\psi^{(k)}]_{T,t}^{(i_1\ldots i_k)} = J''[K]_{T,t}^{(i_1\ldots i_k)} =$$

$$= \sum_{j_1=0}^{p_1} \ldots \sum_{j_k=0}^{p_k} C_{j_k\ldots j_1} J''[\phi_{j_1} \ldots \phi_{j_k}]_{T,t}^{(i_1\ldots i_k)} + J''[R_{p_1\ldots p_k}]_{T,t}^{(i_1\ldots i_k)} \quad \text{w. p. 1}, \tag{231}$$

where $K(t_1,\ldots,t_k)$ and $R_{p_1\ldots p_k}(t_1,\ldots,t_k)$ are defined by (207) and (209) correspondingly. Moreover, $J''[\phi_{j_1} \ldots \phi_{j_k}]_{T,t}^{(i_1\ldots i_k)}$ and $J''[R_{p_1\ldots p_k}]_{T,t}^{(i_1\ldots i_k)}$ are defined by (230). Obviously, we can consider an analogue of (231) for $\Phi(t_1,\ldots,t_k)$ instead of $K(t_1,\ldots,t_k)$.

Passing to the limit $\underset{p_1,\ldots,p_k\to\infty}{\text{l.i.m.}}$ in (231) and using (214), (215), (230), we obtain

$$J[\psi^{(k)}]_{T,t}^{(i_1\ldots i_k)} = \underset{p_1,\ldots,p_k\to\infty}{\text{l.i.m.}} \sum_{j_1=0}^{p_1} \ldots \sum_{j_k=0}^{p_k} C_{j_k\ldots j_1} J''[\phi_{j_1} \ldots \phi_{j_k}]_{T,t}^{(i_1\ldots i_k)} =$$

$$= \underset{p_1,\ldots,p_k\to\infty}{\text{l.i.m.}} \sum_{j_1=0}^{p_1} \ldots \sum_{j_k=0}^{p_k} C_{j_k\ldots j_1} \sum_{(t_1,\ldots,t_k)} \int\limits_t^T \phi_{j_k}(t_k) \ldots \int\limits_t^{t_2} \phi_{j_1}(t_1) d\mathbf{w}_{t_1}^{(i_1)} \ldots d\mathbf{w}_{t_k}^{(i_k)}, \tag{232}$$

where permutations $(t_1,\ldots,t_k)$ when summing are performed only in the values $d\mathbf{w}_{t_1}^{(i_1)} \ldots d\mathbf{w}_{t_k}^{(i_k)}$. At the same time the indices near upper limits of integration in the iterated stochastic integrals are changed correspondently and if t_r swapped with t_q in the permutation $(t_1,\ldots,t_k)$, then i_r swapped with i_q in the permutation $(i_1,\ldots,i_k)$.

It is easy to see that the equality (232) can be written as

$$J[\psi^{(k)}]_{T,t}^{(i_1\ldots i_k)} = \underset{p_1,\ldots,p_k\to\infty}{\text{l.i.m.}} \sum_{j_1=0}^{p_1} \ldots \sum_{j_k=0}^{p_k} C_{j_k\ldots j_1} \times$$

$$\times \sum_{(j_1,\ldots,j_k)} \int\limits_t^T \phi_{j_k}(t_k) \ldots \int\limits_t^{t_2} \phi_{j_1}(t_1) d\mathbf{w}_{t_1}^{(i_1)} \ldots d\mathbf{w}_{t_k}^{(i_k)}, \tag{233}$$

where

$$\sum_{(j_1,\ldots,j_k)}$$

means the sum with respect to all possible permutations $(j_1,\ldots,j_k)$. At the same time if j_r swapped with j_q in the permutation $(j_1,\ldots,j_k)$, then i_r swapped with i_q in the permutation $(i_1,\ldots,i_k)$.

Further, using the Ito formula, we can prove the following equality

$$\sum_{(j_1,\ldots,j_k)}\int\limits_t^T\phi_{j_k}(t_k)\ldots\int\limits_t^{t_2}\phi_{j_1}(t_1)d\mathbf{w}_{t_1}^{(i_1)}\ldots d\mathbf{w}_{t_k}^{(i_k)}=\prod_{l=1}^k\zeta_{j_l}^{(i_l)}+\sum_{r=1}^{[k/2]}(-1)^r\times$$

$$\times\sum_{\substack{(\{\{g_1,g_2\},\ldots,\{g_{2r-1},g_{2r}\}\},\{q_1,\ldots,q_{k-2r}\})\\ \{g_1,g_2,\ldots,g_{2r-1},g_{2r},q_1,\ldots,q_{k-2r}\}=\{1,2,\ldots,k\}}}\prod_{s=1}^r\mathbf{1}_{\{i_{g_{2s-1}}=\ i_{g_{2s}}\ne 0\}}\mathbf{1}_{\{j_{g_{2s-1}}=\ j_{g_{2s}}\}}\prod_{l=1}^{k-2r}\zeta_{j_{q_l}}^{(i_{q_l})}\qquad(234)$$

w. p. 1, where notations are the same as in Theorem 2 and (233).

The main difficulty in proving (234) using the Ito formula is related to the need to take into account various combinations of indices $i_1,\ldots,i_k=0,1,\ldots,m$. To avoid this difficulty, consider another approach, also based on the Ito formula.

First, we prove the following modification and generalization of Theorem 3.1 from [85] (1951) for the case $i_1,\ldots,i_k=0,1,\ldots,m$ using the Ito formula and without explicit use of the multiple Wiener stochastic integral.

Theorem 20 [22]. *Suppose that the condition* $(\star\star)$ *is fulfilled for the multi-index* $(i_1\ldots i_k)$ *(see Sect.* 14*) and the condition* (162) *is also fulfilled. Furthermore, let* $\{\phi_j(x)\}_{j=0}^{\infty}$ *is an arbitrary complete orthonormal system of functions in the space* $L_2([t,T])$*. Then*

$$J''[\phi_{j_1}\ldots\phi_{j_k}]_{T,t}^{(i_1\ldots i_k)}=$$

$$=\prod_{l=1}^k\left(\mathbf{1}_{\{m_l=0\}}+\mathbf{1}_{\{m_l>0\}}\begin{cases}H_{n_{1,l}}\left(\zeta_{j_{h_{1,l}}}^{(i_l)}\right)\ldots H_{n_{d_l,l}}\left(\zeta_{j_{h_{d_l,l}}}^{(i_l)}\right), & \text{if}\quad i_l\ne 0\\ \\ \left(\zeta_{j_{h_{1,l}}}^{(0)}\right)^{n_{1,l}}\ldots\left(\zeta_{j_{h_{d_l,l}}}^{(0)}\right)^{n_{d_l,l}}, & \text{if}\quad i_l=0\end{cases}\right)\qquad(235)$$

w. p. 1*, where* $i_1,\ldots,i_k=0,1,\ldots,m$; $n_{1,l}+n_{2,l}+\ldots+n_{d_l,l}=m_l$; $n_{1,l},n_{2,l},\ldots,n_{d_l,l}=1,\ldots,m_l$; $d_l=1,\ldots,m_l$; $l=1,\ldots,k$; $m_1+\ldots+m_k=k$; *the numbers* $m_1,\ldots,m_k$, $g_1,\ldots,g_k$ *depend on* $(i_1,\ldots,i_k)$ *and the numbers* $n_{1,l},\ldots,n_{d_l,l}$, $h_{1,l},\ldots,h_{d_l,l}$, d_l *depend on* $\{j_1,\ldots,j_k\}$; *moreover,* $\{j_{g_1},\ldots,j_{g_k}\}=\{j_1,\ldots,j_k\}$; $H_n(x)$ *is the Hermite polynomial* (164)*; another notations are the same as in Theorem* 10.

Proof. First, consider the case $i_1=\ldots=i_k=1,\ldots,m$ and $j_1,\ldots,j_k\in\{0\}\cup\mathbb{N}$. By induction, we prove the following equality

$$p!\int\limits_t^T\phi_l(t_p)\ldots\int\limits_t^{t_2}\phi_l(t_1)d\mathbf{w}_{t_1}^{(1)}\ldots d\mathbf{w}_{t_p}^{(1)}\times$$

$$\times\sum_{(j_1,\ldots,j_q)}\int\limits_t^T\phi_{j_q}(t_q)\ldots\int\limits_t^{t_2}\phi_{j_1}(t_1)d\mathbf{w}_{t_1}^{(1)}\ldots d\mathbf{w}_{t_q}^{(1)}=$$

$$=\sum_{(j_1,\ldots,j_q,\underbrace{l,\ldots,l}_{p})}\int\limits_t^T\phi_{j_q}(t_q)\ldots\int\limits_t^{t_2}\phi_{j_1}(t_1)\int\limits_t^{t_1}\phi_l(t_p')\ldots\int\limits_t^{t_2'}\phi_l(t_1')\times$$

$$\times d\mathbf{w}_{t_1'}^{(1)}\ldots d\mathbf{w}_{t_p'}^{(1)}d\mathbf{w}_{t_1}^{(1)}\ldots d\mathbf{w}_{t_q}^{(1)} \tag{236}$$

w. p. 1, where $p\in\mathbb{N}$, $l\ne j_1,\ldots,j_q$, and

$$\sum_{(q_1,\ldots,q_n)}$$

means the sum with respect to all possible permutations $(q_1,\ldots,q_n)$.

Consider the case $p=1$. Using the Ito formula, we get w. p. 1 for $s\in[t,T]$

$$\int\limits_t^s\phi_l(\tau)d\mathbf{w}_{\tau}^{(1)}\int\limits_t^s\phi_{j_q}(t_q)\ldots\int\limits_t^{t_2}\phi_{j_1}(t_1)d\mathbf{w}_{t_1}^{(1)}\ldots d\mathbf{w}_{t_q}^{(1)}=$$

$$=\int\limits_t^s\phi_l(\tau)\phi_{j_q}(\tau)\int\limits_t^{\tau}\phi_{j_{q-1}}(t_{q-1})\ldots\int\limits_t^{t_2}\phi_{j_1}(t_1)d\mathbf{w}_{t_1}^{(1)}\ldots d\mathbf{w}_{t_{q-1}}^{(1)}d\tau+$$

$$+\int\limits_t^s\phi_l(\tau)\int\limits_t^{\tau}\phi_{j_q}(t_q)\ldots\int\limits_t^{t_2}\phi_{j_1}(t_1)d\mathbf{w}_{t_1}^{(1)}\ldots d\mathbf{w}_{t_q}^{(1)}d\mathbf{w}_{\tau}^{(1)}+$$

$$+\int\limits_t^s\phi_{j_q}(\tau)\left(\int\limits_t^{\tau}\phi_l(\theta)d\mathbf{w}_{\theta}^{(1)}\int\limits_t^{\tau}\phi_{j_{q-1}}(t_{q-1})\ldots\int\limits_t^{t_2}\phi_{j_1}(t_1)d\mathbf{w}_{t_1}^{(1)}\ldots d\mathbf{w}_{t_{q-1}}^{(1)}\right)d\mathbf{w}_{\tau}^{(1)}. \tag{237}$$

Hereinafter in this section always $s\in[t,T]$. Differentiating by the Ito formula the expression in parentheses on the right-hand side of equality (237) and combining the result of differentiation with (237), we obtain w. p. 1

$$J_{(l)s,t}J_{(j_q\ldots j_1)s,t}=$$

$$=\int\limits_t^s\phi_l(\tau)\phi_{j_q}(\tau)\int\limits_t^{\tau}\phi_{j_{q-1}}(t_{q-1})\ldots\int\limits_t^{t_2}\phi_{j_1}(t_1)d\mathbf{w}_{t_1}^{(1)}\ldots d\mathbf{w}_{t_{q-1}}^{(1)}d\tau+$$

$$+J_{(lj_q\ldots j_1)s,t}+$$

$$+\int\limits_t^s\phi_{j_q}(\tau)\int\limits_t^{\tau}\phi_l(\theta)\phi_{j_{q-1}}(\theta)\int\limits_t^{\theta}\phi_{j_{q-2}}(t_{q-2})\ldots\int\limits_t^{t_2}\phi_{j_1}(t_1)d\mathbf{w}_{t_1}^{(1)}\ldots d\mathbf{w}_{t_{q-2}}^{(1)}d\theta d\mathbf{w}_{\tau}^{(1)}+$$

$$+J_{(j_qlj_{q-1}\ldots j_1)s,t}+$$

$$+\int\limits_t^s \phi_{j_q}(\tau)\int\limits_t^{\tau}\phi_{j_{q-1}}(\theta)\times$$

$$\times\left(\int\limits_t^{\theta}\phi_l(u)\ d\mathbf{w}_u^{(1)}\int\limits_t^{\theta}\phi_{j_{q-2}}(t_{q-2})\ldots\int\limits_t^{t_2}\phi_{j_1}(t_1)d\mathbf{w}_{t_1}^{(1)}\ldots d\mathbf{w}_{t_{q-2}}^{(1)}\right)d\mathbf{w}_{\theta}^{(1)}d\mathbf{w}_{\tau}^{(1)}, \tag{238}$$

where

$$\int\limits_t^s \phi_{j_q}(t_q)\ldots\int\limits_t^{t_2}\phi_{j_1}(t_1)d\mathbf{w}_{t_1}^{(1)}\ldots d\mathbf{w}_{t_q}^{(1)} \stackrel{\sf def}{=} J_{(j_q\ldots j_1)s,t}.$$

Continuing the process of iterative application of the Ito formula, we have w. p. 1

$$J_{(l)s,t}J_{(j_q\ldots j_1)s,t}=$$

$$=J_{(lj_q\ldots j_1)s,t}+J_{(j_qlj_{q-1}\ldots j_1)s,t}+\ldots+J_{(j_q\ldots j_1l)s,t}+$$

$$+\int\limits_t^s \phi_l(\tau)\phi_{j_q}(\tau)\int\limits_t^{\tau}\phi_{j_{q-1}}(t_{q-1})\ldots\int\limits_t^{t_2}\phi_{j_1}(t_1)d\mathbf{w}_{t_1}^{(1)}\ldots d\mathbf{w}_{t_{q-1}}^{(1)}d\tau+\ldots$$

$$\ldots+\int\limits_t^s \phi_{j_q}(t_q)\ldots\int\limits_t^{t_3}\phi_{j_2}(t_2)\int\limits_t^{t_2}\phi_l(\tau)\phi_{j_1}(\tau)d\tau d\mathbf{w}_{t_2}^{(1)}\ldots d\mathbf{w}_{t_q}^{(1)}. \tag{239}$$

Summing the equality (239) over permutations $(j_1,\ldots,j_q)$, we get

$$\sum_{(j_1,\ldots,j_q)} J_{(l)s,t}J_{(j_q\ldots j_1)s,t}=\sum_{(j_1,\ldots,j_q,l)} J_{(lj_q\ldots j_1)s,t}+S(s) \tag{240}$$

w. p. 1, where

$$S(s)=$$

$$=\sum_{(j_1,\ldots,j_q)}\left(\int\limits_t^s \phi_l(\tau)\phi_{j_q}(\tau)\int\limits_t^{\tau}\phi_{j_{q-1}}(t_{q-1})\ldots\int\limits_t^{t_2}\phi_{j_1}(t_1)d\mathbf{w}_{t_1}^{(1)}\ldots d\mathbf{w}_{t_{q-1}}^{(1)}d\tau+\ldots\right.$$

$$\left.\ldots+\int\limits_t^s \phi_{j_q}(t_q)\ldots\int\limits_t^{t_3}\phi_{j_2}(t_2)\int\limits_t^{t_2}\phi_l(\tau)\phi_{j_1}(\tau)d\tau d\mathbf{w}_{t_2}^{(1)}\ldots d\mathbf{w}_{t_q}^{(1)}\right). \tag{241}$$

Consider

$$\int\limits_t^s \phi_l(\tau)\phi_{j_q}(\tau)d\tau \int\limits_t^s \phi_{j_{q-1}}(t_{q-1})\ldots \int\limits_t^{t_2} \phi_{j_1}(t_1)d\mathbf{w}_{t_1}^{(1)}\ldots d\mathbf{w}_{t_{q-1}}^{(1)}.$$

Applying the Ito formula, we get w. p. 1

$$\int\limits_t^s \phi_l(\tau)\phi_{j_q}(\tau)d\tau \int\limits_t^s \phi_{j_{q-1}}(t_{q-1})\ldots \int\limits_t^{t_2} \phi_{j_1}(t_1)d\mathbf{w}_{t_1}^{(1)}\ldots d\mathbf{w}_{t_{q-1}}^{(1)} =$$

$$= \int\limits_t^s \phi_l(\tau)\phi_{j_q}(\tau) \int\limits_t^{\tau} \phi_{j_{q-1}}(t_{q-1})\ldots \int\limits_t^{t_2} \phi_{j_1}(t_1)d\mathbf{w}_{t_1}^{(1)}\ldots d\mathbf{w}_{t_{q-1}}^{(1)}d\tau +$$

$$+ \int\limits_t^s \phi_{j_{q-1}}(t_{q-1})\times$$

$$\times \left(\int\limits_t^{t_{q-1}} \phi_l(\tau)\phi_{j_q}(\tau)d\tau \int\limits_t^{t_{q-1}} \phi_{j_{q-2}}(t_{q-2})\ldots \int\limits_t^{t_2} \phi_{j_1}(t_1)d\mathbf{w}_{t_1}^{(1)}\ldots d\mathbf{w}_{t_{q-2}}^{(1)}\right)d\mathbf{w}_{t_{q-1}}^{(1)}.$$

By iterative application of the Ito formula (as above), we obtain w. p. 1

$$\int\limits_t^s \phi_l(\tau)\phi_{j_q}(\tau)d\tau \int\limits_t^s \phi_{j_{q-1}}(t_{q-1})\ldots \int\limits_t^{t_2} \phi_{j_1}(t_1)d\mathbf{w}_{t_1}^{(1)}\ldots d\mathbf{w}_{t_{q-1}}^{(1)} =$$

$$= \int\limits_t^s \phi_l(\tau)\phi_{j_q}(\tau) \int\limits_t^{\tau} \phi_{j_{q-1}}(t_{q-1})\ldots \int\limits_t^{t_2} \phi_{j_1}(t_1)d\mathbf{w}_{t_1}^{(1)}\ldots d\mathbf{w}_{t_{q-1}}^{(1)}d\tau + \ldots$$

$$\ldots + \int\limits_t^s \phi_{j_{q-1}}(t_{q-1})\ldots \int\limits_t^{t_2} \phi_{j_1}(t_1) \int\limits_t^{t_1} \phi_l(\tau)\phi_{j_q}(\tau)d\tau d\mathbf{w}_{t_1}^{(1)}\ldots d\mathbf{w}_{t_{q-1}}^{(1)}. \tag{242}$$

Summing the equality (242) over permutations $(j_1,\ldots,j_q)$, we get

$$\sum_{(j_1,\ldots,j_q)} \int\limits_t^s \phi_l(\tau)\phi_{j_q}(\tau)d\tau \int\limits_t^s \phi_{j_{q-1}}(t_{q-1})\ldots \int\limits_t^{t_2} \phi_{j_1}(t_1)d\mathbf{w}_{t_1}^{(1)}\ldots d\mathbf{w}_{t_{q-1}}^{(1)} = S_1(s) \tag{243}$$

w. p. 1, where

$$S_1(s) =$$

$$= \sum_{(j_1,\ldots,j_q)} \left(\int\limits_t^s \phi_l(\tau)\phi_{j_q}(\tau) \int\limits_t^{\tau} \phi_{j_{q-1}}(t_{q-1})\ldots \int\limits_t^{t_2} \phi_{j_1}(t_1)d\mathbf{w}_{t_1}^{(1)}\ldots d\mathbf{w}_{t_{q-1}}^{(1)}d\tau + \ldots\right.$$

$$\ldots+\int\limits_t^s \phi_{j_{q-1}}(t_{q-1})\ldots\int\limits_t^{t_2}\phi_{j_1}(t_1)\int\limits_t^{t_1}\phi_l(\tau)\phi_{j_q}(\tau)d\tau d\mathbf{w}_{t_1}^{(1)}\ldots d\mathbf{w}_{t_{q-1}}^{(1)}\Biggr). \tag{244}$$

It is not difficult to see that

$$S(s)=S_1(s)\quad \text{w. p. 1.} \tag{245}$$

Moreover, due to the orthogonality of $\{\phi_j(x)\}_{j=0}^{\infty}$ and (243), (245), we have

$$S(T)=S_1(T)=0\quad \text{w. p. 1.} \tag{246}$$

Thus (see (240), (246)), the equality (236) is proved for the case $p=1$. Let us assume that the equality (236) is true for $p=2,3,\ldots,k-1$, and prove its validity for $p=k$.

From (240) for the case $q=k-1$, $j_1=\ldots=j_{k-1}=l$ we obtain

$$(J_1)_{s,t}\,(k-1)!\,(J_{k-1})_{s,t}=k!\,(J_k)_{s,t}+S_2(s) \tag{247}$$

w. p. 1, where

$$S_2(s)=S(s)\Bigr|_{j_1=\ldots=j_q=l,\ q=k-1}\quad (k\ge 2)\quad \text{and}\quad S_2(s)\stackrel{\sf def}{=}0\ \ (q=k-1,\ k=1),$$

$$\int\limits_t^s\phi_l(t_r)\ldots\int\limits_t^{t_2}\phi_l(t_1)d\mathbf{w}_{t_1}^{(1)}\ldots d\mathbf{w}_{t_r}^{(1)}\stackrel{\sf def}{=}(J_r)_{s,t}\quad (r\in\mathbb{N})\quad \text{and}\quad (J_0)_{s,t}\stackrel{\sf def}{=}1.$$

Taking into account (241), (243)–(245) and the orthonormality of $\{\phi_j(x)\}_{j=0}^{\infty}$, we have

$$S_2(T)=(k-1)!\,(J_{k-2})_{T,t}\,. \tag{248}$$

Combining (247) and (248), we obtain the following recurrence relation

$$k!\,(J_k)_{T,t}=(J_1)_{T,t}\,(k-1)!\,(J_{k-1})_{T,t}-(k-1)!\,(J_{k-2})_{T,t} \tag{249}$$

w. p. 1.

Using (249) and the induction hypothesis, we get w. p. 1

$$k!\int\limits_t^T\phi_l(t_k)\ldots\int\limits_t^{t_2}\phi_l(t_1)d\mathbf{w}_{t_1}^{(1)}\ldots d\mathbf{w}_{t_k}^{(1)}\times$$

$$\times\sum_{(j_1,\ldots,j_q)}\int\limits_t^T\phi_{j_q}(t_q)\ldots\int\limits_t^{t_2}\phi_{j_1}(t_1)d\mathbf{w}_{t_1}^{(1)}\ldots d\mathbf{w}_{t_q}^{(1)}=$$

$$
=\int\limits_t^T \phi_l(\tau)\ d\mathbf{w}_{\tau}^{(1)}\Biggl((k-1)!\int\limits_t^T \phi_l(t_{k-1})\ldots \int\limits_t^{t_2}\phi_l(t_1)d\mathbf{w}_{t_1}^{(1)}\ldots d\mathbf{w}_{t_{k-1}}^{(1)}\times
$$

$$
\times\sum_{(j_1,\ldots,j_q)}\int\limits_t^T \phi_{j_q}(t_q)\ldots \int\limits_t^{t_2}\phi_{j_1}(t_1)d\mathbf{w}_{t_1}^{(1)}\ldots d\mathbf{w}_{t_q}^{(1)}\Biggr)-
$$

$$
-(k-1)!\int\limits_t^T \phi_l(t_{k-2})\ldots \int\limits_t^{t_2}\phi_l(t_1)d\mathbf{w}_{t_1}^{(1)}\ldots d\mathbf{w}_{t_{k-2}}^{(1)}\times
$$

$$
\times\sum_{(j_1,\ldots,j_q)}\int\limits_t^T \phi_{j_q}(t_q)\ldots \int\limits_t^{t_2}\phi_{j_1}(t_1)d\mathbf{w}_{t_1}^{(1)}\ldots d\mathbf{w}_{t_q}^{(1)}=
$$

$$
=\int\limits_t^T \phi_l(\tau)\ d\mathbf{w}_{\tau}^{(1)}\sum_{(j_1,\ldots,j_q,\underbrace{l,\ldots,l}_{k-1})}\int\limits_t^T \phi_{j_q}(t_q)\ldots \int\limits_t^{t_2}\phi_{j_1}(t_1)\int\limits_t^{t_1}\phi_l(t_{k-1}')\ldots \int\limits_t^{t_2'}\phi_l(t_1')\times
$$

$$
\times d\mathbf{w}_{t_1'}^{(1)}\ldots d\mathbf{w}_{t_{k-1}'}^{(1)}d\mathbf{w}_{t_1}^{(1)}\ldots d\mathbf{w}_{t_q}^{(1)}-
$$

$$
-(k-1)\sum_{(j_1,\ldots,j_q,\underbrace{l,\ldots,l}_{k-2})}\int\limits_t^T \phi_{j_q}(t_q)\ldots \int\limits_t^{t_2}\phi_{j_1}(t_1)\int\limits_t^{t_1}\phi_l(t_{k-2}')\ldots \int\limits_t^{t_2'}\phi_l(t_1')\times
$$

$$
\times d\mathbf{w}_{t_1'}^{(1)}\ldots d\mathbf{w}_{t_{k-2}'}^{(1)}d\mathbf{w}_{t_1}^{(1)}\ldots d\mathbf{w}_{t_q}^{(1)}. \tag{250}
$$

Let $\boxed{l}$ be the symbol l which does not participate in the following sum with respect to permutations

$$
\sum_{(j_1,\ldots,j_q,\underbrace{l,\ldots,l}_{k-1})}.
$$

Applying (240), we have w. p. 1

$$
\int\limits_t^s \phi_l(\tau)\ d\mathbf{w}_{\tau}^{(1)}\sum_{(j_1,\ldots,j_q,\underbrace{l,\ldots,l}_{k-1})}\int\limits_t^s \phi_{j_q}(t_q)\ldots \int\limits_t^{t_2}\phi_{j_1}(t_1)\int\limits_t^{t_1}\phi_l(t_{k-1}')\ldots \int\limits_t^{t_2'}\phi_l(t_1')\times
$$

$$
\times d\mathbf{w}_{t_1'}^{(1)}\ldots d\mathbf{w}_{t_{k-1}'}^{(1)}d\mathbf{w}_{t_1}^{(1)}\ldots d\mathbf{w}_{t_q}^{(1)}=
$$

$$= \sum_{(j_1,\ldots,j_q,\underbrace{l,\ldots,l}_{k-1})} \int\limits_t^s \phi_{\boxed{l}}(\tau)\ d\mathbf{w}_\tau^{(1)} \int\limits_t^s \phi_{j_q}(t_q)\ldots \int\limits_t^{t_2} \phi_{j_1}(t_1) \int\limits_t^{t_1} \phi_l(t'_{k-1})\ldots \int\limits_t^{t'_2} \phi_l(t'_1)\times$$

$$\times d\mathbf{w}_{t'_1}^{(1)}\ldots d\mathbf{w}_{t'_{k-1}}^{(1)} d\mathbf{w}_{t_1}^{(1)}\ldots d\mathbf{w}_{t_q}^{(1)} =$$

$$= \sum_{(j_1,\ldots,j_q,\underbrace{l,\ldots,l}_{k-1})} \left(J_{(\boxed{l} j_q\ldots j_1 \underbrace{l\ldots l}_{k-1})s,t} + J_{(j_q \boxed{l} j_{q-1}\ldots j_1 \underbrace{l\ldots l}_{k-1})s,t} + \ldots \right.$$

$$\left. \ldots + J_{(j_q\ldots j_1 \boxed{l} \underbrace{l\ldots l}_{k-1})s,t} + J_{(j_q\ldots j_1 l \boxed{l} \underbrace{l\ldots l}_{k-2})s,t} + \ldots + J_{(j_q\ldots j_1 \underbrace{l\ldots l}_{k-1} \boxed{l})s,t} \right) + S_3(s) =$$

$$= \sum_{(j_1,\ldots,j_q,\underbrace{l,\ldots,l}_{k})} J_{(j_q\ldots j_1 \underbrace{l\ldots l}_{k})s,t} + S_3(s), \tag{251}$$

where

$$S_3(s) =$$

$$= \sum_{(j_1,\ldots,j_q,\underbrace{l,\ldots,l}_{k-1})} \Biggl(\int\limits_t^s \phi_{\boxed{l}}(\tau)\phi_{j_q}(\tau) \int\limits_t^{\tau} \phi_{j_{q-1}}(t_{q-1})\ldots \int\limits_t^{t_2} \phi_{j_1}(t_1)\times$$

$$\times \int\limits_t^{t_1} \phi_l(t'_{k-1})\ldots \int\limits_t^{t'_2} \phi_l(t'_1) d\mathbf{w}_{t'_1}^{(1)}\ldots d\mathbf{w}_{t'_{k-1}}^{(1)} d\mathbf{w}_{t_1}^{(1)}\ldots d\mathbf{w}_{t_{q-1}}^{(1)} d\tau + \ldots$$

$$+ \ldots \int\limits_t^s \phi_{j_q}(t_q)\ldots \int\limits_t^{t_3} \phi_{j_2}(t_2) \int\limits_t^{t_2} \phi_{\boxed{l}}(\tau)\phi_{j_1}(\tau)\times$$

$$\times \int\limits_t^{\tau} \phi_l(t'_{k-1})\ldots \int\limits_t^{t'_2} \phi_l(t'_1) d\mathbf{w}_{t'_1}^{(1)}\ldots d\mathbf{w}_{t'_{k-1}}^{(1)} d\tau d\mathbf{w}_{t_2}^{(1)}\ldots d\mathbf{w}_{t_q}^{(1)} +$$

$$+ \int\limits_t^s \phi_{j_q}(t_q)\ldots \int\limits_t^{t_2} \phi_{j_1}(t_1) \int\limits_t^{t_1} \phi_{\boxed{l}}(\tau)\phi_l(\tau)\times$$

$$\times \int\limits_t^{\tau} \phi_l(t'_{k-2})\ldots \int\limits_t^{t'_2} \phi_l(t'_1) d\mathbf{w}_{t'_1}^{(1)}\ldots d\mathbf{w}_{t'_{k-2}}^{(1)} d\tau d\mathbf{w}_{t_1}^{(1)}\ldots d\mathbf{w}_{t_q}^{(1)} + \ldots$$

$$
\ldots + \int\limits_t^s \phi_{j_q}(t_q) \ldots \int\limits_t^{t_2} \phi_{j_1}(t_1) \times
$$

$$
\times \int\limits_t^{t_1} \phi_l(t'_{k-1}) \ldots \int\limits_t^{t'_3} \phi_l(t'_2) \int\limits_t^{t'_2} \phi_{\boxed{l}}(\tau)\phi_l(\tau)d\tau d\mathbf{w}_{t'_2}^{(1)} \ldots d\mathbf{w}_{t'_{k-1}}^{(1)} d\mathbf{w}_{t_1}^{(1)} \ldots d\mathbf{w}_{t_q}^{(1)} \Biggr).
$$

Using (241), (243)–(245), we get w. p. 1

$$
S_3(s) =
$$

$$
= \sum_{(j_1,\ldots,j_q,\underbrace{l,\ldots,l}_{k-1})} \int\limits_t^s \phi_{\boxed{l}}(\tau)\phi_l(\tau)d\tau \int\limits_t^s \phi_{j_q}(t_q) \ldots \int\limits_t^{t_2} \phi_{j_1}(t_1) \times
$$

$$
\times \int\limits_t^{t_1} \phi_l(t'_{k-2}) \ldots \int\limits_t^{t'_2} \phi_l(t'_1) d\mathbf{w}_{t'_1}^{(1)} \ldots d\mathbf{w}_{t'_{k-2}}^{(1)} d\mathbf{w}_{t_1}^{(1)} \ldots d\mathbf{w}_{t_q}^{(1)} =
$$

$$
= (k-1) \sum_{(j_1,\ldots,j_q,\underbrace{l,\ldots,l}_{k-2})} \int\limits_t^s \phi_{\boxed{l}}(\tau)\phi_l(\tau)d\tau \int\limits_t^s \phi_{j_q}(t_q) \ldots \int\limits_t^{t_2} \phi_{j_1}(t_1) \times
$$

$$
\times \int\limits_t^{t_1} \phi_l(t'_{k-2}) \ldots \int\limits_t^{t'_2} \phi_l(t'_1) d\mathbf{w}_{t'_1}^{(1)} \ldots d\mathbf{w}_{t'_{k-2}}^{(1)} d\mathbf{w}_{t_1}^{(1)} \ldots d\mathbf{w}_{t_q}^{(1)} +
$$

$$
+ \sum_{(j_1,\ldots,j_{q-1},\underbrace{l,\ldots,l}_{k-1})} \int\limits_t^s \phi_{\boxed{l}}(\tau)\phi_{j_q}(\tau)d\tau \int\limits_t^s \phi_{j_{q-1}}(t_{q-1}) \ldots \int\limits_t^{t_2} \phi_{j_1}(t_1) \times
$$

$$
\times \int\limits_t^{t_1} \phi_l(t'_{k-1}) \ldots \int\limits_t^{t'_2} \phi_l(t'_1) d\mathbf{w}_{t'_1}^{(1)} \ldots d\mathbf{w}_{t'_{k-1}}^{(1)} d\mathbf{w}_{t_1}^{(1)} \ldots d\mathbf{w}_{t_{q-1}}^{(1)} +
$$

$$
+ \sum_{(j_1,\ldots,j_{q-2},j_q,\underbrace{l,\ldots,l}_{k-1})} \int\limits_t^s \phi_{\boxed{l}}(\tau)\phi_{j_{q-1}}(\tau)d\tau \int\limits_t^s \phi_{j_q}(t_q) \int\limits_t^{t_q} \phi_{j_{q-2}}(t_{q-2}) \ldots \int\limits_t^{t_2} \phi_{j_1}(t_1) \times
$$

$$
\times \int\limits_t^{t_1} \phi_l(t'_{k-1}) \ldots \int\limits_t^{t'_2} \phi_l(t'_1) d\mathbf{w}_{t'_1}^{(1)} \ldots d\mathbf{w}_{t'_{k-1}}^{(1)} d\mathbf{w}_{t_1}^{(1)} \ldots d\mathbf{w}_{t_{q-2}}^{(1)} d\mathbf{w}_{t_q}^{(1)} + \ldots
$$

$$\ldots$$

$$\ldots + \sum_{(j_2,\ldots,j_q,\underbrace{l,\ldots,l}_{k-1})} \int\limits_t^s \phi_{\boxed{l}}(\tau)\phi_{j_1}(\tau)d\tau \int\limits_t^s \phi_{j_q}(t_q)\ldots \int\limits_t^{t_3} \phi_{j_2}(t_2)\times$$

$$\times \int\limits_t^{t_2} \phi_l(t'_{k-1})\ldots \int\limits_t^{t'_2} \phi_l(t'_1)d\mathbf{w}_{t'_1}^{(1)}\ldots d\mathbf{w}_{t'_{k-1}}^{(1)} d\mathbf{w}_{t_2}^{(1)}\ldots d\mathbf{w}_{t_q}^{(1)}. \tag{252}$$

Applying (252) and the orthonormality of $\{\phi_j(x)\}_{j=0}^{\infty}$, we finally have

$$S_3(T) = (k-1) \sum_{(j_1,\ldots,j_q,\underbrace{l,\ldots,l}_{k-2})} \int\limits_t^T \phi_{j_q}(t_q)\ldots \int\limits_t^{t_2} \phi_{j_1}(t_1)\times$$

$$\times \int\limits_t^{t_1} \phi_l(t'_{k-2})\ldots \int\limits_t^{t'_2} \phi_l(t'_1)d\mathbf{w}_{t'_1}^{(1)}\ldots d\mathbf{w}_{t'_{k-2}}^{(1)} d\mathbf{w}_{t_1}^{(1)}\ldots d\mathbf{w}_{t_q}^{(1)}. \tag{253}$$

Combining (250), (251), (253), we obtain w. p. 1

$$k! \int\limits_t^T \phi_l(t_k)\ldots \int\limits_t^{t_2} \phi_l(t_1)d\mathbf{w}_{t_1}^{(1)}\ldots d\mathbf{w}_{t_k}^{(1)}\times$$

$$\times \sum_{(j_1,\ldots,j_q)} \int\limits_t^T \phi_{j_q}(t_q)\ldots \int\limits_t^{t_2} \phi_{j_1}(t_1)d\mathbf{w}_{t_1}^{(1)}\ldots d\mathbf{w}_{t_q}^{(1)} =$$

$$= \sum_{(\underbrace{l,\ldots,l}_{k})} \int\limits_t^T \phi_l(t_k)\ldots \int\limits_t^{t_2} \phi_l(t_1)d\mathbf{w}_{t_1}^{(1)}\ldots d\mathbf{w}_{t_k}^{(1)}\times$$

$$\times \sum_{(j_1,\ldots,j_q)} \int\limits_t^T \phi_{j_q}(t_q)\ldots \int\limits_t^{t_2} \phi_{j_1}(t_1)d\mathbf{w}_{t_1}^{(1)}\ldots d\mathbf{w}_{t_q}^{(1)} =$$

$$= \sum_{(j_1,\ldots,j_q,\underbrace{l,\ldots,l}_{k})} \int\limits_t^T \phi_{j_q}(t_q)\ldots \int\limits_t^{t_2} \phi_{j_1}(t_1) \int\limits_t^{t_1} \phi_l(t'_k)\ldots \int\limits_t^{t'_2} \phi_l(t'_1)\times$$

$$\times d\mathbf{w}_{t_1'}^{(1)}\ldots d\mathbf{w}_{t_k'}^{(1)}d\mathbf{w}_{t_1}^{(1)}\ldots d\mathbf{w}_{t_q}^{(1)}, \tag{254}$$

where $l \neq j_1,\ldots,j_q$.

The equality (236) is proved. From the other hand, (254) means that

$$J''[\phi_{j_1}\ldots\phi_{j_q}\underbrace{\phi_l\ldots\phi_l}_{n}]_{T,t}^{(\overbrace{1\ldots1}^{q+n})} = J''[\underbrace{\phi_l\ldots\phi_l}_{n}]_{T,t}^{(\overbrace{1\ldots1}^{n})}\cdot J''[\phi_{j_1}\ldots\phi_{j_q}]_{T,t}^{(\overbrace{1\ldots1}^{q})} \tag{255}$$

w. p. 1, where $n,q=0,1,2\ldots$; $l\neq j_1,\ldots,j_q$ and

$$J''[\phi_{j_1}\ldots\phi_{j_q}]_{T,t}^{(\overbrace{1\ldots1}^{q})}\stackrel{\sf def}{=}1$$

for $q=0$.

Note that [88]

$$\int\limits_t^T\phi_l(t_n)\ldots\int\limits_t^{t_2}\phi_l(t_1)d\mathbf{w}_{t_1}^{(1)}\ldots d\mathbf{w}_{t_n}^{(1)}=$$

$$=\frac{1}{n!}H_n\left(\int\limits_t^T\phi_l(\tau)d\mathbf{w}_{\tau}^{(1)},\int\limits_t^T\phi_l^2(\tau)d\tau\right)=$$

$$=\frac{1}{n!}H_n\left(\int\limits_t^T\phi_l(\tau)d\mathbf{w}_{\tau}^{(1)},1\right)=\frac{1}{n!}H_n\left(\int\limits_t^T\phi_l(\tau)d\mathbf{w}_{\tau}^{(1)}\right) \tag{256}$$

w. p. 1, where $n\in\mathbb{N}$, $H_n(x,y)$ is defined by (173) (also see (174)), and $H_n(x)$ is the Hermite polynomial (164).

From (256) we have w. p. 1

$$J''[\underbrace{\phi_l\ldots\phi_l}_{n}]_{T,t}^{(\overbrace{1\ldots1}^{n})}=n!\int\limits_t^T\phi_l(t_n)\ldots\int\limits_t^{t_2}\phi_l(t_1)d\mathbf{w}_{t_1}^{(1)}\ldots d\mathbf{w}_{t_n}^{(1)}=$$

$$=n!\frac{1}{n!}H_n\left(\int\limits_t^T\phi_l(\tau)d\mathbf{w}_{\tau}^{(1)}\right)=H_n\left(\int\limits_t^T\phi_l(\tau)d\mathbf{w}_{\tau}^{(1)}\right), \tag{257}$$

where $n\in\mathbb{N}$.

Combining (255) and (257), we obtain

$$J''[\phi_{j_1}\ldots\phi_{j_q}\underbrace{\phi_l\ldots\phi_l}_{n}]_{T,t}^{(\overbrace{1\ldots 1}^{q+n})}=H_n\left(\int\limits_t^T\phi_l(\tau)d\mathbf{w}_{\tau}^{(1)}\right)\cdot J''[\phi_{j_1}\ldots\phi_{j_q}]_{T,t}^{(\overbrace{1\ldots 1}^{q})} \tag{258}$$

w. p. 1, where $n,q=0,1,2\ldots;\ l\ne j_1,\ldots,j_q$.

The iterated application of the formula (258) completes the proof of Theorem 20 for the case $i_1=\ldots=i_k=1,\ldots,m$ and $j_1,\ldots,j_k\in\{0\}\cup\mathbb{N}$.

To prove Theorem 20 for the case $i_1=\ldots=i_k=0,1,\ldots,m$ and $j_1,\ldots,j_k\in\{0\}\cup\mathbb{N}$, we need to prove the following formula in addition to the previous proof

$$p!\int\limits_t^T\phi_l(t_p)\ldots\int\limits_t^{t_2}\phi_l(t_1)dt_1\ldots dt_p\sum_{(j_1,\ldots,j_q)}\int\limits_t^T\phi_{j_q}(t_q)\ldots\int\limits_t^{t_2}\phi_{j_1}(t_1)dt_1\ldots dt_q=$$

$$=\sum_{(j_1,\ldots,j_q,\underbrace{l,\ldots,l}_{p})}\int\limits_t^T\phi_{j_q}(t_q)\ldots\int\limits_t^{t_2}\phi_{j_1}(t_1)\int\limits_t^{t_1}\phi_l(t_p')\ldots\int\limits_t^{t_2'}\phi_l(t_1')dt_1'\ldots dt_p'dt_1\ldots dt_q, \tag{259}$$

where $p\in\mathbb{N}$,

$$\sum_{(j_1,\ldots,j_d)}$$

means the sum with respect to all possible permutations $(j_1,\ldots,j_d)$.

First, consider the case $p=1$. We have

$$d\left(\int\limits_t^s\phi_l(\theta)d\theta\int\limits_t^s\phi_{j_q}(t_q)\ldots\int\limits_t^{t_2}\phi_{j_1}(t_1)dt_1\ldots dt_q\right)=$$

$$=\phi_l(s)\int\limits_t^s\phi_{j_q}(t_q)\ldots\int\limits_t^{t_2}\phi_{j_1}(t_1)dt_1\ldots dt_q ds+$$

$$+\phi_{j_q}(s)\left(\int\limits_t^s\phi_{j_{q-1}}(t_{q-1})\ldots\int\limits_t^{t_2}\phi_{j_1}(t_1)dt_1\ldots dt_{q-1}\cdot\int\limits_t^s\phi_l(\theta)d\theta\right)ds.$$

Then

$$\int\limits_t^s\phi_l(\theta)d\theta\int\limits_t^s\phi_{j_q}(t_q)\ldots\int\limits_t^{t_2}\phi_{j_1}(t_1)dt_1\ldots dt_q=$$

$$=I_{(lj_q\ldots j_1)s,t}+$$

$$+\int\limits_t^s \phi_{j_q}(\tau)\left(\int\limits_t^{\tau}\phi_{j_{q-1}}(t_{q-1})\ldots\int\limits_t^{t_2}\phi_{j_1}(t_1)dt_1\ldots dt_{q-1}\cdot\int\limits_t^{\tau}\phi_l(\theta)d\theta\right)d\tau,$$

where

$$\int\limits_t^s \phi_{j_r}(t_r)\ldots\int\limits_t^{t_2}\phi_{j_1}(t_1)dt_1\ldots dt_r \stackrel{\sf def}{=} I_{(j_r\ldots j_1)s,t}. \qquad (260)$$

Continuing this process, we get

$$\int\limits_t^s \phi_l(\theta)d\theta\sum_{(j_1,\ldots,j_q)} I_{(j_q\ldots j_1)s,t}=\sum_{(j_1,\ldots,j_q,l)} I_{(lj_q\ldots j_1)s,t}, \qquad (261)$$

where

$$\sum_{(j_1,\ldots,j_d)}$$

means the sum with respect to all possible permutations $(j_1,\ldots,j_d)$.

The equality (259) is proved for the case $p=1$. Let us assume that the equality (259) is true for $p=2,3,\ldots,k-1$, and prove its validity for $p=k$.

From (261) for $j_1=\ldots=j_q=l$, $q=k-1$ we have

$$\left(I_1\right)_{s,t}(k-1)!\left(I_{k-1}\right)_{s,t}=k!\left(I_k\right)_{s,t}, \qquad (262)$$

where $k\in\mathbb{N}$ and

$$\int\limits_t^s \phi_l(t_k)\ldots\int\limits_t^{t_2}\phi_l(t_1)dt_1\ldots dt_k \stackrel{\sf def}{=} \left(I_k\right)_{s,t}, \quad \left(I_0\right)_{s,t}\stackrel{\sf def}{=}1.$$

Using (262) and the induction hypothesis, we obtain

$$k!\left(I_k\right)_{s,t}\sum_{(j_1,\ldots,j_q)} I_{(j_q\ldots j_1)s,t}=\left(I_1\right)_{s,t}(k-1)!\left(I_{k-1}\right)_{s,t}\sum_{(j_1,\ldots,j_q)} I_{(j_q\ldots j_1)s,t}=$$

$$=I_{(l)s,t}\sum_{(j_1,\ldots,j_q,\underbrace{l,\ldots,l}_{k-1})} I_{(j_q\ldots j_1\underbrace{l,\ldots,l}_{k-1})s,t}=\sum_{(j_1,\ldots,j_q,\underbrace{l,\ldots,l}_{k-1})} I_{(\boxed{l})s,t}I_{(j_q\ldots j_1\underbrace{l,\ldots,l}_{k-1})s,t}, \qquad (263)$$

where $I_{(j_r\ldots j_1)s,t}$ is defined by (260) and $\boxed{l}$ is the symbol l which does not participate in the following sum with respect to permutations

$$\sum_{(j_1,\ldots,j_q,\underbrace{l,\ldots,l}_{k-1})}.$$

By analogy with (261) we have

$$\sum_{(j_1,\ldots,j_q,\underbrace{l,\ldots,l}_{k-1})} I_{(\boxed{l})s,t} I_{(j_q\ldots j_1\underbrace{l,\ldots,l}_{k-1})s,t} = \sum_{(j_1,\ldots,j_q,\underbrace{l,\ldots,l}_{k-1})} \Biggl(I_{(\boxed{l}j_q\ldots j_1\underbrace{l\ldots l}_{k-1})s,t} + I_{(j_q\boxed{l}j_{q-1}\ldots j_1\underbrace{l\ldots l}_{k-1})s,t} + \ldots$$

$$\ldots + I_{(j_q\ldots j_1\boxed{l}\underbrace{l\ldots l}_{k-1})s,t} + I_{(j_q\ldots j_1 l\boxed{l}\underbrace{l\ldots l}_{k-2})s,t} + \ldots + I_{(j_q\ldots j_1\underbrace{l\ldots l}_{k-1}\boxed{l})s,t} \Biggr) =$$

$$= \sum_{(j_1,\ldots,j_q,\underbrace{l,\ldots,l}_{k})} I_{(j_q\ldots j_1\underbrace{l\ldots l}_{k})s,t}. \tag{264}$$

Substituting $s = T$ into (263), (264) and combining (263), (264), we conlude that the equality (259) is proved for $p = k$. The equality (259) is proved.

Note that

$$n!\int\limits_t^T \phi_l(t_n)\ldots\int\limits_t^{t_2}\phi_l(t_1)dt_1\ldots dt_n = n!\frac{1}{n!}\left(\int\limits_t^T \phi_l(\tau)d\tau\right)^n = \left(\int\limits_t^T \phi_l(\tau)d\tau\right)^n, \tag{265}$$

where $n \in \mathbb{N}$.

After substituting (265) into (259), we have for $p = n$

$$\left(\int\limits_t^T \phi_l(\tau)d\tau\right)^n \sum_{(j_1,\ldots,j_q)} J_{(j_q\ldots j_1)T,t} = \sum_{(j_1,\ldots,j_q,\underbrace{l,\ldots,l}_{n})} J_{(j_q\ldots j_1\underbrace{l\ldots l}_{n})T,t}. \tag{266}$$

The equality (266) means that

$$J''[\phi_{j_1}\ldots\phi_{j_q}\underbrace{\phi_l\ldots\phi_l}_{n}]_{T,t}^{(\overbrace{0\ldots 0}^{q+n})} = \left(\int\limits_t^T \phi_l(\tau)d\tau\right)^n \cdot J''[\phi_{j_1}\ldots\phi_{j_q}]_{T,t}^{(\overbrace{0\ldots 0}^{q})}, \tag{267}$$

where $n, q = 0, 1, 2\ldots$ and $J''[\phi_{j_1}\ldots\phi_{j_q}]_{T,t}^{(0\ldots 0)} \stackrel{\sf def}{=} 1$ for $q = 0$.

The relations (258) and (267) prove Theorem 20 for the case $i_1 = \ldots = i_k = 0, 1, \ldots, m$ and $j_1, \ldots, j_k \in \{0\} \cup \mathbb{N}$.

Remark 12. *Note that the equality (259) can be obtained in another way. Let*

$$D_q = \{(t_1,\ldots,t_q)\in [t,T]^q:\ \exists\ i\ne j\ \textit{such that}\ t_i=t_j\}$$

be the "diagonal set"of $[t,T]^q$ $(q=2,3,\ldots)$ [87]. *Since the Lebesgue meashure of the set* D_q *is equal to zero* [87], *then (see (230))*

$$J''[\phi_{j_1}\ldots\phi_{j_q}]_{T,t}^{(\overbrace{0\ldots 0}^{q})} = \int\limits_{[t,T]^q} \phi_{j_1}(t_1)\ldots\phi_{j_q}(t_q)dt_1\ldots dt_q. \tag{268}$$

From (268) we have

$$J''[\phi_l\ldots\phi_l]_{T,t}^{(\overbrace{0\ldots 0}^{p})}\cdot J''[\phi_{j_1}\ldots\phi_{j_q}]_{T,t}^{(\overbrace{0\ldots 0}^{q})} =$$

$$= \int\limits_{[t,T]^q} \phi_{j_1}(t_1)\ldots\phi_{j_q}(t_q)dt_1\ldots dt_q \int\limits_{[t,T]^p} \phi_{l}(t_1)\ldots\phi_{l}(t_p)dt_1\ldots dt_p =$$

$$= \int\limits_{[t,T]^{p+q}} \phi_{j_1}(t_1)\ldots\phi_{j_q}(t_q)\phi_l(t_1')\ldots\phi_l(t_p')dt_1'\ldots dt_p'dt_1\ldots dt_q =$$

$$= J''[\phi_{j_1}\ldots\phi_{j_q}\phi_l\ldots\phi_l]_{T,t}^{(\overbrace{0\ldots 0}^{p+q})}. \tag{269}$$

It is not difficult to see that the equality (269) is nothing but the equality (259) written in another form.

To complete the proof of Theorem 20, we need to consider the case $i_1,\ldots,i_k = 0,1,\ldots,m$ and $j_1,\ldots,j_k\in\{0\}\cup\mathbb{N}$.

Obviously, the proof of Theorem 20 will be completed if we prove the following equalities

$$\sum_{(j_1,\ldots,j_q)} \int\limits_t^T \phi_{j_q}(t_q)\ldots\int\limits_t^{t_2}\phi_{j_1}(t_1)d\mathbf{w}_{t_1}^{(i_1)}\ldots d\mathbf{w}_{t_q}^{(i_q)}\times$$

$$\times\sum_{(j_1',\ldots,j_n')} \int\limits_t^T \phi_{j_n'}(t_n')\ldots\int\limits_t^{t_2'}\phi_{j_1'}(t_1')d\mathbf{w}_{t_1'}^{(1)}\ldots d\mathbf{w}_{t_n'}^{(1)} =$$

$$= \sum_{(j_1,\ldots,j_q,j_1',\ldots,j_n')} \int\limits_t^T \phi_{j_q}(t_q)\ldots\int\limits_t^{t_2}\phi_{j_1}(t_1)\int\limits_t^{t_1}\phi_{j_n'}(t_n')\ldots\int\limits_t^{t_2'}\phi_{j_1'}(t_1')\times$$

$$\times d\mathbf{w}_{t_1'}^{(1)}\ldots d\mathbf{w}_{t_n'}^{(1)}d\mathbf{w}_{t_1}^{(i_1)}\ldots d\mathbf{w}_{t_q}^{(i_q)}, \tag{270}$$

$$\sum_{(j_1,\ldots,j_q)}\int\limits_t^T \phi_{j_q}(t_q)\ldots\int\limits_t^{t_2}\phi_{j_1}(t_1)d\mathbf{w}_{t_1}^{(i_1)}\ldots d\mathbf{w}_{t_q}^{(i_q)}\times$$

$$\times\sum_{(j_1',\ldots,j_n')}\int\limits_t^T \phi_{j_n'}(t_n')\ldots\int\limits_t^{t_2'}\phi_{j_1'}(t_1')d\mathbf{w}_{t_1'}^{(0)}\ldots d\mathbf{w}_{t_n'}^{(0)}=$$

$$=\sum_{(j_1,\ldots,j_q,j_1',\ldots,j_n')}\int\limits_t^T \phi_{j_q}(t_q)\ldots\int\limits_t^{t_2}\phi_{j_1}(t_1)\int\limits_t^{t_1}\phi_{j_n'}(t_n')\ldots\int\limits_t^{t_2'}\phi_{j_1'}(t_1')\times$$

$$\times d\mathbf{w}_{t_1'}^{(0)}\ldots d\mathbf{w}_{t_n'}^{(0)}d\mathbf{w}_{t_1}^{(i_1)}\ldots d\mathbf{w}_{t_q}^{(i_q)} \tag{271}$$

w. p. 1, where $n,q\in\mathbb{N}$, $d\mathbf{w}_\tau^{(0)}\stackrel{\text{def}}{=}d\tau$, $i_1,\ldots,i_q\ne 1$ in (270) and $i_1,\ldots,i_q\ne 0$ in (271),

$$\sum_{(j_1,\ldots,j_g)}$$

means the sum with respect to all possible permutations $(j_1,\ldots,j_g)$. At the same time if j_r swapped with j_d in the permutation $(j_1,\ldots,j_g)$, then i_r swapped with i_d in the permutation $(i_1,\ldots,i_g)$.

The equalities (270) and (271) mean that

$$J''[\phi_{j_1}\ldots\phi_{j_q}\phi_{j_1'}\ldots\phi_{j_n'}]_{T,t}^{(i_1\ldots i_q 1\ldots 1)}=J''[\phi_{j_1}\ldots\phi_{j_q}]_{T,t}^{(i_1\ldots i_q)}\cdot J''[\phi_{j_1'}\ldots\phi_{j_n'}]_{T,t}^{(1\ldots 1)}, \tag{272}$$

$$J''[\phi_{j_1}\ldots\phi_{j_q}\phi_{j_1'}\ldots\phi_{j_n'}]_{T,t}^{(i_1\ldots i_q 0\ldots 0)}=J''[\phi_{j_1}\ldots\phi_{j_q}]_{T,t}^{(i_1\ldots i_q)}\cdot J''[\phi_{j_1'}\ldots\phi_{j_n'}]_{T,t}^{(0\ldots 0)} \tag{273}$$

w. p. 1, where $i_1,\ldots,i_q\ne 1$ in (272) and $i_1,\ldots,i_q\ne 0$ in (273).

First, we prove the equality (270). Consider the case $n=1$. Using the Ito formula, we get w. p. 1

$$\int\limits_t^s\phi_{j_1'}(\theta)d\mathbf{w}_\theta^{(1)}\int\limits_t^s\phi_{j_q}(t_q)\ldots\int\limits_t^{t_2}\phi_{j_1}(t_1)d\mathbf{w}_{t_1}^{(i_1)}\ldots d\mathbf{w}_{t_q}^{(i_q)}=$$

$$=J_{(j_1'j_q\ldots j_1)s,t}^{(1i_q\ldots i_1)}+$$

$$+\int\limits_t^s\phi_{j_q}(\tau)\left(\int\limits_t^\tau\phi_{j_{q-1}}(t_{q-1})\ldots\int\limits_t^{t_2}\phi_{j_1}(t_1)d\mathbf{w}_{t_1}^{(i_1)}\ldots d\mathbf{w}_{t_{q-1}}^{(i_{q-1})}\int\limits_t^\tau\phi_{j_1'}(\theta)d\mathbf{w}_\theta^{(1)}\right)d\mathbf{w}_\tau^{(i_q)}=$$

$$=\ldots=$$

$$=J_{(j_1'j_q\ldots j_1)s,t}^{(1i_q\ldots i_1)}+J_{(j_qj_1'j_{q-1}\ldots j_1)s,t}^{(i_q1i_{q-1}\ldots i_1)}+\ldots+J_{(j_q\ldots j_1j_1')s,t}^{(i_q\ldots i_11)}, \tag{274}$$

where

$$\int\limits_t^s \phi_{j_r}(t_r)\ldots\int\limits_t^{t_2}\phi_{j_1}(t_1)d\mathbf{w}_{t_1}^{(i_1)}\ldots d\mathbf{w}_{t_r}^{(i_r)} \stackrel{\sf def}{=} J_{(j_r\ldots j_1)s,t}^{(i_r\ldots i_1)}, \tag{275}$$

$i_1,\ldots,i_r=0,1,\ldots,m.$

From (274) we obtain

$$\int\limits_t^s \phi_{j_1'}(\theta)d\mathbf{w}_{\theta}^{(1)}\sum_{(j_1,\ldots,j_q)}\int\limits_t^s \phi_{j_q}(t_q)\ldots\int\limits_t^{t_2}\phi_{j_1}(t_1)d\mathbf{w}_{t_1}^{(i_1)}\ldots d\mathbf{w}_{t_q}^{(i_q)}=$$

$$=\sum_{(j_1,\ldots,j_q)}\int\limits_t^s \phi_{j_1'}(\theta)d\mathbf{w}_{\theta}^{(1)}\int\limits_t^s \phi_{j_q}(t_q)\ldots\int\limits_t^{t_2}\phi_{j_1}(t_1)d\mathbf{w}_{t_1}^{(i_1)}\ldots d\mathbf{w}_{t_q}^{(i_q)}=$$

$$=\sum_{(j_1,\ldots,j_q)}\left(J_{(j_1'j_q\ldots j_1)s,t}^{(1i_q\ldots i_1)}+J_{(j_qj_1'j_{q-1}\ldots j_1)s,t}^{(i_q1i_{q-1}\ldots i_1)}+\ldots+J_{(j_q\ldots j_1j_1')s,t}^{(i_q\ldots i_11)}\right)=$$

$$=\sum_{(j_1,\ldots,j_q,j_1')}J_{(j_q\ldots j_1j_1')s,t}^{(i_q\ldots i_11)} \tag{276}$$

w. p. 1, where $J_{(j_r\ldots j_1)s,t}^{(i_r\ldots i_1)}$ is defined by (275). The equality (270) is proved for the case $n=1$.

Let us assume that the equality (270) is true for $n=2,3,\ldots,k-1$, and prove its validity for $n=k$.

Applying (240), (241), (243)–(245), we obtain w. p. 1

$$\sum_{(j_1',\ldots,j_k')}\int\limits_t^s \phi_{j_k'}(t_k')\ldots\int\limits_t^{t_2'}\phi_{j_1'}(t_1')d\mathbf{w}_{t_1'}^{(1)}\ldots d\mathbf{w}_{t_k'}^{(1)}=$$

$$=\int\limits_t^s \phi_{j_k'}(\theta)d\mathbf{w}_{\theta}^{(1)}\sum_{(j_1',\ldots,j_{k-1}')}\int\limits_t^s \phi_{j_{k-1}'}(t_{k-1})\ldots\int\limits_t^{t_2}\phi_{j_1'}(t_1)d\mathbf{w}_{t_1}^{(1)}\ldots d\mathbf{w}_{t_{k-1}}^{(1)}-$$

$$-\sum_{(j_1',\ldots,j_{k-1}')}\int\limits_t^s \phi_{j_k'}(\theta)\phi_{j_{k-1}'}(\theta)d\theta\int\limits_t^s \phi_{j_{k-2}'}(t_{k-2})\ldots\int\limits_t^{t_2}\phi_{j_1'}(t_1)d\mathbf{w}_{t_1}^{(1)}\ldots d\mathbf{w}_{t_{k-2}}^{(1)}. \tag{277}$$

After substituting $s=T$ in (277) and applying the orthonormality of $\{\phi_j(x)\}_{j=0}^{\infty}$, we get w. p. 1

$$\sum_{(j_1',\ldots,j_k')}\int\limits_t^T \phi_{j_k'}(t_k')\ldots\int\limits_t^{t_2'}\phi_{j_1'}(t_1')d\mathbf{w}_{t_1'}^{(1)}\ldots d\mathbf{w}_{t_k'}^{(1)}=$$

$$=\int\limits_t^T \phi_{j_k'}(\theta)d\mathbf{w}_{\theta}^{(1)}\sum_{(j_1',\ldots,j_{k-1}')}\int\limits_t^T \phi_{j_{k-1}'}(t_{k-1})\ldots\int\limits_t^{t_2}\phi_{j_1'}(t_1)d\mathbf{w}_{t_1}^{(1)}\ldots d\mathbf{w}_{t_{k-1}}^{(1)}-$$

$$-\sum_{(j_1',\ldots,j_{k-1}')}\mathbf{1}_{\{j_k'=j_{k-1}'\}}\int\limits_t^T\phi_{j_{k-2}'}(t_{k-2})\ldots\int\limits_t^{t_2}\phi_{j_1'}(t_1)d\mathbf{w}_{t_1}^{(1)}\ldots d\mathbf{w}_{t_{k-2}}^{(1)}, \tag{278}$$

where $\mathbf{1}_A$ is the indicator of the set A.

Using (278) and the induction hypothesis, we obtain w. p. 1

$$\sum_{(j_1',\ldots,j_k')}\int\limits_t^T\phi_{j_k'}(t_k)\ldots\int\limits_t^{t_2}\phi_{j_1'}(t_1)d\mathbf{w}_{t_1}^{(1)}\ldots d\mathbf{w}_{t_k}^{(1)}\times$$

$$\times\sum_{(j_1,\ldots,j_q)}\int\limits_t^T\phi_{j_q}(t_q)\ldots\int\limits_t^{t_2}\phi_{j_1}(t_1)d\mathbf{w}_{t_1}^{(i_1)}\ldots d\mathbf{w}_{t_q}^{(i_q)}=$$

$$=\int\limits_t^T\phi_{j_k'}(\theta)d\mathbf{w}_\theta^{(1)}\sum_{(j_1',\ldots,j_{k-1}')}\int\limits_t^T\phi_{j_{k-1}'}(t_{k-1})\ldots\int\limits_t^{t_2}\phi_{j_1'}(t_1)d\mathbf{w}_{t_1}^{(1)}\ldots d\mathbf{w}_{t_{k-1}}^{(1)}\times$$

$$\times\sum_{(j_1,\ldots,j_q)}\int\limits_t^T\phi_{j_q}(t_q)\ldots\int\limits_t^{t_2}\phi_{j_1}(t_1)d\mathbf{w}_{t_1}^{(i_1)}\ldots d\mathbf{w}_{t_q}^{(i_q)}-$$

$$-\sum_{(j_1',\ldots,j_{k-1}')}\mathbf{1}_{\{j_k'=j_{k-1}'\}}\int\limits_t^T\phi_{j_{k-2}'}(t_{k-2})\ldots\int\limits_t^{t_2}\phi_{j_1'}(t_1)d\mathbf{w}_{t_1}^{(1)}\ldots d\mathbf{w}_{t_{k-2}}^{(1)}\times$$

$$\times\sum_{(j_1,\ldots,j_q)}\int\limits_t^T\phi_{j_q}(t_q)\ldots\int\limits_t^{t_2}\phi_{j_1}(t_1)d\mathbf{w}_{t_1}^{(i_1)}\ldots d\mathbf{w}_{t_q}^{(i_q)}=$$

$$=\int\limits_t^T\phi_{j_k'}(\theta)d\mathbf{w}_\theta^{(1)}\times$$

$$\times\sum_{(j_1,\ldots,j_q,j_1',\ldots,j_{k-1}')}\int\limits_t^T\phi_{j_q}(t_q)\ldots\int\limits_t^{t_2}\phi_{j_1}(t_1)\int\limits_t^{t_1}\phi_{j_{k-1}'}(t_{k-1}')\ldots\int\limits_t^{t_2'}\phi_{j_1'}(t_1')\times$$

$$\times d\mathbf{w}_{t_1'}^{(1)}\ldots d\mathbf{w}_{t_{k-1}'}^{(1)}d\mathbf{w}_{t_1}^{(i_1)}\ldots d\mathbf{w}_{t_q}^{(i_q)}-$$

$$-\sum_{(j_1',\ldots,j_{k-1}')}\mathbf{1}_{\{j_k'=j_{k-1}'\}}\int\limits_t^T\phi_{j_{k-2}'}(t_{k-2})\ldots\int\limits_t^{t_2}\phi_{j_1'}(t_1)d\mathbf{w}_{t_1}^{(1)}\ldots d\mathbf{w}_{t_{k-2}}^{(1)}\times$$

$$\times\sum_{(j_1,\ldots,j_q)}\int\limits_t^T\phi_{j_q}(t_q)\ldots\int\limits_t^{t_2}\phi_{j_1}(t_1)d\mathbf{w}_{t_1}^{(i_1)}\ldots d\mathbf{w}_{t_q}^{(i_q)}. \tag{279}$$

Further, applying the induction hypothesis, we have w. p. 1

$$\sum_{(j_1',\ldots,j_{k-1}')}\mathbf{1}_{\{j_k'=j_{k-1}'\}}\int\limits_t^T\phi_{j_{k-2}'}(t_{k-2})\ldots\int\limits_t^{t_2}\phi_{j_1'}(t_1)d\mathbf{w}_{t_1}^{(1)}\ldots d\mathbf{w}_{t_{k-2}}^{(1)}\times$$

$$\times\sum_{(j_1,\ldots,j_q)}\int\limits_t^T\phi_{j_q}(t_q)\ldots\int\limits_t^{t_2}\phi_{j_1}(t_1)d\mathbf{w}_{t_1}^{(i_1)}\ldots d\mathbf{w}_{t_q}^{(i_q)}=$$

$$=\Biggl(\sum_{(j_1',\ldots,j_{k-2}')}\mathbf{1}_{\{j_k'=j_{k-1}'\}}\int\limits_t^T\phi_{j_{k-2}'}(t_{k-2})\ldots\int\limits_t^{t_2}\phi_{j_1'}(t_1)d\mathbf{w}_{t_1}^{(1)}\ldots d\mathbf{w}_{t_{k-2}}^{(1)}+$$

$$+\sum_{(j_1',\ldots,j_{k-3}',j_{k-1}')}\mathbf{1}_{\{j_k'=j_{k-2}'\}}\int\limits_t^T\phi_{j_{k-1}'}(t_{k-2})\int\limits_t^{t_{k-2}}\phi_{j_{k-3}'}(t_{k-3})\ldots\int\limits_t^{t_2}\phi_{j_1'}(t_1)\times$$

$$\times d\mathbf{w}_{t_1}^{(1)}\ldots d\mathbf{w}_{t_{k-3}}^{(1)}d\mathbf{w}_{t_{k-2}}^{(1)}+\ldots$$

$$\ldots+\sum_{(j_2',\ldots,j_{k-1}')}\mathbf{1}_{\{j_k'=j_1'\}}\int\limits_t^T\phi_{j_{k-2}'}(t_{k-2})\ldots\int\limits_t^{t_3}\phi_{j_2'}(t_2)\int\limits_t^{t_2}\phi_{j_{k-1}'}(t_1)\times$$

$$\times d\mathbf{w}_{t_1}^{(1)}d\mathbf{w}_{t_2}^{(1)}\ldots d\mathbf{w}_{t_{k-2}}^{(1)}\Biggr)\times$$

$$\times\sum_{(j_1,\ldots,j_q)}\int\limits_t^T\phi_{j_q}(t_q)\ldots\int\limits_t^{t_2}\phi_{j_1}(t_1)d\mathbf{w}_{t_1}^{(i_1)}\ldots d\mathbf{w}_{t_q}^{(i_q)}=$$

$$=\Biggl(\mathbf{1}_{\{j_k'=j_{k-1}'\}}\sum_{(j_1',\ldots,j_{k-2}')}\int\limits_t^T\phi_{j_{k-2}'}(t_{k-2})\ldots\int\limits_t^{t_2}\phi_{j_1'}(t_1)d\mathbf{w}_{t_1}^{(1)}\ldots d\mathbf{w}_{t_{k-2}}^{(1)}+$$

$$+\mathbf{1}_{\{j_k'=j_{k-2}'\}}\sum_{(j_1',\ldots,j_{k-3}',j_{k-1}')}\int\limits_t^T\phi_{j_{k-1}'}(t_{k-2})\int\limits_t^{t_{k-2}}\phi_{j_{k-3}'}(t_{k-3})\ldots\int\limits_t^{t_2}\phi_{j_1'}(t_1)\times$$

$$\times d\mathbf{w}_{t_1}^{(1)}\ldots d\mathbf{w}_{t_{k-3}}^{(1)}d\mathbf{w}_{t_{k-2}}^{(1)}+\ldots$$

$$\ldots+\mathbf{1}_{\{j_k'=j_1'\}}\sum_{(j_2',\ldots,j_{k-1}')}\int\limits_t^T\phi_{j_{k-2}'}(t_{k-2})\ldots\int\limits_t^{t_3}\phi_{j_2'}(t_2)\int\limits_t^{t_2}\phi_{j_{k-1}'}(t_1)\times$$

$$\times d\mathbf{w}_{t_1}^{(1)}d\mathbf{w}_{t_2}^{(1)}\ldots d\mathbf{w}_{t_{k-2}}^{(1)}\Biggr)\times$$

$$\times \sum_{(j_1,\ldots,j_q)} \int_t^T \phi_{j_q}(t_q)\ldots \int_t^{t_2} \phi_{j_1}(t_1) d\mathbf{w}_{t_1}^{(i_1)}\ldots d\mathbf{w}_{t_q}^{(i_q)} =$$

$$= \mathbf{1}_{\{j'_k=j'_{k-1}\}} \sum_{(j_1,\ldots,j_q,j'_1,\ldots,j'_{k-2})} \int_t^T \phi_{j_q}(t_q)\ldots \int_t^{t_2} \phi_{j_1}(t_1) \int_t^{t_1} \phi_{j'_{k-2}}(t'_{k-2})\ldots \int_t^{t'_2} \phi_{j'_1}(t'_1)\times$$

$$\times d\mathbf{w}_{t'_1}^{(1)}\ldots d\mathbf{w}_{t'_{k-2}}^{(1)} d\mathbf{w}_{t_1}^{(i_1)}\ldots d\mathbf{w}_{t_q}^{(i_q)}+$$

$$+\mathbf{1}_{\{j'_k=j'_{k-2}\}} \sum_{(j_1,\ldots,j_q,j'_1,\ldots,j'_{k-3},j'_{k-1})} \int_t^T \phi_{j_q}(t_q)\ldots \int_t^{t_2} \phi_{j_1}(t_1) \int_t^{t_1} \phi_{j'_{k-1}}(t'_{k-2})\times$$

$$\times \int_t^{t'_{k-2}} \phi_{j'_{k-3}}(t'_{k-3})\ldots \int_t^{t'_2} \phi_{j'_1}(t'_1) d\mathbf{w}_{t'_1}^{(1)}\ldots d\mathbf{w}_{t'_{k-3}}^{(1)} d\mathbf{w}_{t'_{k-2}}^{(1)} d\mathbf{w}_{t_1}^{(i_1)}\ldots d\mathbf{w}_{t_q}^{(i_q)} + \ldots$$

$$\ldots$$

$$\ldots + \mathbf{1}_{\{j'_k=j'_1\}} \sum_{(j_1,\ldots,j_q,j'_2,\ldots,j'_{k-1})} \int_t^T \phi_{j_q}(t_q)\ldots \int_t^{t_2} \phi_{j_1}(t_1)\times$$

$$\times \int_t^{t_1} \phi_{j'_{k-2}}(t'_{k-2})\ldots \int_t^{t'_3} \phi_{j'_2}(t'_2) \int_t^{t'_2} \phi_{j'_{k-1}}(t'_1) d\mathbf{w}_{t'_1}^{(1)} d\mathbf{w}_{t'_2}^{(1)}\ldots d\mathbf{w}_{t'_{k-2}}^{(1)} d\mathbf{w}_{t_1}^{(i_1)}\ldots d\mathbf{w}_{t_q}^{(i_q)} \stackrel{\text{def}}{=}$$

$$\stackrel{\text{def}}{=} S_4(T). \tag{280}$$

By analogy with (242) we obtain w. p. 1

$$\int_t^T \phi_l(\tau)\phi_{j_r}(\tau)d\tau \int_t^T \phi_{j_{r-1}}(t_{r-1})\ldots \int_t^{t_2} \phi_{j_1}(t_1) d\mathbf{w}_{t_1}^{(i_1)}\ldots d\mathbf{w}_{t_{r-1}}^{(i_{r-1})} =$$

$$= \int_t^T \phi_l(\tau)\phi_{j_r}(\tau) \int_t^{\tau} \phi_{j_{r-1}}(t_{r-1})\ldots \int_t^{t_2} \phi_{j_1}(t_1) d\mathbf{w}_{t_1}^{(i_1)}\ldots d\mathbf{w}_{t_{r-1}}^{(i_{r-1})} d\tau + \ldots$$

$$\ldots + \int_t^T \phi_{j_{r-1}}(t_{r-1})\ldots \int_t^{t_2} \phi_{j_1}(t_1) \int_t^{t_1} \phi_l(\tau)\phi_{j_r}(\tau) d\tau d\mathbf{w}_{t_1}^{(i_1)}\ldots d\mathbf{w}_{t_{r-1}}^{(i_{r-1})}, \tag{281}$$

where $i_1,\ldots,i_{r-1} = 0,1,\ldots,m$.

Using iteratively the Ito formula, as well as (281) and combinatorial reasoning, we obtain w. p. 1 (see Remark 13 below for details)

$$\int\limits_t^T \phi_{j_k'}(\theta)d\mathbf{w}_\theta^{(1)}\times$$

$$\times\sum_{(j_1,\ldots,j_q,j_1',\ldots,j_{k-1}')}\int\limits_t^T \phi_{j_q}(t_q)\ldots\int\limits_t^{t_2}\phi_{j_1}(t_1)\int\limits_t^{t_1}\phi_{j_{k-1}'}(t_{k-1}')\ldots\int\limits_t^{t_2'}\phi_{j_1'}(t_1')\times$$

$$\times d\mathbf{w}_{t_1'}^{(1)}\ldots d\mathbf{w}_{t_{k-1}'}^{(1)}d\mathbf{w}_{t_1}^{(i_1)}\ldots d\mathbf{w}_{t_q}^{(i_q)}=$$

$$=\sum_{(j_1,\ldots,j_q,j_1',\ldots,j_k')}\int\limits_t^T \phi_{j_q}(t_q)\ldots\int\limits_t^{t_2}\phi_{j_1}(t_1)\int\limits_t^{t_1}\phi_{j_k'}(t_k')\ldots\int\limits_t^{t_2'}\phi_{j_1'}(t_1')\times$$

$$\times d\mathbf{w}_{t_1'}^{(1)}\ldots d\mathbf{w}_{t_k'}^{(1)}d\mathbf{w}_{t_1}^{(i_1)}\ldots d\mathbf{w}_{t_q}^{(i_q)}+$$

$$

$$
\ldots \int\limits_t^{t_3'} \phi_{j_2'}(t_2') d\mathbf{w}_{t_2'}^{(1)} \ldots d\mathbf{w}_{t_{k-1}'}^{(1)} d\mathbf{w}_{t_1}^{(i_1)} \ldots d\mathbf{w}_{t_q}^{(i_q)} =
$$

$$
= \sum_{(j_1,\ldots,j_q,j_1',\ldots,j_k')} \int\limits_t^T \phi_{j_q}(t_q) \ldots \int\limits_t^{t_2} \phi_{j_1}(t_1) \int\limits_t^{t_1} \phi_{j_k'}(t_k') \ldots \int\limits_t^{t_2'} \phi_{j_1'}(t_1') \times
$$

$$
\times d\mathbf{w}_{t_1'}^{(1)} \ldots d\mathbf{w}_{t_k'}^{(1)} d\mathbf{w}_{t_1}^{(i_1)} \ldots d\mathbf{w}_{t_q}^{(i_q)} + S_4(T). \tag{282}
$$

From (279), (280), and (282) we conclude that the equality (270) is proved for $n = k$. The equality (270) is proved.

Remark 13. *It should be noted that the sums with respect to permutations*

$$
\sum_{(j_1,\ldots,j_q,j_1',\ldots,j_{k-1}')}
$$

in (282), containing the expressions $\phi_{j'_k}(\theta)\phi_{j'_{k-1}}(\theta),\ldots,\phi_{j'_k}(\theta)\phi_{j'_1}(\theta)$*, should be understood in a special way. Let us explain this rule on the basis of the sum*

$$\sum_{(j_1,\ldots,j_q,j'_1,\ldots,j'_{k-1})}\int\limits_t^T\phi_{j_q}(t_q)\ldots\int\limits_t^{t_2}\phi_{j_1}(t_1)\int\limits_t^{t_1}\phi_{j'_k}(\theta)\phi_{j'_{k-1}}(\theta)\int\limits_t^{\theta}\phi_{j'_{k-2}}(t'_{k-2})\ldots$$

$$\ldots\int\limits_t^{t'_2}\phi_{j'_1}(t'_1)d\mathbf{w}_{t'_1}^{(1)}\ldots d\mathbf{w}_{t'_{k-2}}^{(1)}d\mathbf{w}_{\theta}^{(0)}d\mathbf{w}_{t_1}^{(i_1)}\ldots d\mathbf{w}_{t_q}^{(i_q)}. \tag{283}$$

More precisely, permutations $(j_1,\ldots,j_q,j'_1,\ldots,j'_{k-1})$ *when summing in (283) are performed in such a way that if* j_r^* *swapped with* j_d^* *in the permutation*

$$\left(j^*_{q+k-1},\ldots,j^*_1\right)=\left(j_q,\ldots,j_1,j'_{k-1},j'_{k-2},\ldots,j'_1\right),$$

then i_r^* *swapped with* i_d^* *in the permutation*

$$\left(i^*_{q+k-1},\ldots,i^*_1\right)=\bigl(i_q,\ldots,i_1,0,\underbrace{1,\ldots,1}_{k-2}\bigr).$$

Moreover, $\bar\phi_{j_r^*}$ *swapped with* $\bar\phi_{j_d^*}$ *in the permutation*

$$\left(\bar\phi_{j^*_{q+k-1}},\ldots,\bar\phi_{j^*_1}\right)=\left(\phi_{j_q},\ldots,\phi_{j_1},\ \phi_{j'_k}\cdot\phi_{j'_{k-1}},\ \phi_{j'_{k-2}},\ldots,\phi_{j'_1}\right).$$

A similar rule should be applied to all other sums with respect to permutations

$$\sum_{(j_1,\ldots,j_q,j'_1,\ldots,j'_{k-1})}$$

in (282) that contain the expressions $\phi_{j'_k}(\theta)\phi_{j'_{k-2}}(\theta),\ldots,\phi_{j'_k}(\theta)\phi_{j'_1}(\theta)$*.*

Let us prove the equality (271). Consider the case $n=1$. By analogy with (274) and (276) we obtain

$$\int\limits_t^s\phi_{j'_1}(\theta)d\mathbf{w}_{\theta}^{(0)}\sum_{(j_1,\ldots,j_q)}\int\limits_t^s\phi_{j_q}(t_q)\ldots\int\limits_t^{t_2}\phi_{j_1}(t_1)d\mathbf{w}_{t_1}^{(i_1)}\ldots\mathbf{w}_{t_q}^{(i_q)}=$$

$$=\sum_{(j_1,\ldots,j_q,j'_1)}J^{(i_q\ldots i_1 0)}_{(j_q\ldots j_1 j'_1)s,t}$$

w. p. 1, where $J^{(i_r\ldots i_1)}_{(j_r\ldots j_1)s,t}$ is defined by (275). The equality (271) is proved for the case $n=1$.

Let us assume that the equality (271) is true for $n=2,3,\ldots,k-1$, and prove its validity for $n=k$.

In complete analogy with (261) we get

$$\int\limits_t^s \phi_{j'_k}(\theta)d\theta \int\limits_t^s \phi_{j'_{k-1}}(t_{k-1})\ldots \int\limits_t^{t_2} \phi_{j'_1}(t_1)dt_1\ldots dt_{k-1} =$$

$$= J^{(0\ldots 0)}_{(j'_k j'_{k-1}\ldots j'_1)s,t} + J^{(0\ldots 0)}_{(j'_{k-1} j'_k j'_{k-2}\ldots j'_1)s,t} + \ldots + J^{(0\ldots 0)}_{(j'_{k-1}\ldots j'_1 j'_k)s,t}. \tag{284}$$

Applying (284), we have

$$\sum_{(j'_1,\ldots,j'_k)} \int\limits_t^T \phi_{j'_k}(t'_k)\ldots \int\limits_t^{t'_2} \phi_{j'_1}(t'_1)d\mathbf{w}^{(0)}_{t'_1}\ldots d\mathbf{w}^{(0)}_{t'_k} =$$

$$= \sum_{(j'_1,\ldots,j'_{k-1})} \Bigl(J^{(0\ldots 0)}_{(j'_k j'_{k-1}\ldots j'_1)s,t} + J^{(0\ldots 0)}_{(j'_{k-1} j'_k j'_{k-2}\ldots j'_1)s,t} + \ldots + J^{(0\ldots 0)}_{(j'_{k-1}\ldots j'_1 j'_k)s,t} \Bigr) =$$

$$= \int\limits_t^T \phi_{j'_k}(\theta)d\theta \sum_{(j'_1,\ldots,j'_{k-1})} \int\limits_t^T \phi_{j'_{k-1}}(t_{k-1})\ldots \int\limits_t^{t'_2} \phi_{j'_1}(t_1)d\mathbf{w}^{(0)}_{t_1}\ldots d\mathbf{w}^{(0)}_{t_{k-1}}. \tag{285}$$

Using (285) and the induction hypothesis, we obtain w. p. 1

$$\sum_{(j'_1,\ldots,j'_k)} \int\limits_t^T \phi_{j'_k}(t_k)\ldots \int\limits_t^{t_2} \phi_{j'_1}(t_1)d\mathbf{w}^{(0)}_{t_1}\ldots d\mathbf{w}^{(0)}_{t_k} \times$$

$$\times \sum_{(j_1,\ldots,j_q)} \int\limits_t^T \phi_{j_q}(t_q)\ldots \int\limits_t^{t_2} \phi_{j_1}(t_1)d\mathbf{w}^{(i_1)}_{t_1}\ldots d\mathbf{w}^{(i_q)}_{t_q} =$$

$$= \int\limits_t^T \phi_{j'_k}(\theta)d\theta \sum_{(j'_1,\ldots,j'_{k-1})} \int\limits_t^T \phi_{j'_{k-1}}(t'_{k-1})\ldots \int\limits_t^{t'_2} \phi_{j'_1}(t'_1)d\mathbf{w}^{(0)}_{t'_1}\ldots d\mathbf{w}^{(0)}_{t'_{k-1}} \times$$

$$\times \sum_{(j_1,\ldots,j_q)} \int\limits_t^T \phi_{j_q}(t_q)\ldots \int\limits_t^{t_2} \phi_{j_1}(t_1)d\mathbf{w}^{(i_1)}_{t_1}\ldots d\mathbf{w}^{(i_q)}_{t_q} =$$

$$= \int\limits_t^T \phi_{j'_k}(\theta)d\theta \sum_{(j_1,\ldots,j_q,j'_1,\ldots,j'_{k-1})} \int\limits_t^T \phi_{j_q}(t_q)\ldots \int\limits_t^{t_2} \phi_{j_1}(t_1)\times$$

$$\times \int\limits_t^{t_1} \phi_{j'_{k-1}}(t'_{k-1})\ldots \int\limits_t^{t'_2} \phi_{j'_1}(t'_1)d\mathbf{w}^{(0)}_{t'_1}\ldots d\mathbf{w}^{(0)}_{t'_{k-1}} d\mathbf{w}^{(i_1)}_{t_1}\ldots d\mathbf{w}^{(i_q)}_{t_q} =$$

$$
=\sum_{(j_1,\ldots,j_q,j_1',\ldots,j_{k-1}')}\int\limits_t^T\phi_{j_k'}(\theta)d\theta\int\limits_t^T\phi_{j_q}(t_q)\ldots\int\limits_t^{t_2}\phi_{j_1}(t_1)\times
$$

$$
\times\int\limits_t^{t_1}\phi_{j_{k-1}'}(t_{k-1}')\ldots\int\limits_t^{t_2'}\phi_{j_1'}(t_1')d\mathbf{w}_{t_1'}^{(0)}\ldots d\mathbf{w}_{t_{k-1}'}^{(0)}d\mathbf{w}_{t_1}^{(i_1)}\ldots d\mathbf{w}_{t_q}^{(i_q)}. \tag{286}
$$

An iterative application of the Ito formula leads to the following equality

$$
\int\limits_t^T\phi_{j_k'}(\theta)d\theta\int\limits_t^T\phi_{j_q}(t_q)\ldots\int\limits_t^{t_2}\phi_{j_1}(t_1)\times
$$

$$
\times\int\limits_t^{t_1}\phi_{j_{k-1}'}(t_{k-1}')\ldots\int\limits_t^{t_2'}\phi_{j_1'}(t_1')d\mathbf{w}_{t_1'}^{(0)}\ldots d\mathbf{w}_{t_{k-1}'}^{(0)}d\mathbf{w}_{t_1}^{(i_1)}\ldots d\mathbf{w}_{t_q}^{(i_q)}=
$$

$$
=J_{(j_k'j_q\ldots j_1j_{k-1}'\ldots j_1')T,t}^{(0i_q\ldots i_10\ldots 0)}+J_{(j_qj_k'j_{q-1}\ldots j_1j_{k-1}'\ldots j_1')T,t}^{(i_q0i_{q-1}\ldots i_10\ldots 0)}+\ldots J_{(j_q\ldots j_1j_k'j_{k-1}'\ldots j_1')T,t}^{(i_q\ldots i_10\ldots 0)}+
$$

$$
+J_{(j_q\ldots j_1j_{k-1}'j_k'j_{k-2}'\ldots j_1')T,t}^{(i_q\ldots i_10\ldots 0)}+\ldots+J_{(j_q\ldots j_1j_{k-1}'\ldots j_1'j_k')T,t}^{(i_q\ldots i_10\ldots 0)} \tag{287}
$$

w. p. 1.

Combining (286) and (287) we finally obtain w. p. 1

$$
\sum_{(j_1,\ldots,j_q)}\int\limits_t^T\phi_{j_q}(t_q)\ldots\int\limits_t^{t_2}\phi_{j_1}(t_1)d\mathbf{w}_{t_1}^{(i_1)}\ldots d\mathbf{w}_{t_q}^{(i_q)}\times
$$

$$
\times\sum_{(j_1',\ldots,j_k')}\int\limits_t^T\phi_{j_k'}(t_k')\ldots\int\limits_t^{t_2'}\phi_{j_1'}(t_1')d\mathbf{w}_{t_1'}^{(0)}\ldots d\mathbf{w}_{t_k'}^{(0)}=
$$

$$
=\sum_{(j_1,\ldots,j_q,j_1',\ldots,j_k')}\int\limits_t^T\phi_{j_q}(t_q)\ldots\int\limits_t^{t_2}\phi_{j_1}(t_1)\int\limits_t^{t_1}\phi_{j_k'}(t_k')\ldots\int\limits_t^{t_2'}\phi_{j_1'}(t_1')\times
$$

$$
\times d\mathbf{w}_{t_1'}^{(0)}\ldots d\mathbf{w}_{t_k'}^{(0)}d\mathbf{w}_{t_1}^{(i_1)}\ldots d\mathbf{w}_{t_q}^{(i_q)}.
$$

The equality (271) is proved for $n=k$. The equality (271) is proved. Theorem 20 is proved.

To complete the proof of Theorems 12 and 13, we prove the following theorem.

Theorem 21 [22]. *Suppose that $\{\phi_j(x)\}_{j=0}^{\infty}$ is an arbitrary complete orthonormal system of functions in the space $L_2([t,T])$. Then the following representation*

$$J''[\phi_{j_1}\ldots\phi_{j_k}]^{(i_1\ldots i_k)}=\prod_{l=1}^{k}\zeta_{j_l}^{(i_l)}+\sum_{r=1}^{[k/2]}(-1)^r\times$$

$$\times\sum_{\substack{(\{\{g_1,g_2\},\ldots,\{g_{2r-1},g_{2r}\}\},\{q_1,\ldots,q_{k-2r}\})\\ \{g_1,g_2,\ldots,g_{2r-1},g_{2r},q_1,\ldots,q_{k-2r}\}=\{1,2,\ldots,k\}}}\prod_{s=1}^{r}\mathbf{1}_{\{i_{g_{2s-1}}=\ i_{g_{2s}}\ne 0\}}\mathbf{1}_{\{j_{g_{2s-1}}=\ j_{g_{2s}}\}}\prod_{l=1}^{k-2r}\zeta_{j_{q_l}}^{(i_{q_l})} \tag{288}$$

is valid w. p. 1*, where* $i_1,\ldots,i_k=0,1,\ldots,m$*,* $[x]$ *is an integer part of a real number* x*, the sum in the second line of the formula* (288) *is the sum with respect to all possible partitions* (44)*,* $\prod_{\emptyset}\stackrel{\sf def}{=}1$*,* $\sum_{\emptyset}\stackrel{\sf def}{=}0$*; another notations are the same as in Theorems* 1, 2.

Remark 14. *It should be noted that the formulas* (236)*,* (269)*,* (272)*,* (273) *follow from* (288)*. It is only necessary to set the values of the corresponding indicators of the form* $\mathbf{1}_A$ *from the formula* (288) *equal to* 0 *or* 1.

Proof. The proof of Theorem 21 is carried out by induction using the following recurrence relation

$$J''[\phi_{j_1}\ldots\phi_{j_k}]_{T,t}^{(i_1\ldots i_k)}=J''[\phi_{j_k}]_{T,t}^{(i_k)}\cdot J''[\phi_{j_1}\ldots\phi_{j_{k-1}}]_{T,t}^{(i_1\ldots i_{k-1})}-$$

$$-\sum_{l=1}^{k-1}\mathbf{1}_{\{i_l=i_k\ne 0\}}\mathbf{1}_{\{j_l=j_k\}}\cdot J''[\phi_{j_1}\ldots\phi_{j_{l-1}}\phi_{j_{l+1}}\ldots\phi_{j_{k-1}}]_{T,t}^{(i_1\ldots i_{l-1}i_{l+1}\ldots i_{k-1})} \tag{289}$$

w. p. 1.

Let us prove the recurrence relation (289). Using iteratively the Ito formula, the orthonormality of $\{\phi_j(x)\}_{j=0}^{\infty}$, as well as (281) and combinatorial reasoning, we obtain w. p. 1 (see Remark 15 below for details)

$$J''[\phi_{j_k}]_{T,t}^{(i_k)}\cdot J''[\phi_{j_1}\ldots\phi_{j_{k-1}}]_{T,t}^{(i_1\ldots i_{k-1})}=$$

$$=\int\limits_t^T\phi_{j_k}(\theta)d\mathbf{w}_{\theta}^{(i_k)}\sum_{(j_1,\ldots,j_{k-1})}\int\limits_t^T\phi_{j_{k-1}}(t_{k-1})\ldots\int\limits_t^{t_2}\phi_{j_1}(t_1)d\mathbf{w}_{t_1}^{(i_1)}\ldots d\mathbf{w}_{t_{k-1}}^{(i_{k-1})}=$$

$$=\sum_{(j_1,\ldots,j_{k-1})}\int\limits_t^T\phi_{j_k}(\theta)d\mathbf{w}_{\theta}^{(i_k)}\int\limits_t^T\phi_{j_{k-1}}(t_{k-1})\ldots\int\limits_t^{t_2}\phi_{j_1}(t_1)d\mathbf{w}_{t_1}^{(i_1)}\ldots d\mathbf{w}_{t_{k-1}}^{(i_{k-1})}=$$

$$=\sum_{(j_1,\ldots,j_k)}\int\limits_t^T\phi_{j_k}(t_k)\ldots\int\limits_t^{t_2}\phi_{j_1}(t_1)d\mathbf{w}_{t_1}^{(i_1)}\ldots d\mathbf{w}_{t_k}^{(i_k)}+$$

$$+\sum_{(j_1,\ldots,j_{k-1})}\Biggl(\mathbf{1}_{\{i_k=i_{k-1}\ne 0\}}\int\limits_t^T\phi_{j_k}(\theta)\phi_{j_{k-1}}(\theta)\int\limits_t^{\theta}\phi_{j_{k-2}}(t_{k-2})\ldots\int\limits_t^{t_2}\phi_{j_1}(t_1)\times$$

$$\times d\mathbf{w}_{t_1}^{(i_1)}\ldots d\mathbf{w}_{t_{k-2}}^{(i_{k-2})}d\mathbf{w}_{\theta}^{(0)}+$$

$$+\mathbf{1}_{\{i_k=i_{k-2}\ne 0\}}\int\limits_t^T\phi_{j_{k-1}}(t_{k-1})\int\limits_t^{t_{k-1}}\phi_{j_k}(\theta)\phi_{j_{k-2}}(\theta)\int\limits_t^{\theta}\phi_{j_{k-3}}(t_{k-3})\ldots\int\limits_t^{t_2}\phi_{j_1}(t_1)\times$$

$$\times d\mathbf{w}_{t_1}^{(i_1)}\ldots d\mathbf{w}_{t_{k-3}}^{(i_{k-3})}d\mathbf{w}_{\theta}^{(0)}d\mathbf{w}_{t_{k-1}}^{(i_{k-1})}+\ldots$$

$$

$$
\ldots + \int\limits_t^T \phi_{j_{k-1}}(t_{k-1}) \ldots \int\limits_t^{t_3} \phi_{j_2}(t_2) \int\limits_t^{t_2} \phi_{j_k}(\theta)\phi_{j_1}(\theta) d\mathbf{w}_{\theta}^{(0)} d\mathbf{w}_{t_2}^{(i_2)} \ldots d\mathbf{w}_{t_{k-1}}^{(i_{k-1})} \Biggr\} =
$$

$$
= \sum_{(j_1,\ldots,j_k)} \int\limits_t^T \phi_{j_k}(t_k) \ldots \int\limits_t^{t_2} \phi_{j_1}(t_1) d\mathbf{w}_{t_1}^{(i_1)} \ldots d\mathbf{w}_{t_k}^{(i_k)} +
$$

$$
+ \int\limits_t^T \phi_{j_k}(\theta)\phi_{j_{k-1}}(\theta) d\theta \sum_{(j_1,\ldots,j_{k-2})} \mathbf{1}_{\{i_k=i_{k-1}\ne 0\}} \int\limits_t^T \phi_{j_{k-2}}(t_{k-2}) \ldots \int\limits_t^{t_2} \phi_{j_1}(t_1) \times
$$

$$
\times d\mathbf{w}_{t_1}^{(i_1)} \ldots d\mathbf{w}_{t_{k-2}}^{(i_{k-2})} +
$$

$$
+ \int\limits_t^T \phi_{j_k}(\theta)\phi_{j_{k-2}}(\theta) d\theta \sum_{(j_1,\ldots,j_{k-3},j_{k-1})} \mathbf{1}_{\{i_k=i_{k-2}\ne 0\}} \int\limits_t^T \phi_{j_{k-1}}(t_{k-1}) \int\limits_t^{t_{k-1}} \phi_{j_{k-3}}(t_{k-3}) \ldots
$$

$$
\ldots \int\limits_t^{t_2} \phi_{j_1}(t_1) d\mathbf{w}_{t_1}^{(i_1)} \ldots d\mathbf{w}_{t_{k-3}}^{(i_{k-3})} d\mathbf{w}_{t_{k-1}}^{(i_{k-1})} + \ldots
$$

$$
\ldots + \int\limits_t^T \phi_{j_k}(\theta)\phi_{j_1}(\theta) d\theta \sum_{(j_2,\ldots,j_{k-1})} \mathbf{1}_{\{i_k=i_1\ne 0\}} \int\limits_t^T \phi_{j_{k-1}}(t_{k-1}) \ldots \int\limits_t^{t_3} \phi_{j_2}(t_2) \times
$$

$$
\times d\mathbf{w}_{t_2}^{(i_2)} \ldots d\mathbf{w}_{t_{k-1}}^{(i_{k-1})} =
$$

$$
= J''[\phi_{j_1} \ldots \phi_{j_k}]_{T,t}^{(i_1\ldots i_k)} + \mathbf{1}_{\{i_k=i_{k-1}\ne 0\}} \mathbf{1}_{\{j_k=j_{k-1}\}} \cdot J''[\phi_{j_1} \ldots \phi_{j_{k-2}}]_{T,t}^{(i_1\ldots i_{k-2})} +
$$

$$
+ \mathbf{1}_{\{i_k=i_{k-2}\ne 0\}} \mathbf{1}_{\{j_k=j_{k-2}\}} \cdot J''[\phi_{j_1} \ldots \phi_{j_{k-3}} \phi_{j_{k-1}}]_{T,t}^{(i_1\ldots i_{k-3} i_{k-1})} + \ldots
$$

$$
\ldots + \mathbf{1}_{\{i_k=i_1\ne 0\}} \mathbf{1}_{\{j_k=j_1\}} \cdot J''[\phi_{j_2} \ldots \phi_{j_{k-1}}]_{T,t}^{(i_2\ldots i_{k-1})} =
$$

$$
= J''[\phi_{j_1} \ldots \phi_{j_k}]_{T,t}^{(i_1\ldots i_k)} +
$$

$$+\sum_{l=1}^{k-1}\mathbf{1}_{\{i_l=i_k\ne 0\}}\mathbf{1}_{\{j_l=j_k\}}\cdot J''[\phi_{j_1}\ldots\phi_{j_{l-1}}\phi_{j_{l+1}}\ldots\phi_{j_{k-1}}]_{T,t}^{(i_1\ldots i_{l-1}i_{l+1}\ldots i_{k-1})}. \qquad (290)$$

The equality (289) is proved. Theorem 21 is proved.

Remark 15. *It should be noted that the sums with respect to permutations*

$$\sum_{(j_1,\ldots,j_{k-1})}$$

in (290), *containing the expressions*

$$\mathbf{1}_{\{i_k=i_{k-1}\ne 0\}}\phi_{j_k}(\theta)\phi_{j_{k-1}}(\theta),\ldots,\mathbf{1}_{\{i_k=i_1\ne 0\}}\phi_{j_k}(\theta)\phi_{j_1}(\theta),$$

should be understood in a special way. Let us explain this rule on the basis of the sum

$$\sum_{(j_1,\ldots,j_{k-1})}\mathbf{1}_{\{i_k=i_{k-1}\ne 0\}}\int\limits_t^T\phi_{j_k}(\theta)\phi_{j_{k-1}}(\theta)\int\limits_t^{\theta}\phi_{j_{k-2}}(t_{k-2})\ldots\int\limits_t^{t_2}\phi_{j_1}(t_1)\times$$

$$\times d\mathbf{w}_{t_1}^{(i_1)}\ldots d\mathbf{w}_{t_{k-2}}^{(i_{k-2})}d\mathbf{w}_{\theta}^{(0)}. \qquad (291)$$

More precisely, permutations $(j_1,\ldots,j_{k-1})$ *when summing in* (291) *are performed in such a way that if* j_r *swapped with* j_d *in the permutation* $(j_1,\ldots,j_{k-1})$, *then* i_r *swapped with* i_d *in the permutation* $(i_1,\ldots,i_{k-2}i_{k-1})$ (*note that* $i_{k-1}=0$). *Moreover,* $\bar{\phi}_{j_r}$ *swapped with* $\bar{\phi}_{j_d}$ *in the permutation*

$$\left(\bar{\phi}_{j_1},\ldots,\bar{\phi}_{j_{k-1}}\right)=\left(\phi_{j_1},\ldots,\phi_{j_{k-2}},\ \mathbf{1}_{\{i_k=i_{k-1}\ne 0\}}\cdot\phi_{j_k}\cdot\phi_{j_{k-1}}\right),$$

where $\bar{\phi}_{j_{k-1}}(\tau)=\mathbf{1}_{\{i_k=i_{k-1}\ne 0\}}\phi_{j_k}(\tau)\phi_{j_{k-1}}(\tau)$.

A similar rule should be applied to all other sums with respect to permutations

$$\sum_{(j_1,\ldots,j_{k-1})}$$

in (290) *that contain the expressions*

$$\mathbf{1}_{\{i_k=i_{k-2}\ne 0\}}\phi_{j_k}(\theta)\phi_{j_{k-2}}(\theta),\ldots,\mathbf{1}_{\{i_k=i_1\ne 0\}}\phi_{j_k}(\theta)\phi_{j_1}(\theta).$$

The relations (232), (235), (288) prove Theorem 12. An analogue of the formula (232) for the function $\Phi(t_1,\ldots,t_k)$ instead of $K(t_1,\ldots,t_k)$ and (235), (288) prove Theorem 13.

We also note a number of works [85], [87]-[91] in which the properties of multiple Wiener stochastic integrals were studied using measure theory, in particular, the formulas for the product of such integrals were obtained.

First of all, let us compare Theorem 21 with Proposition 5.1 from [89]. An analogue of the right-hand side of (288) for nonrandom $x_1,\ldots,x_k$ is constructed in [89] using diagrams (see the formula (5.1) in [89]). This means that the application of the formula (5.1) from [89], unlike the formula (288), is difficult when performing algebraic transformations.

Further, we note that the formula (5.1) from [89] was applied to the representation of the multiple Wiener stochastic integral somewhat differently than the formula (288). Namely, using Proposition 5.1 [89]. Let us expain this difference in more detail.

Proposition 5.1 from [89] in our degree of generality and in our notations can be written as

$$J''[\phi_{j_1}\ldots\phi_{j_k}]_{T,t}^{(i_1\ldots i_k)}=$$

$$=J''\Biggl[\underbrace{\phi_{j_1}\ldots\phi_{j_1}}_{m_1}\underbrace{\phi_{j_2}\ldots\phi_{j_2}}_{m_2}\ldots\underbrace{\phi_{j_p}\ldots\phi_{j_p}}_{m_p}\Biggr]_{T,t}^{(\overbrace{i_1\ldots i_{m_1}}^{m_1}\overbrace{i_{m_1+1}\ldots i_{m_2}}^{m_2}\ldots\overbrace{i_{m_1+\ldots+m_{p-1}+1}\ldots i_k}^{m_p})}=$$

$$=J''[\phi_{j_1}\ldots\phi_{j_1}]_{T,t}^{(\overbrace{i_1\ldots i_{m_1}}^{m_1})}\cdot J''[\phi_{j_2}\ldots\phi_{j_2}]_{T,t}^{(\overbrace{i_{m_1+1}\ldots i_{m_2}}^{m_2})}\cdot\ldots\cdot J''\left[\phi_{j_p}\ldots\phi_{j_p}\right]_{T,t}^{(\overbrace{i_{m_1+\ldots+m_{p-1}+1}\ldots i_k}^{m_p})}\tag{292}$$

w. p. 1, where

$$J''[\phi_{j_1}\ldots\phi_{j_1}]_{T,t}^{(\overbrace{i_1\ldots i_{m_1}}^{m_1})},\ J''[\phi_{j_2}\ldots\phi_{j_2}]_{T,t}^{(\overbrace{i_{m_1+1}\ldots i_{m_2}}^{m_2})},\ldots,\ J''\left[\phi_{j_p}\ldots\phi_{j_p}\right]_{T,t}^{(\overbrace{i_{m_1+\ldots+m_{p-1}+1}\ldots i_k}^{m_p})}$$

are defined by the right-hand side of the formula (5.1) from [89], $m_1+\ldots+m_p=k,\ m_1,\ldots,m_p>0$, $j_q\ne j_d\ (q\ne d,\ q,d=1,\ldots,p),\ i_1,\ldots,i_k=1,\ldots,m.$

This actually means that in [89] an analogue of the formula (288) is constructed for the special case $j_1=\ldots=j_k$. Moreover, the specified analogue is based on the formula (5.1) [89] obtained using diagrams.

Comparing the formulas (288) and (292) (or (5.1) from [89]), it is easy to understand that the transition from (288) and (292) is obvious. It is only necessary to set the values of the corresponding indicators of the form $\mathbf{1}_A$ from the formula (288) equal to 0 or 1. The reverse transition from the formula (292) to the formula (288) is not obvious. Note that the formula (288) (not the formula (292)) is convenient for the numerical integration of Ito stochastic differential equations (see [22], Chapter 5 and [56], [57] for details).

Let us turn to the comparison of Theorem 21 with another interesting work [92] (2019). As it turned out, a version of Theorem 21 was obtained in terms of Wick polynomials and for the case of vector valued random measures in [92] (see Theorem 7.2, p. 69). However, much earlier the formula (288) (Theorem 21) is obtained in our monograph [10] (2009) as part of the formula (5.30) (see [10], p. 220). Moreover, particular cases of the formula (288) were obtained even earlier in our works [7] (2006) and [9] (2007). More precisely, partiular cases $k=1,\ldots,5$ of the formula (288) were obtained in [7] (2006) as parts of the formulas on the pages 243-244 and partiular cases $k=1,\ldots,7$ of the formula (288) were obtained in [9] (2007) as parts of the formulas on the pages 208-218.

We also note that we have found an explicit expression for the Wick polynomial of degree k of the arguments $\zeta_{j_1}^{(i_1)},\ldots,\zeta_{j_k}^{(i_k)}$ (see the formula (288)), which is very convenient for the numerical simulation of iterated Ito stochastic integrals (1) [56], [57]. Note that the representation of the Wick polynomial of the arguments $\zeta_{j_1}^{(i_1)},\ldots,\zeta_{j_k}^{(i_k)}$ in terms of the product of Hermite polynomials is less convenient for the numerical simulation of iterated Ito stochastic integrals (1). For example, the expression for $J''[\phi_{j_1}\phi_{j_2}\phi_{j_3}\phi_{j_4}]_{T,t}^{(i_1 i_2 i_3 i_4)}$ in terms of the product of Hermite polynomials, even under the condition $i_1 = i_2 = i_3 = i_4$, already contains 15 different expressions (see Sect. 14). At the same time, all these 15 expressions are contained in one formula (288) provided that $k = 4$ and $i_1 = i_2 = i_3 = i_4$. It is very convenient, since in computer simulation using the formula (288), in addition to modeling of random variables $\zeta_{j_1}^{(i_1)}, \ldots, \zeta_{j_k}^{(i_k)}$, it remains only to set the values of the corresponding indicators of the form $\mathbf{1}_A$ from the formula (288) equal to 0 or 1.

It should be noted that in [90] (Theorem 6.1) a diagram formula was obtained for the product of two multiple Wiener stochastic integrals with respect to vector valued random measures. The formula (270) can be derived from the diagram formula [90]. Although the proof of the diagram formula [90] is much more complicated than our proof of the formula (270).

To conclude this section, we say a few words about expansions (15) and (217). The transition from the expansion (217) to the expansion (15) is obvious. It is only necessary to set the values of the corresponding indicators of the form $\mathbf{1}_A$ from the formula (217) equal to 0 or 1. The reverse transition from the formula (15) to the formula (217) is also possible but not obvious. However, Theorems 20 and 21 provide a transition from (15) to (217) and vice versa. Note that the expansion (15) is interesting from the point of view of studying the structure of the expansion of iterated Ito stochastic integrals. On the orther hand, the expansion (217) is exceptionally convenient for applications (see [56], [57]).

19. Generalization of Theorem 7 to the Case of an Arbitrary Complete Orthonormal System of Functions in the Space $L_2([t,T])$ and $\psi_1(\tau), \ldots, \psi_k(\tau) \in L_2([t,T])$

Suppose that $\psi_1(\tau), \ldots, \psi_k(\tau) \in L_2([t,T])$. Define the following function on the hypercube $[t,T]^k$

$$\bar{K}(t_1,\ldots,t_k,s) = \mathbf{1}_{\{t_k<s\}} K(t_1,\ldots,t_k),$$

where the function $K(t_1,\ldots,t_k)$ has the form (2), $s \in (t,T]$ (s is fixed), and $\mathbf{1}_A$ is the indicator of the set A.

Further, we have (see (2))

$$\bar{K}(t_1,\ldots,t_k,s) = \mathbf{1}_{\{t_1<\ldots<t_k<s\}} \psi_1(t_1)\ldots\psi_k(t_k) =$$

$$= \begin{cases} \psi_1(t_1)\ldots\psi_k(t_k), & t_1<\ldots<t_k<s \\ \\ 0, & \text{otherwise} \end{cases},$$

where $\bar{K}(t_1,\ldots,t_k,s) \in L_2([t,T]^k)$, $k \ge 1$, $t_1,\ldots,t_k \in [t,T]$, and $s \in (t,T]$.

Note that

$$J[\psi^{(k)}]_{s,t} = \int\limits_t^s \psi_k(t_k)\ldots\int\limits_t^{t_2} \psi_1(t_1) d\mathbf{w}_{t_1}^{(i_1)} \ldots d\mathbf{w}_{t_k}^{(i_k)} =$$

$$= \int\limits_t^T \mathbf{1}_{\{t_k<s\}} \psi_k(t_k)\ldots\int\limits_t^{t_2} \psi_1(t_1) d\mathbf{w}_{t_1}^{(i_1)} \ldots d\mathbf{w}_{t_k}^{(i_k)} \quad \text{w. p. 1}, \tag{293}$$

where $s \in (t, T]$ (s is fixed), $i_1, \ldots, i_k = 0, 1, \ldots, m$.

Applying Theorem 12 to the iterated Ito stochastic integral (293), we obtain the following generalization of Theorem 7 to the case of an arbitrary complete orthonormal system of functions in the space $L_2([t, T])$ and $\psi_1(\tau), \ldots, \psi_k(\tau) \in L_2([t, T])$.

Theorem 22. *Suppose that $\psi_1(\tau), \ldots, \psi_k(\tau) \in L_2([t, T])$ and $\{\phi_j(x)\}_{j=0}^{\infty}$ is an arbitrary complete orthonormal system of functions in the space $L_2([t, T])$. Then, the following expansion*

$$J[\psi^{(k)}]_{s,t}^{(i_1\ldots i_k)} = \underset{p_1,\ldots,p_k\to\infty}{\text{l.i.m.}} \sum_{j_1=0}^{p_1} \ldots \sum_{j_k=0}^{p_k} C_{j_k\ldots j_1}(s) \Biggl(\prod_{l=1}^{k} \zeta_{j_l}^{(i_l)} + \sum_{r=1}^{[k/2]} (-1)^r \times$$

$$\times \sum_{\substack{(\{\{g_1,g_2\},\ldots,\{g_{2r-1},g_{2r}\}\},\{q_1,\ldots,q_{k-2r}\})\\ \{g_1,g_2,\ldots,g_{2r-1},g_{2r},q_1,\ldots,q_{k-2r}\}=\{1,2,\ldots,k\}}} \prod_{s=1}^{r} \mathbf{1}_{\{i_{g_{2s-1}} = i_{g_{2s}} \ne 0\}} \mathbf{1}_{\{j_{g_{2s-1}} = j_{g_{2s}}\}} \prod_{l=1}^{k-2r} \zeta_{j_{q_l}}^{(i_{q_l})} \Biggr)$$

converging in the mean-square sense is valid, where $[x]$ is an integer part of a real number x,

$$C_{j_k\ldots j_1}(s) = \int\limits_{[t,T]^k} \bar{K}(t_1, \ldots, t_k, s) \prod_{l=1}^{k} \phi_{j_l}(t_l) dt_1 \ldots dt_k =$$

$$= \int\limits_t^s \psi_k(t_k)\phi_{j_k}(t_k) \ldots \int\limits_t^{t_2} \psi_1(t_1)\phi_{j_1}(t_1) dt_1 \ldots dt_k$$

is the Fourier coefficient, $\prod\limits_{\emptyset} \stackrel{\text{def}}{=} 1$, $\sum\limits_{\emptyset} \stackrel{\text{def}}{=} 0$; *another notations are the same as in Theorem* 2.

Note that the estimates (152) and (154) will also be valid under the conditions of Theorem 22.

EXACT CALCULATION OF THE MEAN-SQUARE ERROR IN THE METHOD OF EXPANSION OF ITERATED ITO STOCHASTIC INTEGRALS BASED ON GENERALIZED MULTIPLE FOURIER SERIES

DMITRIY F. KUZNETSOV

Abstract. The article is devoted to the developement of the method of expansion and mean-square approximation of iterated Ito stochastic integrals based on generalized multiple Fourier series converging in the sense of norm in the space $L_2([t,T]^k)$ (k is the multiplicity of the iterated Ito stochastic integral). We obtain the exact and approximate expressions for the mean-square approximation error of iterated Ito stochastic integrals of multiplicity k ($k \in \mathbb{N}$) from the stochastic Taylor–Ito expansion. As a result, we do not need to use redundant terms of expansions of iterated Ito stochastic integrals that complicate the numerical methods for Ito stochastic differential equations. Moreover, we proved the convergence with propability 1 for the method of expansion of iterated Ito stochastic integrals based on generalized multiple Fourier series for the cases of multiple Fourier–Legendre series and multiple trigonometric Fourier series. Mean-square approximation of iterated Stratonovich stochastic integrals is also considered in the article. The results of the article can be applied to the high-order strong numerical methods for Ito stochastic differential equations as well as for non-commutative semilinear stochastic partial differential equations with multiplicative trace class noise.

Keywords: Iterated Ito stochastic integral, Iterated Stratonovich stochastic integral, Generalized multiple Fourier series, Multiple Fourier–Legendre series, Multiple trigonometric Fourier series, Parseval equality, Ito stochastic differential equation, Taylor–Ito expansion, Mean-square convergence, Convergence in the mean of degree $2n$, ($n \in \mathbb{N}$), Convergence with probability 1, Expansion.

1. Introduction

In this article we develop the method of expansion and mean-square approximation of iterated Ito stochastic integrals based on generalized multiple Fourier series converging in the sense of norm in the space $L_2([t,T]^k)$ (k is the multiplicity of the iterated Ito stochastic integral), which was proposed and developed by the author of this work [1]-[51] (also see related publications [52]-[61]). Further, this method is referred to as the method of generalized multiple Fourier series.

The question of how to estimate or calculate exactly the mean-square approximation error of iterated Ito stochastic integrals for the method of generalized multiple Fourier series composes the subject of the article. From the one side the mentioned question is essentially difficult for the case of a multidimensional Wiener process, because of we need to take into account all possible combinations of components of the multidimensional Wiener process. From the other side an effective solution of the mentioned problem allows us to construct more economical numerical methods for Ito stochastic differential equations than in [62]-[64].

The results of the article (also see [1]-[51] and related publications [52]-[61]) will be useful for the implementation of high-order strong numerical methods for Ito stochastic differential equations as well as for non-commutative semilinear stochastic partial differential equations with multiplicative trace class noise. The latter methods are constucted, for example, in [65], [66].

2. Method of Generalized Multiple Fourier Series. The Case of Complete Orthonormal Systems of Continuous Functions in the Space $L_2([t,T])$ and Continuous Weight Functions $\psi_1(\tau),\ldots,\psi_k(\tau)$

Let $(\Omega, \mathrm{F}, \mathsf{P})$ be a complete probability space, let $\{\mathrm{F}_t, t\in[0,T]\}$ be a nondecreasing right-continous family of σ-subfields of F, and let $\mathbf{f}_t$ be a standard m-dimensional Wiener stochastic process, which is F_t-measurable for any $t\in[0,T]$. We assume that the components $\mathbf{f}_t^{(i)}$ $(i=1,\ldots,m)$ of this process are independent.

Let us consider the following iterated Ito stochastic integrals

$$J[\psi^{(k)}]_{T,t}=\int\limits_t^T\psi_k(t_k)\ldots\int\limits_t^{t_2}\psi_1(t_1)d\mathbf{w}_{t_1}^{(i_1)}\ldots d\mathbf{w}_{t_k}^{(i_k)}, \tag{1}$$

where $\psi_l(\tau)$ $(l=1,\ldots,k)$ are nonrandom functions at the interval $[t,T]$, $\mathbf{w}_\tau^{(i)}=\mathbf{f}_\tau^{(i)}$ for $i=1,\ldots,m$ and $\mathbf{w}_\tau^{(0)}=\tau$, $i_1,\ldots,i_k=0,1,\ldots,m$.

In addition, suppose that every $\psi_l(\tau)$ $(l=1,\ldots,k)$ is a continuous nonrandom function at the interval $[t,T]$ (the case $\psi_1(\tau),\ldots,\psi_k(\tau)\in L_2([t,T])$ will be considered in Sect. 5).

Let us define the following function on the hypercube $[t,T]^k$

$$K(t_1,\ldots,t_k)=\begin{cases}\psi_1(t_1)\ldots\psi_k(t_k), & t_1<\ldots<t_k\\ & \\ 0, & \text{otherwise}\end{cases}\quad=\quad\prod_{l=1}^k\psi_l(t_l)\prod_{l=1}^{k-1}\mathbf{1}_{\{t_l<t_{l+1}\}}, \tag{2}$$

where $t_1,\ldots,t_k\in[t,T]$ for $k\ge 2$ and $K(t_1)\equiv\psi_1(t_1)$ for $t_1\in[t,T]$. Here $\mathbf{1}_A$ denotes the indicator of the set A.

Suppose that $\{\phi_j(x)\}_{j=0}^{\infty}$ is a complete orthonormal system of functions in the space $L_2([t,T])$. The function $K(t_1,\ldots,t_k)$ is piecewise continuous in the hypercube $[t,T]^k$. At this situation it is well known that the generalized multiple Fourier series of $K(t_1,\ldots,t_k)\in L_2([t,T]^k)$ is converging to $K(t_1,\ldots,t_k)$ in the hypercube $[t,T]^k$ in the mean-square sense, i.e.

$$\lim_{p_1,\ldots,p_k\to\infty}\left\|K(t_1,\ldots,t_k)-\sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k}C_{j_k\ldots j_1}\prod_{l=1}^k\phi_{j_l}(t_l)\right\|_{L_2([t,T]^k)}=0, \tag{3}$$

where

$$C_{j_k\ldots j_1}=\int\limits_{[t,T]^k}K(t_1,\ldots,t_k)\prod_{l=1}^k\phi_{j_l}(t_l)dt_1\ldots dt_k \tag{4}$$

is the Fourier coefficient and

$$\|f\|_{L_2([t,T]^k)}=\left(\int\limits_{[t,T]^k}f^2(t_1,\ldots,t_k)dt_1\ldots dt_k\right)^{1/2}$$

is a norm in the space $L_2([t,T]^k)$.

Consider the partition $\{\tau_j\}_{j=0}^{N}$ of the interval $[t,T]$ such that

$$t=\tau_0<\ldots<\tau_N=T,\quad \Delta_N=\max_{0\le j\le N-1}\Delta\tau_j\to 0\ \text{ if }\ N\to\infty,\quad \Delta\tau_j=\tau_{j+1}-\tau_j. \tag{5}$$

Theorem 1 [1] (2006) (also see [2]-[51]). *Suppose that every $\psi_l(\tau)$ $(l=1,\ldots,k)$ is a continuous nonrandom function on $[t,T]$ and $\{\phi_j(x)\}_{j=0}^{\infty}$ is a complete orthonormal system of continuous functions in the space $L_2([t,T])$. Then*

$$J[\psi^{(k)}]_{T,t}\ =\ \underset{p_1,\ldots,p_k\to\infty}{\text{l.i.m.}}\sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k}C_{j_k\ldots j_1}\Biggl(\prod_{l=1}^{k}\zeta_{j_l}^{(i_l)}\ -$$

$$-\ \underset{N\to\infty}{\text{l.i.m.}}\sum_{(l_1,\ldots,l_k)\in\mathrm{G}_k}\phi_{j_1}(\tau_{l_1})\Delta\mathbf{w}_{\tau_{l_1}}^{(i_1)}\ldots\phi_{j_k}(\tau_{l_k})\Delta\mathbf{w}_{\tau_{l_k}}^{(i_k)}\Biggr), \tag{6}$$

where

$$\mathrm{G}_k=\mathrm{H}_k\backslash\mathrm{L}_k,\quad \mathrm{H}_k=\{(l_1,\ldots,l_k):\ l_1,\ldots,l_k=0,\ 1,\ldots,N-1\},$$

$$\mathrm{L}_k=\{(l_1,\ldots,l_k):\ l_1,\ldots,l_k=0,\ 1,\ldots,N-1;\ l_g\ne l_r\ (g\ne r);\ g,r=1,\ldots,k\},$$

l.i.m. *is a limit in the mean-square sense, $i_1,\ldots,i_k=0,1,\ldots,m,$*

$$\zeta_j^{(i)}=\int\limits_t^T\phi_j(s)d\mathbf{w}_s^{(i)} \tag{7}$$

are independent standard Gaussian random variables for various i or j (if $i\ne 0$), $C_{j_k\ldots j_1}$ is the Fourier coefficient (4), $\Delta\mathbf{w}_{\tau_j}^{(i)}=\mathbf{w}_{\tau_{j+1}}^{(i)}-\mathbf{w}_{\tau_j}^{(i)}$ $(i=0,1,\ldots,m)$, *$\{\tau_j\}_{j=0}^{N}$ is a partition of $[t,T]$, which satisfies the condition* (5).

Remark 1. *Further* (see Theorem 2) *we will use the following form of expansion* (6)

$$J[\psi^{(k)}]_{T,t}=\underset{p_1,\ldots,p_k\to\infty}{\text{l.i.m.}}\sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k}C_{j_k\ldots j_1}\left(\prod_{l=1}^{k}\zeta_{j_l}^{(i_l)}-S_{j_1,\ldots,j_k}^{(i_1\ldots i_k)}\right), \tag{8}$$

where

$$S_{j_1,\ldots,j_k}^{(i_1\ldots i_k)}\ =\ \underset{N\to\infty}{\text{l.i.m.}}\sum_{(l_1,\ldots,l_k)\in\mathrm{G}_k}\phi_{j_1}(\tau_{l_1})\Delta\mathbf{w}_{\tau_{l_1}}^{(i_1)}\ldots\phi_{j_k}(\tau_{l_k})\Delta\mathbf{w}_{\tau_{l_k}}^{(i_k)}, \tag{9}$$

where notations are the same as in Theorem 1.

Note that the version of Theorem 1 for the Haar and Rademacher–Walsh functions has been considered in [1]-[17], [27]. Some modifications of Theorem 1 for another types of iterated stochastic integrals (including iterated stochastic integrals with respect to the infinite-dimensional Q-Wiener process) as well as for complete orthonormal with weight $r(t_1)\ldots r(t_k)\ge 0$ systems of functions in the space $L_2([t,T]^k)$ can be found in [27], [39] [46], [47] (also see [1]-[26], [28]-[38], [40]-[45], [48]-[51]). Generalization of Theorem 1 for the case of an arbitrary complete orthonormal systems of functions in the space $L_2([t,T])$ and $\psi_1(\tau),\ldots,\psi_k(\tau)\in L_2([t,T])$ will be considered in Sect. 5.

In order to evaluate the significance of Theorem 1 for practice we will demonstrate its transformed particular cases for $k=1,\ldots,6$ [1]-[51]

$$J[\psi^{(1)}]_{T,t}=\underset{p_1\to\infty}{\text{l.i.m.}}\sum_{j_1=0}^{p_1}C_{j_1}\zeta_{j_1}^{(i_1)}, \tag{10}$$

where $\mathbf{1}_A$ is the indicator of the set A.

The cases $k=7$ and $k>7$ are considered in [1]-[51] (also see Sect. 5).

3. Exact Calculation of the Mean-Square Approximation Error in The Method of Generalized Multiple Fourier Series. The Case of Complete Orthonormal Systems of Continuous Functions in the Space $L_2([t,T])$ and Continuous Weight Functions $\psi_1(\tau),\ldots,\psi_k(\tau)$

Theorem 2 [29] (also see [12]-[17], [18]). *Suppose that every $\psi_l(\tau)$ $(l=1,\ldots,k)$ is a continuous nonrandom function on $[t,T]$ and $\{\phi_j(x)\}_{j=0}^{\infty}$ is a complete orthonormal system of continuous functions in the space $L_2([t,T])$. Then*

$$\mathsf{M}\left\{\left(J[\psi^{(k)}]_{T,t}-J[\psi^{(k)}]_{T,t}^{p}\right)^2\right\}=\int\limits_{[t,T]^k}K^2(t_1,\ldots,t_k)dt_1\ldots dt_k-$$

$$-\sum_{j_1=0}^{p}\ldots\sum_{j_k=0}^{p}C_{j_k\ldots j_1}\mathsf{M}\left\{J[\psi^{(k)}]_{T,t}\sum_{(j_1,\ldots,j_k)}\int\limits_t^T\phi_{j_k}(t_k)\ldots\int\limits_t^{t_2}\phi_{j_1}(t_1)d\mathbf{f}_{t_1}^{(i_1)}\ldots d\mathbf{f}_{t_k}^{(i_k)}\right\}, \tag{16}$$

where

$$J[\psi^{(k)}]_{T,t}=\int\limits_t^T\psi_k(t_k)\ldots\int\limits_t^{t_2}\psi_1(t_1)d\mathbf{f}_{t_1}^{(i_1)}\ldots d\mathbf{f}_{t_k}^{(i_k)},$$

(17)
$$J[\psi^{(k)}]_{T,t}^p=\sum_{j_1=0}^{p}\ldots\sum_{j_k=0}^{p}C_{j_k\ldots j_1}\left(\prod_{l=1}^{k}\zeta_{j_l}^{(i_l)}-S_{j_1,\ldots,j_k}^{(i_1\ldots i_k)}\right),$$

(18)
$$S_{j_1,\ldots,j_k}^{(i_1\ldots i_k)}=\underset{N\to\infty}{\text{l.i.m.}}\sum_{(l_1,\ldots,l_k)\in\mathrm{G}_k}\phi_{j_1}(\tau_{l_1})\Delta\mathbf{f}_{\tau_{l_1}}^{(i_1)}\ldots\phi_{j_k}(\tau_{l_k})\Delta\mathbf{f}_{\tau_{l_k}}^{(i_k)},$$

the Fourier coefficient $C_{j_k\ldots j_1}$ *has the form* (4),

(19)
$$\zeta_j^{(i)}=\int\limits_t^T\phi_j(s)d\mathbf{f}_s^{(i)}$$

are independent standard Gaussian random variables for various i *or* j $(i=1,\ldots,m)$,

$$\sum_{(j_1,\ldots,j_k)}$$

means the sum with respect to all possible permutations $(j_1,\ldots,j_k)$. *At the same time if* j_r *swapped with* j_q *in the permutation* $(j_1,\ldots,j_k)$, *then* i_r *swapped with* i_q *in the permutation* $(i_1,\ldots,i_k)$; *another notations are the same as in Theorem* 1.

Remark 2. *Note that*

$$\mathsf{M}\left\{J[\psi^{(k)}]_{T,t}\int\limits_t^T\phi_{j_k}(t_k)\ldots\int\limits_t^{t_2}\phi_{j_1}(t_1)d\mathbf{f}_{t_1}^{(i_1)}\ldots d\mathbf{f}_{t_k}^{(i_k)}\right\}=$$

$$=\mathsf{M}\left\{\int\limits_t^T\psi_k(t_k)\ldots\int\limits_t^{t_2}\psi_1(t_1)d\mathbf{f}_{t_1}^{(i_1)}\ldots d\mathbf{f}_{t_k}^{(i_k)}\int\limits_t^T\phi_{j_k}(t_k)\ldots\int\limits_t^{t_2}\phi_{j_1}(t_1)d\mathbf{f}_{t_1}^{(i_1)}\ldots d\mathbf{f}_{t_k}^{(i_k)}\right\}=$$

$$=\int\limits_t^T\psi_k(t_k)\phi_{j_k}(t_k)\ldots\int\limits_t^{t_2}\psi_1(t_1)\phi_{j_1}(t_1)dt_1\ldots dt_k=C_{j_k\ldots j_1}.$$

Therefore, from Theorem 2 *for the case of pairwise different numbers* $i_1,\ldots,i_k$ *we obtain*

$$\mathsf{M}\left\{\left(J[\psi^{(k)}]_{T,t}-J[\psi^{(k)}]_{T,t}^p\right)^2\right\}=$$

$$=\int\limits_{[t,T]^k}K^2(t_1,\ldots,t_k)dt_1\ldots dt_k-\sum_{j_1=0}^{p}\ldots\sum_{j_k=0}^{p}C_{j_k\ldots j_1}^2.$$

Moreover, if $i_1 = \ldots = i_k$, then from Theorem 2 we get

$$
\mathsf{M}\left\{\left(J[\psi^{(k)}]_{T,t} - J[\psi^{(k)}]_{T,t}^{p}\right)^2\right\} =
$$

$$
= \int\limits_{[t,T]^k} K^2(t_1,\ldots,t_k)dt_1\ldots dt_k - \sum_{j_1=0}^{p}\ldots\sum_{j_k=0}^{p} C_{j_k\ldots j_1}\left(\sum_{(j_1,\ldots,j_k)} C_{j_k\ldots j_1}\right),
$$

where

$$
\sum_{(j_1,\ldots,j_k)}
$$

means the sum with respect to all possible permutations $(j_1,\ldots,j_k)$.

For example, for the case $k=3$ we have

$$
\mathsf{M}\left\{\left(J[\psi^{(3)}]_{T,t} - J[\psi^{(3)}]_{T,t}^{p}\right)^2\right\} = \int\limits_t^T \psi_3^2(t_3)\int\limits_t^{t_3}\psi_2^2(t_2)\int\limits_t^{t_2}\psi_1^2(t_1)dt_1dt_2dt_3 -
$$

$$
- \sum_{j_1,j_2,j_3=0}^{p} C_{j_3j_2j_1}\left(C_{j_3j_2j_1} + C_{j_3j_1j_2} + C_{j_2j_3j_1} + C_{j_2j_1j_3} + C_{j_1j_2j_3} + C_{j_1j_3j_2}\right).
$$

Proof. Using Theorem 1 for the case $p_1 = \ldots = p_k = p$, we obtain

$$
J[\psi^{(k)}]_{T,t} = \underset{p\to\infty}{\text{l.i.m.}} \sum_{j_1=0}^{p}\ldots\sum_{j_k=0}^{p} C_{j_k\ldots j_1}\left(\prod_{l=1}^{k}\zeta_{j_l}^{(i_l)} - S_{j_1,\ldots,j_k}^{(i_1\ldots i_k)}\right). \tag{20}
$$

For $n > p$ we can write

$$
J[\psi^{(k)}]_{T,t}^{n} = \left(\sum_{j_1=0}^{p} + \sum_{j_1=p+1}^{n}\right)\ldots\left(\sum_{j_k=0}^{p} + \sum_{j_k=p+1}^{n}\right) C_{j_k\ldots j_1}\left(\prod_{l=1}^{k}\zeta_{j_l}^{(i_l)} - S_{j_1,\ldots,j_k}^{(i_1\ldots i_k)}\right) =
$$

$$
= J[\psi^{(k)}]_{T,t}^{p} + \xi[\psi^{(k)}]_{T,t}^{p+1,n}. \tag{21}
$$

Let us prove that due to the special structure of random variables $S_{j_1,\ldots,j_k}^{(i_1\ldots i_k)}$ (see (11)–(15), (18)), the following relations are correct

$$
\mathsf{M}\left\{\prod_{l=1}^{k}\zeta_{j_l}^{(i_l)} - S_{j_1,\ldots,j_k}^{(i_1\ldots i_k)}\right\} = 0, \tag{22}
$$

$$
\mathsf{M}\left\{\left(\prod_{l=1}^{k}\zeta_{j_l}^{(i_l)} - S_{j_1,\ldots,j_k}^{(i_1\ldots i_k)}\right)\left(\prod_{l=1}^{k}\zeta_{j_l'}^{(i_l)} - S_{j_1',\ldots,j_k'}^{(i_1\ldots i_k)}\right)\right\} = 0, \tag{23}
$$

where

$$(j_1,\ldots,j_k)\in \mathrm{K}_p,\quad (j_1',\ldots,j_k')\in \mathrm{K}_n\backslash \mathrm{K}_p$$

and

$$\mathrm{K}_n=\left\{(j_1,\ldots,j_k):\ 0\le j_1,\ldots,j_k\le n\right\},$$

$$\mathrm{K}_p=\left\{(j_1,\ldots,j_k):\ 0\le j_1,\ldots,j_k\le p\right\}.$$

For the case $i_1,\ldots,i_k=0,1,\ldots,m$ from the proof of Theorem 1 in [27] (also see [1]-[26], [28]-[51]) it follows that

$$J[\psi^{(k)}]_{T,t}=\sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k}C_{j_k\ldots j_1}\ \underset{N\to\infty}{\text{l.i.m.}}\sum_{\substack{l_1,\ldots,l_k=0\\ l_q\ne l_r;\ q\ne r;\ q,r=1,\ldots,k}}^{N-1}\phi_{j_1}(\tau_{l_1})\ldots\phi_{j_k}(\tau_{l_k})\Delta\mathbf{w}_{\tau_{l_1}}^{(i_1)}\ldots\Delta\mathbf{w}_{\tau_{l_k}}^{(i_k)}+$$

$$+R_{T,t}^{p_1,\ldots,p_k}=$$

$$=\sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k}C_{j_k\ldots j_1}\Biggl(\underset{N\to\infty}{\text{l.i.m.}}\sum_{l_1,\ldots,l_k=0}^{N-1}\phi_{j_1}(\tau_{l_1})\ldots\phi_{j_k}(\tau_{l_k})\Delta\mathbf{w}_{\tau_{l_1}}^{(i_1)}\ldots\Delta\mathbf{w}_{\tau_{l_k}}^{(i_k)}-$$

$$-\underset{N\to\infty}{\text{l.i.m.}}\sum_{(l_1,\ldots,l_k)\in\mathrm{G}_k}\phi_{j_1}(\tau_{l_1})\Delta\mathbf{w}_{\tau_{l_1}}^{(i_1)}\ldots\phi_{j_k}(\tau_{l_k})\Delta\mathbf{w}_{\tau_{l_k}}^{(i_k)}\Biggr)+R_{T,t}^{p_1,\ldots,p_k}=$$

$$=\sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k}C_{j_k\ldots j_1}\Biggl(\prod_{l=1}^{k}\zeta_{j_l}^{(i_l)}-\underset{N\to\infty}{\text{l.i.m.}}\sum_{(l_1,\ldots,l_k)\in\mathrm{G}_k}\phi_{j_1}(\tau_{l_1})\Delta\mathbf{w}_{\tau_{l_1}}^{(i_1)}\ldots\phi_{j_k}(\tau_{l_k})\Delta\mathbf{w}_{\tau_{l_k}}^{(i_k)}\Biggr)+$$

$$+R_{T,t}^{p_1,\ldots,p_k}\quad \text{w. p. 1},\tag{24}$$

where

$$R_{T,t}^{p_1,\ldots,p_k}=\sum_{(t_1,\ldots,t_k)}\int\limits_t^T\ldots\int\limits_t^{t_2}\left(K(t_1,\ldots,t_k)-\sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k}C_{j_k\ldots j_1}\prod_{l=1}^{k}\phi_{j_l}(t_l)\right)\times$$

$$\times d\mathbf{w}_{t_1}^{(i_1)}\ldots d\mathbf{w}_{t_k}^{(i_k)},\tag{25}$$

where

$$\sum_{(t_1,\ldots,t_k)}$$

means the sum with respect to all possible permutations $(t_1,\ldots,t_k)$, which are performed only in the values $d\mathbf{w}_{t_1}^{(i_1)}\ldots\ d\mathbf{w}_{t_k}^{(i_k)}$. At the same time the indexes near upper limits of integration in the iterated stochastic integrals (see (25)) are changed correspondently and if t_r swapped with t_q in the permutation $(t_1,\ldots,t_k)$, then i_r swapped with i_q in the permutation $(i_1,\ldots,i_k)$.

For the case $i_1,\ldots,i_k=1,\ldots,m$ and $p_1=\ldots=p_k=p$ from (24) we obtain

$$\prod_{l=1}^{k}\zeta_{j_l}^{(i_l)}-S_{j_1,\ldots,j_k}^{(i_1\ldots i_k)}\ =\ \underset{N\to\infty}{\text{l.i.m.}}\sum_{\substack{l_1,\ldots,l_k=0\\ l_q\ne l_r;\ q\ne r;\ q,r=1,\ldots,k}}^{N-1}\phi_{j_1}(\tau_{l_1})\ldots\phi_{j_k}(\tau_{l_k})\Delta\mathbf{f}_{\tau_{l_1}}^{(i_1)}\ldots\Delta\mathbf{f}_{\tau_{l_k}}^{(i_k)}=$$

$$=\sum_{(j_1,\ldots,j_k)}\int\limits_t^T\phi_{j_k}(t_k)\ldots\int\limits_t^{t_2}\phi_{j_1}(t_1)d\mathbf{f}_{t_1}^{(i_1)}\ldots d\mathbf{f}_{t_k}^{(i_k)}\quad \text{w. p. 1,} \tag{26}$$

where

$$\sum_{(j_1,\ldots,j_k)}$$

means the sum with respect to all possible permutations $(j_1,\ldots,j_k)$. At the same time if j_r swapped with j_q in the permutation $(j_1,\ldots,j_k)$, then i_r swapped with i_q in the permutation $(i_1,\ldots,i_k)$; another notations are the same as in Theorem 1.

From (26) due to the moment property of the Ito stochastic integral we obtain (22). Let us prove (23). From (26) we have

$$0\le\left|\mathsf{M}\left\{\left(\prod_{l=1}^{k}\zeta_{j_l}^{(i_l)}-S_{j_1,\ldots,j_k}^{(i_1\ldots i_k)}\right)\left(\prod_{l=1}^{k}\zeta_{j_l'}^{(i_l)}-S_{j_1',\ldots,j_k'}^{(i_1\ldots i_k)}\right)\right\}\right|=$$

$$=\left|\mathsf{M}\left\{\sum_{(j_1,\ldots,j_k)}\sum_{(j_1',\ldots,j_k')}\int\limits_t^T\phi_{j_k}(t_k)\ldots\int\limits_t^{t_2}\phi_{j_1}(t_1)d\mathbf{f}_{t_1}^{(i_1)}\ldots d\mathbf{f}_{t_k}^{(i_k)}\times\right.\right.$$

$$\left.\left.\times\int\limits_t^T\phi_{j_k'}(t_k)\ldots\int\limits_t^{t_2}\phi_{j_1'}(t_1)d\mathbf{f}_{t_1}^{(i_1)}\ldots d\mathbf{f}_{t_k}^{(i_k)}\right\}\right|\le$$

$$\le\sum_{(j_1',\ldots,j_k')}\int\limits_t^T\phi_{j_k}(t_k)\phi_{j_k'}(t_k)dt_k\ldots\int\limits_t^T\phi_{j_1}(t_1)\phi_{j_1'}(t_1)dt_1=$$

$$=\sum_{(j_1',\ldots,j_k')}\mathbf{1}_{\{j_1=j_1'\}}\ldots\mathbf{1}_{\{j_k=j_k'\}}, \tag{27}$$

where where $\mathbf{1}_A$ is the indicator of the set A. Using (27), we obtain (23).

First, let us prove (27) for the cases $k=2$ and $k=3$ in detail. We have

$$\mathsf{M}\left\{\sum_{(j_1,j_2)}\sum_{(j_1',j_2')}\int\limits_t^T\phi_{j_2}(t_2)\int\limits_t^{t_2}\phi_{j_1}(t_1)d\mathbf{f}_{t_1}^{(i_1)}d\mathbf{f}_{t_2}^{(i_2)}\int\limits_t^T\phi_{j_2'}(t_2)\int\limits_t^{t_2}\phi_{j_1'}(t_1)d\mathbf{f}_{t_1}^{(i_1)}d\mathbf{f}_{t_2}^{(i_2)}\right\}=$$

$$=\int\limits_t^T\phi_{j_2}(s)\phi_{j_2'}(s)ds\int\limits_t^T\phi_{j_1}(s)\phi_{j_1'}(s)ds+$$

$$+\mathbf{1}_{\{i_1=i_2\}}\int\limits_t^T\phi_{j_2}(s)\phi_{j_1'}(s)ds\int\limits_t^T\phi_{j_1}(s)\phi_{j_2'}(s)ds=$$

$$=\mathbf{1}_{\{j_1=j_1'\}}\mathbf{1}_{\{j_2=j_2'\}}+\mathbf{1}_{\{i_1=i_2\}}\cdot\mathbf{1}_{\{j_2=j_1'\}}\mathbf{1}_{\{j_1=j_2'\}},\tag{28}$$

$$\mathsf{M}\left\{\sum_{(j_1,j_2,j_3)}\sum_{(j_1',j_2',j_3')}\int\limits_t^T\phi_{j_3}(t_3)\int\limits_t^{t_3}\phi_{j_2}(t_2)\int\limits_t^{t_2}\phi_{j_1}(t_1)d\mathbf{f}_{t_1}^{(i_1)}d\mathbf{f}_{t_2}^{(i_2)}d\mathbf{f}_{t_3}^{(i_3)}\times\right.$$

$$\left.\times\int\limits_t^T\phi_{j_3'}(t_3)\int\limits_t^{t_3}\phi_{j_2'}(t_2)\int\limits_t^{t_2}\phi_{j_1'}(t_1)d\mathbf{f}_{t_1}^{(i_1)}d\mathbf{f}_{t_2}^{(i_2)}d\mathbf{f}_{t_3}^{(i_3)}\right\}=$$

$$=\int\limits_t^T\phi_{j_3}(s)\phi_{j_3'}(s)ds\int\limits_t^T\phi_{j_2}(s)\phi_{j_2'}(s)ds\int\limits_t^T\phi_{j_1}(s)\phi_{j_1'}(s)ds+$$

$$+\mathbf{1}_{\{i_1=i_2\}}\int\limits_t^T\phi_{j_3}(s)\phi_{j_3'}(s)ds\int\limits_t^T\phi_{j_1}(s)\phi_{j_2'}(s)ds\int\limits_t^T\phi_{j_2}(s)\phi_{j_1'}(s)ds+$$

$$+\mathbf{1}_{\{i_2=i_3\}}\int\limits_t^T\phi_{j_1}(s)\phi_{j_1'}(s)ds\int\limits_t^T\phi_{j_2}(s)\phi_{j_3'}(s)ds\int\limits_t^T\phi_{j_3}(s)\phi_{j_2'}(s)ds+$$

$$+\mathbf{1}_{\{i_1=i_3\}}\int\limits_t^T\phi_{j_1}(s)\phi_{j_3'}(s)ds\int\limits_t^T\phi_{j_2}(s)\phi_{j_2'}(s)ds\int\limits_t^T\phi_{j_3}(s)\phi_{j_1'}(s)ds+$$

$$+\mathbf{1}_{\{i_1=i_2=i_3\}}\int\limits_t^T\phi_{j_2}(s)\phi_{j_3'}(s)ds\int\limits_t^T\phi_{j_1}(s)\phi_{j_2'}(s)ds\int\limits_t^T\phi_{j_3}(s)\phi_{j_1'}(s)ds+$$

$$+\mathbf{1}_{\{i_1=i_2=i_3\}}\int\limits_t^T\phi_{j_1}(s)\phi_{j_3'}(s)ds\int\limits_t^T\phi_{j_3}(s)\phi_{j_2'}(s)ds\int\limits_t^T\phi_{j_2}(s)\phi_{j_1'}(s)ds=$$

$$= \mathbf{1}_{\{j_3=j_3'\}}\mathbf{1}_{\{j_2=j_2'\}}\mathbf{1}_{\{j_1=j_1'\}} + \mathbf{1}_{\{i_1=i_2\}}\cdot\mathbf{1}_{\{j_3=j_3'\}}\mathbf{1}_{\{j_1=j_2'\}}\mathbf{1}_{\{j_2=j_1'\}}+$$

$$+\mathbf{1}_{\{i_2=i_3\}}\cdot\mathbf{1}_{\{j_1=j_1'\}}\mathbf{1}_{\{j_2=j_3'\}}\mathbf{1}_{\{j_3=j_2'\}} + \mathbf{1}_{\{i_1=i_3\}}\cdot\mathbf{1}_{\{j_1=j_3'\}}\mathbf{1}_{\{j_2=j_2'\}}\mathbf{1}_{\{j_3=j_1'\}}+$$

$$+\mathbf{1}_{\{i_1=i_2=i_3\}}\cdot\mathbf{1}_{\{j_2=j_3'\}}\mathbf{1}_{\{j_1=j_2'\}}\mathbf{1}_{\{j_3=j_1'\}}+$$

$$+\mathbf{1}_{\{i_1=i_2=i_3\}}\cdot\mathbf{1}_{\{j_1=j_3'\}}\mathbf{1}_{\{j_3=j_2'\}}\mathbf{1}_{\{j_2=j_1'\}}. \tag{29}$$

From (28) and (29) we get

$$\left|\mathsf{M}\left\{\sum_{(j_1,j_2)}\sum_{(j_1',j_2')}\int\limits_t^T\phi_{j_2}(t_2)\int\limits_t^{t_2}\phi_{j_1}(t_1)d\mathbf{f}_{t_1}^{(i_1)}d\mathbf{f}_{t_2}^{(i_2)}\times\right.\right.$$

$$\left.\left.\times\int\limits_t^T\phi_{j_2'}(t_2)\int\limits_t^{t_2}\phi_{j_1'}(t_1)d\mathbf{f}_{t_1}^{(i_1)}d\mathbf{f}_{t_2}^{(i_2)}\right\}\right|\le$$

$$\le \mathbf{1}_{\{j_1=j_1'\}}\mathbf{1}_{\{j_2=j_2'\}} + \mathbf{1}_{\{j_2=j_1'\}}\mathbf{1}_{\{j_1=j_2'\}} =$$

$$= \sum_{(j_1',j_2')}\mathbf{1}_{\{j_1=j_1'\}}\mathbf{1}_{\{j_2=j_2'\}},$$

$$\left|\mathsf{M}\left\{\sum_{(j_1,j_2,j_3)}\sum_{(j_1',j_2',j_3')}\int\limits_t^T\phi_{j_3}(t_3)\int\limits_t^{t_3}\phi_{j_2}(t_2)\int\limits_t^{t_2}\phi_{j_1}(t_1)d\mathbf{f}_{t_1}^{(i_1)}d\mathbf{f}_{t_2}^{(i_2)}d\mathbf{f}_{t_3}^{(i_3)}\times\right.\right.$$

$$\left.\left.\times\int\limits_t^T\phi_{j_3'}(t_3)\int\limits_t^{t_3}\phi_{j_2'}(t_2)\int\limits_t^{t_2}\phi_{j_1'}(t_1)d\mathbf{f}_{t_1}^{(i_1)}d\mathbf{f}_{t_2}^{(i_2)}d\mathbf{f}_{t_3}^{(i_3)}\right\}\right|\le$$

$$\le \mathbf{1}_{\{j_3=j_3'\}}\mathbf{1}_{\{j_2=j_2'\}}\mathbf{1}_{\{j_1=j_1'\}} + \mathbf{1}_{\{j_3=j_3'\}}\mathbf{1}_{\{j_1=j_2'\}}\mathbf{1}_{\{j_2=j_1'\}}+$$

$$+\mathbf{1}_{\{j_1=j_1'\}}\mathbf{1}_{\{j_2=j_3'\}}\mathbf{1}_{\{j_3=j_2'\}} + \mathbf{1}_{\{j_1=j_3'\}}\mathbf{1}_{\{j_2=j_2'\}}\mathbf{1}_{\{j_3=j_1'\}}+$$

$$+\mathbf{1}_{\{j_2=j_3'\}}\mathbf{1}_{\{j_1=j_2'\}}\mathbf{1}_{\{j_3=j_1'\}} + \mathbf{1}_{\{j_1=j_3'\}}\mathbf{1}_{\{j_3=j_2'\}}\mathbf{1}_{\{j_2=j_1'\}} =$$

$$= \sum_{(j_1',j_2',j_3')}\mathbf{1}_{\{j_1=j_1'\}}\mathbf{1}_{\{j_2=j_2'\}}\mathbf{1}_{\{j_3=j_3'\}},$$

where we used the relation

$$\int\limits_t^T \phi_i(\tau)\phi_j(\tau)d\tau = \mathbf{1}_{\{i=j\}}, \quad i,j = 0,1,2\ldots$$

Now consider the case of an arbitrary $k \in \mathbb{N}$. We have

$$\mathsf{M}\left\{\sum_{(j_1,\ldots,j_k)}\sum_{(j_1',\ldots,j_k')}\int\limits_t^T \phi_{j_k}(t_k)\ldots\int\limits_t^{t_2}\phi_{j_1}(t_1)d\mathbf{f}_{t_1}^{(i_1)}\ldots d\mathbf{f}_{t_k}^{(i_k)}\times\right.$$

$$\left.\times\int\limits_t^T \phi_{j_k'}(t_k)\ldots\int\limits_t^{t_2}\phi_{j_1'}(t_1)d\mathbf{f}_{t_1}^{(i_1)}\ldots d\mathbf{f}_{t_k}^{(i_k)}\right\} =$$

$$= \mathsf{M}\left\{\sum_{(j_1,\ldots,j_k)}\sum_{(j_1',\ldots,j_k')}\int\limits_t^T \phi_{j_k}(t_k)\ldots\int\limits_t^{t_2}\phi_{j_1}(t_1)d\mathbf{f}_{t_1}^{(i_1)}\ldots d\mathbf{f}_{t_k}^{(i_k)}\times\right.$$

$$\left.\times\int\limits_t^T \phi_{j_k'}(t_k)\ldots\int\limits_t^{t_2}\phi_{j_1'}(t_1)d\mathbf{f}_{t_1}^{(i_1')}\ldots d\mathbf{f}_{t_k}^{(i_k')}\right\} =$$

$$= \sum_{(j_1,\ldots,j_k)}\sum_{(j_1',\ldots,j_k')}\mathbf{1}_{\{i_k=i_k'\}}\ldots\mathbf{1}_{\{i_1=i_1'\}}\times$$

$$\times\int\limits_t^T \phi_{j_k}(t_k)\phi_{j_k'}(t_k)\ldots\int\limits_t^{t_2}\phi_{j_1}(t_1)\phi_{j_1'}(t_1)dt_1\ldots dt_k =$$

$$= \sum_{(j_1',\ldots,j_k')}\mathbf{1}_{\{i_k=i_k'\}}\ldots\mathbf{1}_{\{i_1=i_1'\}}\times$$

$$\times\int\limits_t^T \phi_{j_k}(t_k)\phi_{j_k'}(t_k)dt_k\ldots\int\limits_t^{T}\phi_{j_1}(t_1)\phi_{j_1'}(t_1)dt_1 =$$

$$= \sum_{(j_1',\ldots,j_k')}\mathbf{1}_{\{i_k=i_k'\}}\ldots\mathbf{1}_{\{i_1=i_1'\}}\mathbf{1}_{\{j_k=j_k'\}}\ldots\mathbf{1}_{\{j_1=j_1'\}}, \tag{30}$$

where $(i_1',\ldots,i_k') = (i_1,\ldots,i_k)$. However, if j_r swapped with j_q in the permutation $(j_1,\ldots,j_k)$, then i_r swapped with i_q in the permutation $(i_1,\ldots,i_k)$ and if j_r' swapped with j_q' in the permutation $(j_1',\ldots,j_k')$, then i_r' swapped with i_q' in the permutation $(i_1',\ldots,i_k')$. From (30) we obtain (27). The equality (23) is proved.

Note that the formula (23) (in the light of the results of Sect. 5) can be interpreted as a consequence of the orthogonality of two random variables that are Hermite polynomials of vector random arguments.

Applying (22) and (23), we obtain

$$\mathsf{M}\left\{J[\psi^{(k)}]_{T,t}^{p}\xi[\psi^{(k)}]_{T,t}^{p+1,n}\right\}=0.$$

Due to (17), (20), and (21) we can write

$$\xi[\psi^{(k)}]_{T,t}^{p+1,n}=J[\psi^{(k)}]_{T,t}^{n}-J[\psi^{(k)}]_{T,t}^{p},$$

$$\underset{n\to\infty}{\text{l.i.m.}}\ \xi[\psi^{(k)}]_{T,t}^{p+1,n}=J[\psi^{(k)}]_{T,t}-J[\psi^{(k)}]_{T,t}^{p}\stackrel{\text{def}}{=}\xi[\psi^{(k)}]_{T,t}^{p+1}.$$

We have

$$0\le\left|\mathsf{M}\left\{\xi[\psi^{(k)}]_{T,t}^{p+1}J[\psi^{(k)}]_{T,t}^{p}\right\}\right|=$$

$$=\left|\mathsf{M}\left\{\left(\xi[\psi^{(k)}]_{T,t}^{p+1}-\xi[\psi^{(k)}]_{T,t}^{p+1,n}+\xi[\psi^{(k)}]_{T,t}^{p+1,n}\right)J[\psi^{(k)}]_{T,t}^{p}\right\}\right|=$$

$$\le\left|\mathsf{M}\left\{\left(\xi[\psi^{(k)}]_{T,t}^{p+1}-\xi[\psi^{(k)}]_{T,t}^{p+1,n}\right)J[\psi^{(k)}]_{T,t}^{p}\right\}\right|+\left|\mathsf{M}\left\{\xi[\psi^{(k)}]_{T,t}^{p+1,n}J[\psi^{(k)}]_{T,t}^{p}\right\}\right|=$$

$$=\left|\mathsf{M}\left\{\left(J[\psi^{(k)}]_{T,t}-J[\psi^{(k)}]_{T,t}^{n}\right)J[\psi^{(k)}]_{T,t}^{p}\right\}\right|\le$$

$$\le\sqrt{\mathsf{M}\left\{\left(J[\psi^{(k)}]_{T,t}-J[\psi^{(k)}]_{T,t}^{n}\right)^{2}\right\}}\sqrt{\mathsf{M}\left\{\left(J[\psi^{(k)}]_{T,t}^{p}\right)^{2}\right\}}\le$$

$$\le\sqrt{\mathsf{M}\left\{\left(J[\psi^{(k)}]_{T,t}-J[\psi^{(k)}]_{T,t}^{n}\right)^{2}\right\}}\times$$

$$\times\left(\sqrt{\mathsf{M}\left\{\left(J[\psi^{(k)}]_{T,t}^{p}-J[\psi^{(k)}]_{T,t}\right)^{2}\right\}}+\sqrt{\mathsf{M}\left\{\left(J[\psi^{(k)}]_{T,t}\right)^{2}\right\}}\right)\le$$

$$\le K\sqrt{\mathsf{M}\left\{\left(J[\psi^{(k)}]_{T,t}-J[\psi^{(k)}]_{T,t}^{n}\right)^{2}\right\}}\to 0\quad\text{if}\quad n\to\infty,\tag{31}$$

where K is a constant.

From (31) it follows that

$$\mathsf{M}\left\{\xi[\psi^{(k)}]_{T,t}^{p+1}J[\psi^{(k)}]_{T,t}^{p}\right\}=0$$

or

$$\mathsf{M}\left\{\left(J[\psi^{(k)}]_{T,t}-J[\psi^{(k)}]_{T,t}^{p}\right)J[\psi^{(k)}]_{T,t}^{p}\right\}=0.$$

The last equality means that

$$\mathsf{M}\left\{J[\psi^{(k)}]_{T,t}J[\psi^{(k)}]_{T,t}^{p}\right\}=\mathsf{M}\left\{\left(J[\psi^{(k)}]_{T,t}^{p}\right)^{2}\right\}. \tag{32}$$

Taking into account (32), we obtain

$$\mathsf{M}\left\{\left(J[\psi^{(k)}]_{T,t}-J[\psi^{(k)}]_{T,t}^{p}\right)^{2}\right\}=\mathsf{M}\left\{\left(J[\psi^{(k)}]_{T,t}\right)^{2}\right\}+$$

$$+\mathsf{M}\left\{\left(J[\psi^{(k)}]_{T,t}^{p}\right)^{2}\right\}-2\mathsf{M}\left\{J[\psi^{(k)}]_{T,t}J[\psi^{(k)}]_{T,t}^{p}\right\}=\mathsf{M}\left\{\left(J[\psi^{(k)}]_{T,t}\right)^{2}\right\}-$$

$$-\mathsf{M}\left\{J[\psi^{(k)}]_{T,t}J[\psi^{(k)}]_{T,t}^{p}\right\}=$$

$$=\int\limits_{[t,T]^k}K^2(t_1,\ldots,t_k)dt_1\ldots dt_k-\mathsf{M}\left\{J[\psi^{(k)}]_{T,t}J[\psi^{(k)}]_{T,t}^{p}\right\}. \tag{33}$$

Let us consider the value

$$\mathsf{M}\left\{J[\psi^{(k)}]_{T,t}J[\psi^{(k)}]_{T,t}^{p}\right\}.$$

Using (17) and (26), we get

$$J[\psi^{(k)}]_{T,t}^{p}=\sum_{j_1=0}^{p}\ldots\sum_{j_k=0}^{p}C_{j_k\ldots j_1}\sum_{(j_1,\ldots,j_k)}\int\limits_t^T\phi_{j_k}(t_k)\ldots\int\limits_t^{t_2}\phi_{j_1}(t_1)d\mathbf{f}_{t_1}^{(i_1)}\ldots d\mathbf{f}_{t_k}^{(i_k)}. \tag{34}$$

After substituting (34) into (33), we obtain

$$\mathsf{M}\left\{\left(J[\psi^{(k)}]_{T,t}-J[\psi^{(k)}]_{T,t}^{p}\right)^{2}\right\}=\int\limits_{[t,T]^k}K^2(t_1,\ldots,t_k)dt_1\ldots dt_k-$$

$$-\sum_{j_1=0}^{p}\ldots\sum_{j_k=0}^{p}C_{j_k\ldots j_1}\mathsf{M}\left\{J[\psi^{(k)}]_{T,t}\sum_{(j_1,\ldots,j_k)}\int\limits_t^T\phi_{j_k}(t_k)\ldots\int\limits_t^{t_2}\phi_{j_1}(t_1)d\mathbf{f}_{t_1}^{(i_1)}\ldots d\mathbf{f}_{t_k}^{(i_k)}\right\}.$$

Theorem 2 is proved.

4. Exact Calculation of the Mean-Square Approximation Error for the Cases $k=1,\ldots,5$

Let us denote

$$\mathsf{M}\left\{\left(J[\psi^{(k)}]_{T,t}-J[\psi^{(k)}]_{T,t}^{p}\right)^2\right\}\stackrel{\rm def}{=}E_k^p,$$

$$\int\limits_{[t,T]^k} K^2(t_1,\ldots,t_k)dt_1\ldots dt_k \stackrel{\rm def}{=} I_k.$$

4.1. **The Case $k=1$.** For this case from Theorem 2 we obtain

$$E_1^p=I_1-\sum_{j_1=0}^{p}C_{j_1}^2.$$

4.2. **The Case $k=2$.** For this case from Theorem 2 we have

(I). $i_1\ne i_2$:

$$E_2^p=I_2-\sum_{j_1,j_2=0}^{p}C_{j_2j_1}^2, \tag{35}$$

(II). $i_1=i_2$:

$$E_2^p=I_2-\sum_{j_1,j_2=0}^{p}C_{j_2j_1}^2-\sum_{j_1,j_2=0}^{p}C_{j_2j_1}C_{j_1j_2}.$$

Example 1. Let us consider the following iterated Ito stochastic integral from the stochastic Taylor–Ito expansion [62]-[64] (also see [49] and [1]-[17])

$$I_{(00)T,t}^{(i_1i_2)}=\int\limits_t^T\int\limits_t^{t_2}d\mathbf{f}_{t_1}^{(i_1)}d\mathbf{f}_{t_2}^{(i_2)}, \tag{36}$$

where $i_1,i_2=1,\ldots,m$.

The approximation based on the expansion (11) for the integral (36) (the case of Legendre polynomials) has the following form [1]-[50]

$$I_{(00)T,t}^{(i_1i_2)p}=\frac{T-t}{2}\left(\zeta_0^{(i_1)}\zeta_0^{(i_2)}+\sum_{i=1}^{p}\frac{1}{\sqrt{4i^2-1}}\left(\zeta_{i-1}^{(i_1)}\zeta_i^{(i_2)}-\zeta_i^{(i_1)}\zeta_{i-1}^{(i_2)}\right)-\mathbf{1}_{\{i_1=i_2\}}\right). \tag{37}$$

It should be noted that the formula (37) has been derived for the first time in [54] (1997), [55] (1998) with using the another approach, which was developed in [32].

Applying (35), we obtain [1]-[50] (also see [54] (1997), [55] (1998))

$$\mathsf{M}\left\{\left(I_{(00)T,t}^{(i_1i_2)}-I_{(00)T,t}^{(i_1i_2)p}\right)^2\right\}=\frac{(T-t)^2}{2}\left(\frac{1}{2}-\sum_{i=1}^{p}\frac{1}{4i^2-1}\right)\quad (i_1\ne i_2). \tag{38}$$

4.3. **The Case** $k=3$**.** For the case $k=3$ from Theorem 2 we obtain

(I). $i_1\ne i_2, i_1\ne i_3, i_2\ne i_3:$

$$E_3^p=I_3-\sum_{j_1,j_2,j_3=0}^{p}C_{j_3j_2j_1}^2, \tag{39}$$

(II). $i_1=i_2=i_3:$

$$E_3^p=I_3-\sum_{j_1,j_2,j_3=0}^{p}C_{j_3j_2j_1}\left(\sum_{(j_1,j_2,j_3)}C_{j_3j_2j_1}\right),$$

(III).1. $i_1=i_2\ne i_3:$

$$E_3^p=I_3-\sum_{j_1,j_2,j_3=0}^{p}C_{j_3j_2j_1}^2-\sum_{j_1,j_2,j_3=0}^{p}C_{j_3j_1j_2}C_{j_3j_2j_1}, \tag{40}$$

(III).2. $i_1\ne i_2=i_3:$

$$E_3^p=I_3-\sum_{j_1,j_2,j_3=0}^{p}C_{j_3j_2j_1}^2-\sum_{j_1,j_2,j_3=0}^{p}C_{j_2j_3j_1}C_{j_3j_2j_1}, \tag{41}$$

(III).3. $i_1=i_3\ne i_2:$

$$E_3^p=I_3-\sum_{j_1,j_2,j_3=0}^{p}C_{j_3j_2j_1}^2-\sum_{j_1,j_2,j_3=0}^{p}C_{j_3j_2j_1}C_{j_1j_2j_3}. \tag{42}$$

It should be noted that the formulas from the above cases (I), (III).1, (III).2, (III).3 have been derived in [1]-[17] by direct calculation.

Example 2. Let us consider the following iterated Ito stochastic integral from the stochastic Taylor–Ito expansion [62]-[64] (also see [49] and [1]-[17])

$$I_{(000)T,t}^{(i_1i_2i_3)}=\int\limits_t^T\int\limits_t^{t_3}\int\limits_t^{t_2}d\mathbf{f}_{t_1}^{(i_1)}d\mathbf{f}_{t_2}^{(i_2)}d\mathbf{f}_{t_3}^{(i_3)}, \tag{43}$$

where $i_1,i_2,i_3=1,\ldots,m.$

The approximation based on the expansion (12) for the integral (43) (the case of Legendre polynomials and $p_1=p_2=p_3=p$) has the following form [1]-[50]

$$I_{(000)T,t}^{(i_1i_2i_3)p}=\sum_{j_1,j_2,j_3=0}^{p}C_{j_3j_2j_1}\Biggl(\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}\zeta_{j_3}^{(i_3)}-\mathbf{1}_{\{i_1=i_2\}}\mathbf{1}_{\{j_1=j_2\}}\zeta_{j_3}^{(i_3)}-$$

$$
-\mathbf{1}_{\{i_2=i_3\}}\mathbf{1}_{\{j_2=j_3\}}\zeta_{j_1}^{(i_1)}-\mathbf{1}_{\{i_1=i_3\}}\mathbf{1}_{\{j_1=j_3\}}\zeta_{j_2}^{(i_2)}\Biggr), \tag{44}
$$

where

$$
C_{j_3j_2j_1}=\frac{\sqrt{(2j_1+1)(2j_2+1)(2j_3+1)}}{8}(T-t)^{3/2}\bar{C}_{j_3j_2j_1}, \tag{45}
$$

$$
\bar{C}_{j_3j_2j_1}=\int\limits_{-1}^{1}P_{j_3}(z)\int\limits_{-1}^{z}P_{j_2}(y)\int\limits_{-1}^{y}P_{j_1}(x)dxdydz,
$$

where $P_i(x)$ is the Legendre polynomial $(i=0,1,2,\ldots)$.

For example, using (40) we obtain

$$
\mathsf{M}\left\{\left(I_{(000)T,t}^{(i_1i_2i_3)}-I_{(000)T,t}^{(i_1i_2i_3)p}\right)^2\right\}=
$$

$$
=\frac{(T-t)^3}{6}-\sum_{j_1,j_2,j_3=0}^{p}C_{j_3j_2j_1}^2-\sum_{j_1,j_2,J_3=0}^{p}C_{j_3j_1j_2}C_{j_3j_2j_1},
$$

where $i_1=i_2\neq i_3$.

As mentioned in [30] (also see [1]-[17]), the exact values of coefficients $\bar{C}_{j_3j_2j_1}$ when $j_1,j_2,j_3=0,1,\ldots,p$ can be calculated using DERIVE (computer algebra system). In [30] (also see [1]-[17]) we can find several tables with exactly calculated Fourier–Legendre coefficients for approximations of iterated Ito stochastic integrals of multiplicities 1 to 5. In addition, in [57], [58], a database was obtained with 270,000 exactly calculated Fourier–Legendre coefficients for approximations of iterated Ito and Stratonovich stochastic integrals of multiplicities 1 to 6.

For the case $i_1=i_2=i_3$ we can use the following formula [62]-[64]

$$
I_{(000)T,t}^{(i_1i_1i_1)}=\frac{1}{6}(T-t)^{3/2}\left(\left(\zeta_0^{(i_1)}\right)^3-3\zeta_0^{(i_1)}\right)
$$

w. p. 1.

4.4. **The Case $k=4$.** For this case from Theorem 2 we obtain

(I). $i_1,\ldots,i_4$ are pairwise different:

$$
E_4^p=I_4-\sum_{j_1,\ldots,j_4=0}^{p}C_{j_4\ldots j_1}^2,
$$

(II). $i_1=i_2=i_3=i_4$:

$$
E_4^p=I_4-\sum_{j_1,\ldots,j_4=0}^{p}C_{j_4\ldots j_1}\Biggl(\sum_{(j_1,\ldots,j_4)}C_{j_4\ldots j_1}\Biggr),
$$

(III).1. $i_1 = i_2 \ne i_3, i_4;\ i_3 \ne i_4:$

$$E_4^p = I_4 - \sum_{j_1,\ldots,j_4=0}^{p} C_{j_4\ldots j_1}\left(\sum_{(j_1,j_2)} C_{j_4\ldots j_1}\right),$$

(III).2. $i_1 = i_3 \ne i_2, i_4;\ i_2 \ne i_4:$

$$E_4^p = I_4 - \sum_{j_1,\ldots,j_4=0}^{p} C_{j_4\ldots j_1}\left(\sum_{(j_1,j_3)} C_{j_4\ldots j_1}\right),$$

(III).3. $i_1 = i_4 \ne i_2, i_3;\ i_2 \ne i_3:$

$$E_4^p = I_4 - \sum_{j_1,\ldots,j_4=0}^{p} C_{j_4\ldots j_1}\left(\sum_{(j_1,j_4)} C_{j_4\ldots j_1}\right),$$

(III).4. $i_2 = i_3 \ne i_1, i_4;\ i_1 \ne i_4:$

$$E_4^p = I_4 - \sum_{j_1,\ldots,j_4=0}^{p} C_{j_4\ldots j_1}\left(\sum_{(j_2,j_3)} C_{j_4\ldots j_1}\right),$$

(III).5. $i_2 = i_4 \ne i_1, i_3;\ i_1 \ne i_3:$

$$E_4^p = I_4 - \sum_{j_1,\ldots,j_4=0}^{p} C_{j_4\ldots j_1}\left(\sum_{(j_2,j_4)} C_{j_4\ldots j_1}\right),$$

(III).6. $i_3 = i_4 \ne i_1, i_2;\ i_1 \ne i_2:$

$$E_4^p = I_4 - \sum_{j_1,\ldots,j_4=0}^{p} C_{j_4\ldots j_1}\left(\sum_{(j_3,j_4)} C_{j_4\ldots j_1}\right),$$

(IV).1. $i_1 = i_2 = i_3 \ne i_4$:

$$E_4^p = I_4 - \sum_{j_1,\ldots,j_4=0}^{p} C_{j_4\ldots j_1}\left(\sum_{(j_1,j_2,j_3)} C_{j_4\ldots j_1}\right),$$

(IV).2. $i_2 = i_3 = i_4 \ne i_1$:

$$E_4^p = I_4 - \sum_{j_1,\ldots,j_4=0}^{p} C_{j_4\ldots j_1}\left(\sum_{(j_2,j_3,j_4)} C_{j_4\ldots j_1}\right),$$

(IV).3. $i_1 = i_2 = i_4 \ne i_3$:

$$E_4^p = I_4 - \sum_{j_1,\ldots,j_4=0}^{p} C_{j_4\ldots j_1}\left(\sum_{(j_1,j_2,j_4)} C_{j_4\ldots j_1}\right),$$

(IV).4. $i_1 = i_3 = i_4 \neq i_2$:

$$E_4^p = I_4 - \sum_{j_1,\ldots,j_4=0}^{p} C_{j_4\ldots j_1}\left(\sum_{(j_1,j_3,j_4)} C_{j_4\ldots j_1}\right),$$

(V).1. $i_1 = i_2 \neq i_3 = i_4$:

$$E_4^p = I_4 - \sum_{j_1,\ldots,j_4=0}^{p} C_{j_4\ldots j_1}\left(\sum_{(j_1,j_2)}\left(\sum_{(j_3,j_4)} C_{j_4\ldots j_1}\right)\right),$$

(V).2. $i_1 = i_3 \neq i_2 = i_4$:

$$E_4^p = I_4 - \sum_{j_1,\ldots,j_4=0}^{p} C_{j_4\ldots j_1}\left(\sum_{(j_1,j_3)}\left(\sum_{(j_2,j_4)} C_{j_4\ldots j_1}\right)\right),$$

(V).3. $i_1 = i_4 \neq i_2 = i_3$:

$$E_4^p = I_4 - \sum_{j_1,\ldots,j_4=0}^{p} C_{j_4\ldots j_1}\left(\sum_{(j_1,j_4)}\left(\sum_{(j_2,j_3)} C_{j_4\ldots j_1}\right)\right).$$

4.5. **The Case $k = 5$.** For the case $k = 5$ from Theorem 2 we obtain

(I). $i_1, \ldots, i_5$ are pairwise different:

$$E_5^p = I_5 - \sum_{j_1,\ldots,j_5=0}^{p} C_{j_5\ldots j_1}^2,$$

(II). $i_1 = i_2 = i_3 = i_4 = i_5$:

$$E_5^p = I_5 - \sum_{j_1,\ldots,j_5=0}^{p} C_{j_5\ldots j_1}\left(\sum_{(j_1,\ldots,j_5)} C_{j_5\ldots j_1}\right),$$

(III).1. $i_1 = i_2 \neq i_3, i_4, i_5$ (i_3, i_4, i_5 are pairwise different):

$$E_5^p = I_5 - \sum_{j_1,\ldots,j_5=0}^{p} C_{j_5\ldots j_1}\left(\sum_{(j_1,j_2)} C_{j_5\ldots j_1}\right),$$

(III).2. $i_1 = i_3 \neq i_2, i_4, i_5$ (i_2, i_4, i_5 are pairwise different):

$$E_5^p = I_5 - \sum_{j_1,\ldots,j_5=0}^{p} C_{j_5\ldots j_1}\left(\sum_{(j_1,j_3)} C_{j_5\ldots j_1}\right),$$

(III).3. $i_1 = i_4 \neq i_2, i_3, i_5$ (i_2, i_3, i_5 are pairwise different):

$$E_5^p = I_5 - \sum_{j_1,\ldots,j_5=0}^{p} C_{j_5\ldots j_1} \left(\sum_{(j_1,j_4)} C_{j_5\ldots j_1} \right),$$

(III).4. $i_1 = i_5 \neq i_2, i_3, i_4$ (i_2, i_3, i_4 are pairwise different):

$$E_5^p = I_5 - \sum_{j_1,\ldots,j_5=0}^{p} C_{j_5\ldots j_1} \left(\sum_{(j_1,j_5)} C_{j_5\ldots j_1} \right),$$

(III).5. $i_2 = i_3 \neq i_1, i_4, i_5$ (i_1, i_4, i_5 are pairwise different):

$$E_5^p = I_5 - \sum_{j_1,\ldots,j_5=0}^{p} C_{j_5\ldots j_1} \left(\sum_{(j_2,j_3)} C_{j_5\ldots j_1} \right),$$

(III).6. $i_2 = i_4 \neq i_1, i_3, i_5$ (i_1, i_3, i_5 are pairwise different):

$$E_5^p = I_5 - \sum_{j_1,\ldots,j_5=0}^{p} C_{j_5\ldots j_1} \left(\sum_{(j_2,j_4)} C_{j_5\ldots j_1} \right),$$

(III).7. $i_2 = i_5 \neq i_1, i_3, i_4$ (i_1, i_3, i_4 are pairwise different):

$$E_5^p = I_5 - \sum_{j_1,\ldots,j_5=0}^{p} C_{j_5\ldots j_1} \left(\sum_{(j_2,j_5)} C_{j_5\ldots j_1} \right),$$

(III).8. $i_3 = i_4 \neq i_1, i_2, i_5$ (i_1, i_2, i_5 are pairwise different):

$$E_5^p = I_5 - \sum_{j_1,\ldots,j_5=0}^{p} C_{j_5\ldots j_1} \left(\sum_{(j_3,j_4)} C_{j_5\ldots j_1} \right),$$

(III).9. $i_3 = i_5 \neq i_1, i_2, i_4$ (i_1, i_2, i_4 are pairwise different):

$$E_5^p = I_5 - \sum_{j_1,\ldots,j_5=0}^{p} C_{j_5\ldots j_1} \left(\sum_{(j_3,j_5)} C_{j_5\ldots j_1} \right),$$

(III).10. $i_4 = i_5 \neq i_1, i_2, i_3$ (i_1, i_2, i_3 are pairwise different):

$$E_5^p = I_5 - \sum_{j_1,\ldots,j_5=0}^{p} C_{j_5\ldots j_1} \left(\sum_{(j_4,j_5)} C_{j_5\ldots j_1} \right),$$

(IV).1. $i_1 = i_2 = i_3 \neq i_4, i_5$ $(i_4 \neq i_5)$:

$$E_5^p = I_5 - \sum_{j_1,\ldots,j_5=0}^{p} C_{j_5\ldots j_1}\Biggl(\sum_{(j_1,j_2,j_3)} C_{j_5\ldots j_1}\Biggr),$$

(IV).2. $i_1 = i_2 = i_4 \neq i_3, i_5$ $(i_3 \neq i_5)$:

$$E_5^p = I_5 - \sum_{j_1,\ldots,j_5=0}^{p} C_{j_5\ldots j_1}\Biggl(\sum_{(j_1,j_2,j_4)} C_{j_5\ldots j_1}\Biggr),$$

(IV).3. $i_1 = i_2 = i_5 \neq i_3, i_4$ $(i_3 \neq i_4)$:

$$E_5^p = I_5 - \sum_{j_1,\ldots,j_5=0}^{p} C_{j_5\ldots j_1}\Biggl(\sum_{(j_1,j_2,j_5)} C_{j_5\ldots j_1}\Biggr),$$

(IV).4. $i_2 = i_3 = i_4 \neq i_1, i_5$ $(i_1 \neq i_5)$:

$$E_5^p = I_5 - \sum_{j_1,\ldots,j_5=0}^{p} C_{j_5\ldots j_1}\Biggl(\sum_{(j_2,j_3,j_4)} C_{j_5\ldots j_1}\Biggr),$$

(IV).5. $i_2 = i_3 = i_5 \neq i_1, i_4$ $(i_1 \neq i_4)$:

$$E_5^p = I_5 - \sum_{j_1,\ldots,j_5=0}^{p} C_{j_5\ldots j_1}\Biggl(\sum_{(j_2,j_3,j_5)} C_{j_5\ldots j_1}\Biggr),$$

(IV).6. $i_2 = i_4 = i_5 \neq i_1, i_3$ $(i_1 \neq i_3)$:

$$E_5^p = I_5 - \sum_{j_1,\ldots,j_5=0}^{p} C_{j_5\ldots j_1}\Biggl(\sum_{(j_2,j_4,j_5)} C_{j_5\ldots j_1}\Biggr),$$

(IV).7. $i_3 = i_4 = i_5 \neq i_1, i_2$ $(i_1 \neq i_2)$:

$$E_5^p = I_5 - \sum_{j_1,\ldots,j_5=0}^{p} C_{j_5\ldots j_1}\Biggl(\sum_{(j_3,j_4,j_5)} C_{j_5\ldots j_1}\Biggr),$$

(IV).8. $i_1 = i_3 = i_5 \neq i_2, i_4$ $(i_2 \neq i_4)$:

$$E_5^p = I_5 - \sum_{j_1,\ldots,j_5=0}^{p} C_{j_5\ldots j_1}\Biggl(\sum_{(j_1,j_3,j_5)} C_{j_5\ldots j_1}\Biggr),$$

(IV).9. $i_1 = i_3 = i_4 \ne i_2, i_5$ $(i_2 \ne i_5)$:

$$E_5^p = I_5 - \sum_{j_1,\ldots,j_5=0}^{p} C_{j_5\ldots j_1} \left(\sum_{(j_1,j_3,j_4)} C_{j_5\ldots j_1} \right),$$

(IV).10. $i_1 = i_4 = i_5 \ne i_2, i_3$ $(i_2 \ne i_3)$:

$$E_5^p = I_5 - \sum_{j_1,\ldots,j_5=0}^{p} C_{j_5\ldots j_1} \left(\sum_{(j_1,j_4,j_5)} C_{j_5\ldots j_1} \right),$$

(V).1. $i_1 = i_2 = i_3 = i_4 \ne i_5$:

$$E_5^p = I_5 - \sum_{j_1,\ldots,j_5=0}^{p} C_{j_5\ldots j_1} \left(\sum_{(j_1,j_2,j_3,j_4)} C_{j_5\ldots j_1} \right),$$

(V).2. $i_1 = i_2 = i_3 = i_5 \ne i_4$:

$$E_5^p = I_5 - \sum_{j_1,\ldots,j_5=0}^{p} C_{j_5\ldots j_1} \left(\sum_{(j_1,j_2,j_3,j_5)} C_{j_5\ldots j_1} \right),$$

(V).3. $i_1 = i_2 = i_4 = i_5 \ne i_3$:

$$E_5^p = I_5 - \sum_{j_1,\ldots,j_5=0}^{p} C_{j_5\ldots j_1} \left(\sum_{(j_1,j_2,j_4,j_5)} C_{j_5\ldots j_1} \right),$$

(V).4. $i_1 = i_3 = i_4 = i_5 \ne i_2$:

$$E_5^p = I_5 - \sum_{j_1,\ldots,j_5=0}^{p} C_{j_5\ldots j_1} \left(\sum_{(j_1,j_3,j_4,j_5)} C_{j_5\ldots j_1} \right),$$

(V).5. $i_2 = i_3 = i_4 = i_5 \ne i_1$:

(VII).3. $i_1 = i_2 = i_5 \neq i_3 = i_4$:

$$E_p = I - \sum_{j_1,\ldots,j_5=0}^{p} C_{j_5\ldots j_1}\left(\sum_{(j_3,j_4)}\left(\sum_{(j_1,j_2,j_5)} C_{j_5\ldots j_1}\right)\right),$$

(VII).4. $i_2 = i_3 = i_4 \neq i_1 = i_5$:

$$E_5^p = I_5 - \sum_{j_1,\ldots,j_5=0}^{p} C_{j_5\ldots j_1}\left(\sum_{(j_1,j_5)}\left(\sum_{(j_2,j_3,j_4)} C_{j_5\ldots j_1}\right)\right),$$

(VII).5. $i_2 = i_3 = i_5 \neq i_1 = i_4$:

$$E_5^p = I_5 - \sum_{j_1,\ldots,j_5=0}^{p} C_{j_5\ldots j_1}\left(\sum_{(j_1,j_4)}\left(\sum_{(j_2,j_3,j_5)} C_{j_5\ldots j_1}\right)\right),$$

(VII).6. $i_2 = i_4 = i_5 \neq i_1 = i_3$:

$$E_5^p = I_5 - \sum_{j_1,\ldots,j_5=0}^{p} C_{j_5\ldots j_1}\left(\sum_{(j_1,j_3)}\left(\sum_{(j_2,j_4,j_5)} C_{j_5\ldots j_1}\right)\right),$$

(VII).7. $i_3 = i_4 = i_5 \neq i_1 = i_2$:

$$E_5^p = I_5 - \sum_{j_1,\ldots,j_5=0}^{p} C_{j_5\ldots j_1}\left(\sum_{(j_1,j_2)}\left(\sum_{(j_3,j_4,j_5)} C_{j_5\ldots j_1}\right)\right),$$

(VI).8. $i_1 = i_3 = i_5 \neq i_2 = i_4$:

$$E_5^p = I_5 - \sum_{j_1,\ldots,j_5=0}^{p} C_{j_5\ldots j_1}\left(\sum_{(j_2,j_4)}\left(\sum_{(j_1,j_3,j_5)} C_{j_5\ldots j_1}\right)\right),$$

(VII).9. $i_1 = i_3 = i_4 \neq i_2 = i_5$:

$$E_5^p = I_5 - \sum_{j_1,\ldots,j_5=0}^{p} C_{j_5\ldots j_1}\left(\sum_{(j_2,j_5)}\left(\sum_{(j_1,j_3,j_4)} C_{j_5\ldots j_1}\right)\right),$$

(VII).10. $i_1 = i_4 = i_5 \neq i_2 = i_3$:

$$E_5^p = I_5 - \sum_{j_1,\ldots,j_5=0}^{p} C_{j_5\ldots j_1}\left(\sum_{(j_2,j_3)}\left(\sum_{(j_1,j_4,j_5)} C_{j_5\ldots j_1}\right)\right).$$

5. Method of Generalized Multiple Fourier Series. The Case of an Arbitrary Complete Orthonormal Systems of Functions in the Space $L_2([t,T])$ and Weight Functions $\psi_1(\tau),\ldots,\psi_k(\tau)\in L_2([t,T])$

For further consideration, let us consider the generalization of formulas (10)–(15) for the case of an arbitrary multiplicity k ($k\in\mathbb{N}$) of the iterated Ito stochastic integral $J[\psi^{(k)}]_{T,t}$ defined by (1). In order to do this, let us introduce some notations. Let us consider the unordered set $\{1,2,\ldots,k\}$ and separate it into two parts: the first part consists of r unordered pairs (sequence order of these pairs is also unimportant) and the second one consists of the remaining $k-2r$ numbers. So, we have

$$(\{\underbrace{\{g_1,g_2\},\ldots,\{g_{2r-1},g_{2r}\}}_{\text{part 1}}\},\{\underbrace{q_1,\ldots,q_{k-2r}}_{\text{part 2}}\}), \tag{46}$$

where

$$\{g_1,g_2,\ldots,g_{2r-1},g_{2r},q_1,\ldots,q_{k-2r}\}=\{1,2,\ldots,k\},$$

braces mean an unordered set, and parentheses mean an ordered set.

We will say that (46) is a partition and consider the sum with respect to all possible partitions

$$\sum_{\substack{(\{\{g_1,g_2\},\ldots,\{g_{2r-1},g_{2r}\}\},\{q_1,\ldots,q_{k-2r}\})\\ \{g_1,g_2,\ldots,g_{2r-1},g_{2r},q_1,\ldots,q_{k-2r}\}=\{1,2,\ldots,k\}}} a_{g_1g_2,\ldots,g_{2r-1}g_{2r},q_1\ldots q_{k-2r}}, \tag{47}$$

where $a_{g_1g_2,\ldots,g_{2r-1}g_{2r},q_1\ldots q_{k-2r}}\in\mathbb{R}$.

Below there are several examples of sums in the form (47)

$$\sum_{\substack{(\{g_1,g_2\})\\ \{g_1,g_2\}=\{1,2\}}} a_{g_1g_2}=a_{12},$$

$$\sum_{\substack{(\{\{g_1,g_2\},\{g_3,g_4\}\})\\ \{g_1,g_2,g_3,g_4\}=\{1,2,3,4\}}} a_{g_1g_2,g_3g_4}=a_{12,34}+a_{13,24}+a_{23,14},$$

$$\sum_{\substack{(\{g_1,g_2\},\{q_1,q_2\})\\ \{g_1,g_2,q_1,q_2\}=\{1,2,3,4\}}} a_{g_1g_2,q_1q_2}=$$

$$=a_{12,34}+a_{13,24}+a_{14,23}+a_{23,14}+a_{24,13}+a_{34,12},$$

$$\sum_{\substack{(\{g_1,g_2\},\{q_1,q_2,q_3\})\\ \{g_1,g_2,q_1,q_2,q_3\}=\{1,2,3,4,5\}}} a_{g_1g_2,q_1q_2q_3}=$$

$$=a_{12,345}+a_{13,245}+a_{14,235}+a_{15,234}+a_{23,145}+a_{24,135}+$$

$$+a_{25,134}+a_{34,125}+a_{35,124}+a_{45,123},$$

$$\sum_{\substack{(\{\{g_1,g_2\},\{g_3,g_4\}\},\{q_1\})\\ \{g_1,g_2,g_3,g_4,q_1\}=\{1,2,3,4,5\}}} a_{g_1g_2,g_3g_4,q_1}=$$

$$=a_{12,34,5}+a_{13,24,5}+a_{14,23,5}+a_{12,35,4}+a_{13,25,4}+a_{15,23,4}+$$
$$+a_{12,54,3}+a_{15,24,3}+a_{14,25,3}+a_{15,34,2}+a_{13,54,2}+a_{14,53,2}+$$
$$+a_{52,34,1}+a_{53,24,1}+a_{54,23,1}.$$

Now we can write (6) as

$$J[\psi^{(k)}]_{T,t}=\underset{p_1,\ldots,p_k\to\infty}{\text{l.i.m.}}\sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k}C_{j_k\ldots j_1}\left(\prod_{l=1}^{k}\zeta_{j_l}^{(i_l)}+\sum_{r=1}^{[k/2]}(-1)^r\times\right.$$

$$\left.\times\sum_{\substack{(\{\{g_1,g_2\},\ldots,\{g_{2r-1},g_{2r}\}\},\{q_1,\ldots,q_{k-2r}\})\\ \{g_1,g_2,\ldots,g_{2r-1},g_{2r},q_1,\ldots,q_{k-2r}\}=\{1,2,\ldots,k\}}}\prod_{s=1}^{r}\mathbf{1}_{\{i_{g_{2s-1}}=\ i_{g_{2s}}\ne 0\}}\mathbf{1}_{\{j_{g_{2s-1}}=\ j_{g_{2s}}\}}\prod_{l=1}^{k-2r}\zeta_{j_{q_l}}^{(i_{q_l})}\right), \tag{48}$$

where $[x]$ is an integer part of a real number x, $\prod\limits_{\emptyset}\stackrel{\sf def}{=}1$, $\sum\limits_{\emptyset}\stackrel{\sf def}{=}0$; another notations are the same as in Theorem 1.

another notations are the same as in Theorem **1**.

In particular, from (48) for $k=5$ we obtain

$$J[\psi^{(5)}]_{T,t}=\underset{p_1,\ldots,p_5\to\infty}{\text{l.i.m.}}\sum_{j_1=0}^{p_1}\ldots\sum_{j_5=0}^{p_5}C_{j_5\ldots j_1}\left(\prod_{l=1}^{5}\zeta_{j_l}^{(i_l)}-\right.$$

$$-\sum_{\substack{(\{g_1,g_2\},\{q_1,q_2,q_3\})\\ \{g_1,g_2,q_1,q_2,q_3\}=\{1,2,3,4,5\}}}\mathbf{1}_{\{i_{g_1}=\ i_{g_2}\ne 0\}}\mathbf{1}_{\{j_{g_1}=\ j_{g_2}\}}\prod_{l=1}^{3}\zeta_{j_{q_l}}^{(i_{q_l})}+$$

$$\left.+\sum_{\substack{(\{\{g_1,g_2\},\{g_3,g_4\}\},\{q_1\})\\ \{g_1,g_2,g_3,g_4,q_1\}=\{1,2,3,4,5\}}}\mathbf{1}_{\{i_{g_1}=\ i_{g_2}\ne 0\}}\mathbf{1}_{\{j_{g_1}=\ j_{g_2}\}}\mathbf{1}_{\{i_{g_3}=\ i_{g_4}\ne 0\}}\mathbf{1}_{\{j_{g_3}=\ j_{g_4}\}}\zeta_{j_{q_1}}^{(i_{q_1})}\right).$$

The last equality obviously agrees with (14).

Further, we will use the definition of the multiple Wiener stochastic integral from [68], [69] to generalize Theorem 1 to the case of an arbitrary complete orthonormal system of functions in the space $L_2([t,T])$ and $\psi_1(\tau),\ldots,\psi_k(\tau)\in L_2([t,T])$.

Consider the following step function on the hypercube $[t,T]^k$

$$\Phi_N(t_1,\ldots,t_k)=\sum_{l_1,\ldots,l_k=0}^{N-1}a_{l_1\ldots l_k}\mathbf{1}_{[\tau_{l_1},\tau_{l_1+1})}(t_1)\ldots\mathbf{1}_{[\tau_{l_k},\tau_{l_k+1})}(t_k), \tag{49}$$

where $a_{l_1\ldots l_k}\in\mathbb{R}$ and such that $a_{l_1\ldots l_k}=0$ if $l_p=l_q$ for some $p\ne q$,

$$\mathbf{1}_A(\tau)=\begin{cases}1 & \text{if } \tau\in A\\ \\ 0 & \text{otherwise}\end{cases},$$

$N\in\mathbb{N}$, $\{\tau_j\}_{j=0}^N$ is a partition of $[t,T]$, which satisfies the condition (5):

$$t=\tau_0<\ldots<\tau_N=T,\quad \Delta_N=\max_{0\le j\le N-1}\Delta\tau_j\to 0\ \ \text{if}\ \ N\to\infty,\quad \Delta\tau_j=\tau_{j+1}-\tau_j. \tag{50}$$

Let us define the multiple Wiener stochastic integral for $\Phi_N(t_1,\ldots,t_k)$ [68], [69]

$$J'[\Phi_N]_{T,t}^{(i_1\ldots i_k)}\stackrel{\text{def}}{=}\sum_{l_1,\ldots,l_k=0}^{N-1}a_{l_1\ldots l_k}\Delta\mathbf{w}_{\tau_{l_1}}^{(i_1)}\ldots\Delta\mathbf{w}_{\tau_{l_k}}^{(i_k)}, \tag{51}$$

where $\Delta\mathbf{w}_{\tau_j}^{(i)}=\mathbf{w}_{\tau_{j+1}}^{(i)}-\mathbf{w}_{\tau_j}^{(i)}$, $i=0,1,\ldots,m$, $\mathbf{w}_\tau^{(0)}=\tau$.

It is known (see [69], Lemma 9.6.4) that for any $\Phi(t_1,\ldots,t_k)\in L_2([t,T]^k)$ there exists a sequence of step functions $\Phi_N(t_1,\ldots,t_k)$ of the form (49) such that

$$\lim_{N\to\infty}\int\limits_{[t,T]^k}\left(\Phi(t_1,\ldots,t_k)-\Phi_N(t_1,\ldots,t_k)\right)^2dt_1\ldots dt_k=0. \tag{52}$$

We have

$$\Phi_N(t_1,\ldots,t_k)=\sum_{l_1,\ldots,l_k=0}^{N-1}a_{l_1\ldots l_k}\mathbf{1}_{[\tau_{l_1},\tau_{l_1+1})}(t_1)\ldots\mathbf{1}_{[\tau_{l_k},\tau_{l_k+1})}(t_k)=$$

$$=\sum_{(l_1,\ldots,l_k)}\sum_{\substack{l_1,\ldots,l_k=0\\ l_1<l_2<\ldots<l_k}}^{N-1}a_{l_1\ldots l_k}\mathbf{1}_{[\tau_{l_1},\tau_{l_1+1})}(t_1)\ldots\mathbf{1}_{[\tau_{l_k},\tau_{l_k+1})}(t_k), \tag{53}$$

where permutations $(l_1,\ldots,l_k)$ when summing are performed only in the expression $l_1<l_2<\ldots<l_k$ (recall that $a_{l_1\ldots l_k}=0$ if $l_p=l_q$ for some $p\neq q$).

Using (53), we get

$$\sum_{(t_1,\ldots,t_k)}\int\limits_t^T\ldots\int\limits_t^{t_2}\Phi_N(t_1,\ldots,t_k)d\mathbf{w}_{t_1}^{(i_1)}\ldots d\mathbf{w}_{t_k}^{(i_k)}= \tag{54}$$

$$=\sum_{(l_1,\ldots,l_k)}\sum_{\substack{l_1,\ldots,l_k=0\\ l_1<l_2<\ldots<l_k}}^{N-1}a_{l_1\ldots l_k}\Delta\mathbf{w}_{\tau_{l_1}}^{(i_1)}\ldots\Delta\mathbf{w}_{\tau_{l_k}}^{(i_k)}=$$

$$=\sum_{\substack{l_1,\ldots,l_k=0\\ l_q\neq l_r;\ q\neq r;\ q,r=1,\ldots,k}}^{N-1}a_{l_1\ldots l_k}\Delta\mathbf{w}_{\tau_{l_1}}^{(i_1)}\ldots\Delta\mathbf{w}_{\tau_{l_k}}^{(i_k)}=$$

$$= J'[\Phi_N]_{T,t}^{(i_1\ldots i_k)} \quad \text{w. p. 1,} \tag{55}$$

where permutations $(t_1,\ldots,t_k)$ when summing are performed only in the values $d\mathbf{w}_{t_1}^{(i_1)}\ldots d\mathbf{w}_{t_k}^{(i_k)}$ and permutations $(l_1,\ldots,l_k)$ when summing are performed only in the expression $l_1 < l_2 < \ldots < l_k$. At the same time the indices near upper limits of integration in the iterated stochastic integrals in (54) are changed correspondently and if t_r swapped with t_q in the permutation $(t_1,\ldots,t_k)$, then i_r swapped with i_q in the permutation $(i_1,\ldots,i_k)$ (see (54)). In addition, the multiple Wiener stochastic integral $J'[\Phi_N]_{T,t}^{(i_1\ldots i_k)}$ is defined by (51) and

$$\int\limits_t^T \ldots \int\limits_t^{t_2} \Phi_N(t_1,\ldots,t_k)d\mathbf{w}_{t_1}^{(i_1)}\ldots d\mathbf{w}_{t_k}^{(i_k)}$$

is the iterated Ito stochastic integral.

Since the integration of a bounded function with respect to the set of measure zero for Lebesgue integrals gives zero result, then the following formula is correct for these integrals

$$\int\limits_{[t,T]^k} |G(t_1,\ldots,t_k)|dt_1\ldots dt_k = \sum_{(t_1,\ldots,t_k)} \int\limits_t^T \ldots \int\limits_t^{t_2} |G(t_1,\ldots,t_k)|dt_1\ldots dt_k, \tag{56}$$

where permutations $(t_1,\ldots,t_k)$ when summing are performed only in the values $dt_1,\ldots,dt_k$. At the same time the indexes near upper limits of integration are changed correspondently and the function $|G(t_1,\ldots,t_k)|$ is assumed to be integrable in the hypercube $[t,T]^k$.

Using (52), (55), (56), and standard moment properties of the Ito stochastic integral, we have

$$\mathsf{M}\left\{\left(J'[\Phi_N]_{T,t}^{(i_1\ldots i_k)} - J'[\Phi_M]_{T,t}^{(i_1\ldots i_k)}\right)^2\right\} \le$$

$$\le C_k \sum_{(t_1,\ldots,t_k)} \int\limits_t^T \ldots \int\limits_t^{t_2} \left(\Phi_N(t_1,\ldots,t_k) - \Phi_M(t_1,\ldots,t_k)\right)^2 dt_1\ldots dt_k =$$

$$= C_k \int\limits_{[t,T]^k} \left(\Phi_N(t_1,\ldots,t_k) - \Phi_M(t_1,\ldots,t_k)\right)^2 dt_1\ldots dt_k =$$

$$= C_k \left\|\Phi_N - \Phi_M\right\|^2_{L_2([t,T]^k)} \le$$

$$\le 2C_k \left(\left\|\Phi_N - \Phi\right\|^2_{L_2([t,T]^k)} + \left\|\Phi - \Phi_M\right\|^2_{L_2([t,T]^k)}\right)^2 \to 0$$

if $N, M \to \infty$, where constant C_k depends only on the multiplicity k of the multiple Wiener stochastic integral.

Thus, there exists the limit

$$\underset{N\to\infty}{\text{l.i.m.}}\ J'[\Phi_N]_{T,t}^{(i_1\ldots i_k)}.$$

We will define the multiple Wiener stochastic integral for $\Phi(t_1,\ldots,t_k)\in L_2([t,T]^k)$ by the formula

$$J'[\Phi]_{T,t}^{(i_1\ldots i_k)} \stackrel{\rm def}{=} \underset{N\to\infty}{\rm l.i.m.}\ J'[\Phi_N]_{T,t}^{(i_1\ldots i_k)} = \underset{N\to\infty}{\rm l.i.m.} \sum_{l_1,\ldots,l_k=0}^{N-1} a_{l_1\ldots l_k}\Delta\mathbf{w}_{\tau_{l_1}}^{(i_1)}\ldots\Delta\mathbf{w}_{\tau_{l_k}}^{(i_k)}, \tag{57}$$

where $\Phi_N(t_1,\ldots,t_k)$ is defined by (49), $\Delta\mathbf{w}_{\tau_j}^{(i)}=\mathbf{w}_{\tau_{j+1}}^{(i)}-\mathbf{w}_{\tau_j}^{(i)}$, $i=0,1,\ldots,m$, $\mathbf{w}_{\tau}^{(0)}=\tau$.

Let us prove the following equality

$$J'[\Phi]_{T,t}^{(i_1\ldots i_k)} = \sum_{(t_1,\ldots,t_k)} \int\limits_t^T\ldots\int\limits_t^{t_2}\Phi(t_1,\ldots,t_k)d\mathbf{w}_{t_1}^{(i_1)}\ldots d\mathbf{w}_{t_k}^{(i_k)}\quad \text{w. p. 1}, \tag{58}$$

where permutations $(t_1,\ldots,t_k)$ when summing are performed only in the values $d\mathbf{w}_{t_1}^{(i_1)}\ldots\ d\mathbf{w}_{t_k}^{(i_k)}$. At the same time the indices near upper limits of integration in the iterated stochastic integrals are changed correspondently and if t_r swapped with t_q in the permutation $(t_1,\ldots,t_k)$, then i_r swapped with i_q in the permutation $(i_1,\ldots,i_k)$. In addition, the multiple Wiener stochastic integral $J'[\Phi]_{T,t}^{(i_1\ldots i_k)}$ is defined by (57) and

$$\int\limits_t^T\ldots\int\limits_t^{t_2}\Phi(t_1,\ldots,t_k)d\mathbf{w}_{t_1}^{(i_1)}\ldots d\mathbf{w}_{t_k}^{(i_k)}$$

is the iterated Ito stochastic integral.

The equality (58) has already been proved for the case $\Phi(t_1,\ldots,t_k)=\Phi_N(t_1,\ldots,t_k)$ (see (55)). From (55) we have

$$J'[\Phi_N]_{T,t}^{(i_1\ldots i_k)} = \sum_{(t_1,\ldots,t_k)} \int\limits_t^T\ldots\int\limits_t^{t_2}\Phi_N(t_1,\ldots,t_k)d\mathbf{w}_{t_1}^{(i_1)}\ldots d\mathbf{w}_{t_k}^{(i_k)} =$$

$$= \sum_{(t_1,\ldots,t_k)} \int\limits_t^T\ldots\int\limits_t^{t_2}\Phi(t_1,\ldots,t_k)d\mathbf{w}_{t_1}^{(i_1)}\ldots d\mathbf{w}_{t_k}^{(i_k)}+$$

$$+\sum_{(t_1,\ldots,t_k)} \int\limits_t^T\ldots\int\limits_t^{t_2}\left(\Phi_N(t_1,\ldots,t_k)-\Phi(t_1,\ldots,t_k)\right)d\mathbf{w}_{t_1}^{(i_1)}\ldots d\mathbf{w}_{t_k}^{(i_k)}\quad \text{w. p. 1}. \tag{59}$$

Passing to the limit $\underset{N\to\infty}{\rm l.i.m.}$ in the equality (59), we obtain

$$J'[\Phi]_{T,t}^{(i_1\ldots i_k)} = \sum_{(t_1,\ldots,t_k)} \int\limits_t^T\ldots\int\limits_t^{t_2}\Phi(t_1,\ldots,t_k)d\mathbf{w}_{t_1}^{(i_1)}\ldots d\mathbf{w}_{t_k}^{(i_k)}+$$

$$+\underset{N\to\infty}{\rm l.i.m.}\sum_{(t_1,\ldots,t_k)} \int\limits_t^T\ldots\int\limits_t^{t_2}\left(\Phi_N(t_1,\ldots,t_k)-\Phi(t_1,\ldots,t_k)\right)d\mathbf{w}_{t_1}^{(i_1)}\ldots d\mathbf{w}_{t_k}^{(i_k)}\quad \text{w. p. 1}. \tag{60}$$

Using (52), (56), and standard moment properties of the Ito stochastic integral, we get

$$\mathsf{M}\left\{\left(\sum_{(t_1,\ldots,t_k)}\int\limits_t^T\ldots\int\limits_t^{t_2}\left(\Phi_N(t_1,\ldots,t_k)-\Phi(t_1,\ldots,t_k)\right)d\mathbf{w}_{t_1}^{(i_1)}\ldots d\mathbf{w}_{t_k}^{(i_k)}\right)^2\right\}\le$$

$$\le C_k\sum_{(t_1,\ldots,t_k)}\int\limits_t^T\ldots\int\limits_t^{t_2}\left(\Phi_N(t_1,\ldots,t_k)-\Phi(t_1,\ldots,t_k)\right)^2dt_1\ldots dt_k=$$

$$=C_k\int\limits_{[t,T]^k}\left(\Phi_N(t_1,\ldots,t_k)-\Phi(t_1,\ldots,t_k)\right)^2dt_1\ldots dt_k\ \to 0 \tag{61}$$

if $N\to\infty$, where constant C_k depends only on the multiplicity k of the multiple Wiener stochastic integral.

The relations (60) and (61) prove the equality (58). From (58) we have

$$J[\psi^{(k)}]_{T,t}^{(i_1\ldots i_k)}=\int\limits_t^T\psi_k(t_k)\ldots\int\limits_t^{t_2}\psi_1(t_1)d\mathbf{w}_{t_1}^{(i_1)}\ldots d\mathbf{w}_{t_k}^{(i_k)}=J'[K]_{T,t}^{(i_1\ldots i_k)}\quad \text{w. p. 1}, \tag{62}$$

where $J[\psi^{(k)}]_{T,t}^{(i_1\ldots i_k)}$ is the iterated Ito stochastic integral (1), $K=K(t_1,\ldots,t_k)$ is defined by (2), i.e.

$$K(t_1,\ldots,t_k)=\begin{cases}\psi_1(t_1)\ldots\psi_k(t_k), & t_1<\ldots<t_k\\ \\ 0, & \text{otherwise}\end{cases}, \tag{63}$$

where $\psi_1(\tau),\ldots,\psi_k(\tau)\in L_2([t,T])$, $t_1,\ldots,t_k\in[t,T]$ $(k\ge 2)$ and $K(t_1)\equiv\psi_1(t_1)$ for $t_1\in[t,T]$.

Applying (62) and the linearity property of the Ito stochastic integral, we obtain

$$J[\psi^{(k)}]_{T,t}^{(i_1\ldots i_k)}=J'[K]_{T,t}^{(i_1\ldots i_k)}=$$

$$=\sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k}C_{j_k\ldots j_1}J'[\phi_{j_1}\ldots\phi_{j_k}]_{T,t}^{(i_1\ldots i_k)}+J'[R_{p_1\ldots p_k}]_{T,t}^{(i_1\ldots i_k)}\quad \text{w. p. 1}, \tag{64}$$

where

$$R_{p_1\ldots p_k}(t_1,\ldots,t_k)\stackrel{\text{def}}{=}K(t_1,\ldots,t_k)-\sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k}C_{j_k\ldots j_1}\prod_{l=1}^k\phi_{j_l}(t_l)$$

and

$$C_{j_k\ldots j_1}=\int\limits_{[t,T]^k}K(t_1,\ldots,t_k)\prod_{l=1}^k\phi_{j_l}(t_l)dt_1\ldots dt_k \tag{65}$$

is the Fourier coefficient corresponding to $K(t_1,\ldots,t_k)$.

Again applying (58), we have

$$J'[R_{p_1\ldots p_k}]_{T,t}^{(i_1\ldots i_k)}=$$

$$=\sum_{(t_1,\ldots,t_k)}\int\limits_t^T\ldots\int\limits_t^{t_2}\left(K(t_1,\ldots,t_k)-\sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k}C_{j_k\ldots j_1}\prod_{l=1}^k\phi_{j_l}(t_l)\right)d\mathbf{w}_{t_1}^{(i_1)}\ldots d\mathbf{w}_{t_k}^{(i_k)}, \tag{66}$$

where permutations $(t_1,\ldots,t_k)$ when summing are performed only in the values $d\mathbf{w}_{t_1}^{(i_1)}\ldots d\mathbf{w}_{t_k}^{(i_k)}$. At the same time the indices near upper limits of integration in the iterated stochastic integrals are changed correspondently and if t_r swapped with t_q in the permutation $(t_1,\ldots,t_k)$, then i_r swapped with i_q in the permutation $(i_1,\ldots,i_k)$. In addition, the multiple Wiener stochastic integral $J'[R_{p_1\ldots p_k}]_{T,t}^{(i_1\ldots i_k)}$ is defined by (57).

According to (3), (56), and the standard moment properties of the Ito stochastic integral, we have

$$\mathsf{M}\left\{\left(J'[R_{p_1\ldots p_k}]_{T,t}^{(i_1\ldots i_k)}\right)^2\right\}\le$$

$$\le C_k\sum_{(t_1,\ldots,t_k)}\int\limits_t^T\ldots\int\limits_t^{t_2}\left(K(t_1,\ldots,t_k)-\sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k}C_{j_k\ldots j_1}\prod_{l=1}^k\phi_{j_l}(t_l)\right)^2dt_1\ldots dt_k=$$

$$=C_k\int\limits_{[t,T]^k}\left(K(t_1,\ldots,t_k)-\sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k}C_{j_k\ldots j_1}\prod_{l=1}^k\phi_{j_l}(t_l)\right)^2dt_1\ldots dt_k\to 0 \tag{67}$$

if $p_1,\ldots,p_k\to\infty$, where constant C_k depends only on the multiplicity k of the iterated Ito stochastic integral $J[\psi^{(k)}]_{T,t}^{(i_1\ldots i_k)}$.

Applying (64) and (67), we obtain the following expansion

$$J[\psi^{(k)}]_{T,t}^{(i_1\ldots i_k)}=\underset{p_1,\ldots,p_k\to\infty}{\text{l.i.m.}}\sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k}C_{j_k\ldots j_1}J'[\phi_{j_1}\ldots\phi_{j_k}]_{T,t}^{(i_1\ldots i_k)}. \tag{68}$$

In [13] (Sect. 1.14, Theorem 1.23), [51] (Theorem 5) it is shown that

$$J'[\phi_{j_1}\ldots\phi_{j_k}]_{T,t}^{(i_1\ldots i_k)}=\prod_{l=1}^k\zeta_{j_l}^{(i_l)}+\sum_{r=1}^{[k/2]}(-1)^r\times$$

$$\times\sum_{\substack{(\{\{g_1,g_2\},\ldots,\{g_{2r-1},g_{2r}\}\},\{q_1,\ldots,q_{k-2r}\})\\ \{g_1,g_2,\ldots,g_{2r-1},g_{2r},q_1,\ldots,q_{k-2r}\}=\{1,2,\ldots,k\}}}\prod_{s=1}^r\mathbf{1}_{\{i_{g_{2s-1}}=\ i_{g_{2s}}\ne 0\}}\mathbf{1}_{\{j_{g_{2s-1}}=\ j_{g_{2s}}\}}\prod_{l=1}^{k-2r}\zeta_{j_{q_l}}^{(i_{q_l})} \tag{69}$$

w. p. 1, where $\{\phi_j(x)\}_{j=0}^{\infty}$ is an arbitrary complete orthonormal system of functions in the space $L_2([t,T])$, $i_1,\ldots,i_k=0,1,\ldots,m$, $J'[\phi_{j_1}\ldots\phi_{j_k}]_{T,t}^{(i_1\ldots i_k)}$ is defined by (57), $[x]$ is an integer part of a real number x, $\prod_{\emptyset}\stackrel{\sf def}{=}1$, $\sum_{\emptyset}\stackrel{\sf def}{=}0$; another notations are the same as in Theorem 1.

Note that the right-hand side of (69) is nothing but the Hermite polynomial of random vector argument with components $\zeta_{j_1}^{(i_1)},\ldots,\zeta_{j_k}^{(i_k)}$.

The equalities (68) and (69) prove Theorem 1 for the case of an arbitrary complete orthonormal systems of functions $\{\phi_j(x)\}_{j=0}^{\infty}$ is in the space $L_2([t,T])$ and $\psi_1(\tau),\ldots,\psi_k(\tau)\in L_2([t,T])$.

Let us find the representation of the right-hand side of (69) through the product of Hermite polynomials of scalar arguments.

We will say that the condition $(\star\star)$ *is fulfilled for the multi-index* $(i_1\ldots i_k)$ $(i_1,\ldots,i_k=0,1,\ldots,m)$ *if* $m_1,\ldots,m_k$ *are multiplicities of the elements* $i_1,\ldots,i_k$, *respectively, i.e.*

$$\{i_1,\ldots,i_k\}=\{\overbrace{i_1,\ldots,i_1}^{m_1},\overbrace{i_2,\ldots,i_2}^{m_2},\ldots,\overbrace{i_r,\ldots,i_r}^{m_r}\},$$

where $r=1,\ldots,k$, *braces mean an unordered set, and parentheses mean an ordered set. At that,* $m_1+\ldots+m_k=k$, $m_1,\ldots,m_k=0,1,\ldots,k$, *and all elements with nonzero multiplicities are pairwise different.*

Let the condition $(\star\star)$ is fulfilled for the multi-index $(i_1\ldots i_k)$. Then

$$J'\left[\phi_{j_1}\ldots\phi_{j_k}\right]_{T,t}^{(i_1\ldots i_k)}=J'\Biggl[\underbrace{\phi_{j_{g_1}}\ldots\phi_{j_{g_{m_1}}}}_{m_1}\underbrace{\phi_{j_{g_{m_1+1}}}\ldots\phi_{j_{g_{m_1+m_2}}}}_{m_2}\ldots$$

$$\ldots\underbrace{\phi_{j_{g_{m_1+m_2+\ldots+m_{k-1}+1}}}\ldots\phi_{j_{g_{m_1+m_2+\ldots+m_k}}}}_{m_k}\Biggr]_{T,t}^{(\overbrace{i_1\ldots i_1}^{m_1}\overbrace{i_2\ldots i_2}^{m_2}\ldots\overbrace{i_k\ldots i_k}^{m_k})} \tag{70}$$

w. p. 1, where $J'\left[\phi_{j_1}\ldots\phi_{j_k}\right]_{T,t}^{(i_1\ldots i_k)}$ is defined by (57), $\Phi(t_1,\ldots,t_k)=\phi_{j_1}(t_1)\ldots\phi_{j_k}(t_k)$, $\{\phi_j(x)\}_{j=0}^{\infty}$ is an arbitrary complete orthonormal system of functions in the space $L_2([t,T])$, $\{j_{g_1},\ldots,j_{g_{m_1+m_2+\ldots+m_k}}\}$ $=\{j_1,\ldots,j_k\}$, braces mean an unordered set, and parentheses mean an ordered set.

From (70) we have

$$J'\left[\phi_{j_1}\ldots\phi_{j_k}\right]_{T,t}^{(i_1\ldots i_k)}=$$

$$=J'\left[\phi_{j_{g_1}}\ldots\phi_{j_{g_{m_1}}}\right]_{T,t}^{(\overbrace{i_1\ldots i_1}^{m_1})}\cdot J'\left[\phi_{j_{g_{m_1+1}}}\ldots\phi_{j_{g_{m_1+m_2}}}\right]_{T,t}^{(\overbrace{i_2\ldots i_2}^{m_2})}\cdot\ldots$$

$$\ldots\cdot J'\left[\phi_{j_{g_{m_1+m_2+\ldots+m_{k-1}+1}}}\ldots\phi_{j_{g_{m_1+m_2+\ldots+m_k}}}\right]_{T,t}^{(\overbrace{i_k\ldots i_k}^{m_k})} \tag{71}$$

w. p. 1, where

$$J'\left[\phi_{j_{g_{m_1+m_2+\ldots+m_{l-1}+1}}}\ldots\phi_{j_{g_{m_1+m_2+\ldots+m_l}}}\right]_{T,t}^{(\overbrace{i_l\ldots i_l}^{m_l})} \stackrel{\sf def}{=} 1 \quad \hbox{for} \quad m_l=0. \tag{72}$$

The detailed proof of the equality (71) is given in [13] (Sect. 1.14), [51], Sect. 2.2).

Let us consider the following multiple Wiener stochastic integral

$$J'\left[\phi_{j_{g_{m_1+m_2+\ldots+m_{l-1}+1}}}\ldots\phi_{j_{g_{m_1+m_2+\ldots+m_l}}}\right]_{T,t}^{(\overbrace{i_l\ldots i_l}^{m_l})} \qquad (m_l>0),$$

where we suppose that

$$\left\{j_{g_{m_1+m_2+\ldots+m_{l-1}+1}},\ldots,j_{g_{m_1+m_2+\ldots+m_l}}\right\}=$$
$$=\bigl\{\underbrace{j_{h_{1,l}},\ldots,j_{h_{1,l}}}_{n_{1,l}},\underbrace{j_{h_{2,l}},\ldots,j_{h_{2,l}}}_{n_{2,l}},\ldots,\underbrace{j_{h_{d_l,l}},\ldots,j_{h_{d_l,l}}}_{n_{d_l,l}}\bigr\}, \tag{73}$$

where $n_{1,l}+n_{2,l}+\ldots+n_{d_l,l}=m_l;\ \ n_{1,l},n_{2,l},\ldots,n_{d_l,l}=1,\ldots,m_l;\ \ d_l=1,\ldots,m_l;\ \ l=1,\ldots,k.$ Note that the numbers $m_1,\ldots,m_k,\ g_1,\ldots,g_k$ depend on $(i_1,\ldots,i_k)$ and the numbers $n_{1,l},\ldots,n_{d_l,l}$, $h_{1,l},\ldots,h_{d_l,l}$, d_l depend on $\{j_1,\ldots,j_k\}$. Moreover, $\{j_{g_1},\ldots,j_{g_k}\}=\{j_1,\ldots,j_k\}$.

Using Theorem 9.6.9 [69] (also see [68], Theorem 3.1), we get w. p. 1

$$J'\left[\phi_{j_{g_{m_1+m_2+\ldots+m_{l-1}+1}}}\ldots\phi_{j_{g_{m_1+m_2+\ldots+m_l}}}\right]_{T,t}^{(\overbrace{i_l\ldots i_l}^{m_l})}=$$

$$=\begin{cases} H_{n_{1,l}}\left(\zeta_{j_{h_{1,l}}}^{(i_l)}\right)\ldots H_{n_{d_l,l}}\left(\zeta_{j_{h_{d_l,l}}}^{(i_l)}\right), & \hbox{if} \quad i_l\ne 0\\ \left(\zeta_{j_{h_{1,l}}}^{(0)}\right)^{n_{1,l}}\ldots\left(\zeta_{j_{h_{d_l,l}}}^{(0)}\right)^{n_{d_l,l}}, & \hbox{if} \quad i_l=0\end{cases} \qquad (m_l>0), \tag{74}$$

where $H_n(x)$ is the Hermite polynomial of degree n

$$H_n(x)=(-1)^n e^{x^2/2}\frac{d^n}{dx^n}\left(e^{-x^2/2}\right)$$

or

$$H_n(x)=n!\sum_{m=0}^{[n/2]}\frac{(-1)^m x^{n-2m}}{m!(n-2m)!2^m} \quad (n\in\mathbb{N}), \tag{75}$$

and $\zeta_j^{(i)}$ $(i=0,1,\ldots,m,\ j=0,1,\ldots)$ is defined by (7).

Note that the equality (74) is proved in [13], [51] using the Ito formula (see the detailed proof in [13] (Sect. 1.14) or [51], Sect. 2.2).

From (72) and (74) we obtain w. p. 1

$$J'\left[\phi_{j_{g_{m_1+m_2+\ldots+m_{l-1}+1}}}\ldots\phi_{j_{g_{m_1+m_2+\ldots+m_l}}}\right]_{T,t}^{(\overbrace{i_l\ldots i_l}^{m_l})}=$$

$$=\mathbf{1}_{\{m_l=0\}}+\mathbf{1}_{\{m_l>0\}}\begin{cases}H_{n_{1,l}}\left(\zeta_{j_{h_{1,l}}}^{(i_l)}\right)\ldots H_{n_{d_l,l}}\left(\zeta_{j_{h_{d_l,l}}}^{(i_l)}\right), & \text{if}\quad i_l\neq 0\\ \left(\zeta_{j_{h_{1,l}}}^{(0)}\right)^{n_{1,l}}\ldots\left(\zeta_{j_{h_{d_l,l}}}^{(0)}\right)^{n_{d_l,l}}, & \text{if}\quad i_l=0\end{cases}, \tag{76}$$

where $\mathbf{1}_A$ denotes the indicator of the set A.

Using (69), (71), and (76), we get w. p. 1

$$J'\left[\phi_{j_1}\ldots\phi_{j_k}\right]_{T,t}^{(i_1\ldots i_k)}=$$

$$=\prod_{l=1}^{k}\left(\mathbf{1}_{\{m_l=0\}}+\mathbf{1}_{\{m_l>0\}}\begin{cases}H_{n_{1,l}}\left(\zeta_{j_{h_{1,l}}}^{(i_l)}\right)\ldots H_{n_{d_l,l}}\left(\zeta_{j_{h_{d_l,l}}}^{(i_l)}\right), & \text{if}\quad i_l\neq 0\\ \left(\zeta_{j_{h_{1,l}}}^{(0)}\right)^{n_{1,l}}\ldots\left(\zeta_{j_{h_{d_l,l}}}^{(0)}\right)^{n_{d_l,l}}, & \text{if}\quad i_l=0\end{cases}\right)= \tag{77}$$

$$=\prod_{l=1}^{k}\zeta_{j_l}^{(i_l)}+\sum_{r=1}^{[k/2]}(-1)^r\times$$

$$\times\sum_{\substack{(\{\{g_1,g_2\},\ldots,\{g_{2r-1},g_{2r}\}\},\{q_1,\ldots,q_{k-2r}\})\\ \{g_1,g_2,\ldots,g_{2r-1},g_{2r},q_1,\ldots,q_{k-2r}\}=\{1,2,\ldots,k\}}}\prod_{s=1}^{r}\mathbf{1}_{\{i_{g_{2s-1}}=\ i_{g_{2s}}\neq 0\}}\mathbf{1}_{\{j_{g_{2s-1}}=\ j_{g_{2s}}\}}\prod_{l=1}^{k-2r}\zeta_{j_{q_l}}^{(i_{q_l})} \tag{78}$$

w. p. 1, where the multiple Wiener stochastic integral $J'[\phi_{j_1}\ldots\phi_{j_k}]_{T,t}^{(i_1\ldots i_k)}$ is defined by (57); another notations are the same as in (69).

Thus, the following theorem is proved.

Theorem 3 [13] (Sect. 1.11), [27] (Sect. 15). *Suppose that the condition* $(\star\star)$ *is fulfilled for the multi-index* $(i_1\ldots i_k)$ *and the condition* (73) *is also fulfilled. Furthermore, let* $\psi_l(\tau)\in L_2([t,T])$ $(l=1,\ldots,k)$ *and* $\{\phi_j(x)\}_{j=0}^{\infty}$ *is an arbitrary complete orthonormal system of functions in the space* $L_2([t,T])$. *Then the following expansions*

$$J[\psi^{(k)}]_{T,t}^{(i_1\ldots i_k)}=\underset{p_1,\ldots,p_k\to\infty}{\text{l.i.m.}}\sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k}C_{j_k\ldots j_1}\times$$

$$\times\prod_{l=1}^{k}\left(\mathbf{1}_{\{m_l=0\}}+\mathbf{1}_{\{m_l>0\}}\begin{cases}H_{n_{1,l}}\left(\zeta_{j_{h_{1,l}}}^{(i_l)}\right)\ldots H_{n_{d_l,l}}\left(\zeta_{j_{h_{d_l,l}}}^{(i_l)}\right), & \text{if}\quad i_l\neq 0\\ \left(\zeta_{j_{h_{1,l}}}^{(0)}\right)^{n_{1,l}}\ldots\left(\zeta_{j_{h_{d_l,l}}}^{(0)}\right)^{n_{d_l,l}}, & \text{if}\quad i_l=0\end{cases}\right), \tag{79}$$

$$J[\psi^{(k)}]_{T,t}^{(i_1\ldots i_k)}=\underset{p_1,\ldots,p_k\to\infty}{\text{l.i.m.}}\sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k}C_{j_k\ldots j_1}\Biggl(\prod_{l=1}^{k}\zeta_{j_l}^{(i_l)}+\sum_{r=1}^{[k/2]}(-1)^r\times$$

$$\times\sum_{\substack{(\{\{g_1,g_2\},\ldots,\{g_{2r-1},g_{2r}\}\},\{q_1,\ldots,q_{k-2r}\})\\ \{g_1,g_2,\ldots,g_{2r-1},g_{2r},q_1,\ldots,q_{k-2r}\}=\{1,2,\ldots,k\}}}\prod_{s=1}^{r}\mathbf{1}_{\{i_{g_{2s-1}}=\ i_{g_{2s}}\neq 0\}}\mathbf{1}_{\{j_{g_{2s-1}}=\ j_{g_{2s}}\}}\prod_{l=1}^{k-2r}\zeta_{j_{q_l}}^{(i_{q_l})}\Biggr) \tag{80}$$

converging in the mean-square sense are valid, where $[x]$ *is an integer part of a real number* x, $n_{1,l}+n_{2,l}+\ldots+n_{d_l,l}=m_l$, $n_{1,l},n_{2,l},\ldots,n_{d_l,l}=1,\ldots,m_l$, $d_l=1,\ldots,m_l$, $l=1,\ldots,k$; $m_1+\ldots+m_k=k$, *the numbers* $m_1,\ldots,m_k$, $g_1,\ldots,g_k$ *depend on* $(i_1,\ldots,i_k)$ *and the numbers* $n_{1,l},\ldots,n_{d_l,l}$, $h_{1,l},\ldots,h_{d_l,l}$, d_l *depend on* $\{j_1,\ldots,j_k\}$; *moreover,* $\{j_{g_1},\ldots,j_{g_k}\}=\{j_1,\ldots,j_k\}$; $H_n(x)$ *is the Hermite polynomial* (75); *another notations are the same as in* (69) *and in Theorem* 1.

It should be noted that an analogue of the expansion (79) was considered in [70]. However, the proof of an analogue of the expansion (79) from [70] is different from the proof given in this section (see [51], Sect. 4 for details).

6. Exact Calculation of the Mean-Square Approximation Error in The Method of Generalized Multiple Fourier Series. The Case of an Arbitrary Complete Orthonormal Systems of Functions in the Space $L_2([t,T])$ and Weight Functions $\psi_1(\tau),\ldots,\psi_k(\tau)\in L_2([t,T])$

In this section, we generalize Theorem 2 to the case of an arbitrary complete orthonormal systems of functions in the Space $L_2([t,T])$ and $\psi_1(\tau),\ldots,\psi_k(\tau)\in L_2([t,T])$.

Theorem 4 [27]. *Suppose that* $\psi_1(\tau),\ldots,\psi_k(\tau)\in L_2([t,T])$ *and* $\{\phi_j(x)\}_{j=0}^{\infty}$ *is an arbitrary complete orthonormal system of functions in the space* $L_2([t,T])$. *Then*

$$\mathsf{M}\left\{\left(J[\psi^{(k)}]_{T,t}-J[\psi^{(k)}]_{T,t}^{p}\right)^2\right\}=\int\limits_{[t,T]^k}K^2(t_1,\ldots,t_k)dt_1\ldots dt_k-$$

$$-\sum_{j_1=0}^{p}\ldots\sum_{j_k=0}^{p}C_{j_k\ldots j_1}\mathsf{M}\left\{J[\psi^{(k)}]_{T,t}\sum_{(j_1,\ldots,j_k)}\int\limits_t^T\phi_{j_k}(t_k)\ldots\int\limits_t^{t_2}\phi_{j_1}(t_1)d\mathbf{f}_{t_1}^{(i_1)}\ldots d\mathbf{f}_{t_k}^{(i_k)}\right\}, \tag{81}$$

where

$$J[\psi^{(k)}]_{T,t}=\int\limits_t^T\psi_k(t_k)\ldots\int\limits_t^{t_2}\psi_1(t_1)d\mathbf{f}_{t_1}^{(i_1)}\ldots d\mathbf{f}_{t_k}^{(i_k)},$$

$$J[\psi^{(k)}]_{T,t}^{p}=\sum_{j_1=0}^{p}\ldots\sum_{j_k=0}^{p}C_{j_k\ldots j_1}J'[\phi_{j_1}\ldots\phi_{j_k}]_{T,t}^{(i_1\ldots i_k)}, \tag{82}$$

$J'[\phi_{j_1}\ldots\phi_{j_k}]_{T,t}^{(i_1\ldots i_k)}$ *is the multiple Wiener stochastic integral defined by* (57), *the Fourier coefficient* $C_{j_k\ldots j_1}$ *has the form* (65), $K(t_1,\ldots,t_k)$ *is defined by* (63),

$$\zeta_j^{(i)}=\int\limits_t^T\phi_j(s)d\mathbf{f}_s^{(i)}$$

are independent standard Gaussian random variables for various i *or* j $(i=1,\ldots,m)$,

$$\sum\limits_{(j_1,\ldots,j_k)}$$

means the sum with respect to all possible permutations $(j_1,\ldots,j_k)$. *At the same time if* j_r *swapped with* j_q *in the permutation* $(j_1,\ldots,j_k)$, *then* i_r *swapped with* i_q *in the permutation* $(i_1,\ldots,i_k)$ *(see* (81)*).*

Proof. First, note that the formula (82) appears due to (68). Using the equality (58), we get

$$J'[\phi_{j_1}\ldots\phi_{j_k}]_{T,t}^{(i_1\ldots i_k)}=\sum\limits_{(t_1,\ldots,t_k)}\int\limits_t^T\phi_{j_k}(t_k)\ldots\int\limits_t^{t_2}\phi_{j_1}(t_1)d\mathbf{f}_{t_1}^{(i_1)}\ldots d\mathbf{f}_{t_k}^{(i_k)}\quad\text{w. p. 1,}\tag{83}$$

where permutations $(t_1,\ldots,t_k)$ when summing are performed only in the values $d\mathbf{f}_{t_1}^{(i_1)}\ldots d\mathbf{f}_{t_k}^{(i_k)}$. At the same time the indices near upper limits of integration in the iterated stochastic integrals are changed correspondently and if t_r swapped with t_q in the permutation $(t_1,\ldots,t_k)$, then i_r swapped with i_q in the permutation $(i_1,\ldots,i_k)$.

It is easy to see that the equality (83) can be written in the form

$$J'[\phi_{j_1}\ldots\phi_{j_k}]_{T,t}^{(i_1\ldots i_k)}=\sum\limits_{(j_1,\ldots,j_k)}\int\limits_t^T\phi_{j_k}(t_k)\ldots\int\limits_t^{t_2}\phi_{j_1}(t_1)d\mathbf{f}_{t_1}^{(i_1)}\ldots d\mathbf{f}_{t_k}^{(i_k)}\quad\text{w. p. 1,}\tag{84}$$

where

$$\sum\limits_{(j_1,\ldots,j_k)}$$

means the sum with respect to all possible permutations $(j_1,\ldots,j_k)$. At the same time if j_r swapped with j_q in the permutation $(j_1,\ldots,j_k)$, then i_r swapped with i_q in the permutation.

Further proof of Theorem 4 is based on the equality (84) and is similar to the proof of Theorem 2. Theorem 4 is proved.

7. Estimate for the Mean-Square Approximation Error in the Method of Generalized Multiple Fourier Series

In this section, we prove the useful estimate for the mean-square error of approximation based on Theorem 3.

Theorem 5. *Suppose that* $\psi_1(\tau),\ldots,\psi_k(\tau)\in L_2([t,T])$ *and* $\{\phi_j(x)\}_{j=0}^{\infty}$ *is an arbitrary complete orthonormal system of functions in the space* $L_2([t,T])$. *Then the estimate*

$$\mathsf{M}\left\{\left(J[\psi^{(k)}]_{T,t}-J[\psi^{(k)}]_{T,t}^{p_1,\ldots,p_k}\right)^2\right\}\le$$

(85) $$\le k!\left(\int\limits_{[t,T]^k} K^2(t_1,\ldots,t_k)dt_1\ldots dt_k-\sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k}C^2_{j_k\ldots j_1}\right)$$

is valid for the following cases:

1. $i_1,\ldots,i_k=1,\ldots,m$ *and* $0<T-t<\infty$,
2. $i_1,\ldots,i_k=0,1,\ldots,m,\ \ i_1^2+\ldots+i_k^2>0,$ *and* $0<T-t<1$,

where $J[\psi^{(k)}]_{T,t}$ *is the iterated Ito stochastic integral* (1), $J[\psi^{(k)}]_{T,t}^{p_1,\ldots,p_k}$ *is the expression on the right-hand side of* (80) *before passing to the limit* $\underset{p_1,\ldots,p_k\to\infty}{\text{l.i.m.}}$; *another notations are the same as in Theorem* 3.

Proof. Using (64), (67), (68), Theorem 3, orthonormality of the system $\{\phi_j(x)\}_{j=0}^{\infty}$, and the elementary inequality

(86) $$(a_1+a_2+\ldots+a_n)^2\le n\left(a_1^2+a_2^2+\ldots+a_n^2\right),$$

we obtain for the case $i_1,\ldots,i_k=1,\ldots,m$ $(0<T-t<\infty)$ the following estimate

$$\mathsf{M}\left\{\left(J[\psi^{(k)}]_{T,t}-J[\psi^{(k)}]_{T,t}^{p_1,\ldots,p_k}\right)^2\right\}\le$$

$$\le k!\sum_{(t_1,\ldots,t_k)}\int\limits_t^T\ldots\int\limits_t^{t_2}\left(K(t_1,\ldots,t_k)-\sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k}C_{j_k\ldots j_1}\prod_{l=1}^k\phi_{j_l}(t_l)\right)^2dt_1\ldots dt_k=$$

$$=k!\int\limits_{[t,T]^k}\left(K(t_1,\ldots,t_k)-\sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k}C_{j_k\ldots j_1}\prod_{l=1}^k\phi_{j_l}(t_l)\right)^2dt_1\ldots dt_k$$

$$=k!\left(\int\limits_{[t,T]^k} K^2(t_1,\ldots,t_k)dt_1\ldots dt_k-\sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k}C^2_{j_k\ldots j_1}\right).$$

Similarly using standard moment properties of stochastic integrals, we get

$$\mathsf{M}\left\{\left(J[\psi^{(k)}]_{T,t}-J[\psi^{(k)}]_{T,t}^{p_1,\ldots,p_k}\right)^2\right\}\le$$

$$=C_k\left(\int\limits_{[t,T]^k} K^2(t_1,\ldots,t_k)dt_1\ldots dt_k-\sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k}C^2_{j_k\ldots j_1}\right),$$

where $i_1,\ldots,i_k=0,1,\ldots,m$ $(i_1^2+\ldots+i_k^2>0)$, and C_k is a constant.

It is not difficult to see that C_k depends on k (k is the multiplicity of the iterated Ito stochastic integral) and $T-t$ ($T-t$ is the length of integration interval for the iterated Ito stochastic integral). Moreover, C_k has the following form

$$C_k = k! \cdot \max\biggl\{(T-t)^{\alpha_1},\ (T-t)^{\alpha_2},\ \ldots,\ (T-t)^{\alpha_{k!}}\biggr\},$$

where $\alpha_1, \alpha_2, \ldots, \alpha_{k!} = 0,\ 1, \ldots,\ k-1$.

Then for the case $i_1, \ldots, i_k = 0, 1, \ldots, m$, $i_1^2 + \ldots + i_k^2 > 0$ $(0 < T-t < 1)$ we obtain (85). Theorem 5 is proved.

Example 3. Let us consider the estimate (85) for the iterated Ito stochastic integral $I_{(000)T,t}^{(i_1 i_2 i_3)}$ defined by (43)

$$\mathsf{M}\left\{\left(I_{(000)T,t}^{(i_1 i_2 i_3)} - I_{(000)T,t}^{(i_1 i_2 i_3)p}\right)^2\right\} \le 6\left(\frac{(T-t)^3}{6} - \sum_{j_1,j_2,j_3=0}^{p} C_{j_3 j_2 j_1}^2\right) \quad (i_1, i_2, i_3 = 1, \ldots, m),$$

where $C_{j_3 j_2 j_1}$ has the form (45).

8. Proof of Convergence With Probability 1 in the Method of Generalized Multiple Fourier Series. The Cases of Complete Orthonormal Systems of Legendre Polynomials and Trigonometric Functions in the Space $L_2([t,T])$

Remind that in a lot of author's publications [1]-[51] the convergence in Theorem 1 has been considered in different probability meanings. For example, the mean-square convergence [1] (2006) (also see [2]-[51]) and convergence in the mean of degree $2n$ ($n \in \mathbb{N}$) [3] (2007) (also see [4]-[17], [27]) have been proved. For some specific iterated Ito stochastic integrals of mutiplicities 1 and 2 the convergence with probability 1 also has been proved [3] (2007) (also see [4]-[17], [30]). However, these examples are narrow particular cases of the iterated Ito stochastic integrals (1).

In this section, we formulate and prove the theorem on convergence with probability 1 (w. p. 1) for expansions of iterated Ito stochastic integrals of multiplicity k ($k \in \mathbb{N}$) from Theorems 1, 3.

Let us remind the well-known fact from the mathematical analysis which is connected to existence of iterated limits.

Proposition 1. *Let* $\left\{x_{n,m}\right\}_{n,m=1}^{\infty}$ *be a double sequence and let there exists the limit*

$$\lim_{n,m\to\infty} x_{n,m} = a < \infty.$$

Moreover, let there exist the limits

$$\lim_{n\to\infty} x_{n,m} < \infty \quad \text{for all} \quad m, \qquad \lim_{m\to\infty} x_{n,m} < \infty \quad \text{for all} \quad n.$$

Then there exist the iterated limits

$$\lim_{n\to\infty}\lim_{m\to\infty} x_{n,m}, \qquad \lim_{m\to\infty}\lim_{n\to\infty} x_{n,m}$$

and moreover,

$$\lim_{n\to\infty}\lim_{m\to\infty} x_{n,m} = \lim_{m\to\infty}\lim_{n\to\infty} x_{n,m} = a.$$

Theorem 6 [13]-[16], [27], [29], [30]. *Let $\psi_l(\tau)$ $(l = 1, \ldots, k)$ are continuously differentiable nonrandom functions at the interval $[t, T]$ and $\{\phi_j(x)\}_{j=0}^{\infty}$ is a complete orthonormal system of Legendre polynomials or trigonometric functions in the space $L_2([t, T])$. Then*

$$J[\psi^{(k)}]_{T,t}^{p,\ldots,p} \ \to\ J[\psi^{(k)}]_{T,t} \quad \textit{if} \quad p \to \infty$$

w. p. 1, where $J[\psi^{(k)}]_{T,t}^{p,\ldots,p}$ is the expression on the right-hand sides of (6) and (48) before passing to the limit $\underset{p_1,\ldots,p_k\to\infty}{\text{l.i.m.}}$ for the case $p_1 = \ldots = p_k = p$, i.e.

$$J[\psi^{(k)}]_{T,t}^{p,\ldots,p} = \sum_{j_1=0}^{p}\ldots\sum_{j_k=0}^{p} C_{j_k\ldots j_1}\Biggl(\prod_{l=1}^{k}\zeta_{j_l}^{(i_l)} -$$

$$- \underset{N\to\infty}{\text{l.i.m.}} \sum_{(l_1,\ldots,l_k)\in \mathrm{G}_k} \phi_{j_1}(\tau_{l_1})\Delta\mathbf{w}_{\tau_{l_1}}^{(i_1)}\ldots\phi_{j_k}(\tau_{l_k})\Delta\mathbf{w}_{\tau_{l_k}}^{(i_k)}\Biggr)$$

or

$$J[\psi^{(k)}]_{T,t}^{p,\ldots,p} = \sum_{j_1=0}^{p}\ldots\sum_{j_k=0}^{p} C_{j_k\ldots j_1}\Biggl(\prod_{l=1}^{k}\zeta_{j_l}^{(i_l)} + \sum_{r=1}^{[k/2]}(-1)^r\times$$

$$\times \sum_{\substack{(\{\{g_1,g_2\},\ldots,\{g_{2r-1},g_{2r}\}\},\{q_1,\ldots,q_{k-2r}\})\\ \{g_1,g_2,\ldots,g_{2r-1},g_{2r},q_1,\ldots,q_{k-2r}\}=\{1,2,\ldots,k\}}} \prod_{s=1}^{r}\mathbf{1}_{\{i_{g_{2s-1}}=\ i_{g_{2s}}\neq 0\}}\mathbf{1}_{\{j_{g_{2s-1}}=\ j_{g_{2s}}\}}\prod_{l=1}^{k-2r}\zeta_{j_{q_l}}^{(i_{q_l})}\Biggr),$$

where $i_1, \ldots, i_k = 1, \ldots, m$.

Proof. Let us consider the Parseval equality

$$\int\limits_{[t,T]^k} K^2(t_1,\ldots,t_k)dt_1\ldots dt_k = \lim_{p_1,\ldots,p_k\to\infty}\sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k} C_{j_k\ldots j_1}^2, \tag{87}$$

where

$$K(t_1,\ldots,t_k) = \begin{cases}\psi_1(t_1)\ldots\psi_k(t_k), & t_1<\ldots<t_k\\ \\ 0, & \text{otherwise}\end{cases} = \prod_{l=1}^{k}\psi_l(t_l)\prod_{l=1}^{k-1}\mathbf{1}_{\{t_l<t_{l+1}\}}, \tag{88}$$

where $t_1, \ldots, t_k \in [t, T]$ for $k \geq 2$ and $K(t_1) \equiv \psi_1(t_1)$ for $t_1 \in [t, T]$, $\mathbf{1}_A$ denotes the indicator of the set A,

(89) $$C_{j_k\ldots j_1}=\int\limits_{[t,T]^k}K(t_1,\ldots,t_k)\prod_{l=1}^{k}\phi_{j_l}(t_l)dt_1\ldots dt_k$$

is the Fourier coefficient.

Using (88), we obtain

$$C_{j_k\ldots j_1}=\int\limits_t^T\phi_{j_k}(t_k)\psi_k(t_k)\ldots\int\limits_t^{t_2}\phi_{j_1}(t_1)\psi_1(t_1)dt_1\ldots dt_k.$$

Further, we denote

$$\lim_{p_1,\ldots,p_k\to\infty}\sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k}C^2_{j_k\ldots j_1}\stackrel{\sf def}{=}\sum_{j_1,\ldots,j_k=0}^{\infty}C^2_{j_k\ldots j_1}.$$

If $p_1=\ldots=p_k=p$, then we also write

$$\lim_{p\to\infty}\sum_{j_1=0}^{p}\ldots\sum_{j_k=0}^{p}C^2_{j_k\ldots j_1}\stackrel{\sf def}{=}\sum_{j_1,\ldots,j_k=0}^{\infty}C^2_{j_k\ldots j_1}.$$

From the other hand, for iterated limits we write

$$\lim_{p_1\to\infty}\ldots\lim_{p_k\to\infty}\sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k}C^2_{j_k\ldots j_1}\stackrel{\sf def}{=}\sum_{j_1=0}^{\infty}\ldots\sum_{j_k=0}^{\infty}C^2_{j_k\ldots j_1},$$

$$\lim_{p_1\to\infty}\lim_{p_2,\ldots,p_k\to\infty}\sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k}C^2_{j_k\ldots j_1}\stackrel{\sf def}{=}\sum_{j_1=0}^{\infty}\sum_{j_2,\ldots,j_k=0}^{\infty}C^2_{j_k\ldots j_1}$$

and so on.

Lemma 1. *The following equalities are fulfilled*

$$\sum_{j_1,\ldots,j_k=0}^{\infty}C^2_{j_k\ldots j_1}=\sum_{j_1=0}^{\infty}\ldots\sum_{j_k=0}^{\infty}C^2_{j_k\ldots j_1}=$$

(90) $$=\sum_{j_k=0}^{\infty}\ldots\sum_{j_1=0}^{\infty}C^2_{j_k\ldots j_1}=\sum_{j_{q_1}=0}^{\infty}\ldots\sum_{j_{q_k}=0}^{\infty}C^2_{j_k\ldots j_1}$$

for any permutation $(q_1,\ldots,q_k)$ *such that* $\{q_1,\ldots,q_k\}=\{1,\ldots,k\}$.

Proof. Let us consider the value

(91) $$\sum_{j_{q_l}=0}^{p}\ldots\sum_{j_{q_k}=0}^{p}C^2_{j_k\ldots j_1}$$

for any permutation $(q_l,\ldots,q_k)$, where $l=1,2,\ldots,k$, $\{q_1,\ldots,q_k\}=\{1,\ldots,k\}$.

Obviously, (91) is the non-decreasing sequence with respect to p. Moreover,

$$\sum_{j_{q_l}=0}^{p}\ldots\sum_{j_{q_k}=0}^{p}C_{j_k\ldots j_1}^2\le\sum_{j_{q_1}=0}^{p}\sum_{j_{q_2}=0}^{p}\ldots\sum_{j_{q_k}=0}^{p}C_{j_k\ldots j_1}^2\le$$

$$\le\sum_{j_1,\ldots,j_k=0}^{\infty}C_{j_k\ldots j_1}^2<\infty.$$

Then the following limit

$$\lim_{p\to\infty}\sum_{j_{q_l}=0}^{p}\ldots\sum_{j_{q_k}=0}^{p}C_{j_k\ldots j_1}^2=\sum_{j_{q_l},\ldots,j_{q_k}=0}^{\infty}C_{j_k\ldots j_1}^2$$

exists.

Let $p_l,\ldots,p_k$ simultaneously tend to infinity. Then $g,r\to\infty$, where $g=\min\{p_l,\ldots,p_k\}$ and $r=\max\{p_l,\ldots,p_k\}$. Moreover,

$$\sum_{j_{q_l}=0}^{g}\ldots\sum_{j_{q_k}=0}^{g}C_{j_k\ldots j_1}^2\le\sum_{j_{q_l}=0}^{p_l}\ldots\sum_{j_{q_k}=0}^{p_k}C_{j_k\ldots j_1}^2\le\sum_{j_{q_l}=0}^{r}\ldots\sum_{j_{q_k}=0}^{r}C_{j_k\ldots j_1}^2.$$

This means that the existence of the limit

$$\lim_{p\to\infty}\sum_{j_{q_l}=0}^{p}\ldots\sum_{j_{q_k}=0}^{p}C_{j_k\ldots j_1}^2 \tag{92}$$

implies the existence of the limit

$$\lim_{p_l,\ldots,p_k\to\infty}\sum_{j_{q_l}=0}^{p_l}\ldots\sum_{j_{q_k}=0}^{p_k}C_{j_k\ldots j_1}^2 \tag{93}$$

and equality of limits (92) and (93).

Taking into account the above reasoning, we have

$$\lim_{p,q\to\infty}\sum_{j_{q_l}=0}^{q}\sum_{j_{q_{l+1}}=0}^{p}\ldots\sum_{j_{q_k}=0}^{p}C_{j_k\ldots j_1}^2=\lim_{p\to\infty}\sum_{j_{q_l}=0}^{p}\ldots\sum_{j_{q_k}=0}^{p}C_{j_k\ldots j_1}^2=$$

$$=\lim_{p_l,\ldots,p_k\to\infty}\sum_{j_{q_l}=0}^{p_l}\ldots\sum_{j_{q_k}=0}^{p_k}C_{j_k\ldots j_1}^2. \tag{94}$$

Since the limit

$$\sum_{j_1,\ldots,j_k=0}^{\infty}C_{j_k\ldots j_1}^2$$

exists (see the Parseval equality (87)), then from Proposition 1 we have

$$\sum_{j_{q_1}=0}^{\infty}\sum_{j_{q_2},\ldots,j_{q_k}=0}^{\infty} C_{j_k\ldots j_1}^2 = \lim_{q\to\infty}\lim_{p\to\infty}\sum_{j_{q_1}=0}^{q}\sum_{j_{q_2}=0}^{p}\ldots\sum_{j_{q_k}=0}^{p} C_{j_k\ldots j_1}^2 =$$

$$= \lim_{q,p\to\infty}\sum_{j_{q_1}=0}^{q}\sum_{j_{q_2}=0}^{p}\ldots\sum_{j_{q_k}=0}^{p} C_{j_k\ldots j_1}^2 = \sum_{j_1,\ldots,j_k=0}^{\infty} C_{j_k\ldots j_1}^2. \tag{95}$$

Using (94) and Proposition 1, we get

$$\sum_{j_{q_2}=0}^{\infty}\sum_{j_{q_3},\ldots,j_{q_k}=0}^{\infty} C_{j_k\ldots j_1}^2 = \lim_{q\to\infty}\lim_{p\to\infty}\sum_{j_{q_2}=0}^{q}\sum_{j_{q_3}=0}^{p}\ldots\sum_{j_{q_k}=0}^{p} C_{j_k\ldots j_1}^2 =$$

$$= \lim_{q,p\to\infty}\sum_{j_{q_2}=0}^{q}\sum_{j_{q_3}=0}^{p}\ldots\sum_{j_{q_k}=0}^{p} C_{j_k\ldots j_1}^2 = \sum_{j_{q_2},\ldots,j_{q_k}=0}^{\infty} C_{j_k\ldots j_1}^2. \tag{96}$$

Combining (96) and (95), we obtain

$$\sum_{j_{q_1}=0}^{\infty}\sum_{j_{q_2}=0}^{\infty}\sum_{j_{q_3},\ldots,j_{q_k}=0}^{\infty} C_{j_k\ldots j_1}^2 = \sum_{j_1,\ldots,j_k=0}^{\infty} C_{j_k\ldots j_1}^2.$$

Repeating the above reasoning, we complete the proof of Lemma 1.
Further, let us show that for $s = 1,\ldots,k$

$$\sum_{j_1=0}^{\infty}\ldots\sum_{j_{s-1}=0}^{\infty}\sum_{j_s=p+1}^{\infty}\sum_{j_{s+1}=0}^{\infty}\ldots\sum_{j_k=0}^{\infty} C_{j_k\ldots j_1}^2 =$$

$$= \sum_{j_s=p+1}^{\infty}\sum_{j_{s-1}=0}^{\infty}\ldots\sum_{j_1=0}^{\infty}\sum_{j_{s+1}=0}^{\infty}\ldots\sum_{j_k=0}^{\infty} C_{j_k\ldots j_1}^2. \tag{97}$$

Using the arguments which we used when proving Lemma 1, we have

$$\lim_{n\to\infty}\sum_{j_1=0}^{n}\ldots\sum_{j_{s-1}=0}^{n}\sum_{j_s=0}^{p}\sum_{j_{s+1}=0}^{n}\ldots\sum_{j_k=0}^{n} C_{j_k\ldots j_1}^2 =$$

$$= \sum_{j_s=0}^{p}\sum_{j_1,\ldots,j_{s-1},j_{s+1},\ldots,j_k=0}^{\infty} C_{j_k\ldots j_1}^2 = \sum_{j_s=0}^{p}\sum_{j_{q_1}=0}^{\infty}\ldots\sum_{j_{q_{k-1}}=0}^{\infty} C_{j_k\ldots j_1}^2 \tag{98}$$

for any permutation $(q_1,\ldots,q_{k-1})$ such that $\{q_1,\ldots,q_{k-1}\} = \{1,\ldots,s-1,s+1,\ldots,k\}$, where p is a fixed natural number.

Obviously, we have

$$\sum_{j_s=0}^{p}\sum_{j_{q_1}=0}^{\infty}\ldots\sum_{j_{q_{k-1}}=0}^{\infty}C_{j_k\ldots j_1}^2=\sum_{j_{q_1}=0}^{\infty}\ldots\sum_{j_s=0}^{p}\ldots\sum_{j_{q_{k-1}}=0}^{\infty}C_{j_k\ldots j_1}^2=\ldots=$$

$$=\sum_{j_{q_1}=0}^{\infty}\ldots\sum_{j_{q_{k-1}}=0}^{\infty}\sum_{j_s=0}^{p}C_{j_k\ldots j_1}^2. \tag{99}$$

Using (98), (99), and Lemma 1, we obtain

$$\sum_{j_1=0}^{\infty}\ldots\sum_{j_{s-1}=0}^{\infty}\sum_{j_s=p+1}^{\infty}\sum_{j_{s+1}=0}^{\infty}\ldots\sum_{j_k=0}^{\infty}C_{j_k\ldots j_1}^2=\sum_{j_1=0}^{\infty}\ldots\sum_{j_{s-1}=0}^{\infty}\sum_{j_s=0}^{\infty}\sum_{j_{s+1}=0}^{\infty}\ldots\sum_{j_k=0}^{\infty}C_{j_k\ldots j_1}^2-$$

$$-\sum_{j_1=0}^{\infty}\ldots\sum_{j_{s-1}=0}^{\infty}\sum_{j_s=0}^{p}\sum_{j_{s+1}=0}^{\infty}\ldots\sum_{j_k=0}^{\infty}C_{j_k\ldots j_1}^2=$$

$$=\sum_{j_s=0}^{\infty}\sum_{j_{s-1}=0}^{\infty}\ldots\sum_{j_1=0}^{\infty}\sum_{j_{s+1}=0}^{\infty}\ldots\sum_{j_k=0}^{\infty}C_{j_k\ldots j_1}^2-\sum_{j_s=0}^{p}\sum_{j_{s-1}=0}^{\infty}\ldots\sum_{j_1=0}^{\infty}\sum_{j_{s+1}=0}^{\infty}\ldots\sum_{j_k=0}^{\infty}C_{j_k\ldots j_1}^2=$$

$$=\sum_{j_s=p+1}^{\infty}\sum_{j_{s-1}=0}^{\infty}\ldots\sum_{j_1=0}^{\infty}\sum_{j_{s+1}=0}^{\infty}\ldots\sum_{j_k=0}^{\infty}C_{j_k\ldots j_1}^2.$$

The equality (97) is proved.

Applying the Parseval equality and Lemma 1, we obtain

$$\int\limits_{[t,T]^k}K^2(t_1,\ldots,t_k)dt_1\ldots dt_k-\sum_{j_1=0}^{p}\ldots\sum_{j_k=0}^{p}C_{j_k\ldots j_1}^2=$$

$$=\sum_{j_1,\ldots,j_k=0}^{\infty}C_{j_k\ldots j_1}^2-\sum_{j_1=0}^{p}\ldots\sum_{j_k=0}^{p}C_{j_k\ldots j_1}^2=$$

$$=\sum_{j_1=0}^{\infty}\ldots\sum_{j_k=0}^{\infty}C_{j_k\ldots j_1}^2-\sum_{j_1=0}^{p}\ldots\sum_{j_k=0}^{p}C_{j_k\ldots j_1}^2=$$

$$=\sum_{j_1=0}^{p}\sum_{j_2=0}^{\infty}\ldots\sum_{j_k=0}^{\infty}C_{j_k\ldots j_1}^2+\sum_{j_1=p+1}^{\infty}\sum_{j_2=0}^{\infty}\ldots\sum_{j_k=0}^{\infty}C_{j_k\ldots j_1}^2-\sum_{j_1=0}^{p}\ldots\sum_{j_k=0}^{p}C_{j_k\ldots j_1}^2=$$

$$=\sum_{j_1=0}^{p}\sum_{j_2=0}^{p}\sum_{j_3=0}^{\infty}\ldots\sum_{j_k=0}^{\infty}C_{j_k\ldots j_1}^2+\sum_{j_1=0}^{p}\sum_{j_2=p+1}^{\infty}\sum_{j_3=0}^{\infty}\ldots\sum_{j_k=0}^{\infty}+$$

$$+\sum_{j_1=p+1}^{\infty}\sum_{j_2=0}^{\infty}\ldots\sum_{j_k=0}^{\infty}C_{j_k\ldots j_1}^2-\sum_{j_1=0}^{p}\ldots\sum_{j_k=0}^{p}C_{j_k\ldots j_1}^2=\ldots=$$

$$=\sum_{j_1=p+1}^{\infty}\sum_{j_2=0}^{\infty}\ldots\sum_{j_k=0}^{\infty}C_{j_k\ldots j_1}^2+\sum_{j_1=0}^{p}\sum_{j_2=p+1}^{\infty}\sum_{j_2=0}^{\infty}\ldots\sum_{j_k=0}^{\infty}C_{j_k\ldots j_1}^2+$$

$$+\sum_{j_1=0}^{p}\sum_{j_2=0}^{p}\sum_{j_3=p+1}^{\infty}\sum_{j_4=0}^{\infty}\ldots\sum_{j_k=0}^{\infty}C_{j_k\ldots j_1}^2+\ldots+\sum_{j_1=0}^{p}\ldots\sum_{j_{k-1}=0}^{p}\sum_{j_k=p+1}^{\infty}C_{j_k\ldots j_1}^2\le$$

$$\le\sum_{j_1=p+1}^{\infty}\sum_{j_2=0}^{\infty}\ldots\sum_{j_k=0}^{\infty}C_{j_k\ldots j_1}^2+\sum_{j_1=0}^{\infty}\sum_{j_2=p+1}^{\infty}\sum_{j_2=0}^{\infty}\ldots\sum_{j_k=0}^{\infty}C_{j_k\ldots j_1}^2+$$

$$+\sum_{j_1=0}^{\infty}\sum_{j_2=0}^{\infty}\sum_{j_3=p+1}^{\infty}\sum_{j_4=0}^{\infty}\ldots\sum_{j_k=0}^{\infty}C_{j_k\ldots j_1}^2+\ldots+\sum_{j_1=0}^{\infty}\ldots\sum_{j_{k-1}=0}^{\infty}\sum_{j_k=p+1}^{\infty}C_{j_k\ldots j_1}^2=$$

$$=\sum_{s=1}^{k}\left(\sum_{j_1=0}^{\infty}\ldots\sum_{j_{s-1}=0}^{\infty}\sum_{j_s=p+1}^{\infty}\sum_{j_{s+1}=0}^{\infty}\ldots\sum_{j_k=0}^{\infty}C_{j_k\ldots j_1}^2\right). \tag{100}$$

Note that deriving (100), we used the following

$$\sum_{j_1=0}^{p}\ldots\sum_{j_{s-1}=0}^{p}\sum_{j_s=p+1}^{\infty}\sum_{j_{s+1}=0}^{\infty}\ldots\sum_{j_k=0}^{\infty}C_{j_k\ldots j_1}^2\le$$

$$\le\sum_{j_1=0}^{m_1}\ldots\sum_{j_{s-1}=0}^{m_{s-1}}\sum_{j_s=p+1}^{\infty}\sum_{j_{s+1}=0}^{\infty}\ldots\sum_{j_k=0}^{\infty}C_{j_k\ldots j_1}^2\le$$

$$\le\lim_{m_{s-1}\to\infty}\sum_{j_1=0}^{m_1}\ldots\sum_{j_{s-1}=0}^{m_{s-1}}\sum_{j_s=p+1}^{\infty}\sum_{j_{s+1}=0}^{\infty}\ldots\sum_{j_k=0}^{\infty}C_{j_k\ldots j_1}^2=$$

$$=\sum_{j_1=0}^{m_1}\ldots\sum_{j_{s-2}=0}^{m_{s-2}}\sum_{j_{s-1}=0}^{\infty}\sum_{j_s=p+1}^{\infty}\sum_{j_{s+1}=0}^{\infty}\ldots\sum_{j_k=0}^{\infty}C_{j_k\ldots j_1}^2\le$$

$$\le\ldots\le$$

$$\le\sum_{j_1=0}^{\infty}\ldots\sum_{j_{s-1}=0}^{\infty}\sum_{j_s=p+1}^{\infty}\sum_{j_{s+1}=0}^{\infty}\ldots\sum_{j_k=0}^{\infty}C_{j_k\ldots j_1}^2,$$

where $m_1,\ldots,m_{s-1}>p$.

Denote

$$C_{j_s\ldots j_1}(\tau)=\int\limits_t^{\tau}\phi_{j_s}(t_s)\psi_s(t_s)\ldots\int\limits_t^{t_2}\phi_{j_1}(t_1)\psi_1(t_1)dt_1\ldots dt_s,$$

where $s=1,\ldots,k-1$.

Let us remind the Dini Theorem, which we will use further.

Theorem (Dini). *Let the functional sequence $u_n(x)$ be non-decreasing at each point of the interval $[a,b]$. In addition, all the functions $u_n(x)$ of this sequence and the limit function $u(x)$ are continuous on the interval $[a,b]$. Then the convergence $u_n(x)$ to $u(x)$ is uniform on the interval $[a,b]$.*

For $s<k$ due to the Parseval equality and Dini Theorem as well as (97) we obtain

$$\sum_{j_1=0}^{\infty}\ldots\sum_{j_{s-1}=0}^{\infty}\sum_{j_s=p+1}^{\infty}\sum_{j_{s+1}=0}^{\infty}\ldots\sum_{j_k=0}^{\infty}C_{j_k\ldots j_1}^2=$$

$$\stackrel{(97)}{=}\sum_{j_s=p+1}^{\infty}\sum_{j_{s-1}=0}^{\infty}\ldots\sum_{j_1=0}^{\infty}\sum_{j_{s+1}=0}^{\infty}\ldots\sum_{j_k=0}^{\infty}C_{j_k\ldots j_1}^2=$$

$$\stackrel{\text{(Parseval Eq.)}}{=}\sum_{j_s=p+1}^{\infty}\sum_{j_{s-1}=0}^{\infty}\ldots\sum_{j_1=0}^{\infty}\sum_{j_{s+1}=0}^{\infty}\ldots\sum_{j_{k-1}=0}^{\infty}\int\limits_t^T\psi_k^2(t_k)\left(C_{j_{k-1}\ldots j_1}(t_k)\right)^2dt_k=$$

$$\stackrel{\text{(Dini Th.)}}{=}\sum_{j_s=p+1}^{\infty}\sum_{j_{s-1}=0}^{\infty}\ldots\sum_{j_1=0}^{\infty}\sum_{j_{s+1}=0}^{\infty}\ldots\sum_{j_{k-2}=0}^{\infty}\int\limits_t^T\psi_k^2(t_k)\sum_{j_{k-1}=0}^{\infty}\left(C_{j_{k-1}\ldots j_1}(t_k)\right)^2dt_k=$$

$$\stackrel{\text{(Parseval Eq.)}}{=}\sum_{j_s=p+1}^{\infty}\sum_{j_{s-1}=0}^{\infty}\ldots\sum_{j_1=0}^{\infty}\sum_{j_{s+1}=0}^{\infty}\ldots\sum_{j_{k-2}=0}^{\infty}\int\limits_t^T\psi_k^2(t_k)\int\limits_t^{t_k}\psi_{k-1}^2(t_{k-1})\left(C_{j_{k-2}\ldots j_1}(t_{k-1})\right)^2\times$$

$$\times dt_{k-1}dt_k\le$$

$$\le C\sum_{j_s=p+1}^{\infty}\sum_{j_{s-1}=0}^{\infty}\ldots\sum_{j_1=0}^{\infty}\sum_{j_{s+1}=0}^{\infty}\ldots\sum_{j_{k-2}=0}^{\infty}\int\limits_t^T\left(C_{j_{k-2}\ldots j_1}(\tau)\right)^2d\tau=$$

$$\stackrel{\text{(Dini Th.)}}{=}C\sum_{j_s=p+1}^{\infty}\sum_{j_{s-1}=0}^{\infty}\ldots\sum_{j_1=0}^{\infty}\sum_{j_{s+1}=0}^{\infty}\ldots\sum_{j_{k-3}=0}^{\infty}\int\limits_t^T\sum_{j_{k-2}=0}^{\infty}\left(C_{j_{k-2}\ldots j_1}(\tau)\right)^2d\tau=$$

$$\stackrel{\text{(Parseval Eq.)}}{=} C\sum_{j_s=p+1}^{\infty}\sum_{j_{s-1}=0}^{\infty}\ldots\sum_{j_1=0}^{\infty}\sum_{j_{s+1}=0}^{\infty}\ldots\sum_{j_{k-3}=0}^{\infty}\int\limits_t^T\int\limits_t^{\tau}\psi_{k-2}^2(\theta)\left(C_{j_{k-3}\ldots j_1}(\theta)\right)^2 d\theta d\tau \le$$

$$\le K\sum_{j_s=p+1}^{\infty}\sum_{j_{s-1}=0}^{\infty}\ldots\sum_{j_1=0}^{\infty}\sum_{j_{s+1}=0}^{\infty}\ldots\sum_{j_{k-3}=0}^{\infty}\int\limits_t^T\left(C_{j_{k-3}\ldots j_1}(\tau)\right)^2 d\tau \le$$

$$\le \ldots \le$$

$$\le C_k\sum_{j_s=p+1}^{\infty}\sum_{j_{s-1}=0}^{\infty}\ldots\sum_{j_1=0}^{\infty}\int\limits_t^T\left(C_{j_s\ldots j_1}(\tau)\right)^2 d\tau =$$

$$\stackrel{\text{(Dini Th.)}}{=} C_k\sum_{j_s=p+1}^{\infty}\sum_{j_{s-1}=0}^{\infty}\ldots\sum_{j_2=0}^{\infty}\int\limits_t^T\sum_{j_1=0}^{\infty}\left(C_{j_s\ldots j_1}(\tau)\right)^2 d\tau, \tag{101}$$

where constants C, K depend on $T-t$ and constant C_k depends on k and $T-t$.

Let us explane more precisely how we obtain (101). For any function $g(s)\in L_2([t,T])$ we have the following Parseval equality

$$\sum_{j=0}^{\infty}\left(\int\limits_t^{\tau}\phi_j(s)g(s)ds\right)^2=\sum_{j=0}^{\infty}\left(\int\limits_t^{T}\mathbf{1}_{\{s<\tau\}}\phi_j(s)g(s)ds\right)^2=$$

$$=\int\limits_t^T\left(\mathbf{1}_{\{s<\tau\}}\right)^2 g^2(s)ds=\int\limits_t^{\tau}g^2(s)ds. \tag{102}$$

The equality (102) has been applied repeatedly when we obtaining (101). Using the integration order replacement in Riemann integrals, we have

$$C_{j_s\ldots j_1}(\tau)=\int\limits_t^{\tau}\phi_{j_s}(t_s)\psi_s(t_s)\ldots\int\limits_t^{t_2}\phi_{j_1}(t_1)\psi_1(t_1)dt_1\ldots dt_s=$$

$$=\int\limits_t^{\tau}\phi_{j_1}(t_1)\psi_1(t_1)\int\limits_{t_1}^{\tau}\phi_{j_2}(t_2)\psi_2(t_2)\ldots\int\limits_{t_{s-1}}^{\tau}\phi_{j_s}(t_s)\psi_s(t_s)dt_s\ldots dt_2dt_1 \stackrel{\text{def}}{=}$$

$$\stackrel{\text{def}}{=}\tilde{C}_{j_s\ldots j_1}(\tau).$$

For $l=1,\ldots,s$ we will use the following notation

$$\tilde{C}_{j_s\ldots j_l}(\tau,\theta)=\int\limits_{\theta}^{\tau}\phi_{j_l}(t_l)\psi_l(t_l)\int\limits_{t_l}^{\tau}\phi_{j_{l+1}}(t_{l+1})\psi_{l+1}(t_{l+1})\ldots\int\limits_{t_{s-1}}^{\tau}\phi_{j_s}(t_s)\psi_s(t_s)dt_s\ldots dt_{l+1}dt_l.$$

Applying the Parseval equality and Dini Theorem, from (101) we obtain

$$\sum_{j_1=0}^{\infty}\ldots\sum_{j_{s-1}=0}^{\infty}\sum_{j_s=p+1}^{\infty}\sum_{j_{s+1}=0}^{\infty}\ldots\sum_{j_k=0}^{\infty}C_{j_k\ldots j_1}^2\le$$

$$\le C_k\sum_{j_s=p+1}^{\infty}\sum_{j_{s-1}=0}^{\infty}\ldots\sum_{j_2=0}^{\infty}\int\limits_t^T\sum_{j_1=0}^{\infty}\left(C_{j_s\ldots j_1}(\tau)\right)^2d\tau=$$

$$=C_k\sum_{j_s=p+1}^{\infty}\sum_{j_{s-1}=0}^{\infty}\ldots\sum_{j_2=0}^{\infty}\int\limits_t^T\sum_{j_1=0}^{\infty}\left(\tilde{C}_{j_s\ldots j_1}(\tau)\right)^2d\tau=$$

$$\stackrel{\text{(Parseval Eq.)}}{=}\quad C_k\sum_{j_s=p+1}^{\infty}\sum_{j_{s-1}=0}^{\infty}\ldots\sum_{j_2=0}^{\infty}\int\limits_t^T\int\limits_t^{\tau}\psi_1^2(t_1)\left(\tilde{C}_{j_s\ldots j_2}(\tau,t_1)\right)^2dt_1d\tau= \qquad (103)$$

$$\stackrel{\text{(Dini Th.)}}{=}\quad C_k\sum_{j_s=p+1}^{\infty}\sum_{j_{s-1}=0}^{\infty}\ldots\sum_{j_3=0}^{\infty}\int\limits_t^T\int\limits_t^{\tau}\psi_1^2(t_1)\sum_{j_2=0}^{\infty}\left(\tilde{C}_{j_s\ldots j_2}(\tau,t_1)\right)^2dt_1d\tau= \qquad (104)$$

$$\stackrel{\text{(Parseval Eq.)}}{=}\quad C_k\sum_{j_s=p+1}^{\infty}\sum_{j_{s-1}=0}^{\infty}\ldots\sum_{j_3=0}^{\infty}\int\limits_t^T\int\limits_t^{\tau}\psi_1^2(t_1)\int\limits_{t_1}^{\tau}\psi_2^2(t_2)\left(\tilde{C}_{j_s\ldots j_3}(\tau,t_2)\right)^2dt_2dt_1d\tau\le$$

$$\le C_k\sum_{j_s=p+1}^{\infty}\sum_{j_{s-1}=0}^{\infty}\ldots\sum_{j_3=0}^{\infty}\int\limits_t^T\int\limits_t^{\tau}\psi_1^2(t_1)\int\limits_{t}^{\tau}\psi_2^2(t_2)\left(\tilde{C}_{j_s\ldots j_3}(\tau,t_2)\right)^2dt_2dt_1d\tau\le$$

$$\le C_k'\sum_{j_s=p+1}^{\infty}\sum_{j_{s-1}=0}^{\infty}\ldots\sum_{j_3=0}^{\infty}\int\limits_t^T\int\limits_t^{\tau}\psi_2^2(t_2)\left(\tilde{C}_{j_s\ldots j_3}(\tau,t_2)\right)^2dt_2d\tau\le$$

$$\le\ldots\le$$

$$\leq C_k^{''} \sum_{j_s=p+1}^{\infty} \int_t^T \int_t^{\tau} \psi_{s-1}^2(t_{s-1}) \left(\tilde{C}_{j_s}(\tau, t_{s-1})\right)^2 dt_{s-1} d\tau \leq$$

$$\leq \tilde{C}_k \sum_{j_s=p+1}^{\infty} \int_t^T \int_t^{\tau} \left(\int_u^{\tau} \phi_{j_s}(\theta)\psi_s(\theta) d\theta \right)^2 du d\tau, \tag{105}$$

where constants $C_k^{'}$, $C_k^{''}$, $\tilde{C}_k$ depend on k and $T-t$.

Let us explane more precisely how we obtain (105). For any function $g(s) \in L_2([t,T])$ we have the following Parseval equality

$$\sum_{j=0}^{\infty} \left(\int_{\theta}^{\tau} \phi_j(s) g(s) ds \right)^2 = \sum_{j=0}^{\infty} \left(\int_t^T \mathbf{1}_{\{\theta < s < \tau\}} \phi_j(s) g(s) ds \right)^2 =$$

$$= \int_t^T \left(\mathbf{1}_{\{\theta < s < \tau\}} \right)^2 g^2(s) ds = \int_{\theta}^{\tau} g^2(s) ds. \tag{106}$$

The equality (106) has been applied repeatedly when we obtaining (105). Let us explane more precisely the passing from (103) to (104) (the same steps were used when we were deriving (105)).

We have

$$\int_t^T \int_t^{\tau} \psi_1^2(t_1) \sum_{j_2=0}^{\infty} \left(\tilde{C}_{j_s \ldots j_2}(\tau, t_1)\right)^2 dt_1 d\tau - \sum_{j_2=0}^{n} \int_t^T \int_t^{\tau} \psi_1^2(t_1) \left(\tilde{C}_{j_s \ldots j_2}(\tau, t_1)\right)^2 dt_1 d\tau =$$

$$= \int_t^T \int_t^{\tau} \psi_1^2(t_1) \sum_{j_2=n+1}^{\infty} \left(\tilde{C}_{j_s \ldots j_2}(\tau, t_1)\right)^2 dt_1 d\tau =$$

$$= \lim_{N \to \infty} \sum_{j=0}^{N-1} \int_t^{\tau_j} \psi_1^2(t_1) \sum_{j_2=n+1}^{\infty} \left(\tilde{C}_{j_s \ldots j_2}(\tau_j, t_1)\right)^2 dt_1 \Delta\tau_j, \tag{107}$$

where $\{\tau_j\}_{j=0}^N$ is the partition of the interval $[t,T]$, which satisfies the condition (5).

Since the non-decreasing functional sequence $u_n(\tau_j, t_1)$ and its limit function $u(\tau_j, t_1)$ are continuous on the interval $[t, \tau_j] \subseteq [t,T]$ with respect to t_1, where

$$u_n(\tau_j, t_1) = \sum_{j_2=0}^{n} \left(\tilde{C}_{j_s \ldots j_2}(\tau_j, t_1)\right)^2,$$

$$u(\tau_j, t_1) = \sum_{j_2=0}^{\infty} \left(\tilde{C}_{j_s \ldots j_2}(\tau_j, t_1)\right)^2 = \int_{t_1}^{\tau_j} \psi_2^2(t_2) \left(\tilde{C}_{j_s \ldots j_3}(\tau_j, t_2)\right)^2 dt_2,$$

then by Dini Theorem we have the uniform convergence of $u_n(\tau_j, t_1)$ to $u(\tau_j, t_1)$ at the interval $[t, \tau_j] \subseteq [t, T]$ with respect to t_1. As a result, we obtain

$$\sum_{j_2=n+1}^{\infty} \left(\tilde{C}_{j_s \ldots j_2}(\tau_j, t_1)\right)^2 < \varepsilon, \quad t_1 \in [t, \tau_j] \tag{108}$$

for $n > N(\varepsilon)$ ($N(\varepsilon)$ exists for any $\varepsilon > 0$ and it does not depend on t_1).

From (107) and (108) we get

$$\lim_{N\to\infty} \sum_{j=0}^{N-1} \int\limits_t^{\tau_j} \psi_1^2(t_1) \sum_{j_2=n+1}^{\infty} \left(\tilde{C}_{j_s \ldots j_2}(\tau_j, t_1)\right)^2 dt_1 \Delta\tau_j \le \varepsilon \lim_{N\to\infty} \sum_{j=0}^{N-1} \int\limits_t^{\tau_j} \psi_1^2(t_1) dt_1 \Delta\tau_j =$$

$$= \varepsilon \int\limits_t^{T} \int\limits_t^{\tau} \psi_1^2(t_1) dt_1 d\tau. \tag{109}$$

From (109) we have

$$\lim_{n\to\infty} \int\limits_t^{T} \int\limits_t^{\tau} \psi_1^2(t_1) \sum_{j_2=n+1}^{\infty} \left(\tilde{C}_{j_s \ldots j_2}(\tau, t_1)\right)^2 dt_1 d\tau = 0.$$

This fact completes the proof of passing from (103) to (104).

Let us estimate the integral

$$\int\limits_u^{\tau} \phi_{j_s}(\theta)\psi_s(\theta) d\theta \tag{110}$$

from (105) for the case when $\{\phi_j(s)\}_{j=0}^{\infty}$ is a complete orthonormal system of Legendre polynomials or trigonometric functions in the space $L_2([t, T])$.

Note that the estimates for the integral

$$\int\limits_t^{\tau} \phi_j(\theta)\psi(\theta) d\theta, \quad j \ge p + 1 \tag{111}$$

have been obtained in [22], [31], where $\psi(\theta)$ is a continuously differentiable function on the interval $[t, T]$. The same estimates can also be found in early publications [10]-[12], [17] or in [13]-[16] (2020-2023).

Let us estimate the integral (110) using the approach from [22], [31]. First consider the case of Legendre polynomials. Then $\phi_j(s)$ looks as follows

$$\phi_j(\theta) = \sqrt{\frac{2j+1}{T-t}} P_j \left(\left(\theta - \frac{T+t}{2}\right) \frac{2}{T-t} \right), \quad j \ge 0, \tag{112}$$

where $P_j(x)$ is the Legendre polynomial.

Further, we have

$$\int\limits_{v}^{x}\phi_j(\theta)\psi(\theta)d\theta=\frac{\sqrt{T-t}\sqrt{2j+1}}{2}\int\limits_{z(v)}^{z(x)}P_j(y)\psi(u(y))dy=$$

$$=\frac{\sqrt{T-t}}{2\sqrt{2j+1}}\Biggl((P_{j+1}(z(x))-P_{j-1}(z(x)))\psi(x)-(P_{j+1}(z(v))-P_{j-1}(z(v)))\psi(v)-$$

$$-\frac{T-t}{2}\int\limits_{z(v)}^{z(x)}((P_{j+1}(y)-P_{j-1}(y))\psi'(u(y))dy\Biggr), \tag{113}$$

where $x,v\in(t,T)$, $j\ge p+1$, $u(y)$ and $z(x)$ are defined by the following relations

$$u(y)=\frac{T-t}{2}y+\frac{T+t}{2},\quad z(x)=\left(x-\frac{T+t}{2}\right)\frac{2}{T-t},$$

ψ' is a derivative of the function $\psi(\theta)$ with respect to the variable $u(y)$.

Note that in (113) we used the following well-known property of the Legendre polynomials

$$\frac{dP_{j+1}}{dx}(x)-\frac{dP_{j-1}}{dx}(x)=(2j+1)P_j(x),\quad j=1,2,\ldots$$

From (113) and the well-known estimate for the Legendre polynomials

$$|P_j(y)|<\frac{K}{\sqrt{j+1}(1-y^2)^{1/4}},\quad y\in(-1,1),\quad j\in\mathbb{N}, \tag{114}$$

where constant K does not depend on y and j, it follows that

$$\left|\int\limits_{v}^{x}\phi_j(\theta)\psi(\theta)d\theta\right|<\frac{C}{j}\left(\frac{1}{(1-(z(x))^2)^{1/4}}+\frac{1}{(1-(z(v))^2)^{1/4}}+C_1\right), \tag{115}$$

where constants C,C_1 do not depend on j $(j>0)$ and $z(x),z(v)\in(-1,1)$, $x,v\in(t,T)$.

From (115) we obtain

$$\left(\int\limits_{v}^{x}\phi_j(\theta)\psi(\theta)d\theta\right)^2<\frac{C_2}{j^2}\left(\frac{1}{(1-(z(x))^2)^{1/2}}+\frac{1}{(1-(z(v))^2)^{1/2}}+C_3\right), \tag{116}$$

where constants C_2,C_3 do not depend on j $(j>0)$.

Let us apply (116) for estimation of the right-hand side of (105). We have

$$\int\limits_t^T\int\limits_t^{\tau}\left(\int\limits_u^{\tau}\phi_{j_s}(\theta)\psi_s(\theta)d\theta\right)^2 dud\tau \le$$

$$\le \frac{K_1}{j_s^2}\left(\int\limits_{-1}^{1}\frac{dy}{(1-y^2)^{1/2}}+\int\limits_{-1}^{1}\int\limits_{-1}^{x}\frac{dy}{(1-y^2)^{1/2}}dx+K_2\right)\le$$

$$\le \frac{K_3}{j_s^2}, \tag{117}$$

where constants K_1, K_2, K_3 are independent of j_s ($j_s > 0$).

Now consider the trigonometric case. The complete orthonormal system of trigonometric functions in the space $L_2([t,T])$ has the following form

$$\phi_j(\theta)=\frac{1}{\sqrt{T-t}}\begin{cases}1, & j=0\\ \sqrt{2}\sin\left(2\pi r(\theta-t)/(T-t)\right), & j=2r-1,\\ \sqrt{2}\cos\left(2\pi r(\theta-t)/(T-t)\right), & j=2r\end{cases} \tag{118}$$

where $r=1,2,\ldots$

Using the system of functions (118), we have

$$\int\limits_v^x\phi_{2r-1}(\theta)\psi(\theta)d\theta=\sqrt{\frac{2}{T-t}}\int\limits_v^x\sin\frac{2\pi r(\theta-t)}{T-t}\psi(\theta)d\theta=$$

$$=-\sqrt{\frac{T-t}{2}}\frac{1}{\pi r}\left(\psi(x)\cos\frac{2\pi r(x-t)}{T-t}-\psi(v)\cos\frac{2\pi r(v-t)}{T-t}-\right.$$

$$\left.-\int\limits_v^x\cos\frac{2\pi r(\theta-t)}{T-t}\psi'(\theta)d\theta\right), \tag{119}$$

$$\int\limits_v^x\phi_{2r}(\theta)\psi(\theta)d\theta=\sqrt{\frac{2}{T-t}}\int\limits_v^x\cos\frac{2\pi r(\theta-t)}{T-t}\psi(\theta)d\theta=$$

$$=\sqrt{\frac{T-t}{2}}\frac{1}{\pi r}\left(\psi(x)\sin\frac{2\pi r(x-t)}{T-t}-\psi(v)\sin\frac{2\pi r(v-t)}{T-t}-\right.$$

$$\left.-\int\limits_v^x\sin\frac{2\pi r(\theta-t)}{T-t}\psi'(\theta)d\theta\right), \tag{120}$$

where $\psi'(\theta)$ is a derivative of the function $\psi(\theta)$ with respect to the variable θ.

Combining (119) and (120), we obtain for the trigonometric case

$$\left(\int\limits_v^x \phi_j(\theta)\psi(\theta)d\theta\right)^2 \le \frac{C_4}{j^2}, \tag{121}$$

where constant C_4 is independent of j $(j>0)$.

From (121) we finally have

$$\int\limits_t^T\int\limits_t^\tau\left(\int\limits_u^\tau \phi_{j_s}(\theta)\psi_s(\theta)d\theta\right)^2 dud\tau \le \frac{K_4}{j_s^2}, \tag{122}$$

where constant K_4 does not depend on j_s $(j_s>0)$.

Combibing (105), (117), and (122), we obtain

$$\sum_{j_1=0}^{\infty}\ldots\sum_{j_{s-1}=0}^{\infty}\sum_{j_s=p+1}^{\infty}\sum_{j_{s+1}=0}^{\infty}\ldots\sum_{j_k=0}^{\infty}C_{j_k\ldots j_1}^2 \le$$

$$\le L_k\sum_{j_s=p+1}^{\infty}\frac{1}{j_s^2}\le\frac{L_k}{p}, \tag{123}$$

where constant L_k depends on k and $T-t$.

Obviously, the case $s=k$ can be considered absolutely analogously to the case $s<k$. Then from (100) and (123) we obtain

$$\int\limits_{[t,T]^k}K^2(t_1,\ldots,t_k)dt_1\ldots dt_k-\sum_{j_1=0}^{p}\ldots\sum_{j_k=0}^{p}C_{j_k\ldots j_1}^2\le\frac{G_k}{p}, \tag{124}$$

where constant G_k depends on k and $T-t$.

For the further consideration we consider the following theorem.

Theorem 7 [3] (2007) (also see [4]-[17]). *Under the conditions of Theorems* 1, 3 *the following estimate is correct*

$$\mathsf{M}\left\{\left(J[\psi^{(k)}]_{T,t}-J[\psi^{(k)}]_{T,t}^{p_1,\ldots,p_k}\right)^{2n}\right\}\le$$

$$\le (k!)^{2n}(n(2n-1))^{n(k-1)}(2n-1)!!\ \times$$

$$\times\left(\int\limits_{[t,T]^k}K^2(t_1,\ldots,t_k)dt_1\ldots dt_k-\sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k}C_{j_k\ldots j_1}^2\right)^n \tag{125}$$

for $n \in \mathbb{N}$, *where* $J[\psi^{(k)}]_{T,t}^{p_1,\ldots,p_k}$ *is the expression on the right-hand side of* (48) *before passing to the limit, i.e.*

$$J[\psi^{(k)}]_{T,t}^{p_1,\ldots,p_k} = \sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k} C_{j_k\ldots j_1}\Biggl(\prod_{l=1}^{k}\zeta_{j_l}^{(i_l)} + \sum_{r=1}^{[k/2]}(-1)^r\times$$

$$\times \sum_{\substack{(\{\{g_1,g_2\},\ldots,\{g_{2r-1},g_{2r}\}\},\{q_1,\ldots,q_{k-2r}\})\\ \{g_1,g_2,\ldots,g_{2r-1},g_{2r},q_1,\ldots,q_{k-2r}\}=\{1,2,\ldots,k\}}} \prod_{s=1}^{r}\mathbf{1}_{\{i_{g_{2s-1}}=\ i_{g_{2s}}\ne 0\}}\mathbf{1}_{\{j_{g_{2s-1}}=\ j_{g_{2s}}\}}\prod_{l=1}^{k-2r}\zeta_{j_{q_l}}^{(i_{q_l})}\Biggr),$$

where $i_1,\ldots,i_k = 1,\ldots,m$ *and the remainder notations are the same as in Theorems* 1, 3.

Using (124) and Theorem 7 for the case $p_1 = \ldots = p_k = p$ and $n = 2$ (see (125)), we obtain

$$\mathsf{M}\left\{\left(J[\psi^{(k)}]_{T,t} - J[\psi^{(k)}]_{T,t}^{p,\ldots,p}\right)^4\right\} \le$$

$$\le C_{2,k}\left(\int\limits_{[t,T]^k} K^2(t_1,\ldots,t_k)dt_1\ldots dt_k - \sum_{j_1=0}^{p}\ldots\sum_{j_k=0}^{p} C_{j_k\ldots j_1}^2\right)^2 \le \frac{H_{2,k}}{p^2}, \tag{126}$$

where $H_{2,k} = G_k^2 C_{2,k}$ and

$$C_{n,k} = (k!)^{2n}(n(2n-1))^{n(k-1)}(2n-1)!!$$

Let us consider the the well-known fact.

Proposition 2. *If for the sequence of random variables* ξ_p *and for some real* $\alpha > 0$ *the number series*

$$\sum_{p=1}^{\infty}\mathsf{M}\left\{|\xi_p|^{\alpha}\right\}$$

converges, then the sequence ξ_p *converges to zero w. p. 1.*

Let us put

$$\xi_p = \left|J[\psi^{(k)}]_{T,t} - J[\psi^{(k)}]_{T,t}^{p,\ldots,p}\right|$$

and $\alpha = 4$.

Then from (126) we obtain

$$\sum_{p=1}^{\infty}\mathsf{M}\left\{\left(J[\psi^{(k)}]_{T,t} - J[\psi^{(k)}]_{T,t}^{p,\ldots,p}\right)^4\right\} \le H_{2,k}\sum_{p=1}^{\infty}\frac{1}{p^2} < \infty. \tag{127}$$

From (127) we get

$$J[\psi^{(k)}]_{T,t}^{p,\ldots,p} \ \to\ J[\psi^{(k)}]_{T,t} \quad \text{if} \quad p\to\infty$$

w. p. 1, where (see Theorem 1)

$$J[\psi^{(k)}]_{T,t}^{p,\ldots,p} = \sum_{j_1=0}^{p}\ldots\sum_{j_k=0}^{p} C_{j_k\ldots j_1}\Biggl(\prod_{l=1}^{k}\zeta_{j_l}^{(i_l)} -$$

$$- \underset{N\to\infty}{\text{l.i.m.}} \sum_{(l_1,\ldots,l_k)\in \mathrm{G}_k} \phi_{j_1}(\tau_{l_1})\Delta\mathbf{w}_{\tau_{l_1}}^{(i_1)}\ldots\phi_{j_k}(\tau_{l_k})\Delta\mathbf{w}_{\tau_{l_k}}^{(i_k)}\Biggr) \tag{128}$$

or (see (48))

$$J[\psi^{(k)}]_{T,t}^{p,\ldots,p} = \sum_{j_1=0}^{p}\ldots\sum_{j_k=0}^{p} C_{j_k\ldots j_1}\Biggl(\prod_{l=1}^{k}\zeta_{j_l}^{(i_l)} + \sum_{r=1}^{[k/2]}(-1)^r\times$$

$$\times \sum_{\substack{(\{\{g_1,g_2\},\ldots,\{g_{2r-1},g_{2r}\}\},\{q_1,\ldots,q_{k-2r}\})\\ \{g_1,g_2,\ldots,g_{2r-1},g_{2r},q_1,\ldots,q_{k-2r}\}=\{1,2,\ldots,k\}}} \prod_{s=1}^{r}\mathbf{1}_{\{i_{g_{2s-1}}=\ i_{g_{2s}}\ne 0\}}\mathbf{1}_{\{j_{g_{2s-1}}=\ j_{g_{2s}}\}}\prod_{l=1}^{k-2r}\zeta_{j_{q_l}}^{(i_{q_l})}\Biggr), \tag{129}$$

where $i_1,\ldots,i_k=1,\ldots,m$ in (128) and (129). Theorem 6 is proved.

9. Mean-Square Approximation of Iterated Stratonovich Stochastic Integrals of Multiplicities 1 to 6

This section is devoted to the mean-square approximation of iterated Stratonovich stochastic integrals. We consider the adaptation of Theorems 1, 3 for iterated Stratonovich stochastic integrals of multiplicities 1 to 6. Also we consider the question on the exact calculation of the mean-square approximation errors for the following iterated Stratonovich stochastic integrals

$$I_{(0)T,t}^{*(i_1)},\quad I_{(1)T,t}^{*(i_1)},\quad I_{(00)T,t}^{*(i_1i_2)},\quad I_{(000)T,t}^{*(i_1i_2i_3)},\quad i_1,i_2,i_3=1,\ldots,m,$$

where

$$I_{(l_1\ldots l_k)T,t}^{*(i_1\ldots i_k)} = \int\limits_t^{*T}(t-t_k)^{l_k}\ldots\int\limits_t^{*t_2}(t-t_1)^{l_1}d\mathbf{f}_{t_1}^{(i_1)}\ldots d\mathbf{f}_{t_k}^{(i_k)} \tag{130}$$

is the iterated Stratonovich stochastic integral; $i_1,\ldots,i_k=1,\ldots,m;\ \ l_1,\ldots,l_k=0,1,\ldots$

Let us first formulate some old results.

Theorem 8 [13], [22] (also see [6]-[12], [14]-[21], [23], [26], [28], [30], [31], [35], [37], [40]-[45], [57], [58]). *Suppose that* $\{\phi_j(x)\}_{j=0}^{\infty}$ *is a complete orthonormal system of Legendre polynomials or* *trigonometric functions in the space* $L_2([t,T])$*. Moreover,* $\psi_1(\tau)$, $\psi_2(\tau)$ *are continuously differentiable functions on* $[t,T]$*. Then, for the iterated Stratonovich stochastic integral*

$$J^*[\psi^{(2)}]_{T,t} = \int\limits_t^{*T} \psi_2(t_2) \int\limits_t^{*t_2} \psi_1(t_1) d\mathbf{f}_{t_1}^{(i_1)} d\mathbf{f}_{t_2}^{(i_2)} \quad (i_1, i_2 = 1, \ldots, m)$$

the following expansion

$$J^*[\psi^{(2)}]_{T,t} = \underset{p_1,p_2\to\infty}{\text{l.i.m.}} \sum_{j_1=0}^{p_1} \sum_{j_2=0}^{p_2} C_{j_2j_1} \zeta_{j_1}^{(i_1)} \zeta_{j_2}^{(i_2)} \tag{131}$$

that converges in the mean-square sense is valid, where

$$C_{j_2j_1} = \int\limits_t^T \psi_2(t_2)\phi_{j_2}(t_2) \int\limits_t^{t_2} \psi_1(t_1)\phi_{j_1}(t_1) dt_1 dt_2 \tag{132}$$

and

$$\zeta_j^{(i)} = \int\limits_t^T \phi_j(\tau) d\mathbf{f}_\tau^{(i)}$$

are independent standard Gaussian random variables for various i *or* j*.*

Theorem 9 [13], [22] (also see [6]-[12], [14]-[21], [23], [26], [28], [30], [31], [37], [40]-[44], [57], [58]). *Suppose that* $\{\phi_j(x)\}_{j=0}^{\infty}$ *is a complete orthonormal system of Legendre polynomials or trigonometric functions in the space* $L_2([t,T])$*. At the same time* $\psi_2(\tau)$ *is a continuously differentiable nonrandom function on* $[t,T]$ *and* $\psi_1(\tau)$, $\psi_3(\tau)$ *are twice continuously differentiable nonrandom functions on* $[t,T]$*. Then, for the iterated Stratonovich stochastic integral of third multiplicity*

$$J^*[\psi^{(3)}]_{T,t} = \int\limits_t^{*T} \psi_3(t_3) \int\limits_t^{*t_3} \psi_2(t_2) \int\limits_t^{*t_2} \psi_1(t_1) d\mathbf{f}_{t_1}^{(i_1)} d\mathbf{f}_{t_2}^{(i_2)} d\mathbf{f}_{t_3}^{(i_3)} \quad (i_1, i_2, i_3 = 1, \ldots, m)$$

the following expansion

$$J^*[\psi^{(3)}]_{T,t} = \underset{p\to\infty}{\text{l.i.m.}} \sum_{j_1,j_2,j_3=0}^{p} C_{j_3j_2j_1} \zeta_{j_1}^{(i_1)} \zeta_{j_2}^{(i_2)} \zeta_{j_3}^{(i_3)} \tag{133}$$

that converges in the mean-square sense is valid, where

$$C_{j_3j_2j_1} = \int\limits_t^T \psi_3(t_3)\phi_{j_3}(t_3) \int\limits_t^{t_3} \psi_2(t_2)\phi_{j_2}(t_2) \int\limits_t^{t_2} \psi_1(t_1)\phi_{j_1}(t_1) dt_1 dt_2 dt_3$$

and

$$\zeta_j^{(i)} = \int\limits_t^T \phi_j(\tau) d\mathbf{f}_\tau^{(i)}$$

are independent standard Gaussian random variables for various i or j.

Theorem 10 [13], [22] (also see [7]-[12], [14]-[21], [23], [26], [28], [30], [31], [37], [40]-[44], [57], [58]). *Suppose that $\{\phi_j(x)\}_{j=0}^{\infty}$ is a complete orthonormal system of Legendre polynomials or trigonometric functions in the space $L_2([t,T])$. Then, for the iterated Stratonovich stochastic integral of fourth multiplicity*

$$J^*[\psi^{(4)}]_{T,t} = \int\limits_t^{*T} \int\limits_t^{*t_4} \int\limits_t^{*t_3} \int\limits_t^{*t_2} d\mathbf{w}_{t_1}^{(i_1)} d\mathbf{w}_{t_2}^{(i_2)} d\mathbf{w}_{t_3}^{(i_3)} d\mathbf{w}_{t_4}^{(i_4)} \quad (i_1, i_2, i_3, i_4 = 0, 1, \ldots, m)$$

the following expansion

$$J^*[\psi^{(4)}]_{T,t} = \underset{p\to\infty}{\text{l.i.m.}} \sum_{j_1,j_2,j_3,j_4=0}^{p} C_{j_4 j_3 j_2 j_1} \zeta_{j_1}^{(i_1)} \zeta_{j_2}^{(i_2)} \zeta_{j_3}^{(i_3)} \zeta_{j_4}^{(i_4)} \tag{134}$$

that converges in the mean-square sense is valid, where

$$C_{j_4 j_3 j_2 j_1} = \int\limits_t^T \phi_{j_4}(t_4) \int\limits_t^{t_4} \phi_{j_3}(t_3) \int\limits_t^{t_3} \phi_{j_2}(t_2) \int\limits_t^{t_2} \phi_{j_1}(t_1) dt_1 dt_2 dt_3 dt_4$$

and

$$\zeta_j^{(i)} = \int\limits_t^T \phi_j(\tau) d\mathbf{w}_\tau^{(i)}$$

are independent standard Gaussian random variables for various i or j (in the case when $i \neq 0$), $\mathbf{w}_\tau^{(i)} = \mathbf{f}_\tau^{(i)}$ for $i = 1, \ldots, m$ and $\mathbf{w}_\tau^{(0)} = \tau$.

Recently, a new approach to the expansion and mean-square approximation of iterated Stratonovich stochastic integrals has been obtained [13] (Sect. 2.10–2.16), [31] (Sect. 13–19), [36] (Sect. 5–11), [37] (Sect. 7–13). Let us formulate four theorems that were obtained using this approach.

Theorem 11 [13], [31], [36], [37]. *Suppose that $\{\phi_j(x)\}_{j=0}^{\infty}$ is a complete orthonormal system of Legendre polynomials or trigonometric functions in the space $L_2([t,T])$. Furthermore, let $\psi_1(\tau), \psi_2(\tau)$, $\psi_3(\tau)$ are continuously differentiable nonrandom functions on $[t,T]$. Then, for the iterated Stratonovich stochastic integral of third multiplicity*

$$J^*[\psi^{(3)}]_{T,t} = \int\limits_t^{*T} \psi_3(t_3) \int\limits_t^{*t_3} \psi_2(t_2) \int\limits_t^{*t_2} \psi_1(t_1) d\mathbf{w}_{t_1}^{(i_1)} d\mathbf{w}_{t_2}^{(i_2)} d\mathbf{w}_{t_3}^{(i_3)} \quad (i_1, i_2, i_3 = 0, 1, \ldots, m)$$

the following relations

$$J^*[\psi^{(3)}]_{T,t} = \underset{p\to\infty}{\text{l.i.m.}} \sum_{j_1,j_2,j_3=0}^{p} C_{j_3j_2j_1}\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}\zeta_{j_3}^{(i_3)}, \tag{135}$$

$$\mathsf{M}\left\{\left(J^*[\psi^{(3)}]_{T,t} - \sum_{j_1,j_2,j_3=0}^{p} C_{j_3j_2j_1}\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}\zeta_{j_3}^{(i_3)}\right)^2\right\} \le \frac{C}{p} \tag{136}$$

are fulfilled, where $i_1, i_2, i_3 = 0, 1, \ldots, m$ *in* (135) *and* $i_1, i_2, i_3 = 1, \ldots, m$ *in* (136)*, constant* C *is independent of* p*,*

$$C_{j_3j_2j_1} = \int\limits_t^T \psi_3(t_3)\phi_{j_3}(t_3)\int\limits_t^{t_3}\psi_2(t_2)\phi_{j_2}(t_2)\int\limits_t^{t_2}\psi_1(t_1)\phi_{j_1}(t_1)dt_1dt_2dt_3$$

and

$$\zeta_j^{(i)} = \int\limits_t^T \phi_j(\tau)d\mathbf{f}_\tau^{(i)}$$

are independent standard Gaussian random variables for various i *or* j *(in the case when* $i \ne 0$*); another notations are the same as in Theorem* 1*.*

Theorem 12 [13], [31], [36], [37]. *Let* $\{\phi_j(x)\}_{j=0}^{\infty}$ *be a complete orthonormal system of Legendre polynomials or trigonometric functions in the space* $L_2([t,T])$*. Furthermore, let* $\psi_1(\tau), \ldots, \psi_4(\tau)$ *be continuously differentiable nonrandom functions on* $[t,T]$*. Then, for the iterated Stratonovich stochastic integral of fourth multiplicity*

$$J^*[\psi^{(4)}]_{T,t} = \int\limits_t^{*T}\psi_4(t_4)\int\limits_t^{*t_4}\psi_3(t_3)\int\limits_t^{*t_3}\psi_2(t_2)\int\limits_t^{*t_2}\psi_1(t_1)d\mathbf{w}_{t_1}^{(i_1)}d\mathbf{w}_{t_2}^{(i_2)}d\mathbf{w}_{t_3}^{(i_3)}d\mathbf{w}_{t_4}^{(i_4)} \tag{137}$$

the following relations

$$J^*[\psi^{(4)}]_{T,t} = \underset{p\to\infty}{\text{l.i.m.}} \sum_{j_1,j_2,j_3,j_4=0}^{p} C_{j_4j_3j_2j_1}\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}\zeta_{j_3}^{(i_3)}\zeta_{j_4}^{(i_4)}, \tag{138}$$

$$\mathsf{M}\left\{\left(J^*[\psi^{(4)}]_{T,t} - \sum_{j_1,j_2,j_3,j_4=0}^{p} C_{j_4j_3j_2j_1}\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}\zeta_{j_3}^{(i_3)}\zeta_{j_4}^{(i_4)}\right)^2\right\} \le \frac{C}{p^{1-\varepsilon}} \tag{139}$$

are fulfilled, where $i_1, \ldots, i_4 = 0, 1, \ldots, m$ *in* (137), (138) *and* $i_1, \ldots, i_4 = 1, \ldots, m$ *in* (139)*, constant* C *does not depend on* p*,* ε *is an arbitrary small positive real number for the case of complete orthonormal system of Legendre polynomials in the space* $L_2([t,T])$ *and* $\varepsilon = 0$ *for the case of complete orthonormal system of trigonometric functions in the space* $L_2([t,T])$*,*

$$C_{j_4 j_3 j_2 j_1}=\int\limits_t^T \psi_4(t_4)\phi_{j_4}(t_4)\int\limits_t^{t_4}\psi_3(t_3)\phi_{j_3}(t_3)\int\limits_t^{t_3}\psi_2(t_2)\phi_{j_2}(t_2)\int\limits_t^{t_2}\psi_1(t_1)\phi_{j_1}(t_1)dt_1dt_2dt_3dt_4;$$

another notations are the same as in Theorem 11.

Theorem 13 [13], [31], [36], [37]. *Assume that* $\{\phi_j(x)\}_{j=0}^{\infty}$ *is a complete orthonormal system of Legendre polynomials or trigonometric functions in the space* $L_2([t,T])$ *and* $\psi_1(\tau),\ldots,\ \psi_5(\tau)$ *are continuously differentiable nonrandom functions on* $[t,T]$*. Then, for the iterated Stratonovich stochastic integral of fifth multiplicity*

$$J^*[\psi^{(5)}]_{T,t}=\int\limits_t^{*T}\psi_5(t_5)\ldots\int\limits_t^{*t_2}\psi_1(t_1)d\mathbf{w}_{t_1}^{(i_1)}\ldots d\mathbf{w}_{t_5}^{(i_5)} \tag{140}$$

the following relations

$$J^*[\psi^{(5)}]_{T,t}=\underset{p\to\infty}{\text{l.i.m.}}\sum_{j_1,\ldots,j_5=0}^{p}C_{j_5\ldots j_1}\zeta_{j_1}^{(i_1)}\ldots\zeta_{j_5}^{(i_5)}, \tag{141}$$

$$\mathsf{M}\left\{\left(J^*[\psi^{(5)}]_{T,t}-\sum_{j_1,\ldots,j_5=0}^{p}C_{j_5\ldots j_1}\zeta_{j_1}^{(i_1)}\ldots\zeta_{j_5}^{(i_5)}\right)^2\right\}\le\frac{C}{p^{1-\varepsilon}} \tag{142}$$

are fulfilled, where $i_1,\ldots,i_5=0,1,\ldots,m$ *in* (140), (141) *and* $i_1,\ldots,i_5=1,\ldots,m$ *in* (142)*, constant* C *is independent of* p, ε *is an arbitrary small positive real number for the case of complete orthonormal system of Legendre polynomials in the space* $L_2([t,T])$ *and* $\varepsilon=0$ *for the case of complete orthonormal system of trigonometric functions in the space* $L_2([t,T])$,

$$C_{j_5\ldots j_1}=\int\limits_t^T\psi_5(t_5)\phi_{j_5}(t_5)\ldots\int\limits_t^{t_2}\psi_1(t_1)\phi_{j_1}(t_1)dt_1\ldots dt_5;$$

another notations are the same as in Theorem 11, 12.

Theorem 14 [13], [31], [36], [37]. *Suppose that* $\{\phi_j(x)\}_{j=0}^{\infty}$ *is a complete orthonormal system of Legendre polynomials or trigonometric functions in the space* $L_2([t,T])$*. Then, for the iterated Stratonovich stochastic integral of sixth multiplicity*

$$J_{T,t}^{*(i_1\ldots i_6)}=\int\limits_t^{*T}\ldots\int\limits_t^{*t_2}d\mathbf{w}_{t_1}^{(i_1)}\ldots d\mathbf{w}_{t_6}^{(i_6)} \tag{143}$$

the following expansion

$$J_{T,t}^{*(i_1\ldots i_6)}=\underset{p\to\infty}{\text{l.i.m.}}\sum_{j_1,\ldots,j_6=0}^{p}C_{j_6\ldots j_1}\zeta_{j_1}^{(i_1)}\ldots\zeta_{j_6}^{(i_6)}$$

that converges in the mean-square sense is valid, where $i_1, \ldots, i_6 = 0, 1, \ldots, m$,

$$C_{j_6 \ldots j_1} = \int\limits_t^T \phi_{j_6}(t_6) \ldots \int\limits_t^{t_2} \phi_{j_1}(t_1) dt_1 \ldots dt_6;$$

another notations are the same as in Theorems 11–13.

Consider the question on the exact calculation of the mean-square approximation errors for the following iterated Stratonovich stochastic integrals

$$I_{(0)T,t}^{*(i_1)}, \quad I_{(1)T,t}^{*(i_1)}, \quad I_{(00)T,t}^{*(i_1 i_2)}, \quad I_{(000)T,t}^{*(i_1 i_2 i_3)}, \quad i_1, i_2, i_3 = 1, \ldots, m. \tag{144}$$

We assume that the stochastic integrals (144) are approximated using Theorems 1, 8, 9 and the Legendre polynomial system. Since $I_{(0)T,t}^{(i_1)} = I_{(0)T,t}^{*(i_1)}$, $I_{(1)T,t}^{(i_1)} = I_{(1)T,t}^{*(i_1)}$ w. p. 1, we can use the following formulas (see (10) for the case of Legendre polynomilas)

$$I_{(0)T,t}^{(i_1)} = \sqrt{T-t} \zeta_0^{(i_1)},$$

$$I_{(1)T,t}^{(i_1)} = -\frac{(T-t)^{3/2}}{2} \left(\zeta_0^{(i_1)} + \frac{1}{\sqrt{3}} \zeta_1^{(i_1)} \right)$$

to approximate the stochastic integrals $I_{(0)T,t}^{*(i_1)}$, $I_{(1)T,t}^{*(i_1)}$. In this case, we will have zero mean-square approximation errors.

To approximate the iterated Stratonovich stochastic integral $I_{(00)T,t}^{*(i_1 i_2)}$ we can use the formula (see (37))

$$I_{(00)T,t}^{*(i_1 i_2)p} = \frac{T-t}{2} \left(\zeta_0^{(i_1)} \zeta_0^{(i_2)} + \sum_{i=1}^{p} \frac{1}{\sqrt{4i^2-1}} \left(\zeta_{i-1}^{(i_1)} \zeta_i^{(i_2)} - \zeta_i^{(i_1)} \zeta_{i-1}^{(i_2)} \right) \right). \tag{145}$$

The mean-square approximation error for (145) will be determined by the formula (38) ($i_1 \neq i_2$). For the case $i_1 = i_2$ we can use the well-known equality [62]

$$I_{(00)T,t}^{*(i_1 i_1)} = \frac{T-t}{2} \left(\zeta_0^{(i_1)} \right)^2 \quad \text{w. p. 1.}$$

Consider now the iterated Stratonovich stochastic integral $I_{(000)T,t}^{*(i_1 i_2 i_3)}$ of multiplicity 3 ($i_1, i_2, i_3 = 1, \ldots, m$). For the case of pairwise different i_1, i_2, i_3 we can use the formula (39). In the case $i_1 = i_2 = i_3$, to approximate the stochastic integral $I_{(000)T,t}^{*(i_1 i_1 i_1)}$, we use the well-known equality [62]

$$I_{(000)T,t}^{*(i_1 i_1 i_1)} = \frac{(T-t)^{3/2}}{6} \left(\zeta_0^{(i_1)} \right)^3 \quad \text{w. p. 1.}$$

Thus, it remains to consider the following three cases

$$i_1 = i_2 \neq i_3, \tag{146}$$

$$i_1 \neq i_2 = i_3, \tag{147}$$

$$i_1 = i_3 \neq i_2. \tag{148}$$

Taking into account the standard relations between Ito and Stratonovich stochastic integrals [62] and Theorem 1 (the case $k=3$) together with Theorem 9, we obtain

$$
{\sf M}\left\{\left(I_{(000)T,t}^{*(i_1 i_2 i_3)}-I_{(000)T,t}^{*(i_1 i_2 i_3)p}\right)^2\right\}=
$$

$$
={\sf M}\left\{\left(I_{(000)T,t}^{(i_1 i_2 i_3)}+\frac{1}{2}{\bf 1}_{\{i_1=i_2\}}\int\limits_t^T\int\limits_t^{\tau}dsd{\bf f}_{\tau}^{(i_3)}+\frac{1}{2}{\bf 1}_{\{i_2=i_3\}}\int\limits_t^T\int\limits_t^{\tau}d{\bf f}_{s}^{(i_1)}d\tau-I_{(000)T,t}^{*(i_1 i_2 i_3)p}\right)^2\right\}=
$$

$$
={\sf M}\left\{\left(I_{(000)T,t}^{(i_1 i_2 i_3)}-I_{(000)T,t}^{(i_1 i_2 i_3)p}+I_{(000)T,t}^{(i_1 i_2 i_3)p}+{\bf 1}_{\{i_1=i_2\}}\frac{1}{2}\int\limits_t^T\int\limits_t^{\tau}dsd{\bf f}_{\tau}^{(i_3)}\ +\right.\right.
$$

$$
\left.\left.+{\bf 1}_{\{i_2=i_3\}}\frac{1}{2}\int\limits_t^T\int\limits_t^{\tau}d{\bf f}_{s}^{(i_1)}d\tau-I_{(000)T,t}^{*(i_1 i_2 i_3)p}\right)^2\right\}, \tag{149}
$$

where $I_{(000)T,t}^{(i_1 i_2 i_3)}$ and $I_{(000)T,t}^{(i_1 i_2 i_3)p}$ are defined by the relations (43), (44). Moreover, $I_{(000)T,t}^{*(i_1 i_2 i_3)p}$ has the form (see Theorem 9)

$$
I_{(000)T,t}^{*(i_1 i_2 i_3)p}=\sum_{j_1,j_2,j_3=0}^{p}C_{j_3 j_2 j_1}\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}\zeta_{j_3}^{(i_3)}. \tag{150}
$$

Substituting (44) and (150) into (149) yields

$$
{\sf M}\left\{\left(I_{(000)T,t}^{*(i_1 i_2 i_3)}-I_{(000)T,t}^{*(i_1 i_2 i_3)p}\right)^2\right\}=
$$

$$
={\sf M}\left\{\left(I_{(000)T,t}^{(i_1 i_2 i_3)}-I_{(000)T,t}^{(i_1 i_2 i_3)p}+{\bf 1}_{\{i_1=i_2\}}\left(\frac{1}{2}\int\limits_t^T\int\limits_t^{\tau}dsd{\bf f}_{\tau}^{(i_3)}-\sum_{j_1,j_3=0}^{q}C_{j_3 j_1 j_1}\zeta_{j_3}^{(i_3)}\right)+\right.\right.
$$

$$
\left.\left.+{\bf 1}_{\{i_2=i_3\}}\left(\frac{1}{2}\int\limits_t^T\int\limits_t^{\tau}d{\bf f}_{s}^{(i_1)}d\tau-\sum_{j_1,j_3=0}^{p}C_{j_3 j_3 j_1}\zeta_{j_1}^{(i_1)}\right)-{\bf 1}_{\{i_1=i_3\}}\sum_{j_1,j_2=0}^{p}C_{j_1 j_2 j_1}\zeta_{j_2}^{(i_2)}\right)^2\right\}. \tag{151}
$$

Consider the case (146). From (151) we obtain

$$
{\sf M}\left\{\left(I_{(000)T,t}^{*(i_1 i_2 i_3)}-I_{(000)T,t}^{*(i_1 i_2 i_3)p}\right)^2\right\}=
$$

$$= \mathsf{M}\left\{\left(I_{(000)T,t}^{(i_1i_2i_3)} - I_{(000)T,t}^{(i_1i_2i_3)p} + \frac{1}{2}\int\limits_t^T\int\limits_t^{\tau} ds d\mathbf{f}_{\tau}^{(i_3)} - \sum_{j_1,j_3=0}^{p} C_{j_3j_1j_1}\zeta_{j_3}^{(i_3)}\right)^2\right\}. \tag{152}$$

According to the formulas (17), (26), the quantity

$$I_{(000)T,t}^{(i_1i_2i_3)} - I_{(000)T,t}^{(i_1i_2i_3)p}$$

includes only iterated Ito stochastic integrals of multiplicity 3. At the same time, the quantity

$$\frac{1}{2}\int\limits_t^T\int\limits_t^{\tau} ds d\mathbf{f}_{\tau}^{(i_3)} - \sum_{j_1,j_3=0}^{p} C_{j_3j_1j_1}\zeta_{j_3}^{(i_3)}$$

contains only iterated Ito stochastic integrals of multiplicity 1. This means that from (152) we get

$$\mathsf{M}\left\{\left(I_{(000)T,t}^{*(i_1i_2i_3)} - I_{(000)T,t}^{*(i_1i_2i_3)p}\right)^2\right\} = \mathsf{M}\left\{\left(I_{(000)T,t}^{(i_1i_2i_3)} - I_{(000)T,t}^{(i_1i_2i_3)p}\right)^2\right\} +$$

$$+\mathsf{M}\left\{\left(\frac{1}{2}\int\limits_t^T(\tau-t)d\mathbf{f}_{\tau}^{(i_3)} - \sum_{j_1,j_3=0}^{p} C_{j_3j_1j_1}\zeta_{j_3}^{(i_3)}\right)^2\right\}. \tag{153}$$

The relation (40) implies that

$$\mathsf{M}\left\{\left(I_{(000)T,t}^{(i_1i_2i_3)} - I_{(000)T,t}^{(i_1i_2i_3)p}\right)^2\right\} = \frac{(T-t)^3}{6} -$$

$$- \sum_{j_1,j_2,j_3=0}^{p} C_{j_3j_2j_1}^2 - \sum_{j_1,j_2,j_3=0}^{p} C_{j_3j_1j_2}C_{j_3j_2j_1}, \tag{154}$$

where $i_1 = i_2 \neq i_3$.

We have

$$\mathsf{M}\left\{\left(\frac{1}{2}\int\limits_t^T(\tau-t)d\mathbf{f}_{\tau}^{(i_3)} - \sum_{j_1,j_3=0}^{p} C_{j_3j_1j_1}\zeta_{j_3}^{(i_3)}\right)^2\right\} = \frac{1}{4}\int\limits_t^T(\tau-t)^2 d\tau -$$

$$- \sum_{j_1,j_3=0}^{p} C_{j_3j_1j_1}\int\limits_t^T(\tau-t)\phi_{j_3}(\tau)d\tau + \sum_{j_3=0}^{p}\left(\sum_{j_1=0}^{p} C_{j_3j_1j_1}\right)^2, \tag{155}$$

where $\{\phi_j(x)\}_{j=0}^{\infty}$ is a complete orthonormal system of Legendre polynomials in the space $L_2([t,T])$.

Using the orthogonality property of Legendre polynomials, we obtain

$$\int\limits_t^T (\tau-t)\phi_{j_3}(\tau)d\tau = \frac{(T-t)^{3/2}}{2}\begin{cases} 1, & j_3=0\\ 1/\sqrt{3}, & j_3=1.\\ 0, & j_3\ge 2\end{cases} \tag{156}$$

Combining (153)–(156), we get

$$\mathsf{M}\left\{\left(I_{(000)T,t}^{*(i_1i_2i_3)}-I_{(000)T,t}^{*(i_1i_2i_3)p}\right)^2\right\}=\frac{(T-t)^3}{4}-\sum_{j_1,j_2,j_3=0}^{p}C_{j_3j_2j_1}^2-\sum_{j_1,j_2,j_3=0}^{p}C_{j_3j_1j_2}C_{j_3j_2j_1}-$$

$$-\frac{(T-t)^{3/2}}{2}\sum_{j_1=0}^{p}\left(C_{0j_1j_1}+\frac{1}{\sqrt{3}}C_{1j_1j_1}\right)+\sum_{j_3=0}^{p}\left(\sum_{j_1=0}^{p}C_{j_3j_1j_1}\right)^2, \tag{157}$$

where $i_1=i_2\ne i_3$.

Consider the case (147). From (151) we obtain

$$\mathsf{M}\left\{\left(I_{(000)T,t}^{*(i_1i_2i_3)}-I_{(000)T,t}^{*(i_1i_2i_3)p}\right)^2\right\}=$$

$$=\mathsf{M}\left\{\left(I_{(000)T,t}^{(i_1i_2i_3)}-I_{(000)T,t}^{(i_1i_2i_3)p}+\frac{1}{2}\int\limits_t^T\int\limits_t^{\tau}d\mathbf{f}_s^{(i_1)}d\tau-\sum_{j_1,j_3=0}^{p}C_{j_3j_3j_1}\zeta_{j_1}^{(i_1)}\right)^2\right\}=$$

$$=\mathsf{M}\left\{\left(I_{(000)T,t}^{(i_1i_2i_3)}-I_{(000)T,t}^{(i_1i_2i_3)p}+\frac{1}{2}\int\limits_t^T(T-s)d\mathbf{f}_s^{(i_1)}-\sum_{j_1,j_3=0}^{p}C_{j_3j_3j_1}\zeta_{j_1}^{(i_1)}\right)^2\right\}=$$

$$=\mathsf{M}\left\{\left(I_{(000)T,t}^{(i_1i_2i_3)}-I_{(000)T,t}^{(i_1i_2i_3)p}\right)^2\right\}+$$

$$+\mathsf{M}\left\{\left(\frac{1}{2}\int\limits_t^T(T-s)d\mathbf{f}_s^{(i_1)}-\sum_{j_1,j_3=0}^{p}C_{j_3j_3j_1}\zeta_{j_1}^{(i_1)}\right)^2\right\}=$$

$$=\mathsf{M}\left\{\left(I_{(000)T,t}^{(i_1i_2i_3)}-I_{(000)T,t}^{(i_1i_2i_3)p}\right)^2\right\}+$$

$$+\frac{1}{4}\int\limits_t^T(T-s)^2ds-\sum_{j_1,j_3=0}^{p}C_{j_3j_3j_1}\int\limits_t^T(T-s)\phi_{j_1}(s)ds+$$

$$+\sum_{j_1=0}^{p}\left(\sum_{j_3=0}^{p}C_{j_3j_3j_1}\right)^2, \tag{158}$$

where $\{\phi_j(x)\}_{j=0}^{\infty}$ is a complete orthonormal system of Legendre polynomials in the space $L_2([t,T])$.

The relation (41) implies that

$$\mathsf{M}\left\{\left(I_{(000)T,t}^{(i_1i_2i_3)}-I_{(000)T,t}^{(i_1i_2i_3)p}\right)^2\right\}=\frac{(T-t)^3}{6}-$$

$$-\sum_{j_1,j_2,j_3=0}^{p}C_{j_3j_2j_1}^2-\sum_{j_1,j_2,j_3=0}^{p}C_{j_2j_3j_1}C_{j_3j_2j_1}, \tag{159}$$

where $i_1\ne i_2=i_3$.

Moreover,

$$\int\limits_t^T(T-s)\phi_{j_1}(s)ds=\frac{(T-t)^{3/2}}{2}\begin{cases}1, & j_1=0\\ -1/\sqrt{3}, & j_1=1.\\ 0, & j_1\ge 2\end{cases} \tag{160}$$

Combining (158)–(160), we get

$$\mathsf{M}\left\{\left(I_{(000)T,t}^{*(i_1i_2i_3)}-I_{(000)T,t}^{*(i_1i_2i_3)p}\right)^2\right\}=\frac{(T-t)^3}{4}-\sum_{j_1,j_2,j_3=0}^{p}C_{j_3j_2j_1}^2-\sum_{j_1,j_2,j_3=0}^{p}C_{j_2j_3j_1}C_{j_3j_2j_1}-$$

$$-\frac{(T-t)^{3/2}}{2}\sum_{j_3=0}^{p}\left(C_{j_3j_30}-\frac{1}{\sqrt{3}}C_{j_3j_31}\right)+\sum_{j_1=0}^{p}\left(\sum_{j_3=0}^{p}C_{j_3j_3j_1}\right)^2, \tag{161}$$

where $i_1\ne i_2=i_3$.

Consider the case (148). From (151) we obtain

$$\mathsf{M}\left\{\left(I_{(000)T,t}^{*(i_1i_2i_3)}-I_{(000)T,t}^{*(i_1i_2i_3)p}\right)^2\right\}=$$

$$=\mathsf{M}\left\{\left(I_{(000)T,t}^{(i_1i_2i_3)}-I_{(000)T,t}^{(i_1i_2i_3)p}-\sum_{j_1,j_2=0}^{q}C_{j_1j_2j_1}\zeta_{j_2}^{(i_2)}\right)^2\right\}=$$

$$=\mathsf{M}\left\{\left(I_{(000)T,t}^{(i_1i_2i_3)}-I_{(000)T,t}^{(i_1i_2i_3)p}\right)^2\right\}+\mathsf{M}\left\{\left(\sum_{j_1,j_2=0}^{p}C_{j_1j_2j_1}\zeta_{j_2}^{(i_2)}\right)^2\right\}=$$

$$= \mathsf{M}\left\{\left(I_{(000)T,t}^{(i_1i_2i_3)} - I_{(000)T,t}^{(i_1i_2i_3)p}\right)^2\right\} + \sum_{j_2=0}^{p}\left(\sum_{j_1=0}^{p} C_{j_1j_2j_1}\right)^2. \tag{162}$$

The relation (42) implies that

$$\mathsf{M}\left\{\left(I_{(000)T,t}^{(i_1i_2i_3)} - I_{(000)T,t}^{(i_1i_2i_3)p}\right)^2\right\} = \frac{(T-t)^3}{6} -$$

$$- \sum_{j_1,j_2,j_3=0}^{p} C_{j_3j_2j_1}^2 - \sum_{j_1,j_2,j_3=0}^{p} C_{j_3j_2j_1}C_{j_1j_2j_3}, \tag{163}$$

where $i_1 = i_3 \neq i_2$.

Combining (162) and (163), we obtain

$$\mathsf{M}\left\{\left(I_{(000)T,t}^{*(i_1i_2i_3)} - I_{(000)T,t}^{*(i_1i_2i_3)p}\right)^2\right\} = \frac{(T-t)^3}{6} - \sum_{j_1,j_2,j_3=0}^{p} C_{j_3j_2j_1}^2 - \sum_{j_1,j_2,j_3=0}^{p} C_{j_3j_2j_1}C_{j_1j_2j_3} +$$

$$+ \sum_{j_2=0}^{p}\left(\sum_{j_1=0}^{p} C_{j_1j_2j_1}\right)^2, \tag{164}$$

where $i_1 = i_3 \neq i_2$.

Thus, the exact calculaton of the mean-square approximation error for the iterated Stratonovich stochastic integral $I_{(000)T,t}^{*(i_1i_2i_3)}$ $(i_1, i_2, i_3 = 1, \ldots, m)$ is given by the formulas (39), (157), (161), and (164).

EXPANSION OF ITERATED STOCHASTIC INTEGRALS WITH RESPECT TO MARTINGALE POISSON MEASURES AND WITH RESPECT TO MARTINGALES BASED ON GENERALIZED MULTIPLE FOURIER SERIES

DMITRIY F. KUZNETSOV

Abstract. We consider some versions and generalizations of the approach to the expansion of iterated Ito stochastic integrals of arbitrary multiplicity k ($k \in \mathbb{N}$) based on generalized multiple Fourier series. Expansions of iterated stochastic integrals with respect to martingale Poisson measures and with respect to martingales were obtained. For the iterated stochastic integrals with respect to martingales, we have proved a theorem which gives a generalization of the expansion for iterated Ito stochastic integrals of arbitrary multiplicity based on generalized multiple Fourier series. Also we consider a modification of the mentioned expansion of iterated Ito stochastic integrals for the case of complete orthonormal with weight $r(t_1)\ldots r(t_k) \geq 0$ systems of functions in the space $L_2([t,T]^k)$. Mean-square convergence of the considered expansions is proved. An example of the expansion of iterated (double) stochastic integrals with respect to martingales using the system of Bessel functions is considered.

Keywords: Iterated Ito stochastic integral, Iterated stochastic integral with respect to martingale Poisson measures, Iterated stochastic integral with respect to martingales, Generalized Multiple Fourier series, Multiple Fourier–Legendre series, Mean-square approximation, Expansion.

1. Introduction

Let $(\Omega,\ \mathrm{F},\ \mathsf{P})$ be a complete probability space, let $\{\mathrm{F}_t, t\in[0,T]\}$ be a non-decreasing right-continous family of σ-algebras of F, and let $\mathbf{f}_t$ be a standard m-dimensional Wiener stochastic process which is F_t-measurable for any $t\in[0,T]$. We assume that the components $\mathbf{f}_t^{(i)}$ $(i=1,\ldots,m)$ of this process are independent. Consider an Ito stochastic differential equation (SDE) in the integral form

$$\mathbf{x}_t=\mathbf{x}_0+\int\limits_0^t \mathbf{a}(\mathbf{x}_\tau,\tau)d\tau+\int\limits_0^t B(\mathbf{x}_\tau,\tau)d\mathbf{f}_\tau,\quad \mathbf{x}_0=\mathbf{x}(0,\omega). \tag{1}$$

Here $\mathbf{x}_t$ is some n-dimensional stochastic process satisfying the equation (1). The non-random functions $\mathbf{a}:\mathbb{R}^n\times[0,T]\to\mathbb{R}^n$, $B:\mathbb{R}^n\times[0,T]\to\mathbb{R}^{n\times m}$ guarantee the existence and uniqueness up to stochastic equivalence of a solution of the equation (1) [1]. The second integral on the right-hand side of (1) is interpreted as an Ito stochastic integral. Let $\mathbf{x}_0$ be an n-dimensional random variable which is F_0-measurable and $\mathsf{M}\left\{|\mathbf{x}_0|^2\right\}<\infty$ (M denotes a mathematical expectation). We assume that $\mathbf{x}_0$ and $\mathbf{f}_t-\mathbf{f}_0$ are independent when $t>0$.

It is well known [2]-[5] that Ito SDEs are adequate mathematical models of dynamic systems under the influence of random disturbances. One of the effective approaches to the numerical integration of Ito SDEs is an approach based on the Taylor–Ito and Taylor–Stratonovich expansions [2]-[17]. The most important feature of such expansions is a presence in them of the so-called iterated Ito and Stratonovich stochastic integrals which play the key role for solving the problem of numerical integration of Ito SDEs and have the following form

$$J[\psi^{(k)}]_{T,t}=\int\limits_t^T \psi_k(t_k)\ldots\int\limits_t^{t_2}\psi_1(t_1)d\mathbf{w}_{t_1}^{(i_1)}\ldots d\mathbf{w}_{t_k}^{(i_k)}, \tag{2}$$

$$J^*[\psi^{(k)}]_{T,t}=\int\limits_t^{*T} \psi_k(t_k)\ldots\int\limits_t^{*t_2}\psi_1(t_1)d\mathbf{w}_{t_1}^{(i_1)}\ldots d\mathbf{w}_{t_k}^{(i_k)}, \tag{3}$$

where every $\psi_l(\tau)$ $(l=1,\ldots,k)$ is a non-random function on $[t,T]$, $\mathbf{w}_\tau^{(i)}=\mathbf{f}_\tau^{(i)}$ for $i=1,\ldots,m$ and $\mathbf{w}_\tau^{(0)}=\tau,\ \ i_1,\ldots,i_k=0,1,\ldots,m,$

$$\int \text{ and } \int\limits^{*}$$

denote Ito and Stratonovich stochastic integrals, respectively (in (3), we use the definition of the Stratonovich stochastic integral from [2]).

Note that $\psi_l(\tau) \equiv 1$ $(l = 1, \ldots, k)$ and $i_1, \ldots, i_k = 0, 1, \ldots, m$ in [2]-[7]. At the same time $\psi_l(\tau) \equiv (t - \tau)^{q_l}$ $(l = 1, \ldots, k,\ q_1, \ldots, q_k = 0, 1, 2, \ldots)$ and $i_1, \ldots, i_k = 1, \ldots, m$ in [8]-[17].

The problem of effective jointly numerical modeling (with respect to the mean-square convergence criterion) of iterated Ito and Stratonovich stochastic integrals (2) and (3) is difficult from theoretical and computing point of view [2]-[5], [10]-[61].

The only exception is connected with a narrow particular case, when $i_1 = \ldots = i_k \neq 0$ and $\psi_1(\tau), \ldots, \psi_k(\tau) \equiv \psi(\tau)$. This case can be investigated using the Ito formula [2]-[4].

Note that even for the mentioned coincidence $(i_1 = \ldots = i_k \neq 0)$ but for different functions $\psi_1(\tau), \ldots, \psi_k(\tau)$ the mentioned difficulties persist. As a result, relatively simple families of iterated Ito and Stratonovich stochastic integrals, which can be often met in the applications, can not be represented effectively in a finite form (with respect to the mean-square criterion of approximation) using the system of standard Gaussian random variables.

Usually, approaches to the expansion of iterated stochastic integrals (2) and (3) are based on the expansion of the Wiener process.

For example, in [3] (also see [2], [4]) Milstein G.N. proposed to expand (2) or (3) (the case $k = 2$ and $i_1 \neq i_2$; $i_1, i_2 = 1, \ldots, m$) into the iterated series of products of standard Gaussian random variables by representing the Brownian bridge process as a trigonometric Fourier series with random coefficients (the version of the so-called Karhunen–Loeve expansion). To obtain the Milstein expansion of (2) or (3), the truncated Fourier expansions of components of the Wiener process $\mathbf{f}_\tau$ must be iteratively substituted in the single integrals, and the integrals must be calculated, starting from the innermost integral. The above procedure leads to iterated application of the operation of limit transition and does not lead to a general expansion of (2) or (3) which is valid for an arbitrary multiplicity k. For this reason, only expansions of single, double, and triple stochastic integrals were presented in [2] $(k = 1, 2, 3)$ and in [3], [4] $(k = 1, 2)$ for the simplest case $\psi_1(\tau), \psi_2(\tau), \psi_3(\tau) \equiv 1$; $i_1, i_2, i_3 = 0, 1, \ldots, m$. Moreover, generally speaking, the convergence of approximations to the appropriate stochastic integrals (3) is not proved rigorously for $k = 3$ in [2] (Sect. 5.8, pp. 202–204), [5] (pp. 82–84), [62] (pp. 438–439), [63] (pp. 263–264) (see [15]-[18] (Sect. 6.2), [43], [45]-[48] for details).

Note that in [60], [61] a method for the expansion of double [60], [61] and triple [60] Ito stochastic integrals (2) $(k = 2, 3;\ \psi_1(\tau), \psi_2(\tau), \psi_3(\tau) \equiv 1;\ i_1, i_2, i_3 = 0, 1, \ldots, m)$ based on the expansion of the Wiener process using Haar functions [61] and trigonometric functions [60], [61] has been considered. The restrictions of this method [60], [61] are also connected with the iterated application of the operation of limit transition at least starting from the second or third multiplicity of iterated stochastic integrals.

A more effective and general approach to the expansion of iterated Ito stochastic integrals (2) of arbitrary multiplicity k $(k \in \mathbb{N})$ based on generalized multiple Fourier series (converging in the sense of norm in Hilbert space $L_2([t, T]^k)$) was proposed and developed by the author of this paper in [10] (2006) (also see [11]-[36], [41]-[50], [52]-[55]). Hereinafter, this method is referred to as the method of generalized multiple Fourier series. As it turned out, the method of generalized multiple Fourier series can be adapted for the iterated Stratonovich stochastic integrals (3) at least for the multiplicities 1 to 6 [11]-[18], [23]-[25], [31], [37], [38], [42], [47]-[49], [51], [54], [57], [58]. Expansions of these iterated Stratonovich stochastic integrals turned out simpler than the appropriate expansions for the iterated Ito stochastic integrals (2).

The problem of iterated application of the operation of limit transition (see above) not appears in the method of generalized multiple Fourier series [10]-[36], [41]-[50], [52]-[55]. The idea of this method is as follows: the iterated Ito stochastic integral (2) of multiplicity k is represented as the multiple stochastic integral from the certain discontinuous non-random function of k variables defined on the hypercube $[t,T]^k$, where $[t,T]$ is the interval of integration of the iterated Ito stochastic integral (2). Then, the indicated non-random function is expanded in the hypercube into the generalized multiple Fourier series converging in the mean-square sense in the space $L_2([t,T]^k)$. After a number of nontrivial transformations we come (see Theorems 1, 2 below) to the mean-square convergening expansion of the iterated Ito stochastic integral (2) into the multiple series of products of standard Gaussian random variables. The coefficients of this series are the coefficients of the generalized multiple Fourier series for the mentioned non-random function of k variables which can be calculated using the explicit formula regardless of the multiplicity k of the iterated Ito stochastic integral (2). Recall that this method is referred to as the method of generalized multiple Fourier series.

Thus, we obtain the following new and useful possibilities of the method of generalized multiple Fourier series.

1. There is the explicit formula (see (6)) for calculation of expansion coefficients of the iterated Ito stochastic integral (2) with any fixed multiplicity k.

2. We have new possibilities for exact calculation of the mean-square approximation error of the iterated Ito stochastic integral (2) of arbitrary multiplicity k [12]-[18], [26], [44].

3. Since the used multiple Fourier series is a generalized in the sense that it is constructed using various complete orthonormal systems of functions in the space $L_2([t,T])$, then we have new possibilities for approximation — we can use not only the trigonometric functions as in [2]-[4] but the Legendre polynomials.

4. As it turned out [10]-[36], [41]-[50], [52]-[55] it is more convenient to work with the Legendre polynomials for constructing the approximations of the iterated Ito stochastic integrals (2). Approximations based on the Legendre polynomials essentially simpler than their analogues based on the trigonometric functions. Another advantages of the application of Legendre polynomials in the framework of the mentioned problem are considered in [15]-[18], [30], [41].

5. The approach based on the Karhunen–Loeve expansion of the Brownian bridge process as well as the approach from [60], [61] lead to iterated application of the operation of limit transition (the operation of limit transition is implemented only once in Theorems 1, 2 (see below)) starting from the second multiplicity (in the general case) and third multiplicity (for the case $\psi_1(\tau),\psi_2(\tau),\psi_3(\tau)\equiv 1$; $i_1,i_2,i_3=1,\ldots,m$) of iterated Ito stochastic integrals. Multiple series (the operation of limit transition is implemented only once) are more convenient for approximation than the iterated ones (iterated application of the operation of limit transition), since partial sums of multiple series converge for any possible case of convergence to infinity of their upper limits of summation (let us denote them as $p_1,\ldots,p_k$). For example, when $p_1=\ldots=p_k=p\to\infty$. For iterated series, the condition $p_1=\ldots=p_k=p\to\infty$ obviously does not guarantee the convergence of this series.

However, in [2] (Sect. 5.8, pp. 202–204), [5] (pp. 82–84), [62] (pp. 438–439), [63] (pp. 263–264) the authors use (without rigorous proof) the condition $p_1=p_2=p_3=p\to\infty$ within the frames of the mentioned approach based on the Karhunen–Loeve expansion of the Brownian bridge process [3] together with the Wong–Zakai approximation [64]-[66] (see [15]-[18] (Sect. 6.2), [43], [45]-[48] for details).

The method of generalized multiple Fourier series allows some generalizations and modifications in several directions.

Recently, the method of generalized multiple Fourier series (see Theorems 1, 2 below) was applied to the expansion and mean-square approximation of iterated stochastic integrals with respect to the infinite-dimensional Q-Wiener process [15]-[18] (Chapter 7), [32]-[35]. These results can be directly applied to the construction of high-order strong numerical methods for non-commutative semilinear stochastic partial differential equations with non-linear multiplicative trace class noise [15]-[18] (Chapter 7), [32]-[35].

In this article, we demonstrate that the method of generalized multiple Fourier series is essentially general and allows some transformations for other types of iterated stochastic integrals. We will consider versions of the method of generalized multiple Fourier series for iterated stochastic integrals with respect to martingale Poisson measures and for iterated stochastic integrals with respect to martingales. The mentioned results are sufficiently natural according to general properties of martingales.

In Sect. 2, we formulate Theorem 1 on expansion of the iterated Ito stochastic integrals (2) of arbitrary multiplicity k based on generalized multiple Fourier series (method of generalized multiple Fourier series) [10]-[36], [41]-[50], [52]-[55]. Sect. 3 is devoted to a generalization of Theorem 1 for the case of an arbitrary complete orthonormal system of functions in the space $L_2([t,T])$ and $\psi_1(\tau), \ldots, \psi_k(\tau) \in L_2([t,T])$. In Sect. 4, we define the stochastic integral with respect to the martingale Poisson measure and consider some properties of this integral. Sect. 5 is devoted to a version of Theorem 1 for the iterated stochastic integrals with respect to martingale Poisson measures. In Sect. 6, we consider a generalization of Theorem 1 for the case of iterated stochastic integrals with respect to martingales. Sect. 7 is devoted to versions of Theorems 1, 2 for the case of complete orthonormal with weight $r(t_1)\ldots r(t_k) \geq 0$ systems of functions in the space $L_2([t,T]^k)$. In Sect. 8, we consider one modification of theorems from Sect. 6 and 7. Sect. 9 is devoted to an example of the application of results from Sect. 8.

We will say that the function $f(x) : [t,T] \to \mathbb{R}^1$ satisfies the condition $(\star)$, if it is continuous at the interval $[t,T]$ except may be for the finite number of points of the finite discontinuity as well as it is right-continuous at the interval $[t,T]$.

Let us suppose that $\{\phi_j(x)\}_{j=0}^{\infty}$ is a complete orthonormal system of functions in the space $L_2([t,T])$, each function $\phi_j(x)$ of which for finite j satisfies the condition $(\star)$.

It is clear that complete orthonormal systems $\{\phi_j(x)\}_{j=0}^{\infty}$ of continuous functions in the space $L_2([t,T])$ satisfy the condition $(\star)$.

Let us consider some examples of systems satisfying the condition $(\star)$.

Example 1. The system of Legendre polynomials

$$\phi_j(x) = \sqrt{\frac{2j+1}{T-t}} P_j\left(\left(x - \frac{T+t}{2}\right)\frac{2}{T-t}\right), \quad j = 0, 1, 2, \ldots, \quad x \in [t,T], \tag{4}$$

where $P_j(y)$, $y \in [-1,1]$ is the Legendre polynomial

$$P_j(y) = \frac{1}{2^j j!}\frac{d^j}{dy^j}\left(y^2-1\right)^j.$$

Example 2. The system of trigonometric functions

$$\phi_j(x) = \frac{1}{\sqrt{T-t}}\begin{cases} 1, & j = 0 \\ \sqrt{2}\sin\left(2\pi r(x-t)/(T-t)\right), & j = 2r-1, \\ \sqrt{2}\cos\left(2\pi r(x-t)/(T-t)\right), & j = 2r \end{cases}$$

where $x \in [t,T]$, $r = 1, 2, \ldots$

Example 3. The system of Haar functions

$$\phi_0(x) = \frac{1}{\sqrt{T-t}}, \quad \phi_{nj}(x) = \frac{1}{\sqrt{T-t}}\varphi_{nj}\left(\frac{x-t}{T-t}\right), \quad x \in [t,T],$$

where $n = 0, 1, \ldots,\ \ j = 1, 2, \ldots, 2^n$, and the functions $\varphi_{nj}(x)$ have the following form

$$\varphi_{nj}(x) = \begin{cases} 2^{n/2}, & x \in [(j-1)/2^n,\ (j-1)/2^n + 1/2^{n+1}) \\ \\ -2^{n/2}, & x \in [(j-1)/2^n + 1/2^{n+1},\ j/2^n) \\ \\ 0, & \text{otherwise} \end{cases},$$

where $n = 0, 1, \ldots,\ \ j = 1, 2, \ldots, 2^n$ (we choose the values of Haar functions in the points of discontinuity in order they will be right-continuous).

Example 4. The system of Rademacher–Walsh functions

$$\phi_0(x) = \frac{1}{\sqrt{T-t}},$$

$$\phi_{m_1\ldots m_k}(x) = \frac{1}{\sqrt{T-t}}\varphi_{m_1}\left(\frac{x-t}{T-t}\right)\ldots\varphi_{m_k}\left(\frac{x-t}{T-t}\right), \quad x \in [t, T],$$

where $0 < m_1 < \ldots < m_k,\ \ m_1, \ldots, m_k = 1, 2, \ldots,\ \ k = 1, 2, \ldots,$

$$\varphi_m(x) = (-1)^{[2^m x]},$$

$x \in [0, 1],\ \ m = 1, 2, \ldots,\ \ [y]$ is an integer part of a real number y.

2. Method of Expansion of Iterated Ito Stochastic Integrals of Arbitrary Multiplicity Based on Generalized Multiple Fourier Series Converging in the Mean

Suppose that every $\psi_l(\tau)$ $(l = 1, \ldots, k)$ is a non-random function from the space $L_2([t, T])$. Define the following function on the hypercube $[t, T]^k$

$$K(t_1, \ldots, t_k) = \begin{cases} \psi_1(t_1)\ldots\psi_k(t_k) & \text{for}\ \ t_1 < \ldots < t_k \\ \\ 0 & \text{otherwise} \end{cases}, \quad t_1, \ldots, t_k \in [t, T], \quad k \geq 2 \tag{5}$$

and $K(t_1) \equiv \psi_1(t_1)$ for $t_1 \in [t, T]$.

Suppose that $\{\phi_j(x)\}_{j=0}^{\infty}$ is a complete orthonormal system of functions in the space $L_2([t, T])$. The function $K(t_1, \ldots, t_k)$ belongs to the space $L_2([t, T]^k)$. At this situation it is well known that the generalized multiple Fourier series of $K(t_1, \ldots, t_k) \in L_2([t, T]^k)$ is converging to $K(t_1, \ldots, t_k)$ in the hypercube $[t, T]^k$ in the mean-square sense, i.e.

$$\lim_{p_1,\ldots,p_k\to\infty}\left\|K(t_1,\ldots,t_k)-\sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k}C_{j_k\ldots j_1}\prod_{l=1}^{k}\phi_{j_l}(t_l)\right\|_{L_2([t,T]^k)}=0,$$

where

$$C_{j_k\ldots j_1}=\int\limits_{[t,T]^k}K(t_1,\ldots,t_k)\prod_{l=1}^{k}\phi_{j_l}(t_l)dt_1\ldots dt_k, \tag{6}$$

$$\|f\|_{L_2([t,T]^k)}=\left(\int\limits_{[t,T]^k}f^2(t_1,\ldots,t_k)dt_1\ldots dt_k\right)^{1/2}.$$

Consider the partition $\{\tau_j\}_{j=0}^{N}$ of $[t,T]$ such that

$$t=\tau_0<\ldots<\tau_N=T,\quad \Delta_N=\max_{0\le j\le N-1}\Delta\tau_j\to 0\ \text{ if }\ N\to\infty,\quad \Delta\tau_j=\tau_{j+1}-\tau_j. \tag{7}$$

Theorem 1 [10] (2006), [11]-[36], [41]-[50], [52]-[55]. *Suppose that every $\psi_l(\tau)$ $(l=1,\ldots,k)$ is a continuous non-random function on $[t,T]$ and $\{\phi_j(x)\}_{j=0}^{\infty}$ is a complete orthonormal system of functions in the space $L_2([t,T])$, each function of which for finite j satisfies the condition $(\star)$ (see Sect. 1). Then*

$$J[\psi^{(k)}]_{T,t}=\underset{p_1,\ldots,p_k\to\infty}{\text{l.i.m.}}\sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k}C_{j_k\ldots j_1}\left(\prod_{l=1}^{k}\zeta_{j_l}^{(i_l)}-\right.$$

$$\left.-\underset{N\to\infty}{\text{l.i.m.}}\sum_{(l_1,\ldots,l_k)\in \mathrm{G}_k}\phi_{j_1}(\tau_{l_1})\Delta\mathbf{w}_{\tau_{l_1}}^{(i_1)}\ldots\phi_{j_k}(\tau_{l_k})\Delta\mathbf{w}_{\tau_{l_k}}^{(i_k)}\right), \tag{8}$$

where $J[\psi^{(k)}]_{T,t}$ is defined by (2),

$$\mathrm{G}_k=\mathrm{H}_k\backslash\mathrm{L}_k,\quad \mathrm{H}_k=\{(l_1,\ldots,l_k):\ l_1,\ldots,l_k=0,\ 1,\ldots,N-1\},$$

$$\mathrm{L}_k=\{(l_1,\ldots,l_k):\ l_1,\ldots,l_k=0,\ 1,\ldots,N-1;\ l_g\ne l_r\ (g\ne r);\ g,r=1,\ldots,k\},$$

l.i.m. *is a limit in the mean-square sense*, $i_1,\ldots,i_k=0,1,\ldots,m$,

$$\zeta_j^{(i)}=\int\limits_t^T\phi_j(\tau)d\mathbf{w}_\tau^{(i)} \tag{9}$$

are independent standard Gaussian random variables for various i or j (if $i\ne 0$), $C_{j_k\ldots j_1}$ is the Fourier coefficient (6), $\Delta\mathbf{w}_{\tau_j}^{(i)}=\mathbf{w}_{\tau_{j+1}}^{(i)}-\mathbf{w}_{\tau_j}^{(i)}$ $(i=0,1,\ldots,m)$, $\{\tau_j\}_{j=0}^{N}$ *is a partition of the interval $[t,T]$ which satisfies the condition* (7).

Let us consider transformed particular cases of Theorem 1 for $k=1,\ldots,5$ [10]-[36], [41]-[50], [52]-[55] (the cases $k=6$ and 7 can be found in [11]-[17], [43])

$$J[\psi^{(1)}]_{T,t} = \underset{p_1\to\infty}{\text{l.i.m.}} \sum_{j_1=0}^{p_1} C_{j_1}\zeta_{j_1}^{(i_1)}, \tag{10}$$

$$J[\psi^{(2)}]_{T,t} = \underset{p_1,p_2\to\infty}{\text{l.i.m.}} \sum_{j_1=0}^{p_1}\sum_{j_2=0}^{p_2} C_{j_2j_1}\Biggl(\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)} - \mathbf{1}_{\{i_1=i_2\ne 0\}}\mathbf{1}_{\{j_1=j_2\}}\Biggr), \tag{11}$$

$$J[\psi^{(3)}]_{T,t} = \underset{p_1,p_2,p_3\to\infty}{\text{l.i.m.}} \sum_{j_1=0}^{p_1}\sum_{j_2=0}^{p_2}\sum_{j_3=0}^{p_3} C_{j_3j_2j_1}\Biggl(\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}\zeta_{j_3}^{(i_3)} -$$

$$-\mathbf{1}_{\{i_1=i_2\ne 0\}}\mathbf{1}_{\{j_1=j_2\}}\zeta_{j_3}^{(i_3)} - \mathbf{1}_{\{i_2=i_3\ne 0\}}\mathbf{1}_{\{j_2=j_3\}}\zeta_{j_1}^{(i_1)} - \mathbf{1}_{\{i_1=i_3\ne 0\}}\mathbf{1}_{\{j_1=j_3\}}\zeta_{j_2}^{(i_2)}\Biggr), \tag{12}$$

$$J[\psi^{(4)}]_{T,t} = \underset{p_1,\ldots,p_4\to\infty}{\text{l.i.m.}} \sum_{j_1=0}^{p_1}\ldots\sum_{j_4=0}^{p_4} C_{j_4\ldots j_1}\Biggl(\prod_{l=1}^{4}\zeta_{j_l}^{(i_l)} -$$
$$-\mathbf{1}_{\{i_1=i_2\ne 0\}}\mathbf{1}_{\{j_1=j_2\}}\zeta_{j_3}^{(i_3)}\zeta_{j_4}^{(i_4)} - \mathbf{1}_{\{i_1=i_3\ne 0\}}\mathbf{1}_{\{j_1=j_3\}}\zeta_{j_2}^{(i_2)}\zeta_{j_4}^{(i_4)} -$$
$$-\mathbf{1}_{\{i_1=i_4\ne 0\}}\mathbf{1}_{\{j_1=j_4\}}\zeta_{j_2}^{(i_2)}\zeta_{j_3}^{(i_3)} - \mathbf{1}_{\{i_2=i_3\ne 0\}}\mathbf{1}_{\{j_2=j_3\}}\zeta_{j_1}^{(i_1)}\zeta_{j_4}^{(i_4)} -$$
$$-\mathbf{1}_{\{i_2=i_4\ne 0\}}\mathbf{1}_{\{j_2=j_4\}}\zeta_{j_1}^{(i_1)}\zeta_{j_3}^{(i_3)} - \mathbf{1}_{\{i_3=i_4\ne 0\}}\mathbf{1}_{\{j_3=j_4\}}\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)} +$$
$$+\mathbf{1}_{\{i_1=i_2\ne 0\}}\mathbf{1}_{\{j_1=j_2\}}\mathbf{1}_{\{i_3=i_4\ne 0\}}\mathbf{1}_{\{j_3=j_4\}} +$$
$$+\mathbf{1}_{\{i_1=i_3\ne 0\}}\mathbf{1}_{\{j_1=j_3\}}\mathbf{1}_{\{i_2=i_4\ne 0\}}\mathbf{1}_{\{j_2=j_4\}} +$$
$$+\mathbf{1}_{\{i_1=i_4\ne 0\}}\mathbf{1}_{\{j_1=j_4\}}\mathbf{1}_{\{i_2=i_3\ne 0\}}\mathbf{1}_{\{j_2=j_3\}}\Biggr), \tag{13}$$

$$J[\psi^{(5)}]_{T,t} = \underset{p_1,\ldots,p_5\to\infty}{\text{l.i.m.}} \sum_{j_1=0}^{p_1}\ldots\sum_{j_5=0}^{p_5} C_{j_5\ldots j_1}\Biggl(\prod_{l=1}^{5}\zeta_{j_l}^{(i_l)} -$$
$$-\mathbf{1}_{\{i_1=i_2\ne 0\}}\mathbf{1}_{\{j_1=j_2\}}\zeta_{j_3}^{(i_3)}\zeta_{j_4}^{(i_4)}\zeta_{j_5}^{(i_5)} - \mathbf{1}_{\{i_1=i_3\ne 0\}}\mathbf{1}_{\{j_1=j_3\}}\zeta_{j_2}^{(i_2)}\zeta_{j_4}^{(i_4)}\zeta_{j_5}^{(i_5)} -$$
$$-\mathbf{1}_{\{i_1=i_4\ne 0\}}\mathbf{1}_{\{j_1=j_4\}}\zeta_{j_2}^{(i_2)}\zeta_{j_3}^{(i_3)}\zeta_{j_5}^{(i_5)} - \mathbf{1}_{\{i_1=i_5\ne 0\}}\mathbf{1}_{\{j_1=j_5\}}\zeta_{j_2}^{(i_2)}\zeta_{j_3}^{(i_3)}\zeta_{j_4}^{(i_4)} -$$
$$-\mathbf{1}_{\{i_2=i_3\ne 0\}}\mathbf{1}_{\{j_2=j_3\}}\zeta_{j_1}^{(i_1)}\zeta_{j_4}^{(i_4)}\zeta_{j_5}^{(i_5)} - \mathbf{1}_{\{i_2=i_4\ne 0\}}\mathbf{1}_{\{j_2=j_4\}}\zeta_{j_1}^{(i_1)}\zeta_{j_3}^{(i_3)}\zeta_{j_5}^{(i_5)} -$$
$$-\mathbf{1}_{\{i_2=i_5\ne 0\}}\mathbf{1}_{\{j_2=j_5\}}\zeta_{j_1}^{(i_1)}\zeta_{j_3}^{(i_3)}\zeta_{j_4}^{(i_4)} - \mathbf{1}_{\{i_3=i_4\ne 0\}}\mathbf{1}_{\{j_3=j_4\}}\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}\zeta_{j_5}^{(i_5)} -$$
$$-\mathbf{1}_{\{i_3=i_5\ne 0\}}\mathbf{1}_{\{j_3=j_5\}}\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}\zeta_{j_4}^{(i_4)} - \mathbf{1}_{\{i_4=i_5\ne 0\}}\mathbf{1}_{\{j_4=j_5\}}\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}\zeta_{j_3}^{(i_3)} +$$
$$+\mathbf{1}_{\{i_1=i_2\ne 0\}}\mathbf{1}_{\{j_1=j_2\}}\mathbf{1}_{\{i_3=i_4\ne 0\}}\mathbf{1}_{\{j_3=j_4\}}\zeta_{j_5}^{(i_5)} + \mathbf{1}_{\{i_1=i_2\ne 0\}}\mathbf{1}_{\{j_1=j_2\}}\mathbf{1}_{\{i_3=i_5\ne 0\}}\mathbf{1}_{\{j_3=j_5\}}\zeta_{j_4}^{(i_4)} +$$
$$+\mathbf{1}_{\{i_1=i_2\ne 0\}}\mathbf{1}_{\{j_1=j_2\}}\mathbf{1}_{\{i_4=i_5\ne 0\}}\mathbf{1}_{\{j_4=j_5\}}\zeta_{j_3}^{(i_3)} + \mathbf{1}_{\{i_1=i_3\ne 0\}}\mathbf{1}_{\{j_1=j_3\}}\mathbf{1}_{\{i_2=i_4\ne 0\}}\mathbf{1}_{\{j_2=j_4\}}\zeta_{j_5}^{(i_5)} +$$
$$+\mathbf{1}_{\{i_1=i_3\ne 0\}}\mathbf{1}_{\{j_1=j_3\}}\mathbf{1}_{\{i_2=i_5\ne 0\}}\mathbf{1}_{\{j_2=j_5\}}\zeta_{j_4}^{(i_4)} + \mathbf{1}_{\{i_1=i_3\ne 0\}}\mathbf{1}_{\{j_1=j_3\}}\mathbf{1}_{\{i_4=i_5\ne 0\}}\mathbf{1}_{\{j_4=j_5\}}\zeta_{j_2}^{(i_2)} +$$
$$+\mathbf{1}_{\{i_1=i_4\ne 0\}}\mathbf{1}_{\{j_1=j_4\}}\mathbf{1}_{\{i_2=i_3\ne 0\}}\mathbf{1}_{\{j_2=j_3\}}\zeta_{j_5}^{(i_5)} + \mathbf{1}_{\{i_1=i_4\ne 0\}}\mathbf{1}_{\{j_1=j_4\}}\mathbf{1}_{\{i_2=i_5\ne 0\}}\mathbf{1}_{\{j_2=j_5\}}\zeta_{j_3}^{(i_3)} +$$
$$+\mathbf{1}_{\{i_1=i_4\ne 0\}}\mathbf{1}_{\{j_1=j_4\}}\mathbf{1}_{\{i_3=i_5\ne 0\}}\mathbf{1}_{\{j_3=j_5\}}\zeta_{j_2}^{(i_2)} + \mathbf{1}_{\{i_1=i_5\ne 0\}}\mathbf{1}_{\{j_1=j_5\}}\mathbf{1}_{\{i_2=i_3\ne 0\}}\mathbf{1}_{\{j_2=j_3\}}\zeta_{j_4}^{(i_4)} +$$
$$+\mathbf{1}_{\{i_1=i_5\ne 0\}}\mathbf{1}_{\{j_1=j_5\}}\mathbf{1}_{\{i_2=i_4\ne 0\}}\mathbf{1}_{\{j_2=j_4\}}\zeta_{j_3}^{(i_3)} + \mathbf{1}_{\{i_1=i_5\ne 0\}}\mathbf{1}_{\{j_1=j_5\}}\mathbf{1}_{\{i_3=i_4\ne 0\}}\mathbf{1}_{\{j_3=j_4\}}\zeta_{j_2}^{(i_2)} +$$

$$+\mathbf{1}_{\{i_2=i_3\neq 0\}}\mathbf{1}_{\{j_2=j_3\}}\mathbf{1}_{\{i_4=i_5\neq 0\}}\mathbf{1}_{\{j_4=j_5\}}\zeta_{j_1}^{(i_1)}+\mathbf{1}_{\{i_2=i_4\neq 0\}}\mathbf{1}_{\{j_2=j_4\}}\mathbf{1}_{\{i_3=i_5\neq 0\}}\mathbf{1}_{\{j_3=j_5\}}\zeta_{j_1}^{(i_1)}+$$

$$+\mathbf{1}_{\{i_2=i_5\neq 0\}}\mathbf{1}_{\{j_2=j_5\}}\mathbf{1}_{\{i_3=i_4\neq 0\}}\mathbf{1}_{\{j_3=j_4\}}\zeta_{j_1}^{(i_1)}\Biggr), \tag{14}$$

where $\mathbf{1}_A$ is the indicator of the set A.

The convergence in the mean of degree $2n$ ($n\in\mathbb{N}$) is proved for approximations from Theorem 1 in [11]-[25], [43]. In [15]-[17], [43]-[45], the convergence with probability 1 (further w. p. 1) is proved for expansions of iterated Ito stochastic integrals of arbitrary multiplicity k ($k\in\mathbb{N}$) from Theorem 1 for the cases of Legendre polynomials and trigonometric functions.

As follows from Theorem 1, the expansion (8) is valid for discontinuous complete orthonormal systems of functions in $L_2([t,T])$ satisfying the condition $(\star)$. For example, Theorem 1 is valid for the system of Haar functions as well as for the system of Rademacher–Walsh functions [10]-[25], [43].

3. Generalization of Theorem 1 to the Case of an Arbitrary Complete Orthonormal System of Functions in the Space $L_2([t,T])$ and $\psi_1(\tau),\ldots,\psi_k(\tau)\in L_2([t,T])$

Consider a generalization of formulas (10)–(14) for the case of arbitrary multiplicity k of the iterated Ito stochastic integrals (2). In order to do this, let us consider the unordered set $\{1,2,\ldots,k\}$ and separate it into two parts: the first part consists of r unordered pairs (sequence order of these pairs is also unimportant) and the second one consists of the remaining $k-2r$ numbers. So, we have

$$(\{\underbrace{\{g_1,g_2\},\ldots,\{g_{2r-1},g_{2r}\}}_{\text{part 1}}\},\{\underbrace{q_1,\ldots,q_{k-2r}}_{\text{part 2}}\}), \tag{15}$$

where $\{g_1,g_2,\ldots,g_{2r-1},g_{2r},q_1,\ldots,q_{k-2r}\}=\{1,2,\ldots,k\}$, braces mean an unordered set, and parentheses mean an ordered set.

We will say that (15) is a partition and consider the sum with respect to all possible partitions

$$\sum_{\substack{(\{\{g_1,g_2\},\ldots,\{g_{2r-1},g_{2r}\}\},\{q_1,\ldots,q_{k-2r}\})\\ \{g_1,g_2,\ldots,g_{2r-1},g_{2r},q_1,\ldots,q_{k-2r}\}=\{1,2,\ldots,k\}}} a_{g_1g_2,\ldots,g_{2r-1}g_{2r},q_1\ldots q_{k-2r}}, \tag{16}$$

where $a_{g_1g_2,\ldots,g_{2r-1}g_{2r},q_1\ldots q_{k-2r}}\in\mathbb{R}$.

Below there are several examples of sums in the form (16)

$$\sum_{\substack{(\{g_1,g_2\})\\ \{g_1,g_2\}=\{1,2\}}} a_{g_1g_2}=a_{12},$$

$$\sum_{\substack{(\{\{g_1,g_2\},\{g_3,g_4\}\})\\ \{g_1,g_2,g_3,g_4\}=\{1,2,3,4\}}} a_{g_1g_2g_3g_4}=a_{12,34}+a_{13,24}+a_{23,14},$$

$$\sum_{\substack{(\{g_1,g_2\},\{q_1,q_2\})\\ \{g_1,g_2,q_1,q_2\}=\{1,2,3,4\}}} a_{g_1g_2,q_1q_2}=a_{12,34}+a_{13,24}+a_{14,23}+a_{23,14}+a_{24,13}+a_{34,12},$$

$$\sum_{\substack{(\{g_1,g_2\},\{q_1,q_2,q_3\})\\ \{g_1,g_2,q_1,q_2,q_3\}=\{1,2,3,4,5\}}} a_{g_1g_2,q_1q_2q_3}=a_{12,345}+a_{13,245}+a_{14,235}+a_{15,234}+a_{23,145}+a_{24,135}+$$

$$+a_{25,134}+a_{34,125}+a_{35,124}+a_{45,123},$$

$$\sum_{\substack{(\{\{g_1,g_2\},\{g_3,g_4\}\},\{q_1\})\\ \{g_1,g_2,g_3,g_4,q_1\}=\{1,2,3,4,5\}}} a_{g_1g_2,g_3g_4,q_1}=a_{12,34,5}+a_{13,24,5}+a_{14,23,5}+a_{12,35,4}+a_{13,25,4}+a_{15,23,4}+$$

$$+a_{12,54,3}+a_{15,24,3}+a_{14,25,3}+a_{15,34,2}+a_{13,54,2}+a_{14,53,2}+a_{52,34,1}+a_{53,24,1}+a_{54,23,1}.$$

Let us consider a generalization of Theorem 1 for the case of an arbitrary complete orthonormal systems of functions in the space $L_2([t,T])$ and $\psi_1(\tau),\ldots,\psi_k(\tau)\in L_2([t,T])$.

Theorem 2 [15] (Sect. 1.11), [36], [43] (Sect. 15). *Suppose that* $\psi_1(\tau),\ldots,\psi_k(\tau)\in L_2([t,T])$ *and* $\{\phi_j(x)\}_{j=0}^{\infty}$ *is an arbitrary complete orthonormal system of functions in the space* $L_2([t,T])$. *Then the following expansion*

$$J[\psi^{(k)}]_{T,t}=\underset{p_1,\ldots,p_k\to\infty}{\text{l.i.m.}}\sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k}C_{j_k\ldots j_1}\Biggl(\prod_{l=1}^{k}\zeta_{j_l}^{(i_l)}+\sum_{r=1}^{[k/2]}(-1)^r\times$$

$$\times\sum_{\substack{(\{\{g_1,g_2\},\ldots,\{g_{2r-1},g_{2r}\}\},\{q_1,\ldots,q_{k-2r}\})\\ \{g_1,g_2,\ldots,g_{2r-1},g_{2r},q_1,\ldots,q_{k-2r}\}=\{1,2,\ldots,k\}}}\prod_{s=1}^{r}\mathbf{1}_{\{i_{g_{2s-1}}=\,i_{g_{2s}}\neq 0\}}\mathbf{1}_{\{j_{g_{2s-1}}=\,j_{g_{2s}}\}}\prod_{l=1}^{k-2r}\zeta_{j_{q_l}}^{(i_{q_l})}\Biggr)\qquad(17)$$

converging in the mean-square sense is valid, where $[x]$ *is an integer part of a real number* x, $\prod_{\emptyset}\stackrel{\mathsf{def}}{=}1$, $\sum_{\emptyset}\stackrel{\mathsf{def}}{=}0$; *another notations are the same as in Theorem* 1.

In particular from (17) for $k=5$ we obtain

$$J[\psi^{(5)}]_{T,t}=\underset{p_1,\ldots,p_5\to\infty}{\text{l.i.m.}}\sum_{j_1=0}^{p_1}\ldots\sum_{j_5=0}^{p_5}C_{j_5\ldots j_1}\Biggl(\prod_{l=1}^{5}\zeta_{j_l}^{(i_l)}-$$

$$-\sum_{\substack{(\{g_1,g_2\},\{q_1,q_2,q_3\})\\ \{g_1,g_2,q_1,q_2,q_3\}=\{1,2,3,4,5\}}}\mathbf{1}_{\{i_{g_1}=\,i_{g_2}\neq 0\}}\mathbf{1}_{\{j_{g_1}=\,j_{g_2}\}}\prod_{l=1}^{3}\zeta_{j_{q_l}}^{(i_{q_l})}+$$

$$+\sum_{\substack{(\{\{g_1,g_2\},\{g_3,g_4\}\},\{q_1\})\\ \{g_1,g_2,g_3,g_4,q_1\}=\{1,2,3,4,5\}}}\mathbf{1}_{\{i_{g_1}=\,i_{g_2}\neq 0\}}\mathbf{1}_{\{j_{g_1}=\,j_{g_2}\}}\mathbf{1}_{\{i_{g_3}=\,i_{g_4}\neq 0\}}\mathbf{1}_{\{j_{g_3}=\,j_{g_4}\}}\zeta_{j_{q_1}}^{(i_{q_1})}\Biggr).$$

The last equality obviously agrees with (14).

It should be noted that an analogue of Theorem 2 (the case $i_1,\ldots,i_k=1,\ldots,m$) was considered in [67] using the Hermite polynomials and Wick product. Note that we use another notations [15]

(Sect. 1.11), [36], [43] (Sect. 15) in comparison with [67]. Moreover, the proof from [67] is different from the proof given in [15] (Sect. 1.11), [36], [43] (Sect. 15). See Sect. 4 in [36] for details.

Below we demonstrate that an approach to the expansion of iterated Ito stochastic integrals considered in Theorems 1, 2 is essentially general and allows some transformations for other types of iterated stochastic integrals.

Note that Theorems 1, 2 allow to calculate exactly the mean-square approximation error of the iterated Ito stochastic integrals (2) of arbitrary multiplicity k (see [13]–[18], [44]). In these papers we consider approxinations of iterated Ito stochastic integrals as the expression on the right-hand side of (17) before passing to the limit with respect to $p_1, \ldots, p_k$.

4. Stochastic Integral with Respect to Martingale Poisson Measure

Let us consider the Poisson random measure in the space $[0,T]\times\mathbf{Y}$ ($\mathbb{R}^n \stackrel{\rm def}{=} \mathbf{Y}$). We will denote the values of this measure at the set $\Delta\times A$ ($\Delta\subseteq[0,T]$, $A\subset\mathbf{Y}$) as $\nu(\Delta,A)$. Let us assume that

$$\mathsf{M}\left\{\nu(\Delta,A)\right\}=|\Delta|\Pi(A),$$

where $|\Delta|$ is the Lebesgue measure of Δ, $\Pi(A)$ is a measure on σ-algebra $\mathcal{B}$ of Borel sets of $\mathbf{Y}$, and $\mathcal{B}_0$ is a subalgebra of $\mathcal{B}$ consisting of sets $A\subset\mathcal{B}$ which satisfy the condition $\Pi(A)<\infty$.

Let us consider the martingale Poisson measure

$$\tilde\nu(\Delta,A)=\nu(\Delta,A)-|\Delta|\Pi(A).$$

Let $(\Omega,{\rm F},\mathsf{P})$ be a fixed probability space, let $\{{\rm F}_t,\ t\in[0,T]\}$ be a non-decreasing family of σ-algebras ${\rm F}_t\subset{\rm F}$.

Assume that:

1. The random variables $\nu([0,t),A)$ are ${\rm F}_t$-measurable for all $A\subseteq\mathcal{B}_0$.
2. The random variables $\nu([t,t+h),A)$, $A\subseteq\mathcal{B}_0$, $h>0$ do not depend on σ-algebra ${\rm F}_t$.

Let us define the class $H_l(\Pi,[0,T])$ of random functions $\varphi:[0,T]\times\mathbf{Y}\times\Omega\to\mathbb{R}^1$, that are ${\rm F}_t$-measurable for all $t\in[0,T]$, $\mathbf{y}\in\mathbf{Y}$ and satisfy the following condition

$$\int\limits_0^T\int\limits_{\mathbf{Y}}\mathsf{M}\left\{|\varphi(t,\mathbf{y})|^l\right\}\Pi(d\mathbf{y})dt<\infty.$$

Let us consider the partition $\{\tau_j\}_{j=0}^N$ of the interval $[0,T]$ which satisfies the condition (7).

For $\varphi(t,\mathbf{y})\in H_2(\Pi,[0,T])$ let us define the stochastic integral with respect to the martingale Poisson measure as the following mean-square limit [1]

$$\int\limits_0^T\int\limits_{\mathbf{Y}}\varphi(t,\mathbf{y})\tilde\nu(dt,d\mathbf{y})\stackrel{\rm def}{=}\underset{N\to\infty}{\text{l.i.m.}}\int\limits_0^T\int\limits_{\mathbf{Y}}\varphi^{(N)}(t,\mathbf{y})\tilde\nu(dt,d\mathbf{y}),\tag{18}$$

where $\varphi^{(N)}(t,\mathbf{y})$ is any sequense of step functions from the class $H_2(\Pi,[0,T])$ such that

$$\lim_{N\to\infty}\int\limits_0^T\int\limits_{\mathbf{Y}}\mathsf{M}\left\{\left|\varphi(t,\mathbf{y})-\varphi^{(N)}(t,\mathbf{y})\right|^2\right\}\Pi(d\mathbf{y})dt=0.$$

It is well known [1] that the stochastic integral (18) exists, it does not depend on selection of the sequence $\varphi^{(N)}(t,\mathbf{y})$ and it satisfies w. p. 1 the following properties

$$\mathsf{M}\left\{\int\limits_0^T\int\limits_{\mathbf{Y}}\varphi(t,\mathbf{y})\tilde{\nu}(dt,d\mathbf{y})\Bigg|\mathrm{F}_0\right\}=0,$$

$$\int\limits_0^T\int\limits_{\mathbf{Y}}(\alpha\varphi_1(t,\mathbf{y})+\beta\varphi_2(t,\mathbf{y}))\tilde{\nu}(dt,d\mathbf{y})=\alpha\int\limits_0^T\int\limits_{\mathbf{Y}}\varphi_1(t,\mathbf{y})\tilde{\nu}(dt,d\mathbf{y})+\beta\int\limits_0^T\int\limits_{\mathbf{Y}}\varphi_2(t,\mathbf{y})\tilde{\nu}(dt,d\mathbf{y}),$$

$$\mathsf{M}\left\{\left|\int\limits_0^T\int\limits_{\mathbf{Y}}\varphi(t,\mathbf{y})\tilde{\nu}(dt,d\mathbf{y})\right|^2\Bigg|\mathrm{F}_0\right\}=\int\limits_0^T\int\limits_{\mathbf{Y}}\mathsf{M}\left\{|\varphi(t,\mathbf{y})|^2\Big|\mathrm{F}_0\right\}\Pi(d\mathbf{y})dt,$$

where α, β are some real constants and $\varphi_1(t,\mathbf{y})$, $\varphi_2(t,\mathbf{y})$, $\varphi(t,\mathbf{y})$ from the class $H_2(\Pi,[0,T])$.

The stochastic integral

$$\int\limits_0^T\int\limits_{\mathbf{Y}}\varphi(t,\mathbf{y})\nu(dt,d\mathbf{y})$$

with respect to the Poisson random measure will be defined as follows [1]

$$\int\limits_0^T\int\limits_{\mathbf{Y}}\varphi(t,\mathbf{y})\nu(dt,d\mathbf{y})=\int\limits_0^T\int\limits_{\mathbf{Y}}\varphi(t,\mathbf{y})\tilde{\nu}(dt,d\mathbf{y})+\int\limits_0^T\int\limits_{\mathbf{Y}}\varphi(t,\mathbf{y})\Pi(d\mathbf{y})dt,$$

where we suppose that the right-hand side of the last equality exists.

According to the Ito formula for Ito processes with jump component, we obtain w. p. 1 [1]

$$(z_t)^n=\int\limits_0^t\int\limits_{\mathbf{Y}}\Big((z_{\tau-}+\gamma(\tau,\mathbf{y}))^n-(z_{\tau-})^n\Big)\nu(d\tau,d\mathbf{y}), \tag{19}$$

where $n\in\mathbb{N}$,

$$z_t=\int\limits_0^t\int\limits_{\mathbf{Y}}\gamma(\tau,\mathbf{y})\nu(d\tau,d\mathbf{y}).$$

We suppose that the function $\gamma(\tau,\mathbf{y})$ satisfies the conditions of existence of the right-hand side of (19) [1].

Let us consider [1] the useful estimate for moments of the stochastic integral with respect to the Poisson random measure

$$a_n(T)\le\max_{j\in\{n,\ 1\}}\left\{\left(\int\limits_0^T\int\limits_{\mathbf{Y}}\left(\left((b_n(\tau,\mathbf{y}))^{1/n}+1\right)^n-1\right)\Pi(d\mathbf{y})d\tau\right)^j\right\}, \tag{20}$$

where

$$a_n(t) = \sup_{0\le\tau\le t} \mathsf{M}\biggl\{|z_\tau|^n\biggr\},\quad b_n(\tau,\mathbf{y}) = \mathsf{M}\biggl\{|\gamma(\tau,\mathbf{y})|^n\biggr\}.$$

We suppose that the right-hand side of (20) exists. Since

$$\tilde{\nu}(dt, d\mathbf{y}) = \nu(dt, d\mathbf{y}) - \Pi(d\mathbf{y})dt,$$

then according to the Minkowski inequality, we obtain

$$\left(\mathsf{M}\biggl\{|\tilde{z}_t|^{2n}\biggr\}\right)^{1/2n} \le \left(\mathsf{M}\biggl\{|z_t|^{2n}\biggr\}\right)^{1/2n} + \left(\mathsf{M}\biggl\{|\hat{z}_t|^{2n}\biggr\}\right)^{1/2n}, \tag{21}$$

where

$$\hat{z}_t \stackrel{\text{def}}{=} \int\limits_0^t \int\limits_{\mathbf{Y}} \gamma(\tau,\mathbf{y})\Pi(d\mathbf{y})d\tau$$

and

$$\tilde{z}_t = \int\limits_0^t \int\limits_{\mathbf{Y}} \gamma(\tau,\mathbf{y})\tilde{\nu}(d\tau, d\mathbf{y}).$$

The value $\mathsf{M}\biggl\{|\hat{z}_\tau|^{2n}\biggr\}$ can be estimated using the well known inequality [1]

$$\mathsf{M}\left\{|\hat{z}_t|^{2n}\right\} \le t^{2n-1}\int\limits_0^t \mathsf{M}\left\{\left|\int\limits_{\mathbf{Y}} \varphi(\tau,\mathbf{y})\Pi(d\mathbf{y})\right|^{2n}\right\}d\tau, \tag{22}$$

where we suppose that

$$\int\limits_0^t \mathsf{M}\left\{\left|\int\limits_{\mathbf{Y}} \gamma(\tau,\mathbf{y})\Pi(d\mathbf{y})\right|^{2n}\right\}d\tau < \infty.$$

5. Expansion of Iterated Stochastic Integrals with Respect to Martingale Poisson Measures Based on Generalized Multiple Fourier Series

Let us consider the following iterated stochastic integrals

$$P[\chi^{(k)}]_{T,t} = \int\limits_t^T \int\limits_{\mathbf{X}} \chi_k(t_k,\mathbf{y}_k)\ldots\int\limits_t^{t_2}\int\limits_{\mathbf{X}} \chi_1(t_1,\mathbf{y}_1)\tilde{\nu}^{(i_1)}(dt_1,d\mathbf{y}_1)\ldots\tilde{\nu}^{(i_k)}(dt_k,d\mathbf{y}_k), \tag{23}$$

where $i_1,\ldots,i_k = 0,1,\ldots,m$, $\mathbb{R}^n \stackrel{\text{def}}{=} \mathbf{X}$,

$$\chi_l(\tau,\mathbf{y}) = \psi_l(\tau)\varphi_l(\mathbf{y})\quad (l = 1,\ldots,k),$$

every function $\psi_l(\tau):[t,T]\to\mathbb{R}^1$ $(l=1,\ldots,k)$ and every function $\varphi_l(\mathbf{y}):\mathbf{X}\to\mathbb{R}^1$ $(l=1,\ldots,k)$ is such that

$$\chi_l(s,\mathbf{y})\in H_2(\Pi,[t,T])\quad (l=1,\ldots,k),$$

where definition of the class $H_2(\Pi,[t,T])$ is given above,

$$\nu^{(i)}(dt,d\mathbf{y})\quad (i=1,\ldots,m)$$

are independent Poisson random measures for various i which are defined on $[0,T]\times\mathbf{X}$,

$$\tilde{\nu}^{(i)}(dt,d\mathbf{y})=\nu^{(i)}(dt,d\mathbf{y})-\Pi(d\mathbf{y})dt\quad (i=1,\ldots,m)$$

are independent martingale Poisson measures for various i,

$$\tilde{\nu}^{(0)}(dt,d\mathbf{y})\stackrel{\rm def}{=}\Pi(d\mathbf{y})dt.$$

Let us formulate an analoque of Theorem 1 for the iterated stochastic integrals (23).

Theorem 3 [12]-[18]. *Suppose that the following conditions are fulfilled*:
1. *Every* $\psi_l(\tau)$ $(l=1,\ldots,k)$ *is a continuous non-random function at the interval* $[t,T]$.
2. $\{\phi_j(x)\}_{j=0}^{\infty}$ *is a complete orthonormal system of functions in the space* $L_2([t,T])$, *each function of which for finite* j *satisfies the condition* $(\star)$ (*see Sect.* 1).
3. *For* $l=1,\ldots,k$ *and* $q=2^{k+1}$ *the following condition is fulfilled*

$$\int\limits_{\mathbf{X}}|\varphi_l(\mathbf{y})|^q\,\Pi(d\mathbf{y})<\infty.$$

Then, for the iterated stochastic integral with respect to martingale Poisson measures $P[\chi^{(k)}]_{T,t}$ *defined by* (23) *the following expansion*

$$P[\chi^{(k)}]_{T,t}=\underset{p_1,\ldots,p_k\to\infty}{\rm l.i.m.}\sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k}C_{j_k\ldots j_1}\Biggl(\prod_{g=1}^{k}\pi_{j_g}^{(g,i_g)}-$$

$$-\underset{N\to\infty}{\rm l.i.m.}\sum_{(l_1,\ldots,l_k)\in{\rm G}_k}\prod_{g=1}^{k}\phi_{j_g}(\tau_{l_g})\int\limits_{\mathbf{X}}\varphi_g(\mathbf{y})\tilde{\nu}^{(i_g)}([\tau_{l_g},\tau_{l_g+1}),d\mathbf{y})\Biggr)\tag{24}$$

converging in the mean-square sense is valid, where $\{\tau_j\}_{j=0}^{N}$ *is a partition of the interval* $[t,T]$ *which satisfies the condition* (7),

$${\rm G}_k={\rm H}_k\backslash{\rm L}_k,\quad {\rm H}_k=\{(l_1,\ldots,l_k):\ l_1,\ldots,l_k=0,\ 1,\ldots,N-1\},$$

$${\rm L}_k=\{(l_1,\ldots,l_k):\ l_1,\ldots,l_k=0,\ 1,\ldots,N-1;\ l_g\ne l_r\ (g\ne r);\ g,r=1,\ldots,k\},$$

l.i.m. *is a limit in the mean-square sense*, $i_1,\ldots,i_k=0,1,\ldots,m$, *random variables*

$$\pi_j^{(g,i_g)}=\int\limits_t^T\phi_j(\tau)\int\limits_{\mathbf{X}}\varphi_g(\mathbf{y})\tilde{\nu}^{(i_g)}(d\tau,d\mathbf{y})$$

are independent for various $i_g \neq 0$ *and uncorrelated for various* j,

$$C_{j_k\ldots j_1} = \int\limits_{[t,T]^k} K(t_1,\ldots,t_k)\prod_{l=1}^{k}\phi_{j_l}(t_l)dt_1\ldots dt_k$$

is the Fourier coefficient,

$$K(t_1,\ldots,t_k) = \begin{cases} \psi_1(t_1)\ldots\psi_k(t_k) & \text{for}\ \ t_1<\ldots<t_k \\ \\ 0 & \text{otherwise} \end{cases},\qquad t_1,\ldots,t_k\in[t,T],\qquad k\geq 2$$

and $K(t_1)\equiv\psi_1(t_1)$ *for* $t_1\in[t,T]$.

Proof. The scheme of the proof of Theorem 3 is the same as the scheme of the proof of Theorem 1 (see [10]-[25], [43] for details). Some differences will take place in the proof of the following lemmas (Lemmas 1, 2) and in the final part of the proof of Theorem 3.

Lemma 1 [11]-[25]. *Suppose that every* $\psi_l(\tau)$ $(l=1,\ldots,k)$ *is a continuous function at the interval* $[t,T]$ *and every function* $\varphi_l(\mathbf{y})$ $(l=1,\ldots,k)$ *is such that*

$$\int\limits_{\mathbf{X}} |\varphi_l(\mathbf{y})|^2\,\Pi(d\mathbf{y})<\infty.$$

Then, the following equality

$$P[\bar{\chi}^{(k)}]_{T,t} = \underset{N\to\infty}{\text{l.i.m.}}\sum_{j_k=0}^{N-1}\ldots\sum_{j_1=0}^{j_2-1}\prod_{l=1}^{k}\int\limits_{\mathbf{X}}\chi_l(\tau_{j_l},\mathbf{y})\bar{\nu}^{(i_l)}([\tau_{j_l},\tau_{j_l+1}),d\mathbf{y}) \tag{25}$$

is valid w. p. 1, where $\{\tau_j\}_{j=0}^{N}$ *is a partition of the interval* $[t,T]$ *which satisfies the condition* (7),

$$\bar{\nu}^{(i)}([\tau,s),d\mathbf{y}) = \begin{cases} \tilde{\nu}^{(i)}([\tau,s),d\mathbf{y}) \\ \\ \nu^{(i)}([\tau,s),d\mathbf{y}) \end{cases}\qquad (i=0,1,\ldots,m),$$

the integral $P[\bar{\chi}^{(k)}]_{T,t}$ *differs from the integral* $P[\chi^{(k)}]_{T,t}$ *(see* (23)*) by the fact that in* $P[\bar{\chi}^{(k)}]_{T,t}$ *we use* $\bar{\nu}^{(i_l)}(dt_l,d\mathbf{y}_l)$ *instead of* $\tilde{\nu}^{(i_l)}(dt_l,d\mathbf{y}_l)$ $(l=1,\ldots,k)$.

Proof. Using the moment properties of stochastic integrals with respect to Poisson random measures (see above) and conditions of Lemma 1, it is easy to notice that the integral sum of the integral $P[\bar{\chi}^{(k)}]_{T,t}$ under the conditions of Lemma 1 can be represented as a sum of the expression from the right-hand side of (25) before passing to the limit $\underset{N\to\infty}{\text{l.i.m.}}$ and the value which converges to zero in the mean-square sense if $N\to\infty$.

Note that in the case when the functions $\psi_l(\tau)$ $(l=1,\ldots,k)$ satisfy the condition $(\star)$ (see Sect. 1) we can suppose that among the points $\tau_j,\ j=0,1,\ldots,N$ there are all points of jumps of the functions $\psi_l(\tau)$ $(l=1,\ldots,k)$. Further, we can apply the argumentation as in Sect. 4 from [43] (also see [10]-[18]).

Let us consider the following multiple and iterated stochastic integrals

$$\underset{N\to\infty}{\text{l.i.m.}} \sum_{j_1,\ldots,j_k=0}^{N-1} \Phi(\tau_{j_1},\ldots,\tau_{j_k}) \prod_{l=1}^{k} \int\limits_{\mathbf{X}} \varphi_l(\mathbf{y})\tilde{\nu}^{(i_l)}([\tau_{j_l},\tau_{j_l+1}),d\mathbf{y}) \stackrel{\text{def}}{=} P[\Phi]_{T,t}^{(k)},$$

$$\int\limits_t^T \ldots \int\limits_t^{t_2} \Phi(t_1,\ldots,t_k) \int\limits_{\mathbf{X}} \varphi_1(\mathbf{y})\tilde{\nu}^{(i_1)}(dt_1,d\mathbf{y}) \ldots \int\limits_{\mathbf{X}} \varphi_k(\mathbf{y})\tilde{\nu}^{(i_k)}(dt_k,d\mathbf{y}) \stackrel{\text{def}}{=} \hat{P}[\Phi]_{T,t}^{(k)},$$

where the sense of notations of the formula (25) is saved and $\Phi(t_1,\ldots,t_k) : [t,T]^k \to \mathbb{R}^1$ is a bounded non-random function.

Note that if the functions $\varphi_l(\mathbf{y})$ $(l=1,\ldots,k)$ satisfy the conditions of Lemma 1 and the function $\Phi(t_1,\ldots,t_k)$ is continuous in the domain of integration, then for the integral $\hat{P}[\Phi]_{T,t}^{(k)}$ the equality similar to (25) is valid w. p. 1.

Lemma 2 [11]-[25]. *Assume that the following conditions are fulfilled*:

$$g_l(\tau,\mathbf{y}) = h_l(\tau)\varphi_l(\mathbf{y}) \quad (l=1,\ldots,k),$$

where the functions $h_l(\tau) : [t,T] \to \mathbb{R}^1$ $(l=1,\ldots,k)$ *satisfy the condition* $(\star)$ (*see Sect.* 1) *and the functions* $\varphi_l(\mathbf{y}) : \mathbf{X} \to \mathbb{R}^1$ $(l=1,\ldots,k)$ *satisfy the condition*

$$\int\limits_{\mathbf{X}} |\varphi_l(\mathbf{y})|^p\, \Pi(d\mathbf{y}) < \infty \quad \text{for} \quad p = 2^{k+1}.$$

Then

$$\prod_{l=1}^{k} \int\limits_t^T \int\limits_{\mathbf{X}} g_l(s,\mathbf{y})\bar{\nu}^{(i_l)}(ds,d\mathbf{y}) = P[\Phi]_{T,t}^{(k)} \quad \text{w. p. } 1,$$

where $i_l = 0,1,\ldots,m$ $(l=1,\ldots,k)$ *and*

$$\Phi(t_1,\ldots,t_k) = \prod_{l=1}^{k} h_l(t_l).$$

Proof. Let us introduce the following notations

$$J[\bar{g}_l]_N \stackrel{\text{def}}{=} \sum_{j=0}^{N-1} \int\limits_{\mathbf{X}} g_l(\tau_j,\mathbf{y})\bar{\nu}^{(i_l)}([\tau_j,\tau_{j+1}),d\mathbf{y}),$$

$$J[\bar{g}_l]_{T,t} \stackrel{\text{def}}{=} \int\limits_t^T \int\limits_{\mathbf{X}} g_l(s,\mathbf{y})\bar{\nu}^{(i_l)}(ds,d\mathbf{y}),$$

where $\{\tau_j\}_{j=0}^{N}$ is a partition of the interval $[t,T]$ satisfying the condition (7).

It is easy to see that

$$\prod_{l=1}^{k} J[\bar{g}_l]_N - \prod_{l=1}^{k} J[\bar{g}_l]_{T,t} =$$

$$
=\sum_{l=1}^{k}\left(\prod_{q=1}^{l-1}J[\bar{g}_q]_{T,t}\right)\left(J[\bar{g}_l]_N-J[\bar{g}_l]_{T,t}\right)\left(\prod_{q=l+1}^{k}J[\bar{g}_q]_N\right).
$$

Using the Minkowski inequality and the inequality of Cauchy–Bunyakovsky together with estimates of moments of stochastic integrals with respect to Poisson random measures (see Sect. 4) and conditions of Lemma 2, we obtain

$$
\left(\mathsf{M}\left\{\left|\prod_{l=1}^{k}J[\bar{g}_l]_N-\prod_{l=1}^{k}J[\bar{g}_l]_{T,t}\right|^2\right\}\right)^{1/2}\le C_k\sum_{l=1}^{k}\left(\mathsf{M}\left\{\left|J[\bar{g}_l]_N-J[\bar{g}_l]_{T,t}\right|^4\right\}\right)^{1/4}, \tag{26}
$$

where $C_k<\infty$.

We have

$$
J[\bar{g}_l]_N-J[\bar{g}_l]_{T,t}=\sum_{q=0}^{N-1}J[\Delta\bar{g}_l]_{\tau_{q+1},\tau_q},
$$

where

$$
J[\Delta\bar{g}_l]_{\tau_{q+1},\tau_q}=\int\limits_{\tau_q}^{\tau_{q+1}}\int\limits_{\mathbf{X}}\left(g_l(\tau_q,\mathbf{y})-g_l(s,\mathbf{y})\right)\bar{\nu}^{(i_l)}(ds,d\mathbf{y}).
$$

Let as introduce the notation

$$
h_l^{(N)}(s)=h_l(\tau_q),\quad s\in[\tau_q,\tau_{q+1}),\quad q=0,1,\ldots,N-1.
$$

Then

$$
J[\bar{g}_l]_N-J[\bar{g}_l]_{T,t}=\sum_{q=0}^{N-1}J[\Delta\bar{g}_l]_{\tau_{q+1},\tau_q}=
$$

$$
=\int\limits_{t}^{T}\left(h_l^{(N)}(s)-h_l(s)\right)\int\limits_{\mathbf{X}}\phi_l(\mathbf{y})\bar{\nu}^{(i_l)}(ds,d\mathbf{y}).
$$

Applying the estimate (20) for $n=4$ and the estimates (21), (22) for $n=2$ to the value

$$
\mathsf{M}\left\{\left|\int\limits_{t}^{T}\left(h_l^{(N)}(s)-h_l(s)\right)\int\limits_{\mathbf{X}}\phi_l(\mathbf{y})\bar{\nu}^{(i_l)}(ds,d\mathbf{y})\right|^4\right\},
$$

taking into account (26) together with the conditions of Lemma 2 and the following estimate

$$
|h_l(\tau_q)-h_l(s)|<\varepsilon,\quad s\in[\tau_q,\tau_{q+1}],\quad q=0,1,\ldots,N-1, \tag{27}
$$

where ε is an arbitrary small positive real number, we obtain that the right-hand side of (26) converges to zero when $N\to\infty$. Considering this fact, we come to the statement of Lemma 2.

It should be noted that (27) is valid if the functions $h_l(s)$ are continuous at the interval $[t,T]$, i.e. these functions are uniformly continuous at this interval. So, $|h_l(\tau_q)-h_l(s)|<\varepsilon$ if $s\in[\tau_q,\tau_{q+1}]$, where $|\tau_{q+1} - \tau_q| < \delta(\varepsilon)$, $q = 0, 1, \ldots, N-1$ ($\delta(\varepsilon) > 0$ exists for any $\varepsilon > 0$ and it does not depend on points of the interval $[t, T]$).

In the case when the functions $h_l(s)$ ($l = 1, \ldots, k$) satisfy the condition ($\star$) (see Sect. 1) we can suppose that among the points τ_q, $q = 0, 1, \ldots, N$ there are all points of jumps of the functions $h_l(s)$ ($l = 1, \ldots, k$). Further, we can apply the argumentation as in Sect. 4 from [43] (also see [10]-[18]).

Obviously, if $i_l = 0$ for some $l = 1, \ldots, k$, then we also come to the statement of Lemma 2. Lemma 2 is proved.

Proving Theorem 3 according to the scheme used for the proof of Theorem 1 in [43] or Theorem 1.1 in [15]-[18] (also see [10] (Theorem 5.1, P. 236-237), [12] (Theorem 1, P. A.22-A.23), [13] (Theorem 5.1, P. A.250), [14] (Theorem 5.1, P. A.252-A.253)) and using Lemmas 1, 2 together with estimates for moments of stochastic integrals with respect to Poisson random measures (see Sect. 4), we obtain

$$\mathsf{M}\left\{\left(R_{T,t}^{p_1,\ldots,p_k}\right)^2\right\} \le$$

$$\le C_k \prod_{l=1}^{k} \int\limits_{\mathbf{X}} \varphi_l^2(\mathbf{y}) \Pi(d\mathbf{y}) \sum_{(t_1,\ldots,t_k)} \int\limits_t^T \ldots \int\limits_t^{t_2} \left(K(t_1,\ldots,t_k) - \sum_{j_1=0}^{p_1} \ldots \sum_{j_k=0}^{p_k} C_{j_k\ldots j_1} \prod_{l=1}^{k} \phi_{j_l}(t_l)\right)^2 \times$$

$$\times dt_1 \ldots dt_k = \tag{28}$$

$$= C_k \prod_{l=1}^{k} \int\limits_{\mathbf{X}} \varphi_l^2(\mathbf{y}) \Pi(d\mathbf{y}) \int\limits_{[t,T]^k} \left(K(t_1,\ldots,t_k) - \sum_{j_1=0}^{p_1} \ldots \sum_{j_k=0}^{p_k} C_{j_k\ldots j_1} \prod_{l=1}^{k} \phi_{j_l}(t_l)\right)^2 \times$$

$$\times dt_1 \ldots dt_k \le$$

$$\le \bar{C}_k \int\limits_{[t,T]^k} \left(K(t_1,\ldots,t_k) - \sum_{j_1=0}^{p_1} \ldots \sum_{j_k=0}^{p_k} C_{j_k\ldots j_1} \prod_{l=1}^{k} \phi_{j_l}(t_l)\right)^2 dt_1 \ldots dt_k \to 0$$

if $p_1, \ldots, p_k \to \infty$, where constant $\bar{C}_k$ depends only on k (multiplicity of the iterated stochastic integral with respect to martingale Poisson measures). At that permutations $(t_1, \ldots, t_k)$ when summing

$$\sum_{(t_1,\ldots,t_k)}$$

in (28) are performed only in the values $dt_1 \ldots dt_k$ and indexes near upper limits of integration are changed correspondently. Moreover, $R_{T,t}^{p_1,\ldots,p_k}$ has the following form

$$R_{T,t}^{p_1,\ldots,p_k} = \sum_{(t_1,\ldots,t_k)} \int\limits_t^T \ldots \int\limits_t^{t_2} \left(K(t_1,\ldots,t_k) - \sum_{j_1=0}^{p_1} \ldots \sum_{j_k=0}^{p_k} C_{j_k\ldots j_1} \prod_{l=1}^{k} \phi_{j_l}(t_l)\right) \times$$

$$\times \int\limits_{\mathbf{X}} \varphi_1(\mathbf{y}) \tilde{\nu}^{(i_1)}(dt_1, d\mathbf{y}) \ldots \int\limits_{\mathbf{X}} \varphi_k(\mathbf{y}) \tilde{\nu}^{(i_k)}(dt_k, d\mathbf{y}), \tag{29}$$

where permutations $(t_1, \ldots, t_k)$ when summing

$$\sum_{(t_1,\ldots,t_k)}$$

in (29) are performed only in the values

$$\varphi_1(\mathbf{y})\tilde{\nu}^{(i_1)}(dt_1, d\mathbf{y})\ldots\varphi_k(\mathbf{y})\tilde{\nu}^{(i_k)}(dt_k, d\mathbf{y}).$$

At the same time the indexes near upper limits of integration in the iterated stochastic integrals are changed correspondently and if t_r swapped with t_q in the permutation $(t_1,\ldots,t_k)$, then i_r swapped with i_q in the permutation $(i_1,\ldots,i_k)$. Moreover, $\varphi_r(\mathbf{y})$ swapped with $\varphi_q(\mathbf{y})$ in the permutation $(\varphi_1(\mathbf{y}),\ldots,\varphi_k(\mathbf{y}))$. Theorem 3 is proved.

Let us consider an example of Theorem 3 usage. Suppose that $i_1 \neq i_2,\ i_1, i_2 = 1,\ldots,m$. According to Theorem 3, we obtain

$$\int\limits_t^T\int\limits_{\mathbf{X}}\varphi_2(\mathbf{y}_2)\int\limits_t^{t_2}\int\limits_{\mathbf{X}}\varphi_1(\mathbf{y}_1)\tilde{\nu}^{(i_1)}(dt_1, d\mathbf{y}_1)\tilde{\nu}^{(i_2)}(dt_2, d\mathbf{y}_2) =$$

$$= \frac{T-t}{2}\left(\pi_0^{(1,i_1)}\pi_0^{(2,i_2)} + \sum_{i=1}^{\infty}\frac{1}{\sqrt{4i^2-1}}\left(\pi_{i-1}^{(1,i_1)}\pi_i^{(2,i_2)} - \pi_i^{(1,i_1)}\pi_{i-1}^{(2,i_2)}\right)\right),$$

$$\int\limits_t^T\int\limits_{\mathbf{X}}\varphi_1(\mathbf{y}_1)\tilde{\nu}^{(i_1)}(dt_1, d\mathbf{y}_1) = \sqrt{T-t}\,\pi_0^{(1,i_1)},$$

where

$$\pi_j^{(l,i_l)} = \int\limits_t^T\phi_j(\tau)\int\limits_{\mathbf{X}}\varphi_l(\mathbf{y})\tilde{\nu}^{(i_l)}(d\tau, d\mathbf{y}) \quad (l = 1,\ 2)$$

and $\{\phi_j(\tau)\}_{j=0}^{\infty}$ is a complete orthonormal system of Legendre polynomials in the space $L_2([t,T])$.

6. Expansion of Iterated Stochastic Integrals with Respect to Martingales

Let $(\Omega, \mathrm{F}, \mathsf{P})$ be a fixed probability space, let $\{\mathrm{F}_t,\ t \in [0,T]\}$ be a non-decreasing family of σ-algebras $\mathrm{F}_t \subset \mathrm{F}$, and let $\mathrm{M}_2(\rho, [0,T])$ be a class of F_t-measurable for each $t \in [0,T]$ martingales M_t satisfying the conditions

$$\mathsf{M}\left\{(M_s - M_t)^2\right\} = \int\limits_t^s\rho(\tau)d\tau, \tag{30}$$

$$\mathsf{M}\left\{|M_s - M_t|^p\right\} \leq C_p|s-t|, \quad p = 3, 4, \ldots,$$

where $0 \leq t < s \leq T$, $\rho(\tau)$ is a non-negative and continuously differentiable non-random function at the interval $[0,T]$, $C_p < \infty$ is a constant.

Let us define the class $H_2(\rho, [0,T])$ of stochastic processes $\xi_t,\ t \in [0,T]$ which are F_t-measurable for all $t \in [0,T]$ and satisfy the condition

$$\int\limits_0^T \mathsf{M}\left\{|\xi_t|^2\right\}\rho(t)dt<\infty.$$

For any partition $\{\tau_j^{(N)}\}_{j=0}^N$ of the interval $[0,T]$ such that

$$0=\tau_0^{(N)}<\tau_1^{(N)}<\ldots<\tau_N^{(N)}=T,\quad \max_{0\le j\le N-1}\left|\tau_{j+1}^{(N)}-\tau_j^{(N)}\right|\to 0\ \text{ if }\ N\to\infty \tag{31}$$

we will define the sequense of step functions $\xi^{(N)}(t,\omega)$ by the following relation

$$\xi^{(N)}(t,\omega)=\xi_j(\omega)\quad \text{w. p. 1}\quad \text{for}\quad t\in\left[\tau_j^{(N)},\tau_{j+1}^{(N)}\right),$$

where $j=0,1,\ldots,N-1,\ \ N=1,2,\ldots.$

Let us define the stochastic integral with respect to martingale from the process $\xi(t,\omega)\in H_2(\rho,[0,T])$ as the following mean-square limit [1]

$$\underset{N\to\infty}{\text{l.i.m.}}\sum_{j=0}^{N-1}\xi^{(N)}\left(\tau_j^{(N)},\omega\right)\left(M\left(\tau_{j+1}^{(N)},\omega\right)-M\left(\tau_j^{(N)},\omega\right)\right)\stackrel{\text{def}}{=}\int\limits_0^T\xi_\tau dM_\tau, \tag{32}$$

where $\xi^{(N)}(t,\omega)$ is any step function from the class $H_2(\rho,[0,T])$ which converges to the function $\xi(t,\omega)$ in the following sense

$$\lim_{N\to\infty}\int\limits_0^T\mathsf{M}\left\{\left|\xi^{(N)}(t,\omega)-\xi(t,\omega)\right|^2\right\}\rho(t)dt=0.$$

It is well known [1] that the stochastic integral

$$\int\limits_0^T\xi_t dM_t$$

exists and it does not depend on the selection of sequence $\xi^{(N)}(t,\omega)$ and it satisfies w. p. 1 the following properties

$$\mathsf{M}\left\{\int\limits_0^T\xi_t dM_t\bigg|\mathrm{F}_0\right\}=0,$$

$$\mathsf{M}\left\{\left|\int\limits_0^T\xi_t dM_t\right|^2\bigg|\mathrm{F}_0\right\}=\mathsf{M}\left\{\int\limits_0^T\xi_t^2\rho(t)dt\bigg|\mathrm{F}_0\right\},$$

$$\int\limits_0^T(\alpha\xi_t+\beta\psi_t)dM_t=\alpha\int\limits_0^T\xi_t dM_t+\beta\int\limits_0^T\psi_t dM_t,$$

where $\xi_t,\ \phi_t \in H_2(\rho,[0,T]),\ \ \alpha,\ \beta \in \mathbb{R}^1$.

Let $Q_4(\rho,[0,T])$ be the class of martingales $M_t,\ t\in[0,T]$ which satisfy the following conditions:

1. $M_t,\ t\in[0,T]$ belongs to the class $\text{M}_2(\rho,[0,T])$.

2. For some $\alpha>0$ the following estimate is correct

$$\mathsf{M}\left\{\left|\int\limits_t^{\tau} g(s)dM_s\right|^4\right\} \le K_4\int\limits_t^{\tau}|g(s)|^{\alpha}ds, \tag{33}$$

where $0\le t<\tau\le T,\ \ g(s)$ is a bounded non-random function at the interval $[0,T],\ \ K_4<\infty$ is a constant.

Let $G_n(\rho,[0,T])$ be the class of martingales $M_t,\ t\in[0,T]$ which satisfy the following conditions:

1. $M_t,\ t\in[0,T]$ belongs to the class $\text{M}_2(\rho,[0,T])$.

2. The following estimate is correct

$$\mathsf{M}\left\{\left|\int\limits_t^{\tau} g(s)dM_s\right|^n\right\} <\infty,$$

where $0\le t<\tau\le T,\ \ n\in\mathbb{N},\ \ g(s)$ is the same function as in the definition of $Q_4(\rho,[0,T])$.

Let us remind that if $(\xi_t)^n\in H_2(\rho,[0,T])$ with $\rho(t)\equiv 1$, then the following estimate is correct [1]

$$\mathsf{M}\left\{\left|\int\limits_t^{\tau}\xi_s ds\right|^{2n}\right\}\le(\tau-t)^{2n-1}\int\limits_t^{\tau}\mathsf{M}\left\{|\xi_s|^{2n}\right\}ds,\quad 0\le t<\tau\le T. \tag{34}$$

Let us consider the iterated stochastic integral with respect to martingales

$$J[\psi^{(k)}]_{T,t}^M=\int\limits_t^T\psi_k(t_k)\ldots\int\limits_t^{t_2}\psi_1(t_1)dM_{t_1}^{(1,i_1)}\ldots dM_{t_k}^{(k,i_k)}\quad(i_1,\ldots,i_k=0,1,\ldots,m), \tag{35}$$

where every $\psi_l(\tau)$ $(l=1,\ldots,k)$ is a continuous non-random function at the interval $[t,T]$, $M^{(r,i)}$ $(r=1,\ldots,k)$ are independent martingales for various $i=1,\ldots,m$, $M_{\tau}^{(r,0)}\stackrel{\text{def}}{=}\tau$.

Let us formulate the following theorem.

Theorem 4 [12]-[18]. *Suppose that the following conditions are fulfilled*:

1. *Every* $\psi_l(\tau)$ $(l=1,\ldots,k)$ *is a continuous non-random function at the interval* $[t,T]$.

2. $\{\phi_j(x)\}_{j=0}^{\infty}$ *is a complete orthonormal system of functions in the space* $L_2([t,T])$, *each function of which for finite* j *satisfies the condition* $(\star)$ *(see Sect.* 1*).*

3. $M_{\tau}^{(l,i_l)}\in Q_4(\rho,[t,T])$, $G_n(\rho,[t,T])$ *with* $n=2^{k+1}$, $i_l=1,\ldots,m,\ \ l=1,\ldots,k$.

Then, for the iterated stochastic integral $J[\psi^{(k)}]_{T,t}^M$ *with respect to martingales defined by* (35) *the following expansion*

$$J[\psi^{(k)}]_{T,t}^M=\underset{p_1,\ldots,p_k\to\infty}{\text{l.i.m.}}\sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k}C_{j_k\ldots j_1}\Biggl(\prod_{l=1}^k\xi_{j_l}^{(l,i_l)}-$$

$$-\underset{N\to\infty}{\text{l.i.m.}}\sum_{(l_1,\ldots,l_k)\in\text{G}_k}\phi_{j_1}(\tau_{l_1})\Delta M_{\tau_{l_1}}^{(1,i_1)}\ldots\phi_{j_k}(\tau_{l_k})\Delta M_{\tau_{l_k}}^{(k,i_k)}\Biggr)$$

converging in the mean-square sense is valid, where $i_1,\ldots,i_k=0,1,\ldots,m$, $\{\tau_j\}_{j=0}^{N}$ *is a partition of the interval* $[t,T]$ *which satisfies the condition* (7), $\Delta M_{\tau_j}^{(r,i)}=M_{\tau_{j+1}}^{(r,i)}-M_{\tau_j}^{(r,i)}$ $(i=0,1,\ldots,m,\ \ r=1,\ldots,k)$,

$$
\mathrm{G}_k=\mathrm{H}_k\backslash\mathrm{L}_k,\quad \mathrm{H}_k=\{(l_1,\ldots,l_k):\ l_1,\ldots,l_k=0,\ 1,\ldots,N-1\},
$$

$$
\mathrm{L}_k=\{(l_1,\ldots,l_k):\ l_1,\ldots,l_k=0,\ 1,\ldots,N-1;\ l_g\ne l_r\ (g\ne r);\ g,r=1,\ldots,k\},
$$

l.i.m. *is a limit in the mean-square sense,*

$$
\xi_j^{(l,i_l)}=\int\limits_t^T\phi_j(s)dM_s^{(l,i_l)}
$$

are independent for various $i_l=1,\ldots,m$, $l=1,\ldots,k$ *and uncorrelated for various* j *(if* $\rho(\tau)$ *is a constant,* $i_l\ne 0$*) random variables,*

$$
C_{j_k\ldots j_1}=\int\limits_{[t,T]^k}K(t_1,\ldots,t_k)\prod_{l=1}^{k}\phi_{j_l}(t_l)dt_1\ldots dt_k
$$

is the Fourier coefficient,

$$
K(t_1,\ldots,t_k)=\begin{cases}\psi_1(t_1)\ldots\psi_k(t_k) & for\ \ t_1<\ldots<t_k\\ \\ 0 & otherwise\end{cases},\qquad t_1,\ldots,t_k\in[t,T],\qquad k\ge 2
$$

and $K(t_1)\equiv\psi_1(t_1)$ *for* $t_1\in[t,T]$.

Remark 1. *Note that from Theorem* 4 *for the case* $\rho(\tau)\equiv 1$ *we obtain the variant of Theorem* 1.

Proof. The scheme of the proof of Theorem 4 is the same with the scheme of the proof of Theorem 1 in [43] or Theorem 1.1 in [15]-[18] (also see [10]-[25], [43]). Some differences will take place in the proof of the following lemmas (Lemmas 3, 4) and in the final part of the proof of Theorem 4.

Lemma 3. *Suppose that* $M_\tau^{(r,i)}\in\mathrm{M}_2(\rho,[t,T])$, $M_\tau^{(r,0)}=\tau$ $(i=0,1,\ldots,m,\ \ r=1,\ldots,k)$, *and every* $\psi_l(\tau)$ $(l=1,\ldots,k)$ *is a continuous non-random function at the interval* $[t,T]$. *Then*

$$
J[\psi^{(k)}]_{T,t}^{M}=\underset{N\to\infty}{\mathrm{l.i.m.}}\sum_{j_k=0}^{N-1}\ldots\sum_{j_1=0}^{j_2-1}\prod_{l=1}^{k}\psi_l(\tau_{j_l})\Delta M_{\tau_{j_l}}^{(l,i_l)}\quad w.\ p.\ 1, \tag{36}
$$

where $\{\tau_j\}_{j=0}^{N}$ *is a partition of the interval* $[0,T]$ *satisfying the condition* (7).

Proof. According to properties of the stochastic integral with respect to martingale, we have [1]

$$
\mathsf{M}\left\{\left(\int\limits_t^\tau\xi_s dM_s^{(l,i_l)}\right)^2\right\}=\int\limits_t^\tau\mathsf{M}\left\{|\xi_s|^2\right\}\rho(s)ds, \tag{37}
$$

$$\mathsf{M}\left\{\left(\int\limits_t^\tau \xi_s ds\right)^2\right\} \le (\tau - t)\int\limits_t^\tau \mathsf{M}\left\{|\xi_s|^2\right\} ds, \tag{38}$$

where $\xi_s \in H_2(\rho, [0,T])$, $0 \le t < \tau \le T$, $i_l = 1,\ldots,m$, $l = 1,\ldots,k$. Then the integral sum of the integral $J[\psi^{(k)}]^M_{T,t}$ under the conditions of Lemma 3 can be represented as a sum of the expression from the right-hand side of (36) before passing to the limit and the value which converges to zero in the mean-square sense if $N \to \infty$. More detailed proof of the analogous lemma for the case $\rho(\tau) \equiv 1$ can be found in [10]-[25], [43].

In the case when the functions $\psi_l(\tau)$ $(l = 1,\ldots,k)$ satisfy the condition $(\star)$ (see Sect. 1) we can suppose that among the points τ_j, $j = 0,1,\ldots,N$ there are all points of jumps of the functions $\psi_l(\tau)$ $(l = 1,\ldots,k)$. Then can apply the argumentation as in Sect. 4 from [43] (also see [10]-[18]).

Let us define the folloing multiple stochastic integral

$$\underset{N\to\infty}{\text{l.i.m.}} \sum_{j_1,\ldots,j_k=0}^{N-1} \Phi(\tau_{j_1},\ldots,\tau_{j_k}) \prod_{l=1}^k \Delta M^{(l,i_l)}_{\tau_{j_l}} \stackrel{\rm def}{=} I[\Phi]^{(k)}_{T,t}, \tag{39}$$

where $\{\tau_j\}_{j=0}^N$ is a partition of the interval $[0,T]$ satisfying the condition (7) and $\Phi(t_1,\ldots,t_k)$: $[t,T]^k \to \mathbb{R}^1$ is a bounded non-random function.

Lemma 4. *Suppose that $M^{(l,i_l)}_s \in Q_4(\rho,[t,T])$, $G_n(\rho,[t,T])$ with $n = 2^{k+1}$, $k \in \mathbb{N}$ $(i_l = 0,1,\ldots,m$, $l = 1,\ldots,k)$ and the functions $g_1(s),\ldots,g_k(s)$ satisfy the condition $(\star)$ (see Sect. 1). Then*

$$\prod_{l=1}^k \int\limits_t^T g_l(s) dM^{(l,i_l)}_s = I[\Phi]^{(k)}_{T,t} \quad \text{w. p. } 1,$$

where

$$\Phi(t_1,\ldots,t_k) = \prod_{l=1}^k g_l(t_l).$$

Proof. Let us denote

$$J[g_l]_N \stackrel{\rm def}{=} \sum_{j=0}^{N-1} g_l(\tau_j)\Delta M^{(l,i_l)}_{\tau_j}, \quad J[g_l]_{T,t} \stackrel{\rm def}{=} \int\limits_t^T g_l(s) dM^{(l,i_l)}_s,$$

where $\{\tau_j\}_{j=0}^N$ is a partition of the interval $[t,T]$ satisfying the condition (7).

Note that

$$\prod_{l=1}^k J[g_l]_N - \prod_{l=1}^k J[g_l]_{T,t} =$$

$$= \sum_{l=1}^k \left(\prod_{q=1}^{l-1} J[g_q]_{T,t}\right)\left(J[g_l]_N - J[g_l]_{T,t}\right)\left(\prod_{q=l+1}^k J[g_q]_N\right).$$

Using the Minkowski inequality and the inequality of Cauchy-Bunyakovsky as well as the conditions of Lemma 4, we obtain

$$\left(\mathsf{M}\left\{\left|\prod_{l=1}^{k}J[g_l]_N-\prod_{l=1}^{k}J[g_l]_{T,t}\right|^2\right\}\right)^{1/2}\le C_k\sum_{l=1}^{k}\left(\mathsf{M}\left\{\left|J[g_l]_N-J[g_l]_{T,t}\right|^4\right\}\right)^{1/4}, \tag{40}$$

where $C_k<\infty$ is a constant.

We have

$$J[g_l]_N-J[g_l]_{T,t}=\sum_{q=0}^{N-1}J[\Delta g_l]_{\tau_{q+1},\tau_q},$$

$$J[\Delta g_l]_{\tau_{q+1},\tau_q}=\int\limits_{\tau_q}^{\tau_{q+1}}\left(g_l(\tau_q)-g_l(s)\right)dM_s^{(l,i_l)}.$$

Let as introduce the notation

$$g_l^{(N)}(s)=g_l(\tau_q),\quad s\in[\tau_q,\tau_{q+1}),\quad q=0,1,\ldots,N-1.$$

Then

$$J[\bar{g}_l]_N-J[\bar{g}_l]_{T,t}=\sum_{q=0}^{N-1}J[\Delta\bar{g}_l]_{\tau_{q+1},\tau_q}=$$

$$=\int\limits_t^T\left(g_l^{(N)}(s)-g_l(s)\right)dM_s^{(l,i_l)}.$$

Applying the estimate (33), we obtain

$$\mathsf{M}\left\{\left|\int\limits_t^T\left(g_l^{(N)}(s)-g_l(s)\right)dM_s^{(l,i_l)}\right|^4\right\}\le K_4\int\limits_t^T\left|g_l^{(N)}(s)-g_l(s)\right|^\alpha ds=$$

$$=K_4\sum_{q=0}^{N-1}\int\limits_{\tau_q}^{\tau_{q+1}}\left|g_l(\tau_q)-g_l(s)\right|^\alpha ds<K_4\varepsilon^\alpha\sum_{q=0}^{N-1}(\tau_{q+1}-\tau_q)=$$

$$=K_4\varepsilon^\alpha(T-t). \tag{41}$$

Note that deriving (41) we used the estimate

$$|g_l(\tau_q)-g_l(s)|<\varepsilon,\quad s\in[\tau_q,\tau_{q+1}],\quad q=0,1,\ldots,N-1, \tag{42}$$

where ε is an arbitrary small positive real number.

Note that (42) is valid if the functions $g_l(s)$ are continuous at the interval $[t,T]$, i.e. these functions are uniformly continuous at this interval. So, $|g_l(\tau_q)-g_l(s)|<\varepsilon$ if $s\in[\tau_q,\tau_{q+1}]$, where $|\tau_{q+1}-\tau_q|<\delta(\varepsilon)$, $q=0,1,\ldots,N-1$ ($\delta(\varepsilon)>0$ exists for any $\varepsilon>0$ and it does not depend on points of the interval $[t,T]$).

Thus, taking into account (41), we obtain that the right-hand side of (40) converges to zero when $N\to\infty$. Considering this fact, we come to the statement of Lemma 4.

In the case when the functions $g_l(s)$ $(l=1,\ldots,k)$ satisfy the condition $(\star)$ (see Sect. 1) we can suppose that among the points τ_q, $q=0,1,\ldots,N$ there are all points of jumps of the functions $g_l(s)$ $(l=1,\ldots,k)$. Further, we can apply the argumentation as in Sect. 4 from [43] (also see [10]-[18]).

Obviously, if $i_l=0$ for some $l=1,\ldots,k$, then we also come to the statement of Lemma 4 with using (38). Lemma 4 is proved.

Proving Theorem 4 according to the scheme used for the proof of Theorem 1 in [43] or Theorem 1.1 in [15]-[18] (also see [10] (Theorem 5.1, P. 236-237), [12] (Theorem 1, P. A.22-A.23), [13] (Theorem 5.1, P. A.250), [14] (Theorem 5.1, P. A.252-A.253)) and using Lemmas 3, 4 together with the estimates (37), (38) for moments of stochastic integrals with respect to martingales, we obtain

$$\mathsf{M}\left\{\left(R_{T,t}^{p_1,\ldots,p_k}\right)^2\right\}\le$$

$$\le C_k\sum_{(t_1,\ldots,t_k)}\int\limits_t^T\ldots\int\limits_t^{t_2}\left(K(t_1,\ldots,t_k)-\sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k}C_{j_k\ldots j_1}\prod_{l=1}^k\phi_{j_l}(t_l)\right)^2\times$$

$$\times\tilde\rho_1(t_1)dt_1\ldots\tilde\rho_k(t_k)dt_k\le \tag{43}$$

$$\le \bar C_k\sum_{(t_1,\ldots,t_k)}\int\limits_t^T\ldots\int\limits_t^{t_2}\left(K(t_1,\ldots,t_k)-\sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k}C_{j_k\ldots j_1}\prod_{l=1}^k\phi_{j_l}(t_l)\right)^2 dt_1\ldots dt_k=$$

$$=\bar C_k\int\limits_{[t,T]^k}\left(K(t_1,\ldots,t_k)-\sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k}C_{j_k\ldots j_1}\prod_{l=1}^k\phi_{j_l}(t_l)\right)^2 dt_1\ldots dt_k\to 0$$

when $p_1,\ldots,p_k\to\infty$, where constant $\bar C_k$ depends only on k (multiplicity of the iterated stochastic integral with respect to martingales) and $\tilde\rho_l(s)\equiv\rho(s)$ or $\tilde\rho_l(s)\equiv 1$ $(l=1,\ldots,k)$. At that permutations $(t_1,\ldots,t_k)$ when summing

$$\sum_{(t_1,\ldots,t_k)}$$

in (43) are performed only in the values $dt_1\ldots dt_k$ and indexes near upper limits of integration are changed correspondently. Moreover, $R_{T,t}^{p_1,\ldots,p_k}$ has the following form

$$R_{T,t}^{p_1,\ldots,p_k}=\sum_{(t_1,\ldots,t_k)}\int\limits_t^T\ldots\int\limits_t^{t_2}\left(K(t_1,\ldots,t_k)-\sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k}C_{j_k\ldots j_1}\prod_{l=1}^k\phi_{j_l}(t_l)\right)\times$$

$$\times dM_{t_1}^{(1,i_1)}\ldots dM_{t_k}^{(k,i_k)}, \tag{44}$$

where permutations $(t_1,\ldots,t_k)$ when summing

$$\sum_{(t_1,\ldots,t_k)}$$

in (44) are performed only in the values

$$dM_{t_1}^{(1,i_1)}\ldots dM_{t_k}^{(k,i_k)}.$$

At the same time the indexes near upper limits of integration in the iterated stochastic integrals are changed correspondently and if t_r swapped with t_q in the permutation $(t_1,\ldots,t_k)$, then i_r swapped with i_q in the permutation $(i_1,\ldots,i_k)$. Moreover, r swapped with q in the permutation $(1,\ldots,k)$. Theorem 4 is proved.

7. Expansion of Iterated Ito Stochastic Integrals Based on Generalized Multiple Fourier Series. The Case of Complete Orthonormal With Weight $r(t_1)\ldots r(t_k)\ge 0$ Systems of Functions in the Space $L_2([t,T]^k)$

In this section, we consider modifications of Theorems 1, 2 for the case of complete orthonormal with weight $r(t_1)\ldots r(t_k)\ge 0$ systems of functions in the space $L_2([t,T]^k)$, $k\in\mathbb{N}$.

Let $\{\Psi_j(x)\}_{j=0}^{\infty}$ be a complete orthonormal with weight $r(x)\ge 0$ system of functions in the space $L_2([t,T])$. It is well known that the Fourier series with respect to the system

$$\{\Psi_j(x)\}_{j=0}^{\infty}$$

of the function $f(x)$ $\left(f(x)\sqrt{r(x)}\in L_2([t,T])\right)$ converges to the function $f(x)$ in the mean-square sense with weight $r(x)$, i.e.

$$\lim_{p\to\infty}\int\limits_t^T\left(f(x)-\sum_{j=0}^{p}\tilde C_j\Psi_j(x)\right)^2 r(x)dx=0, \tag{45}$$

where

$$\tilde C_j=\int\limits_t^T f(x)\Psi_j(x)r(x)dx \tag{46}$$

is the Fourier coefficient.

Obviously, the relation (45) can be obtained if we will expand the function $f(x)\sqrt{r(x)}\in L_2([t,T])$ into a usual Fourier series with respect to the complete orthonormal with weight 1 system of functions

$$\left\{\Psi_j(x)\sqrt{r(x)}\right\}_{j=0}^{\infty}$$

in the space $L_2([t,T])$. Then

$$\lim_{p\to\infty}\int\limits_t^T\left(f(x)\sqrt{r(x)}-\sum_{j=0}^{p}\tilde C_j\Psi_j(x)\sqrt{r(x)}\right)^2 dx=$$

$$=\lim_{p\to\infty}\int\limits_t^T\left(f(x)-\sum_{j=0}^{p}\tilde C_j\Psi_j(x)\right)^2 r(x)dx=0, \tag{47}$$

where $\tilde{C}_j$ has the form (46).

Let us consider an obvious generalization of this approach to the case of several variables. Let us expand the function $K(t_1,\ldots,t_k)$ such that

$$K(t_1,\ldots,t_k)\prod_{l=1}^{k}\sqrt{r(t_l)}\in L_2([t,T]^k)$$

using the complete orthonormal system of functions

$$\prod_{l=1}^{k}\Psi_{j_l}(t_l)\sqrt{r(t_l)},\quad j_l=0,1,2,\ldots,\quad l=1,\ldots,k$$

in the space $L_2([t,T]^k)$ into the generalized multiple Fourier series.

It is well known that the mentioned generalized multiple Fourier series converges in the mean-square sense, i.e.

$$\lim_{p_1,\ldots,p_k\to\infty}\int\limits_{[t,T]^k}\left(K(t_1,\ldots,t_k)\prod_{l=1}^{k}\sqrt{r(t_l)}-\sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k}\tilde{C}_{j_k\ldots j_1}\prod_{l=1}^{k}\Psi_{j_l}(t_l)\sqrt{r(t_l)}\right)^2\times$$

$$\times dt_1\ldots dt_k=$$

$$=\lim_{p_1,\ldots,p_k\to\infty}\int\limits_{[t,T]^k}\left(K(t_1,\ldots,t_k)-\sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k}\tilde{C}_{j_k\ldots j_1}\prod_{l=1}^{k}\Psi_{j_l}(t_l)\right)^2\times$$

$$\times\left(\prod_{l=1}^{k}r(t_l)\right)dt_1\ldots dt_k=0, \tag{48}$$

where

$$\tilde{C}_{j_k\ldots j_1}=\int\limits_{[t,T]^k}K(t_1,\ldots,t_k)\prod_{l=1}^{k}\Bigl(\Psi_{j_l}(t_l)r(t_l)\Bigr)dt_1\ldots dt_k.$$

Let us consider the following iterated Ito stochastic integrals

$$\tilde{J}[\psi^{(k)}]_{T,t}=\int\limits_t^T\psi_k(t_k)\sqrt{r(t_k)}\ldots\int\limits_t^{t_2}\psi_1(t_1)\sqrt{r(t_1)}d\mathbf{w}_{t_1}^{(i_1)}\ldots d\mathbf{w}_{t_k}^{(i_k)}, \tag{49}$$

where every $\psi_l(\tau)$ $(l=1,\ldots,k)$ is a non-random function on $[t,T]$, $\mathbf{w}_\tau^{(i)}=\mathbf{f}_\tau^{(i)}$ for $i=1,\ldots,m$, $\mathbf{w}_\tau^{(0)}=\tau$, and $i_1,\ldots,i_k=0,1,\ldots,m$.

So, we obtain the following modification of Theorem 1.

Theorem 5 [14]-[17], [53]. *Suppose that every $\psi_l(\tau)$ $(l=1,\ldots,k)$ is a continuous non-random function on $[t,T]$ and $\{\Psi_j(x)\sqrt{r(x)}\}_{j=0}^{\infty}$ $(r(x)\ge 0)$ is a complete orthonormal system of functions in the space $L_2([t,T])$, each function $\Psi_j(x)\sqrt{r(x)}$ of which for finite j satisfies the condition $(\star)$ (see Sect. 1). Then*

$$\tilde{J}[\psi^{(k)}]_{T,t} = \underset{p_1,\ldots,p_k\to\infty}{\text{l.i.m.}} \sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k}\tilde{C}_{j_k\ldots j_1}\Biggl(\prod_{l=1}^{k}\tilde{\zeta}_{j_l}^{(i_l)}-$$

$$-\underset{N\to\infty}{\text{l.i.m.}}\sum_{(l_1,\ldots,l_k)\in\mathrm{G}_k}\Psi_{j_1}(\tau_{l_1})\sqrt{r(\tau_{l_1})}\Delta\mathbf{w}_{\tau_{l_1}}^{(i_1)}\ldots\Psi_{j_k}(\tau_{l_k})\sqrt{r(\tau_{l_k})}\Delta\mathbf{w}_{\tau_{l_k}}^{(i_k)}\Biggr), \tag{50}$$

where

$$\mathrm{G}_k=\mathrm{H}_k\backslash\mathrm{L}_k,\quad \mathrm{H}_k=\{(l_1,\ldots,l_k):\ l_1,\ldots,l_k=0,\ 1,\ldots,N-1\},$$

$$\mathrm{L}_k=\{(l_1,\ldots,l_k):\ l_1,\ldots,l_k=0,\ 1,\ldots,N-1;\ l_g\ne l_r\ (g\ne r);\ g,r=1,\ldots,k\},$$

l.i.m. *is a limit in the mean-square sense,* $i_1,\ldots,i_k=0,1,\ldots,m,$

$$\tilde{\zeta}_j^{(i)}=\int\limits_t^T\Psi_j(s)\sqrt{r(s)}d\mathbf{w}_s^{(i)}$$

are independent standard Gaussian random variables for various i *or* j (*in the case when* $i\ne 0$), $\Delta\mathbf{w}_{\tau_j}^{(i)}=\mathbf{w}_{\tau_{j+1}}^{(i)}-\mathbf{w}_{\tau_j}^{(i)}$ $(i=0,1,\ldots,m)$, $\{\tau_j\}_{j=0}^{N}$ *is a partition of* $[t,T]$ *which satisfies the condition* (7),

$$\tilde{C}_{j_k\ldots j_1}=\int\limits_{[t,T]^k}K(t_1,\ldots,t_k)\prod_{l=1}^{k}\Bigl(\Psi_{j_l}(t_l)r(t_l)\Bigr)dt_1\ldots dt_k \tag{51}$$

is the Fourier coefficient,

$$K(t_1,\ldots,t_k)=\begin{cases}\psi_1(t_1)\ldots\psi_k(t_k) & \text{for}\ \ t_1<\ldots<t_k\\ & \\ 0 & \text{otherwise}\end{cases},\qquad t_1,\ldots,t_k\in[t,T],\qquad k\ge 2$$

and $K(t_1)\equiv\psi_1(t_1)$ *for* $t_1\in[t,T]$.

Proof. According to Lemmas 1–3 in [43] or Lemmas 1.1–1.3 in [15]-[18] (also see [10]-[14]), we get the following representation w. p. 1

$$\tilde{J}[\psi^{(k)}]_{T,t}=$$

$$=\sum_{(t_1,\ldots,t_k)}\int\limits_t^T\ldots\int\limits_t^{t_2}K(t_1,\ldots,t_k)\prod_{l=1}^{k}\sqrt{r(t_l)}d\mathbf{w}_{t_1}^{(i_1)}\ldots d\mathbf{w}_{t_k}^{(i_k)}=$$

$$=\sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k}\tilde{C}_{j_k\ldots j_1}\sum_{(t_1,\ldots,t_k)}\int\limits_t^T\ldots\int\limits_t^{t_2}\prod_{l=1}^{k}\left(\Psi_{j_l}(t_l)\sqrt{r(t_l)}\right)d\mathbf{w}_{t_1}^{(i_1)}\ldots d\mathbf{w}_{t_k}^{(i_k)}+$$

$$+\tilde{R}_{T,t}^{p_1,\ldots,p_k}=$$

$$=\sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k}\tilde{C}_{j_k\ldots j_1}\times$$

$$\times \underset{N\to\infty}{\text{l.i.m.}}\sum_{\substack{l_1,\ldots,l_k=0\\ l_q\ne l_r;\ q\ne r;\ q,r=1,\ldots,k}}^{N-1}\Psi_{j_1}(\tau_{l_1})\sqrt{r(\tau_{l_1})}\Delta\mathbf{w}_{\tau_{l_1}}^{(i_1)}\ldots\Psi_{j_k}(\tau_{l_k})\sqrt{(\tau_{l_k})}\Delta\mathbf{w}_{\tau_{l_k}}^{(i_k)}+$$

$$+\tilde{R}_{T,t}^{p_1,\ldots,p_k}=$$

$$=\sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k}\tilde{C}_{j_k\ldots j_1}\times$$

$$\times\left(\underset{N\to\infty}{\text{l.i.m.}}\sum_{l_1,\ldots,l_k=0}^{N-1}\Psi_{j_1}(\tau_{l_1})\sqrt{r(\tau_{l_1})}\Delta\mathbf{w}_{\tau_{l_1}}^{(i_1)}\ldots\Psi_{j_k}(\tau_{l_k})\sqrt{(\tau_{l_k})}\Delta\mathbf{w}_{\tau_{l_k}}^{(i_k)}-\right.$$

$$\left.-\underset{N\to\infty}{\text{l.i.m.}}\sum_{(l_1,\ldots,l_k)\in\mathrm{G}_k}\Psi_{j_1}(\tau_{l_1})\sqrt{r(\tau_{l_1})}\Delta\mathbf{w}_{\tau_{l_1}}^{(i_1)}\ldots\Psi_{j_k}(\tau_{l_k})\sqrt{(\tau_{l_k})}\Delta\mathbf{w}_{\tau_{l_k}}^{(i_k)}\right)+$$

$$+\tilde{R}_{T,t}^{p_1,\ldots,p_k}=$$

$$=\sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k}\tilde{C}_{j_k\ldots j_1}\times$$

$$\times\left(\prod_{l=1}^{k}\tilde{\zeta}_{j_l}^{(i_l)}-\underset{N\to\infty}{\text{l.i.m.}}\sum_{(l_1,\ldots,l_k)\in\mathrm{G}_k}\Psi_{j_1}(\tau_{l_1})\sqrt{r(\tau_{l_1})}\Delta\mathbf{w}_{\tau_{l_1}}^{(i_1)}\ldots\Psi_{j_k}(\tau_{l_k})\sqrt{(\tau_{l_k})}\Delta\mathbf{w}_{\tau_{l_k}}^{(i_k)}\right)+$$

$$+\tilde{R}_{T,t}^{p_1,\ldots,p_k},$$

where

$$\tilde{R}_{T,t}^{p_1,\ldots,p_k}=\sum_{(t_1,\ldots,t_k)}\int_t^T\ldots\int_t^{t_2}\left(K(t_1,\ldots,t_k)\prod_{l=1}^{k}\sqrt{r(t_l)}-\right.$$

$$\left.-\sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k}\tilde{C}_{j_k\ldots j_1}\prod_{l=1}^{k}\left(\Psi_{j_l}(t_l)\sqrt{r(t_l)}\right)\right)d\mathbf{w}_{t_1}^{(i_1)}\ldots d\mathbf{w}_{t_k}^{(i_k)},$$

where permutations $(t_1,\ldots,t_k)$ when summing are performed only in the values $d\mathbf{w}_{t_1}^{(i_1)}\ldots d\mathbf{w}_{t_k}^{(i_k)}$. At the same time the indexes near upper limits of integration in the iterated stochastic integrals are changed correspondently and if t_r swapped with t_q in the permutation $(t_1,\ldots,t_k)$, then i_r swapped i_q in the permutation $(i_1,\ldots,i_k)$.

Let us evaluate the remainder $\tilde{R}_{T,t}^{p_1,\ldots,p_k}$ of the series.

According to Lemma 2 in [43] or Lemma 1.2 in [15] (also see [16]-[18]), we have

$$\mathsf{M}\left\{\left(\tilde{R}_{T,t}^{p_1,\ldots,p_k}\right)^2\right\}\le C_k\sum_{(t_1,\ldots,t_k)}\int\limits_t^T\ldots\int\limits_t^{t_2}\Biggl(K(t_1,\ldots,t_k)\prod_{l=1}^k\sqrt{r(t_l)}-$$

$$-\sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k}\tilde{C}_{j_k\ldots j_1}\prod_{l=1}^k\left(\Psi_{j_l}(t_l)\sqrt{r(t_l)}\right)\Biggr)^2 dt_1\ldots dt_k= \tag{52}$$

$$=C_k\int\limits_{[t,T]^k}\left(K(t_1,\ldots,t_k)-\sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k}\tilde{C}_{j_k\ldots j_1}\prod_{l=1}^k\Psi_{j_l}(t_l)\right)^2\times$$

$$\times\left(\prod_{l=1}^k r(t_l)\right)dt_1\ldots dt_k\to 0$$

if $p_1,\ldots,p_k\to\infty$, where constant C_k depends only on the multiplicity k of the iterated Ito stochastic integral (49). Theorem 5 is proved.

Let us formulate the following theorem (the version of Theorem 3 in [44]).

Theorem 6 [15]-[18]. *Suppose that every* $\psi_l(\tau)$ $(l=1,\ldots,k)$ *is a continuous non-random function on* $[t,T]$ *and* $\{\Psi_j(x)\sqrt{r(x)}\}_{j=0}^{\infty}$ $(r(x)\ge 0)$ *is a complete orthonormal system of functions in the space* $L_2([t,T])$, *each function* $\Psi_j(x)\sqrt{r(x)}$ *of which for finite* j *satisfies the condition* $(\star)$ *(see Sect.* 1*). Then the estimate*

$$\mathsf{M}\left\{\left(\tilde{J}[\psi^{(k)}]_{T,t}-\tilde{J}[\psi^{(k)}]_{T,t}^{p_1,\ldots,p_k}\right)^2\right\}\le$$

$$\le k!\left(\int\limits_{[t,T]^k}K^2(t_1,\ldots,t_k)\left(\prod_{l=1}^k r(t_l)\right)dt_1\ldots dt_k-\sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k}\tilde{C}_{j_k\ldots j_1}^2\right) \tag{53}$$

is valid for the following cases:

1. $i_1,\ldots,i_k=1,\ldots,m$ *and* $0<T-t<\infty$,
2. $i_1,\ldots,i_k=0,1,\ldots,m,$ $i_1^2+\ldots+i_k^2>0,$ *and* $0<T-t<1$,

where $\tilde{J}[\psi^{(k)}]_{T,t}$ *is the stochastic integral* (49), $\tilde{J}[\psi^{(k)}]_{T,t}^{p_1,\ldots,p_k}$ *is the expression on the right-hand side of* (50) *before passing to the limit* $\underset{p_1,\ldots,p_k\to\infty}{\text{l.i.m.}}$; *another notations are the same as in Theorem* 5.

Consider the following generalizations of Theorems 5, 6.

Theorem 7 [15] (Sect. 1.13), [43] (Sect. 17). *Let* $\psi_1(x)\sqrt{r(x)},\ldots,\psi_k(x)\sqrt{r(x)}\in L_2([t,T])$, *where* $r(x)\ge 0$. *Furthermore, let* $\{\Psi_j(x)\sqrt{r(x)}\}_{j=0}^{\infty}$ *is an arbitrary complete orthonormal system of functions in the space* $L_2([t,T])$. *Then, for the iterated Ito stochastic integral*

$$\tilde{J}[\psi^{(k)}]_{T,t}=\int\limits_t^T\psi_k(t_k)\sqrt{r(t_k)}\ldots\int\limits_t^{t_2}\psi_1(t_1)\sqrt{r(t_1)}d\mathbf{w}_{t_1}^{(i_1)}\ldots d\mathbf{w}_{t_k}^{(i_k)} \tag{54}$$

the following expansion

$$\tilde{J}[\psi^{(k)}]_{T,t}=\underset{p_1,\ldots,p_k\to\infty}{\text{l.i.m.}}\ \sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k}C_{j_k\ldots j_1}\left(\prod_{l=1}^{k}\tilde{\zeta}_{j_l}^{(i_l)}+\sum_{r=1}^{[k/2]}(-1)^r\times\right.$$

$$\left.\times\sum_{\substack{(\{\{g_1,g_2\},\ldots,\{g_{2r-1},g_{2r}\}\},\{q_1,\ldots,q_{k-2r}\})\\ \{g_1,g_2,\ldots,g_{2r-1},g_{2r},q_1,\ldots,q_{k-2r}\}=\{1,2,\ldots,k\}}}\prod_{s=1}^{r}\mathbf{1}_{\{i_{g_{2s-1}}=\ i_{g_{2s}}\ne 0\}}\mathbf{1}_{\{j_{g_{2s-1}}=\ j_{g_{2s}}\}}\prod_{l=1}^{k-2r}\tilde{\zeta}_{j_{q_l}}^{(i_{q_l})}\right) \tag{55}$$

that converges in the mean-square sense is valid, where $i_1,\ldots,i_k=0,1,\ldots,m$,

$$\tilde{\zeta}_j^{(i)}=\int\limits_t^T\Psi_j(s)\sqrt{r(s)}d\mathbf{w}_s^{(i)}$$

are independent standard Gaussian random variables for various i *or* j (*in the case when* $i\ne 0$),

$$\tilde{C}_{j_k\ldots j_1}=\int\limits_{[t,T]^k}K(t_1,\ldots,t_k)\prod_{l=1}^{k}\Bigl(\Psi_{j_l}(t_l)r(t_l)\Bigr)dt_1\ldots dt_k$$

is the Fourier coefficient, $K(t_1,\ldots,t_k)$ *is defined by* (5); *another notations are the same as in Theorems* 1, 2, 5.

Theorem 8 [15] (Sect. 1.13), [43] (Sect. 17). *Let* $\psi_1(x)\sqrt{r(x)},\ldots,\psi_k(x)\sqrt{r(x)}\in L_2([t,T])$, *where* $r(x)\ge 0$. *Furthermore, let* $\{\Psi_j(x)\sqrt{r(x)}\}_{j=0}^{\infty}$ *is an arbitrary complete orthonormal system of functions in the space* $L_2([t,T])$. *Then the following estimate*

$$\mathsf{M}\left\{\left(\tilde{J}[\psi^{(k)}]_{T,t}-\tilde{J}[\psi^{(k)}]_{T,t}^{p_1,\ldots,p_k}\right)^2\right\}\le$$

$$\le k!\left(\int\limits_{[t,T]^k}K^2(t_1,\ldots,t_k)\left(\prod_{l=1}^{k}r(t_l)\right)dt_1\ldots dt_k-\sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k}\tilde{C}_{j_k\ldots j_1}^2\right)$$

is valid for the following cases:

1. $i_1,\ldots,i_k=1,\ldots,m$ *and* $0<T-t<\infty$,
2. $i_1,\ldots,i_k=0,1,\ldots,m,\ \ i_1^2+\ldots+i_k^2>0,$ *and* $0<T-t<1$,

where $\tilde{J}[\psi^{(k)}]_{T,t}$ *is the stochastic integral* (54), $\tilde{J}[\psi^{(k)}]_{T,t}^{p_1,\ldots,p_k}$ *is the expression on the right-hand side of* (55) *before passing to the limit* $\underset{p_1,\ldots,p_k\to\infty}{\text{l.i.m.}}$; *another notations are the same as in Theorem* 2, 7.

8. One Modification of Theorems 4 and 5

Let us compare (52) and (43). If we suppose that $r(x)\ge 0$ and

$$\frac{\rho(x)}{r(x)}\le C<\infty,$$

where $\rho(x)$ as in (30), then

$$\int\limits_{[t,T]^k}\left(K(t_1,\ldots,t_k)-\sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k}\tilde{C}_{j_k\ldots j_1}\prod_{l=1}^{k}\Psi_{j_l}(t_l)\right)^2\times$$

$$\times\rho(t_1)dt_1\ldots\rho(t_k)dt_k=$$

$$=\int\limits_{[t,T]^k}\left(K(t_1,\ldots,t_k)-\sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k}\tilde{C}_{j_k\ldots j_1}\prod_{l=1}^{k}\Psi_{j_l}(t_l)\right)^2\times$$

$$\times\frac{\rho(t_1)}{r(t_1)}r(t_1)dt_1\ldots\frac{\rho(t_k)}{r(t_k)}r(t_k)dt_k\le$$

$$\le C_k'\int\limits_{[t,T]^k}\left(K(t_1,\ldots,t_k)-\sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k}\tilde{C}_{j_k\ldots j_1}\prod_{l=1}^{k}\Psi_{j_l}(t_l)\right)^2\times$$

$$\times r(t_1)dt_1\ldots r(t_k)dt_k,$$

where C_k' is a constant, $\{\Psi_j(x)\}_{j=0}^{\infty}$ is a complete orthonormal with weight $r(x)\ge 0$ system of functions in the space $L_2([t,T])$, and the Fourier coefficient $\tilde{C}_{j_k\ldots j_1}$ has the form (51).

So, we obtain the following modification of Theorems 4 and 5.

Theorem 9 [15], [53]. *Suppose that the following conditions are fulfilled*:

1. *Every* $\psi_l(\tau)$ $(l=1,\ldots,k)$ *is a continuous non-random function at the interval* $[t,T]$.
2. $M_\tau^{(l,i_l)}\in Q_4(\rho,[t,T])$, $G_n(\rho,[t,T])$ *with* $n=2^{k+1}$, $i_l=1,\ldots,m$, $l=1,\ldots,k$ $(k\in\mathbb{N})$.
3. $\{\Psi_j(x)\}_{j=0}^{\infty}$ *is a complete orthonormal with weight* $r(\tau)\ge 0$ *system of functions in the space* $L_2([t,T])$, *each function of which for finite* j *satisfies the condition* $(\star)$ (*see Sect.* 1). *Moreover,*

$$\frac{\rho(x)}{r(x)}\le C<\infty.$$

Then, for the iterated stochastic integral $J[\psi^{(k)}]_{T,t}^M$ *with respect to martingales defined by* (35) *the following expansion*

$$J[\psi^{(k)}]_{T,t}^{M}=\underset{p_1,\ldots,p_k\to\infty}{\text{l.i.m.}}\sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k}\tilde{C}_{j_k\ldots j_1}\Biggl(\prod_{l=1}^{k}\xi_{j_l}^{(l,i_l)}-$$

$$-\underset{N\to\infty}{\text{l.i.m.}}\sum_{(l_1,\ldots,l_k)\in\mathrm{G}_k}\Psi_{j_1}(\tau_{l_1})\Delta M_{\tau_{l_1}}^{(1,i_1)}\ldots\Psi_{j_k}(\tau_{l_k})\Delta M_{\tau_{l_k}}^{(k,i_k)}\Biggr)$$

converging in the mean-square sense is valid, where $i_1,\ldots,i_k=1,\ldots,m$, $\{\tau_j\}_{j=0}^{N}$ *is a partition of the interval* $[t,T]$ *which satisfies the condition* (31), $\Delta M_{\tau_j}^{(r,i)}=M_{\tau_{j+1}}^{(r,i)}-M_{\tau_j}^{(r,i)}$ $(i=1,\ldots,m,\ r=1,\ldots,k)$,

$$\mathrm{G}_k=\mathrm{H}_k\backslash\mathrm{L}_k,\quad \mathrm{H}_k=\{(l_1,\ldots,l_k):\ l_1,\ldots,l_k=0,\ 1,\ldots,N-1\},$$

$$\mathrm{L}_k=\{(l_1,\ldots,l_k):\ l_1,\ldots,l_k=0,\ 1,\ldots,N-1;\ l_g\neq l_r\ (g\neq r);\ g,r=1,\ldots,k\},$$

l.i.m. *is a limit in the mean-square sense,*

$$\xi_j^{(l,i_l)}=\int\limits_t^T\Psi_j(s)dM_s^{(l,i_l)}$$

are independent for various $i_l=1,\ldots,m$ $(l=1,\ldots,k)$ *and uncorrelated for various* j *(if* $i_l\neq 0$, $\rho(x)\equiv r(x)$*) random variables,*

$$\tilde{C}_{j_k\ldots j_1}=\int\limits_{[t,T]^k}K(t_1,\ldots,t_k)\prod_{l=1}^{k}\Bigl(\Psi_{j_l}(t_l)r(t_l)\Bigr)dt_1\ldots dt_k$$

is the Fourier coefficient,

$$K(t_1,\ldots,t_k)=\begin{cases}\psi_1(t_1)\ldots\psi_k(t_k) & \text{for}\ \ t_1<\ldots<t_k\\ & \\ 0 & \text{otherwise}\end{cases},\qquad t_1,\ldots,t_k\in[t,T],\qquad k\geq 2$$

and $K(t_1)\equiv\psi_1(t_1)$ *for* $t_1\in[t,T]$.

Remark 2. *Note that if* $\rho(\tau),r(\tau)\equiv 1$ *in Theorem* 9*, then we obtain the variant of Theorem* 1.

9. Example on Application of Theorem 9 for the System of Bessel Functions

Let us consider the following boundary-value problem

$$\bigl(p(x)\Phi'(x)\bigr)'+q(x)\Phi(x)=-\lambda r(x)\Phi(x),$$

$$\alpha\Phi(a)+\beta\Phi'(a)=0,\quad \gamma\Phi(b)+\delta\Phi'(b)=0,$$

where the functions $p(x)$, $q(x)$, $r(x)$ satisfy the well known conditions and α, β, γ, δ, λ are real numbers.

It is well known (Steklov V.A.) that the eigenfunctions $\Phi_0(x)$, $\Phi_1(x)$, $\ldots$ of this boundary-value problem form a complete orthonormal with weight $r(x)$ system of functions in the space $L_2([a,b])$. It means that the Fourier series of the function $\sqrt{r(x)}f(x) \in L_2([a,b])$ with respect to the system of functions

$$\sqrt{r(x)}\Phi_0(x), \quad \sqrt{r(x)}\Phi_1(x), \quad \ldots$$

converges in the mean-square sense to the function $\sqrt{r(x)}f(x)$ at the interval $[a,b]$. Moreover, the Fourier coefficients are defined by the formula

$$C_j = \int\limits_a^b r(x)f(x)\Phi_j(x)dx. \tag{56}$$

It is known that when solving the problem on oscillations of a circular membrane (general case), a boundary-value problem arises for the following Euler–Bessel equation

$$r^2R''(r) + rR'(r) + \left(\lambda^2r^2 - n^2\right)R(r) = 0 \quad (\lambda \in \mathbb{R}, \quad n \in \mathbb{N}). \tag{57}$$

The eigenfunctions of this problem, taking into account specific boundary conditions, are the following functions

$$J_n\left(\mu_j\frac{r}{L}\right), \tag{58}$$

where $\tau \in [0,L]$ and μ_j $(j = 0,1,2,\ldots)$ are positive roots of the Bessel function $J_n(\mu)$ $(n = 0,1,2,\ldots)$ numbered in ascending order.

The problem on radial oscillations of a circular membrane leads to the boundary-value problem for the equation (57) for $n = 0$, the eigenfunctions of which are the functions (58) when $n = 0$.

Let us analyze the system of functions

$$\Psi_j(\tau) = \frac{\sqrt{2}}{TJ_{n+1}(\mu_j)}J_n\left(\frac{\mu_j}{T}\tau\right), \quad j = 0,1,2,\ldots, \tag{59}$$

where

$$J_n(x) = \sum_{m=0}^{\infty}(-1)^m\left(\frac{x}{2}\right)^{n+2m}\frac{1}{\Gamma(m+1)\Gamma(m+n+1)}$$

is the Bessel function of the first kind and

$$\Gamma(z) = \int\limits_0^{\infty} e^{-x}x^{z-1}dx$$

is the gamma-function, μ_j are positive roots of the function $J_n(x)$ numbered in ascending order, and n is a natural number or zero.

Due to the well known properties of the Bessel functions, the system $\{\Psi_j(\tau)\}_{j=0}^{\infty}$ is a complete orthonormal system of continuous functions with weight τ in the space $L_2([0,T])$.

Let us use the system of functions (59) in Theorem 9.

Consider the following iterated stochastic integral with respect to martingales

$$\int\limits_0^T\int\limits_0^s dM_\tau^{(1)}dM_s^{(2)},$$

where

$$M_s^{(i)}=\int\limits_0^s\sqrt{\tau}d\mathbf{f}_\tau^{(i)}\quad (i=1,2),$$

$\mathbf{f}_\tau^{(i)}$ $(i=1,2)$ are independent standard Wiener processes, $M_s^{(i)}$ $(i=1,2)$ are martingales (here $\rho(\tau)\equiv\tau$), $0\le s\le T$. In addition, $M_s^{(i)}$ has a Gaussian distribution.

It is obvious that the conditions of Theorem 9 are fulfilled for $k=2$. Using Theorem 9, we obtain

$$\int\limits_0^T\int\limits_0^s dM_\tau^{(1)}dM_s^{(2)}=\underset{p_1,p_2\to\infty}{\text{l.i.m.}}\sum_{j_1=0}^{p_1}\sum_{j_2=0}^{p_2}\tilde{C}_{j_2j_1}\zeta_{j_1}^{(1)}\zeta_{j_2}^{(2)},$$

where

$$\zeta_j^{(i)}=\int\limits_0^T\Psi_j(\tau)dM_\tau^{(i)}$$

are independent standard Gaussian random variables for various i or j $(i=1,2,\ \ j=0,1,2,\ldots)$,

$$\mathsf{M}\left\{\zeta_{j_1}^{(1)}\zeta_{j_2}^{(2)}\right\}=0,$$

$$\tilde{C}_{j_2j_1}=\int\limits_0^T s\Psi_{j_2}(s)\int\limits_0^s\tau\Psi_{j_1}(\tau)d\tau ds.$$

It is obvious that we can get this result using the another approach: we can use Theorems 1, 2 for the iterated Ito stochastic integral

$$\int\limits_0^T\sqrt{s}\int\limits_0^s\sqrt{\tau}d\mathbf{f}_\tau^{(1)}d\mathbf{f}_s^{(2)},$$

and as a system of functions $\{\phi_j(s)\}_{j=0}^{\infty}$ in Theorems 1, 2 we can take

$$\phi_j(s)=\frac{\sqrt{2s}}{TJ_{n+1}(\mu_j)}J_n\left(\frac{\mu_j}{T}s\right),\quad j=0,1,2,\ldots.$$

As a result, we obtain

$$\int\limits_0^T \sqrt{s}\int\limits_0^s \sqrt{\tau}d\mathbf{f}_\tau^{(1)}d\mathbf{f}_s^{(2)} = \underset{p_1,p_2\to\infty}{\text{l.i.m.}} \sum_{j_1=0}^{p_1}\sum_{j_2=0}^{p_2} C_{j_2j_1}\zeta_{j_1}^{(1)}\zeta_{j_2}^{(2)},$$

where

$$\zeta_j^{(i)} = \int\limits_0^T \phi_j(\tau)d\mathbf{f}_\tau^{(i)}$$

are independent standard Gaussian random variables for various i or j $(i=1,2,\ \ j=0,1,2,\ldots)$,

$$\mathsf{M}\left\{\zeta_{j_1}^{(1)}\zeta_{j_2}^{(2)}\right\}=0,\quad C_{j_2j_1}=\int\limits_0^T\sqrt{s}\phi_{j_2}(s)\int\limits_0^s\sqrt{\tau}\phi_{j_1}(\tau)d\tau ds$$

is the Fourier coefficient. Obviously that $C_{j_2j_1}=\tilde{C}_{j_2j_1}$.

Easy calculation demonstrates that

$$\tilde{\phi}_j(s)=\frac{\sqrt{2(s-t)}}{(T-t)J_{n+1}(\mu_j)}J_n\left(\frac{\mu_j}{T-t}(s-t)\right),\quad j=0,1,2,\ldots$$

is a complete orthonormal system of functions in the space $L_2([t,T])$.

Then, using Theorems 1, 2, we obtain

$$\int\limits_t^T \sqrt{s-t}\int\limits_t^s \sqrt{\tau-t}d\mathbf{f}_\tau^{(1)}d\mathbf{f}_s^{(2)} = \underset{p_1,p_2\to\infty}{\text{l.i.m.}} \sum_{j_1=0}^{p_1}\sum_{j_2=0}^{p_2} C_{j_2j_1}\tilde{\zeta}_{j_1}^{(1)}\tilde{\zeta}_{j_2}^{(2)},$$

where

$$\tilde{\zeta}_j^{(i)} = \int\limits_t^T \tilde{\phi}_j(\tau)d\mathbf{f}_\tau^{(i)}$$

are independent standard Gaussian random variables for various i or j $(i=1,2,\ \ j=0,1,2,\ldots)$,

$$\mathsf{M}\left\{\tilde{\zeta}_{j_1}^{(1)}\tilde{\zeta}_{j_2}^{(2)}\right\}=0,\quad C_{j_2j_1}=\int\limits_t^T\sqrt{s-t}\tilde{\phi}_{j_2}(s)\int\limits_t^s\sqrt{\tau-t}\tilde{\phi}_{j_1}(\tau)d\tau ds.$$

The Proof of Convergence with Probability 1 in the Method of Expansion of Iterated Itô Stochastic Integrals Based on Generalized Multiple Fourier Series

Dmitriy F. Kuznetsov

Peter the Great Saint-Petersburg Polytechnic University
e-mail: sde_kuznetsov@inbox.ru

Abstract. The article is devoted to the formulation and proof of the theorem on convergence with probability 1 of expansion of iterated Itô stochastic integrals of arbitrary multiplicity based on generalized multiple Fourier series converging in the sense of norm in Hilbert space. The cases of multiple Fourier–Legendre series and multiple trigonomertic Fourier series are considered in detail. The proof of the mentioned theorem is based on the general properties of multiple Fourier series as well as on the estimate for the fourth moment of approximation error in the method of expansion of iterated Itô stochastic integrals based on generalized multiple Fourier series.

Key words: Iterated Itô stochastic integral, generalized multiple Fourier series, multiple Fourier–Legendre series, multiple trigonometric Fourier series, Parseval equality, Legendre polynomials, convergence with probability 1, mean-square convergence, convergence in the mean of arbitrary degree, expansion, approximation.

1 Introduction

The beginning of an intensive study of the problem of mean-square approximation of iterated Itô and Stratonovich stochastic integrals in the context of the numerical solution of Itô stochastic differential equations dates back to the 1980s–1990s. To date, there are many publications on the mentioned problem [1]-[36] (also see bibliographic references in these works). There are various approaches to solving the problem of the mean-square approximation of iterated stochastic integrals. Among them, we note the approach based on the Karhunen–Loeve expansion of the Brownian bridge process [1]-[4], [13], [18], [21], approach based on the expansion of the Wiener process using various basis systems of functions [6], [10], [30], [31], approach based on the conditional joint characteristic function of a stochastic integral of multiplicity 2 [11], [12] as well as an approach based on multiple integral sums [1], [19].

The use of multiple and iterated generalized Fourier series by various complete orthonormal systems of functions in the space $L_2([t,T])$ for the expansion of iterated Itô and Stratonovich stochastic integrals was reflected in a number of author's works [7]-[9], [14]-[17], [20], [22]-[29], [35]. The mentioned results based on generalized multiple and iterated Fourier series are systematized in the monograph [36] (2022).

The idea of the method of expansion of iterated Itô stochastic integrals based on generalized multiple Fourier series is as follows: the iterated Itô stochastic integral of multiplicity k ($k \in \mathbb{N}$) is represented as a multiple stochastic integral from the certain discontinuous nonrandom function of k variables defined on the hypercube $[t,T]^k$, where $[t,T]$ is an interval of integration of the iterated Itô stochastic integral. Then, the indicated nonrandom function is expanded into the generalized multiple Fourier series converging in the sense of norm in the space $L_2([t,T]^k)$. After a number of nontrivial transformations we come [14] (2006) to the mean-square converging expansion of the iterated Itô stochastic integral into the multiple series of products of standard Gaussian random variables. The coefficients of this series are the coefficients of generalized multiple Fourier series for the mentioned nonrandom function of k variables, which can be calculated using the explicit formula regardless of multiplicity k of the iterated Itô stochastic integral.

In a lot of author's publications the convergence of the method of expansion of iterated Itô stochastic integrals based on generalized multiple Fourier series has been considered in different probabilistic meanings. For example, the mean-square convergence [14]-[17], [20], [22]-[29], [35], [36] and convergence in the mean of degree $2n$ ($n \in \mathbb{N}$) [15]-[17], [20], [22], [23], [36] have been proved. On the examples of specific iterated Itô stochastic integrals of mutiplicities 1 and 2 the convergence with probability 1 also has been considered [15]-[17], [20], [22], [23]. This article is devoted to the development of the method of expansion of iterated Itô stochastic integrals based on generalized multiple Fourier series. Namely, we formulate and prove the theorem on convergence with probability 1 of the mentioned method for an arbitrary multiplicity k ($k \in \mathbb{N}$) of the iterated Itô stochastic integrals. Moreover, the cases of multiple Fourier–Legendre series and multiple trigonometric Fourier series are considered in detail.

2 Method of Expansion of Iterated Itô Stochastic Integrals of Multiplicity k ($k \in \mathbb{N}$) Based on Generalized Multiple Fourier Series

Let $(\Omega,\ \mathrm{F},\ \mathsf{P})$ be a complete probability space, let $\{\mathrm{F}_t, t \in [0,T]\}$ be a non-decreasing right-continuous family of σ-algebras of F, and let $\mathbf{w}_t$ be a standard m-dimensional Wiener stochastic process, which is F_t-measurable for any $t \in [0,T]$. We assume that the components $\mathbf{w}_t^{(i)}$ ($i = 1, \ldots, m$) of this process are independent.

Let us consider an efficient method [14]-[17], [20], [22]-[29], [35], [36] of the expansion and mean-square approximation of iterated Itô stochastic integrals of the form

$$J[\psi^{(k)}]_{T,t} = \int\limits_t^T \psi_k(t_k) \ldots \int\limits_t^{t_2} \psi_1(t_1) d\mathbf{w}_{t_1}^{(i_1)} \ldots d\mathbf{w}_{t_k}^{(i_k)}, \tag{1}$$

where $0 \le t < T < \infty$, $\psi_l(\tau)$ ($l = 1, \ldots, k$) are nonrandom functions from the space $L_2([t,T])$, $\mathbf{w}_\tau^{(i)}$ ($i = 1, \ldots, m$) are independent standard Wiener processes and $\mathbf{w}_\tau^{(0)} = \tau$, $i_1, \ldots, i_k = 0, 1, \ldots, m$.

Suppose that $\{\phi_j(x)\}_{j=0}^{\infty}$ is a complete orthonormal system of functions in the space $L_2([t,T])$ and define the following function on the hypercube $[t,T]^k$

$$K(t_1, \ldots, t_k) = \begin{cases} \psi_1(t_1) \ldots \psi_k(t_k), & t_1 < \ldots < t_k \\ & \\ 0, & \text{otherwise} \end{cases}, \tag{2}$$

where $t_1,\ldots,t_k\in[t,T]$ $(k\ge 2)$ and $K(t_1)\equiv\psi_1(t_1)$ for $t_1\in[t,T]$.

The function $K(t_1,\ldots,t_k)$ belongs to the space $L_2([t,T]^k)$. At this situation it is well known that the generalized multiple Fourier series of $K(t_1,\ldots,t_k)\in L_2([t,T]^k)$ converges to $K(t_1,\ldots,t_k)$ on the hypercube $[t,T]^k$ in the mean-square sense, i.e.

$$\lim_{p_1,\ldots,p_k\to\infty}\left\|K(t_1,\ldots,t_k)-\sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k}C_{j_k\ldots j_1}\prod_{l=1}^{k}\phi_{j_l}(t_l)\right\|_{L_2([t,T]^k)}=0, \qquad (3)$$

where

$$C_{j_k\ldots j_1}=\int\limits_{[t,T]^k}K(t_1,\ldots,t_k)\prod_{l=1}^{k}\phi_{j_l}(t_l)dt_1\ldots dt_k \qquad (4)$$

is the Fourier coefficient and

$$\|f\|_{L_2([t,T]^k)}=\left(\int\limits_{[t,T]^k}f^2(t_1,\ldots,t_k)dt_1\ldots dt_k\right)^{1/2}.$$

Consider the discretization $\{\tau_j\}_{j=0}^{N}$ of $[t,T]$ such that

$$t=\tau_0<\ldots<\tau_N=T,\qquad \Delta_N=\max_{0\le j\le N-1}\Delta\tau_j\to 0\quad\text{if}\quad N\to\infty, \qquad (5)$$

where $\Delta\tau_j=\tau_{j+1}-\tau_j$.

Theorem 1 [14] (2006), [15]-[17], [20], [22]-[29], [35], [36]. *Suppose that every $\psi_l(\tau)$ $(l=1,\ldots,k)$ is a continuous nonrandom function on the interval $[t,T]$ and $\{\phi_j(x)\}_{j=0}^{\infty}$ is a complete orthonormal system of continuous functions in the space $L_2([t,T])$. Then*

$$J[\psi^{(k)}]_{T,t}=\underset{p_1,\ldots,p_k\to\infty}{\text{l.i.m.}}\ J[\psi^{(k)}]_{T,t}^{p_1,\ldots,p_k},$$

$$\mathsf{M}\left\{\left(J[\psi^{(k)}]_{T,t}-J[\psi^{(k)}]_{T,t}^{p_1,\ldots,p_k}\right)^2\right\}\le$$

$$\le k!\left(\int\limits_{[t,T]^k}K^2(t_1,\ldots,t_k)dt_1\ldots dt_k-\sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k}C_{j_k\ldots j_1}^2\right), \qquad (6)$$

where

$$J[\psi^{(k)}]_{T,t}^{p_1,\ldots,p_k}=\sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k}C_{j_k\ldots j_1}\Biggl(\prod_{l=1}^{k}\zeta_{j_l}^{(i_l)}-$$

$$-\underset{N\to\infty}{\text{l.i.m.}}\sum_{(l_1,\ldots,l_k)\in\mathrm{G}_k}\phi_{j_1}(\tau_{l_1})\Delta\mathbf{w}_{\tau_{l_1}}^{(i_1)}\ldots\phi_{j_k}(\tau_{l_k})\Delta\mathbf{w}_{\tau_{l_k}}^{(i_k)}\Biggr) \tag{7}$$

and

$$\mathrm{G}_k=\mathrm{H}_k\backslash\mathrm{L}_k,\quad \mathrm{H}_k=\{(l_1,\ldots,l_k):\ l_1,\ldots,l_k=0,\ 1,\ldots,N-1\},$$

$$\mathrm{L}_k=\{(l_1,\ldots,l_k):\ l_1,\ldots,l_k=0,\ 1,\ldots,N-1;\ l_g\neq l_r\ (g\neq r);\ g,r=1,\ldots,k\},$$

l.i.m. *is a limit in the mean-square sense,* $i_1,\ldots,i_k=0,1,\ldots,m,$

$$\zeta_j^{(i)}=\int\limits_t^T\phi_j(s)d\mathbf{w}_s^{(i)} \tag{8}$$

are independent standard Gaussian random variables for various i *or* j (*if* $i\neq 0$), $C_{j_k\ldots j_1}$ *is the Fourier coefficient* (4), $\Delta\mathbf{w}_{\tau_j}^{(i)}=\mathbf{w}_{\tau_{j+1}}^{(i)}-\mathbf{w}_{\tau_j}^{(i)}$ $(i=0,\ 1,\ldots,m)$, $\{\tau_j\}_{j=0}^{N}$ *is the discretization* (5), *the estimate* (6) *is valid for* $T-t\in(0,\infty)$ *and* $i_1,\ldots,i_k=1,\ldots,m$ *or* $T-t\in(0,1)$ *and* $i_1,\ldots,i_k=0,1,\ldots,m.$

Note that in [14]-[17], [20], [22], [23], [36] the version of Theorem 1 for systems of Haar and Rademacher–Walsh functions has been considered. Some modifications of Theorem 1 for another types of iterated stochastic integrals as well as for complete orthonormal with weight $r(t_1)\ldots r(t_k)\geq 0$ systems of functions in the space $L_2([t,T]^k)$ can be found in [14]-[17], [20], [22], [23], [36]. Application of Theorem 1 and Theorem 4 (see below) to the mean-square approximation of iterated stochastic integrals with respect to the infinite-dimensional Q-Wiener process is presented in [29], [36] (Chapter 7), [38], [39].

Obtain transformed particular cases of Theorem 1 for $k=1,\ldots,5$ [14]-[17], [20], [22]-[29], [35], [36]

$$J[\psi^{(1)}]_{T,t}=\underset{p_1\to\infty}{\text{l.i.m.}}\sum_{j_1=0}^{p_1}C_{j_1}\zeta_{j_1}^{(i_1)}, \tag{9}$$

$$J[\psi^{(2)}]_{T,t}=\underset{p_1,p_2\to\infty}{\text{l.i.m.}}\sum_{j_1=0}^{p_1}\sum_{j_2=0}^{p_2}C_{j_2j_1}\Biggl(\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}-\mathbf{1}_{\{i_1=i_2\neq 0\}}\mathbf{1}_{\{j_1=j_2\}}\Biggr), \tag{10}$$

$$+\mathbf{1}_{\{i_2=i_3\neq 0\}}\mathbf{1}_{\{j_2=j_3\}}\mathbf{1}_{\{i_4=i_5\neq 0\}}\mathbf{1}_{\{j_4=j_5\}}\zeta_{j_1}^{(i_1)}+\mathbf{1}_{\{i_2=i_4\neq 0\}}\mathbf{1}_{\{j_2=j_4\}}\mathbf{1}_{\{i_3=i_5\neq 0\}}\mathbf{1}_{\{j_3=j_5\}}\zeta_{j_1}^{(i_1)}+$$

$$\left.+\mathbf{1}_{\{i_2=i_5\neq 0\}}\mathbf{1}_{\{j_2=j_5\}}\mathbf{1}_{\{i_3=i_4\neq 0\}}\mathbf{1}_{\{j_3=j_4\}}\zeta_{j_1}^{(i_1)}\right), \qquad (13)$$

where $\mathbf{1}_A$ is the indicator of the set A.

Let us consider the generalization of the formulas (9)–(13) for the case of an arbitrary k ($k\in\mathbb{N}$).

Theorem 2 [16] (2009), [17], [20], [22], [23], [29], [36]. *Under the conditions of Theorem* 1 *the following expansion*

$$J[\psi^{(k)}]_{T,t}^{(i_1\ldots i_k)}=\underset{p_1,\ldots,p_k\to\infty}{\text{l.i.m.}}\sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k}C_{j_k\ldots j_1}\left(\prod_{l=1}^{k}\zeta_{j_l}^{(i_l)}+\sum_{r=1}^{[k/2]}(-1)^r\times\right.$$

$$\left.\times\sum_{\substack{(\{\{g_1,g_2\},\ldots,\{g_{2r-1},g_{2r}\}\},\{q_1,\ldots,q_{k-2r}\})\\ \{g_1,g_2,\ldots,g_{2r-1},g_{2r},q_1,\ldots,q_{k-2r}\}=\{1,2,\ldots,k\}}}\prod_{s=1}^{r}\mathbf{1}_{\{i_{g_{2s-1}}=~i_{g_{2s}}\neq 0\}}\mathbf{1}_{\{j_{g_{2s-1}}=~j_{g_{2s}}\}}\prod_{l=1}^{k-2r}\zeta_{j_{q_l}}^{(i_{q_l})}\right) \qquad (14)$$

converging in the mean-square sense is valid, where $[\cdot]$ *is an integer part of a real number,*

$$\sum_{\substack{(\{\{g_1,g_2\},\ldots,\{g_{2r-1},g_{2r}\}\},\{q_1,\ldots,q_{k-2r}\})\\ \{g_1,g_2,\ldots,g_{2r-1},g_{2r},q_1,\ldots,q_{k-2r}\}=\{1,2,\ldots,k\}}}$$

means the sum with respect to all possible permutations of the set

$$(\{\{g_1,g_2\},\ldots,\{g_{2r-1},g_{2r}\}\},\{q_1,\ldots,q_{k-2r}\}),$$

where $\{g_1,g_2,\ldots,g_{2r-1},g_{2r},q_1,\ldots,q_{k-2r}\}=\{1,2,\ldots,k\}$, *braces mean an unordered set, and parentheses mean an ordered set*; *another notations are the same as in Theorem* 1.

For further consideration, we need the following statement.

Theorem 3 [15] (2007), [16], [17], [20], [22], [23], [36]. *Under the conditions of Theorem* 1 *the following estimate*

$$
\mathsf{M}\left\{\left(J[\psi^{(k)}]_{T,t}-J[\psi^{(k)}]_{T,t}^{p_1,\ldots,p_k}\right)^{2n}\right\}\le
$$

$$
\le (k!)^{2n}(n(2n-1))^{n(k-1)}(2n-1)!!\ \times
$$

$$
\times\ \left(\ \int\limits_{[t,T]^k} K^2(t_1,\ldots,t_k)dt_1\ldots dt_k-\sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k}C_{j_k\ldots j_1}^2\right)^n \tag{15}
$$

is valid, where $n\in\mathbb{N}$; *another notations are the same as in Theorem* 1.

Since according to the Parseval's equality

$$
\int\limits_{[t,T]^k} K^2(t_1,\ldots,t_k)dt_1\ldots dt_k-\sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k}C_{j_k\ldots j_1}^2\ \to\ 0
$$

if $p_1,\ldots,p_k\to\infty$, then the inequality (15) means that the expansions of iterated Itô stochastic integrals in Theorem 1 converge in the mean of degree $2n$ ($n\in\mathbb{N}$).

Let us consider the generalization of Theorems 1–3 for the case of an arbitrary complete orthonormal systems of functions in the space $L_2([t,T])$ and $\psi_1(\tau),\ldots,\psi_k(\tau)\in L_2([t,T])$.

Theorem 4 [36] (Sect. 1.11), [37] (Sect. 15). *Suppose that* $\psi_1(\tau),\ \ldots,$ $\psi_k(\tau)\in L_2([t,T])$ *and* $\{\phi_j(x)\}_{j=0}^{\infty}$ *is an arbitrary complete orthonormal system of functions in the space* $L_2([t,T])$. *Then*

$$
J[\psi^{(k)}]_{T,t}=\underset{p_1,\ldots,p_k\to\infty}{\text{l.i.m.}}\ J[\psi^{(k)}]_{T,t}^{p_1,\ldots,p_k}, \tag{16}
$$

$$
\mathsf{M}\left\{\left(J[\psi^{(k)}]_{T,t}-J[\psi^{(k)}]_{T,t}^{p_1,\ldots,p_k}\right)^{2}\right\}\le
$$

$$
\le k!\left(\ \int\limits_{[t,T]^k} K^2(t_1,\ldots,t_k)dt_1\ldots dt_k-\sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k}C_{j_k\ldots j_1}^2\right),
$$

$$\mathsf{M}\left\{\left(J[\psi^{(k)}]_{T,t}-J[\psi^{(k)}]_{T,t}^{p_1,\ldots,p_k}\right)^{2n}\right\}\le$$

$$\le (k!)^{2n}(n(2n-1))^{n(k-1)}(2n-1)!!\times$$

$$\times\left(\int\limits_{[t,T]^k}K^2(t_1,\ldots,t_k)dt_1\ldots dt_k-\sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k}C_{j_k\ldots j_1}^2\right)^n,$$

where $n\in\mathbb{N}$,

$$J[\psi^{(k)}]_{T,t}^{p_1,\ldots,p_k}=\sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k}C_{j_k\ldots j_1}\left(\prod_{l=1}^{k}\zeta_{j_l}^{(i_l)}+\sum_{r=1}^{[k/2]}(-1)^r\times\right.$$

$$\times\left.\sum_{\substack{(\{\{g_1,g_2\},\ldots,\{g_{2r-1},g_{2r}\}\},\{q_1,\ldots,q_{k-2r}\})\\ \{g_1,g_2,\ldots,g_{2r-1},g_{2r},q_1,\ldots,q_{k-2r}\}=\{1,2,\ldots,k\}}}\prod_{s=1}^{r}\mathbf{1}_{\{i_{g_{2s-1}}=~i_{g_{2s}}\ne 0\}}\mathbf{1}_{\{j_{g_{2s-1}}=~j_{g_{2s}}\}}\prod_{l=1}^{k-2r}\zeta_{j_{q_l}}^{(i_{q_l})}\right),\quad(17)$$

where $[x]$ *is an integer part of a real number* x; *another notations are the same as in Theorems* 1–3*.*

It should be noted that an analogue of the expansion (16) under the conditions of Theorem 4 was considered in [40]. Note that we use another notations [36] (Sect. 1.11), [37] (Sect. 15) in comparison with [40]. Moreover, the proof of an analogue of (16) from [40] is somewhat different from the proof given in [36] (Sect. 1.11), [37] (Sect. 15).

Also note the following theorem.

Theorem 5 [36] (Sect. 1.12), [41] (Sect. 6). *Suppose that* $\{\phi_j(x)\}_{j=0}^{\infty}$ *is an arbitrary complete orthonormal system of functions in the space* $L_2([t,T])$ *and* $\psi_1(\tau),\ldots,\psi_k(\tau)\in L_2([t,T])$, $i_1,\ldots,i_k=1,\ldots,m$. *Then*

$$\mathsf{M}\left\{\left(J[\psi^{(k)}]_{T,t}-J[\psi^{(k)}]_{T,t}^{p,\ldots,p}\right)^{2}\right\}=\int\limits_{[t,T]^k}K^2(t_1,\ldots,t_k)dt_1\ldots dt_k-$$

$$-\sum_{j_1,\ldots,j_k=0}^{p} C_{j_k\ldots j_1}\mathsf{M}\left\{J[\psi^{(k)}]_{T,t}\sum_{(j_1,\ldots,j_k)}\int\limits_t^T \phi_{j_k}(t_k)\ldots\int\limits_t^{t_2}\phi_{j_1}(t_1)d\mathbf{w}_{t_1}^{(i_1)}\ldots d\mathbf{w}_{t_k}^{(i_k)}\right\},$$

where $i_1,\ldots,i_k=1,\ldots,m$; *the value* $J[\psi^{(k)}]_{T,t}^{p,\ldots,p}$ *is defined by* (17) ($p_1=\ldots=p_k=p$); *the expression*

$$\sum_{(j_1,\ldots,j_k)}$$

means the sum with respect to all possible permutations $(j_1,\ldots,j_k)$. *At the same time if* j_r *swapped with* j_q *in the permutation* $(j_1,\ldots,j_k)$, *then* i_r *swapped with* i_q *in the permutation* $(i_1,\ldots,i_k)$; *another notations are the same as in Theorems* 1, 2.

Let us consider the following iterated Itô stochastic integrals from the Taylor–Itô expansion [3]

$$J_{(\lambda_1\ldots\lambda_k)T,t}^{(i_1\ldots i_k)}=\int\limits_t^T\ldots\int\limits_t^{t_2}d\mathbf{w}_{t_1}^{(i_1)}\ldots d\mathbf{w}_{t_k}^{(i_k)},\tag{18}$$

where $i_1,\ldots,i_k=0,1,\ldots,m$, $\lambda_l=1$ if $i_l=1,\ldots,m$ and $\lambda_l=0$ if $i_l=0$ $(l=1,\ldots,k)$. Remind that $\mathbf{w}_\tau^{(i)}$, $i=1,\ldots,m$ are independent standard Wiener processes and $\mathbf{w}_\tau^{(0)}=\tau$.

For example, using Theorems 1, 4 (see (9)-(11)) and complete orthonormal system of Legendre polynomials in the space $L_2([t,T])$ we obtain the following approximations of the iterated Itô stochastic integrals (18) [14]-[17], [20], [22]-[29], [35], [36] (also see early publications [8], [9])

$$J_{(1)T,t}^{(i_1)}=\sqrt{T-t}\zeta_0^{(i_1)},\tag{19}$$

$$J_{(01)T,t}^{(0i_1)}=\frac{(T-t)^{3/2}}{2}\left(\zeta_0^{(i_1)}+\frac{1}{\sqrt{3}}\zeta_1^{(i_1)}\right),\tag{20}$$

$$J_{(10)T,t}^{(i_10)}=\frac{(T-t)^{3/2}}{2}\left(\zeta_0^{(i_1)}-\frac{1}{\sqrt{3}}\zeta_1^{(i_1)}\right),\tag{21}$$

$$J_{(11)T,t}^{(i_1i_2)q}=\frac{T-t}{2}\left(\zeta_0^{(i_1)}\zeta_0^{(i_2)}+\sum_{i=1}^{q}\frac{1}{\sqrt{4i^2-1}}\left(\zeta_{i-1}^{(i_1)}\zeta_i^{(i_2)}-\zeta_i^{(i_1)}\zeta_{i-1}^{(i_2)}\right)-\mathbf{1}_{\{i_1=i_2\}}\right),\tag{22}$$

$$J_{(11)T,t}^{(i_1 i_1)} = \frac{1}{2}(T-t)\left(\left(\zeta_0^{(i_1)}\right)^2 - 1\right),$$

$$J_{(111)T,t}^{(i_1 i_2 i_3)p} = \sum_{j_1,j_2,j_3=0}^{p} C_{j_3 j_2 j_1}\Biggl(\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}\zeta_{j_3}^{(i_3)} - \mathbf{1}_{\{i_1=i_2\}}\mathbf{1}_{\{j_1=j_2\}}\zeta_{j_3}^{(i_3)} -$$

$$-\mathbf{1}_{\{i_2=i_3\}}\mathbf{1}_{\{j_2=j_3\}}\zeta_{j_1}^{(i_1)} - \mathbf{1}_{\{i_1=i_3\}}\mathbf{1}_{\{j_1=j_3\}}\zeta_{j_2}^{(i_2)}\Biggr), \qquad (23)$$

$$J_{(111)T,t}^{(i_1 i_1 i_1)} = \frac{1}{6}(T-t)^{3/2}\left(\left(\zeta_0^{(i_1)}\right)^3 - 3\zeta_0^{(i_1)}\right),$$

where

$$C_{j_3 j_2 j_1} = \frac{\sqrt{(2j_1+1)(2j_2+1)(2j_3+1)}(T-t)^{3/2}}{8}\bar{C}_{j_3 j_2 j_1},$$

$$\bar{C}_{j_3 j_2 j_1} = \int\limits_{-1}^{1} P_{j_3}(z)\int\limits_{-1}^{z} P_{j_2}(y)\int\limits_{-1}^{y} P_{j_1}(x)dxdydz,$$

where the Gaussian random variable $\zeta_j^{(i)}$ (if $i \ne 0$) is defined by (8) and $P_j(x)$ ($j = 0, 1, 2, \ldots$) is the Legendre polynomial [42].

Note that formula (22) has been obtained for the first time in [8] (1997). For pairwise different $i_1, i_2, i_3 = 1, \ldots, m$ we have [8], [9], [14]-[17], [20], [22]-[29], [35]

$$\mathsf{M}\left\{\left(J_{(11)T,t}^{(i_1 i_2)} - J_{(11)T,t}^{(i_1 i_2)q}\right)^2\right\} = \frac{(T-t)^2}{2}\left(\frac{1}{2} - \sum_{i=1}^{q}\frac{1}{4i^2-1}\right), \qquad (24)$$

$$\mathsf{M}\left\{\left(J_{(111)T,t}^{(i_1 i_2 i_3)} - J_{(111)T,t}^{(i_1 i_2 i_3)p}\right)^2\right\} = \frac{(T-t)^3}{6} - \sum_{j_1,j_2,j_3=0}^{p} C_{j_3 j_2 j_1}^2. \qquad (25)$$

The problem of the exact calculation of the mean-square error of approximation in Theorems 1, 4 is solved completely for an arbitrary k ($k \in \mathbb{N}$) and any possible combinations of the numbers $i_1, \ldots, i_k = 1, \ldots, m$ in Theorem 5 (also see [23], [36], [41]).

3 Convergence With Probability 1 of Expansions of Iterated Itô Stochastic Integrals of Multiplicity k $(k \in \mathbb{N})$ in Theorems 1, 2

Let us address now to the convergence with probability 1 (w. p. 1) in Theorem 1. As we mentioned above this question has been studied for simplest iterated Itô stochastic integrals of multiplicities 1 and 2 in [15]-[17], [20], [22], [23], [36].

In this section, we formulate and prove the general result on convergence w. p. 1 of expansions of iterated Itô stochastic integrals in Theorems 1, 2 for the case of multiplicity k $(k \in \mathbb{N})$ for these integrals.

Theorem 6. *Let $\psi_l(\tau)$ $(l = 1, \ldots, k)$ are continuously differentiable nonrandom functions on the interval $[t, T]$ and $\{\phi_j(x)\}_{j=0}^{\infty}$ is a complete orthonormal system of Legendre polynomials or trigonometric functions in the space $L_2([t, T])$. Then $J[\psi^{(k)}]_{T,t}^{p,\ldots,p} \to J[\psi^{(k)}]_{T,t}$ if $p \to \infty$ w. p. 1, where $J[\psi^{(k)}]_{T,t}^{p,\ldots,p}$ is defined as the right-hand side of (14) before passing to the limit for the case $p_1 = \ldots = p_k = p$, i.e. (see Theorem 2)*

$$J[\psi^{(k)}]_{T,t}^{p,\ldots,p} = \sum_{j_1,\ldots,j_k=0}^{p} C_{j_k\ldots j_1}\left(\prod_{l=1}^{k}\zeta_{j_l}^{(i_l)} + \sum_{r=1}^{[k/2]}(-1)^r \times\right.$$

$$\left. \times \sum_{\substack{(\{\{g_1,g_2\},\ldots,\{g_{2r-1},g_{2r}\}\},\{q_1,\ldots,q_{k-2r}\}) \\ \{g_1,g_2,\ldots,g_{2r-1},g_{2r},q_1,\ldots,q_{k-2r}\}=\{1,2,\ldots,k\}}} \prod_{s=1}^{r} \mathbf{1}_{\{i_{g_{2s-1}} = i_{g_{2s}} \ne 0\}} \mathbf{1}_{\{j_{g_{2s-1}} = j_{g_{2s}}\}} \prod_{l=1}^{k-2r} \zeta_{j_{q_l}}^{(i_{q_l})}\right),$$

where $i_1, \ldots, i_k = 1, \ldots, m$, another notations are the same as in Theorems 1, 2.

Proof. Let us consider the Parseval equality

$$\int\limits_{[t,T]^k} K^2(t_1, \ldots, t_k)dt_1 \ldots dt_k = \lim_{p_1,\ldots,p_k\to\infty} \sum_{j_1=0}^{p_1} \ldots \sum_{j_k=0}^{p_k} C_{j_k\ldots j_1}^2, \qquad (26)$$

where

$$K(t_1, \ldots, t_k) = \begin{cases} \psi_1(t_1) \ldots \psi_k(t_k), & t_1 < \ldots < t_k \\ \\ 0, & \text{otherwise} \end{cases},$$

where $t_1,\ldots,t_k\in[t,T]$ $(k\ge 2)$ and $K(t_1)\equiv\psi_1(t_1)$ for $t_1\in[t,T]$,

$$C_{j_k\ldots j_1}=\int\limits_{[t,T]^k}K(t_1,\ldots,t_k)\prod_{l=1}^{k}\phi_{j_l}(t_l)dt_1\ldots dt_k$$

is the Fourier coefficient.

Taking into account the definitions of $K(t_1,\ldots,t_k)$ and $C_{j_k\ldots j_1}$, we obtain

$$C_{j_k\ldots j_1}=\int\limits_{t}^{T}\phi_{j_k}(t_k)\psi_k(t_k)\ldots\int\limits_{t}^{t_2}\phi_{j_1}(t_1)\psi_1(t_1)dt_1\ldots dt_k. \tag{27}$$

Further, we denote

$$\lim_{p_1,\ldots,p_k\to\infty}\sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k}C^2_{j_k\ldots j_1}\stackrel{\mathrm{def}}{=}\sum_{j_1,\ldots,j_k=0}^{\infty}C^2_{j_k\ldots j_1}.$$

If $p_1=\ldots=p_k=p$, then we also write

$$\lim_{p\to\infty}\sum_{j_1=0}^{p}\ldots\sum_{j_k=0}^{p}C^2_{j_k\ldots j_1}\stackrel{\mathrm{def}}{=}\sum_{j_1,\ldots,j_k=0}^{\infty}C^2_{j_k\ldots j_1}.$$

From the other hand, for iterated limits we write

$$\lim_{p_1\to\infty}\ldots\lim_{p_k\to\infty}\sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k}C^2_{j_k\ldots j_1}\stackrel{\mathrm{def}}{=}\sum_{j_1=0}^{\infty}\ldots\sum_{j_k=0}^{\infty}C^2_{j_k\ldots j_1},$$

$$\lim_{p_1\to\infty}\lim_{p_2,\ldots,p_k\to\infty}\sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k}C^2_{j_k\ldots j_1}\stackrel{\mathrm{def}}{=}\sum_{j_1=0}^{\infty}\sum_{j_2,\ldots,j_k=0}^{\infty}C^2_{j_k\ldots j_1}$$

and so on.

Using the Parseval equality and Lemma 2 (see Appendix) we obtain

$$\int\limits_{[t,T]^k}K^2(t_1,\ldots,t_k)dt_1\ldots dt_k-\sum_{j_1=0}^{p}\ldots\sum_{j_k=0}^{p}C^2_{j_k\ldots j_1}=$$

$$=\sum_{j_1,\ldots,j_k=0}^{\infty}C^2_{j_k\ldots j_1}-\sum_{j_1=0}^{p}\ldots\sum_{j_k=0}^{p}C^2_{j_k\ldots j_1}=$$

$$= \sum_{j_1=0}^{\infty} \ldots \sum_{j_k=0}^{\infty} C_{j_k\ldots j_1}^2 - \sum_{j_1=0}^{p} \ldots \sum_{j_k=0}^{p} C_{j_k\ldots j_1}^2 =$$

$$= \sum_{j_1=0}^{p} \sum_{j_2=0}^{\infty} \ldots \sum_{j_k=0}^{\infty} C_{j_k\ldots j_1}^2 + \sum_{j_1=p+1}^{\infty} \sum_{j_2=0}^{\infty} \ldots \sum_{j_k=0}^{\infty} C_{j_k\ldots j_1}^2 - \sum_{j_1=0}^{p} \ldots \sum_{j_k=0}^{p} C_{j_k\ldots j_1}^2 =$$

$$= \sum_{j_1=0}^{p} \sum_{j_2=0}^{p} \sum_{j_3=0}^{\infty} \ldots \sum_{j_k=0}^{\infty} C_{j_k\ldots j_1}^2 + \sum_{j_1=0}^{p} \sum_{j_2=p+1}^{\infty} \sum_{j_3=0}^{\infty} \ldots \sum_{j_k=0}^{\infty} +$$

$$+ \sum_{j_1=p+1}^{\infty} \sum_{j_2=0}^{\infty} \ldots \sum_{j_k=0}^{\infty} C_{j_k\ldots j_1}^2 - \sum_{j_1=0}^{p} \ldots \sum_{j_k=0}^{p} C_{j_k\ldots j_1}^2 =$$

$$= \ldots =$$

$$= \sum_{j_1=p+1}^{\infty} \sum_{j_2=0}^{\infty} \ldots \sum_{j_k=0}^{\infty} C_{j_k\ldots j_1}^2 + \sum_{j_1=0}^{p} \sum_{j_2=p+1}^{\infty} \sum_{j_2=0}^{\infty} \ldots \sum_{j_k=0}^{\infty} C_{j_k\ldots j_1}^2 +$$

$$+ \sum_{j_1=0}^{p} \sum_{j_2=0}^{p} \sum_{j_3=p+1}^{\infty} \sum_{j_4=0}^{\infty} \ldots \sum_{j_k=0}^{\infty} C_{j_k\ldots j_1}^2 + \ldots + \sum_{j_1=0}^{p} \ldots \sum_{j_{k-1}=0}^{p} \sum_{j_k=p+1}^{\infty} C_{j_k\ldots j_1}^2 \leq$$

$$\leq \sum_{j_1=p+1}^{\infty} \sum_{j_2=0}^{\infty} \ldots \sum_{j_k=0}^{\infty} C_{j_k\ldots j_1}^2 + \sum_{j_1=0}^{\infty} \sum_{j_2=p+1}^{\infty} \sum_{j_2=0}^{\infty} \ldots \sum_{j_k=0}^{\infty} C_{j_k\ldots j_1}^2 +$$

$$+ \sum_{j_1=0}^{\infty} \sum_{j_2=0}^{\infty} \sum_{j_3=p+1}^{\infty} \sum_{j_4=0}^{\infty} \ldots \sum_{j_k=0}^{\infty} C_{j_k\ldots j_1}^2 + \ldots + \sum_{j_1=0}^{\infty} \ldots \sum_{j_{k-1}=0}^{\infty} \sum_{j_k=p+1}^{\infty} C_{j_k\ldots j_1}^2 =$$

$$= \sum_{s=1}^{k} \left(\sum_{j_1=0}^{\infty} \ldots \sum_{j_{s-1}=0}^{\infty} \sum_{j_s=p+1}^{\infty} \sum_{j_{s+1}=0}^{\infty} \ldots \sum_{j_k=0}^{\infty} C_{j_k\ldots j_1}^2 \right). \qquad (28)$$

Note that deriving (28) we use the following

$$\sum_{j_1=0}^{p} \ldots \sum_{j_{s-1}=0}^{p} \sum_{j_s=p+1}^{\infty} \sum_{j_{s+1}=0}^{\infty} \ldots \sum_{j_k=0}^{\infty} C_{j_k\ldots j_1}^2 \leq$$

$$\leq \sum_{j_1=0}^{m_1} \ldots \sum_{j_{s-1}=0}^{m_{s-1}} \sum_{j_s=p+1}^{\infty} \sum_{j_{s+1}=0}^{\infty} \ldots \sum_{j_k=0}^{\infty} C_{j_k\ldots j_1}^2 \leq$$

$$\leq \lim_{m_{s-1}\to\infty} \sum_{j_1=0}^{m_1} \ldots \sum_{j_{s-1}=0}^{m_{s-1}} \sum_{j_s=p+1}^{\infty} \sum_{j_{s+1}=0}^{\infty} \ldots \sum_{j_k=0}^{\infty} C_{j_k\ldots j_1}^2 =$$

$$
=\sum_{j_1=0}^{m_1}\ldots\sum_{j_{s-2}=0}^{m_{s-2}}\sum_{j_{s-1}=0}^{\infty}\sum_{j_s=p+1}^{\infty}\sum_{j_{s+1}=0}^{\infty}\ldots\sum_{j_k=0}^{\infty}C_{j_k\ldots j_1}^2\le\ldots\le
$$

$$
\le\sum_{j_1=0}^{\infty}\ldots\sum_{j_{s-1}=0}^{\infty}\sum_{j_s=p+1}^{\infty}\sum_{j_{s+1}=0}^{\infty}\ldots\sum_{j_k=0}^{\infty}C_{j_k\ldots j_1}^2,
$$

where $m_1,\ldots,m_{s-1}>p$.

Denote

$$
C_{j_s\ldots j_1}(\tau)=\int\limits_t^{\tau}\phi_{j_s}(t_s)\psi_s(t_s)\ldots\int\limits_t^{t_2}\phi_{j_1}(t_1)\psi_1(t_1)dt_1\ldots dt_s,
$$

where $s=1,\ldots,k-1$.

For $s<k$ due to Lemma 3, Dini Theorem (see Appendix) and Parseval equality we obtain

$$
\sum_{j_1=0}^{\infty}\ldots\sum_{j_{s-1}=0}^{\infty}\sum_{j_s=p+1}^{\infty}\sum_{j_{s+1}=0}^{\infty}\ldots\sum_{j_k=0}^{\infty}C_{j_k\ldots j_1}^2=
$$

$$
=\sum_{j_s=p+1}^{\infty}\sum_{j_{s-1}=0}^{\infty}\ldots\sum_{j_1=0}^{\infty}\sum_{j_{s+1}=0}^{\infty}\ldots\sum_{j_k=0}^{\infty}C_{j_k\ldots j_1}^2=
$$

$$
=\sum_{j_s=p+1}^{\infty}\sum_{j_{s-1}=0}^{\infty}\ldots\sum_{j_1=0}^{\infty}\sum_{j_{s+1}=0}^{\infty}\ldots\sum_{j_{k-1}=0}^{\infty}\int\limits_t^T\psi_k^2(t_k)\left(C_{j_{k-1}\ldots j_1}(t_k)\right)^2dt_k=
$$

$$
=\sum_{j_s=p+1}^{\infty}\sum_{j_{s-1}=0}^{\infty}\ldots\sum_{j_1=0}^{\infty}\sum_{j_{s+1}=0}^{\infty}\ldots\sum_{j_{k-2}=0}^{\infty}\int\limits_t^T\psi_k^2(t_k)\sum_{j_{k-1}=0}^{\infty}\left(C_{j_{k-1}\ldots j_1}(t_k)\right)^2dt_k=
$$

$$
=\sum_{j_s=p+1}^{\infty}\sum_{j_{s-1}=0}^{\infty}\ldots\sum_{j_1=0}^{\infty}\sum_{j_{s+1}=0}^{\infty}\ldots\sum_{j_{k-2}=0}^{\infty}\int\limits_t^T\psi_k^2(t_k)\int\limits_t^{t_k}\psi_{k-1}^2(\tau)\left(C_{j_{k-2}\ldots j_1}(\tau)\right)^2d\tau dt_k\le
$$

$$
\le M\sum_{j_s=p+1}^{\infty}\sum_{j_{s-1}=0}^{\infty}\ldots\sum_{j_1=0}^{\infty}\sum_{j_{s+1}=0}^{\infty}\ldots\sum_{j_{k-2}=0}^{\infty}\int\limits_t^T\left(C_{j_{k-2}\ldots j_1}(\tau)\right)^2d\tau=
$$

$$
=M\sum_{j_s=p+1}^{\infty}\sum_{j_{s-1}=0}^{\infty}\ldots\sum_{j_1=0}^{\infty}\sum_{j_{s+1}=0}^{\infty}\ldots\sum_{j_{k-3}=0}^{\infty}\int\limits_t^T\sum_{j_{k-2}=0}^{\infty}\left(C_{j_{k-2}\ldots j_1}(\tau)\right)^2d\tau=
$$

$$= M \sum_{j_s=p+1}^{\infty} \sum_{j_{s-1}=0}^{\infty} \ldots \sum_{j_1=0}^{\infty} \sum_{j_{s+1}=0}^{\infty} \ldots \sum_{j_{k-3}=0}^{\infty} \int_t^T \int_t^{\tau} \psi_{k-2}^2(\theta) \left(C_{j_{k-3}\ldots j_1}(\theta)\right)^2 d\theta d\tau \le$$

$$\le M' \sum_{j_s=p+1}^{\infty} \sum_{j_{s-1}=0}^{\infty} \ldots \sum_{j_1=0}^{\infty} \sum_{j_{s+1}=0}^{\infty} \ldots \sum_{j_{k-3}=0}^{\infty} \int_t^T \left(C_{j_{k-3}\ldots j_1}(\tau)\right)^2 d\tau \le \ldots \le$$

$$\le M_k \sum_{j_s=p+1}^{\infty} \sum_{j_{s-1}=0}^{\infty} \ldots \sum_{j_1=0}^{\infty} \int_t^T \left(C_{j_s\ldots j_1}(\tau)\right)^2 d\tau =$$

$$= M_k \sum_{j_s=p+1}^{\infty} \sum_{j_{s-1}=0}^{\infty} \ldots \sum_{j_2=0}^{\infty} \int_t^T \sum_{j_1=0}^{\infty} \left(C_{j_s\ldots j_1}(\tau)\right)^2 d\tau, \qquad (29)$$

where constants M, M' depend on $T-t$ and constant M_k depends on $T-t$ and k.

Let us explane more precisely how we obtain (29). For any function $g(s) \in L_2([t,T])$ we have the following Parseval equality

$$\sum_{j=0}^{\infty} \left(\int_t^{\tau} \phi_j(s) g(s) ds\right)^2 = \sum_{j=0}^{\infty} \left(\int_t^{T} \mathbf{1}_{\{s<\tau\}} \phi_j(s) g(s) ds\right)^2 =$$

$$= \int_t^T \left(\mathbf{1}_{\{s<\tau\}}\right)^2 g^2(s) ds = \int_t^{\tau} g^2(s) ds. \qquad (30)$$

Equality (30) has been applied repeatedly when we obtaining (29).

Using the replacement of integration order for Riemann integrals, we have

$$C_{j_s\ldots j_1}(\tau) = \int_t^{\tau} \phi_{j_s}(t_s)\psi_s(t_s) \ldots \int_t^{t_2} \phi_{j_1}(t_1)\psi_1(t_1) dt_1 \ldots dt_s =$$

$$= \int_t^{\tau} \phi_{j_1}(t_1)\psi_1(t_1) \int_{t_1}^{\tau} \phi_{j_2}(t_2)\psi_2(t_2) \ldots \int_{t_{s-1}}^{\tau} \phi_{j_s}(t_s)\psi_s(t_s) dt_s \ldots dt_2 dt_1.$$

For $l = 1, \ldots, s$ we will use the following notation

$$\tilde{C}_{j_s\ldots j_l}(\tau,\theta)=$$

$$=\int\limits_{\theta}^{\tau}\phi_{j_l}(t_l)\psi_l(t_l)\int\limits_{t_l}^{\tau}\phi_{j_{l+1}}(t_{l+1})\psi_{l+1}(t_{l+1})\ldots\int\limits_{t_{s-1}}^{\tau}\phi_{j_s}(t_s)\psi_s(t_s)dt_s\ldots dt_{l+1}dt_l.$$

Using the Parseval equality and Dini Theorem (see Appendix), from (29) we obtain

$$\sum_{j_1=0}^{\infty}\ldots\sum_{j_{s-1}=0}^{\infty}\sum_{j_s=p+1}^{\infty}\sum_{j_{s+1}=0}^{\infty}\ldots\sum_{j_k=0}^{\infty}C^2_{j_k\ldots j_1}\le$$

$$\le M_k\sum_{j_s=p+1}^{\infty}\sum_{j_{s-1}=0}^{\infty}\ldots\sum_{j_2=0}^{\infty}\int\limits_t^T\sum_{j_1=0}^{\infty}\left(C_{j_s\ldots j_1}(\tau)\right)^2d\tau=$$

$$=M_k\sum_{j_s=p+1}^{\infty}\sum_{j_{s-1}=0}^{\infty}\ldots\sum_{j_2=0}^{\infty}\int\limits_t^T\int\limits_t^{\tau}\psi_1^2(t_1)\left(\tilde{C}_{j_s\ldots j_2}(\tau,t_1)\right)^2dt_1d\tau= \qquad (31)$$

$$=M_k\sum_{j_s=p+1}^{\infty}\sum_{j_{s-1}=0}^{\infty}\ldots\sum_{j_3=0}^{\infty}\int\limits_t^T\int\limits_t^{\tau}\psi_1^2(t_1)\sum_{j_2=0}^{\infty}\left(\tilde{C}_{j_s\ldots j_2}(\tau,t_1)\right)^2dt_1d\tau= \qquad (32)$$

$$=M_k\sum_{j_s=p+1}^{\infty}\sum_{j_{s-1}=0}^{\infty}\ldots\sum_{j_3=0}^{\infty}\int\limits_t^T\int\limits_t^{\tau}\psi_1^2(t_1)\int\limits_{t_1}^{\tau}\psi_2^2(t_2)\left(\tilde{C}_{j_s\ldots j_3}(\tau,t_2)\right)^2dt_2dt_1d\tau\le$$

$$\le M_k\sum_{j_s=p+1}^{\infty}\sum_{j_{s-1}=0}^{\infty}\ldots\sum_{j_3=0}^{\infty}\int\limits_t^T\int\limits_t^{\tau}\psi_1^2(t_1)\int\limits_{t}^{\tau}\psi_2^2(t_2)\left(\tilde{C}_{j_s\ldots j_3}(\tau,t_2)\right)^2dt_2dt_1d\tau\le$$

$$\le M_k^{'}\sum_{j_s=p+1}^{\infty}\sum_{j_{s-1}=0}^{\infty}\ldots\sum_{j_3=0}^{\infty}\int\limits_t^T\int\limits_t^{\tau}\psi_2^2(t_2)\left(\tilde{C}_{j_s\ldots j_3}(\tau,t_2)\right)^2dt_2d\tau\le\ldots\le$$

$$\le M_k^{''}\sum_{j_s=p+1}^{\infty}\int\limits_t^T\int\limits_t^{\tau}\psi_{s-1}^2(t_{s-1})\left(\tilde{C}_{j_s}(\tau,t_{s-1})\right)^2dt_{s-1}d\tau\le$$

$$\le\tilde{M}_k\sum_{j_s=p+1}^{\infty}\int\limits_t^T\int\limits_t^{\tau}\left(\int\limits_u^{\tau}\phi_{j_s}(\theta)\psi_s(\theta)d\theta\right)^2dud\tau, \qquad (33)$$

where constants $M_k^{'}$, $M_k^{''}$, and $\tilde{M}_k$ depend on k and $T-t$.

Let us explane more precisely how we obtain (33). For any function $g(s) \in L_2([t,T])$ we have the following Parseval equality

$$\sum_{j=0}^{\infty}\left(\int\limits_{\theta}^{\tau}\phi_j(s)g(s)ds\right)^2=\sum_{j=0}^{\infty}\left(\int\limits_{t}^{T}\mathbf{1}_{\{\theta<s<\tau\}}\phi_j(s)g(s)ds\right)^2=$$

$$=\int\limits_{t}^{T}\left(\mathbf{1}_{\{\theta<s<\tau\}}\right)^2 g^2(s)ds=\int\limits_{\theta}^{\tau}g^2(s)ds. \qquad (34)$$

Equality (34) has been applied repeatedly when we obtain (33).

Let us explane more precisely the passing from (31) to (32) (the same steps have been used when we derived (33)).

We have

$$\int\limits_{t}^{T}\int\limits_{t}^{\tau}\psi_1^2(t_1)\sum_{j_2=0}^{\infty}\left(\tilde{C}_{j_s\ldots j_2}(\tau,t_1)\right)^2 dt_1d\tau-\sum_{j_2=0}^{n}\int\limits_{t}^{T}\int\limits_{t}^{\tau}\psi_1^2(t_1)\left(\tilde{C}_{j_s\ldots j_2}(\tau,t_1)\right)^2 dt_1d\tau=$$

$$=\int\limits_{t}^{T}\int\limits_{t}^{\tau}\psi_1^2(t_1)\sum_{j_2=n+1}^{\infty}\left(\tilde{C}_{j_s\ldots j_2}(\tau,t_1)\right)^2 dt_1d\tau=$$

$$=\lim_{N\to\infty}\sum_{j=0}^{N-1}\int\limits_{t}^{\tau_j}\psi_1^2(t_1)\sum_{j_2=n+1}^{\infty}\left(\tilde{C}_{j_s\ldots j_2}(\tau_j,t_1)\right)^2 dt_1\Delta\tau_j, \qquad (35)$$

where $\{\tau_j\}_{j=0}^{N}$ is the partition of the interval $[t,T]$, which satisfies the condition (5).

Since the non-decreasing functional sequence $u_n(\tau_j,t_1)$ and its limit function $u(\tau_j,t_1)$ are continuous on the interval $[t,\tau_j]\subseteq[t,T]$ with respect to t_1, where

$$u_n(\tau_j,t_1)=\sum_{j_2=0}^{n}\left(\tilde{C}_{j_s\ldots j_2}(\tau_j,t_1)\right)^2,$$

$$u(\tau_j,t_1)=\sum_{j_2=0}^{\infty}\left(\tilde{C}_{j_s\ldots j_2}(\tau_j,t_1)\right)^2=\int\limits_{t_1}^{\tau_j}\psi_2^2(t_2)\left(\tilde{C}_{j_s\ldots j_3}(\tau_j,t_2)\right)^2 dt_2,$$

then by Dini Theorem we have the uniform convergence of $u_n(\tau_j,t_1)$ to $u(\tau_j,t_1)$ at the interval $[t,\tau_j]\subseteq[t,T]$ with respect to t_1. As a result, we obtain

$$\sum_{j_2=n+1}^{\infty}\left(\tilde{C}_{j_s\ldots j_2}(\tau_j,t_1)\right)^2<\varepsilon,\quad t_1\in[t,\tau_j] \tag{36}$$

for $n>N(\varepsilon)$ ($N(\varepsilon)$ exists for any $\varepsilon>0$ and it does not depend on t_1).

From (35) and (36) we obtain

$$\lim_{N\to\infty}\sum_{j=0}^{N-1}\int\limits_t^{\tau_j}\psi_1^2(t_1)\sum_{j_2=n+1}^{\infty}\left(\tilde{C}_{j_s\ldots j_2}(\tau_j,t_1)\right)^2dt_1\Delta\tau_j\le$$

$$\le\varepsilon\lim_{N\to\infty}\sum_{j=0}^{N-1}\int\limits_t^{\tau_j}\psi_1^2(t_1)dt_1\Delta\tau_j=$$

$$=\varepsilon\int\limits_t^{T}\int\limits_t^{\tau}\psi_1^2(t_1)dt_1d\tau. \tag{37}$$

From (37) we get

$$\lim_{n\to\infty}\int\limits_t^{T}\int\limits_t^{\tau}\psi_1^2(t_1)\sum_{j_2=n+1}^{\infty}\left(\tilde{C}_{j_s\ldots j_2}(\tau,t_1)\right)^2dt_1d\tau=0.$$

This fact completes the proof of passing from (31) to (32).

Let us estimate the integral

$$\int\limits_u^{\tau}\phi_{j_s}(\theta)\psi_s(\theta)d\theta \tag{38}$$

from (33) for the cases when $\{\phi_j(s)\}_{j=0}^{\infty}$ is a complete orthonormal system of Legendre polynomials or trigonometric functions in the space $L_2([t,T])$.

Note that the estimates for the integral

$$\int\limits_t^{\tau}\phi_j(\theta)\psi(\theta)d\theta,\quad j\ge p+1 \tag{39}$$

have been obtained in [20], [22], [23], [36]. Here $\psi(\theta)$ is a continuously differentiable function on the interval $[t, T]$,

Let us estimate the integral (38) using the approach from [20], [22], [23], [36].

First consider the case of Legendre polynomials. Then $\phi_j(\theta)$ looks as follows

$$\phi_j(\theta)=\sqrt{\frac{2j+1}{T-t}}P_j\left(\left(\theta-\frac{T+t}{2}\right)\frac{2}{T-t}\right),\quad j\ge 0,$$

where $P_j(x)$ $(j=0,1,2\ldots)$ is the Legendre polynomial.

Further, we have

$$\int\limits_{v}^{x}\phi_j(\theta)\psi(\theta)d\theta=\frac{\sqrt{T-t}\sqrt{2j+1}}{2}\int\limits_{z(v)}^{z(x)}P_j(y)\psi(u(y))dy=$$

$$=\frac{\sqrt{T-t}}{2\sqrt{2j+1}}\Biggl((P_{j+1}(z(x))-P_{j-1}(z(x)))\psi(x)-$$

$$-(P_{j+1}(z(v))-P_{j-1}(z(v)))\psi(v)-$$

$$-\frac{T-t}{2}\int\limits_{z(v)}^{z(x)}((P_{j+1}(y)-P_{j-1}(y))\psi'(u(y))dy\Biggr),\tag{40}$$

where $x,v\in(t,T)$, $j\ge p+1$, and $u(y)$, $z(x)$ are defined by the following relations

$$u(y)=\frac{T-t}{2}y+\frac{T+t}{2},\quad z(x)=\left(x-\frac{T+t}{2}\right)\frac{2}{T-t},$$

ψ' is a derivative of the function $\psi(\theta)$ with respect to the variable $u(y)$.

Note that in (40) we used the following well-known property of the Legendre polynomials [42]

$$\frac{dP_{j+1}}{dx}(x)-\frac{dP_{j-1}}{dx}(x)=(2j+1)P_j(x),\quad j=1,2,\ldots$$

From (40) and the well-known estimate for the Legendre polynomials [46]

$$|P_j(y)|<\frac{K}{\sqrt{j+1}(1-y^2)^{1/4}},\quad y\in(-1,1),\quad j\in\mathbb{N},$$

where constant K does not depend on y and j, it follows that

$$\left|\int\limits_v^x \phi_j(\theta)\psi(\theta)d\theta\right| < \frac{C}{j}\left(\frac{1}{(1-(z(x))^2)^{1/4}} + \frac{1}{(1-(z(v))^2)^{1/4}} + C_1\right), \qquad (41)$$

where $z(x), z(v) \in (-1,1)$, $x, v \in (t,T)$ and constants C, C_1 does not depend on j.

From (41) we obtain

$$\left(\int\limits_v^x \phi_j(\theta)\psi(\theta)d\theta\right)^2 < \frac{C_2}{j^2}\left(\frac{1}{(1-(z(x))^2)^{1/2}} + \frac{1}{(1-(z(v))^2)^{1/2}} + C_3\right), \qquad (42)$$

where constants C_2, C_3 does not depend on j.

Let us apply (42) for the estimate of the right-hand side of (33). We have

$$\int\limits_t^T \int\limits_t^\tau \left(\int\limits_u^\tau \phi_{j_s}(\theta)\psi_s(\theta)d\theta\right)^2 dud\tau \le$$

$$\le \frac{K_1}{j_s^2}\left(\int\limits_{-1}^1 \frac{dy}{\left(1-y^2\right)^{1/2}} + \int\limits_{-1}^1 \int\limits_{-1}^x \frac{dy}{\left(1-y^2\right)^{1/2}}dx + K_2\right) \le$$

$$\le \frac{K_3}{j_s^2}, \qquad (43)$$

where constants K_1, K_2, K_3 are independent of j_s.

Now consider the trigonometric case. The complete orthonormal system of trigonometric functions in the space $L_2([t,T])$ has the following form

$$\phi_j(\theta) = \frac{1}{\sqrt{T-t}}\begin{cases} 1, & j=0 \\ \sqrt{2}\sin\left(2\pi r(\theta-t)/(T-t)\right), & j=2r-1, \\ \sqrt{2}\cos\left(2\pi r(\theta-t)/(T-t)\right), & j=2r \end{cases} \qquad (44)$$

where $r = 1, 2, \ldots$

Using the system of functions (44), we have

$$\int\limits_{v}^{x} \phi_{2r-1}(\theta)\psi(\theta)d\theta = \sqrt{\frac{2}{T-t}}\int\limits_{v}^{x} \sin\frac{2\pi r(\theta-t)}{T-t}\psi(\theta)d\theta =$$

$$= -\sqrt{\frac{T-t}{2}}\frac{1}{\pi r}\Biggl(\psi(x)\cos\frac{2\pi r(x-t)}{T-t} - \psi(v)\cos\frac{2\pi r(v-t)}{T-t} -$$

$$- \int\limits_{v}^{x} \cos\frac{2\pi r(\theta-t)}{T-t}\psi'(\theta)d\theta\Biggr), \qquad (45)$$

$$\int\limits_{v}^{x} \phi_{2r}(\theta)\psi(\theta)d\theta = \sqrt{\frac{2}{T-t}}\int\limits_{v}^{x} \cos\frac{2\pi r(\theta-t)}{T-t}\psi(\theta)d\theta =$$

$$= \sqrt{\frac{T-t}{2}}\frac{1}{\pi r}\Biggl(\psi(x)\sin\frac{2\pi r(x-t)}{T-t} - \psi(v)\sin\frac{2\pi r(v-t)}{T-t} -$$

$$- \int\limits_{v}^{x} \sin\frac{2\pi r(\theta-t)}{T-t}\psi'(\theta)d\theta\Biggr), \qquad (46)$$

where $\psi'(\theta)$ is a derivative of the function $\psi(\theta)$ with respect to the variable θ.

Combining (45) and (46), we obtain for the trigonometric case

$$\left(\int\limits_{v}^{x} \phi_j(\theta)\psi(\theta)d\theta\right)^2 \le \frac{C_4}{j^2}, \qquad (47)$$

where constant C_4 is independent of j.

From (47) we finally have

$$\int\limits_{t}^{T}\int\limits_{t}^{\tau}\left(\int\limits_{u}^{\tau} \phi_{j_s}(\theta)\psi_s(\theta)d\theta\right)^2 dud\tau \le \frac{K_4}{j_s^2}, \qquad (48)$$

where constant K_4 is independent of j_s.

Combining (33), (43) and (48), we obtain

$$\sum_{j_1=0}^{\infty}\ldots\sum_{j_{s-1}=0}^{\infty}\sum_{j_s=p+1}^{\infty}\sum_{j_{s+1}=0}^{\infty}\ldots\sum_{j_k=0}^{\infty} C_{j_k\ldots j_1}^2 \le$$

$$\leq L_k \sum_{j_s=p+1}^{\infty} \frac{1}{j_s^2} \leq L_k \int\limits_p^{\infty} \frac{dx}{x^2} = \frac{L_k}{p}, \tag{49}$$

where constant L_k depends on k and $T-t$.

Obviously, the case $s=k$ can be considered absolutely analogously to the case $s<k$. Then from (28) and (49) we obtain

$$\int\limits_{[t,T]^k} K^2(t_1,\ldots,t_k)dt_1\ldots dt_k - \sum_{j_1=0}^{p}\ldots\sum_{j_k=0}^{p} C_{j_k\ldots j_1}^2 \leq \frac{G_k}{p}, \tag{50}$$

where constant G_k depends on k and $T-t$.

For the further consideration we will use estimate (15). Using (50) and the estimate (15) for the case $p_1=\ldots=p_k=p$ and $n=2$, we obtain

$$\mathsf{M}\left\{\left(J[\psi^{(k)}]_{T,t} - J[\psi^{(k)}]_{T,t}^{p,\ldots,p}\right)^4\right\} \leq$$

$$\leq C_{2,k}\left(\int\limits_{[t,T]^k} K^2(t_1,\ldots,t_k)dt_1\ldots dt_k - \sum_{j_1=0}^{p}\ldots\sum_{j_k=0}^{p} C_{j_k\ldots j_1}^2\right)^2 \leq$$

$$\leq \frac{H_{2,k}}{p^2}, \tag{51}$$

where

$$C_{n,k} = (k!)^{2n}(n(2n-1))^{n(k-1)}(2n-1)!!$$

and $H_{2,k} = G_k^2 C_{2,k}$.

Let us consider Lemma 1 (see Appendix) with

$$\xi_p = \left|J[\psi^{(k)}]_{T,t} - J[\psi^{(k)}]_{T,t}^{p,\ldots,p}\right| \quad \text{and} \quad \alpha = 4.$$

Then from (51) we get

$$\sum_{p=1}^{\infty} \mathsf{M}\left\{\left(J[\psi^{(k)}]_{T,t} - J[\psi^{(k)}]_{T,t}^{p,\ldots,p}\right)^4\right\} \leq H_{2,k}\sum_{p=1}^{\infty}\frac{1}{p^2} < \infty. \tag{52}$$

Using Lemma 1 (see Appendix) and the estimate (52), we obtain

$$J[\psi^{(k)}]_{T,t}^{p,\ldots,p} \ \to \ J[\psi^{(k)}]_{T,t} \quad \text{if} \quad p\to\infty \quad \text{w. p. 1},$$

where (see Theorem 1)

$$J[\psi^{(k)}]_{T,t}^{p,\ldots,p} = \sum_{j_1,\ldots,j_k=0}^{p} C_{j_k\ldots j_1}\Biggl(\prod_{l=1}^{k}\zeta_{j_l}^{(i_l)} -$$

$$- \ \underset{N\to\infty}{\text{l.i.m.}} \sum_{(l_1,\ldots,l_k)\in\mathrm{G}_k} \phi_{j_1}(\tau_{l_1})\Delta\mathbf{w}_{\tau_{l_1}}^{(i_1)}\ldots\phi_{j_k}(\tau_{l_k})\Delta\mathbf{w}_{\tau_{l_k}}^{(i_k)}\Biggr) \tag{53}$$

or (see Theorem 2)

$$J[\psi^{(k)}]_{T,t}^{p,\ldots,p} = \sum_{j_1,\ldots,j_k=0}^{p} C_{j_k\ldots j_1}\Biggl(\prod_{l=1}^{k}\zeta_{j_l}^{(i_l)} + \sum_{r=1}^{[k/2]}(-1)^r\times$$

$$\times \sum_{\substack{(\{\{g_1,g_2\},\ldots,\{g_{2r-1},g_{2r}\}\},\{q_1,\ldots,q_{k-2r}\})\\ \{g_1,g_2,\ldots,g_{2r-1},g_{2r},q_1,\ldots,q_{k-2r}\}=\{1,2,\ldots,k\}}} \prod_{s=1}^{r}\mathbf{1}_{\{i_{g_{2s-1}}=\ i_{g_{2s}}\ne 0\}}\mathbf{1}_{\{j_{g_{2s-1}}=\ j_{g_{2s}}\}}\prod_{l=1}^{k-2r}\zeta_{j_{q_l}}^{(i_{q_l})}\Biggr), \tag{54}$$

where $i_1,\ldots,i_k=1,\ldots,m$ in (53) and (54). The proof of Theorem 6 is completed.

4 Appendix

Lemma 1 [43]. *If for the sequence of random variables ξ_p and for some $\alpha>0$ the number series*

$$\sum_{p=1}^{\infty}\mathsf{M}\left\{|\xi_p|^{\alpha}\right\}$$

converges, then the sequence ξ_p converges to zero w. p. 1.

Lemma 2. *The following equalities are fulfilled*

$$\sum_{j_1,\ldots,j_k=0}^{\infty} C_{j_k\ldots j_1}^2 = \sum_{j_1=0}^{\infty}\ldots\sum_{j_k=0}^{\infty} C_{j_k\ldots j_1}^2 =$$

$$= \sum_{j_k=0}^{\infty}\ldots\sum_{j_1=0}^{\infty} C_{j_k\ldots j_1}^2 = \sum_{j_{q_1}=0}^{\infty}\ldots\sum_{j_{q_k}=0}^{\infty} C_{j_k\ldots j_1}^2 \tag{55}$$

for any permutation $(q_1,\ldots,q_k)$ *such that* $\{q_1,\ldots,q_k\} = \{1,\ldots,k\}$, *where* $C_{j_k\ldots j_1}$ *is defined by* (27).

Proof. Let us remind the well-known fact from the mathematical analysis, which is connected to existence of iterated limits.

Proposition 1 [44]. *Let* $\bigl\{x_{n,m}\bigr\}_{n,m=1}^{\infty}$ *be a double sequence and let there exists the limit*

$$\lim_{n,m\to\infty} x_{n,m} = a < \infty.$$

Moreover, let there exist the limits

$$\lim_{n\to\infty} x_{n,m} < \infty \quad \text{for any} \ \ m, \qquad \lim_{m\to\infty} x_{n,m} < \infty \quad \text{for any} \ \ n.$$

Then there exist the iterated limits

$$\lim_{n\to\infty}\lim_{m\to\infty} x_{n,m}, \qquad \lim_{m\to\infty}\lim_{n\to\infty} x_{n,m}$$

and moreover,

$$\lim_{n\to\infty}\lim_{m\to\infty} x_{n,m} = \lim_{m\to\infty}\lim_{n\to\infty} x_{n,m} = a.$$

Let us consider the value

$$\sum_{j_{q_l}=0}^{p}\ldots\sum_{j_{q_k}=0}^{p} C_{j_k\ldots j_1}^2 \tag{56}$$

for any permutation $(q_l,\ldots,q_k)$, where $l=1,2,\ldots,k$, $\{q_1,\ldots,q_k\} = \{1,\ldots,k\}$.

Obviously, (56) is the non-decreasing sequence with respect to p. Moreover,

$$\sum_{j_{q_l}=0}^{p}\ldots\sum_{j_{q_k}=0}^{p} C_{j_k\ldots j_1}^2 \le \sum_{j_{q_1}=0}^{p}\sum_{j_{q_2}=0}^{p}\ldots\sum_{j_{q_k}=0}^{p} C_{j_k\ldots j_1}^2 \le$$

$$\le \sum_{j_1,\ldots,j_k=0}^{\infty} C_{j_k\ldots j_1}^2 < \infty.$$

Then the following limit

$$\lim_{p\to\infty}\sum_{j_{q_l}=0}^{p}\ldots\sum_{j_{q_k}=0}^{p} C_{j_k\ldots j_1}^2 = \sum_{j_{q_l},\ldots,j_{q_k}=0}^{\infty} C_{j_k\ldots j_1}^2$$

exists.

Let $p_l,\ldots,p_k$ simultaneously tend to infinity. Then $g,r\to\infty$, where $g=\min\{p_l,\ldots,p_k\}$ and $r=\max\{p_l,\ldots,p_k\}$. Moreover,

$$\sum_{j_{q_l}=0}^{g}\ldots\sum_{j_{q_k}=0}^{g}C_{j_k\ldots j_1}^2\le\sum_{j_{q_l}=0}^{p_l}\ldots\sum_{j_{q_k}=0}^{p_k}C_{j_k\ldots j_1}^2\le\sum_{j_{q_l}=0}^{r}\ldots\sum_{j_{q_k}=0}^{r}C_{j_k\ldots j_1}^2.$$

This means that the existence of the limit

$$\lim_{p\to\infty}\sum_{j_{q_l}=0}^{p}\ldots\sum_{j_{q_k}=0}^{p}C_{j_k\ldots j_1}^2 \tag{57}$$

implies the existence of the limit

$$\lim_{p_l,\ldots,p_k\to\infty}\sum_{j_{q_l}=0}^{p_l}\ldots\sum_{j_{q_k}=0}^{p_k}C_{j_k\ldots j_1}^2 \tag{58}$$

and equality of the limits (57) and (58).

Consequently,

$$\lim_{p,q\to\infty}\sum_{j_{q_l}=0}^{q}\sum_{j_{q_{l+1}}=0}^{p}\ldots\sum_{j_{q_k}=0}^{p}C_{j_k\ldots j_1}^2=\lim_{p\to\infty}\sum_{j_{q_l}=0}^{p}\ldots\sum_{j_{q_k}=0}^{p}C_{j_k\ldots j_1}^2=$$

$$=\lim_{p_l,\ldots,p_k\to\infty}\sum_{j_{q_l}=0}^{p_l}\ldots\sum_{j_{q_k}=0}^{p_k}C_{j_k\ldots j_1}^2. \tag{59}$$

Since the limit

$$\sum_{j_1,\ldots,j_k=0}^{\infty}C_{j_k\ldots j_1}^2$$

exists (see the Parseval equality (26)), then from Proposition 1 we have

$$\sum_{j_{q_1}=0}^{\infty}\sum_{j_{q_2},\ldots,j_{q_k}=0}^{\infty}C_{j_k\ldots j_1}^2=\lim_{q\to\infty}\lim_{p\to\infty}\sum_{j_{q_1}=0}^{q}\sum_{j_{q_2}=0}^{p}\ldots\sum_{j_{q_k}=0}^{p}C_{j_k\ldots j_1}^2=$$

$$=\lim_{q,p\to\infty}\sum_{j_{q_1}=0}^{q}\sum_{j_{q_2}=0}^{p}\ldots\sum_{j_{q_k}=0}^{p}C_{j_k\ldots j_1}^2=\sum_{j_1,\ldots,j_k=0}^{\infty}C_{j_k\ldots j_1}^2. \tag{60}$$

Using (59) and Proposition 1, we have

$$\sum_{j_{q_2}=0}^{\infty}\ \sum_{j_{q_3},\ldots,j_{q_k}=0}^{\infty} C^2_{j_k\ldots j_1} = \lim_{q\to\infty}\lim_{p\to\infty}\sum_{j_{q_2}=0}^{q}\sum_{j_{q_3}=0}^{p}\ldots\sum_{j_{q_k}=0}^{p} C^2_{j_k\ldots j_1} =$$

$$= \lim_{q,p\to\infty}\sum_{j_{q_2}=0}^{q}\sum_{j_{q_3}=0}^{p}\ldots\sum_{j_{q_k}=0}^{p} C^2_{j_k\ldots j_1} = \sum_{j_{q_2},\ldots,j_{q_k}=0}^{\infty} C^2_{j_k\ldots j_1}. \tag{61}$$

Combining (61) and (60), we obtain

$$\sum_{j_{q_1}=0}^{\infty}\sum_{j_{q_2}=0}^{\infty}\ \sum_{j_{q_3},\ldots,j_{q_k}=0}^{\infty} C^2_{j_k\ldots j_1} = \sum_{j_1,\ldots,j_k=0}^{\infty} C^2_{j_k\ldots j_1}.$$

Repeating the above steps, we complete the proof of Lemma 2.

Lemma 3. *The following equality takes place*

$$\sum_{j_1=0}^{\infty}\ldots\sum_{j_{s-1}=0}^{\infty}\sum_{j_s=p+1}^{\infty}\sum_{j_{s+1}=0}^{\infty}\ldots\sum_{j_k=0}^{\infty} C^2_{j_k\ldots j_1} =$$

$$= \sum_{j_s=p+1}^{\infty}\sum_{j_{s-1}=0}^{\infty}\ldots\sum_{j_1=0}^{\infty}\sum_{j_{s+1}=0}^{\infty}\ldots\sum_{j_k=0}^{\infty} C^2_{j_k\ldots j_1}, \tag{62}$$

where $s = 1,\ldots,k$ *and* $C_{j_k\ldots j_1}$ *is defined by* (27).

Proof. Applying the arguments that we used in the proof of Lemma 2, we obtain

$$\lim_{n\to\infty}\sum_{j_1=0}^{n}\ldots\sum_{j_{s-1}=0}^{n}\sum_{j_s=0}^{p}\sum_{j_{s+1}=0}^{n}\ldots\sum_{j_k=0}^{n} C^2_{j_k\ldots j_1} =$$

$$= \sum_{j_s=0}^{p}\ \sum_{j_1,\ldots,j_{s-1},j_{s+1},\ldots,j_k=0}^{\infty} C^2_{j_k\ldots j_1} = \sum_{j_s=0}^{p}\sum_{j_{q_1}=0}^{\infty}\ldots\sum_{j_{q_{k-1}}=0}^{\infty} C^2_{j_k\ldots j_1} \tag{63}$$

for any permutation $(q_1,\ldots,q_{k-1})$ such that $\{q_1,\ldots,q_{k-1}\} = \{1,\ldots,s-1,s+1,\ldots,k\}$, where p is a fixed natural number.

Obviously, we have

$$\sum_{j_s=0}^{p}\sum_{j_{q_1}=0}^{\infty}\ldots\sum_{j_{q_{k-1}}=0}^{\infty} C^2_{j_k\ldots j_1} = \sum_{j_{q_1}=0}^{\infty}\ldots\sum_{j_s=0}^{p}\ldots\sum_{j_{q_{k-1}}=0}^{\infty} C^2_{j_k\ldots j_1} = \ldots =$$

$$= \sum_{j_{q_1}=0}^{\infty} \dots \sum_{j_{q_{k-1}}=0}^{\infty} \sum_{j_s=0}^{p} C_{j_k \dots j_1}^2. \tag{64}$$

Using (63), (64) and Lemma 2, we obtain

$$\sum_{j_1=0}^{\infty} \dots \sum_{j_{s-1}=0}^{\infty} \sum_{j_s=p+1}^{\infty} \sum_{j_{s+1}=0}^{\infty} \dots \sum_{j_k=0}^{\infty} C_{j_k \dots j_1}^2 =$$

$$= \sum_{j_1=0}^{\infty} \dots \sum_{j_{s-1}=0}^{\infty} \sum_{j_s=0}^{\infty} \sum_{j_{s+1}=0}^{\infty} \dots \sum_{j_k=0}^{\infty} C_{j_k \dots j_1}^2 - \sum_{j_1=0}^{\infty} \dots \sum_{j_{s-1}=0}^{\infty} \sum_{j_s=0}^{p} \sum_{j_{s+1}=0}^{\infty} \dots \sum_{j_k=0}^{\infty} C_{j_k \dots j_1}^2 =$$

$$= \sum_{j_s=0}^{\infty} \sum_{j_{s-1}=0}^{\infty} \dots \sum_{j_1=0}^{\infty} \sum_{j_{s+1}=0}^{\infty} \dots \sum_{j_k=0}^{\infty} C_{j_k \dots j_1}^2 - \sum_{j_s=0}^{p} \sum_{j_{s-1}=0}^{\infty} \dots \sum_{j_1=0}^{\infty} \sum_{j_{s+1}=0}^{\infty} \dots \sum_{j_k=0}^{\infty} C_{j_k \dots j_1}^2 =$$

$$= \sum_{j_s=p+1}^{\infty} \sum_{j_{s-1}=0}^{\infty} \dots \sum_{j_1=0}^{\infty} \sum_{j_{s+1}=0}^{\infty} \dots \sum_{j_k=0}^{\infty} C_{j_k \dots j_1}^2.$$

The equality (4) is proved.

Theorem (Dini) [45]. *Let the functional sequence $u_n(x)$ be non-decreasing at each point of the interval $[a, b]$. In addition, all the functions $u_n(x)$ of this sequence and the limit function $u(x)$ are continuous on the interval $[a, b]$. Then the convergence $u_n(x)$ to $u(x)$ is uniform on the interval $[a, b]$.*

Expansions of Iterated Stratonovich Stochastic Integrals Based on Generalized Multiple Fourier Series

EXPANSIONS OF ITERATED STRATONOVICH STOCHASTIC INTEGRALS BASED ON GENERALIZED MULTIPLE FOURIER SERIES: MULTIPLICITIES 1 TO 6 AND BEYOND

DMITRIY F. KUZNETSOV

Abstract. The article is devoted to the expansions of iterated Stratonovich stochastic integrals of multiplicities 1 to 6 on the basis of the method of generalized multiple Fourier series that converge in the sense of norm in Hilbert space $L_2([t,T]^k)$, $k=1,\ldots,6$. The rate of mean-square convergence of the mentioned expansions for the case of multiple Fourier–Legendre series and for the case of multiple trigonometric Fourier series is found. Sufficient conditions are given for the expansion of iterated Stratonovich stochastic integrals of arbitrary miltiplicity k ($k\in\mathbb{N}$). The considered expansions contain only one operation of the limit transition in contrast to its existing analogues. This property is very important for the mean-square approximation of iterated stochastic integrals. The results of the article can be applied to the numerical integration of Ito stochastic differential equations with multidimensional non-commutative noises.

1. Introduction

Let $(\Omega, \mathrm{F}, \mathsf{P})$ be a complete probability space, let $\{\mathrm{F}_t, t \in [0,T]\}$ be a nondecreasing right-continous family of σ-algebras of F, and let $\mathbf{f}_t$ be a standard m-dimensional Wiener stochastic process, which is F_t-measurable for any $t \in [0,T]$. We assume that the components $\mathbf{f}_t^{(i)}$ $(i = 1, \ldots, m)$ of this process are independent. Consider an Ito stochastic differential equation (SDE) in the integral form

$$\mathbf{x}_t = \mathbf{x}_0 + \int\limits_0^t \mathbf{a}(\mathbf{x}_\tau, \tau)d\tau + \int\limits_0^t B(\mathbf{x}_\tau, \tau)d\mathbf{f}_\tau, \quad \mathbf{x}_0 = \mathbf{x}(0, \omega). \tag{1}$$

Here $\mathbf{x}_t$ is some n-dimensional stochastic process satisfying the equation (1). The nonrandom functions $\mathbf{a} : \mathbb{R}^n \times [0,T] \to \mathbb{R}^n$, $B : \mathbb{R}^n \times [0,T] \to \mathbb{R}^{n \times m}$ guarantee the existence and uniqueness up to stochastic equivalence of a solution of (1) [1]. The second integral on the right-hand side of (1) is interpreted as an Ito stochastic integral. Let $\mathbf{x}_0$ be an n-dimensional random variable, which is F_0-measurable and $\mathsf{M}\{|\mathbf{x}_0|^2\} < \infty$ (M denotes a mathematical expectation). We assume that $\mathbf{x}_0$ and $\mathbf{f}_t - \mathbf{f}_0$ are independent when $t > 0$.

It is well known that one of the effective approaches to the numerical integration of Ito SDEs is an approach based on the Taylor–Ito and Taylor–Stratonovich expansions [2]-[5]. The most important feature of such expansions is a presence in them of the so-called iterated Ito and Stratonovich stochastic integrals, which play the key role for solving the problem of numerical integration of Ito SDEs and have the following form

$$J[\psi^{(k)}]_{T,t} = \int\limits_t^T \psi_k(t_k) \ldots \int\limits_t^{t_2} \psi_1(t_1) d\mathbf{w}_{t_1}^{(i_1)} \ldots d\mathbf{w}_{t_k}^{(i_k)}, \tag{2}$$

$$J^*[\psi^{(k)}]_{T,t} = \int\limits_t^{*T} \psi_k(t_k) \ldots \int\limits_t^{*t_2} \psi_1(t_1) d\mathbf{w}_{t_1}^{(i_1)} \ldots d\mathbf{w}_{t_k}^{(i_k)}, \tag{3}$$

where every $\psi_l(\tau)$ $(l=1,\ldots,k)$ is a nonrandom function on $[t,T]$, $\mathbf{w}_\tau^{(i)}=\mathbf{f}_\tau^{(i)}$ for $i=1,\ldots,m$ and $\mathbf{w}_\tau^{(0)}=\tau$, $i_1,\ldots,i_k=0,1,\ldots,m$,

$$\int \text{ and } \int\limits^{*}$$

denote Ito and Stratonovich stochastic integrals, respectively (in this paper we use the definition of the Stratonovich stochastic integral from [2]).

Note that $\psi_l(\tau)\equiv 1$ $(l=1,\ldots,k)$ and $i_1,\ldots,i_k=0,1,\ldots,m$ in [2]-[5]. At the same time $\psi_l(\tau)\equiv (t-\tau)^{q_l}$ $(l=1,\ldots,k;\ q_1,\ldots,q_k=0,1,2,\ldots)$ and $i_1,\ldots,i_k=1,\ldots,m$ in [6]-[29].

The construction of effective expansions (converging in the mean-square sense) for collections of iterated Stratonovich stochastic integrals (3) composes the subject of this article.

The problem of effective jointly numerical modeling (in the sense of the mean-square convergence criterion) of the iterated Ito and Stratonovich stochastic integrals (2) and (3) is difficult from theoretical and computing point of view [2]-[55]. The only exception is connected with a narrow particular case when $i_1=\ldots=i_k\neq 0$ and $\psi_1(\tau),\ldots,\psi_k(\tau)\equiv\psi(\tau)$. This case allows the investigation with using of the Ito formula [2]-[5].

Seems that iterated stochastic integrals may be approximated by multiple integral sums of different types [3], [5], [52]. However, this approach implies partitioning of the interval of integration $[t,T]$ of iterated stochastic integrals (the length $T-t$ of this interval is a rather small value, because it is a step of integration of numerical methods for Ito SDEs) and according to numerical experiments this additional partitioning leads to significant calculating costs [10].

In [3] (also see [2], [4], [5], [53], [54]) Milstein G.N. proposed to expand (2), (3) (the case $k=2$ and $\psi_1(\tau),\psi_2(\tau)\equiv 1$) in iterated series of products of standard Gaussian random variables by representing the Brownian bridge process as the trigonometric Fourier series with random coefficients (version of the so-called Karhunen–Loeve expansion). To obtain the Milstein expansion of (3), the truncated Fourier expansions of components of the Wiener process $\mathbf{f}_s$ must be iteratively substituted in the single integrals, and the integrals must be calculated, starting from the innermost integral. This is a complicated procedure that does not lead to a general expansion of (3) valid for an arbitrary multiplicity k. For this reason, only expansions of single, double, and triple stochastic integrals (2), (3) were presented in [2], [4], [53], [54] $(k=1,2,3)$ and in [3], [5] $(k=1,2)$ for the case $\psi_1(\tau),\psi_2(\tau),\psi_3(\tau)\equiv 1;\ i_1,i_2,i_3=0,1,\ldots,m$. Moreover, the authors of the works [2] (Sect. 5.8, pp. 202-204), [4] (pp. 82-84), [53] (pp. 438-439), [54] (pp. 263-264) use the Wong–Zakai approximation [56]-[59] (without rigorous proof) within the frames of the Milstein approach [3] based on the series expansion of the Brownian bridge process. See discussion in Sect. 6 of this paper for details.

Note that in [55] the method (similar to the Milstein approach) of expansion of the double Ito stochastic integrals (2) $(k=2;\ \psi_1(\tau),\psi_2(\tau)\equiv 1;\ i_1,i_2=1,\ldots,m)$ based on the series expansion of the Wiener process [60] using Haar basis functions and trigonometric basis functions has been considered.

It is necessary to note that the approach based on the Karhunen–Loeve expansion [3] excelled in several times (or even in several orders) the methods of integral sums [3], [5], [52] considering computational costs in the sense of their diminishing.

An alternative strong approximation method was proposed for (3) in [6], [7] (also see [14]-[19], [22], [24], [26]-[29]) where $J^*[\psi^{(k)}]_{T,t}$ (see (3)) was represented as a multiple stochastic integral from the certain discontinuous nonrandom function of k variables, and the function was then expressed as the generalized iterated Fourier series by complete systems of continuously differentiable functions that are orthonormal in the space $L_2([t,T])$. As a result, the general iterated series expansion in terms of products of standard Gaussian random variables was obtained in [6], [7] (also see [14]-[19], [22], [24], [26]-[29]) for (3) with arbitrary multiplicity k. Hereinafter, this method is referred to as the method of generalized iterated Fourier series. It was shown [6], [7] (also see [14]-[19], [22], [24], [26]-[29]) that the method of generalized iterated Fourier series leads to the approach based on the Karhunen–Loeve expansion [3] in the case of trigonometric system of functions and to a substantially simpler expansion of (3) in the case of Legendre polynomials system.

2. Method of Generalized Multiple Fourier Series

In the previous section we paid attention on the fact that the approach based on the Karhunen–Loeve expansion [3] and the method of generalized iterated Fourier series [6], [7] (also see [14]-[19], [22], [24], [26]-[29]) leads to iterated application of the operation of limit transition. This means that these methods may not converge in the mean-square sense to the appropriate stochastic integrals (3) for some methods of series summation. As we noted above, where is no rigorous proof how to overcome the mentioned problem (iterated application of the operation of limit transition) in the papers [2] (Sect. 5.8, pp. 202-204), [4] (pp. 82-84), [53] (pp. 438-439), [54] (pp. 263-264). Nevetheless, this problem not appears in the method, which is proposed for (2) in Theorem 1 (see below).

Let us consider the efficient approach to expansion of the iterated Ito stochastic integrals (2) [10]-[22], [24]-[44] (the so-called method of generalized multiple Fourier series).

The idea of this method is as follows: the iterated Ito stochastic integral (2) of multiplicity k is represented as the multiple stochastic integral from the certain discontinuous nonrandom function of k variables defined on the hypercube $[t,T]^k$, where $[t,T]$ is the interval of integration of the iterated Ito stochastic integral (2). Then the indicated nonrandom function is expanded in the hypercube $[t,T]^k$ into the generalized multiple Fourier series that converges in the mean-square sense in the space $L_2([t,T]^k)$. After a number of nontrivial transformations we come (see Theorem 1 below) to the mean-square convergening expansion of the iterated Ito stochastic integral (2) into the multiple series of products of standard Gaussian random variables. The coefficients of this series are the coefficients of generalized multiple Fourier series for the mentioned nonrandom function of k variables, which can be calculated using the explicit formula regardless of the multiplicity k of the iterated Ito stochastic integral (2).

Suppose that every $\psi_l(\tau)$ $(l=1,\ldots,k)$ is a continuous nonrandom function on $[t,T]$ (the case $\psi_1(\tau),\ldots,\psi_k(\tau)\in L_2([t,T])$ will be considered in Sect. 13 (see Theorem 18)). Define the following function on the hypercube $[t,T]^k$

$$K(t_1,\ldots,t_k)=\begin{cases}\psi_1(t_1)\ldots\psi_k(t_k), & \text{for}\ \ t_1<\ldots<t_k\\ & \\ 0, & \text{otherwise}\end{cases},\qquad t_1,\ldots,t_k\in[t,T],\qquad k\ge 2, \tag{4}$$

and $K(t_1)\equiv\psi_1(t_1)$ for $t_1\in[t,T]$.

Suppose that $\{\phi_j(x)\}_{j=0}^{\infty}$ is a complete orthonormal system of functions in the space $L_2([t,T])$. The function $K(t_1,\ldots,t_k)$ is piecewise continuous in the hypercube $[t,T]^k$. At this situation it is well known that the generalized multiple Fourier series of $K(t_1,\ldots,t_k)\in L_2([t,T]^k)$ is converging to $K(t_1,\ldots,t_k)$ in the hypercube $[t,T]^k$ in the mean-square sense, i.e.

$$\lim_{p_1,\ldots,p_k\to\infty}\left\|K(t_1,\ldots,t_k)-\sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k}C_{j_k\ldots j_1}\prod_{l=1}^{k}\phi_{j_l}(t_l)\right\|_{L_2([t,T]^k)}=0,$$

where

$$C_{j_k\ldots j_1}=\int\limits_{[t,T]^k}K(t_1,\ldots,t_k)\prod_{l=1}^{k}\phi_{j_l}(t_l)dt_1\ldots dt_k \tag{5}$$

is the Fourier coefficient,

$$\|f\|_{L_2([t,T]^k)}=\left(\int\limits_{[t,T]^k} f^2(t_1,\ldots,t_k)dt_1\ldots dt_k\right)^{1/2}.$$

Consider the partition $\{\tau_j\}_{j=0}^N$ of $[t,T]$ such that

$$t=\tau_0<\ldots<\tau_N=T,\quad \Delta_N=\max_{0\le j\le N-1}\Delta\tau_j\to 0\ \text{ if }\ N\to\infty,\quad \Delta\tau_j=\tau_{j+1}-\tau_j. \tag{6}$$

Theorem 1 [10] (2006), [11]-[22], [24]-[44], [51]. *Suppose that every $\psi_l(\tau)$ $(l=1,\ldots,k)$ is a continuous nonrandom function on $[t,T]$ and $\{\phi_j(x)\}_{j=0}^{\infty}$ is a complete orthonormal system of continuous functions in the space $L_2([t,T])$. Then*

$$J[\psi^{(k)}]_{T,t}\ =\ \underset{p_1,\ldots,p_k\to\infty}{\text{l.i.m.}}\sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k}C_{j_k\ldots j_1}\Biggl(\prod_{l=1}^k\zeta_{j_l}^{(i_l)}\ -$$

$$-\ \underset{N\to\infty}{\text{l.i.m.}}\sum_{(l_1,\ldots,l_k)\in \mathrm{G}_k}\phi_{j_1}(\tau_{l_1})\Delta\mathbf{w}_{\tau_{l_1}}^{(i_1)}\ldots\phi_{j_k}(\tau_{l_k})\Delta\mathbf{w}_{\tau_{l_k}}^{(i_k)}\Biggr), \tag{7}$$

where $J[\psi^{(k)}]_{T,t}$ is defined by (2),

$$\mathrm{G}_k=\mathrm{H}_k\backslash\mathrm{L}_k,\quad \mathrm{H}_k=\{(l_1,\ldots,l_k):\ l_1,\ldots,l_k=0,\ 1,\ldots,N-1\},$$

$$\mathrm{L}_k=\{(l_1,\ldots,l_k):\ l_1,\ldots,l_k=0,\ 1,\ldots,N-1;\ l_g\ne l_r\ (g\ne r);\ g,r=1,\ldots,k\},$$

l.i.m. *is a limit in the mean-square sense*, $i_1,\ldots,i_k=0,1,\ldots,m$,

$$\zeta_j^{(i)}=\int\limits_t^T\phi_j(\tau)d\mathbf{w}_\tau^{(i)} \tag{8}$$

are independent standard Gaussian random variables for various i or j (if $i\ne 0$), $C_{j_k\ldots j_1}$ is the Fourier coefficient (5), $\Delta\mathbf{w}_{\tau_j}^{(i)}=\mathbf{w}_{\tau_{j+1}}^{(i)}-\mathbf{w}_{\tau_j}^{(i)}$ $(i=0,1,\ldots,m)$, $\{\tau_j\}_{j=0}^N$ *is a partition of the interval* $[t,T]$, *which satisfies the condition* (6).

It was shown [12]-[19], [22], [24], [26]-[29], [36] that Theorem 1 is valid for convergence in the mean of degree $2n$ $(n\in\mathbb{N})$ and for convergence with probability 1 [26]-[29], [25]. Moreover, the complete orthonormal systems of Haar and Rademacher–Walsh functions in $L_2([t,T])$ also can be applied in Theorem 1 [12]-[19], [22], [24], [26]-[29], [36]. The modification of Theorem 1 for complete orthonormal with weigth $r(x)\ge 0$ systems of functions in the space $L_2([t,T])$ can be found in [24], [26]-[29], [37]. The generalization of Theorem 1 for the case of an arbitrary complete orthonormal system of functions $\{\phi_j(x)\}_{j=0}^{\infty}$ in the space $L_2([t,T])$ and $\psi_1(\tau),\ldots,\psi_k(\tau)\in L_2([t,T])$ is given in [26] (Sect. 1.11), [36] (Sect. 15), [51] (see Theorem 18 from this paper).

In order to evaluate the significance of Theorem 1 for practice we will demonstrate its transformed particular cases for $k=1,\ldots,6$ [10]-[22], [24]-[44]

$$J[\psi^{(1)}]_{T,t} = \underset{p_1\to\infty}{\text{l.i.m.}} \sum_{j_1=0}^{p_1} C_{j_1}\zeta_{j_1}^{(i_1)}, \tag{9}$$

$$J[\psi^{(2)}]_{T,t} = \underset{p_1,p_2\to\infty}{\text{l.i.m.}} \sum_{j_1=0}^{p_1}\sum_{j_2=0}^{p_2} C_{j_2j_1}\left(\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)} - \mathbf{1}_{\{i_1=i_2\ne 0\}}\mathbf{1}_{\{j_1=j_2\}}\right), \tag{10}$$

$$J[\psi^{(3)}]_{T,t} = \underset{p_1,\ldots,p_3\to\infty}{\text{l.i.m.}} \sum_{j_1=0}^{p_1}\sum_{j_2=0}^{p_2}\sum_{j_3=0}^{p_3} C_{j_3j_2j_1}\Biggl(\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}\zeta_{j_3}^{(i_3)} -$$

$$-\mathbf{1}_{\{i_1=i_2\ne 0\}}\mathbf{1}_{\{j_1=j_2\}}\zeta_{j_3}^{(i_3)} - \mathbf{1}_{\{i_2=i_3\ne 0\}}\mathbf{1}_{\{j_2=j_3\}}\zeta_{j_1}^{(i_1)} - \mathbf{1}_{\{i_1=i_3\ne 0\}}\mathbf{1}_{\{j_1=j_3\}}\zeta_{j_2}^{(i_2)}\Biggr), \tag{11}$$

$$J[\psi^{(4)}]_{T,t} = \underset{p_1,\ldots,p_4\to\infty}{\text{l.i.m.}} \sum_{j_1=0}^{p_1}\ldots\sum_{j_4=0}^{p_4} C_{j_4\ldots j_1}\Biggl(\prod_{l=1}^{4}\zeta_{j_l}^{(i_l)} -$$

where $\mathbf{1}_A$ is the indicator of the set A.

Thus, we obtain the following useful possibilities of the method of generalized multiple Fourier series.

1. There is the explicit formula (see (5)) for calculation of expansion coefficients of the iterated Ito stochastic integral (2) with any fixed multiplicity k.

2. We have new possibilities for exact calculation of the mean-square error of approximation of the iterated Ito stochastic integral (2) (see [20], [22], [24], [26]-[29], [35]).

3. Since the used multiple Fourier series is a generalized in the sense that it is built using various complete orthonormal systems of functions in the space $L_2([t,T])$, then we have new possibilities for approximation — we can use not only trigonometric functions as in [2]-[5] but Legendre polynomials.

4. As it turned out (see [6]-[22], [24]-[44]), it is more convenient to work with Legendre polynomials for construction the approximations of iterated Ito stochastic integrals (2). Approximations based on the Legendre polynomials essentially simpler than their analogues based on the trigonometric functions (see [6]-[22], [24]-[44]). Another advantages of the application of Legendre polynomials in the framework of the mentioned problem are considered in [26]-[29], [40], [41].

5. As we noted above, the approach based on the Karhunen–Loeve expansion of the Brownian bridge process (also see similar approach [55]) leads to iterated application of the operation of limit transition (the operation of limit transition is implemented only once in Theorem 1) starting from the second multiplicity (in the general case) and third multiplicity (for the case $\psi_1(\tau),\psi_2(\tau),\psi_3(\tau)\equiv 1$; $i_1,i_2,i_3=0,1,\ldots,m$) of iterated Ito stochastic integrals. Multiple series (the operation of limit transition is implemented only once) are more convenient for approximation than the iterated ones (iterated application of the operation of limit transition), since the partial sums of multiple series converge for any possible case of convergence to infinity of their upper limits of summation (let us denote them as $p_1,\ldots,p_k$). For example, when $p_1=\ldots=p_k=p\to\infty$. For iterated series, the

condition $p_1 = \ldots = p_k = p \to \infty$ obviously does not guarantee the convergence of this series. However, in [2] (Sect. 5.8, pp. 202-204), [4] (pp. 82-84), [53] (pp. 438-439), [54] (pp. 263-264) the authors use (without rigorous proof) the condition $p_1 = p_2 = p_3 = p \to \infty$ within the frames of the mentioned approach based on the Karhunen–Loeve expansion of the Brownian bridge process [3] together with the Wong–Zakai approximation [56]-[59] (see discussion in Sect. 6 of this paper for details).

Note that the correctness of formulas (9)–(14) can be verified by the fact that if $i_1 = \ldots = i_6 = i = 1, \ldots, m$ and $\psi_1(\tau), \ldots, \psi_6(\tau) \equiv \psi(\tau)$, then we can derive from (9)–(14) the well known equalities [11]-[19], [22], [24], [26]-[29]

$$J[\psi^{(1)}]_{T,t} = \frac{1}{1!}\delta_{T,t},$$

$$J[\psi^{(2)}]_{T,t} = \frac{1}{2!}\left(\delta^2_{T,t} - \Delta_{T,t}\right),$$

$$J[\psi^{(3)}]_{T,t} = \frac{1}{3!}\left(\delta^3_{T,t} - 3\delta_{T,t}\Delta_{T,t}\right),$$

$$J[\psi^{(4)}]_{T,t} = \frac{1}{4!}\left(\delta^4_{T,t} - 6\delta^2_{T,t}\Delta_{T,t} + 3\Delta^2_{T,t}\right),$$

$$J[\psi^{(5)}]_{T,t} = \frac{1}{5!}\left(\delta^5_{T,t} - 10\delta^3_{T,t}\Delta_{T,t} + 15\delta_{T,t}\Delta^2_{T,t}\right),$$

$$J[\psi^{(6)}]_{T,t} = \frac{1}{6!}\left(\delta^6_{T,t} - 15\delta^4_{T,t}\Delta_{T,t} + 45\delta^2_{T,t}\Delta^2_{T,t} - 15\Delta^3_{T,t}\right)$$

w. p. 1, where

$$\delta_{T,t} = \int\limits_t^T \psi(\tau)d\mathbf{f}_\tau^{(i)}, \quad \Delta_{T,t} = \int\limits_t^T \psi^2(\tau)d\tau.$$

The above relations can be independently obtained using the Ito formula and Hermite polynomials.

The results of Sect. 3–5 adapt Theorem 1 for the iterated Stratonovich stochastic integrals (3) of multiplicities 2–4. The case of multiplicity 1 follows from (9).

3. Expansion of Iterated Stratonovich Stochastic Integrals of Multiplicity 2

Theorem 2 [17]-[19], [22], [24], [26]-[29]. *Suppose that $\{\phi_j(x)\}_{j=0}^{\infty}$ is a complete orthonormal system of Legendre polynomials or trigonometric functions in the space $L_2([t,T])$. At the same time $\psi_2(\tau)$ is a continuously differentiable nonrandom function on $[t,T]$ and $\psi_1(\tau)$ is twice continuously differentiable nonrandom function on $[t,T]$. Then*

$$J^*[\psi^{(2)}]_{T,t} = \underset{p_1,p_2\to\infty}{\text{l.i.m.}} \sum_{j_1=0}^{p_1}\sum_{j_2=0}^{p_2} C_{j_2 j_1}\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)} \quad (i_1, i_2 = 1, \ldots, m),$$

where notations are the same as in Theorem 1.

Proof. In accordance to the standard relations between Ito and Stratonovich stochastic integrals [2] we have w. p. 1

(15)
$$J^*[\psi^{(2)}]_{T,t} = J[\psi^{(2)}]_{T,t} + \frac{1}{2}\mathbf{1}_{\{i_1=i_2\ne 0\}}\int\limits_t^T \psi_1(t_1)\psi_2(t_1)dt_1.$$

From the other hand, according to (10), we obtain

$$J[\psi^{(2)}]_{T,t} = \underset{p_1,p_2\to\infty}{\text{l.i.m.}} \sum_{j_1=0}^{p_1}\sum_{j_2=0}^{p_2} C_{j_2j_1}\left(\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)} - \mathbf{1}_{\{i_1=i_2\ne 0\}}\mathbf{1}_{\{j_1=j_2\}}\right) =$$

(16)
$$= \underset{p_1,p_2\to\infty}{\text{l.i.m.}} \sum_{j_1=0}^{p_1}\sum_{j_2=0}^{p_2} C_{j_2j_1}\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)} - \mathbf{1}_{\{i_1=i_2\}}\lim_{p_1,p_2\to\infty}\sum_{j_1=0}^{\min\{p_1,p_2\}} C_{j_1j_1}.$$

From (15) and (16) it folows that Theorem 2 will be proved if

(17)
$$\frac{1}{2}\int\limits_t^T \psi_1(t_1)\psi_2(t_1)dt_1 = \sum_{j_1=0}^{\infty} C_{j_1j_1}.$$

Note that in this section we present two different proofs of the existence of a limit on the right-hand side of (17) for the polynomial and trigonometric cases.

Let us prove (17). Consider the function

(18)
$$K^*(t_1,t_2) = K(t_1,t_2) + \frac{1}{2}\mathbf{1}_{\{t_1=t_2\}}\psi_1(t_1)\psi_2(t_1),$$

where $t_1, t_2 \in [t, T]$ and $K(t_1, t_2)$ has the form (4) for $k = 2$.

Let us expand the function $K^*(t_1, t_2)$ defined by (18) using the variable t_1, when t_2 is fixed, into the generalized Fourier series at the interval (t, T)

(19)
$$K^*(t_1,t_2) = \sum_{j_1=0}^{\infty} C_{j_1}(t_2)\phi_{j_1}(t_1) \quad (t_1 \ne t, T),$$

where

$$C_{j_1}(t_2) = \int\limits_t^T K^*(t_1,t_2)\phi_{j_1}(t_1)dt_1 = \psi_2(t_2)\int\limits_t^{t_2} \psi_1(t_1)\phi_{j_1}(t_1)dt_1.$$

The equality (19) is fulfilled pointwise in each point of the interval (t, T) with respect to the variable t_1, when $t_2 \in [t, T]$ is fixed, due to the piecewise smoothness of the function $K^*(t_1, t_2)$ with respect to the variable $t_1 \in [t, T]$ (t_2 is fixed).

Note that due to the well-known properties of the Fourier–Legendre series and trigonometric Fourier series, the series (19) converges when $t_1 = t$, $t_1 = T$.

Obtaining (19) we also used the fact that the right-hand side of (19) converges when $t_1 = t_2$ (point of a finite discontinuity of the function $K(t_1, t_2)$) to the value

$$\frac{1}{2}\left(K(t_2-0,t_2)+K(t_2+0,t_2)\right)=\frac{1}{2}\psi_1(t_2)\psi_2(t_2)=K^*(t_2,t_2).$$

The function $C_{j_1}(t_2)$ is a continuously differentiable one at the interval $[t,T]$. Let us expand it into the generalized Fourier series at the interval (t,T)

$$C_{j_1}(t_2)=\sum_{j_2=0}^{\infty}C_{j_2j_1}\phi_{j_2}(t_2)\quad (t_2\neq t,T), \tag{20}$$

where

$$C_{j_2j_1}=\int\limits_t^T C_{j_1}(t_2)\phi_{j_2}(t_2)dt_2=\int\limits_t^T \psi_2(t_2)\phi_{j_2}(t_2)\int\limits_t^{t_2}\psi_1(t_1)\phi_{j_1}(t_1)dt_1dt_2,$$

and the equality (20) is fulfilled pointwise at any point of the interval (t,T) (the right-hand side of (20) converges when $t_2=t$, $t_2=T$).

Let us substitute (20) into (19)

$$K^*(t_1,t_2)=\sum_{j_1=0}^{\infty}\sum_{j_2=0}^{\infty}C_{j_2j_1}\phi_{j_1}(t_1)\phi_{j_2}(t_2),\quad (t_1,t_2)\in(t,T)^2. \tag{21}$$

Note that the series on the right-hand side of (21) converges at the boundary of the square $[t,T]^2$.

It is easy to see that substituting $t_1=t_2$ into (21), we obtain

$$\frac{1}{2}\psi_1(t_1)\psi_2(t_1)=\sum_{j_1=0}^{\infty}\sum_{j_2=0}^{\infty}C_{j_2j_1}\phi_{j_1}(t_1)\phi_{j_2}(t_1). \tag{22}$$

From (22) we formally have

$$\frac{1}{2}\int\limits_t^T\psi_1(t_1)\psi_2(t_1)dt_1=\int\limits_t^T\sum_{j_1=0}^{\infty}\sum_{j_2=0}^{\infty}C_{j_2j_1}\phi_{j_1}(t_1)\phi_{j_2}(t_1)dt_1=$$

$$=\sum_{j_1=0}^{\infty}\sum_{j_2=0}^{\infty}\int\limits_t^T C_{j_2j_1}\phi_{j_1}(t_1)\phi_{j_2}(t_1)dt_1=$$

$$=\lim_{p_1\to\infty}\lim_{p_2\to\infty}\sum_{j_1=0}^{p_1}\sum_{j_2=0}^{p_2}C_{j_2j_1}\int\limits_t^T\phi_{j_1}(t_1)\phi_{j_2}(t_1)dt_1=$$

$$=\lim_{p_1\to\infty}\lim_{p_2\to\infty}\sum_{j_1=0}^{p_1}\sum_{j_2=0}^{p_2}C_{j_2j_1}\mathbf{1}_{\{j_1=j_2\}}=$$

$$=\lim_{p_1\to\infty}\lim_{p_2\to\infty}\sum_{j_1=0}^{\min\{p_1,p_2\}}C_{j_1j_1}=\sum_{j_1=0}^{\infty}C_{j_1j_1}. \tag{23}$$

Let us explain the second step in (23) (the fourth step in (23) follows from the orthonormality of the functions $\phi_j(s)$ at the interval $[t, T]$).

We have

$$\left|\int\limits_t^T \sum_{j_1=0}^{\infty} C_{j_1}(t_1)\phi_{j_1}(t_1)dt_1 - \sum_{j_1=0}^{p_1}\int\limits_t^T C_{j_1}(t_1)\phi_{j_1}(t_1)dt_1\right| \le$$

$$\le \int\limits_t^T |\psi_2(t_1)G_{p_1}(t_1)|\,dt_1 \le C\int\limits_t^T |G_{p_1}(t_1)|\,dt_1, \tag{24}$$

where $C < \infty$ and

$$\sum_{j=p+1}^{\infty}\int\limits_t^{\tau}\psi_1(s)\phi_j(s)ds\phi_j(\tau) \stackrel{\mathsf{def}}{=} G_p(\tau).$$

Let us consider the case of Legendre polynomials. Then

$$|G_{p_1}(t_1)| = \frac{1}{2}\left|\sum_{j_1=p_1+1}^{\infty}(2j_1+1)\int\limits_{-1}^{z(t_1)}\psi_1(u(y))P_{j_1}(y)dyP_{j_1}(z(t_1))\right|, \tag{25}$$

where

$$u(y) = \frac{T-t}{2}y + \frac{T+t}{2}, \quad z(s) = \left(s - \frac{T+t}{2}\right)\frac{2}{T-t}, \tag{26}$$

and $P_j(s)$ $(j = 0, 1, \ldots)$ is the Legendre polynomial.

From (25) and the well-known formula

$$\frac{dP_{j+1}}{dx}(x) - \frac{dP_{j-1}}{dx}(x) = (2j+1)P_j(x), \quad j = 1, 2, \ldots \tag{27}$$

it follows that

$$|G_{p_1}(t_1)| = \frac{1}{2}\left|\sum_{j_1=p_1+1}^{\infty}\left\{(P_{j_1+1}(z(t_1)) - P_{j_1-1}(z(t_1)))\,\psi_1(t_1) - \right.\right.$$

$$\left.\left. -\frac{T-t}{2}\int\limits_{-1}^{z(t_1)}(P_{j_1+1}(y) - P_{j_1-1}(y))\,\psi_1'(u(y))dy\right\}P_{j_1}(z(t_1))\right| \le$$

$$\le C_0\left|\sum_{j_1=p_1+1}^{\infty}(P_{j_1+1}(z(t_1))P_{j_1}(z(t_1)) - P_{j_1-1}(z(t_1))P_{j_1}(z(t_1)))\right| +$$

$$+\frac{T-t}{4}\left|\sum_{j_1=p_1+1}^{\infty}\left\{\psi_1'(t_1)\left(\frac{1}{2j_1+3}(P_{j_1+2}(z(t_1)) - P_{j_1}(z(t_1))) - \right.\right.\right.$$

$$-\frac{1}{2j_1-1}(P_{j_1}(z(t_1))-P_{j_1-2}(z(t_1)))\Biggr)-$$

$$-\frac{T-t}{2}\int\limits_{-1}^{z(t_1)}\Biggl(\frac{1}{2j_1+3}(P_{j_1+2}(y)-P_{j_1}(y))-$$

$$-\frac{1}{2j_1-1}(P_{j_1}(y)-P_{j_1-2}(y))\Biggr)\psi_1''(u(y))dy\Biggr\}P_{j_1}(z(t_1))\Biggr|, \tag{28}$$

where C_0 is a constant, ψ_1' and ψ_1'' are derivatives of the function $\psi_1(s)$ with respect to the variable $u(y)$.

Using (28) and the well-known estimate for Legendre polynomials

$$|P_n(y)|<\frac{K}{\sqrt{n+1}(1-y^2)^{1/4}},\quad y\in(-1,1),\quad n\in\mathbb{N}, \tag{29}$$

where constant K does not depend on y and n, we have

$$|G_{p_1}(t_1)|<$$

$$<C_0\left|\lim_{n\to\infty}\sum_{j_1=p_1+1}^{n}(P_{j_1+1}(z(t_1))P_{j_1}(z(t_1))-P_{j_1-1}(z(t_1))P_{j_1}(z(t_1)))\right|+$$

$$+C_1\sum_{j_1=p_1+1}^{\infty}\frac{1}{j_1^2}\left(\frac{1}{(1-(z(t_1))^2)^{1/2}}+\int\limits_{-1}^{z(t_1)}\frac{dy}{(1-y^2)^{1/4}}\frac{1}{(1-(z(t_1))^2)^{1/4}}\right)<$$

$$<C_0\left|\lim_{n\to\infty}(P_{n+1}(z(t_1))P_n(z(t_1))-P_{p_1}(z(t_1))P_{p_1+1}(z(t_1)))\right|+$$

$$+C_1\sum_{j_1=p_1+1}^{\infty}\frac{1}{j_1^2}\left(\frac{1}{(1-(z(t_1))^2)^{1/2}}+C_2\frac{1}{(1-(z(t_1))^2)^{1/4}}\right)<$$

$$<C_3\lim_{n\to\infty}\left(\frac{1}{n}+\frac{1}{p_1}\right)\frac{1}{(1-(z(t_1))^2)^{1/2}}+$$

$$+C_1\sum_{j_1=p_1+1}^{\infty}\frac{1}{j_1^2}\left(\frac{1}{(1-(z(t_1))^2)^{1/2}}+C_2\frac{1}{(1-(z(t_1))^2)^{1/4}}\right)\le$$

$$\le C_4\left(\left(\frac{1}{p_1}+\sum_{j_1=p_1+1}^{\infty}\frac{1}{j_1^2}\right)\frac{1}{(1-(z(t_1))^2)^{1/2}}+\sum_{j_1=p_1+1}^{\infty}\frac{1}{j_1^2}\frac{1}{(1-(z(t_1))^2)^{1/4}}\right)\le$$

$$\le\frac{K}{p_1}\left(\frac{1}{(1-(z(t_1))^2)^{1/2}}+\frac{1}{(1-(z(t_1))^2)^{1/4}}\right), \tag{30}$$

where $C_0, C_1, \ldots, C_4, K$ are constants, $t_1 \in (t, T)$.

Note that in (30) we used the following inequality

$$\sum_{j_1=p_1+1}^{\infty} \frac{1}{j_1^2} \le \int\limits_{p_1}^{\infty} \frac{dx}{x^2} = \frac{1}{p_1}. \tag{31}$$

From (24) and (30) we get

$$\left| \int\limits_t^T \sum_{j_1=0}^{\infty} C_{j_1}(t_1)\phi_{j_1}(t_1)dt_1 - \sum_{j_1=0}^{p_1} \int\limits_t^T C_{j_1}(t_1)\phi_{j_1}(t_1)dt_1 \right| <$$

$$< \frac{K}{p_1} \left(\int\limits_{-1}^{1} \frac{dy}{(1-y^2)^{1/2}} + \int\limits_{-1}^{1} \frac{dy}{(1-y^2)^{1/4}} \right) \to 0$$

if $p_1 \to \infty$. So we obtain

$$\frac{1}{2} \int\limits_t^T \psi_1(t_1)\psi_2(t_1)dt_1 = \int\limits_t^T \sum_{j_1=0}^{\infty} C_{j_1}(t_1)\phi_{j_1}(t_1)dt_1 =$$

$$= \sum_{j_1=0}^{\infty} \int\limits_t^T C_{j_1}(t_1)\phi_{j_1}(t_1)dt_1 = \sum_{j_1=0}^{\infty} \int\limits_t^T \sum_{j_2=0}^{\infty} C_{j_2j_1}\phi_{j_2}(t_1)\phi_{j_1}(t_1)dt_1 =$$

$$= \sum_{j_1=0}^{\infty} \sum_{j_2=0}^{\infty} \int\limits_t^T C_{j_2j_1}\phi_{j_2}(t_1)\phi_{j_1}(t_1)dt_1 = \sum_{j_1=0}^{\infty} C_{j_1j_1}. \tag{32}$$

In (32) we used the fact that the Fourier–Legendre series

$$\sum_{j_2=0}^{\infty} C_{j_2j_1}\phi_{j_2}(t_1)$$

of the smooth function $C_{j_1}(t_1)$ converges uniformly to this function at the interval $[t+\varepsilon, T-\varepsilon]$ for any $\varepsilon > 0$, converges to this function at any point $t_1 \in (t, T)$, and converges to $C_{j_1}(t+0)$ and $C_{j_1}(T-0)$ when $t_1 = t$, $t_1 = T$ [61].

More precisely, we have

$$\int\limits_t^T \sum_{j_2=0}^{\infty} C_{j_2j_1}\phi_{j_2}(t_1)\phi_{j_1}(t_1)dt_1 = \int\limits_{t+\varepsilon}^{T-\varepsilon} \sum_{j_2=0}^{\infty} C_{j_2j_1}\phi_{j_2}(t_1)\phi_{j_1}(t_1)dt_1 + A_\varepsilon + B_\varepsilon =$$

$$= \sum_{j_2=0}^{\infty} C_{j_2j_1} \int\limits_{t+\varepsilon}^{T-\varepsilon} \phi_{j_2}(t_1)\phi_{j_1}(t_1)dt_1 + A_\varepsilon + B_\varepsilon =$$

$$= \sum_{j_2=0}^{\infty} C_{j_2 j_1} \left(\int\limits_t^T - \int\limits_t^{t+\varepsilon} - \int\limits_{T-\varepsilon}^T \right) \phi_{j_2}(t_1)\phi_{j_1}(t_1)dt_1 + A_\varepsilon + B_\varepsilon =$$

$$= \sum_{j_2=0}^{\infty} C_{j_2 j_1} \Bigl(\mathbf{1}_{\{j_1=j_2\}} - \varepsilon\bigl(\phi_{j_2}(\lambda)\phi_{j_1}(\lambda) + \phi_{j_2}(\theta)\phi_{j_1}(\theta)\bigr) \Bigr) + A_\varepsilon + B_\varepsilon =$$

$$= C_{j_1 j_1} - \varepsilon \left(\sum_{j_2=0}^{\infty} C_{j_2 j_1}\phi_{j_2}(\lambda)\phi_{j_1}(\lambda) + \sum_{j_2=0}^{\infty} C_{j_2 j_1}\phi_{j_2}(\theta)\phi_{j_1}(\theta) \right) + A_\varepsilon + B_\varepsilon, \qquad (33)$$

where $\theta \in [t, t+\varepsilon]$, $\lambda \in [T-\varepsilon, T]$, and

$$A_\varepsilon = \int\limits_t^{t+\varepsilon} \sum_{j_2=0}^{\infty} C_{j_2 j_1}\phi_{j_2}(t_1)\phi_{j_1}(t_1)dt_1, \quad B_\varepsilon = \int\limits_{T-\varepsilon}^{T} \sum_{j_2=0}^{\infty} C_{j_2 j_1}\phi_{j_2}(t_1)\phi_{j_1}(t_1)dt_1.$$

In obtaining (33) we used the theorem on the mean value for the Riemann integral and orthonormality of the functions $\phi_j(x)$ for $j = 0, 1, 2 \ldots$

Further, we have $|A_\varepsilon| + |B_\varepsilon| \le \varepsilon C$, where $C < \infty$ is a constant. Performing the passage to the limit $\lim\limits_{\varepsilon \to +0}$ in the equality (33), we get

$$\int\limits_t^T \sum_{j_2=0}^{\infty} C_{j_2 j_1}\phi_{j_2}(t_1)\phi_{j_1}(t_1)dt_1 = C_{j_1 j_1}.$$

Then (see (32))

$$\sum_{j_1=0}^{\infty} \int\limits_t^T \sum_{j_2=0}^{\infty} C_{j_2 j_1}\phi_{j_2}(t_1)\phi_{j_1}(t_1)dt_1 = \sum_{j_1=0}^{\infty} C_{j_1 j_1}$$

and the relation (17) is proved for the case of Legendre polynomials.

Let us consider the trigonometric case. The complete orthonormal system $\{\phi_j(x)\}_{j=0}^{\infty}$ of trigonometric functions in the space $L_2([t,T])$ has the following form

$$\phi_j(\theta) = \frac{1}{\sqrt{T-t}} \begin{cases} 1, & j = 0 \\ \sqrt{2}\sin\left(2\pi r(\theta - t)/(T-t)\right), & j = 2r-1, \\ \sqrt{2}\cos\left(2\pi r(\theta - t)/(T-t)\right), & j = 2r \end{cases} \qquad (34)$$

where $r = 1, 2, \ldots$

We have

$$S_{2p_1} \stackrel{\mathsf{def}}{=} \left| \int\limits_t^T \sum_{j_1=0}^{\infty} C_{j_1}(t_1)\phi_{j_1}(t_1)dt_1 - \sum_{j_1=0}^{2p_1} \int\limits_t^T C_{j_1}(t_1)\phi_{j_1}(t_1)dt_1 \right| =$$

$$=\left|\int\limits_t^T\sum_{j_1=2p_1+1}^{\infty}\psi_2(t_1)\phi_{j_1}(t_1)\int\limits_t^{t_1}\psi_1(\theta)\phi_{j_1}(\theta)d\theta dt_1\right|=$$

$$=\frac{2}{T-t}\left|\int\limits_t^T\psi_2(t_1)\sum_{j_1=p_1+1}^{\infty}\left(\int\limits_t^{t_1}\psi_1(s)\sin\frac{2\pi j_1(s-t)}{T-t}ds\ \sin\frac{2\pi j_1(t_1-t)}{T-t}+\right.\right.$$

$$\left.\left.+\int\limits_t^{t_1}\psi_1(s)\cos\frac{2\pi j_1(s-t)}{T-t}ds\ \cos\frac{2\pi j_1(t_1-t)}{T-t}\right)dt_1\right|=$$

$$=\frac{1}{\pi}\left|\int\limits_t^T\left(\psi_1(t)\psi_2(t_1)\sum_{j_1=p_1+1}^{\infty}\frac{1}{j_1}\sin\frac{2\pi j_1(t_1-t)}{T-t}+\right.\right.$$

$$+\frac{T-t}{2\pi}\psi_2(t_1)\sum_{j_1=p_1+1}^{\infty}\frac{1}{j_1^2}\left(\psi_1'(t_1)-\psi_1'(t)\cos\frac{2\pi j_1(t_1-t)}{T-t}-\right.$$

$$-\int\limits_t^{t_1}\sin\frac{2\pi j_1(s-t)}{T-t}\psi_1''(s)ds\ \sin\frac{2\pi j_1(t_1-t)}{T-t}-$$

$$\left.\left.\left.-\int\limits_t^{t_1}\cos\frac{2\pi j_1(s-t)}{T-t}\psi_1''(s)ds\ \cos\frac{2\pi j_1(t_1-t)}{T-t}\right)\right)dt_1\right|\le$$

$$\le C_1\left|\int\limits_t^T\psi_2(t_1)\sum_{j_1=p_1+1}^{\infty}\frac{1}{j_1}\sin\frac{2\pi j_1(t_1-t)}{T-t}dt_1\right|+\frac{C_2}{p_1}=$$

$$=C_1\left|\sum_{j_1=p_1+1}^{\infty}\frac{1}{j_1}\int\limits_t^T\psi_2(t_1)\sin\frac{2\pi j_1(t_1-t)}{T-t}dt_1\right|+\frac{C_2}{p_1},\tag{35}$$

where constants C_1, C_2 do not depend on p_1.

Here we used the fact that the functional series

$$\sum_{j_1=1}^{\infty}\frac{1}{j_1}\sin\frac{2\pi j_1(t_1-t)}{T-t}\tag{36}$$

converges uniformly at the interval $[t+\varepsilon, T-\varepsilon]$ for any $\varepsilon>0$ due to Drichlet–Abel Theorem, and converges to zero at the points t and T. Moreover, the series (36) (with accuracy to a linear transformation) is the trigonometric Fourier series of the smooth function $K(t_1)=t_1-t$, $t_1\in[t,T]$. So the series (36) converges to the smooth function at any point $t_1\in(t,T)$.

From (35) we obtain

$$S_{2p_1}=\left|\int\limits_t^T\sum_{j_1=2p_1+1}^{\infty}\psi_2(t_1)\phi_{j_1}(t_1)\int\limits_t^{t_1}\psi_1(\theta)\phi_{j_1}(\theta)d\theta dt_1\right|\le$$

$$
\leq C_3 \left| \sum_{j_1=p_1+1}^{\infty} \frac{1}{j_1^2} \left(\psi_2(T) - \psi_2(t) - \int\limits_t^T \cos\frac{2\pi j_1(s-t)}{T-t} \psi_2'(s) ds \right) \right| + \frac{C_2}{p_1} \leq \frac{C_4}{p_1}, \tag{37}
$$

where constants C_2, C_3, C_4 do not depend on p_1.

Further,

$$
S_{2p_1-1} = \left| \int\limits_t^T \sum_{j_1=2p_1}^{\infty} \psi_2(t_1) \phi_{j_1}(t_1) \int\limits_t^{t_1} \psi_1(\theta) \phi_{j_1}(\theta) d\theta dt_1 \right| =
$$

$$
= \left| S_{2p_1} + \int\limits_t^T \psi_2(t_1) \phi_{2p_1}(t_1) \int\limits_t^{t_1} \psi_1(\theta) \phi_{2p_1}(\theta) d\theta dt_1 \right| \leq
$$

$$
\leq S_{2p_1} + \frac{2}{T-t} \left| \int\limits_t^T \psi_2(t_1) \cos\frac{2\pi p_1(t_1-t)}{T-t} \int\limits_t^{t_1} \psi_1(\theta) \cos\frac{2\pi p_1(\theta-t)}{T-t} d\theta dt_1 \right|. \tag{38}
$$

Moreover,

$$
\int\limits_t^T \psi_2(t_1) \cos\frac{2\pi p_1(t_1-t)}{T-t} \int\limits_t^{t_1} \psi_1(\theta) \cos\frac{2\pi p_1(\theta-t)}{T-t} d\theta dt_1 =
$$

$$
= \frac{T-t}{2\pi p_1} \int\limits_t^T \psi_2(t_1) \cos\frac{2\pi p_1(t_1-t)}{T-t} \left(\psi_1(t_1) \sin\frac{2\pi p_1(t_1-t)}{T-t} - \right.
$$

$$
\left. - \int\limits_t^T \psi_1'(\theta) \sin\frac{2\pi p_1(\theta-t)}{T-t} d\theta \right) dt_1. \tag{39}
$$

The relations (37)–(39) imply that

$$
S_{2p_1-1} \leq \frac{C_5}{p_1}, \tag{40}
$$

where constant C_5 is independent of p_1.

From (37) and (40) we get

$$
S_{p_1} = \left| \int\limits_t^T \sum_{j_1=p_1+1}^{\infty} \psi_2(t_1) \phi_{j_1}(t_1) \int\limits_t^{t_1} \psi_1(\theta) \phi_{j_1}(\theta) d\theta dt_1 \right| \leq \frac{K}{p_1} \to 0 \tag{41}
$$

if $p_1 \to \infty$, where constant K does not depend on p_1 ($p_1 \in \mathbb{N}$). Further steps are similar to the proof of (17) for the case of Legendre polynomials. Theorem 2 is proved.

Note that the estimate (41) will be used further.

Lemma 1. *Under the conditions of Theorem* 2 *the following limit*

$$\lim_{n\to\infty}\sum_{j_1=0}^{n}C_{j_1j_1}$$

exists, where $C_{j_1j_1}$ *is defined by* (5) *for* $k=2$ *and* $j_1=j_2$, *i.e.*

$$C_{j_1j_1}=\int\limits_t^T\psi_2(t_2)\phi_{j_1}(t_2)\int\limits_t^{t_2}\psi_1(t_1)\phi_{j_1}(t_1)dt_1dt_2.$$

Lemma 1 has already been proved in this section. Further, in this section, another proof of Lemma 1 is given. This will allow us to obtain useful estimates that will be used later.

Consider another proof of Lemma 1. We will prove that

$$\sum_{j_1=0}^{n}C_{j_1j_1}$$

is the Cauchy sequence for the cases of Legendre polynomials and trigonometric functions.

Consider the case of Legendre polynomials. Below in this section we write $\lim\limits_{n,m\to\infty}$ instead of $\lim\limits_{\substack{n,m\to\infty\\ n>m}}$. Fix $n>m$ ($n,m\in\mathbb{N}$). We have

$$\sum_{j_1=m+1}^{n}C_{j_1j_1}=\sum_{j_1=m+1}^{n}\int\limits_t^T\psi_2(s)\phi_{j_1}(s)\int\limits_t^{s}\psi_1(\tau)\phi_{j_1}(\tau)d\tau ds=$$

$$=\frac{T-t}{4}\sum_{j_1=m+1}^{n}(2j_1+1)\int\limits_{-1}^{1}\psi_2(u(x))P_{j_1}(x)\int\limits_{-1}^{x}\psi_1(u(y))P_{j_1}(y)dydx=$$

$$=\frac{T-t}{4}\sum_{j_1=m+1}^{n}\int\limits_{-1}^{1}\psi_1(u(x))\psi_2(u(x))\left(P_{j_1+1}(x)P_{j_1}(x)-P_{j_1}(x)P_{j_1-1}(x)\right)dx-$$

$$-\frac{(T-t)^2}{8}\sum_{j_1=m+1}^{n}\int\limits_{-1}^{1}\psi_2(u(x))P_{j_1}(x)\int\limits_{-1}^{x}\left(P_{j_1+1}(y)-P_{j_1-1}(y)\right)\psi_1'(u(y))dydx=$$

$$=\frac{T-t}{4}\int\limits_{-1}^{1}\psi_1(u(x))\psi_2(u(x))\sum_{j_1=m+1}^{n}\left(P_{j_1+1}(x)P_{j_1}(x)-P_{j_1}(x)P_{j_1-1}(x)\right)dx-$$

$$-\frac{(T-t)^2}{8}\sum_{j_1=m+1}^{n}\int\limits_{-1}^{1}\left(P_{j_1+1}(y)-P_{j_1-1}(y)\right)\psi_1'(u(y))\int\limits_{y}^{1}P_{j_1}(x)\psi_2(u(x))dxdy=$$

$$=\frac{T-t}{4}\int\limits_{-1}^{1}\psi_1(u(x))\psi_2(u(x))\left(P_{n+1}(x)P_n(x)-P_{m+1}(x)P_m(x)\right)dx+$$

$$+\frac{(T-t)^2}{8}\sum_{j_1=m+1}^{n}\frac{1}{2j_1+1}\int\limits_{-1}^{1}\left(P_{j_1+1}(y)-P_{j_1-1}(y)\right)\psi_1'(u(y))\times$$

$$\times\Biggl(\left(P_{j_1+1}(y)-P_{j_1-1}(y)\right)\psi_2(u(y))+$$

$$+\frac{T-t}{2}\int\limits_{y}^{1}\left(P_{j_1+1}(x)-P_{j_1-1}(x)\right)\psi_2'(u(x))dx\Biggr)dy, \tag{42}$$

where ψ_1', ψ_2' are derivatives of the functions $\psi_1(\tau)$, $\psi_2(\tau)$ with respect to the variable $u(y)$ (see (26)).

Applying the estimate (29) and taking into account the boundedness of the functions $\psi_1(\tau)$, $\psi_2(\tau)$ and their derivatives, we finally obtain

$$\left|\sum_{j_1=m+1}^{n}C_{j_1j_1}\right|\le C_1\left(\frac{1}{n}+\frac{1}{m}\right)\int\limits_{-1}^{1}\frac{dx}{\left(1-x^2\right)^{1/2}}+$$

$$+C_2\sum_{j_1=m+1}^{n}\frac{1}{j_1^2}\left(\int\limits_{-1}^{1}\frac{dy}{\left(1-y^2\right)^{1/2}}+\int\limits_{-1}^{1}\frac{1}{\left(1-y^2\right)^{1/4}}\int\limits_{y}^{1}\frac{dx}{\left(1-x^2\right)^{1/4}}dy\right)\le$$

$$\le C_3\left(\frac{1}{n}+\frac{1}{m}+\sum_{j_1=m+1}^{n}\frac{1}{j_1^2}\right)\to 0 \tag{43}$$

if $n,m\to\infty$ $(n>m)$, where constants C_1,C_2,C_3 do not depend on n and m. The relation (43) completes the proof of Lemma 1 for the polynomial case.

Consider the trigonometric case. Fix $n>m$ $(n,m\in\mathbb{N})$. Denote

$$S_{n,m}\stackrel{\sf def}{=}\sum_{j_1=m+1}^{n}C_{j_1j_1}=\sum_{j_1=m+1}^{n}\int\limits_{t}^{T}\psi_2(t_2)\phi_{j_1}(t_2)\int\limits_{t}^{t_2}\psi_1(t_1)\phi_{j_1}(t_1)dt_1dt_2.$$

By analogy with (42) we obtain

$$S_{2n,2m}=\sum_{j_1=2m+1}^{2n}\int\limits_{t}^{T}\psi_2(t_2)\phi_{j_1}(t_2)\int\limits_{t}^{t_2}\psi_1(t_1)\phi_{j_1}(t_1)dt_1dt_2=$$

$$=\frac{2}{T-t}\sum_{j_1=m+1}^{n}\left(\int\limits_{t}^{T}\psi_2(t_2){\rm sin}\frac{2\pi j_1(t_2-t)}{T-t}\int\limits_{t}^{t_2}\psi_1(t_1){\rm sin}\frac{2\pi j_1(t_1-t)}{T-t}dt_1dt_2+\right.$$

$$\left.+\int\limits_{t}^{T}\psi_2(t_2){\rm cos}\frac{2\pi j_1(t_2-t)}{T-t}\int\limits_{t}^{t_2}\psi_1(t_1){\rm cos}\frac{2\pi j_1(t_1-t)}{T-t}dt_1dt_2\right)=$$

$$=\frac{T-t}{2\pi^2}\sum_{j_1=m+1}^{n}\frac{1}{j_1^2}\left(\psi_1(t)\left(\psi_2(t)-\psi_2(T)+\int\limits_{t}^{T}\psi_2'(t_2){\rm cos}\frac{2\pi j_1(t_2-t)}{T-t}dt_2\right)-\right.$$

$$-\int\limits_{t}^{T}\psi_1'(t_1){\rm cos}\frac{2\pi j_1(t_1-t)}{T-t}\left(\psi_2(T)-\psi_2(t_1){\rm cos}\frac{2\pi j_1(t_1-t)}{T-t}-\int\limits_{t_1}^{T}\psi_2'(t_2){\rm cos}\frac{2\pi j_1(t_2-t)}{T-t}dt_2\right)dt_1+$$

$$+\int\limits_t^T \psi_1'(t_1){\rm sin}\frac{2\pi j_1(t_1-t)}{T-t}\left(\psi_2(t_1){\rm sin}\frac{2\pi j_1(t_1-t)}{T-t}+\int\limits_{t_1}^T \psi_2'(t_2){\rm sin}\frac{2\pi j_1(t_2-t)}{T-t}dt_2\right)dt_1\Biggr), \qquad (44)$$

where $\psi_1'(\tau)$, $\psi_2'(\tau)$ are derivatives of the functions $\psi_1(\tau)$, $\psi_2(\tau)$ with respect to the variable τ.

From (44) we get

$$\left|S_{2n,2m}\right| \le C\sum_{j_1=m+1}^{n}\frac{1}{j_1^2}\to 0 \qquad (45)$$

if $n,m\to\infty$ $(n>m)$, where constant C does not depend on n and m.

Further,

$$S_{2n-1,2m}=S_{2n,2m}-\frac{2}{T-t}\int\limits_t^T \psi_2(t_2){\rm cos}\frac{2\pi n(t_2-t)}{T-t}\int\limits_t^{t_2} \psi_1(t_1){\rm cos}\frac{2\pi n(t_1-t)}{T-t}dt_1dt_2, \qquad (46)$$

$$S_{2n,2m-1}=S_{2n,2m}+\frac{2}{T-t}\int\limits_t^T \psi_2(t_2){\rm cos}\frac{2\pi m(t_2-t)}{T-t}\int\limits_t^{t_2} \psi_1(t_1){\rm cos}\frac{2\pi m(t_1-t)}{T-t}dt_1dt_2, \qquad (47)$$

$$S_{2n-1,2m-1}=S_{2n,2m-1}-\frac{2}{T-t}\int\limits_t^T \psi_2(t_2){\rm cos}\frac{2\pi n(t_2-t)}{T-t}\int\limits_t^{t_2} \psi_1(t_1){\rm cos}\frac{2\pi n(t_1-t)}{T-t}dt_1dt_2=$$

$$=S_{2n,2m}+\frac{2}{T-t}\int\limits_t^T \psi_2(t_2){\rm cos}\frac{2\pi m(t_2-t)}{T-t}\int\limits_t^{t_2} \psi_1(t_1){\rm cos}\frac{2\pi m(t_1-t)}{T-t}dt_1dt_2-$$

$$-\frac{2}{T-t}\int\limits_t^T \psi_2(t_2){\rm cos}\frac{2\pi n(t_2-t)}{T-t}\int\limits_t^{t_2} \psi_1(t_1){\rm cos}\frac{2\pi n(t_1-t)}{T-t}dt_1dt_2. \qquad (48)$$

Integrating by parts in (46)–(48), we obtain

$$\left|S_{2n-1,2m}\right|\le\left|S_{2n,2m}\right|+\frac{C_1}{n},\quad \left|S_{2n,2m-1}\right|\le\left|S_{2n,2m}\right|+\frac{C_1}{m}, \qquad (49)$$

$$\left|S_{2n-1,2m-1}\right|\le\left|S_{2n,2m}\right|+C_1\left(\frac{1}{m}+\frac{1}{n}\right), \qquad (50)$$

where constant C_1 does not depend on n and m.

The relations (45), (49), (50) imply that

$$\lim_{n,m\to\infty}\left|S_{2n,2m}\right|=\lim_{n,m\to\infty}\left|S_{2n-1,2m}\right|=\lim_{n,m\to\infty}\left|S_{2n,2m-1}\right|=\lim_{n,m\to\infty}\left|S_{2n-1,2m-1}\right|=0. \qquad (51)$$

From (51) we get

$$\lim_{n,m\to\infty}|S_{n,m}|=0. \tag{52}$$

The relation (52) completes the proof.

To conclude this section, we note that in [26], Sect. 2.1.4 (also see [64]) the following formula

$$\sum_{j=0}^{\infty}\int\limits_t^T\psi_2(t_2)\phi_j(t_2)\int\limits_t^{t_2}\psi_1(\tau)\phi_j(t_1)dt_1dt_2=\frac{1}{2}\int\limits_t^T\psi_1(\tau)\psi_2(\tau)d\tau \tag{53}$$

is proved, where $\{\phi_j(x)\}_{j=0}^{\infty}$ is an arbitrary complete orthonormal system of functions in the space $L_2([t,T])$ and $\psi_1(\tau),\psi_2(\tau)\in L_2([t,T])$.

Let us consider the proof of (53) from [26], Sect. 2.1.4. First consider the case $\psi_1(\tau)\equiv\psi_2(\tau)$ or

$$\psi_1(\tau)=\psi_2(\tau)\int\limits_t^{\tau}g(\theta)d\theta, \tag{54}$$

where $\tau\in[t,T]$ and $\psi_1(\tau),\psi_2(\tau),g(\tau)\in L_2([t,T])$.

Suppose that $\{\phi_j(x)\}_{j=0}^{\infty}$ is an arbitrary complete orthonormal system of functions in the space $L_2([t,T])$.

Using Fubini's Theorem, Lebesgue's Dominated Convergence Theorem and the Parseval equality, we have (see (54))

$$\sum_{j=0}^{\infty}\int\limits_t^T\psi_2(t_2)\phi_j(t_2)\int\limits_t^{t_2}\psi_1(t_1)\phi_j(t_1)dt_1dt_2=$$

$$=\sum_{j=0}^{\infty}\int\limits_t^T\psi_2(t_2)\phi_j(t_2)\int\limits_t^{t_2}\psi_2(t_1)\phi_j(t_1)\int\limits_t^{t_1}g(\tau)d\tau dt_1dt_2=$$

$$=\sum_{j=0}^{\infty}\int\limits_t^T g(\tau)\int\limits_{\tau}^T\psi_2(t_1)\phi_j(t_1)\int\limits_{t_1}^T\psi_2(t_2)\phi_j(t_2)dt_2dt_1d\tau=$$

$$=\frac{1}{2}\sum_{j=0}^{\infty}\int\limits_t^T g(\tau)\left(\int\limits_{\tau}^T\psi_2(t_1)\phi_j(t_1)dt_1\right)^2d\tau= \tag{55}$$

$$=\frac{1}{2}\int\limits_t^T g(\tau)\sum_{j=0}^{\infty}\left(\int\limits_t^T\mathbf{1}_{\{\tau<t_1\}}\psi_2(t_1)\phi_j(t_1)dt_1\right)^2d\tau= \tag{56}$$

$$=\frac{1}{2}\int\limits_t^T g(\tau)\int\limits_t^T\mathbf{1}_{\{\tau<t_1\}}\psi_2^2(t_1)dt_1d\tau=\frac{1}{2}\int\limits_t^T g(\tau)\int\limits_{\tau}^T\psi_2^2(t_1)dt_1d\tau=$$

$$= \frac{1}{2}\int\limits_t^T \psi_2^2(t_1)\int\limits_t^{t_1} g(\tau)d\tau dt_1 = \tag{57}$$

$$= \frac{1}{2}\int\limits_t^T \psi_1(t_1)\psi_2(t_1)dt_1, \tag{58}$$

where the transition from (55) to (56) is based on Lebesgue's Dominated Convergence Theorem. The integrable majorant exists due to Parseval's equality

$$|g(\tau)|\sum_{j=0}^{q}\left(\int\limits_{\tau}^{T}\psi_2(t_1)\phi_j(t_1)dt_1\right)^2 \le |g(\tau)|\sum_{j=0}^{\infty}\left(\int\limits_{t}^{T}\mathbf{1}_{\{\tau<t_1\}}\psi_2(t_1)\phi_j(t_1)dt_1\right)^2 \le C\,|g(\tau)|\,,\quad C<\infty.$$

From the other hand, using Fubini's Theorem and the generalized Parseval equality as well as (57), we get

$$\sum_{j=0}^{\infty}\int\limits_t^T \psi_1(t_2)\phi_j(t_2)\int\limits_t^{t_2}\psi_2(t_1)\phi_j(t_1)dt_1dt_2 =$$

$$= \sum_{j=0}^{\infty}\int\limits_t^T \psi_2(t_2)\phi_j(t_2)\int\limits_t^{t_2}g(\tau)d\tau\int\limits_t^{t_2}\psi_2(t_1)\phi_j(t_1)dt_1dt_2 =$$

$$= \sum_{j=0}^{\infty}\int\limits_t^T \psi_2(t_1)\phi_j(t_1)\int\limits_{t_1}^{T}\psi_2(t_2)\phi_j(t_2)\int\limits_t^{t_2}g(\tau)d\tau dt_2dt_1 =$$

$$= \sum_{j=0}^{\infty}\int\limits_t^T \psi_2(t_1)\phi_j(t_1)dt_1\int\limits_t^{T}\psi_2(t_2)\phi_j(t_2)\int\limits_t^{t_2}g(\tau)d\tau dt_2 -$$

$$- \sum_{j=0}^{\infty}\int\limits_t^T \psi_2(t_1)\phi_j(t_1)\int\limits_t^{t_1}\psi_2(t_2)\phi_j(t_2)\int\limits_t^{t_2}g(\tau)d\tau dt_2dt_1 =$$

$$= \int\limits_t^T \psi_2(t_1)\cdot\psi_2(t_1)\int\limits_t^{t_1}g(\tau)d\tau dt_1 - \frac{1}{2}\int\limits_t^T \psi_2^2(t_1)\int\limits_t^{t_1}g(\tau)d\tau dt_1 =$$

$$= \frac{1}{2}\int\limits_t^T \psi_2^2(t_1)\int\limits_t^{t_1}g(\tau)d\tau dt_1 = \frac{1}{2}\int\limits_t^T \psi_1(t_1)\psi_2(t_1)dt_1. \tag{59}$$

In addition, for the case $\psi_1(\tau)\equiv\psi_2(\tau)$, using the Parseval equality, we obtain

$$\sum_{j=0}^{\infty}\int\limits_t^T \psi_1(t_2)\phi_j(t_2)\int\limits_t^{t_2}\psi_1(t_1)\phi_j(t_1)dt_1dt_2 =$$

$$
= \frac{1}{2} \sum_{j=0}^{\infty} \left(\int_t^T \psi_1(t_1)\phi_j(t_1)dt_1 \right)^2 = \frac{1}{2} \int_t^T \psi_1^2(t_1)dt_1. \tag{60}
$$

Suppose that $\psi_2(\tau) = (\tau - t)^l, g(\tau) = k(\tau - t)^{k-1}$, where $l = 0, 1, 2, \ldots,\ k = 1, 2, \ldots$ From (54) we have

$$
\psi_1(\tau) = \psi_2(\tau) \int_t^\tau g(\theta)d\theta = k(\tau - t)^l \int_t^\tau (\theta - t)^{k-1} d\theta = (\tau - t)^{l+k}.
$$

Taking into account (58)–(60), we obtain

$$
\sum_{j=0}^{\infty} \int_t^T (t_2 - t)^l \phi_j(t_2) \int_t^{t_2} (t_1 - t)^{l+k} \phi_j(t_1) dt_1 dt_2 =
$$

$$
= \sum_{j=0}^{\infty} \int_t^T (t_2 - t)^{l+k} \phi_j(t_2) \int_t^{t_2} (t_1 - t)^l \phi_j(t_1) dt_1 dt_2 = \frac{1}{2} \int_t^T (\tau - t)^{2l+k} d\tau, \tag{61}
$$

where $k, l = 0, 1, 2, \ldots$

The equality similar to (61) was obtained in [64] using other arguments. In addition, the formula similar to (61) was used in [64] to generalize the equality (53) to the case of an arbitrary complete orthonormal system of functions in the space $L_2([t,T])$ and $\psi_1(\tau), \psi_2(\tau) \in L_2([t,T])$. Consider this approach [64] in more detail.

Let us rewrite the equality (61) in the following form

$$
\sum_{j=0}^{\infty} \int_t^T (t_2 - t)^l \phi_j(t_2) \int_t^{t_2} (t_1 - t)^m \phi_j(t_1) dt_1 dt_2 = \frac{1}{2} \int_t^T (\tau - t)^l (\tau - t)^m d\tau, \tag{62}
$$

where $l, m = 0, 1, 2, \ldots$

Since the equality (62) is valid for monomials with respect to $\tau - t$ ($\tau \in [t,T]$), it will obviously also be valid for Legendre polynomials that form a complete orthonormal system of functions in the space $L_2([t,T])$ and finite linear combinations of Legendre polynomials.

Let $\psi_1(\tau), \psi_2(\tau) \in L_2([t,T])$ and $\psi_1^{(p)}(\tau), \psi_2^{(q)}(\tau)$ be approximations of the functions $\psi_1(\tau), \psi_2(\tau)$, respectively, which are partial sums of the corresponding Fourier–Legendre series. Then we have (see (62))

$$
\sum_{j=0}^{\infty} \int_t^T \psi_2^{(q)}(t_2) \phi_j(t_2) \int_t^{t_2} \psi_1^{(p)}(\tau) \phi_j(t_1) dt_1 dt_2 = \frac{1}{2} \int_t^T \psi_1^{(p)}(\tau) \psi_2^{(q)}(\tau) d\tau, \tag{63}
$$

where $p, q \in \mathbb{N}$, the series converges absolutly and its sum does not depend on a basis system $\{\phi_j(x)\}_{j=0}^{\infty}$.

Let us fix q in (63). The right-hand side of (63) for a fixed q defines (as a scalar product in $L_2([t,T])$) a linear bounded (and therefore continuous) functional in $L_2([t,T])$, which is given by the function $\psi_2^{(q)}$. The left-hand side of the equality (63) has the same properties. Let us implement the passage to the limit $\lim\limits_{p \to \infty}$ in (63)

(64) $$\sum_{j=0}^{\infty}\int\limits_t^T \psi_2^{(q)}(t_2)\phi_j(t_2)\int\limits_t^{t_2}\psi_1(\tau)\phi_j(t_1)dt_1dt_2=\frac{1}{2}\int\limits_t^T\psi_1(\tau)\psi_2^{(q)}(\tau)d\tau,$$

where $q\in\mathbb{N}$. The equality (64) defines a linear bounded functional in $L_2([t,T])$ given by the function ψ_1. Let us implement the passage to the limit $\lim\limits_{q\to\infty}$ in (64)

$$\sum_{j=0}^{\infty}\int\limits_t^T \psi_2(t_2)\phi_j(t_2)\int\limits_t^{t_2}\psi_1(\tau)\phi_j(t_1)dt_1dt_2=\frac{1}{2}\int\limits_t^T\psi_1(\tau)\psi_2(\tau)d\tau,$$

where $\{\phi_j(x)\}_{j=0}^{\infty}$ is an arbitrary complete orthonormal system of functions in the space $L_2([t,T])$ and $\psi_1(\tau),\psi_2(\tau)\in L_2([t,T])$. The proof is completed.

4. Expansion of Iterated Stratonovich Stochastic Integrals of Multiplicity 3

Theorem 3 [18], [19], [22], [24], [26]-[29]. *Suppose that $\{\phi_j(x)\}_{j=0}^{\infty}$ is a complete orthonormal system of Legendre polynomials or trigonometric functions in the space $L_2([t,T])$. At the same time $\psi_2(s)$ is a continuously differentiable nonrandom function on $[t,T]$ and $\psi_1(s)$, $\psi_3(s)$ are twice continuously differentiable nonrandom functions on $[t,T]$. Then*

(65) $$J^*[\psi^{(3)}]_{T,t}=\underset{p\to\infty}{\text{l.i.m.}}\sum_{j_1,j_2,j_3=0}^{p}C_{j_3j_2j_1}\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}\zeta_{j_3}^{(i_3)}\quad (i_1,i_2,i_3=1,\ldots,m),$$

where notations are the same as in Theorem 1.

Proof. Let us consider the case of Legendre polynomials. From (11) for the case $p_1=p_2=p_3=p$ and the standard relation between Ito and Stratonovich stochastic integrals (2), (3) of third multiplicity it follows that Theorem 3 will be proved if w. p. 1

(66) $$\underset{p\to\infty}{\text{l.i.m.}}\sum_{j_1=0}^{p}\sum_{j_3=0}^{p}C_{j_3j_1j_1}\zeta_{j_3}^{(i_3)}=\frac{1}{2}\int\limits_t^T\psi_3(s)\int\limits_t^s\psi_2(s_1)\psi_1(s_1)ds_1d\mathbf{f}_s^{(i_3)},$$

(67) $$\underset{p\to\infty}{\text{l.i.m.}}\sum_{j_1=0}^{p}\sum_{j_3=0}^{p}C_{j_3j_3j_1}\zeta_{j_1}^{(i_1)}=\frac{1}{2}\int\limits_t^T\psi_3(s)\psi_2(s)\int\limits_t^s\psi_1(s_1)d\mathbf{f}_{s_1}^{(i_1)}ds,$$

(68) $$\underset{p\to\infty}{\text{l.i.m.}}\sum_{j_1=0}^{p}\sum_{j_3=0}^{p}C_{j_1j_3j_1}\zeta_{j_3}^{(i_2)}=0.$$

Let us prove (66). Using Theorem 1 when $k=1$ (also see (9)), we can write

$$\frac{1}{2}\int\limits_t^T\psi_3(s)\int\limits_t^s\psi_2(s_1)\psi_1(s_1)ds_1d\mathbf{f}_s^{(i_3)}=\frac{1}{2}\underset{p\to\infty}{\text{l.i.m.}}\sum_{j_3=0}^{p}\tilde{C}_{j_3}\zeta_{j_3}^{(i_3)},$$

where

$$\tilde{C}_{j_3}=\int\limits_t^T\phi_{j_3}(s)\psi_3(s)\int\limits_t^s\psi_2(s_1)\psi_1(s_1)ds_1ds.$$

We have

$$E_p\stackrel{\rm def}{=}{\sf M}\left\{\left(\sum_{j_1=0}^p\sum_{j_3=0}^p C_{j_3j_1j_1}\zeta_{j_3}^{(i_3)}-\frac{1}{2}\sum_{j_3=0}^p\tilde{C}_{j_3}\zeta_{j_3}^{(i_3)}\right)^2\right\}=$$

$$={\sf M}\left\{\left(\sum_{j_3=0}^p\left(\sum_{j_1=0}^p C_{j_3j_1j_1}-\frac{1}{2}\tilde{C}_{j_3}\right)\zeta_{j_3}^{(i_3)}\right)^2\right\}=\sum_{j_3=0}^p\left(\sum_{j_1=0}^p C_{j_3j_1j_1}-\frac{1}{2}\tilde{C}_{j_3}\right)^2=$$

$$=\sum_{j_3=0}^p\left(\sum_{j_1=0}^p\int\limits_t^T\psi_3(s)\phi_{j_3}(s)\int\limits_t^s\psi_2(s_1)\phi_{j_1}(s_1)\int\limits_t^{s_1}\psi_1(s_2)\phi_{j_1}(s_2)ds_2ds_1ds-\right.$$

$$\left.-\frac{1}{2}\int\limits_t^T\psi_3(s)\phi_{j_3}(s)\int\limits_t^s\psi_1(s_1)\psi_2(s_1)ds_1ds\right)^2=$$

$$=\sum_{j_3=0}^p\left(\int\limits_t^T\psi_3(s)\phi_{j_3}(s)\int\limits_t^s\left(\sum_{j_1=0}^p\psi_2(s_1)\phi_{j_1}(s_1)\times\right.\right.$$

$$\left.\left.\times\int\limits_t^{s_1}\psi_1(s_2)\phi_{j_1}(s_2)ds_2-\frac{1}{2}\psi_1(s_1)\psi_2(s_1)\right)ds_1ds\right)^2. \qquad (69)$$

Let us substitute $t_1=t_2=s_1$ into (19). Then for all $s_1\in(t,T)$

$$\sum_{j_1=0}^{\infty}\psi_2(s_1)\phi_{j_1}(s_1)\int\limits_t^{s_1}\psi_1(s_2)\phi_{j_1}(s_2)ds_2=\frac{1}{2}\psi_1(s_1)\psi_2(s_1). \qquad (70)$$

From (69) and (70) it follows that

$$E_p=\sum_{j_3=0}^p\left(\int\limits_t^T\psi_3(s)\phi_{j_3}(s)\int\limits_t^s\sum_{j_1=p+1}^{\infty}\psi_2(s_1)\phi_{j_1}(s_1)\int\limits_t^{s_1}\psi_1(s_2)\phi_{j_1}(s_2)ds_2ds_1ds\right)^2. \qquad (71)$$

From (71) and (30) we obtain

$$E_p<C_1\sum_{j_3=0}^p\left(\int\limits_t^T|\phi_{j_3}(s)|\frac{1}{p}\left(\int\limits_{-1}^{z(s)}\frac{dy}{(1-y^2)^{1/2}}+\int\limits_{-1}^{z(s)}\frac{dy}{(1-y^2)^{1/4}}\right)ds\right)^2\le$$

$$
\leq \frac{C_2}{p^2} \sum_{j_3=0}^{p} \left(\int\limits_t^T |\phi_{j_3}(s)| ds \right)^2 \leq \frac{C_2(T-t)}{p^2} \sum_{j_3=0}^{p} \int\limits_t^T \phi_{j_3}^2(s) ds = \frac{C_3 p}{p^2} \ \ \to \ 0
$$

if $p \to \infty$, where constants C_1, C_2, C_3 do not depend on p. The equality (66) is proved.

Let us prove (67). Using the Ito formula, we have

$$
\frac{1}{2} \int\limits_t^T \psi_3(s)\psi_2(s) \int\limits_t^s \psi_1(s_1) d\mathbf{f}_{s_1}^{(i_1)} ds = \frac{1}{2} \int\limits_t^T \psi_1(s_1) \int\limits_{s_1}^T \psi_3(s)\psi_2(s) ds d\mathbf{f}_{s_1}^{(i_1)} \quad \text{w. p. 1.}
$$

Using Theorem 1 for $k = 1$ (also see (9)), we obtain

$$
\frac{1}{2} \int\limits_t^T \psi_1(s) \int\limits_s^T \psi_3(s_1)\psi_2(s_1) ds_1 d\mathbf{f}_s^{(i_1)} = \frac{1}{2} \underset{p\to\infty}{\text{l.i.m.}} \sum_{j_1=0}^{p} C_{j_1}^{*} \zeta_{j_1}^{(i_1)},
$$

where

$$
C_{j_1}^{*} = \int\limits_t^T \psi_1(s)\phi_{j_1}(s) \int\limits_s^T \psi_3(s_1)\psi_2(s_1) ds_1 ds. \tag{72}
$$

We have

$$
E_p' \stackrel{\text{def}}{=} \mathsf{M}\left\{ \left(\sum_{j_1=0}^{p} \sum_{j_3=0}^{p} C_{j_3 j_3 j_1} \zeta_{j_1}^{(i_1)} - \frac{1}{2} \sum_{j_1=0}^{p} C_{j_1}^{*} \zeta_{j_1}^{(i_1)} \right)^2 \right\} =
$$

$$
= \mathsf{M}\left\{ \left(\sum_{j_1=0}^{p} \left(\sum_{j_3=0}^{p} C_{j_3 j_3 j_1} - \frac{1}{2} C_{j_1}^{*} \right) \zeta_{j_1}^{(i_1)} \right)^2 \right\} =
$$

$$
= \sum_{j_1=0}^{p} \left(\sum_{j_3=0}^{p} C_{j_3 j_3 j_1} - \frac{1}{2} C_{j_1}^{*} \right)^2, \tag{73}
$$

$$
C_{j_3 j_3 j_1} = \int\limits_t^T \psi_3(s)\phi_{j_3}(s) \int\limits_t^s \psi_2(s_1)\phi_{j_3}(s_1) \int\limits_t^{s_1} \psi_1(s_2)\phi_{j_1}(s_2) ds_2 ds_1 ds =
$$

$$
= \int\limits_t^T \psi_1(s_2)\phi_{j_1}(s_2) \int\limits_{s_2}^T \psi_2(s_1)\phi_{j_3}(s_1) \int\limits_{s_1}^T \psi_3(s)\phi_{j_3}(s) ds ds_1 ds_2. \tag{74}
$$

From (72)–(74) we obtain

$$E'_p = \sum_{j_1=0}^{p} \left(\int\limits_t^T \psi_1(s_2)\phi_{j_1}(s_2) \int\limits_{s_2}^T \left(\sum_{j_3=0}^{p} \psi_2(s_1)\phi_{j_3}(s_1) \times \right.\right.$$

$$\left.\left. \times \int\limits_{s_1}^T \psi_3(s)\phi_{j_3}(s)ds - \frac{1}{2}\psi_3(s_1)\psi_2(s_1) \right) ds_1 ds_2 \right)^2 . \tag{75}$$

Let us prove the following equality for all $s_1 \in (t, T)$

$$\sum_{j_3=0}^{\infty} \psi_2(s_1)\phi_{j_3}(s_1) \int\limits_{s_1}^T \psi_3(s)\phi_{j_3}(s)ds = \frac{1}{2}\psi_2(s_1)\psi_3(s_1). \tag{76}$$

Denote

$$K_1^*(t_1, t_2) = K_1(t_1, t_2) + \frac{1}{2}\mathbf{1}_{\{t_1=t_2\}}\psi_2(t_1)\psi_3(t_1), \tag{77}$$

where

$$K_1(t_1, t_2) = \psi_2(t_1)\psi_3(t_2)\mathbf{1}_{\{t_1<t_2\}}, \quad t_1, t_2 \in [t, T].$$

Let us expand the function $K_1^*(t_1, t_2)$ using the variable t_2, when t_1 is fixed, into the Fourier–Legendre series at the interval (t, T)

$$K_1^*(t_1, t_2) = \sum_{j_3=0}^{\infty} \psi_2(t_1) \int\limits_{t_1}^T \psi_3(t_2)\phi_{j_3}(t_2)dt_2 \cdot \phi_{j_3}(t_2) \quad (t_2 \neq t, T). \tag{78}$$

The equality (78) is fulfilled pointwise in each point of the interval (t, T) with respect to the variable t_2, when $t_1 \in [t, T]$ is fixed, due to piecewise smoothness of the function $K_1^*(t_1, t_2)$ with respect to the variable $t_2 \in [t, T]$ (t_1 is fixed).

Obtaining (78) we also used the fact that the right-hand side of (78) converges when $t_1 = t_2$ (point of a finite discontinuity of the function $K_1(t_1, t_2)$) to the value

$$\frac{1}{2}\left(K_1(t_1, t_1 - 0) + K_1(t_1, t_1 + 0)\right) = \frac{1}{2}\psi_2(t_1)\psi_3(t_1) = K_1^*(t_1, t_1).$$

Let us substitute $t_1 = t_2$ into (78). Then we have (76).

From (75) and (76) we obtain

$$E'_p = \sum_{j_1=0}^{p} \left(\int\limits_t^T \psi_1(s_2)\phi_{j_1}(s_2) \int\limits_{s_2}^T \sum_{j_3=p+1}^{\infty} \psi_2(s_1)\phi_{j_3}(s_1) \int\limits_{s_1}^T \psi_3(s)\phi_{j_3}(s)ds ds_1 ds_2 \right)^2 . \tag{79}$$

Analogously to (30) we obtain for the twice continuously differentiable function $\psi_3(s)$ the following estimate

$$\left|\sum_{j_3=p+1}^{\infty}\phi_{j_3}(s_1)\int\limits_{s_1}^{T}\psi_3(s)\phi_{j_3}(s)ds\right|<$$

$$<\frac{C}{p}\left(\frac{1}{(1-(z(s_1))^2)^{1/2}}+\frac{1}{(1-(z(s_1))^2)^{1/4}}\right), \tag{80}$$

where constant C does not depend on p, $s_1\in(t,T)$, and $z(s_1)$ is defined by (26). Further consideration is similar to the proof of (66). The relation (67) is proved.

Let us prove (68). We have

$$E_p''\stackrel{\sf def}{=}{\sf M}\left\{\left(\sum_{j_1=0}^{p}\sum_{j_3=0}^{p}C_{j_1j_3j_1}\zeta_{j_3}^{(i_2)}\right)^2\right\}=\sum_{j_3=0}^{p}\left(\sum_{j_1=0}^{p}C_{j_1j_3j_1}\right)^2, \tag{81}$$

$$C_{j_1j_3j_1}=\int\limits_t^T\psi_3(s)\phi_{j_1}(s)\int\limits_t^s\psi_2(s_1)\phi_{j_3}(s_1)\int\limits_t^{s_1}\psi_1(s_2)\phi_{j_1}(s_2)ds_2ds_1ds=$$

$$=\int\limits_t^T\psi_2(s_1)\phi_{j_3}(s_1)\int\limits_t^{s_1}\psi_1(s_2)\phi_{j_1}(s_2)ds_2\int\limits_{s_1}^T\psi_3(s)\phi_{j_1}(s)dsds_1. \tag{82}$$

Let us substitute (82) into (81)

$$E_p''=\sum_{j_3=0}^{p}\left(\int\limits_t^T\psi_2(s_1)\phi_{j_3}(s_1)\sum_{j_1=0}^{p}\int\limits_t^{s_1}\psi_1(\theta)\phi_{j_1}(\theta)d\theta\int\limits_{s_1}^T\psi_3(s)\phi_{j_1}(s)dsds_1\right)^2. \tag{83}$$

The generalized Parseval equality gives

$$\sum_{j_1=0}^{\infty}\int\limits_t^{s_1}\psi_1(\theta)\phi_{j_1}(\theta)d\theta\int\limits_{s_1}^T\psi_3(s)\phi_{j_1}(s)ds=$$

$$=\sum_{j_1=0}^{\infty}\int\limits_t^T\mathbf{1}_{\{\theta<s_1\}}\psi_1(\theta)\phi_{j_1}(\theta)d\theta\int\limits_t^T\mathbf{1}_{\{s>s_1\}}\psi_3(s)\phi_{j_1}(s)ds=$$

$$=\int\limits_t^T\mathbf{1}_{\{\tau<s_1\}}\psi_1(\tau)\mathbf{1}_{\{\tau>s_1\}}\psi_3(\tau)d\tau=0. \tag{84}$$

Using (83) and (84), we get

$$E_p'' = \sum_{j_3=0}^{p}\left(\int\limits_t^T \psi_2(s_1)\phi_{j_3}(s_1)\sum_{j_1=p+1}^{\infty}\int\limits_t^{s_1}\psi_1(\theta)\phi_{j_1}(\theta)d\theta\int\limits_{s_1}^T\psi_3(s)\phi_{j_1}(s)dsds_1\right)^2. \tag{85}$$

We have

$$\int\limits_t^x \psi_1(s)\phi_{j_1}(s)ds = \frac{\sqrt{T-t}\sqrt{2j_1+1}}{2}\int\limits_{-1}^{z(x)}P_{j_1}(y)\psi(u(y))dy =$$

$$= \frac{\sqrt{T-t}}{2\sqrt{2j_1+1}}\Biggl((P_{j_1+1}(z(x)) - P_{j_1-1}(z(x)))\psi_1(x) -$$

$$-\frac{T-t}{2}\int\limits_{-1}^{z(x)}((P_{j_1+1}(y) - P_{j_1-1}(y))\psi_1{}'(u(y))dy\Biggr), \tag{86}$$

where $x \in (t,T)$, $j_1 \ge p+1$, $z(x)$ and $u(y)$ are defined by (26), $\psi_1{}'$ is a derivative of the function $\psi_1(s)$ with respect to the variable $u(y)$.

Note that in (86) we used the following well-known property of Legendre polynomials

$$P_{j+1}(-1) = -P_j(-1), \quad j = 0, 1, 2, \ldots$$

and (27).

From (29) and (86) we get

$$\left|\int\limits_t^x \psi_1(s)\phi_{j_1}(s)ds\right| < \frac{C}{j_1}\left(\frac{1}{(1-(z(x))^2)^{1/4}} + C_1\right), \quad x \in (t,T), \tag{87}$$

where constants C, C_1 do not depend on j_1.

Similarly to (87) and due to

$$P_j(1) = 1, \quad j = 0, 1, 2, \ldots$$

we obtain for the integral (like the integral, which is on the left-hand side of (87), but with integration limits x and T) the estimate (87).

From the formula (87) and its analogue for the integral with integration limits x and T we have

$$\left|\int\limits_t^x \psi_1(s)\phi_{j_1}(s)ds\int\limits_x^T\psi_3(s)\phi_{j_1}(s)ds\right| < \frac{K}{j_1^2}\left(\frac{1}{(1-(z(x))^2)^{1/2}} + K_1\right), \tag{88}$$

where $x \in (t,T)$ and constants K, K_1 do not depend on j_1.

The estimate (29) can be rewritten for the function $\phi_j(s)$ in the following form

$$|\phi_j(s)| < \sqrt{\frac{2j+1}{j+1}}\frac{K}{\sqrt{T-t}}\frac{1}{(1-z^2(s))^{1/4}} < \frac{K_1}{\sqrt{T-t}}\frac{1}{(1-z^2(s))^{1/4}}, \tag{89}$$

where $K_1 = K\sqrt{2}$, $s \in (t, T)$, $j \in \mathbb{N}$.

Let us estimate the right-hand side of (85) using (88)

$$E_p'' \le L \sum_{j_3=0}^{p} \left(\int_t^T |\phi_{j_3}(s_1)| \sum_{j_1=p+1}^{\infty} \left| \int_t^{s_1} \psi_1(\theta)\phi_{j_1}(\theta)d\theta \int_{s_1}^{T} \psi_3(s)\phi_{j_1}(s)ds \right| ds_1 \right)^2 <$$

$$< L_1 \sum_{j_3=0}^{p} \left(\int_t^T |\phi_{j_3}(s_1)| \sum_{j_1=p+1}^{\infty} \frac{1}{j_1^2} \left(\frac{1}{(1-(z(s_1))^2)^{1/2}} + K_1 \right) ds_1 \right)^2 <$$

$$< \frac{L_2}{p^2} \sum_{j_3=0}^{p} \left(\int_t^T \frac{ds_1}{(1-(z(s_1))^2)^{3/4}} + K_1 \int_t^T \frac{ds_1}{(1-(z(s_1))^2)^{1/4}} \right)^2 =$$

$$= \frac{L_2(T-t)^2}{4p^2} \sum_{j_3=0}^{p} \left(\int_{-1}^{1} \frac{dy}{(1-y^2)^{3/4}} + K_1 \int_{-1}^{1} \frac{dy}{(1-y^2)^{1/4}} \right)^2 \le$$

$$\le \frac{L_3 p}{p^2} = \frac{L_3}{p} \to 0 \qquad (90)$$

if $p \to \infty$, where constants L, L_1, L_2, L_3 do not depend on p and we used (31), (89) in (90). The relation (68) is proved. Theorem 3 is proved for the case of Legendre polynomials.

Let us consider the trigonometric case. Analogously to (41) we obtain

$$\left| \int_{s_2}^{T} \sum_{j_3=p+1}^{\infty} \psi_2(s_1)\phi_{j_3}(s_1) \int_{s_1}^{T} \psi_3(s)\phi_{j_3}(s)ds ds_1 \right| \le \frac{K_1}{p}, \qquad (91)$$

where $s_2 \in (t, T)$ and constant K_1 does not depend on p.

Using (41) for $T = s$ and (71), we obtain

$$E_p \le K \sum_{j_3=0}^{p} \left(\int_t^T \left| \int_t^s \sum_{j_1=p+1}^{\infty} \psi_2(s_1)\phi_{j_1}(s_1) \int_t^{s_1} \psi_1(s_2)\phi_{j_1}(s_2)ds_2 ds_1 \right| ds \right)^2 \le$$

$$\le K \sum_{j_3=0}^{p} \left((T-t)\frac{K_1}{p} \right)^2 \le \frac{K_2}{p^2} \sum_{j_3=0}^{p} (T-t)^2 \le \frac{L}{p} \to 0 \qquad (92)$$

if $p \to \infty$, where constants K, K_1, K_2, L do not depend on p.

Analogously, using (91) and (79), we obtain that $E_p' \to 0$ if $p \to \infty$.

Integrating by parts, we have

$$\int_t^s \phi_{2r-1}(\theta)\psi(\theta)d\theta = \frac{\sqrt{2}}{\sqrt{T-t}} \int_t^s \psi(\theta) \sin\frac{2\pi r(\theta - t)}{T-t} d\theta =$$

$$
= \sqrt{\frac{T-t}{2}} \frac{1}{\pi r} \left(-\psi(s) \cos\frac{2\pi r(s-t)}{T-t} + \psi(t) + \right.
$$

$$
\left. + \int\limits_t^s \psi'(\theta) \cos\frac{2\pi r(\theta-t)}{T-t} d\theta \right),
$$

$$
\int\limits_t^s \phi_{2r}(\theta)\psi(\theta)d\theta = \frac{\sqrt{2}}{\sqrt{T-t}} \int\limits_t^s \psi(\theta) \cos\frac{2\pi r(\theta-t)}{T-t} d\theta =
$$

$$
= \sqrt{\frac{T-t}{2}} \frac{1}{\pi r} \left(\psi(s) \sin\frac{2\pi r(s-t)}{T-t} - \int\limits_t^s \psi'(\theta) \sin\frac{2\pi r(\theta-t)}{T-t} d\theta \right),
$$

where $\phi_{2r-1}(\theta)$, $\phi_{2r}(\theta)$ are defined by (34) $(r = 1, 2, \ldots)$ and $\psi'(\theta)$ is a derivative of the function $\psi(\theta)$ with respect to the variable θ (we suppose that $\psi(\theta)$ is a continuously differentiable nonrandom function on $[t, T]$).

Then

$$
\left| \int\limits_t^s \phi_{2r-1}(\theta)\psi(\theta)d\theta \right| \le \frac{C}{r} = \frac{2C}{2r} < \frac{2C}{2r-1}, \tag{93}
$$

$$
\left| \int\limits_t^s \phi_{2r}(\theta)\psi(\theta)d\theta \right| \le \frac{C}{r} = \frac{2C}{2r}, \tag{94}
$$

where constant C does not depend on r $(r = 1, 2, \ldots)$.

From (93), (94) we get

$$
\left| \int\limits_t^s \phi_{j_1}(\theta)\psi(\theta)d\theta \right| \le \frac{K}{j_1}, \tag{95}
$$

where constant K is independent of j_1 $(j_1 = 1, 2, \ldots)$.

Analogously, we obtain

$$
\left| \int\limits_s^T \phi_{j_1}(\theta)\psi(\theta)d\theta \right| \le \frac{K}{j_1}, \tag{96}
$$

where constant K does not depend on j_1 $(j_1 = 1, 2, \ldots)$.

From (95) and (96) we have

$$
\left| \int\limits_t^x \psi_1(s)\phi_{j_1}(s)ds \int\limits_x^T \psi_3(s)\phi_{j_1}(s)ds \right| < \frac{C_1}{j_1^2} \quad (j_1 \ne 0), \tag{97}
$$

where constant C_1 does not depend on j_1.

Using (85) and (97), we obtain

$$E_p'' \le L\sum_{j_3=0}^{p}\left(\int\limits_t^T |\phi_{j_3}(s_1)|\sum_{j_1=p+1}^{\infty}\left|\int\limits_t^{s_1}\psi_1(\theta)\phi_{j_1}(\theta)d\theta\int\limits_{s_1}^{T}\psi_3(s)\phi_{j_1}(s)ds\right|ds_1\right)^2 \le$$

$$\le L_1\sum_{j_3=0}^{p}\left((T-t)\sum_{j_1=p+1}^{\infty}\frac{1}{j_1^2}\right)^2 \le \frac{L_1}{p^2}\sum_{j_3=0}^{p}(T-t)^2 \le$$

$$\le \frac{L_2}{p} \to 0 \qquad (98)$$

if $p\to\infty$, where constants L, L_1, L_2 do not depend on p. Theorem 3 is proved for the trigonometric case. Theorem 3 is proved.

5. Expansion of Iterated Stratonovich Stochastic Integrals of Multiplicity 4

In this section, we will develop the approach to expansion of iterated Stratonovich stochatic integrals based on Theorem 1 for the stochastic integrals of multiplicity 4.

Theorem 4 [17]-[19], [22], [24], [26]-[29]. *Suppose that $\{\phi_j(x)\}_{j=0}^{\infty}$ is a complete orthonormal system of Legendre polynomials or trigonometric functions in the space $L_2([t,T])$. Then*

$$J^*[\psi^{(4)}]_{T,t} = \underset{p\to\infty}{\text{l.i.m.}}\sum_{j_1,j_2,j_3,j_4=0}^{p} C_{j_4j_3j_2j_1}\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}\zeta_{j_3}^{(i_3)}\zeta_{j_4}^{(i_4)}, \qquad (99)$$

where $C_{j_4j_3j_2j_1}$ is defined by (5) for $k=4$ and $\psi_1(s),\ldots,\psi_4(s)\equiv 1$; another notations are the same as in Theorem 1.

Proof. From (12) it follows that

$$\underset{p\to\infty}{\text{l.i.m.}}\sum_{j_1,j_2,j_3,j_4=0}^{p} C_{j_4j_3j_2j_1}\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}\zeta_{j_3}^{(i_3)}\zeta_{j_4}^{(i_4)} = J[\psi^{(4)}]_{T,t}+$$

$$+\mathbf{1}_{\{i_1=i_2\ne 0\}}A_1^{(i_3i_4)}+\mathbf{1}_{\{i_1=i_3\ne 0\}}A_2^{(i_2i_4)}+\mathbf{1}_{\{i_1=i_4\ne 0\}}A_3^{(i_2i_3)}+\mathbf{1}_{\{i_2=i_3\ne 0\}}A_4^{(i_1i_4)}+$$

$$+\mathbf{1}_{\{i_2=i_4\ne 0\}}A_5^{(i_1i_3)}+\mathbf{1}_{\{i_3=i_4\ne 0\}}A_6^{(i_1i_2)}-\mathbf{1}_{\{i_1=i_2\ne 0\}}\mathbf{1}_{\{i_3=i_4\ne 0\}}B_1-$$

$$-\mathbf{1}_{\{i_1=i_3\ne 0\}}\mathbf{1}_{\{i_2=i_4\ne 0\}}B_2-\mathbf{1}_{\{i_1=i_4\ne 0\}}\mathbf{1}_{\{i_2=i_3\ne 0\}}B_3, \qquad (100)$$

where $J[\psi^{(4)}]_{T,t}$ is defined by (2) for $\psi_1(s),\ldots,\psi_4(s)\equiv 1$ and $i_1,\ldots,i_4=0,1,\ldots,m$,

$$A_1^{(i_3 i_4)} = \underset{p\to\infty}{\text{l.i.m.}} \sum_{j_4,j_3,j_1=0}^{p} C_{j_4 j_3 j_1 j_1} \zeta_{j_3}^{(i_3)} \zeta_{j_4}^{(i_4)},$$

$$A_2^{(i_2 i_4)} = \underset{p\to\infty}{\text{l.i.m.}} \sum_{j_4,j_3,j_2=0}^{p} C_{j_4 j_3 j_2 j_3} \zeta_{j_2}^{(i_2)} \zeta_{j_4}^{(i_4)},$$

$$A_3^{(i_2 i_3)} = \underset{p\to\infty}{\text{l.i.m.}} \sum_{j_4,j_3,j_2=0}^{p} C_{j_4 j_3 j_2 j_4} \zeta_{j_2}^{(i_2)} \zeta_{j_3}^{(i_3)},$$

$$A_4^{(i_1 i_4)} = \underset{p\to\infty}{\text{l.i.m.}} \sum_{j_4,j_3,j_1=0}^{p} C_{j_4 j_3 j_3 j_1} \zeta_{j_1}^{(i_1)} \zeta_{j_4}^{(i_4)},$$

$$A_5^{(i_1 i_3)} = \underset{p\to\infty}{\text{l.i.m.}} \sum_{j_4,j_3,j_1=0}^{p} C_{j_4 j_3 j_4 j_1} \zeta_{j_1}^{(i_1)} \zeta_{j_3}^{(i_3)},$$

$$A_6^{(i_1 i_2)} = \underset{p\to\infty}{\text{l.i.m.}} \sum_{j_3,j_2,j_1=0}^{p} C_{j_3 j_3 j_2 j_1} \zeta_{j_1}^{(i_1)} \zeta_{j_2}^{(i_2)},$$

$$B_1 = \lim_{p\to\infty} \sum_{j_1,j_4=0}^{p} C_{j_4 j_4 j_1 j_1}, \quad B_2 = \lim_{p\to\infty} \sum_{j_4,j_3=0}^{p} C_{j_3 j_4 j_3 j_4},$$

$$B_3 = \lim_{p\to\infty} \sum_{j_4,j_3=0}^{p} C_{j_4 j_3 j_3 j_4}.$$

Using the integration order replacement in Riemann integrals, Theorem 1 for $k = 2$ (see (10)) and (17), Parseval's equality and integration order replacement technique for Ito stochastic integrals [17] (also see [26]-[29], Chapter 3) or Ito's formula, we obtain

$$A_1^{(i_3 i_4)} =$$

$$= \underset{p\to\infty}{\text{l.i.m.}} \sum_{j_4,j_3,j_1=0}^{p} \frac{1}{2} \int_t^T \phi_{j_4}(s) \int_t^s \phi_{j_3}(s_1) \left(\int_t^{s_1} \phi_{j_1}(s_2) ds_2 \right)^2 ds_1 ds \zeta_{j_3}^{(i_3)} \zeta_{j_4}^{(i_4)} =$$

$$= \underset{p\to\infty}{\text{l.i.m.}} \sum_{j_4,j_3=0}^{p} \frac{1}{2} \int_t^T \phi_{j_4}(s) \int_t^s \phi_{j_3}(s_1) \sum_{j_1=0}^{p} \left(\int_t^{s_1} \phi_{j_1}(s_2) ds_2 \right)^2 ds_1 ds \zeta_{j_3}^{(i_3)} \zeta_{j_4}^{(i_4)} =$$

$$= \underset{p\to\infty}{\text{l.i.m.}} \sum_{j_4,j_3=0}^{p} \frac{1}{2} \int_t^T \phi_{j_4}(s) \int_t^s \phi_{j_3}(s_1) \left((s_1 - t) - \sum_{j_1=p+1}^{\infty} \left(\int_t^{s_1} \phi_{j_1}(s_2) ds_2 \right)^2 \right) ds_1 ds \zeta_{j_3}^{(i_3)} \zeta_{j_4}^{(i_4)} =$$

$$= \underset{p\to\infty}{\text{l.i.m.}} \sum_{j_4,j_3=0}^{p} \frac{1}{2} \int_t^T \phi_{j_4}(s) \int_t^s \phi_{j_3}(s_1)(s_1 - t) ds_1 ds \zeta_{j_3}^{(i_3)} \zeta_{j_4}^{(i_4)} - \Delta_1^{(i_3 i_4)} =$$

$$=\frac{1}{2}\int\limits_t^T\int\limits_t^s (s_1-t)d\mathbf{w}_{s_1}^{(i_3)}d\mathbf{w}_s^{(i_4)}+$$

$$+\frac{1}{2}\mathbf{1}_{\{i_3=i_4\ne 0\}}\lim_{p\to\infty}\sum_{j_3=0}^{p}\int\limits_t^T\phi_{j_3}(s)\int\limits_t^s\phi_{j_3}(s_1)(s_1-t)ds_1ds-\Delta_1^{(i_3i_4)}=$$

(101) $$=\frac{1}{2}\int\limits_t^T\int\limits_t^s\int\limits_t^{s_1}ds_2d\mathbf{w}_{s_1}^{(i_3)}d\mathbf{w}_s^{(i_4)}+\frac{1}{4}\mathbf{1}_{\{i_3=i_4\ne 0\}}\int\limits_t^T(s_1-t)ds_1-\Delta_1^{(i_3i_4)}\quad \text{w. p. 1},$$

where

$$

$$
=\lim_{p\to\infty}\sum_{j_3=0}^{p}a^p_{j_3j_3}+\lim_{p\to\infty}\sum_{j_3=0}^{p}c^p_{j_3j_3}-\lim_{p\to\infty}\sum_{j_3=0}^{p}b^p_{j_3j_3}. \qquad (115)
$$

Moreover,

$$
B_2+B_3=\lim_{p\to\infty}\sum_{j_4,j_3=0}^{p}\left(C_{j_3j_4j_3j_4}+C_{j_3j_4j_4j_3}\right)=
$$

$$
=\lim_{p\to\infty}\sum_{j_4,j_3=0}^{p}\int\limits_t^T\phi_{j_3}(s)\int\limits_t^s\phi_{j_4}(s_1)\int\limits_t^{s_1}\phi_{j_4}(s_2)\int\limits_t^{s_1}\phi_{j_3}(s_3)ds_3ds_2ds_1ds=
$$

$$
=\lim_{p\to\infty}\sum_{j_4,j_3=0}^{p}\int\limits_t^T\phi_{j_4}(s_1)\int\limits_t^{s_1}\phi_{j_4}(s_2)\int\limits_t^{s_1}\phi_{j_3}(s_3)ds_3ds_2\int\limits_{s_1}^T\phi_{j_3}(s)dsds_1=
$$

$$
=\lim_{p\to\infty}\sum_{j_4,j_3=0}^{p}\left(\int\limits_t^T\phi_{j_4}(s_1)\int\limits_t^{s_1}\phi_{j_4}(s_3)\int\limits_t^T\phi_{j_3}(s_2)ds_2\int\limits_{s_1}^T\phi_{j_3}(s)dsds_3ds_1-\right.
$$

$$
\left.-\int\limits_t^T\phi_{j_4}(s_1)\int\limits_t^{s_1}\phi_{j_4}(s_3)\left(\int\limits_{s_1}^T\phi_{j_3}(s)ds\right)^2ds_3ds_1\right)=
$$

$$
=\sum_{j_4=0}^{\infty}\int\limits_t^T\phi_{j_4}(s_1)(T-s_1)\int\limits_t^{s_1}\phi_{j_4}(s_3)ds_3ds_1-
$$

$$
-\sum_{j_4=0}^{\infty}\int\limits_t^T\phi_{j_4}(s_1)(T-s_1)\int\limits_t^{s_1}\phi_{j_4}(s_3)ds_3ds_1+2\lim_{p\to\infty}\sum_{j_4=0}^{p}f^p_{j_4j_4}=2\lim_{p\to\infty}\sum_{j_4=0}^{p}f^p_{j_4j_4}. \qquad (116)
$$

Therefore,

$$
B_3=2\lim_{p\to\infty}\sum_{j_3=0}^{p}f^p_{j_3j_3}-\lim_{p\to\infty}\sum_{j_3=0}^{p}a^p_{j_3j_3}-\lim_{p\to\infty}\sum_{j_3=0}^{p}c^p_{j_3j_3}+\lim_{p\to\infty}\sum_{j_3=0}^{p}b^p_{j_3j_3}. \qquad (117)
$$

After substituting the relations (101)–(117) into (100), we obtain

$$
\underset{p\to\infty}{\text{l.i.m.}}\sum_{j_1,j_2,j_3,j_4=0}^{p}C_{j_4j_3j_2j_1}\zeta^{(i_1)}_{j_1}\zeta^{(i_2)}_{j_2}\zeta^{(i_3)}_{j_3}\zeta^{(i_4)}_{j_4}=J[\psi^{(4)}]_{T,t}+\frac{1}{2}\mathbf{1}_{\{i_1=i_2\ne 0\}}\int\limits_t^T\int\limits_t^s\int\limits_t^{s_1}ds_2d\mathbf{w}^{(i_3)}_{s_1}d\mathbf{w}^{(i_4)}_s+
$$

$$+\frac{1}{2}\mathbf{1}_{\{i_2=i_3\neq 0\}}\int\limits_t^T\int\limits_t^{s_2}\int\limits_t^{s_1}d\mathbf{w}_s^{(i_1)}ds_1d\mathbf{w}_{s_2}^{(i_4)}+\frac{1}{2}\mathbf{1}_{\{i_3=i_4\neq 0\}}\int\limits_t^T\int\limits_t^{s_1}\int\limits_t^{s_2}d\mathbf{w}_s^{(i_1)}d\mathbf{w}_{s_2}^{(i_2)}ds_1+$$

$$+\frac{1}{4}\mathbf{1}_{\{i_1=i_2\neq 0\}}\mathbf{1}_{\{i_3=i_4\neq 0\}}\int\limits_t^T\int\limits_t^{s_1}ds_2ds_1+R=J^*[\psi^{(4)}]_{T,t}+R\quad \text{w. p. 1}, \tag{118}$$

where

$$R=-\mathbf{1}_{\{i_1=i_2\neq 0\}}\Delta_1^{(i_3i_4)}+\mathbf{1}_{\{i_1=i_3\neq 0\}}\left(-\Delta_2^{(i_2i_4)}+\Delta_1^{(i_2i_4)}+\Delta_3^{(i_2i_4)}\right)+$$

$$+\mathbf{1}_{\{i_1=i_4\neq 0\}}\left(\Delta_4^{(i_2i_3)}-\Delta_5^{(i_2i_3)}+\Delta_6^{(i_2i_3)}\right)-\mathbf{1}_{\{i_2=i_3\neq 0\}}\Delta_3^{(i_1i_4)}+$$

$$+\mathbf{1}_{\{i_2=i_4\neq 0\}}\left(-\Delta_4^{(i_1i_3)}+\Delta_5^{(i_1i_3)}+\Delta_6^{(i_1i_3)}\right)-\mathbf{1}_{\{i_3=i_4\neq 0\}}\Delta_6^{(i_1i_2)}-$$

$$-\mathbf{1}_{\{i_1=i_3\neq 0\}}\mathbf{1}_{\{i_2=i_4\neq 0\}}\left(\lim_{p\to\infty}\sum_{j_3=0}^{p}a_{j_3j_3}^p+\lim_{p\to\infty}\sum_{j_3=0}^{p}c_{j_3j_3}^p-\lim_{p\to\infty}\sum_{j_3=0}^{p}b_{j_3j_3}^p\right)-$$

$$-\mathbf{1}_{\{i_1=i_4\neq 0\}}\mathbf{1}_{\{i_2=i_3\neq 0\}}\left(2\lim_{p\to\infty}\sum_{j_3=0}^{p}f_{j_3j_3}^p-\lim_{p\to\infty}\sum_{j_3=0}^{p}a_{j_3j_3}^p-\right.$$

$$\left.-\lim_{p\to\infty}\sum_{j_3=0}^{p}c_{j_3j_3}^p+\lim_{p\to\infty}\sum_{j_3=0}^{p}b_{j_3j_3}^p\right)+\mathbf{1}_{\{i_1=i_2\neq 0\}}\mathbf{1}_{\{i_3=i_4\neq 0\}}\lim_{p\to\infty}\sum_{j_3=0}^{p}a_{j_3j_3}^p. \tag{119}$$

From (118) and (119) it follows that Theorem 4 will be proved if

(120)

$$\Delta_k^{(ij)}=0\ \text{w. p. 1},\quad \lim_{p\to\infty}\sum_{j_3=0}^{p}a_{j_3j_3}^p=0,\quad \lim_{p\to\infty}\sum_{j_3=0}^{p}b_{j_3j_3}^p=0,\quad \lim_{p\to\infty}\sum_{j_3=0}^{p}c_{j_3j_3}^p=0,\quad \lim_{p\to\infty}\sum_{j_3=0}^{p}f_{j_3j_3}^p=0,$$

where $k=1,2,\ldots,6,\quad i,j=0,1,\ldots,m$.

Let us consider the case of Legendre polynomials. Let us prove that $\Delta_1^{(i_3i_4)}=0$ w. p. 1. We have

$$\mathsf{M}\left\{\left(\sum_{j_3,j_4=0}^{p}a_{j_4j_3}^p\zeta_{j_3}^{(i_3)}\zeta_{j_4}^{(i_4)}\right)^2\right\}=$$

$$=\sum_{j_3'=0}^{p}\sum_{j_3=0}^{j_3'-1}\left(2a_{j_3j_3}^pa_{j_3'j_3'}^p+\left(a_{j_3j_3'}^p\right)^2+2a_{j_3j_3'}^pa_{j_3'j_3}^p+\left(a_{j_3'j_3}^p\right)^2\right)+3\sum_{j_3'=0}^{p}\left(a_{j_3'j_3'}^p\right)^2=$$

$$=\left(\sum_{j_3=0}^{p}a_{j_3j_3}^p\right)^2+\sum_{j_3'=0}^{p}\sum_{j_3=0}^{j_3'-1}\left(a_{j_3j_3'}^p+a_{j_3'j_3}^p\right)^2+2\sum_{j_3'=0}^{p}\left(a_{j_3'j_3'}^p\right)^2\quad (i_3=i_4\neq 0), \tag{121}$$

$$
\mathsf{M}\left\{\left(\sum_{j_3,j_4=0}^{p} a_{j_4j_3}^{p}\zeta_{j_3}^{(i_3)}\zeta_{j_4}^{(i_4)}\right)^2\right\}=\sum_{j_3,j_4=0}^{p}\left(a_{j_4j_3}^{p}\right)^2\quad (i_3\ne i_4,\ i_3\ne 0,\ i_4\ne 0), \tag{122}
$$

$$
\mathsf{M}\left\{\left(\sum_{j_3,j_4=0}^{p} a_{j_4j_3}^{p}\zeta_{j_3}^{(i_3)}\zeta_{j_4}^{(i_4)}\right)^2\right\}=\begin{cases}(T-t)\sum\limits_{j_4=0}^{p}\left(a_{j_4,0}^{p}\right)^2 & \text{if}\quad i_3=0,\ i_4\ne 0\\ (T-t)\sum\limits_{j_3=0}^{p}\left(a_{0,j_3}^{p}\right)^2 & \text{if}\quad i_4=0,\ i_3\ne 0\\ (T-t)^2\left(a_{00}^{p}\right)^2 & \text{if}\quad i_3=i_4=0\end{cases}. \tag{123}
$$

Consider the case $i_3=i_4\ne 0$

$$
a_{j_4j_3}^{p}=\frac{(T-t)^2\sqrt{(2j_4+1)(2j_3+1)}}{32}\times
$$

$$
\times\int\limits_{-1}^{1}P_{j_4}(y)\int\limits_{-1}^{y}P_{j_3}(y_1)\sum_{j_1=p+1}^{\infty}(2j_1+1)\left(\int\limits_{-1}^{y_1}P_{j_1}(y_2)dy_2\right)^2dy_1dy=
$$

$$
=\frac{(T-t)^2\sqrt{(2j_4+1)(2j_3+1)}}{32}\times
$$

$$
\times\int\limits_{-1}^{1}P_{j_3}(y_1)\sum_{j_1=p+1}^{\infty}\frac{1}{2j_1+1}\left(P_{j_1+1}(y_1)-P_{j_1-1}(y_1)\right)^2\int\limits_{y_1}^{1}P_{j_4}(y)dydy_1=
$$

$$
=\frac{(T-t)^2\sqrt{2j_3+1}}{32\sqrt{2j_4+1}}\times
$$

$$
\times\int\limits_{-1}^{1}P_{j_3}(y_1)\left(P_{j_4-1}(y_1)-P_{j_4+1}(y_1)\right)\sum_{j_1=p+1}^{\infty}\frac{1}{2j_1+1}\left(P_{j_1+1}(y_1)-P_{j_1-1}(y_1)\right)^2dy_1
$$

if $j_4\ne 0$ and

$$
a_{j_4j_3}^{p}=\frac{(T-t)^2\sqrt{2j_3+1}}{32}\int\limits_{-1}^{1}P_{j_3}(y_1)(1-y_1)\sum_{j_1=p+1}^{\infty}\frac{1}{2j_1+1}\left(P_{j_1+1}(y_1)-P_{j_1-1}(y_1)\right)^2dy_1
$$

if $j_4=0$.

From (29) and the estimate $|\ P_j(y)\ |\le 1,\ y\in[-1,1]$ we obtain

$$|P_j(y)| = \sqrt{|P_j(y)|}\cdot\sqrt{|P_j(y)|} \le \frac{C}{j^{1/4}(1-y^2)^{1/8}},\quad y\in(-1,1),\quad j\in\mathbb{N}. \tag{124}$$

Using (29) and (124), we get

$$|a^p_{j_4j_3}| \le \frac{C_0}{(j_4)^{3/4}}\sum_{j_1=p+1}^{\infty}\frac{1}{j_1^2}\int\limits_{-1}^{1}\frac{dy}{(1-y^2)^{7/8}} \le \frac{C_1}{p\,(j_4)^{3/4}}\quad (j_3\ne 0, j_4\ge 2), \tag{125}$$

$$|a^p_{0j_3}| + |a^p_{1j_3}| \le C_0\sum_{j_1=p+1}^{\infty}\frac{1}{j_1^2}\int\limits_{-1}^{1}\frac{dy}{(1-y^2)^{3/4}} \le \frac{C_1}{p}\quad (j_3\ne 0), \tag{126}$$

$$|a^p_{j_40}| + |a^p_{00}| \le C_0\sum_{j_1=p+1}^{\infty}\frac{1}{j_1^2}\int\limits_{-1}^{1}\frac{dy}{(1-y^2)^{1/2}} \le \frac{C_1}{p}\quad (j_4\ge 1), \tag{127}$$

where constants C_0, C_1 do not depend on p.

Taking into account (121), (125)–(127), we have

$$\mathsf{M}\left\{\left(\sum_{j_3,j_4=0}^{p} a^p_{j_4j_3}\zeta^{(i_3)}_{j_3}\zeta^{(i_4)}_{j_4}\right)^2\right\} = \left(a^p_{00} + \sum_{j_3=1}^{p} a^p_{j_3j_3}\right)^2 + \sum_{j_3'=1}^{p}\left(a^p_{0j_3'} + a^p_{j_3'0}\right)^2 +$$

$$+\sum_{j_3'=1}^{p}\sum_{j_3=1}^{j_3'-1}\left(a^p_{j_3j_3'} + a^p_{j_3'j_3}\right)^2 + 2\left(\sum_{j_3'=1}^{p}\left(a^p_{j_3'j_3'}\right)^2 + (a_{00})^2\right) \le$$

$$\le K_0\left(\frac{1}{p} + \frac{1}{p}\sum_{j_3=1}^{p}\frac{1}{(j_3)^{3/4}}\right)^2 + \frac{K_1}{p} + K_2\sum_{j_3'=1}^{p}\sum_{j_3=1}^{j_3'-1}\frac{1}{p^2}\left(\frac{1}{(j_3')^{3/4}} + \frac{1}{(j_3)^{3/4}}\right)^2 \le$$

$$\le K_0\left(\frac{1}{p} + \frac{1}{p}\int\limits_{0}^{p}\frac{dx}{x^{3/4}}\right)^2 + \frac{K_1}{p} + \frac{K_3}{p}\sum_{j_3=1}^{p}\frac{1}{(j_3)^{3/2}} \le$$

$$\le K_0\left(\frac{1}{p} + \frac{4}{p^{3/4}}\right)^2 + \frac{K_1}{p} + \frac{K_3}{p}\left(1 + \int\limits_{1}^{p}\frac{dx}{x^{3/2}}\right) \le$$

$$\le \frac{K_4}{p} + \frac{K_3}{p}\left(3 - \frac{2}{\sqrt{p}}\right) \le \frac{K_5}{p}\ \to 0$$

if $p \to \infty$ ($i_3 = i_4 \ne 0$).

The same result for the cases (122), (123) also follows from the estimates (125)–(127). Therefore,

$$\Delta_1^{(i_3 i_4)} = 0 \quad \text{w. p. 1.} \tag{128}$$

It is not difficult to see that the formulas

$$\Delta_2^{(i_2 i_4)} = 0, \quad \Delta_4^{(i_1 i_3)} = 0, \quad \Delta_6^{(i_1 i_3)} = 0 \quad \text{w. p. 1} \tag{129}$$

can be proved similarly to the proof of the relation (128).

Moreover, from the estimates (125)–(127) we obtain

$$\lim_{p\to\infty} \sum_{j_3=0}^{p} a_{j_3 j_3}^{p} = 0. \tag{130}$$

The relations

$$\lim_{p\to\infty} \sum_{j_3=0}^{p} b_{j_3 j_3}^{p} = 0 \quad \text{and} \quad \lim_{p\to\infty} \sum_{j_3=0}^{p} f_{j_3 j_3}^{p} = 0 \tag{131}$$

can also be proved analogously to (130).

Let us consider $\Delta_3^{(i_2 i_4)}$

$$\Delta_3^{(i_2 i_4)} = \Delta_4^{(i_2 i_4)} + \Delta_6^{(i_2 i_4)} - \Delta_7^{(i_2 i_4)} = -\Delta_7^{(i_2 i_4)} \quad \text{w. p. 1,} \tag{132}$$

where

$$\Delta_7^{(i_2 i_4)} = \underset{p\to\infty}{\text{l.i.m.}} \sum_{j_2, j_4=0}^{p} g_{j_4 j_2}^{p} \zeta_{j_2}^{(i_2)} \zeta_{j_4}^{(i_4)},$$

$$g_{j_4 j_2}^{p} = \int_t^T \phi_{j_4}(s) \int_t^s \phi_{j_2}(s_1) \sum_{j_1=p+1}^{\infty} \left(\int_{s_1}^T \phi_{j_1}(s_2) ds_2 \int_s^T \phi_{j_1}(s_2) ds_2 \right) ds_1 ds =$$

$$= \sum_{j_1=p+1}^{\infty} \int_t^T \phi_{j_4}(s) \int_s^T \phi_{j_1}(s_2) ds_2 \int_t^s \phi_{j_2}(s_1) \int_{s_1}^T \phi_{j_1}(s_2) ds_2 ds_1 ds. \tag{133}$$

The last step in (133) follows from the estimate

$$\left| g_{j_4 j_2}^{p} \right| \le K \sum_{j_1=p+1}^{\infty} \frac{1}{j_1^2} \int_{-1}^{1} \frac{1}{(1-y^2)^{1/2}} \int_{-1}^{y} \frac{1}{(1-x^2)^{1/2}} dx dy \ \le \frac{K_1}{p}.$$

Note that

$$g_{j_4j_4}^p=\sum_{j_1=p+1}^{\infty}\frac{1}{2}\left(\int\limits_t^T\phi_{j_4}(s)\int\limits_s^T\phi_{j_1}(s_2)ds_2ds\right)^2, \tag{134}$$

$$g_{j_4j_2}^p+g_{j_2j_4}^p=\sum_{j_1=p+1}^{\infty}\int\limits_t^T\phi_{j_4}(s)\int\limits_s^T\phi_{j_1}(s_2)ds_2ds\int\limits_t^T\phi_{j_2}(s)\int\limits_s^T\phi_{j_1}(s_2)ds_2ds, \tag{135}$$

and

$$g_{j_4j_2}^p=\frac{(T-t)^2\sqrt{(2j_4+1)(2j_2+1)}}{16}\sum_{j_1=p+1}^{\infty}\frac{1}{2j_1+1}\int\limits_{-1}^{1}P_{j_4}(y_1)\left(P_{j_1-1}(y_1)-P_{j_1+1}(y_1)\right)\times$$

$$\times\int\limits_{-1}^{y_1}P_{j_2}(y)\left(P_{j_1-1}(y)-P_{j_1+1}(y)\right)dydy_1,\quad j_4,j_2\le p.$$

Due to the orthogonality of the Legendre polynomials we obtain

$$g_{j_4j_2}^p+g_{j_2j_4}^p=\frac{(T-t)^2\sqrt{(2j_4+1)(2j_2+1)}}{16}\times$$

$$\times\sum_{j_1=p+1}^{\infty}\frac{1}{2j_1+1}\int\limits_{-1}^{1}P_{j_4}(y_1)\left(P_{j_1-1}(y_1)-P_{j_1+1}(y_1)\right)dy_1\times$$

$$\times\int\limits_{-1}^{1}P_{j_2}(y)\left(P_{j_1-1}(y)-P_{j_1+1}(y)\right)dy=$$

$$=\frac{(T-t)^2(2p+1)}{16}\frac{1}{2p+3}\left(\int\limits_{-1}^{1}P_p^2(y_1)dy_1\right)^2\begin{cases}1 & \text{if } j_2=j_4=p\\ 0 & \text{otherwise}\end{cases}=$$

$$=\frac{(T-t)^2}{4(2p+3)(2p+1)}\begin{cases}1 & \text{if } j_2=j_4=p\\ 0 & \text{otherwise}\end{cases}, \tag{136}$$

$$g_{j_4j_4}^p=\frac{(T-t)^2(2j_4+1)}{16}\sum_{j_1=p+1}^{\infty}\frac{1}{2j_1+1}\cdot\frac{1}{2}\left(\int\limits_{-1}^{1}P_{j_4}(y_1)\left(P_{j_1-1}(y_1)-P_{j_1+1}(y_1)\right)dy_1\right)^2=$$

$$
= \frac{(T-t)^2(2p+1)}{32}\frac{1}{2p+3}\left(\int\limits_{-1}^{1}P_p^2(y_1)dy_1\right)^2 \begin{cases} 1 & \text{if } j_4 = p\\ \\ 0 & \text{otherwise}\end{cases} =
$$

(137)
$$
= \frac{(T-t)^2}{8(2p+3)(2p+1)} \begin{cases} 1 & \text{if } j_4 = p\\ \\ 0 & \text{otherwise}\end{cases}.
$$

From (121), (136), (5) it follows that

$$
\mathsf{M}\left\{\left(\sum_{j_2,j_4=0}^{p} g_{j_4j_2}^p \zeta_{j_2}^{(i_2)}\zeta_{j_4}^{(i_4)}\right)^2\right\} = \left(\sum_{j_3=0}^{p} g_{j_3j_3}^p\right)^2 + \sum_{j_3'=0}^{p}\sum_{j_3=0}^{j_3'-1}\left(g_{j_3j_3'}^p + g_{j_3'j_3}^p\right)^2 + 2\sum_{j_3'=0}^{p}\left(g_{j_3'j_3'}^p\right)^2 =
$$

$$
= \left(\frac{(T-t)^2}{8(2p+3)(2p+1)}\right)^2 + \ 0 \ + 2\left(\frac{(T-t)^2}{8(2p+3)(2p+1)}\right)^2 \to 0
$$

if $p\to\infty \quad (i_2 = i_4 \neq 0)$.

Let us consider the case $i_2 \neq i_4,\ i_2 \neq 0,\ i_4 \neq 0$. It is not difficult to see that

$$
g_{j_4j_2}^p = \int\limits_t^T \phi_{j_4}(s)\int\limits_t^s \phi_{j_2}(s_1)F_p(s,s_1)ds_1ds = \int\limits_{[t,T]^2} K_p(s,s_1)\phi_{j_4}(s)\phi_{j_2}(s_1)ds_1ds
$$

is a coefficient of the double Fourier–Legendre series of the function

(138)
$$
K_p(s,s_1) = \mathbf{1}_{\{s_1<s\}}F_p(s,s_1),
$$

where

$$
\sum_{j_1=p+1}^{\infty}\int\limits_{s_1}^{T}\phi_{j_1}(s_2)ds_2\int\limits_{s}^{T}\phi_{j_1}(s_2)ds_2 \stackrel{\mathsf{def}}{=} F_p(s,s_1).
$$

The Parseval equality in this case has the form

(139)
$$
\lim_{p_1\to\infty}\sum_{j_4,j_2=0}^{p_1}\left(g_{j_4j_2}^p\right)^2 = \int\limits_{[t,T]^2}\left(K_p(s,s_1)\right)^2 ds_1ds = \int\limits_t^T\int\limits_t^s\left(F_p(s,s_1)\right)^2 ds_1ds.
$$

From (29) we obtain

$$\left|\int\limits_{s_1}^{T}\phi_{j_1}(\theta)d\theta\right| = \frac{1}{2}\sqrt{2j_1+1}\sqrt{T-t}\left|\int\limits_{z(s_1)}^{1}P_{j_1}(y)dy\right| =$$

$$= \frac{\sqrt{T-t}}{2\sqrt{2j_1+1}}\left|P_{j_1-1}(z(s_1)) - P_{j_1+1}(z(s_1))\right| \le \frac{K}{j_1}\frac{1}{\left(1-z^2(s_1)\right)^{1/4}}, \tag{140}$$

where $z(s_1)$ is defined by (26) and $s_1 \in (t,T)$.

Using (140), we have

$$\left(F_p(s,s_1)\right)^2 \le \frac{C^2}{p^2}\frac{1}{\left(1-z^2(s)\right)^{1/2}}\frac{1}{\left(1-z^2(s_1)\right)^{1/2}}, \quad s,\ s_1 \in (t,T). \tag{141}$$

From (141) it follows that $|F_p(s,s_1)| \le M_\varepsilon/p$ in the domain

$$D_\varepsilon = \{(s,s_1):\ s\in[t+\varepsilon, T-\varepsilon],\ s_1\in[t+\varepsilon,s]\} \quad \forall\ \varepsilon>0,$$

where constant M_ε does not depend on s, s_1. Then we have the uniform convergence

$$\sum_{j_1=0}^{p}\int\limits_{s}^{T}\phi_{j_1}(\theta)d\theta\int\limits_{s_1}^{T}\phi_{j_1}(\theta)d\theta \to \sum_{j_1=0}^{\infty}\int\limits_{s}^{T}\phi_{j_1}(\theta)d\theta\int\limits_{s_1}^{T}\phi_{j_1}(\theta)d\theta \tag{142}$$

at the set D_ε if $p\to\infty$.

Due to continuity of the function on the left-hand side of (142) we obtain continuity of the limit function on the right-hand side of (142) at the set D_ε.

Using this fact and (141), we obtain

$$\int\limits_{t}^{T}\int\limits_{t}^{s}\left(F_p(s,s_1)\right)^2 ds_1 ds = \lim_{\varepsilon\to+0}\int\limits_{t+\varepsilon}^{T-\varepsilon}\int\limits_{t+\varepsilon}^{s}\left(F_p(s,s_1)\right)^2 ds_1 ds \le$$

$$\le \frac{C^2}{p^2}\lim_{\varepsilon\to+0}\int\limits_{t+\varepsilon}^{T-\varepsilon}\int\limits_{t+\varepsilon}^{s}\frac{ds_1}{\left(1-z^2(s_1)\right)^{1/2}}\frac{ds}{\left(1-z^2(s)\right)^{1/2}} =$$

$$= \frac{C^2}{p^2}\int\limits_{t}^{T}\int\limits_{t}^{s}\frac{ds_1}{\left(1-z^2(s_1)\right)^{1/2}}\frac{ds}{\left(1-z^2(s)\right)^{1/2}} =$$

$$= \frac{K}{p^2}\int\limits_{-1}^{1}\int\limits_{-1}^{y}\frac{dy_1}{\left(1-y_1^2\right)^{1/2}}\frac{dy}{\left(1-y^2\right)^{1/2}} < \frac{K_1}{p^2}, \tag{143}$$

where constant K_1 does not depend on p.

From (143) and (139) we obtain

$$0 \le \sum_{j_2,j_4=0}^{p} \left(g^p_{j_4 j_2}\right)^2 \le \lim_{p_1\to\infty} \sum_{j_2,j_4=0}^{p_1} \left(g^p_{j_4 j_2}\right)^2 = \sum_{j_2,j_4=0}^{\infty} \left(g^p_{j_4 j_2}\right)^2 \le \frac{K_1}{p^2} \to 0 \tag{144}$$

if $p\to\infty$. The case $i_2 \ne i_4$, $i_2 \ne 0$, $i_4 \ne 0$ is proved.

The same result for the cases

1) $i_2 = 0$, $i_4 \ne 0$,
2) $i_4 = 0$, $i_2 \ne 0$,
3) $i_2 = 0$, $i_4 = 0$

can also be obtained. Then $\Delta_7^{(i_2 i_4)} = 0$ and $\Delta_3^{(i_2 i_4)} = 0$ w. p. 1.

Let us consider $\Delta_5^{(i_1 i_3)}$

$$\Delta_5^{(i_1 i_3)} = \Delta_4^{(i_1 i_3)} + \Delta_6^{(i_1 i_3)} - \Delta_8^{(i_1 i_3)} \quad \text{w. p. 1},$$

where

$$\Delta_8^{(i_1 i_3)} = \underset{p\to\infty}{\text{l.i.m.}} \sum_{j_3,j_1=0}^{p} h^p_{j_3 j_1} \zeta^{(i_1)}_{j_1} \zeta^{(i_3)}_{j_3},$$

$$h^p_{j_3 j_1} = \int\limits_t^T \phi_{j_1}(s_3) \int\limits_{s_3}^T \phi_{j_3}(s) F_p(s_3,s) ds ds_3.$$

Analogously, we obtain that $\Delta_8^{(i_1 i_3)} = 0$ w. p. 1. Here we consider the function

$$K_p(s,s_3) = \mathbf{1}_{\{s_3<s\}} F_p(s_3,s)$$

and the relation

$$h^p_{j_3 j_1} = \int\limits_{[t,T]^2} K_p(s,s_3)\phi_{j_1}(s_3)\phi_{j_3}(s) ds ds_3 \quad (i_1 \ne i_3,\ i_1 \ne 0,\ i_3 \ne 0)$$

for the case $i_1 \ne i_3$, $i_1 \ne 0$, $i_3 \ne 0$.

For the case $i_1 = i_3 \ne 0$ we use (see (134), (135))

$$h^p_{j_1 j_1} = \sum_{j_4=p+1}^{\infty} \frac{1}{2} \left(\int\limits_t^T \phi_{j_1}(s) \int\limits_s^T \phi_{j_4}(s_1) ds_1 ds \right)^2,$$

$$h^p_{j_3 j_1} + h^p_{j_1 j_3} = \sum_{j_4=p+1}^{\infty} \int\limits_t^T \phi_{j_1}(s) \int\limits_s^T \phi_{j_4}(s_2) ds_2 ds \int\limits_t^T \phi_{j_3}(s) \int\limits_s^T \phi_{j_4}(s_2) ds_2 ds.$$

Let us prove that

$$\lim_{p\to\infty}\sum_{j_3=0}^{p} c^p_{j_3j_3} = 0. \tag{145}$$

We have

$$c^p_{j_3j_3} = f^p_{j_3j_3} + d^p_{j_3j_3} - g^p_{j_3j_3}. \tag{146}$$

Moreover,

$$\lim_{p\to\infty}\sum_{j_3=0}^{p} f^p_{j_3j_3} = 0, \quad \lim_{p\to\infty}\sum_{j_3=0}^{p} d^p_{j_3j_3} = 0, \tag{147}$$

where the first equality in (147) has been proved earlier. Analogously, we can prove the second equality in (147).

From (5) we obtain

$$0 \le \lim_{p\to\infty}\sum_{j_3=0}^{p} g^p_{j_3j_3} \le \lim_{p\to\infty}\frac{(T-t)^2}{8(2p+3)(2p+1)} = 0.$$

So the equality (145) is proved. The relations (120) are proved for the polynomial case. Theorem 4 is proved for the case of Legendre polynomials.

Let us consider the trigonometric case. According to (102), we have

$$a^p_{j_4j_3} = \frac{1}{2}\int\limits_t^T \phi_{j_3}(s_1)\sum_{j_1=p+1}^{\infty}\left(\int\limits_t^{s_1}\phi_{j_1}(s_2)ds_2\right)^2\int\limits_{s_1}^T\phi_{j_4}(s)dsds_1. \tag{148}$$

Moreover (see (95), (96)),

$$\left|\int\limits_t^{s_1}\phi_j(s_2)ds_2\right| \le \frac{K}{j}, \quad \left|\int\limits_{s_1}^{T}\phi_j(s_2)ds_2\right| \le \frac{K}{j}, \tag{149}$$

where constant K does not depend on j $(j = 1, 2, \ldots)$.

Note that

$$\int\limits_{s_1}^T \phi_0(s)ds = \frac{T-s_1}{\sqrt{T-t}}.$$

Using (148) and (149), we obtain

$$\left|a^p_{j_4j_3}\right| \le \frac{C_1}{j_4}\sum_{j_1=p+1}^{\infty}\frac{1}{j_1^2} \le \frac{C_1}{pj_4} \quad (j_4 \ne 0), \qquad \left|a^p_{0j_3}\right| \le \frac{C_1}{p}, \tag{150}$$

where constant C_1 does not depend on p.

Taking into account (121)–(123) and (150), we obtain that $\Delta_1^{(i_3i_4)}=0$ w. p. 1. Analogously, we get $\Delta_2^{(i_2i_4)}=0$, $\Delta_4^{(i_1i_3)}=0$, $\Delta_6^{(i_1i_3)}=0$ w. p. 1 and

$$\lim_{p\to\infty}\sum_{j_3=0}^{p}a_{j_3j_3}^{p}=0,\quad \lim_{p\to\infty}\sum_{j_3=0}^{p}b_{j_3j_3}^{p}=0,\quad \lim_{p\to\infty}\sum_{j_3=0}^{p}f_{j_3j_3}^{p}=0.$$

Let us consider $\Delta_3^{(i_2i_4)}$ for the case $i_2=i_4\ne 0$. For the values $g_{j_4j_2}^{2m}+g_{j_2j_4}^{2m}$ and $g_{j_4j_2}^{2m-1}+g_{j_2j_4}^{2m-1}$ $(m\in\mathbb{N})$ we have (see (135))

$$g_{j_4j_2}^{2m}+g_{j_2j_4}^{2m}=\sum_{j_1=2m+1}^{\infty}\int\limits_t^T\phi_{j_4}(s)\int\limits_s^T\phi_{j_1}(s_2)ds_2ds\int\limits_t^T\phi_{j_2}(s)\int\limits_s^T\phi_{j_1}(s_2)ds_2ds=$$

$$=\sum_{r=m+1}^{\infty}\Biggl(\int\limits_t^T\phi_{j_4}(s)\int\limits_s^T\phi_{2r-1}(s_2)ds_2ds\int\limits_t^T\phi_{j_2}(s)\int\limits_s^T\phi_{2r-1}(s_2)ds_2ds+$$

$$+\int\limits_t^T\phi_{j_4}(s)\int\limits_s^T\phi_{2r}(s_2)ds_2ds\int\limits_t^T\phi_{j_2}(s)\int\limits_s^T\phi_{2r}(s_2)ds_2ds\Biggr),\tag{151}$$

$$g_{j_4j_2}^{2m-1}+g_{j_2j_4}^{2m-1}=\sum_{j_1=2m}^{\infty}\int\limits_t^T\phi_{j_4}(s)\int\limits_s^T\phi_{j_1}(s_2)ds_2ds\int\limits_t^T\phi_{j_2}(s)\int\limits_s^T\phi_{j_1}(s_2)ds_2ds=$$

$$=g_{j_4j_2}^{2m}+g_{j_2j_4}^{2m}+\int\limits_t^T\phi_{j_4}(s)\int\limits_s^T\phi_{2m}(s_2)ds_2ds\int\limits_t^T\phi_{j_2}(s)\int\limits_s^T\phi_{2m}(s_2)ds_2ds,\tag{152}$$

where

$$\int\limits_t^T\phi_{j_4}(s)\int\limits_s^T\phi_{2r-1}(s_2)ds_2ds=\sqrt{\frac{2}{T-t}}\int\limits_t^T\phi_{j_4}(s)\int\limits_s^T\sin\frac{2\pi r(s_2-t)}{T-t}ds_2ds=$$

$$=\frac{\sqrt{2}\sqrt{T-t}}{2\pi r}\int\limits_t^T\phi_{j_4}(s)\left(\cos\frac{2\pi r(s-t)}{T-t}-1\right)ds,$$

$$\int\limits_t^T\phi_{j_4}(s)\int\limits_s^T\phi_{2r}(s_2)ds_2ds=\sqrt{\frac{2}{T-t}}\int\limits_t^T\phi_{j_4}(s)\int\limits_s^T\cos\frac{2\pi r(s_2-t)}{T-t}ds_2ds=$$

$$=\frac{\sqrt{2}\sqrt{T-t}}{2\pi r}\int\limits_t^T\phi_{j_4}(s)\left(-\sin\frac{2\pi r(s-t)}{T-t}\right)ds,$$

where $2r-1,\ 2r \ge p+1$, and $j_2, j_4 = 0, 1, \ldots, p$.

Due to orthogonality of the trigonometric functions we have

$$\int\limits_t^T \phi_{j_4}(s) \int\limits_s^T \phi_{2r-1}(s_2) ds_2 ds = \frac{\sqrt{2}(T-t)}{2\pi r} \cdot \begin{cases} -1 & \text{if } \ j_4 = 0 \\ 0 & \text{otherwise} \end{cases}, \tag{153}$$

$$\int\limits_t^T \phi_{j_4}(s) \int\limits_s^T \phi_{2r}(s_2) ds_2 ds = 0, \tag{154}$$

where $2r-1,\ 2r \ge p+1$, and $j_4 = 0, 1, \ldots, p$.

Using (151), (153), and (154), we obtain

$$g_{j_4 j_2}^{2m} + g_{j_2 j_4}^{2m} = \sum_{j_1=m+1}^{\infty} \frac{(T-t)^2}{2\pi^2 j_1^2} \cdot \begin{cases} 1 & \text{if } \ j_2 = j_4 = 0 \\ 0 & \text{otherwise} \end{cases},$$

$$g_{j_4 j_4}^{2m} = \frac{1}{2}\left(g_{j_4 j_2}^{2m} + g_{j_2 j_4}^{2m}\right)\Biggr|_{j_2=j_4} = \sum_{j_1=m+1}^{\infty} \frac{(T-t)^2}{4\pi^2 j_1^2} \cdot \begin{cases} 1 & \text{if } \ j_4 = 0 \\ 0 & \text{otherwise} \end{cases}.$$

Therefore (see (31)),

$$\begin{cases} \left|g_{j_4 j_2}^{2m} + g_{j_2 j_4}^{2m}\right| \le K_1/(2m) & \text{if } \ j_2 = j_4 = 0 \\ g_{j_4 j_2}^{2m} + g_{j_2 j_4}^{2m} = 0 & \text{otherwise} \end{cases}, \tag{155}$$

$$\begin{cases} \left|g_{j_4 j_4}^{2m}\right| \le K_1/(2m) & \text{if } \ j_4 = 0 \\ g_{j_4 j_4}^{2m} = 0 & \text{otherwise} \end{cases}, \tag{156}$$

where constant K_1 does not depend on $p = 2m$.

For $p = 2m-1$ from (152) and (154) we have

$$g_{j_4 j_2}^{2m-1} + g_{j_2 j_4}^{2m-1} = \sum_{j_1=m+1}^{\infty} \frac{(T-t)^2}{2\pi^2 j_1^2} \cdot \begin{cases} 1 \ \text{ or } \ 0 & \text{if } j_2 = j_4 = 0 \\ 0 & \text{otherwise} \end{cases}. \tag{157}$$

The relation (157) implies that

(158) $$g_{j_4j_4}^{2m-1}=\frac{1}{2}\left(g_{j_4j_2}^{2m-1}+g_{j_2j_4}^{2m-1}\right)\Biggl|_{j_2=j_4}=\sum_{j_1=m+1}^{\infty}\frac{(T-t)^2}{4\pi^2j_1^2}\cdot\begin{cases}1\ \text{ or }\ 0 & \text{if } j_4=0\\ \\ 0 & \text{otherwise}\end{cases}.$$

Using (157) and (158), we obtain

(159) $$\begin{cases}\left|g_{j_4j_2}^{2m-1}+g_{j_2j_4}^{2m-1}\right|\le\ K_2/(2m-1) & \text{if }\ j_2=j_4=0\\ \\ g_{j_4j_2}^{2m-1}+g_{j_2j_4}^{2m-1}=0 & \text{otherwise}\end{cases},$$

(160) $$\begin{cases}\left|g_{j_4j_4}^{2m-1}\right|\le\ K_2/(2m-1) & \text{if }\ j_4=0\\ \\ g_{j_4j_4}^{2m-1}=0 & \text{otherwise}\end{cases},$$

where constant K_2 does not depend on $p=2m-1$.

The relations (155), (156), (159), and (160) imply the following formulas

(161) $$\begin{cases}\left|g_{j_4j_2}^{p}+g_{j_2j_4}^{p}\right|\le\ K_3/p & \text{if }\ j_2=j_4=0\\ \\ g_{j_4j_2}^{p}+g_{j_2j_4}^{p}=0 & \text{otherwise}\end{cases},\qquad \begin{cases}\left|g_{j_4j_4}^{p}\right|\le\ K_3/p & \text{if }\ j_4=0\\ \\ g_{j_4j_4}^{p}=0 & \text{otherwise}\end{cases},$$

where constant K_3 does not depend on p ($p\in\mathbb{N}$). Moreover, $g_{j_4j_4}^{p}\ge 0$ (see (134)).

From (121) and (161) it follows that $\Delta_7^{(i_2i_4)}=0$ and $\Delta_3^{(i_2i_4)}=0$ w. p. 1 for $i_2=i_4\ne 0$. Analogously to the polynomial case, we obtain $\Delta_7^{(i_2i_4)}=0$ and $\Delta_3^{(i_2i_4)}=0$ w. p. 1 for $i_2\ne i_4$, $i_2\ne 0$, $i_4\ne 0$. The similar arguments prove that $\Delta_5^{(i_1i_3)}=0$ w. p. 1.

Taking into account (146), (161) and the relations

$$\lim_{p\to\infty}\sum_{j_3=0}^{p}f_{j_3j_3}^{p}=\lim_{p\to\infty}\sum_{j_3=0}^{p}d_{j_3j_3}^{p}=0,$$

which follow from the estimates

(162) $$|f_{jj}^{p}|\le\frac{C_1}{pj},\quad |d_{jj}^{p}|\le\frac{C_1}{pj}\quad (j\ne 0),\quad |f_{00}^{p}|\le\frac{C_1}{p},\quad |d_{00}^{p}|\le\frac{C_1}{p},$$

we obtain

$$\lim_{p\to\infty}\sum_{j_3=0}^{p}c_{j_3j_3}^{p}=-\lim_{p\to\infty}\sum_{j_3=0}^{p}g_{j_3j_3}^{p},$$

$$0 \le \lim_{p\to\infty} \sum_{j_3=0}^{p} g_{j_3 j_3}^{p} \le \lim_{p\to\infty} \frac{K_3}{p} = 0.$$

Note that the estimates (162) can be obtained by analogy with (150); constant C_1 in (162) has the same meaning as constant C_1 in (150).

Finally, we have

$$\lim_{p\to\infty} \sum_{j_3=0}^{p} c_{j_3 j_3}^{p} = 0.$$

The relations (120) are proved for the trigonometric case. Theorem 4 is proved for the trigonometric case. Theorem 4 is proved.

Remark 1. *It should be noted that the proof of Theorem 4 can be somewhat simplified. More precisely, instead of (121)–(123), we can use only one and rather simple estimate.*

We have

$$\mathsf{M}\left\{\left(\sum_{j_3,j_4=0}^{p} a_{j_4 j_3}^{p} \zeta_{j_3}^{(i_3)} \zeta_{j_4}^{(i_4)}\right)^2\right\} =$$

$$= \mathsf{M}\left\{\left(\sum_{j_3,j_4=0}^{p} a_{j_4 j_3}^{p} \left(\zeta_{j_3}^{(i_3)} \zeta_{j_4}^{(i_4)} - \mathbf{1}_{\{i_3=i_4\ne 0\}} \mathbf{1}_{\{j_3=j_4\}} + \mathbf{1}_{\{i_3=i_4\ne 0\}} \mathbf{1}_{\{j_3=j_4\}}\right)\right)^2\right\} =$$

$$= \mathsf{M}\left\{\left(\sum_{j_3,j_4=0}^{p} a_{j_4 j_3}^{p} \left(\zeta_{j_3}^{(i_3)} \zeta_{j_4}^{(i_4)} - \mathbf{1}_{\{i_3=i_4\ne 0\}} \mathbf{1}_{\{j_3=j_4\}}\right) + \mathbf{1}_{\{i_3=i_4\ne 0\}} \sum_{j_4=0}^{p} a_{j_4 j_4}^{p}\right)^2\right\} =$$

$$= \mathsf{M}\left\{\left(\sum_{j_3,j_4=0}^{p} a_{j_4 j_3}^{p} \left(\zeta_{j_3}^{(i_3)} \zeta_{j_4}^{(i_4)} - \mathbf{1}_{\{i_3=i_4\ne 0\}} \mathbf{1}_{\{j_3=j_4\}}\right)\right)^2\right\} +$$

$$+\mathbf{1}_{\{i_3=i_4\ne 0\}} \left(\sum_{j_4=0}^{p} a_{j_4 j_4}^{p}\right)^2. \tag{163}$$

Let us consider the following multiple stochastic integral

$$\underset{N\to\infty}{\text{l.i.m.}} \sum_{\substack{j_1,\ldots,j_k=0 \\ j_q\ne j_r;\ q\ne r;\ q,r=1,\ldots,k}}^{N-1} \Phi\left(\tau_{j_1},\ldots,\tau_{j_k}\right) \prod_{l=1}^{k} \Delta \mathbf{w}_{\tau_{j_l}}^{(i_l)} \stackrel{\text{def}}{=} J'[\Phi]_{T,t}^{(i_1\ldots i_k)}, \tag{164}$$

where for simplicity we assume that $\Phi(t_1,\ldots,t_k):\ [t,T]^k \to \mathbb{R}$ *is a continuous nonrandom function on* $[t,T]^k$. *Moreover,* $\Delta \mathbf{w}_{\tau_j}^{(i)} = \mathbf{w}_{\tau_{j+1}}^{(i)} - \mathbf{w}_{\tau_j}^{(i)}$ $(i=0,1,\ldots,m)$, $\{\tau_j\}_{j=0}^{N}$ *is a partition of* $[t,T]$, *which satisfies the condition* (6), $i_1,\ldots,i_k = 0,1,\ldots,m$.

The stochastic integral with respect to the scalar standard Wiener process ($i_1 = \ldots = i_k \neq 0$) *and similar to* (164) *was considered in* [57] (1951) *and is called the multiple Wiener stochastic integral* [57].

The expression

$$\sum_{j_3,j_4=0}^{p} a_{j_4 j_3}^{p}\left(\zeta_{j_3}^{(i_3)}\zeta_{j_4}^{(i_4)} - \mathbf{1}_{\{i_3=i_4\neq 0\}}\mathbf{1}_{\{j_3=j_4\}}\right)$$

can be interpreted as the multiple Wiener stochastic integral (164) *of multiplicity* 2 *with nonrandom integrand function*

$$\sum_{j_3,j_4=0}^{p} a_{j_4 j_3}^{p}\phi_{j_3}(t_3)\phi_{j_4}(t_4).$$

Note that the following estimate is true [57] (*also see* [26], *Sect.* 2.3)

$$\mathsf{M}\left\{\left(J'[\Phi]_{T,t}^{(i_1\ldots i_k)}\right)^2\right\} \leq C_k \int\limits_{[t,T]^k} \Phi^2(t_1,\ldots,t_k)dt_1\ldots dt_k, \tag{165}$$

where $J'[\Phi]_{T,t}^{(i_1\ldots i_k)}$ *is defined by* (164) *and* C_k *is a constant.*

Then

$$\mathsf{M}\left\{\left(\sum_{j_3,j_4=0}^{p} a_{j_4 j_3}^{p}\left(\zeta_{j_3}^{(i_3)}\zeta_{j_4}^{(i_4)} - \mathbf{1}_{\{i_3=i_4\neq 0\}}\mathbf{1}_{\{j_3=j_4\}}\right)\right)^2\right\} \leq$$

$$\leq C_2 \int\limits_{[t,T]^2}\left(\sum_{j_3,j_4=0}^{p} a_{j_4 j_3}^{p}\phi_{j_3}(t_3)\phi_{j_4}(t_4)\right)^2 dt_3dt_4 = C_2\sum_{j_3,j_4=0}^{p}\left(a_{j_4 j_3}^{p}\right)^2. \tag{166}$$

From (163) *and* (166) *we obtain*

$$\mathsf{M}\left\{\left(\sum_{j_3,j_4=0}^{p} a_{j_4 j_3}^{p}\zeta_{j_3}^{(i_3)}\zeta_{j_4}^{(i_4)}\right)^2\right\} \leq C_2\sum_{j_3,j_4=0}^{p}\left(a_{j_4 j_3}^{p}\right)^2 + \mathbf{1}_{\{i_3=i_4\neq 0\}}\left(\sum_{j_4=0}^{p} a_{j_4 j_4}^{p}\right)^2. \tag{167}$$

Obviously, the estimate (167) *can be used in the proof of Theorem* 4 *instead of* (121)–(123). *The estimate* (167) *can be refined. We have* [26] (*see the relation* (1.87), *Sect.* 1.2)

$$\mathsf{M}\left\{\left(\sum_{j_3,j_4=0}^{p} a_{j_4 j_3}^{p}\left(\zeta_{j_3}^{(i_3)}\zeta_{j_4}^{(i_4)} - \mathbf{1}_{\{i_3=i_4\neq 0\}}\mathbf{1}_{\{j_3=j_4\}}\right)\right)^2\right\} =$$

$$= \sum_{j_3,j_4=0}^{p} \left(a_{j_4 j_3}^{p}\right)^2 + \mathbf{1}_{\{i_3=i_4\ne 0\}} \sum_{j_3,j_4=0}^{p} a_{j_4 j_3}^{p} a_{j_3 j_4}^{p} \le$$

$$\le \sum_{j_3,j_4=0}^{p} \left(a_{j_4 j_3}^{p}\right)^2 + \mathbf{1}_{\{i_3=i_4\ne 0\}} \frac{1}{2} \sum_{j_3,j_4=0}^{p} \left(\left(a_{j_4 j_3}^{p}\right)^2 + \left(a_{j_3 j_4}^{p}\right)^2\right) =$$

$$= \left(1 + \mathbf{1}_{\{i_3=i_4\ne 0\}}\right) \sum_{j_3,j_4=0}^{p} \left(a_{j_4 j_3}^{p}\right)^2. \tag{168}$$

Combining (163) *and* (168), *we finally have*

$$\mathsf{M}\left\{\left(\sum_{j_3,j_4=0}^{p} a_{j_4 j_3}^{p} \zeta_{j_3}^{(i_3)} \zeta_{j_4}^{(i_4)}\right)^2\right\} \le \left(1 + \mathbf{1}_{\{i_3=i_4\ne 0\}}\right) \sum_{j_3,j_4=0}^{p} \left(a_{j_4 j_3}^{p}\right)^2 +$$

$$+\mathbf{1}_{\{i_3=i_4\ne 0\}} \left(\sum_{j_4=0}^{p} a_{j_4 j_4}^{p}\right)^2. \tag{169}$$

6. Theorems 1–4 from Point of View of the Wong–Zakai Approximation

The iterated Ito stochastic integrals and solutions of Ito SDEs are complex and important functionals from the independent components $\mathbf{f}_s^{(i)}$, $i = 1, \ldots, m$ of the multidimensional Wiener process $\mathbf{f}_s$, $s \in [0, T]$. Let $\mathbf{f}_s^{(i)p}$, $p \in \mathbb{N}$ be some approximation of $\mathbf{f}_s^{(i)}$, $i = 1, \ldots, m$. Suppose that $\mathbf{f}_s^{(i)p}$ converges to $\mathbf{f}_s^{(i)}$, $i = 1, \ldots, m$ if $p \to \infty$ in some sense and has differentiable sample trajectories.

A natural question arises: if we replace $\mathbf{f}_s^{(i)}$ by $\mathbf{f}_s^{(i)p}$, $i = 1, \ldots, m$ in the functionals mentioned above, will the resulting functionals converge to the original functionals from the components $\mathbf{f}_s^{(i)}$, $i = 1, \ldots, m$ of the multidimentional Wiener process $\mathbf{f}_s$? The answere to this question is negative in the general case. However, in the pioneering works of Wong E. and Zakai M. [56], [58], it was shown that under the special conditions and for some types of approximations of the Wiener process the answere is affirmative with one peculiarity: the convergence takes place to the iterated Stratonovich stochastic integrals and solutions of Stratonovich SDEs and not to iterated Ito stochastic integrals and solutions of Ito SDEs. The piecewise linear approximation as well as the regularization by convolution [56]-[59] relate the mentioned types of approximations of the Wiener process. The above approximation of stochastic integrals and solutions of SDEs is often called the Wong–Zakai approximation.

Let $\mathbf{f}_s$, $s \in [0, T]$ be an m-dimensional standard Wiener process with independent components $\mathbf{f}_s^{(i)}$, $i = 1, \ldots, m$. It is well known that the following representation takes place [60], [62]

$$\mathbf{f}_\tau^{(i)} - \mathbf{f}_t^{(i)} = \sum_{j=0}^{\infty} \int\limits_t^\tau \phi_j(s) ds\ \zeta_j^{(i)}, \quad \zeta_j^{(i)} = \int\limits_t^T \phi_j(s) d\mathbf{f}_s^{(i)}, \tag{170}$$

where $\tau \in [t,T]$, $t \ge 0$, $\{\phi_j(x)\}_{j=0}^{\infty}$ is an arbitrary complete orthonormal system of functions in the space $L_2([t,T])$, and $\zeta_j^{(i)}$ are independent standard Gaussian random variables for various i or j. Moreover, the series (170) converges for any $\tau \in [t,T]$ in the mean-square sense.

Let $\mathbf{f}_\tau^{(i)p} - \mathbf{f}_t^{(i)p}$ be the mean-square approximation of the process $\mathbf{f}_\tau^{(i)} - \mathbf{f}_t^{(i)}$, which has the following form

$$\mathbf{f}_\tau^{(i)p} - \mathbf{f}_t^{(i)p} = \sum_{j=0}^{p} \int\limits_t^{\tau} \phi_j(s)ds\ \zeta_j^{(i)}. \tag{171}$$

From (171) we obtain

$$d\mathbf{f}_\tau^{(i)p} = \sum_{j=0}^{p} \phi_j(\tau)\zeta_j^{(i)} d\tau. \tag{172}$$

Consider the following iterated Riemann–Stieltjes integral

$$\int\limits_t^T \psi_k(t_k)\ldots \int\limits_t^{t_2} \psi_1(t_1) d\mathbf{w}_{t_1}^{(i_1)p_1} \ldots d\mathbf{w}_{t_k}^{(i_k)p_k}, \tag{173}$$

where $p_1,\ldots,p_k \in \mathbb{N}$, $i_1,\ldots,i_k = 0,1,\ldots,m$,

$$d\mathbf{w}_\tau^{(i)p} = \begin{cases} d\mathbf{f}_\tau^{(i)p} & \text{for} \quad i = 1,\ldots,m \\ \\ d\tau & \text{for} \quad i = 0 \end{cases}, \tag{174}$$

and $d\mathbf{f}_\tau^{(i)p}$ in defined by the relation (172).

Let us substitute (174) into (173)

$$\int\limits_t^T \psi_k(t_k)\ldots \int\limits_t^{t_2} \psi_1(t_1) d\mathbf{w}_{t_1}^{(i_1)p_1} \ldots d\mathbf{w}_{t_k}^{(i_k)p_k} = \sum_{j_1=0}^{p_1} \ldots \sum_{j_k=0}^{p_k} C_{j_k\ldots j_1} \prod_{l=1}^{k} \zeta_{j_l}^{(i_l)}, \tag{175}$$

where

$$\zeta_j^{(i)} = \int\limits_t^T \phi_j(s) d\mathbf{w}_s^{(i)}$$

are independent standard Gaussian random variables for various i or j (in the case when $i \ne 0$), $\mathbf{w}_s^{(i)} = \mathbf{f}_s^{(i)}$ for $i = 1,\ldots,m$ and $\mathbf{w}_s^{(0)} = s$,

$$C_{j_k\ldots j_1} = \int\limits_t^T \psi_k(t_k)\phi_{j_k}(t_k)\ldots \int\limits_t^{t_2} \psi_1(t_1)\phi_{j_1}(t_1) dt_1 \ldots dt_k$$

is the Fourier coefficient.

To best of our knowledge [56]-[59] the approximations of the Wiener process in the Wong–Zakai approximation must satisfy fairly strong restrictions [59] (see Definition 7.1, pp. 480-481). Moreover, approximations of the Wiener process that are similar to (171) were not considered in [56], [58] (also see [59], Theorems 7.1, 7.2). Therefore, the proof of analogs of Theorems 7.1 and 7.2 [59] for approximations of the Wiener process based on its series expansion (170) should be carried out separately. Thus, the mean-square convergence of the right-hand side of (175) to the iterated Stratonovich stochastic integral (3) does not follow from the results of the papers [56], [58] (also see [59], Theorems 7.1, 7.2).

From the other hand, Theorems 1–4 from this paper can be considered as the proof of the Wong–Zakai approximation based on the iterated Riemann–Stieltjes integrals (173) of multiplicities 1 to 4 and the approximation (171) of the Wiener process. At that, the mentioned Riemann–Stieltjes integrals converge (according to Theorems 1–4) to the appropriate Stratonovich stochastic integrals (3). Recall that $\{\phi_j(x)\}_{j=0}^{\infty}$ (see (170), (171), and Theorems 2–4) is a complete orthonormal system of Legendre polynomials or trigonometric functions in the space $L_2([t,T])$.

To illustrate the above reasoning, consider two examples for the case $k=2,\ \psi_1(s),\ \psi_2(s)\equiv 1;$ $i_1,i_2=1,\ldots,m.$

The first example relates to the piecewise linear approximation of the multidimensional Wiener process (these approximations were considered in [56]-[59]).

Let $\mathbf{b}_{\Delta}^{(i)}(t),\ t\in[0,T]$ be the piecewise linear approximation of the ith component $\mathbf{f}_t^{(i)}$ of the multidimensional standard Wiener process $\mathbf{f}_t,\ t\in[0,T]$ with independent components $\mathbf{f}_t^{(i)},\ i=1,\ldots,m$, i.e.

$$\mathbf{b}_{\Delta}^{(i)}(t)=\mathbf{f}_{k\Delta}^{(i)}+\frac{t-k\Delta}{\Delta}\Delta\mathbf{f}_{k\Delta}^{(i)},$$

where

$$\Delta\mathbf{f}_{k\Delta}^{(i)}=\mathbf{f}_{(k+1)\Delta}^{(i)}-\mathbf{f}_{k\Delta}^{(i)},\quad t\in[k\Delta,(k+1)\Delta),\quad k=0,1,\ldots,N-1.$$

Note that w. p. 1

$$\frac{d\mathbf{b}_{\Delta}^{(i)}}{dt}(t)=\frac{\Delta\mathbf{f}_{k\Delta}^{(i)}}{\Delta},\quad t\in[k\Delta,(k+1)\Delta),\quad k=0,1,\ldots,N-1. \tag{176}$$

Consider the following iterated Riemann–Stieltjes integral

$$\int\limits_0^T\int\limits_0^s d\mathbf{b}_{\Delta}^{(i_1)}(\tau)d\mathbf{b}_{\Delta}^{(i_2)}(s),\quad i_1,i_2=1,\ldots,m.$$

Using (176) and additive property of Riemann–Stieltjes integrals, we can write w. p. 1

$$\int\limits_0^T\int\limits_0^s d\mathbf{b}_{\Delta}^{(i_1)}(\tau)d\mathbf{b}_{\Delta}^{(i_2)}(s)=\int\limits_0^T\int\limits_0^s \frac{d\mathbf{b}_{\Delta}^{(i_1)}}{d\tau}(\tau)d\tau\frac{d\mathbf{b}_{\Delta}^{(i_2)}}{ds}(s)ds=$$

$$=\sum_{l=0}^{N-1}\int\limits_{l\Delta}^{(l+1)\Delta}\left(\sum_{q=0}^{l-1}\int\limits_{q\Delta}^{(q+1)\Delta}\frac{\Delta\mathbf{f}_{q\Delta}^{(i_1)}}{\Delta}d\tau+\int\limits_{l\Delta}^{s}\frac{\Delta\mathbf{f}_{l\Delta}^{(i_1)}}{\Delta}d\tau\right)\frac{\Delta\mathbf{f}_{l\Delta}^{(i_2)}}{\Delta}ds=$$

$$
= \sum_{l=0}^{N-1}\sum_{q=0}^{l-1} \Delta\mathbf{f}_{q\Delta}^{(i_1)}\Delta\mathbf{f}_{l\Delta}^{(i_2)} + \frac{1}{\Delta^2}\sum_{l=0}^{N-1} \Delta\mathbf{f}_{l\Delta}^{(i_1)}\Delta\mathbf{f}_{l\Delta}^{(i_2)} \int\limits_{l\Delta}^{(l+1)\Delta}\int\limits_{l\Delta}^{s} d\tau ds =
$$

$$
= \sum_{l=0}^{N-1}\sum_{q=0}^{l-1} \Delta\mathbf{f}_{q\Delta}^{(i_1)}\Delta\mathbf{f}_{l\Delta}^{(i_2)} + \frac{1}{2}\sum_{l=0}^{N-1} \Delta\mathbf{f}_{l\Delta}^{(i_1)}\Delta\mathbf{f}_{l\Delta}^{(i_2)}. \tag{177}
$$

Using (177) it is not difficult to show that

$$
\underset{N\to\infty}{\text{l.i.m.}} \int\limits_0^T\int\limits_0^s d\mathbf{b}_{\Delta}^{(i_1)}(\tau)d\mathbf{b}_{\Delta}^{(i_2)}(s) = \int\limits_0^T\int\limits_0^s d\mathbf{f}_{\tau}^{(i_1)}d\mathbf{f}_{s}^{(i_2)} + \frac{1}{2}\mathbf{1}_{\{i_1=i_2\}}\int\limits_0^T ds =
$$

$$
= \int\limits_0^{*T}\int\limits_0^{*s} d\mathbf{f}_{\tau}^{(i_1)}d\mathbf{f}_{s}^{(i_2)}, \tag{178}
$$

where $\Delta \to 0$ if $N \to \infty$ $(N\Delta = T)$.

Obviously, (178) agrees with Theorem 7.1 (see [59], p. 486).

The next example relates to the approximation of the Wiener process based on its series expansion (170) for $t = 0$, where $\{\phi_j(x)\}_{j=0}^{\infty}$ is a complete orthonormal system of Legendre polynomials or trigonometric functions in the space $L_2([0,T])$.

Consider the following iterated Riemann–Stieltjes integral

$$
\int\limits_0^T\int\limits_0^s d\mathbf{f}_{\tau}^{(i_1)p}d\mathbf{f}_{s}^{(i_2)p}, \quad i_1, i_2 = 1,\ldots,m, \tag{179}
$$

where $d\mathbf{f}_{\tau}^{(i)p}$ is defined by the relation (172).

Let us substitute (172) into (179)

$$
\int\limits_0^T\int\limits_0^s d\mathbf{f}_{\tau}^{(i_1)p}d\mathbf{f}_{s}^{(i_2)p} = \sum_{j_1,j_2=0}^{p} C_{j_2j_1}\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}, \tag{180}
$$

where

$$
C_{j_2j_1} = \int\limits_0^T \phi_{j_2}(s)\int\limits_0^s \phi_{j_1}(\tau)d\tau ds
$$

is the Fourier coefficient; another notations are the same as in (175).

As we noted above, approximations of the Wiener process that are similar to (171) were not considered in [56], [58] (also see Theorems 7.1, 7.2 in [59]). Furthermore, the extension of the results of Theorems 7.1 and 7.2 [59] to the case under consideration is not obvious.

On the other hand, we can apply the theory built in Chapters 1 and 2 of the monographs [26]-[29]. More precisely, using Theorem 2, we obtain from (180) the desired result

$$\underset{p\to\infty}{\text{l.i.m.}}\int\limits_0^T\int\limits_0^s d\mathbf{f}_\tau^{(i_1)p}d\mathbf{f}_s^{(i_2)p}=\underset{p\to\infty}{\text{l.i.m.}}\sum_{j_1,j_2=0}^{p}C_{j_2j_1}\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}=\int\limits_0^{*T}\int\limits_0^{*s}d\mathbf{f}_\tau^{(i_1)}d\mathbf{f}_s^{(i_2)}. \tag{181}$$

From the other hand, by Theorem 1 (see (10)) for the case $k=2$ we obtain from (180) the following relation

$$\underset{p\to\infty}{\text{l.i.m.}}\int\limits_0^T\int\limits_0^s d\mathbf{f}_\tau^{(i_1)p}d\mathbf{f}_s^{(i_2)p}=\underset{p\to\infty}{\text{l.i.m.}}\sum_{j_1,j_2=0}^{p}C_{j_2j_1}\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}=$$

$$=\underset{p\to\infty}{\text{l.i.m.}}\sum_{j_1,j_2=0}^{p}C_{j_2j_1}\left(\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}-\mathbf{1}_{\{i_1=i_2\}}\mathbf{1}_{\{j_1=j_2\}}\right)+\mathbf{1}_{\{i_1=i_2\}}\sum_{j_1=0}^{\infty}C_{j_1j_1}=$$

$$=\int\limits_0^T\int\limits_0^s d\mathbf{f}_\tau^{(i_1)}d\mathbf{f}_s^{(i_2)}+\mathbf{1}_{\{i_1=i_2\}}\sum_{j_1=0}^{\infty}C_{j_1j_1}. \tag{182}$$

Since

$$\sum_{j_1=0}^{\infty}C_{j_1j_1}=\frac{1}{2}\sum_{j_1=0}^{\infty}\left(\int\limits_0^T\phi_j(\tau)d\tau\right)^2=\frac{1}{2}\left(\int\limits_0^T\phi_0(\tau)d\tau\right)^2=\frac{1}{2}\int\limits_0^T ds,$$

then from (15) and (182) we obtain (181).

7. Modification of Theorem 1 for the Case of Integration Interval $[t,s]$ $(s\in(t,T])$ of Iterated Ito Stochastic Integrals

Suppose that every $\psi_l(\tau)$ $(l=1,\ldots,k)$ is a continuous nonrandom function on $[t,T]$. Define the following function on the hypercube $[t,T]^k$

$$\bar{K}(t_1,\ldots,t_k,s)=\mathbf{1}_{\{t_k<s\}}K(t_1,\ldots,t_k),$$

where the function $K(t_1,\ldots,t_k)$ is defined by (4), $s\in(t,T]$ (s is fixed), and $\mathbf{1}_A$ is the indicator of the set A. So we have

$$\bar{K}(t_1,\ldots,t_k,s)=\mathbf{1}_{\{t_1<\ldots<t_k<s\}}\psi_1(t_1)\ldots\psi_k(t_k)=\begin{cases}\psi_1(t_1)\ldots\psi_k(t_k), & t_1<\ldots<t_k<s\\ \\ 0, & \text{otherwise}\end{cases}, \tag{183}$$

where $k\ge 1$, $t_1,\ldots,t_k\in[t,T]$, and $s\in(t,T]$.

Suppose that $\{\phi_j(x)\}_{j=0}^{\infty}$ is a complete orthonormal system of functions in the space $L_2([t,T])$. The function $\bar{K}(t_1,\ldots,t_k,s)$ defined by (183) is piecewise continuous in the hypercube $[t,T]^k$. At this situation it is well known that the generalized multiple Fourier series of $\bar{K}(t_1,\ldots,t_k,s)\in L_2([t,T]^k)$ is converging to $\bar{K}(t_1,\ldots,t_k,s)$ in the hypercube $[t,T]^k$ in the mean-square sense, i.e.

$$\lim_{p_1,\ldots,p_k\to\infty}\left\|\bar{K}(t_1,\ldots,t_k,s)-\sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k}C_{j_k\ldots j_1}(s)\prod_{l=1}^{k}\phi_{j_l}(t_l)\right\|_{L_2([t,T]^k)}=0,$$

where

$$C_{j_k\ldots j_1}(s)=\int\limits_{[t,T]^k}\bar{K}(t_1,\ldots,t_k,s)\prod_{l=1}^{k}\phi_{j_l}(t_l)dt_1\ldots dt_k=$$

$$=\int\limits_t^s\psi_k(t_k)\phi_{j_k}(t_k)\ldots\int\limits_t^{t_2}\psi_1(t_1)\phi_{j_1}(t_1)dt_1\ldots dt_k \tag{184}$$

is the Fourier coefficient, and

$$\|f\|_{L_2([t,T]^k)}=\left(\int\limits_{[t,T]^k}f^2(t_1,\ldots,t_k)dt_1\ldots dt_k\right)^{1/2}.$$

Note that

$$J[\psi^{(k)}]_{s,t}=\int\limits_t^s\psi_k(t_k)\ldots\int\limits_t^{t_2}\psi_1(t_1)d\mathbf{w}_{t_1}^{(i_1)}\ldots d\mathbf{w}_{t_k}^{(i_k)}= \tag{185}$$

$$=\int\limits_t^T\mathbf{1}_{\{t_k<s\}}\psi_k(t_k)\ldots\int\limits_t^{t_2}\psi_1(t_1)d\mathbf{w}_{t_1}^{(i_1)}\ldots d\mathbf{w}_{t_k}^{(i_k)}\quad \text{w. p. 1},$$

where $s\in(t,T]$ (s is fixed), $i_1,\ldots,i_k=0,1,\ldots,m$.

Consider the partition $\{\tau_j\}_{j=0}^N$ of $[t,T]$, which satisfies the condition (6).

We will say that the function $f(x):[t,T]\to\mathbb{R}$ satisfies the condition $(\star)$ if it is continuous on the interval $[t,T]$ except may be for the finite number of points of the finite discontinuity as well as it is right-continuous on the interval $[t,T]$.

Theorem 5 [26]-[29], [36]. *Suppose that every $\psi_l(\tau)$ $(l=1,\ldots,k)$ is a continuous nonrandom function on $[t,T]$ and $\{\phi_j(x)\}_{j=0}^{\infty}$ is a complete orthonormal system of functions in the space $L_2([t,T])$, each function $\phi_j(x)$ of which for finite j satisfies the condition $(\star)$. Then*

$$J[\psi^{(k)}]_{s,t}=\underset{p_1,\ldots,p_k\to\infty}{\text{l.i.m.}}\sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k}C_{j_k\ldots j_1}(s)\Biggl(\prod_{l=1}^{k}\zeta_{j_l}^{(i_l)}-$$

$$-\underset{N\to\infty}{\text{l.i.m.}}\sum_{(l_1,\ldots,l_k)\in\mathrm{G}_k}\phi_{j_1}(\tau_{l_1})\Delta\mathbf{w}_{\tau_{l_1}}^{(i_1)}\ldots\phi_{j_k}(\tau_{l_k})\Delta\mathbf{w}_{\tau_{l_k}}^{(i_k)}\Biggr), \tag{186}$$

where $J[\psi^{(k)}]_{s,t}$ *is the iterated Ito stochastic integral* (185), $s\in(t,T]$ (s is fixed),

$$
\mathrm{G}_k=\mathrm{H}_k\backslash\mathrm{L}_k,\quad \mathrm{H}_k=\bigl\{(l_1,\ldots,l_k):\ l_1,\ldots,l_k=0,\ 1,\ldots,N-1\bigr\},
$$

$$
\mathrm{L}_k=\bigl\{(l_1,\ldots,l_k):\ l_1,\ldots,l_k=0,\ 1,\ldots,N-1;\ l_g\ne l_r\ (g\ne r);\ g,r=1,\ldots,k\bigr\},
$$

l.i.m. *is a limit in the mean-square sense,* $i_1,\ldots,i_k=0,1,\ldots,m,$

$$
\zeta_j^{(i)}=\int\limits_t^T\phi_j(\tau)d\mathbf{w}_\tau^{(i)}
$$

are independent standard Gaussian random variables for various i *or* j (*in the case when* $i\ne 0$), $C_{j_k\ldots j_1}(s)$ *is the Fourier coefficient* (184), $\Delta\mathbf{w}_{\tau_j}^{(i)}=\mathbf{w}_{\tau_{j+1}}^{(i)}-\mathbf{w}_{\tau_j}^{(i)}$ $(i=0,\ 1,\ldots,m)$, $\{\tau_j\}_{j=0}^N$ *is a partition of* $[t,T]$, *which satisfies the condition* (6).

It is not difficult to see that for the case of pairwise different numbers $i_1,\ldots,i_k=1,\ldots,m$ from Theorem 5 we obtain

$$
J[\psi^{(k)}]_{s,t}=\underset{p_1,\ldots,p_k\to\infty}{\text{l.i.m.}}\sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k}C_{j_k\ldots j_1}(s)\zeta_{j_1}^{(i_1)}\ldots\zeta_{j_k}^{(i_k)}.
$$

Consider particular cases of Theorem 5 for $k=1,\ldots,5$ [27]–[29], [36]

$$
J[\psi^{(1)}]_{s,t}=\underset{p_1\to\infty}{\text{l.i.m.}}\sum_{j_1=0}^{p_1}C_{j_1}(s)\zeta_{j_1}^{(i_1)},\tag{187}
$$

$$
J[\psi^{(2)}]_{s,t}=\underset{p_1,p_2\to\infty}{\text{l.i.m.}}\sum_{j_1=0}^{p_1}\sum_{j_2=0}^{p_2}C_{j_2j_1}(s)\Biggl(\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}-\mathbf{1}_{\{i_1=i_2\ne 0\}}\mathbf{1}_{\{j_1=j_2\}}\Biggr),\tag{188}
$$

$$
\begin{aligned}
J[\psi^{(3)}]_{s,t}=\underset{p_1,\ldots,p_3\to\infty}{\text{l.i.m.}}\sum_{j_1=0}^{p_1}\sum_{j_2=0}^{p_2}\sum_{j_3=0}^{p_3}C_{j_3j_2j_1}(s)\Biggl(\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}\zeta_{j_3}^{(i_3)}-\\
-\mathbf{1}_{\{i_1=i_2\ne 0\}}\mathbf{1}_{\{j_1=j_2\}}\zeta_{j_3}^{(i_3)}-\mathbf{1}_{\{i_2=i_3\ne 0\}}\mathbf{1}_{\{j_2=j_3\}}\zeta_{j_1}^{(i_1)}-\mathbf{1}_{\{i_1=i_3\ne 0\}}\mathbf{1}_{\{j_1=j_3\}}\zeta_{j_2}^{(i_2)}\Biggr),
\end{aligned}\tag{189}
$$

$$
\begin{aligned}
J[\psi^{(4)}]_{s,t}=\underset{p_1,\ldots,p_4\to\infty}{\text{l.i.m.}}\sum_{j_1=0}^{p_1}\ldots\sum_{j_4=0}^{p_4}C_{j_4\ldots j_1}(s)\Biggl(\prod_{l=1}^4\zeta_{j_l}^{(i_l)}-\\
-\mathbf{1}_{\{i_1=i_2\ne 0\}}\mathbf{1}_{\{j_1=j_2\}}\zeta_{j_3}^{(i_3)}\zeta_{j_4}^{(i_4)}-\mathbf{1}_{\{i_1=i_3\ne 0\}}\mathbf{1}_{\{j_1=j_3\}}\zeta_{j_2}^{(i_2)}\zeta_{j_4}^{(i_4)}-\\
-\mathbf{1}_{\{i_1=i_4\ne 0\}}\mathbf{1}_{\{j_1=j_4\}}\zeta_{j_2}^{(i_2)}\zeta_{j_3}^{(i_3)}-\mathbf{1}_{\{i_2=i_3\ne 0\}}\mathbf{1}_{\{j_2=j_3\}}\zeta_{j_1}^{(i_1)}\zeta_{j_4}^{(i_4)}-\\
-\mathbf{1}_{\{i_2=i_4\ne 0\}}\mathbf{1}_{\{j_2=j_4\}}\zeta_{j_1}^{(i_1)}\zeta_{j_3}^{(i_3)}-\mathbf{1}_{\{i_3=i_4\ne 0\}}\mathbf{1}_{\{j_3=j_4\}}\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}+\\
+\mathbf{1}_{\{i_1=i_2\ne 0\}}\mathbf{1}_{\{j_1=j_2\}}\mathbf{1}_{\{i_3=i_4\ne 0\}}\mathbf{1}_{\{j_3=j_4\}}+\mathbf{1}_{\{i_1=i_3\ne 0\}}\mathbf{1}_{\{j_1=j_3\}}\mathbf{1}_{\{i_2=i_4\ne 0\}}\mathbf{1}_{\{j_2=j_4\}}+
\end{aligned}
$$

$$
+\mathbf{1}_{\{i_1=i_4\ne 0\}}\mathbf{1}_{\{j_1=j_4\}}\mathbf{1}_{\{i_2=i_3\ne 0\}}\mathbf{1}_{\{j_2=j_3\}}\Biggr), \tag{190}
$$

$$
\begin{gathered}
J[\psi^{(5)}]_{s,t}=\underset{p_1,\ldots,p_5\to\infty}{\text{l.i.m.}}\sum_{j_1=0}^{p_1}\ldots\sum_{j_5=0}^{p_5}C_{j_5\ldots j_1}(s)\Biggl(\prod_{l=1}^{5}\zeta_{j_l}^{(i_l)}-\\

-\mathbf{1}_{\{i_3=i_5\ne 0\}}\mathbf{1}_{\{j_3=j_5\}}\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}\zeta_{j_4}^{(i_4)}-\mathbf{1}_{\{i_4=i_5\ne 0\}}\mathbf{1}_{\{j_4=j_5\}}\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}\zeta_{j_3}^{(i_3)}+\\
+\mathbf{1}_{\{i_1=i_2\ne 0\}}\mathbf{1}_{\{j_1=j_2\}}\mathbf{1}_{\{i_3=i_4\ne 0\}}\mathbf{1}_{\{j_3=j_4\}}\zeta_{j_5}^{(i_5)}+\mathbf{1}_{\{i_1=i_2\ne 0\}}\mathbf{1}_{\{j_1=j_2\}}\mathbf{1}_{\{i_3=i_5\ne 0\}}\mathbf{1}_{\{j_3=j_5\}}\zeta_{j_4}^{(i_4)}+\\
+\mathbf{1}_{\{i_1=i_2\ne 0\}}\mathbf{1}_{\{j_1=j_2\}}\mathbf{1}_{\{i_4=i_5\ne 0\}}\mathbf{1}_{\{j_4=j_5\}}\zeta_{j_3}^{(i_3)}+\mathbf{1}_{\{i_1=i_3\ne 0\}}\mathbf{1}_{\{j_1=j_3\}}\mathbf{1}_{\{i_2=i_4\ne 0\}}\mathbf{1}_{\{j_2=j_4\}}\zeta_{j_5}^{(i_5)}+\\
+\mathbf{1}_{\{i_1=i_3\ne 0\}}\mathbf{1}_{\{j_1=j_3\}}\mathbf{1}_{\{i_2=i_5\ne 0\}}\mathbf{1}_{\{j_2=j_5\}}\zeta_{j_4}^{(i_4)}+\mathbf{1}_{\{i_1=i_3\ne 0\}}\mathbf{1}_{\{j_1=j_3\}}\mathbf{1}_{\{i_4=i_5\ne 0\}}\mathbf{1}_{\{j_4=j_5\}}\zeta_{j_2}^{(i_2)}+\\
+\mathbf{1}_{\{i_1=i_4\ne 0\}}\mathbf{1}_{\{j_1=j_4\}}\mathbf{1}_{\{i_2=i_3\ne 0\}}\mathbf{1}_{\{j_2=j_3\}}\zeta_{j_5}^{(i_5)}+\mathbf{1}_{\{i_1=i_4\ne 0\}}\mathbf{1}_{\{j_1=j_4\}}\mathbf{1}_{\{i_2=i_5\ne 0\}}\mathbf{1}_{\{j_2=j_5\}}\zeta_{j_3}^{(i_3)}+\\
+\mathbf{1}_{\{i_1=i_4\ne 0\}}\mathbf{1}_{\{j_1=j_4\}}\mathbf{1}_{\{i_3=i_5\ne 0\}}\mathbf{1}_{\{j_3=j_5\}}\zeta_{j_2}^{(i_2)}+\mathbf{1}_{\{i_1=i_5\ne 0\}}\mathbf{1}_{\{j_1=j_5\}}\mathbf{1}_{\{i_2=i_3\ne 0\}}\mathbf{1}_{\{j_2=j_3\}}\zeta_{j_4}^{(i_4)}+\\
+\mathbf{1}_{\{i_1=i_5\ne 0\}}\mathbf{1}_{\{j_1=j_5\}}\mathbf{1}_{\{i_2=i_4\ne 0\}}\mathbf{1}_{\{j_2=j_4\}}\zeta_{j_3}^{(i_3)}+\mathbf{1}_{\{i_1=i_5\ne 0\}}\mathbf{1}_{\{j_1=j_5\}}\mathbf{1}_{\{i_3=i_4\ne 0\}}\mathbf{1}_{\{j_3=j_4\}}\zeta_{j_2}^{(i_2)}+\\
+\mathbf{1}_{\{i_2=i_3\ne 0\}}\mathbf{1}_{\{j_2=j_3\}}\mathbf{1}_{\{i_4=i_5\ne 0\}}\mathbf{1}_{\{j_4=j_5\}}\zeta_{j_1}^{(i_1)}+\mathbf{1}_{\{i_2=i_4\ne 0\}}\mathbf{1}_{\{j_2=j_4\}}\mathbf{1}_{\{i_3=i_5\ne 0\}}\mathbf{1}_{\{j_3=j_5\}}\zeta_{j_1}^{(i_1)}+\\
+\mathbf{1}_{\{i_2=i_5\ne 0\}}\mathbf{1}_{\{j_2=j_5\}}\mathbf{1}_{\{i_3=i_4\ne 0\}}\mathbf{1}_{\{j_3=j_4\}}\zeta_{j_1}^{(i_1)}\Biggr),
\end{gathered}
$$

where $\mathbf{1}_A$ is the indicator of the set A, $C_{j_k\ldots j_1}(s)$ $(k=1,\ldots,5)$ has the form (184), $s\in(t,T]$ (s is fixed).

Note that in [26] (see Sect. 1.15) Theorem 5 is generalized to the case of an arbitrary complete orthonormal system of functions in the space $L_2([t,T])$ and $\psi_1(\tau),\ldots,\psi_k(\tau)\in L_2([t,T])$.

8. Modification of Theorem 2 for the Case of Integration Interval $[t,s]$ $(s\in(t,T])$ of Iterated Stratonovich Stochastic Integrals of Multiplicity 2 and Wong–Zakai Type Theorem

Let us prove the following theorem.

Theorem 6 [26]. *Suppose that $\{\phi_j(x)\}_{j=0}^{\infty}$ is an arbitrary complete orthonormal system of functions in the space $L_2([t,T])$ and $\psi_1(\tau),\psi_2(\tau)$ are continuous functions on $[t,T]$. Then, for the iterated Stratonovich stochastic integral*

$$
J^*[\psi^{(2)}]_{s,t}=\int\limits_t^{*s}\psi_2(t_2)\int\limits_t^{*t_2}\psi_1(t_1)d\mathbf{f}_{t_1}^{(i_1)}d\mathbf{f}_{t_2}^{(i_2)}\quad (i_1,i_2=1,\ldots,m)
$$

the following expansion

$$J^*[\psi^{(2)}]_{s,t} = \underset{p_1,p_2\to\infty}{\text{l.i.m.}} \sum_{j_1=0}^{p_1}\sum_{j_2=0}^{p_2} C_{j_2j_1}(s)\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)} \tag{191}$$

that converges in the mean-square sense is valid, where $s\in(t,T]$ *(*s *is fixed),*

$$C_{j_2j_1}(s) = \int\limits_t^s \psi_2(t_2)\phi_{j_2}(t_2)\int\limits_t^{t_2}\psi_1(t_1)\phi_{j_1}(t_1)dt_1dt_2, \tag{192}$$

and

$$\zeta_j^{(i)} = \int\limits_t^T \phi_j(\tau)d\mathbf{f}_\tau^{(i)}$$

are independent standard Gaussian random variables for various i *or* j*.*

The condition of continuity of the functions $\psi_1(\tau),\psi_2(\tau)$ is related to the definition [2] of the Stratonovich stochastic integral that we use.

Proof. The case $s=T$ follows from (53). Below we consider the case $s\in(t,T)$. In accordance to the standard relations between Stratonovich and Ito stochastic integrals we have w. p. 1

$$J^*[\psi^{(2)}]_{s,t} = J[\psi^{(2)}]_{s,t} + \frac{1}{2}\mathbf{1}_{\{i_1=i_2\}}\int\limits_t^s \psi_1(t_1)\psi_2(t_1)dt_1, \tag{193}$$

where $s\in(t,T]$ (s is fixed), $\mathbf{1}_A$ is the indicator of the set A.

From the other side according to (188) for the case of an arbitrary complete orthonormal system of functions in the space $L_2([t,T])$ and $\psi_1(\tau),\psi_2(\tau)\in L_2([t,T])$ (see [26], Sect. 1.15), we have

$$J[\psi^{(2)}]_{s,t} = \underset{p_1,p_2\to\infty}{\text{l.i.m.}} \sum_{j_1=0}^{p_1}\sum_{j_2=0}^{p_2} C_{j_2j_1}(s)\left(\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)} - \mathbf{1}_{\{i_1=i_2\}}\mathbf{1}_{\{j_1=j_2\}}\right) =$$

$$= \underset{p_1,p_2\to\infty}{\text{l.i.m.}} \sum_{j_1=0}^{p_1}\sum_{j_2=0}^{p_2} C_{j_2j_1}(s)\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)} - \mathbf{1}_{\{i_1=i_2\}}\lim_{p_1,p_2\to\infty}\sum_{j_1=0}^{\min\{p_1,p_2\}} C_{j_1j_1}(s). \tag{194}$$

From (193) and (194) it follows that Theorem 6 will be proved if

$$\frac{1}{2}\int\limits_t^s \psi_1(t_1)\psi_2(t_1)dt_1 = \sum_{j_1=0}^{\infty} C_{j_1j_1}(s), \tag{195}$$

where $\psi_1(\tau),\psi_2(\tau)\in L_2([t,T])$.

Let us rewrite (53) in the form

$$\frac{1}{2}\int\limits_t^T \bar{\psi}_1(\tau)\bar{\psi}_2(\tau)d\tau = \sum_{j=0}^{\infty}\int\limits_t^T \bar{\psi}_2(t_2)\phi_j(t_2)\int\limits_t^{t_2}\bar{\psi}_1(t_1)\phi_j(t_1)dt_1dt_2, \tag{196}$$

where $\bar{\psi}_1(\tau), \bar{\psi}_2(\tau) \in L_2([t,T])$.

Suppose that

$$\bar{\psi}_1(\tau) = \psi_1(\tau)\mathbf{1}_{\{\tau<s\}}, \quad \bar{\psi}_2(\tau) = \psi_2(\tau)\mathbf{1}_{\{\tau<s\}}, \tag{197}$$

where $\psi_1(\tau), \psi_2(\tau) \in L_2([t,T])$, $s \in (t,T)$ (s is fixed).

Combining (196) and (197), we get

$$\frac{1}{2}\int\limits_t^T \psi_1(\tau)\psi_2(\tau)\mathbf{1}_{\{\tau<s\}}d\tau =$$

$$= \sum_{j=0}^{\infty}\int\limits_t^T \psi_2(t_2)\mathbf{1}_{\{t_2<s\}}\phi_j(t_2)\int\limits_t^{t_2}\psi_1(t_1)\mathbf{1}_{\{t_1<s\}}\phi_j(t_1)dt_1dt_2,$$

i.e.

$$\frac{1}{2}\int\limits_t^s \psi_1(\tau)\psi_2(\tau)d\tau = \sum_{j=0}^{\infty}\int\limits_t^s \psi_2(t_2)\phi_j(t_2)\int\limits_t^{t_2}\psi_1(t_1)\phi_j(t_1)dt_1dt_2.$$

The equality (195) is proved. Theorem 6 is proved.

Let us reformulate Theorem 6 in terms on the convergence of solution of system of ordinary differential equations (ODEs) to the solution of system of Stratnovich SDEs (the so-called Wong–Zakai type theorem).

By analogy with (175) for $k=2$, $i_1, i_2 = 1,\ldots,m$, and $s \in (t,T]$ (s is fixed) we obtain

$$\int\limits_t^s \psi_2(t_2)\int\limits_t^{t_2}\psi_1(t_1)d\mathbf{f}_{t_1}^{(i_1)p_1}d\mathbf{f}_{t_2}^{(i_2)p_2} = \sum_{j_1=0}^{p_1}\sum_{j_2=0}^{p_2} C_{j_2j_1}(s)\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}, \tag{198}$$

where $p_1, p_2 \in \mathbb{N}$ and $d\mathbf{f}_{\tau}^{(i)p}$ is defined by (172); another notations are the same as in Theorem 6.

The iterated Riemann–Stiltjes integrals

$$Y_{s,t}^{(i_1i_2)p_1p_2} = \int\limits_t^s \psi_2(t_2)\int\limits_t^{t_2}\psi_1(t_1)d\mathbf{f}_{t_1}^{(i_1)p_1}d\mathbf{f}_{t_2}^{(i_2)p_2},$$

$$X_{s,t}^{(i_1)p_1} = \int\limits_t^s \psi_1(t_1)d\mathbf{f}_{t_1}^{(i_1)p_1}$$

are the solution of the following system of ODEs

$$\begin{cases} dY_{s,t}^{(i_1i_2)p_1p_2} = \psi_2(s)X_{s,t}^{(i_1)p_1}d\mathbf{f}_s^{(i_2)p_2}, & Y_{t,t}^{(i_1i_2)p_1p_2} = 0 \\ \\ dX_{s,t}^{(i_1)p_1} = \psi_1(s)d\mathbf{f}_s^{(i_1)p_1}, & X_{t,t}^{(i_1)p_1} = 0 \end{cases}.$$

From the other hand, the iterated Stratonovich stochastic integrals

$$
Y_{s,t}^{(i_1 i_2)} = \int\limits_t^{*s} \psi_2(t_2) \int\limits_t^{*t_2} \psi_1(t_1) d\mathbf{f}_{t_1}^{(i_1)} d\mathbf{f}_{t_2}^{(i_2)},
$$

$$
X_{s,t}^{(i_1)} = \int\limits_t^{*s} \psi_1(t_1) d\mathbf{f}_{t_1}^{(i_1)}
$$

are the solution of the following system of Stratonovich SDEs

$$
\begin{cases}
dY_{s,t}^{(i_1 i_2)} = \psi_2(s) X_{s,t}^{(i_1)} * d\mathbf{f}_s^{(i_2)}, & Y_{t,t}^{(i_1 i_2)} = 0 \\
\\
dX_{s,t}^{(i_1)} = \psi_1(s) * d\mathbf{f}_s^{(i_1)}, & X_{t,t}^{(i_1)} = 0
\end{cases},
$$

where $* d\mathbf{f}_s^{(i)}$, $i = 1, \ldots, m$ is the Stratonovich differential.

Then from Theorem 6 and (187) we obtain the following theorem.

Theorem 7 [26]. *Suppose that $\{\phi_j(x)\}_{j=0}^{\infty}$ is an arbitrary complete orthonormal system of functions in the space $L_2([t,T])$ and $\psi_1(\tau), \psi_2(\tau)$ are continuous functions on $[t,T]$. Then for any fixed s $(s \in (t,T])$*

$$
\underset{p_1,p_2\to\infty}{\text{l.i.m.}}\ Y_{s,t}^{(i_1 i_2)p_1 p_2} = Y_{s,t}^{(i_1 i_2)}, \quad \underset{p_1\to\infty}{\text{l.i.m.}}\ X_{s,t}^{(i_1)p_1} = X_{s,t}^{(i_1)}.
$$

9. Modification of Theorem 3 for the Case of Integration Interval $[t,s]$ $(s \in (t,T])$ of Iterated Stratonovich Stochastic Integrals of Multiplicity 3 and Wong–Zakai Type Theorem

Let us prove the following theorem.

Theorem 8 [26]. *Suppose that $\{\phi_j(x)\}_{j=0}^{\infty}$ is a complete orthonormal system of Legendre polynomials or trigonometric functions in the space $L_2([t,T])$. At the same time $\psi_2(\tau)$ is a continuously differentiable nonrandom function on $[t,T]$ and $\psi_1(\tau)$, $\psi_3(\tau)$ are twice continuously differentiable nonrandom functions on $[t,T]$. Then, for the iterated Stratonovich stochastic integral of third multiplicity*

$$
J^*[\psi^{(3)}]_{s,t} = \int\limits_t^{*s} \psi_3(t_3) \int\limits_t^{*t_3} \psi_2(t_2) \int\limits_t^{*t_2} \psi_1(t_1) d\mathbf{f}_{t_1}^{(i_1)} d\mathbf{f}_{t_2}^{(i_2)} d\mathbf{f}_{t_3}^{(i_3)} \quad (i_1, i_2, i_3 = 1, \ldots, m)
$$

the following expansion

$$
J^*[\psi^{(3)}]_{s,t} = \underset{p\to\infty}{\text{l.i.m.}} \sum_{j_1,j_2,j_3=0}^{p} C_{j_3 j_2 j_1}(s) \zeta_{j_1}^{(i_1)} \zeta_{j_2}^{(i_2)} \zeta_{j_3}^{(i_3)}
$$

that converges in the mean-square sense is valid, where $s \in (t,T]$ (s is fixed),

$$C_{j_3j_2j_1}(s)=\int\limits_t^s\psi_3(t_3)\phi_{j_3}(t_3)\int\limits_t^{t_3}\psi_2(t_2)\phi_{j_2}(t_2)\int\limits_t^{t_2}\psi_1(t_1)\phi_{j_1}(t_1)dt_1dt_2dt_3$$

and

$$\zeta_j^{(i)}=\int\limits_t^T\phi_j(\tau)d\mathbf{f}_\tau^{(i)}$$

are independent standard Gaussian random variables for various i or j.

Proof. The case $s=T$ is considered in Theorem 3. Below we consider the case $s\in(t,T)$. First, let us consider the case of Legendre polynomials. From (189) for the case $p_1=p_2=p_3=p$ and the standard relation between Ito and Stratonovich stochastic integrals (2), (3) of third multiplicity we conclude that Theorem 8 will be proved if w. p. 1

$$\underset{p\to\infty}{\text{l.i.m.}}\sum_{j_1=0}^{p}\sum_{j_3=0}^{p}C_{j_3j_1j_1}(s)\zeta_{j_3}^{(i_3)}=\frac{1}{2}\int\limits_t^s\psi_3(\tau)\int\limits_t^{\tau}\psi_2(s_1)\psi_1(s_1)ds_1d\mathbf{f}_\tau^{(i_3)},\tag{199}$$

$$\underset{p\to\infty}{\text{l.i.m.}}\sum_{j_1=0}^{p}\sum_{j_3=0}^{p}C_{j_3j_3j_1}(s)\zeta_{j_1}^{(i_1)}=\frac{1}{2}\int\limits_t^s\psi_3(\tau)\psi_2(\tau)\int\limits_t^{\tau}\psi_1(s_1)d\mathbf{f}_{s_1}^{(i_1)}d\tau,\tag{200}$$

$$\underset{p\to\infty}{\text{l.i.m.}}\sum_{j_1=0}^{p}\sum_{j_3=0}^{p}C_{j_1j_3j_1}(s)\zeta_{j_3}^{(i_2)}=0.\tag{201}$$

The proof of the formulas (199), (201) is absolutely similar to the proof of the formulas (66), (68). It is only necessary to replace the interval of integration $[t,T]$ by $[t,s]$ in the proof of the formulas (66), (68) and use Theorem 5 instead of Theorem 1. Also in the case (201) it is necessary to use the estimate (87).

Let us prove (200). Using Theorem 5 for $k=2$ (see (188) for $i_1=1,\ldots,m,\ i_2=0$), we obtain w. p. 1 (also see (367), (368))

$$\frac{1}{2}\int\limits_t^s\psi_3(\tau)\psi_2(\tau)\int\limits_t^{\tau}\psi_1(s_1)d\mathbf{f}_{s_1}^{(i_1)}d\tau=\frac{1}{2}\ \underset{p\to\infty}{\text{l.i.m.}}\sum_{j_1=0}^{p}C_{j_1}^{*}(s)\zeta_{j_1}^{(i_1)},$$

where

$$C_{j_1}^{*}(s)=\int\limits_t^s\psi_3(\tau)\psi_2(\tau)\int\limits_t^{\tau}\psi_1(s_1)\phi_{j_1}(s_1)ds_1d\tau=$$

$$=\int\limits_t^s\psi_1(s_1)\phi_{j_1}(s_1)\int\limits_{s_1}^s\psi_3(\tau)\psi_2(\tau)d\tau ds_1.\tag{202}$$

We have

$$E'_p(s) \stackrel{\sf def}{=} {\sf M}\left\{\left(\sum_{j_1=0}^{p}\sum_{j_3=0}^{p} C_{j_3j_3j_1}(s)\zeta_{j_1}^{(i_1)}-\frac{1}{2}\sum_{j_1=0}^{p} C_{j_1}^{*}(s)\zeta_{j_1}^{(i_1)}\right)^2\right\}=$$

$$={\sf M}\left\{\left(\sum_{j_1=0}^{p}\left(\sum_{j_3=0}^{p} C_{j_3j_3j_1}(s)-\frac{1}{2}C_{j_1}^{*}(s)\right)\zeta_{j_1}^{(i_1)}\right)^2\right\}=$$

(203) $$=\sum_{j_1=0}^{p}\left(\sum_{j_3=0}^{p} C_{j_3j_3j_1}(s)-\frac{1}{2}C_{j_1}^{*}(s)\right)^2,$$

$$C_{j_3j_3j_1}(s)=\int\limits_t^s \psi_3(\theta)\phi_{j_3}(\theta)\int\limits_t^{\theta}\psi_2(\tau)\phi_{j_3}(\tau)\int\limits_t^{\tau}\psi_1(s_1)\phi_{j_1}(s_1)ds_1d\tau d\theta=$$

(204) $$=\int\limits_t^s \psi_1(s_1)\phi_{j_1}(s_1)\int\limits_{s_1}^s\psi_2(\tau)\phi_{j_3}(\tau)\int\limits_{\tau}^{s}\psi_3(\theta)\phi_{j_3}(\theta)d\theta d\tau ds_1.$$

From (202)–(204) we obtain

$$E'_p(s)=\sum_{j_1=0}^{p}\left(\int\limits_t^s\psi_1(s_1)\phi_{j_1}(s_1)\left(\sum_{j_3=0}^{p}\int\limits_{s_1}^{s}\psi_2(\tau)\phi_{j_3}(\tau)\int\limits_{\tau}^{s}\psi_3(\theta)\phi_{j_3}(\theta)d\theta d\tau-\right.\right.$$

(205) $$\left.\left.-\frac{1}{2}\int\limits_{s_1}^{s}\psi_3(\tau)\psi_2(\tau)d\tau\right)ds_1\right)^2.$$

Let us show that

(206) $$\sum_{j_3=0}^{\infty}\int\limits_{s_1}^{s}\psi_2(\tau)\phi_{j_3}(\tau)\int\limits_{\tau}^{s}\psi_3(\theta)\phi_{j_3}(\theta)d\theta d\tau=\frac{1}{2}\int\limits_{s_1}^{s}\psi_3(\tau)\psi_2(\tau)d\tau.$$

Using (196) and Fubini's Theorem, we have

(207) $$\frac{1}{2}\int\limits_t^T\bar\psi_1(\tau)\bar\psi_2(\tau)d\tau=\sum_{j=0}^{\infty}\int\limits_t^T\bar\psi_1(t_1)\phi_j(t_1)\int\limits_{t_1}^{T}\bar\psi_2(t_2)\phi_j(t_2)dt_2dt_1,$$

where $\bar\psi_1(\tau),\bar\psi_2(\tau)\in L_2([t,T])$.

Suppose that

(208) $$\bar\psi_1(\tau)=\psi_2(\tau)\mathbf{1}_{\{s_1<\tau<s\}},\quad \bar\psi_2(\tau)=\psi_3(\tau)\mathbf{1}_{\{\tau<s\}}.$$

Using (207) and (208), we get (206). Combining (205) and (206), we obtain

$$E'_p(s) = \sum_{j_1=0}^{p}\left(\int\limits_t^s \psi_1(s_1)\phi_{j_1}(s_1)\sum_{j_3=p+1}^{\infty}\int\limits_{s_1}^s \psi_2(\tau)\phi_{j_3}(\tau)\int\limits_{\tau}^s \psi_3(\theta)\phi_{j_3}(\theta)d\theta d\tau ds_1\right)^2 \le$$

$$\le K\sum_{j_1=0}^{p}\left(\int\limits_t^s |\phi_{j_1}(s_1)|\left|\sum_{j_3=p+1}^{\infty}\int\limits_{s_1}^s \psi_2(\tau)\phi_{j_3}(\tau)\int\limits_{\tau}^s \psi_3(\theta)\phi_{j_3}(\theta)d\theta d\tau\right| ds_1\right)^2, \qquad (209)$$

where constant K does not depend on p.

Let us estimate the value

$$\left|\sum_{j_3=p+1}^{\infty}\int\limits_{s_1}^s \psi_2(\tau)\phi_{j_3}(\tau)\int\limits_{\tau}^s \psi_3(\theta)\phi_{j_3}(\theta)d\theta d\tau\right|.$$

Note that, by virtue of the additivity property of the integral, we obtain

$$\int\limits_{s_1}^s \psi_2(\tau)\phi_{j_3}(\tau)\int\limits_{\tau}^s \psi_3(\theta)\phi_{j_3}(\theta)d\theta d\tau =$$

$$= \int\limits_t^s \psi_3(\theta)\phi_{j_3}(\theta)\int\limits_t^{\theta} \psi_2(\tau)\phi_{j_3}(\tau)d\tau d\theta -$$

$$- \int\limits_t^{s_1} \psi_3(\theta)\phi_{j_3}(\theta)\int\limits_t^{\theta} \psi_2(\tau)\phi_{j_3}(\tau)d\tau d\theta -$$

$$- \int\limits_{s_1}^s \psi_3(\theta)\phi_{j_3}(\theta)d\theta\int\limits_t^{s_1} \psi_2(\tau)\phi_{j_3}(\tau)d\tau.$$

Further, we have

$$\left|\sum_{j_3=p+1}^{\infty}\int\limits_{s_1}^s \psi_2(\tau)\phi_{j_3}(\tau)\int\limits_{\tau}^s \psi_3(\theta)\phi_{j_3}(\theta)d\theta d\tau\right| \le$$

$$\le \left|\sum_{j_3=p+1}^{\infty}\int\limits_t^s \psi_3(\theta)\phi_{j_3}(\theta)\int\limits_t^{\theta} \psi_2(\tau)\phi_{j_3}(\tau)d\tau d\theta\right| +$$

$$+ \left|\sum_{j_3=p+1}^{\infty}\int\limits_t^{s_1} \psi_3(\theta)\phi_{j_3}(\theta)\int\limits_t^{\theta} \psi_2(\tau)\phi_{j_3}(\tau)d\tau d\theta\right| +$$

$$+\sum_{j_3=p+1}^{\infty}\left|\int\limits_{s_1}^{s}\psi_3(\theta)\phi_{j_3}(\theta)d\theta\int\limits_{t}^{s_1}\psi_2(\tau)\phi_{j_3}(\tau)d\tau\right|. \tag{210}$$

Applying the estimate (312), we can write

$$\left|\sum_{j_1=p+1}^{\infty}C_{j_1j_1}(s)\right|\le\frac{C}{p}\left(1+\frac{1}{\left(1-(z(s))^2\right)^{1/4}}\right), \tag{211}$$

where $s\in(t,T)$, constant C does not depend on p, $z(s)$ has the form (26), and $C_{j_1j_1}(s)$ is defined by (192) for the case $j_1=j_2$.

Let us estimate the integral

$$\int\limits_{u}^{\tau}\phi_j(\theta)\psi(\theta)d\theta\quad(j\ne 0), \tag{212}$$

where $\psi(\theta)$ is a continuously differentiable function on $[t,T]$ and $\{\phi_j(x)\}_{j=0}^{\infty}$ is a complete orthonormal system of Legendre polynomials in the space $L_2([t,T])$.

We have

$$\int\limits_{v}^{x}\phi_j(\theta)\psi(\theta)d\theta=\frac{\sqrt{T-t}\sqrt{2j+1}}{2}\int\limits_{z(v)}^{z(x)}P_j(y)\psi(u(y))dy=$$

$$=\frac{\sqrt{T-t}}{2\sqrt{2j+1}}\Biggl((P_{j+1}(z(x))-P_{j-1}(z(x)))\psi(x)-(P_{j+1}(z(v))-P_{j-1}(z(v)))\psi(v)-$$

$$-\frac{T-t}{2}\int\limits_{z(v)}^{z(x)}((P_{j+1}(y)-P_{j-1}(y))\psi'(u(y))dy\Biggr), \tag{213}$$

where $x,v\in(t,T)$, $u(y)$ and $z(x)$ are defined by (26), ψ' is a derivative of the function $\psi(\theta)$ with respect to the variable $u(y)$.

Note that in (213) we used (27). From (213) and (29) it follows that

$$\left|\int\limits_{v}^{x}\phi_j(\theta)\psi(\theta)d\theta\right|<\frac{C}{j}\left(\frac{1}{(1-(z(x))^2)^{1/4}}+\frac{1}{(1-(z(v))^2)^{1/4}}+C_1\right), \tag{214}$$

where $z(x),z(v)\in(-1,1)$, $x,v\in(t,T)$ and constants C, C_1 do not depend on j.

Applying the estimates (87), (211) , and (214) to the right-hand side of (210) gives

$$\left|\sum_{j_3=p+1}^{\infty}\int\limits_{s_1}^{s}\psi_2(\tau)\phi_{j_3}(\tau)\int\limits_{\tau}^{s}\psi_3(\theta)\phi_{j_3}(\theta)d\theta d\tau\right|\le\frac{L}{p}\left(1+\frac{1}{\left(1-(z(s_1))^2\right)^{1/4}}\right)\times$$

$$\times\left(1+\frac{1}{(1-(z(s))^2)^{1/4}}+\frac{1}{(1-(z(s_1))^2)^{1/4}}\right), \tag{215}$$

where $s, s_1 \in (t, T)$ and constant L is independent of p.

Combining the estimates (89), (209), and (215), we finally obtain

$$E_p'(s) \le \frac{L(s)p}{p^2} = \frac{L(s)}{p}$$

if $p \to \infty$, where constant $L(s)$ (s is fixed, $s \in (t, T)$) does not depend on p. The relation (200) is proved for the polynomial case. Theorem 8 is proved for the case of Legendre polynomials.

For the trigonometric case, by analogy with the proof of Lemma 1 (Sect. 3), we obtain the following analog of (211)

$$\left|\sum_{j_1=p+1}^{\infty} C_{j_1 j_1}(s)\right| \le \frac{C}{p}, \tag{216}$$

where $s \in [t, T]$, constant C does not depend on p, and $C_{j_1 j_1}(s)$ is defined by (192) for the case $j_1 = j_2$.

Note the following obvious estimates for the trigonometric case

$$\left|\int\limits_{s_1}^{s} \psi_3(\theta)\phi_j(\theta)d\theta\right| \le \frac{C}{j}, \quad \left|\int\limits_{t}^{s_1} \psi_2(\tau)\phi_j(\tau)d\tau\right| \le \frac{C}{j} \quad (j \ne 0), \tag{217}$$

where $s, s_1 \in [t, T]$, constant C does not depend on p.

Applying (209), (210), (216), and (217), we obtain the assertion of Theorem 8 for the trigonometric case. Theorem 8 is proved.

Let us reformulate Theorem 8 in terms on the convergence of solution of system of ODEs to the solution of system of Stratonovich SDEs (the so-called Wong–Zakai type theorem).

By analogy with (175) for the case $k = 3$, $p_1 = p_2 = p_3 = p$, $i_1, i_2, i_3 = 1, \ldots, m$, and $s \in (t, T]$ (s is fixed) we obtain

$$\int\limits_t^s \psi_3(t_3) \int\limits_t^{t_3} \psi_2(t_2) \int\limits_t^{t_2} \psi_1(t_1) d\mathbf{f}_{t_1}^{(i_1)p} d\mathbf{f}_{t_2}^{(i_2)p} d\mathbf{f}_{t_3}^{(i_3)p} = \sum_{j_1,j_2,j_3=0}^{p} C_{j_3 j_2 j_1}(s) \zeta_{j_1}^{(i_1)} \zeta_{j_2}^{(i_2)} \zeta_{j_3}^{(i_3)}, \tag{218}$$

where $p \in \mathbb{N}$ and $d\mathbf{f}_\tau^{(i)p}$ is defined by (172); another notations are the same as in Theorem 8.

The iterated Riemann–Stiltjes integrals

$$Z_{s,t}^{(i_1 i_2 i_3)p} = \int\limits_t^s \psi_3(t_3) \int\limits_t^{t_3} \psi_2(t_2) \int\limits_t^{t_2} \psi_1(t_1) d\mathbf{f}_{t_1}^{(i_1)p} d\mathbf{f}_{t_2}^{(i_2)p} d\mathbf{f}_{t_3}^{(i_3)p},$$

$$Y_{s,t}^{(i_1 i_2)p} = \int\limits_t^s \psi_2(t_2) \int\limits_t^{t_2} \psi_1(t_1) d\mathbf{f}_{t_1}^{(i_1)p} d\mathbf{f}_{t_2}^{(i_2)p},$$

$$
X_{s,t}^{(i_1)p} = \int\limits_t^s \psi_1(t_1) d\mathbf{f}_{t_1}^{(i_1)p}
$$

are the solution of the following system of ODEs

$$
\begin{cases}
dZ_{s,t}^{(i_1 i_2 i_3)p} = \psi_3(s) Y_{s,t}^{(i_1 i_2)p} d\mathbf{f}_s^{(i_3)p}, & Z_{t,t}^{(i_1 i_2 i_3)p} = 0 \\
\\
dY_{s,t}^{(i_1 i_2)p} = \psi_2(s) X_{s,t}^{(i_1)p} d\mathbf{f}_s^{(i_2)p}, & Y_{t,t}^{(i_1 i_2)p} = 0 \\
\\
dX_{s,t}^{(i_1)p} = \psi_1(s) d\mathbf{f}_s^{(i_1)p}, & X_{t,t}^{(i_1)p_1} = 0
\end{cases}.
$$

From the other hand, the iterated Stratonovich stochastic integrals

$$
Z_{s,t}^{(i_1 i_2 i_3)} = {\int\limits_t^{*}}^s \psi_3(t_3) {\int\limits_t^{*}}^{t_3} \psi_2(t_2) {\int\limits_t^{*}}^{t_2} \psi_1(t_1) d\mathbf{f}_{t_1}^{(i_1)} d\mathbf{f}_{t_2}^{(i_2)} d\mathbf{f}_{t_3}^{(i_3)},
$$

$$
Y_{s,t}^{(i_1 i_2)} = {\int\limits_t^{*}}^s \psi_2(t_2) {\int\limits_t^{*}}^{t_2} \psi_1(t_1) d\mathbf{f}_{t_1}^{(i_1)} d\mathbf{f}_{t_2}^{(i_2)},
$$

$$
X_{s,t}^{(i_1)} = {\int\limits_t^{*}}^s \psi_1(t_1) d\mathbf{f}_{t_1}^{(i_1)}
$$

are the solution of the following system of Stratonovich SDEs

$$
\begin{cases}
dZ_{s,t}^{(i_1 i_2 i_3)} = \psi_3(s) Y_{s,t}^{(i_1 i_2)} * d\mathbf{f}_s^{(i_3)}, & Z_{t,t}^{(i_1 i_2 i_3)} = 0 \\
\\
dY_{s,t}^{(i_1 i_2)} = \psi_2(s) X_{s,t}^{(i_1)} * d\mathbf{f}_s^{(i_2)}, & Y_{t,t}^{(i_1 i_2)} = 0 \\
\\
dX_{s,t}^{(i_1)} = \psi_1(s) * d\mathbf{f}_s^{(i_1)}, & X_{t,t}^{(i_1)} = 0
\end{cases},
$$

where $* d\mathbf{f}_s^{(i)}$, $i = 1, \ldots, m$ is the Stratonovich differential.

Then from Theorems 7 and 8 we obtain the following theorem.

Theorem 9 [26]. *Suppose that* $\{\phi_j(x)\}_{j=0}^{\infty}$ *is a complete orthonormal system of Legendre polynomials or trigonometric functions in the space* $L_2([t,T])$*. At the same time* $\psi_2(\tau)$ *is a continuously differentiable nonrandom function on* $[t,T]$ *and* $\psi_1(\tau)$*,* $\psi_3(\tau)$ *are twice continuously differentiable nonrandom functions on* $[t,T]$*. Then for any fixed* s $(s \in (t,T])$

$$\underset{p\to\infty}{\text{l.i.m.}}\ Z_{s,t}^{(i_1i_2i_3)p}=Z_{s,t}^{(i_1i_2i_3)},\quad \underset{p\to\infty}{\text{l.i.m.}}\ Y_{s,t}^{(i_1i_2)p}=Y_{s,t}^{(i_1i_2)},$$

$$\underset{p\to\infty}{\text{l.i.m.}}\ X_{s,t}^{(i_1)p}=X_{s,t}^{(i_1)}.$$

10. Modification of Theorem 4 for the Case of Integration Interval $[t,s]$ $(s\in(t,T])$ of Iterated Stratonovich Stochastic Integrals of Multiplicity 4 and Wong–Zakai Type Theorem

Let us prove the following theorem.

Theorem 10 [26]. *Suppose that $\{\phi_j(x)\}_{j=0}^{\infty}$ is a complete orthonormal system of Legendre polynomials or trigonometric functions in the space $L_2([t,T])$. Then, for the iterated Stratonovich stochastic integral of fourth multiplicity*

$$J^*[\psi^{(4)}]_{s,t}=\int\limits_t^{*s}\int\limits_t^{*t_4}\int\limits_t^{*t_3}\int\limits_t^{*t_2}d\mathbf{w}_{t_1}^{(i_1)}d\mathbf{w}_{t_2}^{(i_2)}d\mathbf{w}_{t_3}^{(i_3)}d\mathbf{w}_{t_4}^{(i_4)}\quad (i_1,i_2,i_3,i_4=0,1,\ldots,m)$$

the following expansion

$$J^*[\psi^{(4)}]_{s,t}=\underset{p\to\infty}{\text{l.i.m.}}\sum_{j_1,j_2,j_3,j_4=0}^{p}C_{j_4j_3j_2j_1}(s)\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}\zeta_{j_3}^{(i_3)}\zeta_{j_4}^{(i_4)}$$

that converges in the mean-square sense is valid, where $s\in(t,T]$ (s is fixed),

$$C_{j_4j_3j_2j_1}(s)=\int\limits_t^{s}\phi_{j_4}(s_4)\int\limits_t^{s_4}\phi_{j_3}(s_3)\int\limits_t^{s_3}\phi_{j_2}(s_2)\int\limits_t^{s_2}\phi_{j_1}(s_1)ds_1ds_2ds_3ds_4$$

and

$$\zeta_j^{(i)}=\int\limits_t^{T}\phi_j(\tau)d\mathbf{w}_{\tau}^{(i)}$$

are independent standard Gaussian random variables for various i or j (in the case when $i\ne 0$), $\mathbf{w}_{\tau}^{(i)}=\mathbf{f}_{\tau}^{(i)}$ for $i=1,\ldots,m$ and $\mathbf{w}_{\tau}^{(0)}=\tau$.

Proof. The case $s=T$ is considered in Theorem 4. Below we consider the case $s\in(t,T)$. The relation (190) (in the case when $p_1=\ldots=p_4=p\to\infty$) implies that

$$\underset{p\to\infty}{\text{l.i.m.}}\sum_{j_1,j_2,j_3,j_4=0}^{p}C_{j_4j_3j_2j_1}(s)\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}\zeta_{j_3}^{(i_3)}\zeta_{j_4}^{(i_4)}=J[\psi^{(4)}]_{s,t}+$$

$$+\mathbf{1}_{\{i_1=i_2\ne 0\}}A_1^{(i_3i_4)}(s)+\mathbf{1}_{\{i_1=i_3\ne 0\}}A_2^{(i_2i_4)}(s)+\mathbf{1}_{\{i_1=i_4\ne 0\}}A_3^{(i_2i_3)}(s)+\mathbf{1}_{\{i_2=i_3\ne 0\}}A_4^{(i_1i_4)}(s)+$$

$$+\mathbf{1}_{\{i_2=i_4\ne 0\}}A_5^{(i_1i_3)}(s)+\mathbf{1}_{\{i_3=i_4\ne 0\}}A_6^{(i_1i_2)}(s)-\mathbf{1}_{\{i_1=i_2\ne 0\}}\mathbf{1}_{\{i_3=i_4\ne 0\}}B_1(s)-$$

$$-\mathbf{1}_{\{i_1=i_3\ne 0\}}\mathbf{1}_{\{i_2=i_4\ne 0\}}B_2(s)-\mathbf{1}_{\{i_1=i_4\ne 0\}}\mathbf{1}_{\{i_2=i_3\ne 0\}}B_3(s), \tag{219}$$

where $J[\psi^{(4)}]_{s,t}$ has the form (185) for $\psi_1(\tau),\ldots,\psi_4(\tau)\equiv 1$ and $i_1,\ldots,i_4=0,1,\ldots,m$,

$$A_1^{(i_3i_4)}(s)=\underset{p\to\infty}{\text{l.i.m.}}\sum_{j_4,j_3,j_1=0}^{p}C_{j_4j_3j_1j_1}(s)\zeta_{j_3}^{(i_3)}\zeta_{j_4}^{(i_4)},$$

$$A_2^{(i_2i_4)}(s)=\underset{p\to\infty}{\text{l.i.m.}}\sum_{j_4,j_3,j_2=0}^{p}C_{j_4j_3j_2j_3}(s)\zeta_{j_2}^{(i_2)}\zeta_{j_4}^{(i_4)},$$

$$A_3^{(i_2i_3)}(s)=\underset{p\to\infty}{\text{l.i.m.}}\sum_{j_4,j_3,j_2=0}^{p}C_{j_4j_3j_2j_4}(s)\zeta_{j_2}^{(i_2)}\zeta_{j_3}^{(i_3)},$$

$$A_4^{(i_1i_4)}(s)=\underset{p\to\infty}{\text{l.i.m.}}\sum_{j_4,j_3,j_1=0}^{p}C_{j_4j_3j_3j_1}(s)\zeta_{j_1}^{(i_1)}\zeta_{j_4}^{(i_4)},$$

$$A_5^{(i_1i_3)}(s)=\underset{p\to\infty}{\text{l.i.m.}}\sum_{j_4,j_3,j_1=0}^{p}C_{j_4j_3j_4j_1}(s)\zeta_{j_1}^{(i_1)}\zeta_{j_3}^{(i_3)},$$

$$A_6^{(i_1i_2)}(s)=\underset{p\to\infty}{\text{l.i.m.}}\sum_{j_3,j_2,j_1=0}^{p}C_{j_3j_3j_2j_1}(s)\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)},$$

$$B_1(s)=\lim_{p\to\infty}\sum_{j_1,j_4=0}^{p}C_{j_4j_4j_1j_1}(s),\quad B_2(s)=\lim_{p\to\infty}\sum_{j_4,j_3=0}^{p}C_{j_3j_4j_3j_4}(s),$$

$$B_3(s)=\lim_{p\to\infty}\sum_{j_4,j_3=0}^{p}C_{j_4j_3j_3j_4}(s).$$

Using the integration order replacement in Riemann integrals, Theorem 5 for $k=2$ (see (188)) and (195), Parseval's equality and the integration order replacement technique for Ito stochastic integrals (see [26]-[29], Chapter 3) or Ito's formula, we obtain (see the derivation of the formula (101))

$$A_1^{(i_3i_4)}(s)=\frac{1}{2}\int\limits_t^s\int\limits_t^\tau\int\limits_t^{s_1}ds_2d\mathbf{w}_{s_1}^{(i_3)}d\mathbf{w}_\tau^{(i_4)}+$$

$$+\frac{1}{4}\mathbf{1}_{\{i_3=i_4\ne 0\}}\int\limits_t^s(s_1-t)ds_1-\Delta_1^{(i_3i_4)}(s)\quad \text{w. p. 1}, \tag{220}$$

where

$$\Delta_1^{(i_3i_4)}(s)=\underset{p\to\infty}{\text{l.i.m.}}\sum_{j_3,j_4=0}^{p}a_{j_4j_3}^{p}(s)\zeta_{j_3}^{(i_3)}\zeta_{j_4}^{(i_4)},$$

$$a^p_{j_4j_3}(s)=\frac{1}{2}\int\limits_t^s\phi_{j_4}(\tau)\int\limits_t^\tau\phi_{j_3}(s_1)\sum_{j_1=p+1}^{\infty}\left(\int\limits_t^{s_1}\phi_{j_1}(s_2)ds_2\right)^2ds_1d\tau.$$

Let us consider $A_2^{(i_2i_4)}(s)$ (see the derivation of the formula (103))

(221) $$A_2^{(i_2i_4)}(s)=-\Delta_2^{(i_2i_4)}(s)+\Delta_1^{(i_2i_4)}(s)+\Delta_3^{(i_2i_4)}(s)\ \text{w. p. 1},$$

where

$$\Delta_2^{(i_2i_4)}(s)=\underset{p\to\infty}{\text{l.i.m.}}\sum_{j_4,j_2=0}^{p}b^p_{j_4j_2}(s)\zeta_{j_2}^{(i_2)}\zeta_{j_4}^{(i_4)},$$

$$\Delta_3^{(i_2i_4)}(s)=\underset{p\to\infty}{\text{l.i.m.}}\sum_{j_4,j_2=0}^{p}c^p_{j_4j_2}(s)\zeta_{j_2}^{(i_2)}\zeta_{j_4}^{(i_4)},$$

$$b^p_{j_4j_2}(s)=\frac{1}{2}\int\limits_t^s\phi_{j_4}(\tau)\sum_{j_3=p+1}^{\infty}\left(\int\limits_t^{\tau}\phi_{j_3}(s_1)ds_1\right)^2\int\limits_t^{\tau}\phi_{j_2}(s_1)ds_1d\tau,$$

$$c^p_{j_4j_2}(s)=\frac{1}{2}\int\limits_t^s\phi_{j_4}(\tau)\int\limits_t^\tau\phi_{j_2}(s_3)\sum_{j_3=p+1}^{\infty}\left(\int\limits_{s_3}^{\tau}\phi_{j_3}(s_1)ds_1\right)^2ds_3d\tau.$$

Let us consider $A_5^{(i_1i_3)}(s)$ (see the derivation of the formula (106))

(222) $$A_5^{(i_1i_3)}(s)=-\Delta_4^{(i_1i_3)}(s)+\Delta_5^{(i_1i_3)}(s)+\Delta_6^{(i_1i_3)}(s)\quad\text{w. p. 1},$$

where

$$\Delta_4^{(i_1i_3)}(s)=\underset{p\to\infty}{\text{l.i.m.}}\sum_{j_3,j_1=0}^{p}d^p_{j_3j_1}(s)\zeta_{j_1}^{(i_1)}\zeta_{j_3}^{(i_3)},$$

$$\Delta_5^{(i_1i_3)}(s)=\underset{p\to\infty}{\text{l.i.m.}}\sum_{j_3,j_1=0}^{p}e^p_{j_3j_1}(s)\zeta_{j_1}^{(i_1)}\zeta_{j_3}^{(i_3)},$$

$$\Delta_6^{(i_1i_3)}(s)=\underset{p\to\infty}{\text{l.i.m.}}\sum_{j_3,j_1=0}^{p}f^p_{j_3j_1}(s)\zeta_{j_1}^{(i_1)}\zeta_{j_3}^{(i_3)},$$

$$d^p_{j_3j_1}(s)=\frac{1}{2}\int\limits_t^s\phi_{j_1}(s_3)\sum_{j_4=p+1}^{\infty}\left(\int\limits_{s_3}^{s}\phi_{j_4}(\tau)d\tau\right)^2\int\limits_{s_3}^{s}\phi_{j_3}(\tau)d\tau ds_3,$$

$$e^p_{j_3 j_1}(s) = \frac{1}{2}\int\limits_t^s \phi_{j_1}(s_3)\int\limits_{s_3}^s \phi_{j_3}(\tau)\sum_{j_4=p+1}^{\infty}\left(\int\limits_{s_3}^{\tau}\phi_{j_4}(s_1)ds_1\right)^2 d\tau ds_3,$$

$$f^p_{j_3 j_1}(s) = \frac{1}{2}\int\limits_t^s \phi_{j_1}(s_3)\int\limits_{s_3}^s \phi_{j_3}(s_2)\sum_{j_4=p+1}^{\infty}\left(\int\limits_{s_2}^{s}\phi_{j_4}(s_1)ds_1\right)^2 ds_2 ds_3 =$$

$$= \frac{1}{2}\int\limits_t^s \phi_{j_3}(s_2)\sum_{j_4=p+1}^{\infty}\left(\int\limits_{s_2}^{s}\phi_{j_4}(s_1)ds_1\right)^2 \int\limits_t^{s_2}\phi_{j_1}(s_3)ds_3 ds_2.$$

Moreover (see the derivation of the formula (111)),

$$A_3^{(i_2 i_3)}(s) = 2\Delta_6^{(i_2 i_3)}(s) - A_5^{(i_2 i_3)}(s) = \Delta_4^{(i_2 i_3)}(s) - \Delta_5^{(i_2 i_3)}(s) + \Delta_6^{(i_2 i_3)}(s) \quad \text{w. p. 1.} \tag{223}$$

Let us consider $A_4^{(i_1 i_4)}(s)$ (see the derivation of the formula (112))

$$A_4^{(i_1 i_4)}(s) = \frac{1}{2}\int\limits_t^s \int\limits_t^{s_2}\int\limits_t^{s_1} d\mathbf{w}_\tau^{(i_1)} ds_1 d\mathbf{w}_{s_2}^{(i_4)} - \Delta_3^{(i_1 i_4)}(s) \quad \text{w. p. 1.} \tag{224}$$

Let us consider $A_6^{(i_1 i_2)}(s)$ (see the derivation of the formula (113))

$$A_6^{(i_1 i_2)}(s) = \frac{1}{2}\int\limits_t^s \int\limits_t^{s_1}\int\limits_t^{s_2} d\mathbf{w}_\tau^{(i_1)} d\mathbf{w}_{s_2}^{(i_2)} ds_1 +$$

$$+\frac{1}{4}\mathbf{1}_{\{i_1=i_2\ne 0\}}\int\limits_t^s (s-s_2)ds_2 - \Delta_6^{(i_1 i_2)}(s) \quad \text{w. p. 1.} \tag{225}$$

Further, we have w. p. 1 (see the derivation of the formula (110))

$$A_3^{(i_2 i_3)}(s) + A_5^{(i_2 i_3)}(s) =$$

$$= \underset{p\to\infty}{\text{l.i.m.}}\sum_{j_4,j_3,j_2=0}^{p}\int\limits_t^s \phi_{j_3}(s_1)\int\limits_t^{s_1}\phi_{j_2}(s_2)ds_2\int\limits_t^{s_1}\phi_{j_4}(s_3)ds_3\int\limits_{s_1}^{s}\phi_{j_4}(\tau)d\tau ds_1 \zeta_{j_2}^{(i_2)}\zeta_{j_3}^{(i_3)}. \tag{226}$$

Using (226) and the generalized Parseval equality, we obtain w. p. 1

$$A_3^{(i_2 i_3)}(s) + A_5^{(i_2 i_3)}(s) =$$

$$=\underset{p\to\infty}{\text{l.i.m.}}\sum_{j_3,j_2=0}^{p}\int\limits_t^s\phi_{j_3}(s_1)\int\limits_t^{s_1}\phi_{j_2}(s_2)ds_2\sum_{j_4=0}^{p}\int\limits_t^{s_1}\phi_{j_4}(s_3)ds_3\int\limits_{s_1}^{s}\phi_{j_4}(\tau)d\tau ds_1\zeta_{j_2}^{(i_2)}\zeta_{j_3}^{(i_3)}=$$

$$=-\underset{p\to\infty}{\text{l.i.m.}}\sum_{j_3,j_2=0}^{p}\int\limits_t^s\phi_{j_3}(s_1)\int\limits_t^{s_1}\phi_{j_2}(s_2)ds_2\sum_{j_4=p+1}^{\infty}\int\limits_t^{s_1}\phi_{j_4}(s_3)ds_3\int\limits_{s_1}^{s}\phi_{j_4}(\tau)d\tau ds_1\times$$

$$\times\zeta_{j_2}^{(i_2)}\zeta_{j_3}^{(i_3)}=$$

$$=\Delta_6^{(i_2i_3)}(s)+\Delta_2^{(i_2i_3)}(s)-\Delta_9^{(i_2i_3)}(s), \tag{227}$$

where

$$\Delta_9^{(i_2i_3)}(s)=\underset{p\to\infty}{\text{l.i.m.}}\sum_{j_3,j_2=0}^{p}q_{j_2j_3}^{p}(s)\zeta_{j_2}^{(i_3)}\zeta_{j_3}^{(i_3)},$$

$$q_{j_2j_3}^{p}(s)=\frac{1}{2}\int\limits_t^s\phi_{j_3}(s_1)\int\limits_t^{s_1}\phi_{j_2}(s_2)ds_2ds_1\sum_{j_4=p+1}^{\infty}\left(\int\limits_t^s\phi_{j_4}(\tau)d\tau\right)^2.$$

From (222) and (227) we get

$$A_3^{(i_2i_3)}(s)=\Delta_2^{(i_2i_3)}(s)+\Delta_4^{(i_2i_3)}(s)-\Delta_5^{(i_2i_3)}(s)-\Delta_9^{(i_2i_3)}(s)\quad \text{w. p. 1.} \tag{228}$$

Let us consider $B_1(s), B_2(s), B_3(s)$ (see the derivation of the formulas (114), (115))

$$B_1(s)=\frac{1}{4}\int\limits_t^s(s_1-t)ds_1-\lim_{p\to\infty}\sum_{j_4=0}^{p}a_{j_4j_4}^{p}(s), \tag{229}$$

$$B_2(s)=\lim_{p\to\infty}\sum_{j_3=0}^{p}a_{j_3j_3}^{p}(s)+\lim_{p\to\infty}\sum_{j_3=0}^{p}c_{j_3j_3}^{p}(s)-\lim_{p\to\infty}\sum_{j_3=0}^{p}b_{j_3j_3}^{p}(s). \tag{230}$$

Moreover (see the derivation of the formula (116)),

$$B_2(s)+B_3(s)=$$

$$=\lim_{p\to\infty}\sum_{j_4=0}^{p}\int\limits_t^s\phi_{j_4}(s_1)\int\limits_t^{s_1}\phi_{j_4}(s_2)ds_2\sum_{j_3=0}^{p}\int\limits_t^{s_1}\phi_{j_3}(s_3)ds_3\int\limits_{s_1}^{s}\phi_{j_3}(\tau)d\tau ds_1. \tag{231}$$

Using (231) and the generalized Parseval equality, we obtain

$$B_2(s)+B_3(s)=$$

$$= -\lim_{p\to\infty}\sum_{j_4=0}^{p}\int\limits_t^s \phi_{j_4}(s_1)\int\limits_t^{s_1}\phi_{j_4}(s_2)ds_2\sum_{j_3=p+1}^{\infty}\int\limits_t^{s_1}\phi_{j_3}(s_3)ds_3\int\limits_{s_1}^{s}\phi_{j_3}(\tau)d\tau ds_1 =$$

$$= \lim_{p\to\infty}\sum_{j_4=0}^{p} f^p_{j_4j_4}(s) + \lim_{p\to\infty}\sum_{j_4=0}^{p} b^p_{j_4j_4}(s) - \lim_{p\to\infty}\sum_{j_4=0}^{p} q^p_{j_4j_4}(s). \tag{232}$$

Combining (230) and (232), we have

$$B_3(s) = 2\lim_{p\to\infty}\sum_{j_4=0}^{p} b^p_{j_4j_4}(s) + \lim_{p\to\infty}\sum_{j_4=0}^{p} f^p_{j_4j_4}(s) - \lim_{p\to\infty}\sum_{j_4=0}^{p} c^p_{j_4j_4}(s) -$$

$$- \lim_{p\to\infty}\sum_{j_4=0}^{p} a^p_{j_4j_4}(s) - \lim_{p\to\infty}\sum_{j_4=0}^{p} q^p_{j_4j_4}(s). \tag{233}$$

After substituting the relations (220)–(225), (228)–(230), (233) into (219), we obtain

$$\underset{p\to\infty}{\text{l.i.m.}}\sum_{j_1,j_2,j_3,j_4=0}^{p} C_{j_4j_3j_2j_1}(s)\zeta^{(i_1)}_{j_1}\zeta^{(i_2)}_{j_2}\zeta^{(i_3)}_{j_3}\zeta^{(i_4)}_{j_4} =$$

$$= J[\psi^{(4)}]_{s,t} + \frac{1}{2}\mathbf{1}_{\{i_1=i_2\ne 0\}}\int\limits_t^s\int\limits_t^{\tau}\int\limits_t^{s_1} ds_2 d\mathbf{w}^{(i_3)}_{s_1}d\mathbf{w}^{(i_4)}_{\tau} +$$

$$+\frac{1}{2}\mathbf{1}_{\{i_2=i_3\ne 0\}}\int\limits_t^s\int\limits_t^{s_2}\int\limits_t^{s_1} d\mathbf{w}^{(i_1)}_{\tau}ds_1 d\mathbf{w}^{(i_4)}_{s_2} + \frac{1}{2}\mathbf{1}_{\{i_3=i_4\ne 0\}}\int\limits_t^s\int\limits_t^{s_1}\int\limits_t^{s_2} d\mathbf{w}^{(i_1)}_{\tau}d\mathbf{w}^{(i_2)}_{s_2}ds_1 +$$

$$+\frac{1}{4}\mathbf{1}_{\{i_1=i_2\ne 0\}}\mathbf{1}_{\{i_3=i_4\ne 0\}}\int\limits_t^T\int\limits_t^{s_1} ds_2 ds_1 + R(s) = J^*[\psi^{(4)}]_{s,t} +$$

$$+R(s) \quad \text{w. p. 1}, \tag{234}$$

where

$$R(s) = -\mathbf{1}_{\{i_1=i_2\ne 0\}}\Delta_1^{(i_3i_4)}(s) + \mathbf{1}_{\{i_1=i_3\ne 0\}}\left(-\Delta_2^{(i_2i_4)}(s) + \Delta_1^{(i_2i_4)}(s) + \Delta_3^{(i_2i_4)}(s)\right) +$$

$$+\mathbf{1}_{\{i_1=i_4\ne 0\}}\left(\Delta_2^{(i_2i_3)}(s) + \Delta_4^{(i_2i_3)}(s) - \Delta_5^{(i_2i_3)}(s) - \Delta_9^{(i_2i_3)}(s)\right) - \mathbf{1}_{\{i_2=i_3\ne 0\}}\Delta_3^{(i_1i_4)}(s) +$$

$$+\mathbf{1}_{\{i_2=i_4\ne 0\}}\left(-\Delta_4^{(i_1i_3)}(s) + \Delta_5^{(i_1i_3)}(s) + \Delta_6^{(i_1i_3)}(s)\right) - \mathbf{1}_{\{i_3=i_4\ne 0\}}\Delta_6^{(i_1i_2)}(s) -$$

$$-\mathbf{1}_{\{i_1=i_3\ne 0\}}\mathbf{1}_{\{i_2=i_4\ne 0\}}\left(\lim_{p\to\infty}\sum_{j_3=0}^{p} a^p_{j_3j_3}(s) + \lim_{p\to\infty}\sum_{j_3=0}^{p} c^p_{j_3j_3}(s) - \lim_{p\to\infty}\sum_{j_3=0}^{p} b^p_{j_3j_3}(s)\right) -$$

$$-\mathbf{1}_{\{i_1=i_4\neq 0\}}\mathbf{1}_{\{i_2=i_3\neq 0\}}\Biggl(2\lim_{p\to\infty}\sum_{j_4=0}^{p} b^p_{j_4j_4}(s)+\lim_{p\to\infty}\sum_{j_4=0}^{p} f^p_{j_4j_4}(s)-\lim_{p\to\infty}\sum_{j_4=0}^{p} c^p_{j_4j_4}(s)-$$

$$-\lim_{p\to\infty}\sum_{j_4=0}^{p} a^p_{j_4j_4}(s)-\lim_{p\to\infty}\sum_{j_4=0}^{p} q^p_{j_4j_4}(s)\Biggr)+$$

$$+\mathbf{1}_{\{i_1=i_2\neq 0\}}\mathbf{1}_{\{i_3=i_4\neq 0\}}\lim_{p\to\infty}\sum_{j_3=0}^{p} a^p_{j_3j_3}(s). \tag{235}$$

Let us prove that

$$R(s)=0\quad \text{w. p. 1.} \tag{236}$$

Consider the case of Legendre polynomials. Let us prove that

$$\Delta_1^{(i_3i_4)}(s)=0\quad \text{w. p. 1.} \tag{237}$$

We have

$$a^p_{j_4j_3}(s)=\frac{(T-t)^2\sqrt{(2j_4+1)(2j_3+1)}}{32}\times$$

$$\times\int\limits_{-1}^{z(s)} P_{j_4}(y)\int\limits_{-1}^{y} P_{j_3}(y_1)\sum_{j_1=p+1}^{\infty}(2j_1+1)\left(\int\limits_{-1}^{y_1} P_{j_1}(y_2)dy_2\right)^2 dy_1dy=$$

$$=\frac{(T-t)^2\sqrt{(2j_4+1)(2j_3+1)}}{32}\times$$

$$\times\int\limits_{-1}^{z(s)} P_{j_3}(y_1)\sum_{j_1=p+1}^{\infty}\frac{1}{2j_1+1}\left(P_{j_1+1}(y_1)-P_{j_1-1}(y_1)\right)^2\int\limits_{y_1}^{z(s)} P_{j_4}(y)dydy_1=$$

$$=\frac{(T-t)^2\sqrt{2j_3+1}}{32\sqrt{2j_4+1}}\times$$

$$\times\int\limits_{-1}^{z(s)} P_{j_3}(y_1)\left(\left(P_{j_4+1}(z(s))-P_{j_4-1}(z(s))\right)-\left(P_{j_4+1}(y_1)-P_{j_4-1}(y_1)\right)\right)\times$$

$$\times\sum_{j_1=p+1}^{\infty}\frac{1}{2j_1+1}\left(P_{j_1+1}(y_1)-P_{j_1-1}(y_1)\right)^2 dy_1$$

if $j_4\neq 0$ and

$$a^p_{j_4 j_3}(s) = \frac{(T-t)^2\sqrt{2j_3+1}}{32}\times$$

$$\times \int\limits_{-1}^{z(s)} P_{j_3}(y_1)(z(s)-y_1)\sum_{j_1=p+1}^{\infty}\frac{1}{2j_1+1}\left(P_{j_1+1}(y_1)-P_{j_1-1}(y_1)\right)^2 dy_1$$

if $j_4 = 0$, where $z(s)$ is defined by (26).

We can assume that $s \in (t, T)$ $(z(s) \neq \pm 1)$ since the case $s = T$ has already been considered in Theorem 4. Now the further proof of the equality (237) is completely analogous to the proof of the equality (128).

It is not difficult to see that the formulas

$$\Delta_2^{(i_2 i_4)}(s) = 0, \quad \Delta_4^{(i_1 i_3)}(s) = 0, \quad \Delta_6^{(i_1 i_3)}(s) = 0, \quad \Delta_9^{(i_2 i_3)}(s) = 0 \quad \text{w. p. 1} \tag{238}$$

can be proved similarly with the proof of (237).

Moreover, the relations

$$\lim_{p\to\infty}\sum_{j_3=0}^{p} a^p_{j_3 j_3}(s) = 0, \quad \lim_{p\to\infty}\sum_{j_3=0}^{p} b^p_{j_3 j_3}(s) = 0, \quad \lim_{p\to\infty}\sum_{j_3=0}^{p} f^p_{j_3 j_3}(s) = 0, \quad \lim_{p\to\infty}\sum_{j_3=0}^{p} q^p_{j_3 j_3}(s) = 0 \tag{239}$$

can also be proved analogously with (130), (131).

Let us consider $\Delta_3^{(i_2 i_4)}(s)$ and prove that

$$\Delta_3^{(i_2 i_4)}(s) = 0 \quad \text{w. p. 1.} \tag{240}$$

We have

$$\Delta_3^{(i_2 i_4)}(s) = \Delta_4^{(i_2 i_4)}(s) + \Delta_6^{(i_2 i_4)}(s) - \Delta_7^{(i_2 i_4)}(s) =$$

$$= -\Delta_7^{(i_2 i_4)}(s) \quad \text{w. p. 1,} \tag{241}$$

where

$$\Delta_7^{(i_2 i_4)}(s) = \underset{p\to\infty}{\text{l.i.m.}}\sum_{j_2, j_4=0}^{p} g^p_{j_4 j_2}(s)\zeta_{j_2}^{(i_2)}\zeta_{j_4}^{(i_4)},$$

$$g^p_{j_4 j_2}(s) = \int\limits_t^s \phi_{j_4}(\tau)\int\limits_t^{\tau}\phi_{j_2}(s_1)\sum_{j_1=p+1}^{\infty}\left(\int\limits_{s_1}^{s}\phi_{j_1}(s_2)ds_2\int\limits_{\tau}^{s}\phi_{j_1}(s_2)ds_2\right)ds_1 d\tau.$$

Note that (see (134))

$$g^p_{j_4j_4}(s)=\sum_{j_1=p+1}^{\infty}\frac{1}{2}\left(\int\limits_t^s\phi_{j_4}(\tau)\int\limits_\tau^s\phi_{j_1}(s_2)ds_2d\tau\right)^2. \tag{242}$$

The proof of (240) for the case $i_2=i_4\ne 0$ differs from the proof of the equality

$$\Delta_3^{(i_2i_4)}=0\quad \text{w. p. 1}$$

for the case $i_2=i_4\ne 0$ (see the proof of Theorem 4). In our case we will use Parseval's equality instead of the orthogonality property of the Legendre polynomials.

Using the Parseval equality, we obtain

$$\sum_{j_4=0}^{p}g^p_{j_4j_4}(s)=\sum_{j_4=0}^{p}\sum_{j_1=p+1}^{\infty}\frac{1}{2}\left(\int\limits_t^s\phi_{j_4}(\tau)\int\limits_\tau^s\phi_{j_1}(s_2)ds_2d\tau\right)^2=$$

$$=\sum_{j_4=0}^{p}\sum_{j_1=p+1}^{\infty}\frac{1}{2}\left(\int\limits_t^s\phi_{j_4}(\tau)\left(\int\limits_t^s\phi_{j_1}(s_2)ds_2-\int\limits_t^\tau\phi_{j_1}(s_2)ds_2\right)d\tau\right)^2\le$$

$$\le\sum_{j_4=0}^{p}\left(\int\limits_t^s\phi_{j_4}(\tau)d\tau\right)^2\sum_{j_1=p+1}^{\infty}\left(\int\limits_t^s\phi_{j_1}(s_2)ds_2\right)^2+\sum_{j_4=0}^{p}\sum_{j_1=p+1}^{\infty}\left(\int\limits_t^s\phi_{j_4}(\tau)\int\limits_t^\tau\phi_{j_1}(s_2)ds_2d\tau\right)^2=$$

$$=\sum_{j_4=0}^{p}\left(\int\limits_t^T\mathbf{1}_{\{\tau<s\}}\phi_{j_4}(\tau)d\tau\right)^2\sum_{j_1=p+1}^{\infty}\left(\int\limits_t^s\phi_{j_1}(s_2)ds_2\right)^2+$$

$$+\sum_{j_1=p+1}^{\infty}\sum_{j_4=0}^{p}\left(\int\limits_t^T\mathbf{1}_{\{\tau<s\}}\phi_{j_4}(\tau)\int\limits_t^\tau\phi_{j_1}(s_2)ds_2d\tau\right)^2\le$$

$$\le\sum_{j_4=0}^{\infty}\left(\int\limits_t^T\mathbf{1}_{\{\tau<s\}}\phi_{j_4}(\tau)d\tau\right)^2\sum_{j_1=p+1}^{\infty}\left(\int\limits_t^s\phi_{j_1}(s_2)ds_2\right)^2+$$

$$+\sum_{j_1=p+1}^{\infty}\sum_{j_4=0}^{\infty}\left(\int\limits_t^T\mathbf{1}_{\{\tau<s\}}\phi_{j_4}(\tau)\int\limits_t^\tau\phi_{j_1}(s_2)ds_2d\tau\right)^2=$$

$$=\int\limits_t^T\left(\mathbf{1}_{\{\tau<s\}}\right)^2d\tau\sum_{j_1=p+1}^{\infty}\left(\int\limits_t^s\phi_{j_1}(s_2)ds_2\right)^2+\sum_{j_1=p+1}^{\infty}\int\limits_t^T\left(\mathbf{1}_{\{\tau<s\}}\right)^2\left(\int\limits_t^\tau\phi_{j_1}(s_2)ds_2\right)^2d\tau=$$

$$= (s-t)\sum_{j_1=p+1}^{\infty}\left(\int\limits_t^s \phi_{j_1}(s_2)ds_2\right)^2 + \sum_{j_1=p+1}^{\infty}\int\limits_t^s\left(\int\limits_t^{\tau} \phi_{j_1}(s_2)ds_2\right)^2 d\tau. \tag{243}$$

We can assume that $s \in (t, T)$ $(z(s) \neq \pm 1)$ since the case $s = T$ has already been considered in Theorem 4. Then from (243) and (87) we obtain

$$0 \le \sum_{j_4=0}^{p} g^p_{j_4 j_4}(s) \le \frac{C(s)}{p}, \tag{244}$$

where constant $C(s)$ (s is fixed) is independent of p.

Combining (29) and (124) with (213), we obtain

$$\left|\int\limits_{s_1}^{s} \phi_j(\theta)d\theta\right| < \frac{K}{j^{1/2+m/4}}\left(\frac{1}{(1-z^2(s))^{m/8}} + \frac{1}{(1-z^2(s_1))^{m/8}}\right), \tag{245}$$

where $s, s_1 \in (t, T)$, $m = 1$ or $m = 2$, $z(s)$ is defined by (26), constant K does not depend on j.

Using the Parseval equality, we get

$$\lim_{p_1\to\infty}\sum_{j_4,j_2=0}^{p_1}\left(g^p_{j_4 j_2}(s)\right)^2 = \int\limits_{[t,T]^2}\left(K_p(\tau, s_1, s)\right)^2 ds_1 d\tau = \int\limits_t^s\int\limits_t^{\tau}\left(F_p(\tau, s_1, s)\right)^2 ds_1 d\tau, \tag{246}$$

where

$$g^p_{j_4 j_2}(s) = \int\limits_t^T \mathbf{1}_{\{\tau<s\}}\phi_{j_4}(\tau)\int\limits_t^{\tau}\phi_{j_2}(s_1)F_p(\tau, s_1, s)ds_1 d\tau = \int\limits_{[t,T]^2} K_p(\tau, s_1, s)\phi_{j_4}(\tau)\phi_{j_2}(s_1)ds_1 d\tau$$

is a coefficient of the double Fourier–Legendre series of the function

$$K_p(\tau, s_1, s) = \mathbf{1}_{\{\tau<s\}}\mathbf{1}_{\{s_1<\tau<s\}}F_p(\tau, s_1, s),$$

where

$$\sum_{j_1=p+1}^{\infty}\int\limits_{s_1}^{s}\phi_{j_1}(s_2)ds_2\int\limits_{\tau}^{s}\phi_{j_1}(s_2)ds_2 \stackrel{\sf def}{=} F_p(\tau, s_1, s). \tag{247}$$

From (245) for $m = 1$ and $m = 2$ we have

$$|F_p(\tau, s_1, s)| <$$

$$< \sum_{j_1=p+1}^{\infty}\frac{K_1}{(j_1)^{7/4}}\left(\frac{1}{(1-z^2(s))^{1/8}} + \frac{1}{(1-z^2(s_1))^{1/8}}\right)\times$$

$$\times\left(\frac{1}{(1-z^2(s))^{1/4}}+\frac{1}{(1-z^2(\tau))^{1/4}}\right)\le$$

$$\le\frac{K_2}{p^{3/4}}\left(\frac{1}{(1-z^2(s))^{1/8}}+\frac{1}{(1-z^2(s_1))^{1/8}}\right)\left(\frac{1}{(1-z^2(s))^{1/4}}+\frac{1}{(1-z^2(\tau))^{1/4}}\right), \tag{248}$$

where $s, s_1, \tau\in(t,T)$, constant K_2 is independent of p and we used the estimate (409) in (248).

The relations (246) and (248) imply the estimate

$$\sum_{j_2,j_4=0}^{p}\left(g_{j_4j_2}^p(s)\right)^2\le\frac{C_1(s)}{p^{3/2}} \tag{249}$$

for the case $s\in(t,T)$ or $z(s)\in(-1,1)$ (the case $s=T$ has already been considered in Theorem 4), where constant $C_1(s)$ (s is fixed) does not depend on p.

Then from analogue of (169) for $s\in(t,T)$ (s is fixed), (244), and (249) we have

$$\mathsf{M}\left\{\left(\sum_{j_2,j_4=0}^{p}g_{j_4j_2}^p(s)\zeta_{j_2}^{(i_2)}\zeta_{j_4}^{(i_4)}\right)^2\right\}\le\left(1+\mathbf{1}_{\{i_2=i_4\ne 0\}}\right)\sum_{j_2,j_4=0}^{p}\left(g_{j_4j_2}^p(s)\right)^2+$$

$$+\mathbf{1}_{\{i_2=i_4\ne 0\}}\left(\sum_{j_4=0}^{p}g_{j_4j_4}^p(s)\right)^2\le\frac{C_2(s)}{p^{3/2}}\ \to 0$$

if $p\to\infty$, where constant $C_2(s)$ (s is fixed) does not depend on p. The equality (240) is proved.

Let us consider $\Delta_5^{(i_1i_3)}(s)$

$$\Delta_5^{(i_1i_3)}(s)=\Delta_4^{(i_1i_3)}(s)+\Delta_6^{(i_1i_3)}(s)-\Delta_8^{(i_1i_3)}(s)\quad \text{w. p. 1},$$

where

$$\Delta_8^{(i_1i_3)}(s)=\underset{p\to\infty}{\text{l.i.m.}}\sum_{j_3,j_1=0}^{p}h_{j_3j_1}^p(s)\zeta_{j_1}^{(i_1)}\zeta_{j_3}^{(i_3)},$$

$$h_{j_3j_1}^p(s)=\int\limits_t^s\phi_{j_1}(s_3)\int\limits_{s_3}^s\phi_{j_3}(\tau)F_p(s_3,\tau,s)d\tau ds_3,$$

where $F_p(s_3,\tau,s)$ is defined by (247).

Analogously to (240), we obtain that $\Delta_8^{(i_1i_3)}(s)=0$ w. p. 1. In this case we consider the function

$$K_p(s_3,\tau,s)=\mathbf{1}_{\{s_3<s\}}\mathbf{1}_{\{s_3<\tau<s\}}F_p(s_3,\tau,s)$$

and the relation

$$h_{j_3j_1}^p(s)=\int\limits_{[t,T]^2}K_p(s_3,\tau,s)\phi_{j_1}(s_3)\phi_{j_3}(\tau)d\tau ds_3.$$

For the case $i_1 = i_3 \neq 0$ we use (see (242))

$$h^p_{j_1 j_1}(s) = \sum_{j_4=p+1}^{\infty} \frac{1}{2} \left(\int\limits_t^s \phi_{j_1}(\tau) \int\limits_\tau^s \phi_{j_4}(s_1) ds_1 d\tau \right)^2 .$$

Let us prove that

$$\lim_{p\to\infty} \sum_{j_3=0}^{p} c^p_{j_3 j_3}(s) = 0. \tag{250}$$

We have

$$c^p_{j_3 j_3}(s) = f^p_{j_3 j_3}(s) + d^p_{j_3 j_3}(s) - g^p_{j_3 j_3}(s). \tag{251}$$

Moreover,

$$\lim_{p\to\infty} \sum_{j_3=0}^{p} f^p_{j_3 j_3}(s) = 0, \quad \lim_{p\to\infty} \sum_{j_3=0}^{p} d^p_{j_3 j_3}(s) = 0, \tag{252}$$

where the first equality in (252) has been proved earlier. Analogously, we can prove the second equality in (252).

From (244) we obtain

$$\lim_{p\to\infty} \sum_{j_3=0}^{p} g^p_{j_3 j_3}(s) = 0.$$

So, (250) is proved. The relation (236) is proved for the polynomial case. Theorem 10 is proved for the case of Legendre polynomials.

It is easy to see that the trigonometric case is considered by analogy with the case of Legendre polynomials using the estimate

$$\left| \int\limits_\tau^s \phi_j(\theta) d\theta \right| \le \frac{C}{j} \quad (j \neq 0),$$

where constant C is independent of p, $t \le \tau < s \le T$, and $\{\phi_j(x)\}_{j=0}^{\infty}$ is a complete orthonormal system of trigonometric functions in the space $L_2([t, T])$. Theorem 10 is proved.

Let us reformulate Theorem 10 in terms on the convergence of solution of system of ODEs to the solution of system of Stratonovich SDEs.

By analogy with (175) for the case $k = 4$, $p_1 = \ldots = p_4 = p$, $i_1, \ldots, i_4 = 0, 1, \ldots, m$, and $s \in (t, T]$ (s is fixed) we obtain

$$\int\limits_t^s \int\limits_t^{t_4} \int\limits_t^{t_3} \int\limits_t^{t_2} d\mathbf{w}^{(i_1)p}_{t_1} d\mathbf{w}^{(i_2)p}_{t_2} d\mathbf{w}^{(i_3)p}_{t_3} d\mathbf{w}^{(i_4)p}_{t_4} = \sum_{j_1, j_2, j_3, j_4 = 0}^{p} C_{j_4 j_3 j_2 j_1}(s) \zeta^{(i_1)}_{j_1} \zeta^{(i_2)}_{j_2} \zeta^{(i_3)}_{j_3} \zeta^{(i_4)}_{j_4},$$

where $p \in \mathbb{N}$ and $d\mathbf{w}^{(i)p}_\tau$ is defined by (174); another notations are the same as in Theorem 10.

The iterated Riemann–Stiltjes integrals

$$V_{s,t}^{(i_1 i_2 i_3 i_4)p} = \int_t^s \int_t^{t_4} \int_t^{t_3} \int_t^{t_2} d\mathbf{w}_{t_1}^{(i_1)p} d\mathbf{w}_{t_2}^{(i_2)p} d\mathbf{w}_{t_3}^{(i_3)p} d\mathbf{w}_{t_4}^{(i_4)p}, \tag{253}$$

$$Z_{s,t}^{(i_1 i_2 i_3)p} = \int_t^s \int_t^{t_3} \int_t^{t_2} d\mathbf{w}_{t_1}^{(i_1)p} d\mathbf{w}_{t_2}^{(i_2)p} d\mathbf{w}_{t_3}^{(i_3)p}, \tag{254}$$

$$Y_{s,t}^{(i_1 i_2)p} = \int_t^s \int_t^{t_2} d\mathbf{w}_{t_1}^{(i_1)p} d\mathbf{w}_{t_2}^{(i_2)p}, \tag{255}$$

$$X_{s,t}^{(i_1)p} = \int_t^s d\mathbf{w}_{t_1}^{(i_1)p} \tag{256}$$

are the solution of the following system of ODEs

$$\begin{cases} dV_{s,t}^{(i_1 i_2 i_3 i_4)p} = Z_{s,t}^{(i_1 i_2 i_3)p} d\mathbf{w}_s^{(i_4)p}, & V_{t,t}^{(i_1 i_2 i_3 i_4)p} = 0 \\ \\ dZ_{s,t}^{(i_1 i_2 i_3)p} = Y_{s,t}^{(i_1 i_2)p} d\mathbf{w}_s^{(i_3)p}, & Z_{t,t}^{(i_1 i_2 i_3)p} = 0 \\ \\ dY_{s,t}^{(i_1 i_2)p} = X_{s,t}^{(i_1)p} d\mathbf{w}_s^{(i_2)p}, & Y_{t,t}^{(i_1 i_2)p} = 0 \\ \\ dX_{s,t}^{(i_1)p} = 1 \cdot d\mathbf{w}_s^{(i_1)p}, & X_{t,t}^{(i_1)p} = 0 \end{cases}.$$

From the other hand, the iterated Stratonovich stochastic integrals

$$V_{s,t}^{(i_1 i_2 i_3 i_4)} = \int_t^{*s} \int_t^{*t_4} \int_t^{*t_3} \int_t^{*t_2} d\mathbf{w}_{t_1}^{(i_1)} d\mathbf{w}_{t_2}^{(i_2)} d\mathbf{w}_{t_3}^{(i_3)} d\mathbf{w}_{t_4}^{(i_4)}, \tag{257}$$

$$Z_{s,t}^{(i_1 i_2 i_3)} = \int_t^{*s} \int_t^{*t_3} \int_t^{*t_2} d\mathbf{w}_{t_1}^{(i_1)} d\mathbf{w}_{t_2}^{(i_2)} d\mathbf{w}_{t_3}^{(i_3)}, \tag{258}$$

$$Y_{s,t}^{(i_1 i_2)} = \int_t^{*s} \int_t^{*t_2} d\mathbf{w}_{t_1}^{(i_1)} d\mathbf{w}_{t_2}^{(i_2)}, \tag{259}$$

$$X_{s,t}^{(i_1)} = \int_t^{*s} d\mathbf{w}_{t_1}^{(i_1)} \tag{260}$$

are the solution of the following system of Stratonovich SDEs

$$\begin{cases} dV_{s,t}^{(i_1 i_2 i_3 i_4)} = Z_{s,t}^{(i_1 i_2 i_3)} * d\mathbf{w}_s^{(i_4)}, & V_{t,t}^{(i_1 i_2 i_3 i_4)} = 0 \\ \\ dZ_{s,t}^{(i_1 i_2 i_3)} = Y_{s,t}^{(i_1 i_2)} * d\mathbf{w}_s^{(i_3)}, & Z_{t,t}^{(i_1 i_2 i_3)} = 0 \\ \\ dY_{s,t}^{(i_1 i_2)} = X_{s,t}^{(i_1)} * d\mathbf{w}_s^{(i_2)}, & Y_{t,t}^{(i_1 i_2)} = 0 \\ \\ dX_{s,t}^{(i_1)} = 1 * d\mathbf{w}_s^{(i_1)}, & X_{t,t}^{(i_1)} = 0 \end{cases},$$

where $* d\mathbf{w}_s^{(i)}$, $i = 0, 1, \ldots, m$ is the Stratonovich differential.

Then from Theorems 7, 9, and 10 we obtain the following theorem.

Theorem 11 [26]. *Suppose that* $\{\phi_j(x)\}_{j=0}^{\infty}$ *is a complete orthonormal system of Legendre polynomials or trigonometric functions in the space* $L_2([t, T])$. *Then for any fixed* s $(s \in (t, T])$

$$\underset{p\to\infty}{\text{l.i.m.}}\ V_{s,t}^{(i_1 i_2 i_3 i_4)p} = V_{s,t}^{(i_1 i_2 i_3 i_4)}, \quad \underset{p\to\infty}{\text{l.i.m.}}\ Z_{s,t}^{(i_1 i_2 i_3)p} = Z_{s,t}^{(i_1 i_2 i_3)},$$

$$\underset{p\to\infty}{\text{l.i.m.}}\ Y_{s,t}^{(i_1 i_2)p} = Y_{s,t}^{(i_1 i_2)}, \quad \underset{p\to\infty}{\text{l.i.m.}}\ X_{s,t}^{(i_1)p} = X_{s,t}^{(i_1)}.$$

11. Rate of the Mean-Square Convergence of Expansions of Iterated Stratonovich Stochastic Integrals of Multiplicities 2 to 4 in Theorems 2–4

Let us prove the following Theorem.

Theorem 12 [26]. *Suppose that* $\{\phi_j(x)\}_{j=0}^{\infty}$ *is a complete orthonormal system of Legendre polynomials or trigonometric functions in the space* $L_2([t, T])$. *Moreover,* $\psi_1(\tau), \psi_2(\tau)$ *are continuously differentiable nonrandom functions on* $[t, T]$. *Then, for the iterated Stratonovich stochastic integral*

$$J^*[\psi^{(2)}]_{T,t} = \int\limits_t^{*T} \psi_2(t_2) \int\limits_t^{*t_2} \psi_1(t_1) d\mathbf{f}_{t_1}^{(i_1)} d\mathbf{f}_{t_2}^{(i_2)} \quad (i_1, i_2 = 1, \ldots, m)$$

the following estimate

$$\mathsf{M}\left\{\left(J^*[\psi^{(2)}]_{T,t} - \sum_{j_1,j_2=0}^{p} C_{j_2 j_1} \zeta_{j_1}^{(i_1)} \zeta_{j_2}^{(i_2)}\right)^2\right\} \le \frac{C}{p} \tag{261}$$

is valid, where constant C *is independent of* p,

$$C_{j_2 j_1} = \int\limits_t^T \psi_2(s_2)\phi_{j_2}(s_2) \int\limits_t^{s_2} \psi_1(s_1)\phi_{j_1}(s_1) ds_1 ds_2,$$

and

$$\zeta_j^{(i)} = \int\limits_t^T \phi_j(\tau) d\mathbf{f}_\tau^{(i)}$$

are independent standard Gaussian random variables for various i or j.

Proof. From (15) we obtain

$$\mathsf{M}\left\{\left(J^*[\psi^{(2)}]_{T,t} - \sum_{j_1,j_2=0}^{p} C_{j_2 j_1}\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}\right)^2\right\} =$$

$$= \mathsf{M}\left\{\left(J[\psi^{(2)}]_{T,t} + \frac{1}{2}\mathbf{1}_{\{i_1=i_2\}}\int\limits_t^T \psi_1(t_1)\psi_2(t_1)dt_1 - \sum_{j_1,j_2=0}^{p} C_{j_2 j_1}\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}\right)^2\right\} =$$

$$= \mathsf{M}\Biggl\{\Biggl(J[\psi^{(2)}]_{T,t} - \sum_{j_1,j_2=0}^{p} C_{j_2 j_1}\left(\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)} - \mathbf{1}_{\{i_1=i_2\}}\mathbf{1}_{\{j_1=j_2\}}\right) +$$

$$+\frac{1}{2}\mathbf{1}_{\{i_1=i_2\}}\int\limits_t^T \psi_1(t_1)\psi_2(t_1)dt_1 - \mathbf{1}_{\{i_1=i_2\}}\sum_{j_1=0}^{p} C_{j_1 j_1}\Biggr)^2\Biggr\} =$$

$$= \mathsf{M}\left\{\left(J[\psi^{(2)}]_{T,t} - \sum_{j_1,j_2=0}^{p} C_{j_2 j_1}\left(\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)} - \mathbf{1}_{\{i_1=i_2\}}\mathbf{1}_{\{j_1=j_2\}}\right)\right)^2\right\} +$$

$$+\left(\frac{1}{2}\mathbf{1}_{\{i_1=i_2\}}\int\limits_t^T \psi_1(t_1)\psi_2(t_1)dt_1 - \mathbf{1}_{\{i_1=i_2\}}\sum_{j_1=0}^{p} C_{j_1 j_1}\right)^2 =$$

$$= \mathsf{M}\left\{\left(J[\psi^{(2)}]_{T,t} - J[\psi^{(2)}]_{T,t}^{p,p}\right)^2\right\} +$$

$$+\mathbf{1}_{\{i_1=i_2\}}\left(\frac{1}{2}\int\limits_t^T \psi_1(t_1)\psi_2(t_1)dt_1 - \sum_{j_1=0}^{p} C_{j_1 j_1}\right)^2, \tag{262}$$

where (see (10))

$$J[\psi^{(2)}]_{T,t}^{p,p} = \sum_{j_1,j_2=0}^{p} C_{j_2 j_1}\left(\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)} - \mathbf{1}_{\{i_1=i_2\}}\mathbf{1}_{\{j_1=j_2\}}\right).$$

In [26] (Sect. 1.7.2, Remark 1.7) it is shown that

$$\mathsf{M}\left\{\left(J[\psi^{(k)}]_{T,t}-J[\psi^{(k)}]_{T,t}^{p,\ldots,p}\right)^2\right\}\le\frac{k!P_k(T-t)^k}{p},\tag{263}$$

where $J[\psi^{(k)}]_{T,t}$ is defined by (2), $J[\psi^{(k)}]_{T,t}^{p,\ldots,p}$ is the expression on the right-hand side of (7) before passing to the limit $\underset{p_1,\ldots,p_k\to\infty}{\text{l.i.m.}}$ for the case $p_1=\ldots=p_k=p$, $\{\phi_j(x)\}_{j=0}^{\infty}$ is a complete orthonormal system of Legendre polynomials or trigonometric functions in the space $L_2([t,T])$, $\psi_1(\tau),\ldots,\psi_k(\tau)$ are continuously differentiable nonrandom functions on $[t,T]$, constant P_k depends only on k, $i_1,\ldots,i_k=1,\ldots,m$.

From (263) we get

$$\mathsf{M}\left\{\left(J[\psi^{(2)}]_{T,t}-J[\psi^{(2)}]_{T,t}^{p,p}\right)^2\right\}\le\frac{C_1}{p},\tag{264}$$

where constant C_1 is independent of p.

Using (53), we obtain

$$\frac{1}{2}\int\limits_t^T\psi_1(t_1)\psi_2(t_1)dt_1-\sum_{j_1=0}^{p}C_{j_1j_1}=\sum_{j_1=p+1}^{\infty}C_{j_1j_1}.\tag{265}$$

The estimate (43) implies that (polynomial case)

$$\left|\sum_{j_1=p+1}^{\infty}C_{j_1j_1}\right|\le C_2\left(\frac{1}{p}+\sum_{j_1=p+1}^{\infty}\frac{1}{j_1^2}\right),\tag{266}$$

where constant C_2 does not depend on p.

From (31) and (266) we have

$$S_p\stackrel{\mathsf{def}}{=}\left|\sum_{j_1=p+1}^{\infty}C_{j_1j_1}\right|\le\frac{C_3}{p},\tag{267}$$

where constant C_3 is independent of p.

Applying the ideas that we used to obtain the relations (45), (49), (50), we can prove the following estimates for the trigonometric case

$$S_{2p}=\left|\sum_{j_1=2p+1}^{\infty}C_{j_1j_1}\right|\le\frac{K_1}{p},\tag{268}$$

$$S_{2p-1}=\left|\sum_{j_1=2p}^{\infty}C_{j_1j_1}\right|\le S_{2p}+\frac{K_2}{p},\tag{269}$$

where constants K_1,K_2 do not depend on p.

From (268) and (269) we get the estimate (267) for the trigonometric case. Combining (262), (264), (265), and (267), we obtain (261). Theorem 12 is proved.

Let us consider an analogue of Theorem 12 for iterated Stratonovich stochastic integrals of multiplicity 3.

Theorem 13 [26]. *Suppose that* $\{\phi_j(x)\}_{j=0}^{\infty}$ *is a complete orthonormal system of Legendre polynomials or trigonometric functions in the space* $L_2([t,T])$. *At the same time* $\psi_2(\tau)$ *is a continuously differentiable nonrandom function on* $[t,T]$ *and* $\psi_1(\tau)$, $\psi_3(\tau)$ *are twice continuously differentiable nonrandom functions on* $[t,T]$. *Then, for the iterated Stratonovich stochastic integral of third multiplicity*

$$J^*[\psi^{(3)}]_{T,t}=\int\limits_t^{*T}\psi_3(t_3)\int\limits_t^{*t_3}\psi_2(t_2)\int\limits_t^{*t_2}\psi_1(t_1)d\mathbf{f}_{t_1}^{(i_1)}d\mathbf{f}_{t_2}^{(i_2)}d\mathbf{f}_{t_3}^{(i_3)}\quad (i_1,i_2,i_3=1,\ldots,m)$$

the following estimate

$$\mathsf{M}\left\{\left(J^*[\psi^{(3)}]_{T,t}-\sum_{j_1,j_2,j_3=0}^{p}C_{j_3j_2j_1}\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}\zeta_{j_3}^{(i_3)}\right)^2\right\}\le\frac{C}{p}\qquad (270)$$

is valid, where constant C *is independent of* p,

$$C_{j_3j_2j_1}=\int\limits_t^T\psi_3(s)\phi_{j_3}(s)\int\limits_t^s\psi_2(s_1)\phi_{j_2}(s_1)\int\limits_t^{s_1}\psi_1(s_2)\phi_{j_1}(s_2)ds_2ds_1ds,$$

and

$$\zeta_j^{(i)}=\int\limits_t^T\phi_j(\tau)d\mathbf{f}_\tau^{(i)}$$

are independent standard Gaussian random variables for various i *or* j.

Proof. Using standard relations between Stratonovich and Ito stochastic integrals, we obtain

$$\mathsf{M}\left\{\left(J^*[\psi^{(3)}]_{T,t}-\sum_{j_1,j_2,j_3=0}^{p}C_{j_3j_2j_1}\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}\zeta_{j_3}^{(i_3)}\right)^2\right\}=$$

$$=\mathsf{M}\left\{\left(J[\psi^{(3)}]_{T,t}+\frac{1}{2}\mathbf{1}_{\{i_1=i_2\}}\int\limits_t^T\psi_3(t_3)\int\limits_t^{t_3}\psi_2(t_2)\psi_1(t_2)dt_2d\mathbf{f}_{t_3}^{(i_3)}+\right.\right.$$

$$\left.\left.+\frac{1}{2}\mathbf{1}_{\{i_2=i_3\}}\int\limits_t^T\psi_3(t_3)\psi_2(t_3)\int\limits_t^{t_3}\psi_1(t_1)d\mathbf{f}_{t_1}^{(i_1)}dt_3\;-\sum_{j_1,j_2,j_3=0}^{p}C_{j_3j_2j_1}\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}\zeta_{j_3}^{(i_3)}\right)^2\right\}=$$

$$=\mathsf{M}\left\{\left(J[\psi^{(3)}]_{T,t}-J[\psi^{(3)}]_{T,t}^{p,p,p}+\right.\right.$$

$$
+\mathbf{1}_{\{i_1=i_2\}}\left(\frac{1}{2}\int\limits_t^T\psi_3(t_3)\int\limits_t^{t_3}\psi_2(t_2)\psi_1(t_2)dt_2d\mathbf{f}_{t_3}^{(i_3)}-\sum_{j_1,j_3=0}^{p}C_{j_3j_1j_1}\zeta_{j_3}^{(i_3)}\right)+
$$

$$
+\mathbf{1}_{\{i_2=i_3\}}\left(\frac{1}{2}\int\limits_t^T\psi_3(t_3)\psi_2(t_3)\int\limits_t^{t_3}\psi_1(t_1)d\mathbf{f}_{t_1}^{(i_1)}dt_3-\sum_{j_1,j_3=0}^{p}C_{j_3j_3j_1}\zeta_{j_1}^{(i_1)}\right)-
$$

$$
-\mathbf{1}_{\{i_1=i_3\}}\sum_{j_1=0}^{p}\sum_{j_3=0}^{p}C_{j_1j_3j_1}\zeta_{j_3}^{(i_2)}\Biggr)^2\Biggr\}, \tag{271}
$$

where (see (11))

$$
J[\psi^{(3)}]_{T,t}^{p,p,p}=\sum_{j_1,j_2,j_3=0}^{p}C_{j_3j_2j_1}\Biggl(\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}\zeta_{j_3}^{(i_3)}-
$$

$$
-\mathbf{1}_{\{i_1=i_2\}}\mathbf{1}_{\{j_1=j_2\}}\zeta_{j_3}^{(i_3)}-\mathbf{1}_{\{i_2=i_3\}}\mathbf{1}_{\{j_2=j_3\}}\zeta_{j_1}^{(i_1)}-\mathbf{1}_{\{i_1=i_3\}}\mathbf{1}_{\{j_1=j_3\}}\zeta_{j_2}^{(i_2)}\Biggr).
$$

From (271) and the elementary inequality $(a+b+c+d)^2\le 4\left(a^2+b^2+c^2+d^2\right)$ we obtain

$$
\mathsf{M}\left\{\left(J^*[\psi^{(3)}]_{T,t}-\sum_{j_1,j_2,j_3=0}^{p}C_{j_3j_2j_1}\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}\zeta_{j_3}^{(i_3)}\right)^2\right\}\le
$$

$$
\le 4\left(\mathsf{M}\left\{\left(J[\psi^{(3)}]_{s,t}-J[\psi^{(3)}]_{T,t}^{p,p,p}\right)^2\right\}+\mathbf{1}_{\{i_1=i_2\}}E_p^{(1)}+\mathbf{1}_{\{i_2=i_3\}}E_p^{(2)}+\mathbf{1}_{\{i_1=i_3\}}E_p^{(3)}\right), \tag{272}
$$

where

$$
E_p^{(1)}=\mathsf{M}\left\{\left(\frac{1}{2}\int\limits_t^T\psi_3(t_3)\int\limits_t^{t_3}\psi_2(t_2)\psi_1(t_2)dt_2d\mathbf{f}_{t_3}^{(i_3)}-\sum_{j_1,j_3=0}^{p}C_{j_3j_1j_1}\zeta_{j_3}^{(i_3)}\right)^2\right\},
$$

$$
E_p^{(2)}=\mathsf{M}\left\{\left(\frac{1}{2}\int\limits_t^T\psi_3(t_3)\psi_2(t_3)\int\limits_t^{t_3}\psi_1(t_1)d\mathbf{f}_{t_1}^{(i_1)}dt_3-\sum_{j_1,j_3=0}^{p}C_{j_3j_3j_1}\zeta_{j_1}^{(i_1)}\right)^2\right\},
$$

$$
E_p^{(3)}=\mathsf{M}\left\{\left(\sum_{j_1=0}^{p}\sum_{j_3=0}^{p}C_{j_1j_3j_1}\zeta_{j_3}^{(i_2)}\right)^2\right\}.
$$

From (263) we have

(273)
$$\mathsf{M}\left\{\left(J[\psi^{(3)}]_{T,t}-J[\psi^{(3)}]_{T,t}^{p,p,p}\right)^2\right\}\le\frac{C_1}{p},$$

where constant C_1 is independent of p.

Moreover, from (90) and (98) we have the following estimate

(274)
$$E_p^{(3)}\le\frac{C_2}{p}$$

for the polynomial and trigonometric cases, where constant C_2 does not depend on p.

Using Theorem 1 for $k=1$ (also see (9)), we obtain w. p. 1

$$\frac{1}{2}\int\limits_t^T\psi_3(s)\int\limits_t^s\psi_2(s_1)\psi_1(s_1)ds_1d\mathbf{f}_s^{(i_3)}=\frac{1}{2}\underset{p\to\infty}{\text{l.i.m.}}\sum_{j_3=0}^{p}\tilde C_{j_3}\zeta_{j_3}^{(i_3)},$$

where

$$\tilde C_{j_3}=\int\limits_t^T\phi_{j_3}(s)\psi_3(s)\int\limits_t^s\psi_2(s_1)\psi_1(s_1)ds_1ds.$$

Applying the Ito formula, we have

$$\int\limits_t^T\psi_3(s)\psi_2(s)\int\limits_t^s\psi_1(s_1)d\mathbf{f}_{s_1}^{(i_1)}ds=\int\limits_t^T\psi_1(s_1)\int\limits_{s_1}^T\psi_3(s)\psi_2(s)dsd\mathbf{f}_{s_1}^{(i_1)}\quad\text{w. p. 1.}$$

Using Theorem 1 for $k=1$, we have w. p. 1

$$\frac{1}{2}\int\limits_t^T\psi_1(s)\int\limits_s^T\psi_3(s_1)\psi_2(s_1)ds_1d\mathbf{f}_s^{(i_1)}=\frac{1}{2}\underset{p\to\infty}{\text{l.i.m.}}\sum_{j_1=0}^{p}C^*_{j_1}\zeta_{j_1}^{(i_1)},$$

where

$$C^*_{j_1}=\int\limits_t^T\psi_1(s)\phi_{j_1}(s)\int\limits_s^T\psi_3(s_1)\psi_2(s_1)ds_1ds.$$

Further, we get

(275)
$$E_p^{(1)}\le 2G_p^{(1)}+2G_p^{(2)},$$

(276)
$$E_p^{(2)}\le 2H_p^{(1)}+2H_p^{(2)},$$

where

$$G_p^{(1)}=\mathsf{M}\left\{\frac{1}{4}\left(\int\limits_t^T\psi_3(t_3)\int\limits_t^{t_3}\psi_2(t_2)\psi_1(t_2)dt_2d\mathbf{f}_{t_3}^{(i_3)}-\sum_{j_3=0}^{p}\tilde C_{j_3}\zeta_{j_3}^{(i_3)}\right)^2\right\},$$

$$G_p^{(2)} = \mathsf{M}\left\{\left(\frac{1}{2}\sum_{j_3=0}^{p}\tilde C_{j_3}\zeta_{j_3}^{(i_3)} - \sum_{j_1,j_3=0}^{p} C_{j_3j_1j_1}\zeta_{j_3}^{(i_3)}\right)^2\right\},$$

$$H_p^{(1)} = \mathsf{M}\left\{\frac{1}{4}\left(\int\limits_t^T \psi_3(t_3)\psi_2(t_3)\int\limits_t^{t_3}\psi_1(t_1)d\mathbf{f}_{t_1}^{(i_1)}dt_3 - \sum_{j_1=0}^{p} C_{j_1}^{*}\zeta_{j_1}^{(i_1)}\right)^2\right\},$$

$$H_p^{(2)} = \mathsf{M}\left\{\left(\frac{1}{2}\sum_{j_1=0}^{p} C_{j_1}^{*}\zeta_{j_1}^{(i_1)} - \sum_{j_1,j_3=0}^{p} C_{j_3j_3j_1}\zeta_{j_1}^{(i_1)}\right)^2\right\}.$$

From (263) we have

$$G_p^{(1)} \le \frac{C_2}{p}, \quad H_p^{(1)} \le \frac{C_2}{p}, \tag{277}$$

where constant C_2 is independent of p.

The estimates

$$G_p^{(2)} \le \frac{C_3}{p}, \quad H_p^{(2)} \le \frac{C_3}{p} \tag{278}$$

are proved in Sect. 4 (see the proof of Theorem 3) for the polynomial and trigonometric cases; constant C_3 does not depend on p. Combining the estimates (272)–(278), we obtain the inequality (270). Theorem 13 is proved.

Consider an analogue of Theorem 13 for iterated Stratonovich stochastic integrals of fourth multiplicity.

Theorem 14 [26]. *Suppose that $\{\phi_j(x)\}_{j=0}^{\infty}$ is a complete orthonormal system of Legendre polynomials or trigonometric functions in the space $L_2([t,T])$. Then, for the iterated Stratonovich stochastic integral of fourth multiplicity*

$$J^*[\psi^{(4)}]_{T,t} = \int\limits_t^{*T}\int\limits_t^{*t_4}\int\limits_t^{*t_3}\int\limits_t^{*t_2} d\mathbf{w}_{t_1}^{(i_1)}d\mathbf{w}_{t_2}^{(i_2)}d\mathbf{w}_{t_3}^{(i_3)}d\mathbf{w}_{t_4}^{(i_4)} \quad (i_1,i_2,i_3,i_4=0,1,\ldots,m)$$

the following estimate

$$\mathsf{M}\left\{\left(J^*[\psi^{(4)}]_{T,t} - \sum_{j_1,j_2,j_3,j_4=0}^{p} C_{j_4j_3j_2j_1}\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}\zeta_{j_3}^{(i_3)}\zeta_{j_4}^{(i_4)}\right)^2\right\} \le \frac{C}{p} \tag{279}$$

is valid, where constant C is independent of p,

$$C_{j_4j_3j_2j_1} = \int\limits_t^T \phi_{j_4}(s_4)\int\limits_t^{s_4}\phi_{j_3}(s_3)\int\limits_t^{s_3}\phi_{j_2}(s_2)\int\limits_t^{s_2}\phi_{j_1}(s_1)ds_1ds_2ds_3ds_4,$$

and

$$\zeta_j^{(i)} = \int\limits_t^T \phi_j(\tau) d\mathbf{w}_\tau^{(i)}$$

are independent standard Gaussian random variables for various i *or* j *(in the case when* $i \neq 0$*),* $\mathbf{w}_\tau^{(i)} = \mathbf{f}_\tau^{(i)}$ *for* $i = 1, \ldots, m$ *and* $\mathbf{w}_\tau^{(0)} = \tau$.

Proof. First, let us prove that Theorem 3 is valid for the case $i_1, i_2, i_3 = 0, 1, \ldots, m$. The case $i_1, i_2, i_3 = 1, \ldots, m$ has been proved in Theorem 3. From (11) and the standard relation between Stratonovich and Ito stochastic integrals (2), (3) of third multiplicity we have that Theorem 3 is valid for the following cases

$$i_1 = i_2 = 0, \quad i_3 = 1, \ldots, m,$$

$$i_1 = i_3 = 0, \quad i_2 = 1, \ldots, m,$$

$$i_2 = i_3 = 0, \quad i_1 = 1, \ldots, m.$$

Thus, it remains to consider the following three cases

$$i_1,\ i_2 = 1, \ldots, m, \quad i_3 = 0, \tag{280}$$

$$i_2,\ i_3 = 1, \ldots, m, \quad i_1 = 0, \tag{281}$$

$$i_1,\ i_3 = 1, \ldots, m, \quad i_2 = 0. \tag{282}$$

The relation (11) and the standard relation between Stratonovich and Ito stochastic integrals (2), (3) of third multiplicity imply that for the case (280) we need to prove the following equality

$$\sum_{j_1=0}^{\infty} \int\limits_t^T \psi_3(t_3) \int\limits_t^{t_3} \phi_{j_1}(t_2)\psi_2(t_2) \int\limits_t^{t_2} \phi_{j_1}(t_1)\psi_1(t_1) dt_1 dt_2 dt_3 =$$

$$= \frac{1}{2} \int\limits_t^T \psi_3(t_3) \int\limits_t^{t_3} \psi_1(t_1)\psi_2(t_1) dt_1 dt_3. \tag{283}$$

Using the relation (17), we get

$$\sum_{j_1=0}^{\infty} \int\limits_t^T \psi_3(t_3) \int\limits_t^{t_3} \phi_{j_1}(t_2)\psi_2(t_2) \int\limits_t^{t_2} \phi_{j_1}(t_1)\psi_1(t_1) dt_1 dt_2 dt_3 =$$

$$= \sum_{j_1=0}^{\infty} \int\limits_t^T \phi_{j_1}(t_1)\psi_1(t_1) \int\limits_{t_1}^T \phi_{j_1}(t_2)\psi_2(t_2) \int\limits_{t_2}^T \psi_3(t_3) dt_3 dt_2 dt_1 =$$

$$= \sum_{j_1=0}^{\infty} \int\limits_t^T \phi_{j_1}(t_1)\psi_1(t_1) \int\limits_{t_1}^T \phi_{j_1}(t_2)\tilde{\psi}_2(t_2) dt_2 dt_1 =$$

$$= \sum_{j_1=0}^{\infty} \int\limits_t^T \phi_{j_1}(t_2)\tilde{\psi}_2(t_2) \int\limits_t^{t_2} \phi_{j_1}(t_1)\psi_1(t_1)dt_1dt_2 =$$

$$= \frac{1}{2} \int\limits_t^T \psi_1(t_2)\tilde{\psi}_2(t_2)dt_2, \tag{284}$$

where

$$\tilde{\psi}_2(t_2) = \psi_2(t_2) \int\limits_{t_2}^T \psi_3(t_3)dt_3. \tag{285}$$

From (284) and (285) we obtain

$$\sum_{j_1=0}^{\infty} \int\limits_t^T \psi_3(t_3) \int\limits_t^{t_3} \phi_{j_1}(t_2)\psi_2(t_2) \int\limits_t^{t_2} \phi_{j_1}(t_1)\psi_1(t_1)dt_1dt_2dt_3 =$$

$$= \frac{1}{2} \int\limits_t^T \psi_1(t_2)\psi_2(t_2) \int\limits_{t_2}^T \psi_3(t_3)dt_3dt_2 =$$

$$= \frac{1}{2} \int\limits_t^T \psi_3(t_3) \int\limits_t^{t_3} \psi_1(t_2)\psi_2(t_2)dt_2dt_3. \tag{286}$$

The relation (283) is proved.

From (11) and the standard relation between Stratonovich and Ito stochastic integrals (2), (3) of third multiplicity it follows that for the case (281) we need to prove the following equality

$$\sum_{j_2=0}^{\infty} \int\limits_t^T \phi_{j_2}(t_3)\psi_3(t_3) \int\limits_t^{t_3} \phi_{j_2}(t_2)\psi_2(t_2) \int\limits_t^{t_2} \psi_1(t_1)dt_1dt_2dt_3 =$$

$$= \frac{1}{2} \int\limits_t^T \psi_3(t_3)\psi_2(t_3) \int\limits_t^{t_3} \psi_1(t_1)dt_1dt_3. \tag{287}$$

Using the relation (17), we have

$$\sum_{j_2=0}^{\infty} \int\limits_t^T \phi_{j_2}(t_3)\psi_3(t_3) \int\limits_t^{t_3} \phi_{j_2}(t_2)\psi_2(t_2) \int\limits_t^{t_2} \psi_1(t_1)dt_1dt_2dt_3 =$$

$$= \sum_{j_2=0}^{\infty} \int\limits_t^T \phi_{j_2}(t_3)\psi_3(t_3) \int\limits_t^{t_3} \phi_{j_2}(t_2)\bar{\psi}_2(t_2)dt_2dt_3 =$$

$$=\frac{1}{2}\int\limits_t^T\psi_3(t_3)\bar\psi_2(t_3)dt_3,$$

where

$$\bar\psi_2(t_2)=\psi_2(t_2)\int\limits_t^{t_2}\psi_1(t_1)dt_1. \qquad (288)$$

The relation (287) is proved.

The relation (11) and the standard relation between Stratonovich and Ito stochastic integrals (2), (3) of third multiplicity imply that for the case (282) we need to prove the following equality

$$\sum_{j_1=0}^{\infty}\int\limits_t^T\phi_{j_1}(t_3)\psi_3(t_3)\int\limits_t^{t_3}\psi_2(t_2)\int\limits_t^{t_2}\phi_{j_1}(t_1)\psi_1(t_1)dt_1dt_2dt_3=0. \qquad (289)$$

We have

$$\sum_{j_1=0}^{\infty}\int\limits_t^T\phi_{j_1}(t_3)\psi_3(t_3)\int\limits_t^{t_3}\psi_2(t_2)\int\limits_t^{t_2}\phi_{j_1}(t_1)\psi_1(t_1)dt_1dt_2dt_3=$$

$$=\sum_{j_1=0}^{\infty}\int\limits_t^T\phi_{j_1}(t_3)\psi_3(t_3)\int\limits_t^{t_3}\phi_{j_1}(t_1)\psi_1(t_1)\int\limits_{t_1}^{t_3}\psi_2(t_2)dt_2dt_1dt_3=$$

$$=\sum_{j_1=0}^{\infty}\int\limits_t^T\phi_{j_1}(t_3)\psi_3(t_3)\int\limits_t^{t_3}\phi_{j_1}(t_1)\psi_1(t_1)\left(\int\limits_{t_1}^{T}\psi_2(t_2)dt_2-\int\limits_{t_3}^{T}\psi_2(t_2)dt_2\right)dt_1dt_3=$$

$$+\mathbf{1}_{\{i_1=i_2\neq 0\}}\mathbf{1}_{\{i_3=i_4\neq 0\}}\sum_{j_3=0}^{p}a^p_{j_3j_3},$$

where

$$\Delta_1^{(i_3i_4)p}=\sum_{j_3,j_4=0}^{p}a^p_{j_4j_3}\zeta_{j_3}^{(i_3)}\zeta_{j_4}^{(i_4)},\quad \Delta_2^{(i_2i_4)p}=\sum_{j_4,j_2=0}^{p}b^p_{j_4j_2}\zeta_{j_2}^{(i_2)}\zeta_{j_4}^{(i_4)},$$

$$\Delta_3^{(i_2i_4)p}=\sum_{j_4,j_2=0}^{p}c^p_{j_4j_2}\zeta_{j_2}^{(i_2)}\zeta_{j_4}^{(i_4)},\quad \Delta_4^{(i_1i_3)p}=\sum_{j_3,j_1=0}^{p}d^p_{j_3j_1}\zeta_{j_1}^{(i_1)}\zeta_{j_3}^{(i_3)},$$

$$\Delta_5^{(i_1i_3)p}=\sum_{j_3,j_1=0}^{p}e^p_{j_3j_1}\zeta_{j_1}^{(i_1)}\zeta_{j_3}^{(i_3)},\quad \Delta_6^{(i_1i_3)p}=\sum_{j_3,j_1=0}^{p}f^p_{j_3j_1}\zeta_{j_1}^{(i_1)}\zeta_{j_3}^{(i_3)},$$

where $a^p_{j_4j_3}$, $b^p_{j_4j_2}$, $c^p_{j_4j_2}$, $d^p_{j_3j_1}$, $e^p_{j_3j_1}$, $f^p_{j_3j_1}$ are defined by the relations (102), (104), (105), (107)–(109).

From (292) and the elementary inequality $(a_1+\ldots+a_6)^2\le 6\left(a_1^2+\ldots+a_6^2\right)$ we obtain

$$\mathsf{M}\left\{\left(J^*[\psi^{(4)}]_{T,t}-\sum_{j_1,j_2,j_3,j_4=0}^{p}C_{j_4j_3j_2j_1}\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}\zeta_{j_3}^{(i_3)}\zeta_{j_4}^{(i_4)}\right)^2\right\}\le$$

$$\le 6\left(Q_p^{(1)}+Q_p^{(2)}+Q_p^{(3)}+Q_p^{(4)}+Q_p^{(5)}+Q_p^{(6)}\right), \tag{293}$$

where

$$Q_p^{(1)}=\mathsf{M}\left\{\left(J[\psi^{(4)}]_{T,t}-J[\psi^{(4)}]_{T,t}^{p,p,p,p}\right)^3\right\},$$

$$Q_p^{(2)}=\frac{1}{4}\mathbf{1}_{\{i_1=i_2\neq 0\}}\mathsf{M}\left\{\left(\int_t^{*T}\int_t^{*s}\int_t^{*s_1}ds_2d\mathbf{w}_{s_1}^{(i_3)}d\mathbf{w}_s^{(i_4)}-S_1^{(i_3i_4)p}\right)^2\right\},$$

$$Q_p^{(3)}=\frac{1}{4}\mathbf{1}_{\{i_2=i_3\neq 0\}}\mathsf{M}\left\{\left(\int_t^{*T}\int_t^{*s_2}\int_t^{*s_1}d\mathbf{w}_s^{(i_1)}ds_1d\mathbf{w}_{s_2}^{(i_4)}-S_2^{(i_1i_4)p}\right)^2\right\},$$

$$Q_p^{(4)}=\frac{1}{4}\mathbf{1}_{\{i_3=i_4\ne 0\}}\mathsf{M}\left\{\left(\int\limits_t^{*T}\int\limits_t^{*s_1}\int\limits_t^{*s_2}d\mathbf{w}_s^{(i_1)}d\mathbf{w}_{s_2}^{(i_2)}ds_1-S_3^{(i_1 i_2)p}\right)^2\right\},$$

$$Q_p^{(5)}=\mathbf{1}_{\{i_1=i_2\ne 0\}}\mathbf{1}_{\{i_3=i_4\ne 0\}}\times$$

$$\times\left(\frac{1}{4}\int\limits_t^T(s_1-t)ds_1-\sum_{j_4=0}^{p}\frac{1}{2}\int\limits_t^T\phi_{j_4}(s)\int\limits_t^s\phi_{j_4}(s_1)(s_1-t)ds_1ds\right)^2,$$

$$Q_p^{(6)}=\mathsf{M}\left\{(R_p)^2\right\}.$$

From (263) we have

$$Q_p^{(1)}\le\frac{C_1}{p}, \tag{294}$$

where constant C_1 is independent of p.

Let us prove the version of Theorem 13 for the case $i_1,i_2,i_3=0,1,\ldots,m$. The case $i_1,i_2,i_3=1,\ldots,m$ has been proved in Theorem 13. It is easy to see that, in addition to the proof of Theorem 13, we need to prove the following inequalities

$$\left|\frac{1}{2}\int\limits_t^T\psi_3(t_3)\int\limits_t^{t_3}\psi_1(t_1)\psi_2(t_1)dt_1dt_3-\right.$$

$$\left.-\sum_{j_1=0}^{p}\int\limits_t^T\psi_3(t_3)\int\limits_t^{t_3}\phi_{j_1}(t_2)\psi_2(t_2)\int\limits_t^{t_2}\phi_{j_1}(t_1)\psi_1(t_1)dt_1dt_2dt_3\right|\le\frac{C}{p}, \tag{295}$$

$$\left|\frac{1}{2}\int\limits_t^T\psi_3(t_3)\psi_2(t_3)\int\limits_t^{t_3}\psi_1(t_1)dt_1dt_3-\right.$$

$$\left.-\sum_{j_3=0}^{p}\int\limits_t^T\phi_{j_3}(t_3)\psi_3(t_3)\int\limits_t^{t_3}\phi_{j_3}(t_2)\psi_3(t_2)\int\limits_t^{t_2}\psi_1(t_1)dt_1dt_2dt_3\right|\le\frac{C}{p}, \tag{296}$$

$$\left|\sum_{j_1=0}^{p}\int\limits_t^T\phi_{j_1}(t_3)\psi_3(t_3)\int\limits_t^{t_3}\psi_2(t_2)\int\limits_t^{t_2}\phi_{j_1}(t_1)\psi_1(t_1)dt_1dt_2dt_3\right|\le\frac{C}{p}, \tag{297}$$

where constant C is independent of p.

The inequalities (295) and (296) are equivalent to the following inequalities (see the proof of the cases (280), (281))

$$\left|\frac{1}{2}\int\limits_t^T \psi_1(t_2)\tilde{\psi}_2(t_2)dt_2 - \sum_{j_1=0}^{p}\int\limits_t^T \phi_{j_1}(t_2)\tilde{\psi}_2(t_2)\int\limits_t^{t_2}\phi_{j_1}(t_1)\psi_1(t_1)dt_1dt_2\right| \le \frac{C}{p}, \tag{298}$$

$$\left|\frac{1}{2}\int\limits_t^T \psi_3(t_3)\bar{\psi}_2(t_3)dt_3 - \sum_{j_3=0}^{p}\int\limits_t^T \phi_{j_3}(t_3)\psi_3(t_3)\int\limits_t^{t_3}\phi_{j_3}(t_2)\bar{\psi}_2(t_2)dt_2dt_3\right| \le \frac{C}{p}, \tag{299}$$

where $\tilde{\psi}_2(t_2)$, $\bar{\psi}_2(t_2)$ are defined by (285) and (288), respectively. The inequalities (298), (299) follow from (265), (267)–(269).

Let us prove (297). By analogy with the proof of (289) we have

$$\sum_{j_1=0}^{p}\int\limits_t^T \phi_{j_1}(t_3)\psi_3(t_3)\int\limits_t^{t_3}\psi_2(t_2)\int\limits_t^{t_2}\phi_{j_1}(t_1)\psi_1(t_1)dt_1dt_2dt_3 =$$

$$= \sum_{j_1=0}^{p}\int\limits_t^T \phi_{j_1}(t_3)\psi_3(t_3)\int\limits_t^{t_3}\phi_{j_1}(t_1)\tilde{\psi}_1(t_1)dt_1dt_3 -$$

$$- \sum_{j_1=0}^{p}\int\limits_t^T \phi_{j_1}(t_3)\tilde{\psi}_3(t_3)\int\limits_t^{t_3}\phi_{j_1}(t_1)\psi_1(t_1)dt_1dt_3 =$$

$$= \sum_{j_1=0}^{\infty}\int\limits_t^T \phi_{j_1}(t_3)\psi_3(t_3)\int\limits_t^{t_3}\phi_{j_1}(t_1)\tilde{\psi}_1(t_1)dt_1dt_3 -$$

$$- \sum_{j_1=0}^{\infty}\int\limits_t^T \phi_{j_1}(t_3)\tilde{\psi}_3(t_3)\int\limits_t^{t_3}\phi_{j_1}(t_1)\psi_1(t_1)dt_1dt_3 -$$

$$- \sum_{j_1=p+1}^{\infty}\int\limits_t^T \phi_{j_1}(t_3)\psi_3(t_3)\int\limits_t^{t_3}\phi_{j_1}(t_1)\tilde{\psi}_1(t_1)dt_1dt_3 +$$

$$+ \sum_{j_1=p+1}^{\infty}\int\limits_t^T \phi_{j_1}(t_3)\tilde{\psi}_3(t_3)\int\limits_t^{t_3}\phi_{j_1}(t_1)\psi_1(t_1)dt_1dt_3 =$$

$$= - \sum_{j_1=p+1}^{\infty}\int\limits_t^T \phi_{j_1}(t_3)\psi_3(t_3)\int\limits_t^{t_3}\phi_{j_1}(t_1)\tilde{\psi}_1(t_1)dt_1dt_3 +$$

$$+ \sum_{j_1=p+1}^{\infty}\int\limits_t^T \phi_{j_1}(t_3)\tilde{\psi}_3(t_3)\int\limits_t^{t_3}\phi_{j_1}(t_1)\psi_1(t_1)dt_1dt_3, \tag{300}$$

where $\tilde{\psi}_1(t_1)$, $\tilde{\psi}_3(t_3)$ are defined by (290), (291), respectively.

Now the estimate (297) follows from (300) and (267)–(269). Theorem 13 is proved for the case $i_1, i_2, i_3 = 0, 1, \ldots, m$.

Using the version of Theorem 13 for the case $i_1, i_2, i_3 = 0, 1, \ldots, m$, we obtain the following estimates

$$Q_p^{(2)} \le \frac{C_2}{p}, \quad Q_p^{(3)} \le \frac{C_2}{p}, \quad Q_p^{(4)} \le \frac{C_2}{p}, \tag{301}$$

where constant C_2 does not depend on p.

From (265) we get

$$\frac{1}{2}\int\limits_t^T (s_1 - t)ds_1 - \sum_{j_4=0}^{p} \int\limits_t^T \phi_{j_4}(s) \int\limits_t^s \phi_{j_4}(s_1)(s_1 - t)ds_1 ds =$$

$$= \sum_{j_4=p+1}^{\infty} \int\limits_t^T \phi_{j_4}(s) \int\limits_t^s \phi_{j_4}(s_1)(s_1 - t)ds_1 ds. \tag{302}$$

Let us consider the case of Legendre polynomials. From (267) and (302) we have

$$\left| \sum_{j_4=p+1}^{\infty} \int\limits_t^T \phi_{j_4}(s) \int\limits_t^s \phi_{j_4}(s_1)(s_1 - t)ds_1 ds \right| \le \frac{C_3}{p}, \tag{303}$$

where constant C_3 is independent of p.

For the trigonometric case, the analogue of the inequality (303) can be obtained by analogy with (268) and (269). Then

$$Q_p^{(5)} \le \frac{C_4}{p^2}, \tag{304}$$

where constant C_4 does not depend on p.

Analyzing the proof of Theorem 4, we conclude that

$$Q_p^{(6)} \le \frac{C_5}{p} \tag{305}$$

for the polynomial and trigonometric cases; constant C_5 is independent of p. Combining (293)–(301), (304), (305), we get (279). Theorem 14 is proved.

12. Rate of the Mean-Square Convergence of Expansions of Iterated Stratonovich Stochastic Integrals of Multiplicities 2 to 4 in Modifications of Theorems 12-14 for the Case of Integration Interval $[t, s]$ $(s \in (t, T])$

Let us prove the following theorem.

Theorem 15 [26]. *Suppose that* $\{\phi_j(x)\}_{j=0}^{\infty}$ *is a complete orthonormal system of Legendre polynomials or trigonometric functions in the space* $L_2([t,T])$. *Moreover,* $\psi_1(\tau),\psi_2(\tau)$ *are continuously differentiable nonrandom functions on* $[t,T]$. *Then, for the iterated Stratonovich stochastic integral*

$$J^*[\psi^{(2)}]_{s,t} = \int\limits_t^{*s} \psi_2(t_2)\int\limits_t^{*t_2} \psi_1(t_1)d\mathbf{f}_{t_1}^{(i_1)}d\mathbf{f}_{t_2}^{(i_2)} \quad (i_1,i_2=1,\ldots,m)$$

the following estimate

$$\mathsf{M}\left\{\left(J^*[\psi^{(2)}]_{s,t} - \sum_{j_1,j_2=0}^{p} C_{j_2j_1}(s)\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}\right)^2\right\} \le \frac{C(s)}{p} \tag{306}$$

is valid, where $s\in(t,T]$ $(s$ *is fixed*$)$, *constant* $C(s)$ *is independent of* p,

$$C_{j_2j_1}(s) = \int\limits_t^{s} \psi_2(t_2)\phi_{j_2}(t_2)\int\limits_t^{t_2} \psi_1(t_1)\phi_{j_1}(t_1)dt_1dt_2,$$

and

$$\zeta_j^{(i)} = \int\limits_t^{T} \phi_j(\tau)d\mathbf{f}_{\tau}^{(i)}$$

are independent standard Gaussian random variables for various i *or* j.

Proof. The case $s=T$ has already been considered in Theorem 12. Below we consider the case $s\in(t,T)$. By analogy with (262) we obtain

$$\mathsf{M}\left\{\left(J^*[\psi^{(2)}]_{s,t} - \sum_{j_1,j_2=0}^{p} C_{j_2j_1}(s)\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}\right)^2\right\} =$$

$$= \mathsf{M}\left\{\left(J[\psi^{(2)}]_{s,t} - J[\psi^{(2)}]_{s,t}^{p,p}\right)^2\right\} +$$

$$+\mathbf{1}_{\{i_1=i_2\}}\left(\frac{1}{2}\int\limits_t^{s} \psi_1(t_1)\psi_2(t_1)dt_1 - \sum_{j_1=0}^{p} C_{j_1j_1}(s)\right)^2, \tag{307}$$

where (see (188))

$$J[\psi^{(2)}]_{s,t}^{p,p} = \sum_{j_1,j_2=0}^{p} C_{j_2j_1}(s)\left(\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)} - \mathbf{1}_{\{i_1=i_2\neq 0\}}\mathbf{1}_{\{j_1=j_2\}}\right).$$

In [26] (Sect. 1.8) it is shown that

$$
\mathsf{M}\left\{\left(J[\psi^{(k)}]_{s,t}-J[\psi^{(k)}]_{s,t}^{p,\ldots,p}\right)^2\right\}\le\frac{k!P_k(s-t)^k}{p}, \tag{308}
$$

where $s\in(t,T]$ (s is fixed), $J[\psi^{(k)}]_{s,t}$ is defined by (185), $J[\psi^{(k)}]_{s,t}^{p,\ldots,p}$ is the expression on the right-hand side of (186) before passing to the limit $\underset{p_1,\ldots,p_k\to\infty}{\text{l.i.m.}}$ for the case $p_1=\ldots=p_k=p$, $\psi_1(\tau),\ldots,\psi_k(\tau)$ are continuously differentiable nonrandom functions on $[t,T]$, constant P_k depends only on k, $i_1,\ldots,i_k=1,\ldots,m$.

From (308) we get

$$
\mathsf{M}\left\{\left(J[\psi^{(2)}]_{s,t}-J[\psi^{(2)}]_{s,t}^{p,p}\right)^2\right\}\le\frac{C_1(s)}{p}, \tag{309}
$$

where constant $C_1(s)$ is independent of p.

Using (195), we obtain

$$
\frac{1}{2}\int\limits_t^s\psi_1(t_1)\psi_2(t_1)dt_1-\sum_{j_1=0}^{p}C_{j_1j_1}(s)=\sum_{j_1=p+1}^{\infty}C_{j_1j_1}(s). \tag{310}
$$

Consider the case of Legendre polynomials. By analogy with (42) we get for $n>m$ ($n,m\in\mathbb{N}$)

$$
\sum_{j_1=m+1}^{n}C_{j_1j_1}(s)=\sum_{j_1=m+1}^{n}\int\limits_t^s\psi_2(\theta)\phi_{j_1}(\theta)\int\limits_t^{\theta}\psi_1(\tau)\phi_{j_1}(\tau)d\tau d\theta=
$$

$$
=\frac{T-t}{4}\int\limits_{-1}^{z(s)}\psi_1(u(x))\psi_2(u(x))\left(P_{n+1}(x)P_n(x)-P_{m+1}(x)P_m(x)\right)dx-
$$

$$
-\frac{(T-t)^2}{8}\sum_{j_1=m+1}^{n}\frac{1}{2j_1+1}\int\limits_{-1}^{z(s)}\left(P_{j_1+1}(y)-P_{j_1-1}(y)\right)\psi_1'(u(y))\times
$$

$$
\times\Biggl(\left(P_{j_1+1}(z(s))-P_{j_1-1}(z(s))\right)\psi_2(s)-\left(P_{j_1+1}(y)-P_{j_1-1}(y)\right)\psi_2(u(y))-
$$

$$
-\frac{T-t}{2}\int\limits_{y}^{z(s)}\left(P_{j_1+1}(x)-P_{j_1-1}(x)\right)\psi_2'(u(x))dx\Biggr)dy, \tag{311}
$$

where

$$
u(y)=\frac{T-t}{2}y+\frac{T+t}{2},\quad z(s)=\left(s-\frac{T+t}{2}\right)\frac{2}{T-t},
$$

and ψ_1', ψ_2' are derivatives of the functions $\psi_1(\tau)$, $\psi_2(\tau)$ with respect to the variable $u(y)$.

Applying the estimate (29) and taking into account the boundedness of the functions $\psi_1(\tau)$, $\psi_2(\tau)$ and their derivatives, we finally obtain

$$\left|\sum_{j_1=m+1}^{n} C_{j_1j_1}(s)\right| \le C_1\left(\frac{1}{n}+\frac{1}{m}\right)\int\limits_{-1}^{z(s)}\frac{dx}{\left(1-x^2\right)^{1/2}}+$$

$$+C_2\sum_{j_1=m+1}^{n}\frac{1}{j_1^2}\left(\int\limits_{-1}^{z(s)}\frac{dy}{\left(1-y^2\right)^{1/2}}+\frac{1}{\left(1-z^2(s)\right)^{1/4}}\int\limits_{-1}^{z(s)}\frac{dy}{\left(1-y^2\right)^{1/4}}+\right.$$

$$\left.+\int\limits_{-1}^{z(s)}\frac{1}{\left(1-y^2\right)^{1/4}}\int\limits_{y}^{z(s)}\frac{dx}{\left(1-x^2\right)^{1/4}}dy\right), \tag{312}$$

where constants C_1, C_2 do not depend on n and m.

We assume that $s \in (t,T)$ $(z(s) \ne \pm 1)$ since the case $s = T$ has already been considered in Theorem 12. Then

$$\left|\sum_{j_1=m+1}^{n} C_{j_1j_1}(s)\right| \le C_3(s)\left(\frac{1}{n}+\frac{1}{m}+\sum_{j_1=m+1}^{n}\frac{1}{j_1^2}\right), \tag{313}$$

where constant $C_3(s)$ does not depend on n and m.

The relations (313) and (31) imply that

$$\left|\sum_{j_1=p+1}^{\infty} C_{j_1j_1}(s)\right| \le C_3(s)\left(\frac{1}{p}+\sum_{j_1=p+1}^{\infty}\frac{1}{j_1^2}\right) \le \frac{C_4(s)}{p}, \tag{314}$$

where constant $C_4(s)$ is independent of p.

For the trigonometric case, the analogue of the inequality (314) can be obtained by analogy with (268) and (269).

Combining (307), (309), (310), (314), we obtain the estimate (306). Theorem 15 is proved.

The arguments given earlier in this paper allow us to formulate the following two theorems.

Theorem 16 [26]. *Suppose that $\{\phi_j(x)\}_{j=0}^{\infty}$ is a complete orthonormal system of Legendre polynomials or trigonometric functions in the space $L_2([t,T])$. At the same time $\psi_2(\tau)$ is a continuously differentiable nonrandom function on $[t,T]$ and $\psi_1(\tau)$, $\psi_3(\tau)$ are twice continuously differentiable nonrandom functions on $[t,T]$. Then, for the iterated Stratonovich stochastic integral of third multiplicity*

$$J^*[\psi^{(3)}]_{s,t} = \int\limits_t^{*s}\psi_3(t_3)\int\limits_t^{*t_3}\psi_2(t_2)\int\limits_t^{*t_2}\psi_1(t_1)d\mathbf{f}_{t_1}^{(i_1)}d\mathbf{f}_{t_2}^{(i_2)}d\mathbf{f}_{t_3}^{(i_3)}\quad (i_1,i_2,i_3=1,\ldots,m)$$

the following estimate

$$\mathsf{M}\left\{\left(J^*[\psi^{(3)}]_{s,t}-\sum_{j_1,j_2,j_3=0}^{p}C_{j_3j_2j_1}(s)\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}\zeta_{j_3}^{(i_3)}\right)^2\right\} \le \frac{C(s)}{p}$$

is valid, where $s \in (t, T]$ *(*s *is fixed), constant* $C(s)$ *is independent of* p,

$$C_{j_3 j_2 j_1}(s) = \int\limits_t^s \psi_3(\tau)\phi_{j_3}(\tau) \int\limits_t^{\tau} \psi_2(s_1)\phi_{j_2}(s_1) \int\limits_t^{s_1} \psi_1(s_2)\phi_{j_1}(s_2) ds_2 ds_1 d\tau,$$

and

$$\zeta_j^{(i)} = \int\limits_t^T \phi_j(\tau) d\mathbf{f}_\tau^{(i)}$$

are independent standard Gaussian random variables for various i *or* j.

Theorem 17 [26]. *Suppose that* $\{\phi_j(x)\}_{j=0}^{\infty}$ *is a complete orthonormal system of Legendre polynomials or trigonometric functions in the space* $L_2([t, T])$. *Then, for the iterated Stratonovich stochastic integral of fourth multiplicity*

$$J^*[\psi^{(4)}]_{s,t} = \int\limits_t^{*s} \int\limits_t^{*t_4} \int\limits_t^{*t_3} \int\limits_t^{*t_2} d\mathbf{w}_{t_1}^{(i_1)} d\mathbf{w}_{t_2}^{(i_2)} d\mathbf{w}_{t_3}^{(i_3)} d\mathbf{w}_{t_4}^{(i_4)} \quad (i_1, i_2, i_3, i_4 = 0, 1, \ldots, m)$$

the following estimate

$$\mathsf{M}\left\{\left(J^*[\psi^{(4)}]_{s,t} - \sum_{j_1, j_2, j_3, j_4 = 0}^{p} C_{j_4 j_3 j_2 j_1}(s) \zeta_{j_1}^{(i_1)} \zeta_{j_2}^{(i_2)} \zeta_{j_3}^{(i_3)} \zeta_{j_4}^{(i_4)}\right)^2\right\} \le \frac{C(s)}{p}$$

is valid, where $s \in (t, T]$ *(*s *is fixed), constant* $C(s)$ *is independent of* p,

$$C_{j_4 j_3 j_2 j_1}(s) = \int\limits_t^s \phi_{j_4}(s_4) \int\limits_t^{s_4} \phi_{j_3}(s_3) \int\limits_t^{s_3} \phi_{j_2}(s_2) \int\limits_t^{s_2} \phi_{j_1}(s_1) ds_1 ds_2 ds_3 ds_4,$$

and

$$\zeta_j^{(i)} = \int\limits_t^T \phi_j(\tau) d\mathbf{w}_\tau^{(i)}$$

are independent standard Gaussian random variables for various i *or* j *(in the case when* $i \ne 0$*),* $\mathbf{w}_\tau^{(i)} = \mathbf{f}_\tau^{(i)}$ *for* $i = 1, \ldots, m$ *and* $\mathbf{w}_\tau^{(0)} = \tau$.

13. Expansion of Iterated Stratonovich Stochastic Integrals of Arbitrary Multiplicity k ($k \in \mathbb{N}$). Proof Under the Condition of Convergence of Trace Series

In this section, we prove the expansion of iterated Stratonovich stochastic integrals of arbitrary multiplicity k ($k \in \mathbb{N}$) under the condition of convergence of trace series.

Let us introduce some notations and formulate some auxiliary results. Consider the unordered set $\{1, 2, \ldots, k\}$ and separate it into two parts: the first part consists of r unordered pairs (sequence order of these pairs is also unimportant) and the second one consists of the remaining $k-2r$ numbers. So, we have

$$(\{\underbrace{\{g_1,g_2\},\ldots,\{g_{2r-1},g_{2r}\}}_{\text{part 1}}\},\{\underbrace{q_1,\ldots,q_{k-2r}}_{\text{part 2}}\}), \tag{315}$$

where

$$\{g_1,g_2,\ldots,g_{2r-1},g_{2r},q_1,\ldots,q_{k-2r}\}=\{1,2,\ldots,k\},$$

braces mean an unordered set, and parentheses mean an ordered set.

We will say that (315) is a partition and consider the sum with respect to all possible partitions

$$\sum_{\substack{(\{\{g_1,g_2\},\ldots,\{g_{2r-1},g_{2r}\}\},\{q_1,\ldots,q_{k-2r}\})\\ \{g_1,g_2,\ldots,g_{2r-1},g_{2r},q_1,\ldots,q_{k-2r}\}=\{1,2,\ldots,k\}}} a_{g_1g_2,\ldots,g_{2r-1}g_{2r},q_1\ldots q_{k-2r}}, \tag{316}$$

where $a_{g_1g_2,\ldots,g_{2r-1}g_{2r},q_1\ldots q_{k-2r}}\in\mathbb{R}$.

Below there are several examples of sums in the form (316)

$$\sum_{\substack{(\{g_1,g_2\})\\ \{g_1,g_2\}=\{1,2\}}} a_{g_1g_2}=a_{12},$$

$$\sum_{\substack{(\{\{g_1,g_2\},\{g_3,g_4\}\})\\ \{g_1,g_2,g_3,g_4\}=\{1,2,3,4\}}} a_{g_1g_2g_3g_4}=a_{1234}+a_{1324}+a_{2314},$$

$$\sum_{\substack{(\{g_1,g_2\},\{q_1,q_2\})\\ \{g_1,g_2,q_1,q_2\}=\{1,2,3,4\}}} a_{g_1g_2,q_1q_2}=$$

$$=a_{12,34}+a_{13,24}+a_{14,23}+a_{23,14}+a_{24,13}+a_{34,12},$$

$$\sum_{\substack{(\{g_1,g_2\},\{q_1,q_2,q_3\})\\ \{g_1,g_2,q_1,q_2,q_3\}=\{1,2,3,4,5\}}} a_{g_1g_2,q_1q_2q_3}=$$

$$=a_{12,345}+a_{13,245}+a_{14,235}+a_{15,234}+a_{23,145}+a_{24,135}+$$
$$+a_{25,134}+a_{34,125}+a_{35,124}+a_{45,123},$$

$$\sum_{\substack{(\{\{g_1,g_2\},\{g_3,g_4\}\},\{q_1\})\\ \{g_1,g_2,g_3,g_4,q_1\}=\{1,2,3,4,5\}}} a_{g_1g_2,g_3g_4,q_1}=$$

$$=a_{12,34,5}+a_{13,24,5}+a_{14,23,5}+a_{12,35,4}+a_{13,25,4}+a_{15,23,4}+$$
$$+a_{12,54,3}+a_{15,24,3}+a_{14,25,3}+a_{15,34,2}+a_{13,54,2}+a_{14,53,2}+$$
$$+a_{52,34,1}+a_{53,24,1}+a_{54,23,1}.$$

Now we can write (7) as

$$J[\psi^{(k)}]_{T,t} = \underset{p_1,\ldots,p_k\to\infty}{\text{l.i.m.}} \sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k} C_{j_k\ldots j_1}\Biggl(\prod_{l=1}^{k}\zeta_{j_l}^{(i_l)} + \sum_{r=1}^{[k/2]}(-1)^r\times$$

$$\times \sum_{\substack{(\{\{g_1,g_2\},\ldots,\{g_{2r-1},g_{2r}\}\},\{q_1,\ldots,q_{k-2r}\})\\ \{g_1,g_2,\ldots,g_{2r-1},g_{2r},q_1,\ldots,q_{k-2r}\}=\{1,2,\ldots,k\}}} \prod_{s=1}^{r}\mathbf{1}_{\{i_{g_{2s-1}}=\ i_{g_{2s}}\neq 0\}}\mathbf{1}_{\{j_{g_{2s-1}}=\ j_{g_{2s}}\}}\prod_{l=1}^{k-2r}\zeta_{j_{q_l}}^{(i_{q_l})}\Biggr), \tag{317}$$

where $[x]$ is an integer part of a real number x, $\prod_{\emptyset} \stackrel{\sf def}{=} 1$, $\sum_{\emptyset} \stackrel{\sf def}{=} 0$; another notations are the same as in Theorem 1.

Let us consider the generalization of Theorem 1 for the case of an arbitrary complete orthonormal systems of functions in the space $L_2([t,T])$ and $\psi_1(\tau),\ldots,\psi_k(\tau)\in L_2([t,T])$.

Theorem 18 [26] (Sect. 1.11), [36] (Sect. 15), [51]. *Suppose that* $\psi_1(\tau),\ldots,\psi_k(\tau)\in L_2([t,T])$ *and* $\{\phi_j(x)\}_{j=0}^{\infty}$ *is an arbitrary complete orthonormal system of functions in the space* $L_2([t,T])$. *Then the following expansion*

$$J[\psi^{(k)}]_{T,t} = \underset{p_1,\ldots,p_k\to\infty}{\text{l.i.m.}} \sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k} C_{j_k\ldots j_1}\Biggl(\prod_{l=1}^{k}\zeta_{j_l}^{(i_l)} + \sum_{r=1}^{[k/2]}(-1)^r\times$$

$$\times \sum_{\substack{(\{\{g_1,g_2\},\ldots,\{g_{2r-1},g_{2r}\}\},\{q_1,\ldots,q_{k-2r}\})\\ \{g_1,g_2,\ldots,g_{2r-1},g_{2r},q_1,\ldots,q_{k-2r}\}=\{1,2,\ldots,k\}}} \prod_{s=1}^{r}\mathbf{1}_{\{i_{g_{2s-1}}=\ i_{g_{2s}}\neq 0\}}\mathbf{1}_{\{j_{g_{2s-1}}=\ j_{g_{2s}}\}}\prod_{l=1}^{k-2r}\zeta_{j_{q_l}}^{(i_{q_l})}\Biggr) \tag{318}$$

converging in the mean-square sense is valid, where $\prod_{\emptyset} \stackrel{\sf def}{=} 1$, $\sum_{\emptyset} \stackrel{\sf def}{=} 0$, $[x]$ *is an integer part of a real number* x; *another notations are the same as in Theorem* 1.

It should be noted that an analogue of Theorem 18 was considered in [63]. Note that we use another notations in comparison with [63]. Moreover, the proof of an analogue of Theorem 18 from [63] is somewhat different from the proof given in [26] (Sect. 1.11), [36] (Sect. 15), [51].

Denote

$$J[\psi^{(k)}]_{T,t}^{s_l,\ldots,s_1} \stackrel{\rm def}{=} \prod_{p=1}^{l}\mathbf{1}_{\{i_{s_p}=i_{s_p+1}\neq 0\}}\times$$

$$\times\int\limits_t^T\psi_k(t_k)\ldots\int\limits_t^{t_{s_l+3}}\psi_{s_l+2}(t_{s_l+2})\int\limits_t^{t_{s_l+2}}\psi_{s_l}(t_{s_l+1})\psi_{s_l+1}(t_{s_l+1})\times$$

$$\times\int\limits_t^{t_{s_l+1}}\psi_{s_l-1}(t_{s_l-1})\ldots\int\limits_t^{t_{s_1+3}}\psi_{s_1+2}(t_{s_1+2})\int\limits_t^{t_{s_1+2}}\psi_{s_1}(t_{s_1+1})\psi_{s_1+1}(t_{s_1+1})\times$$

$$\times\int\limits_t^{t_{s_1+1}}\psi_{s_1-1}(t_{s_1-1})\ldots\int\limits_t^{t_2}\psi_1(t_1)d\mathbf{w}_{t_1}^{(i_1)}\ldots d\mathbf{w}_{t_{s_1-1}}^{(i_{s_1-1})}dt_{s_1+1}d\mathbf{w}_{t_{s_1+2}}^{(i_{s_1+2})}\ldots$$

$$\ldots\ d\mathbf{w}_{t_{s_l-1}}^{(i_{s_l-1})}dt_{s_l+1}d\mathbf{w}_{t_{s_l+2}}^{(i_{s_l+2})}\ldots d\mathbf{w}_{t_k}^{(i_k)}, \tag{319}$$

where

$$\mathrm{A}_{k,l} = \left\{(s_l,\ldots,s_1):\; s_l > s_{l-1}+1,\ldots,s_2 > s_1+1,\; s_l,\ldots,s_1 = 1,\ldots,k-1\right\}, \tag{320}$$

$$(s_l,\ldots,s_1)\in \mathrm{A}_{k,l},\quad l=1,\ldots,[k/2]\,,\quad i_s=0,1,\ldots,m,\quad s=1,\ldots,k,$$

$[x]$ is an integer part of a real number x, and $\mathbf{1}_A$ is the indicator of the set A.

Let us formulate the statement on connection between iterated Stratonovich and Ito stochastic integrals $J^*[\psi^{(k)}]_{T,t},\ J[\psi^{(k)}]_{T,t}$ of arbitrary multiplicity k, $k\in\mathbb{N}$ (see (2), (3)).

Theorem 19 [6] (1997), [12]-[19], [26]-[29]. *Suppose that every $\psi_l(\tau)$ $(l=1,\ldots,k)$ is a continuous function at the interval $[t,T]$. Then, the following relation between iterated Stratonovich and Ito stochastic integrals*

$$J^*[\psi^{(k)}]_{T,t} = J[\psi^{(k)}]_{T,t} + \sum_{r=1}^{[k/2]}\frac{1}{2^r}\sum_{(s_r,\ldots,s_1)\in\mathrm{A}_{k,r}} J[\psi^{(k)}]_{T,t}^{s_r,\ldots,s_1}\quad \text{w. p. 1} \tag{321}$$

is correct, where $\sum\limits_{\emptyset}$ is supposed to be equal to zero.

Consider the Fourier coefficient

$$C_{j_k\ldots j_1} = \int\limits_t^T \psi_k(t_k)\phi_{j_k}(t_k)\ldots\int\limits_t^{t_2}\psi_1(t_1)\phi_{j_1}(t_1)dt_1\ldots dt_k \tag{322}$$

corresponding to the function (4), where $\{\phi_j(x)\}_{j=0}^{\infty}$ is a complete orthonormal system of functions in the space $L_2([t,T])$. At that we suppose $\phi_0(x)=1/\sqrt{T-t}$.

Denote

$$C_{j_k\ldots j_{l+1}j_lj_lj_{l-2}\ldots j_1}\Bigg|_{(j_lj_l)\frown(\cdot)} \stackrel{\sf def}{=}$$

$$\stackrel{\sf def}{=}\int\limits_t^T \psi_k(t_k)\phi_{j_k}(t_k)\ldots\int\limits_t^{t_{l+2}}\psi_{l+1}(t_{l+1})\phi_{j_{l+1}}(t_{l+1})\int\limits_t^{t_{l+1}}\psi_l(t_l)\psi_{l-1}(t_l)\times$$

$$\times\int\limits_t^{t_l}\psi_{l-2}(t_{l-2})\phi_{j_{l-2}}(t_{l-2})\ldots\int\limits_t^{t_2}\psi_1(t_1)\phi_{j_1}(t_1)dt_1\ldots dt_{l-2}dt_lt_{l+1}\ldots dt_k = \tag{323}$$

$$=\sqrt{T-t}\int\limits_t^T \psi_k(t_k)\phi_{j_k}(t_k)\ldots\int\limits_t^{t_{l+2}}\psi_{l+1}(t_{l+1})\phi_{j_{l+1}}(t_{l+1})\int\limits_t^{t_{l+1}}\psi_l(t_l)\psi_{l-1}(t_l)\phi_0(t_l)\times$$

$$\times\int\limits_t^{t_l}\psi_{l-2}(t_{l-2})\phi_{j_{l-2}}(t_{l-2})\ldots\int\limits_t^{t_2}\psi_1(t_1)\phi_{j_1}(t_1)dt_1\ldots dt_{l-2}dt_lt_{l+1}\ldots dt_k =$$

$$=\sqrt{T-t}\hat{C}_{j_k\ldots j_{l+1}0j_{l-2}\ldots j_1},$$

i.e. $\sqrt{T-t}\hat{C}_{j_k\ldots j_{l+1}0j_{l-2}\ldots j_1}$ is again the Fourier coefficient of type $C_{j_k\ldots j_1}$ but with a new shorter multi-index $j_k\ldots j_{l+1}0j_{l-2}\ldots j_1$ and new weight functions $\psi_1(\tau),\ \ldots,\ \psi_{l-2}(\tau),\ \sqrt{T-t}\psi_{l-1}(\tau)\psi_l(\tau),$ $\psi_{l+1}(\tau),\ \ldots,\ \psi_k(\tau)$ (also we suppose that $\{l,l-1\}$ is one of the pairs $\{g_1,g_2\},\ldots,\{g_{2r-1},g_{2r}\}$).

Let

$$C_{j_k\ldots j_{l+1}j_lj_lj_{l-2}\ldots j_1}\Bigg|_{(j_lj_l)\curvearrowright j_m} \stackrel{\sf def}{=}$$

$$\stackrel{\sf def}{=} \int\limits_t^T \psi_k(t_k)\phi_{j_k}(t_k)\ldots \int\limits_t^{t_{l+2}} \psi_{l+1}(t_{l+1})\phi_{j_{l+1}}(t_{l+1}) \int\limits_t^{t_{l+1}} \psi_l(t_l)\psi_{l-1}(t_l)\phi_{j_m}(t_l)\times$$

$$\times \int\limits_t^{t_l} \psi_{l-2}(t_{l-2})\phi_{j_{l-2}}(t_{l-2})\ldots \int\limits_t^{t_2} \psi_1(t_1)\phi_{j_1}(t_1)dt_1\ldots dt_{l-2}dt_lt_{l+1}\ldots dt_k = \tag{324}$$

$$= \bar{C}_{j_k\ldots j_{l+1}j_mj_{l-2}\ldots j_1},$$

i.e. $\bar{C}_{j_k\ldots j_{l+1}j_mj_{l-2}\ldots j_1}$ is again the Fourier coefficient of type $C_{j_k\ldots j_1}$ but with a new shorter multi-index $j_k\ldots j_{l+1}j_mj_{l-2}\ldots j_1$ and new weight functions $\psi_1(\tau),\ \ldots,\ \psi_{l-2}(\tau),\ \psi_{l-1}(\tau)\psi_l(\tau),\ \psi_{l+1}(\tau),\ \ldots,$ $\psi_k(\tau)$ (also we suppose that $\{l-1,l\}$ is one of the pairs $\{g_1,g_2\},\ldots,\{g_{2r-1},g_{2r}\}$).

Denote

$$\bar{C}^{(p)}_{j_k\ldots j_q\ldots j_1}\Bigg|_{q\ne g_1,g_2,\ldots,g_{2r-1},g_{2r}} \stackrel{\sf def}{=}$$

$$\stackrel{\sf def}{=} \sum_{j_{g_{2r-1}}=p+1}^{\infty}\ \sum_{j_{g_{2r-3}}=p+1}^{\infty}\ldots \sum_{j_{g_3}=p+1}^{\infty}\ \sum_{j_{g_1}=p+1}^{\infty} C_{j_k\ldots j_1}\Bigg|_{j_{g_1}=j_{g_2},\ldots,j_{g_{2r-1}}=j_{g_{2r}}}. \tag{325}$$

Introduce the following notation

$$S_l\left\{\bar{C}^{(p)}_{j_k\ldots j_q\ldots j_1}\Bigg|_{q\ne g_1,g_2,\ldots,g_{2r-1},g_{2r}}\right\} \stackrel{\sf def}{=} \frac{1}{2}\mathbf{1}_{\{g_{2l}=g_{2l-1}+1\}} \sum_{j_{g_{2r-1}}=p+1}^{\infty}\ \sum_{j_{g_{2r-3}}=p+1}^{\infty}\ldots$$

$$\ldots \sum_{j_{g_{2l+1}}=p+1}^{\infty}\ \sum_{j_{g_{2l-3}}=p+1}^{\infty}\ldots \sum_{j_{g_3}=p+1}^{\infty}\ \sum_{j_{g_1}=p+1}^{\infty} C_{j_k\ldots j_1}\Bigg|_{(j_{g_{2l}}j_{g_{2l-1}})\curvearrowright(\cdot),j_{g_1}=j_{g_2},\ldots,j_{g_{2r-1}}=j_{g_{2r}}}. \tag{326}$$

Note that the operation S_l $(l=1,2,\ldots,r)$ acts on the value

$$\bar{C}^{(p)}_{j_k\ldots j_q\ldots j_1}\Bigg|_{q\ne g_1,g_2,\ldots,g_{2r-1},g_{2r}} \tag{327}$$

as follows: S_l multiplies (327) by $\mathbf{1}_{\{g_{2l}=g_{2l-1}+1\}}/2$, removes the summation

$$\sum_{j_{g_{2l-1}}=p+1}^{\infty},$$

and replaces

$$C_{j_k\ldots j_1}\Bigg|_{j_{g_1}=j_{g_2},\ldots,j_{g_{2r-1}}=j_{g_{2r}}}$$

with

$$C_{j_k\ldots j_1}\Bigg|_{(j_{g_{2l}}j_{g_{2l-1}})\curvearrowright(\cdot),j_{g_1}=j_{g_2},\ldots,j_{g_{2r-1}}=j_{g_{2r}}}. \tag{328}$$

Note that we write

$$C_{j_k\ldots j_1}\Bigg|_{(j_{g_1}j_{g_2})\curvearrowright(\cdot),j_{g_1}=j_{g_2}} = C_{j_k\ldots j_1}\Bigg|_{(j_{g_1}j_{g_1})\curvearrowright(\cdot),j_{g_1}=j_{g_2}},$$

$$C_{j_k\ldots j_1}\Bigg|_{(j_{g_1}j_{g_2})\curvearrowright j_m,j_{g_1}=j_{g_2}} = C_{j_k\ldots j_1}\Bigg|_{(j_{g_1}j_{g_1})\curvearrowright j_m,j_{g_1}=j_{g_2}},$$

$$C_{j_k\ldots j_1}\Bigg|_{(j_{g_1}j_{g_2})\curvearrowright(\cdot),(j_{g_3}j_{g_4})\curvearrowright(\cdot),j_{g_1}=j_{g_2},j_{g_3}=j_{g_4}} = C_{j_k\ldots j_1}\Bigg|_{(j_{g_1}j_{g_1})\curvearrowright(\cdot)(j_{g_3}j_{g_3})\curvearrowright(\cdot),j_{g_1}=j_{g_2},j_{g_3}=j_{g_4}}, \quad \ldots$$

Since (328) is again the Fourier coefficient, then the action of superposition S_lS_m on (328) is obvious. For example, for $r=3$

$$S_3S_2S_1\left\{\bar{C}^{(p)}_{j_k\ldots j_q\ldots j_1}\Bigg|_{q\ne g_1,g_2,\ldots,g_5,g_6}\right\} =$$

$$= \frac{1}{2^3}\prod_{s=1}^{3}\mathbf{1}_{\{g_{2s}=g_{2s-1}+1\}}C_{j_k\ldots j_1}\Bigg|_{(j_{g_2}j_{g_1})\curvearrowright(\cdot)(j_{g_4}j_{g_3})\curvearrowright(\cdot)(j_{g_6}j_{g_5})\curvearrowright(\cdot),j_{g_1}=j_{g_2},j_{g_3}=j_{g_4},j_{g_5}=j_{g_6}},$$

$$S_3S_1\left\{\bar{C}^{(p)}_{j_k\ldots j_q\ldots j_1}\Bigg|_{q\ne g_1,g_2,\ldots,g_5,g_6}\right\} =$$

$$= \frac{1}{2^2}\mathbf{1}_{\{g_6=g_5+1\}}\mathbf{1}_{\{g_2=g_1+1\}}\sum_{j_{g_3}=p+1}^{\infty}C_{j_k\ldots j_1}\Bigg|_{(j_{g_2}j_{g_1})\curvearrowright(\cdot)(j_{g_6}j_{g_5})\curvearrowright(\cdot),j_{g_1}=j_{g_2},j_{g_3}=j_{g_4},j_{g_5}=j_{g_6}},$$

$$S_2\left\{\bar{C}^{(p)}_{j_k\ldots j_q\ldots j_1}\Bigg|_{q\ne g_1,g_2,\ldots,g_5,g_6}\right\} =$$

$$= \frac{1}{2}\mathbf{1}_{\{g_4=g_3+1\}}\sum_{j_{g_1}=p+1}^{\infty}\sum_{j_{g_5}=p+1}^{\infty}C_{j_k\ldots j_1}\Bigg|_{(j_{g_4}j_{g_3})\curvearrowright(\cdot),j_{g_1}=j_{g_2},j_{g_3}=j_{g_4},j_{g_5}=j_{g_6}}.$$

Theorem 20 [26], [34], [50], [72]. *Assume that the continuously differentiable functions $\psi_l(\tau)$ $(l=1,\ldots,k)$ and the complete orthonormal system $\{\phi_j(x)\}_{j=0}^{\infty}$ of continuous functions ($\phi_0(x)=1/\sqrt{T-t}$) in the space $L_2([t,T])$ are such that the following conditions are satisfied*:

1. *The equality*

$$\frac{1}{2}\int\limits_t^s \Phi_1(t_1)\Phi_2(t_1)dt_1 = \sum_{j_1=0}^{\infty}\int\limits_t^s \Phi_2(t_2)\phi_{j_1}(t_2)\int\limits_t^{t_2} \Phi_1(t_1)\phi_{j_1}(t_1)dt_1dt_2 \tag{329}$$

holds for all $s \in (t, T]$*, where the nonrandom functions* $\Phi_1(\tau)$*,* $\Phi_2(\tau)$ *are continuously differentiable on* $[t, T]$ *and the series on the right-hand side of* (329) *converges absolutely.*

2. *The estimates*

$$\left|\int\limits_t^s \phi_j(\tau)\Phi_1(\tau)d\tau\right| \le \frac{\Psi_1(s)}{j^{1/2+\alpha}}, \quad \left|\int\limits_s^T \phi_j(\tau)\Phi_2(\tau)d\tau\right| \le \frac{\Psi_1(s)}{j^{1/2+\alpha}},$$

$$\left|\sum_{j=p+1}^{\infty}\int\limits_t^s \Phi_2(\tau)\phi_j(\tau)\int\limits_t^{\tau} \Phi_1(\theta)\phi_j(\theta)d\theta d\tau\right| \le \frac{\Psi_2(s)}{p^{\beta}}$$

hold for all $s \in (t, T)$ *and for some* $\alpha, \beta > 0$*, where* $\Phi_1(\tau)$*,* $\Phi_2(\tau)$ *are continuously differentiable nonrandom functions on* $[t, T]$*,* $j, p \in \mathbb{N}$*, and*

$$\int\limits_t^T \Psi_1^2(\tau)d\tau < \infty, \quad \int\limits_t^T |\Psi_2(\tau)|\, d\tau < \infty.$$

3. *The condition*

$$\lim_{p\to\infty}\sum_{\substack{j_1,\ldots,j_q,\ldots,j_k=0\\ q\ne g_1,g_2,\ldots,g_{2r-1},g_{2r}}}^{p}\left(S_{l_1}S_{l_2}\ldots S_{l_d}\left\{\bar{C}^{(p)}_{j_k\ldots j_q\ldots j_1}\Big|_{q\ne g_1,g_2,\ldots,g_{2r-1},g_{2r}}\right\}\right)^2 = 0$$

holds for all possible $g_1, g_2, \ldots, g_{2r-1}, g_{2r}$ *(see* (315)*) and* $l_1, l_2, \ldots, l_d$ *such that* $l_1, l_2, \ldots, l_d \in \{1, 2, \ldots, r\}$*,* $l_1 > l_2 > \ldots > l_d$*,* $d = 0, 1, 2, \ldots, r-1$*, where* $r = 1, 2, \ldots, [k/2]$ *and*

$$S_{l_1}S_{l_2}\ldots S_{l_d}\left\{\bar{C}^{(p)}_{j_k\ldots j_q\ldots j_1}\Big|_{q\ne g_1,g_2,\ldots,g_{2r-1},g_{2r}}\right\} \stackrel{\sf def}{=} \bar{C}^{(p)}_{j_k\ldots j_q\ldots j_1}\Big|_{q\ne g_1,g_2,\ldots,g_{2r-1},g_{2r}}$$

for $d = 0$*.*

Then, for the iterated Stratonovich stochastic integral of arbitrary multiplicity k

$$J^*[\psi^{(k)}]_{T,t}^{(i_1\ldots i_k)} = \int\limits_t^{*T} \psi_k(t_k)\ldots \int\limits_t^{*t_2} \psi_1(t_1)d\mathbf{w}_{t_1}^{(i_1)}\ldots d\mathbf{w}_{t_k}^{(i_k)} \tag{330}$$

the following expansion

$$J^*[\psi^{(k)}]_{T,t}^{(i_1\ldots i_k)} = \underset{p\to\infty}{\text{l.i.m.}}\sum_{j_1,\ldots,j_k=0}^{p} C_{j_k\ldots j_1}\prod_{l=1}^{k}\zeta_{j_l}^{(i_l)} \tag{331}$$

that converges in the mean-square sense is valid, where

$$(332)\qquad C_{j_k\ldots j_1}=\int\limits_t^T\psi_k(t_k)\phi_{j_k}(t_k)\ldots\int\limits_t^{t_2}\psi_1(t_1)\phi_{j_1}(t_1)dt_1\ldots dt_k$$

is the Fourier coefficient, l.i.m. *is a limit in the mean-square sense,* $i_1,\ldots,i_k=0,1,\ldots,m,$

$$\zeta_j^{(i)}=\int\limits_t^T\phi_j(s)d\mathbf{w}_s^{(i)}$$

are independent standard Gaussian random variables for various i *or* j *(in the case when* $i\neq 0$*),* $\mathbf{w}_\tau^{(i)}=\mathbf{f}_\tau^{(i)}$ *for* $i=1,\ldots,m$ *and* $\mathbf{w}_\tau^{(0)}=\tau.$

Proof. Note that (329) is true (see (195)). The proof of Theorem 20 will consist of several steps.

Step 1. Let us find a representation of the quantity

$$\sum_{j_1,\ldots,j_k=0}^{p}C_{j_k\ldots j_1}\prod_{l=1}^{k}\zeta_{j_l}^{(i_l)}$$

that will be convenient for further consideration.

Note that (7) can be written as (see [26] or [29], Sect. 1.1.3)

$$(333)\qquad J[\psi^{(k)}]_{T,t}^{(i_1\ldots i_k)}=\underset{p_1,\ldots,p_k\to\infty}{\text{l.i.m.}}\sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k}C_{j_k\ldots j_1}J'[\phi_{j_1}\ldots\phi_{j_k}]_{T,t}^{(i_1\ldots i_k)},$$

where $J'[\phi_{j_1}\ldots\phi_{j_k}]_{T,t}^{(i_1\ldots i_k)}$ is the multiple Wiener stochatic integral defined by (164) and $J[\psi^{(k)}]_{T,t}^{(i_1\ldots i_k)}$ is the iterated Ito stochastic integral (2).

Let us consider the following multiple stochastic integral

$$(334)\qquad \underset{N\to\infty}{\text{l.i.m.}}\sum_{j_1,\ldots,j_k=0}^{N-1}\Phi\left(\tau_{j_1},\ldots,\tau_{j_k}\right)\prod_{l=1}^{k}\Delta\mathbf{w}_{\tau_{j_l}}^{(i_l)}\stackrel{\text{def}}{=}J[\Phi]_{T,t}^{(i_1\ldots i_k)},$$

where we assume that $\Phi(t_1,\ldots,t_k):\ [t,T]^k\to\mathbb{R}$ is a continuous nonrandom function on $[t,T]^k$. Other notations are the same as in (164).

The stochastic integral with respect to the scalar standard Wiener process ($i_1=\ldots=i_k\neq 0$) and similar to (334) (the function $\Phi(t_1,\ldots,t_k)$ is assumed to be symmetric on the hypercube $[t,T]^k$) has been considered in literature (see, for example, Remark 1.5.7 [65]). The integral (334) is sometimes called the multiple Stratonovich stochastic integral. This is due to the fact that the following rule of the classical integral calculus holds for this integral

$$J[\Phi]_{T,t}^{(i_1\ldots i_k)}=J[\varphi_1]_{T,t}^{(i_1)}\ldots J[\varphi_k]_{T,t}^{(i_k)}\quad\text{w. p. 1},$$

where $\Phi(t_1,\ldots,t_k)=\varphi_1(t_1)\ldots\varphi_k(t_k)$ and

$$J[\varphi_l]_{T,t}^{(i_l)}=\int\limits_t^T\varphi_l(s)d\mathbf{w}_s^{(i_l)}\quad(l=1,\ldots,k).$$

Theorem 21 [26]–[29]. *Suppose that* $\Phi(t_1,\ldots,t_k):\ [t,T]^k\to\mathbb{R}$ *is a continuous nonrandom function on* $[t,T]^k$*. Furthermore,* $\{\phi_j(x)\}_{j=0}^{\infty}$ *is a complete orthonormal system of functions in the* *space* $L_2([t,T])$, *each function* $\phi_j(x)$ *of which for finite* j *is continuous at the interval* $[t,T]$ *except may be for the finite number of points of the finite discontinuity as well as* $\phi_j(x)$ *right-continuous at the interval* $[t,T]$. *Then the following expansion*

$$J'[\Phi]_{T,t}^{(i_1\ldots i_k)} = \underset{p_1,\ldots,p_k\to\infty}{\text{l.i.m.}} \sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k} C_{j_k\ldots j_1}\Biggl(\prod_{l=1}^{k}\zeta_{j_l}^{(i_l)} + \sum_{r=1}^{[k/2]}(-1)^r\times$$

$$\times \sum_{\substack{(\{\{g_1,g_2\},\ldots,\{g_{2r-1},g_{2r}\}\},\{q_1,\ldots,q_{k-2r}\})\\ \{g_1,g_2,\ldots,g_{2r-1},g_{2r},q_1,\ldots,q_{k-2r}\}=\{1,2,\ldots,k\}}} \prod_{s=1}^{r}\mathbf{1}_{\{i_{g_{2s-1}}=\ i_{g_{2s}}\neq 0\}}\mathbf{1}_{\{j_{g_{2s-1}}=\ j_{g_{2s}}\}}\prod_{l=1}^{k-2r}\zeta_{j_{q_l}}^{(i_{q_l})}\Biggr) \tag{335}$$

converging in the mean-square sense is valid, where $J'[\Phi]_{T,t}^{(i_1\ldots i_k)}$ *is the multiple Wiener stochatic integral defined by* (164),

$$C_{j_k\ldots j_1} = \int\limits_{[t,T]^k}\Phi(t_1,\ldots,t_k)\prod_{l=1}^{k}\phi_{j_l}(t_l)dt_1\ldots dt_k \tag{336}$$

is the Fourier coefficient. Other notations are the same as in Theorems 1, 18.

From (317) and (333) we conclude that

$$J'[\phi_{j_1}\ldots\phi_{j_k}]_{T,t}^{(i_1\ldots i_k)} =$$

$$= \prod_{l=1}^{k}\zeta_{j_l}^{(i_l)} + \sum_{r=1}^{[k/2]}(-1)^r \sum_{\substack{(\{\{g_1,g_2\},\ldots,\{g_{2r-1},g_{2r}\}\},\{q_1,\ldots,q_{k-2r}\})\\ \{g_1,g_2,\ldots,g_{2r-1},g_{2r},q_1,\ldots,q_{k-2r}\}=\{1,2,\ldots,k\}}} \prod_{s=1}^{r}\mathbf{1}_{\{i_{g_{2s-1}}=\ i_{g_{2s}}\neq 0\}}\mathbf{1}_{\{j_{g_{2s-1}}=\ j_{g_{2s}}\}}\prod_{l=1}^{k-2r}\zeta_{j_{q_l}}^{(i_{q_l})} \tag{337}$$

w. p. 1, where notations are the same as in Theorems 1, 18 and $J'[\phi_{j_1}\ldots\phi_{j_k}]_{T,t}^{(i_1\ldots i_k)}$ is the multiple Wiener stochastic integral (164). For a more detailed derivation of (337), see [51].

Using (337), we obtain

$$\prod_{l=1}^{k}\zeta_{j_l}^{(i_l)} = J'[\phi_{j_1}\ldots\phi_{j_k}]_{T,t}^{(i_1\ldots i_k)}-$$

$$-\sum_{r=1}^{[k/2]}(-1)^r \sum_{\substack{(\{\{g_1,g_2\},\ldots,\{g_{2r-1},g_{2r}\}\},\{q_1,\ldots,q_{k-2r}\})\\ \{g_1,g_2,\ldots,g_{2r-1},g_{2r},q_1,\ldots,q_{k-2r}\}=\{1,2,\ldots,k\}}} \prod_{s=1}^{r}\mathbf{1}_{\{i_{g_{2s-1}}=\ i_{g_{2s}}\neq 0\}}\mathbf{1}_{\{j_{g_{2s-1}}=\ j_{g_{2s}}\}}\prod_{l=1}^{k-2r}\zeta_{j_{q_l}}^{(i_{q_l})} \tag{338}$$

w. p. 1.

By iteratively applying the formula (338) (also see (10)–(14)), we obtain the following representation of the product

$$\prod_{l=1}^{k}\zeta_{j_l}^{(i_l)}$$

as the sum of some constant value and multiple Wiener stochastic integrals of multiplicities not exceeding k

$$\prod_{l=1}^{k}\zeta_{j_l}^{(i_l)}=J'[\phi_{j_1}\ldots\phi_{j_k}]_{T,t}^{(i_1\ldots i_k)}+$$

$$+\sum_{r=1}^{[k/2]}\sum_{\substack{(\{\{g_1,g_2\},\ldots,\{g_{2r-1},g_{2r}\}\},\{q_1,\ldots,q_{k-2r}\})\\ \{g_1,g_2,\ldots,g_{2r-1},g_{2r},q_1,\ldots,q_{k-2r}\}=\{1,2,\ldots,k\}}}\prod_{s=1}^{r}\mathbf{1}_{\{i_{g_{2s-1}}=\ i_{g_{2s}}\neq 0\}}\ \mathbf{1}_{\{j_{g_{2s-1}}=\ j_{g_{2s}}\}}\times$$

$$\times J'[\phi_{j_{q_1}}\ldots\phi_{j_{q_{k-2r}}}]_{T,t}^{(i_{q_1}\ldots i_{q_{k-2r}})}\quad \text{w. p. 1,}\tag{339}$$

where $J'[\phi_{j_{q_1}}\ldots\phi_{j_{q_{k-2r}}}]_{T,t}^{(i_{q_1}\ldots i_{q_{k-2r}})}\stackrel{\sf def}{=}1$ for $k=2r$.

Multiplying both sides of the equality (339) by $C_{j_k\ldots j_1}$ and summing over $j_1,\ldots,j_k$, we get w. p. 1

$$\sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k}C_{j_k\ldots j_1}\prod_{l=1}^{k}\zeta_{j_l}^{(i_l)}=\sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k}C_{j_k\ldots j_1}J'[\phi_{j_1}\ldots\phi_{j_k}]_{T,t}^{(i_1\ldots i_k)}+$$

$$+\sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k}C_{j_k\ldots j_1}\sum_{r=1}^{[k/2]}\sum_{\substack{(\{\{g_1,g_2\},\ldots,\{g_{2r-1},g_{2r}\}\},\{q_1,\ldots,q_{k-2r}\})\\ \{g_1,g_2,\ldots,g_{2r-1},g_{2r},q_1,\ldots,q_{k-2r}\}=\{1,2,\ldots,k\}}}\prod_{s=1}^{r}\mathbf{1}_{\{i_{g_{2s-1}}=\ i_{g_{2s}}\neq 0\}}\times$$

$$\times\mathbf{1}_{\{j_{g_{2s-1}}=\ j_{g_{2s}}\}}J'[\phi_{j_{q_1}}\ldots\phi_{j_{q_{k-2r}}}]_{T,t}^{(i_{q_1}\ldots i_{q_{k-2r}})}\quad \text{w. p. 1.}\tag{340}$$

Denote

$$K_{p_1\ldots p_k}(t_1,\ldots,t_k)=\sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k}C_{j_k\ldots j_1}\prod_{l=1}^{k}\phi_{j_l}(t_l),\tag{341}$$

$$K_{p_1\ldots p_k}^{g_1\ldots g_{2r},q_1\ldots q_{k-2r}}(t_{q_1},\ldots,t_{q_{k-2r}})=\sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k}C_{j_k\ldots j_1}\prod_{s=1}^{r}\mathbf{1}_{\{j_{g_{2s-1}}=\ j_{g_{2s}}\}}\prod_{l=1}^{k-2r}\phi_{j_{q_l}}(t_{q_l}),\tag{342}$$

where $C_{j_k\ldots j_1}$ is defined by (332) and $\prod_{\emptyset}\stackrel{\sf def}{=}1$.

The equality (340) can be written as

$$J[K_{p_1\ldots p_k}]_{T,t}^{(i_1\ldots i_k)}=J'[K_{p_1\ldots p_k}]_{T,t}^{(i_1\ldots i_k)}+$$

$$+\sum_{r=1}^{[k/2]}\sum_{\substack{(\{\{g_1,g_2\},\ldots,\{g_{2r-1},g_{2r}\}\},\{q_1,\ldots,q_{k-2r}\})\\ \{g_1,g_2,\ldots,g_{2r-1},g_{2r},q_1,\ldots,q_{k-2r}\}=\{1,2,\ldots,k\}}}\prod_{s=1}^{r}\mathbf{1}_{\{i_{g_{2s-1}}=\ i_{g_{2s}}\neq 0\}}\times$$

$$\times J'[K_{p_1\ldots p_k}^{g_1\ldots g_{2r},q_1\ldots q_{k-2r}}]_{T,t}^{(i_{q_1}\ldots i_{q_{k-2r}})}\tag{343}$$

w. p. 1, where $K_{p_1\ldots p_k}(t_1,\ldots,t_k)$ and $K_{p_1\ldots p_k}^{g_1\ldots g_{2r},q_1\ldots q_{k-2r}}(t_{q_1},\ldots,t_{q_{k-2r}})$ have the form (341), (342), $J[K_{p_1\ldots p_k}]_{T,t}^{(i_1\ldots i_k)}$ is the multiple Stratonovich stochastic integral defined by (334), $J'[K_{p_1\ldots p_k}]_{T,t}^{(i_1\ldots i_k)}$ and $J'[K_{p_1\ldots p_k}^{g_1\ldots g_{2r},q_1\ldots q_{k-2r}}]_{T,t}^{(i_{q_1}\ldots i_{q_{k-2r}})}$ are multiple Wiener stochastic integrals defined by (164).

Passing to the limit $\underset{p_1,\ldots,p_k\to\infty}{\text{l.i.m.}}$ $(p_1=\ldots=p_k=p)$ in (340) or (343), we get w. p. 1 (see (333))

$$\underset{p\to\infty}{\text{l.i.m.}}\sum_{j_1,\ldots,j_k=0}^{p} C_{j_k\ldots j_1}\prod_{l=1}^{k}\zeta_{j_l}^{(i_l)} = J[\psi^{(k)}]_{T,t}^{(i_1\ldots i_k)}+$$

$$+\underset{p\to\infty}{\text{l.i.m.}}\sum_{j_1,\ldots,j_k=0}^{p} C_{j_k\ldots j_1}\sum_{r=1}^{[k/2]}\sum_{\substack{(\{\{g_1,g_2\},\ldots,\{g_{2r-1},g_{2r}\}\},\{q_1,\ldots,q_{k-2r}\})\\ \{g_1,g_2,\ldots,g_{2r-1},g_{2r},q_1,\ldots,q_{k-2r}\}=\{1,2,\ldots,k\}}}\prod_{s=1}^{r}\mathbf{1}_{\{i_{g_{2s-1}}=\ i_{g_{2s}}\neq 0\}}\times$$

$$\times\mathbf{1}_{\{j_{g_{2s-1}}=\ j_{g_{2s}}\}}J'[\phi_{j_{q_1}}\ldots\phi_{j_{q_{k-2r}}}]_{T,t}^{(i_{q_1}\ldots i_{q_{k-2r}})} \tag{344}$$

w. p. 1, where $J[\psi^{(k)}]_{T,t}^{(i_1\ldots i_k)}$ is the iterated Ito stochastic integral (2).

If we prove that w. p. 1

$$\sum_{r=1}^{[k/2]}\frac{1}{2^r}\sum_{(s_r,\ldots,s_1)\in\mathrm{A}_{k,r}} J[\psi^{(k)}]_{T,t}^{s_r,\ldots,s_1} =$$

$$=\underset{p\to\infty}{\text{l.i.m.}}\sum_{j_1,\ldots,j_k=0}^{p} C_{j_k\ldots j_1}\sum_{r=1}^{[k/2]}\sum_{\substack{(\{\{g_1,g_2\},\ldots,\{g_{2r-1},g_{2r}\}\},\{q_1,\ldots,q_{k-2r}\})\\ \{g_1,g_2,\ldots,g_{2r-1},g_{2r},q_1,\ldots,q_{k-2r}\}=\{1,2,\ldots,k\}}}\prod_{s=1}^{r}\mathbf{1}_{\{i_{g_{2s-1}}=\ i_{g_{2s}}\neq 0\}}\times$$

$$\times\mathbf{1}_{\{j_{g_{2s-1}}=\ j_{g_{2s}}\}}J'[\phi_{j_{q_1}}\ldots\phi_{j_{q_{k-2r}}}]_{T,t}^{(i_{q_1}\ldots i_{q_{k-2r}})}, \tag{345}$$

then (see (344), (345), and Theorem 19)

$$\underset{p\to\infty}{\text{l.i.m.}}\sum_{j_1,\ldots,j_k=0}^{p} C_{j_k\ldots j_1}\prod_{l=1}^{k}\zeta_{j_l}^{(i_l)} =$$

$$= J[\psi^{(k)}]_{T,t}^{(i_1\ldots i_k)}+\sum_{r=1}^{[k/2]}\frac{1}{2^r}\sum_{(s_r,\ldots,s_1)\in\mathrm{A}_{k,r}} J[\psi^{(k)}]_{T,t}^{s_r,\ldots,s_1} = J^*[\psi^{(k)}]_{T,t}^{(i_1\ldots i_k)} \tag{346}$$

w. p. 1, where notations in (346) are the same as in Theorem 19. Thus Theorem 20 will be proved.

From (343) we have that the multiple Stratonovich stochastic integral $J[K_{p_1\ldots p_k}]_{T,t}^{(i_1\ldots i_k)}$ of multiplicity k is expressed as a sum of some constant value and multiple Wiener stochastic integrals $J'[K_{p_1\ldots p_k}]_{T,t}^{(i_1\ldots i_k)}$ and $J'[K_{p_1\ldots p_k}^{g_1\ldots g_{2r},q_1\ldots q_{k-2r}}]_{T,t}^{(i_{q_1}\ldots i_{q_{k-2r}})}$ of multiplicities $k,\ k-2,\ k-4,\ \ldots,\ k-2[k/2]$ $(r=1,2,\ldots,[k/2])$.

The formulas (340), (343) can be considered as new representations of the Hu-Meyer formula for the case of a multidimensional Wiener process [66] (also see [65], [67]) and kernel $K_{p_1\ldots p_k}(t_1,\ldots,t_k)$ (see (341)).

Note that the equality (343) can be obtained from (335) if we consider (335) for $\Phi(t_1,\ldots,t_k)=K_{p_1\ldots p_k}(t_1,\ldots,t_k)$ and without passing to the limit $\underset{p_1,\ldots,p_k\to\infty}{\hbox{l.i.m.}}$

For $k=2,3,4,5,6$ we have from (340) w. p. 1

$$
\sum_{j_1=0}^{p_1}\sum_{j_2=0}^{p_2}C_{j_2j_1}\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}=J'[K_{p_1p_2}]_{T,t}^{(i_1i_2)}+\sum_{j_1=0}^{p_1}\sum_{j_2=0}^{p_2}C_{j_2j_1}\mathbf{1}_{\{i_1=i_2\ne 0\}}\mathbf{1}_{\{j_1=j_2\}}, \tag{347}

Note that the relation (349) can be written in the following form

$$\sum_{j_1=0}^{p_1}\ldots\sum_{j_4=0}^{p_4}C_{j_4j_3j_2j_1}\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}\zeta_{j_3}^{(i_3)}\zeta_{j_4}^{(i_4)}=\sum_{j_1=0}^{p_1}\ldots\sum_{j_4=0}^{p_4}C_{j_4j_3j_2j_1}J'[\phi_{j_1}\phi_{j_2}\phi_{j_3}\phi_{j_4}]_{T,t}^{(i_1i_2i_3i_4)}+$$
$$+\mathbf{1}_{\{i_1=i_2\ne 0\}}\sum_{j_3=0}^{p_3}\sum_{j_4=0}^{p_4}\left(\sum_{j_1=0}^{\min\{p_1,p_2\}}C_{j_4j_3j_1j_1}\right)J'[\phi_{j_3}\phi_{j_4}]_{T,t}^{(i_3i_4)}+$$
$$+\mathbf{1}_{\{i_1=i_3\ne 0\}}\sum_{j_2=0}^{p_2}\sum_{j_4=0}^{p_4}\left(\sum_{j_3=0}^{\min\{p_1,p_3\}}C_{j_4j_3j_2j_3}\right)J'[\phi_{j_2}\phi_{j_4}]_{T,t}^{(i_2i_4)}+$$
$$+\mathbf{1}_{\{i_1=i_4\ne 0\}}\sum_{j_2=0}^{p_2}\sum_{j_3=0}^{p_3}\left(\sum_{j_4=0}^{\min\{p_1,p_4\}}C_{j_4j_3j_2j_4}\right)J'[\phi_{j_2}\phi_{j_3}]_{T,t}^{(i_2i_3)}+$$
$$+\mathbf{1}_{\{i_2=i_3\ne 0\}}\sum_{j_1=0}^{p_1}\sum_{j_4=0}^{p_4}\left(\sum_{j_3=0}^{\min\{p_2,p_3\}}C_{j_4j_3j_3j_1}\right)J'[\phi_{j_1}\phi_{j_4}]_{T,t}^{(i_1i_4)}+$$
$$+\mathbf{1}_{\{i_2=i_4\ne 0\}}\sum_{j_1=0}^{p_1}\sum_{j_3=0}^{p_3}\left(\sum_{j_4=0}^{\min\{p_2,p_4\}}C_{j_4j_3j_4j_1}\right)J'[\phi_{j_1}\phi_{j_3}]_{T,t}^{(i_1i_3)}+$$

$$+\mathbf{1}_{\{i_3=i_4\ne 0\}}\sum_{j_1=0}^{p_1}\sum_{j_2=0}^{p_2}\left(\sum_{j_4=0}^{\min\{p_3,p_4\}}C_{j_4j_4j_2j_1}\right)J'[\phi_{j_1}\phi_{j_2}]_{T,t}^{(i_1i_2)}+$$

$$+\mathbf{1}_{\{i_2=i_3\ne 0\}}\mathbf{1}_{\{i_1=i_4\ne 0\}}\sum_{j_2=0}^{\min\{p_2,p_3\}}\sum_{j_4=0}^{\min\{p_1,p_4\}}C_{j_4j_2j_2j_4}+$$

$$+\mathbf{1}_{\{i_2=i_4\ne 0\}}\mathbf{1}_{\{i_1=i_3\ne 0\}}\sum_{j_3=0}^{\min\{p_1,p_3\}}\sum_{j_4=0}^{\min\{p_2,p_4\}}C_{j_4j_3j_4j_3}+$$

$$+\mathbf{1}_{\{i_3=i_4\ne 0\}}\mathbf{1}_{\{i_1=i_2\ne 0\}}\sum_{j_2=0}^{\min\{p_1,p_2\}}\sum_{j_4=0}^{\min\{p_3,p_4\}}C_{j_4j_4j_2j_2}\quad \text{w. p. 1.}$$

Further, we will use the representation (340) for $p_1=\ldots=p_k=p$, i.e.

$$\sum_{j_1,\ldots,j_k=0}^{p}C_{j_k\ldots j_1}\prod_{l=1}^{k}\zeta_{j_l}^{(i_l)}=\sum_{j_1,\ldots,j_k=0}^{p}C_{j_k\ldots j_1}J'[\phi_{j_1}\ldots\phi_{j_k}]_{T,t}^{(i_1\ldots i_k)}+$$

$$+\sum_{j_1,\ldots,j_k=0}^{p}C_{j_k\ldots j_1}\sum_{r=1}^{[k/2]}\sum_{\substack{(\{\{g_1,g_2\},\ldots,\{g_{2r-1},g_{2r}\}\},\{q_1,\ldots,q_{k-2r}\})\\ \{g_1,g_2,\ldots,g_{2r-1},g_{2r},q_1,\ldots,q_{k-2r}\}=\{1,2,\ldots,k\}}}\prod_{s=1}^{r}\mathbf{1}_{\{i_{g_{2s-1}}=\ i_{g_{2s}}\ne 0\}}\times$$

$$\times\mathbf{1}_{\{j_{g_{2s-1}}=\ j_{g_{2s}}\}}J'[\phi_{j_{q_1}}\ldots\phi_{j_{q_{k-2r}}}]_{T,t}^{(i_{q_1}\ldots i_{q_{k-2r}})}\quad \text{w. p. 1.}\tag{352}$$

Step 2. Let us prove that

$$\sum_{j_l=0}^{\infty}C_{j_k\ldots j_{l+1}j_lj_{l-1}\ldots j_{s+1}j_lj_{s-1}\ldots j_1}=0\tag{353}$$

or

$$\sum_{j_l=0}^{p}C_{j_k\ldots j_{l+1}j_lj_{l-1}\ldots j_{s+1}j_lj_{s-1}\ldots j_1}=-\sum_{j_l=p+1}^{\infty}C_{j_k\ldots j_{l+1}j_lj_{l-1}\ldots j_{s+1}j_lj_{s-1}\ldots j_1},\tag{354}$$

where $l-1\ge s+1$.

Our further proof will not fundamentally depend on the weight functions $\psi_1(\tau),\ldots,\psi_k(\tau)$. Therefore, sometimes in subsequent consideration we assume that $\psi_1(\tau),\ldots,\psi_k(\tau)\equiv 1$.

We have

$$C_{j_k\ldots j_{l+1}j_lj_{l-1}\ldots j_{s+1}j_lj_{s-1}\ldots j_1}=$$

$$=\int_t^T\phi_{j_k}(t_k)\ldots\int_t^{t_{l+2}}\phi_{j_{l+1}}(t_{l+1})\int_t^{t_{l+1}}\phi_{j_l}(t_l)\int_t^{t_l}\phi_{j_{l-1}}(t_{l-1})\ldots$$

$$
\ldots \int\limits_t^{t_{s+2}} \phi_{j_{s+1}}(t_{s+1}) \int\limits_t^{t_{s+1}} \phi_{j_l}(t_s) \int\limits_t^{t_s} \phi_{j_{s-1}}(t_{s-1}) \ldots
$$

$$
\ldots \int\limits_t^{t_2} \phi_{j_1}(t_1) dt_1 \ldots dt_{s-1} dt_s dt_{s+1} \ldots dt_{l-1} dt_l dt_{l+1} \ldots dt_k =
$$

$$
= \int\limits_t^{T} \phi_{j_{s+1}}(t_{s+1}) \int\limits_t^{t_{s+1}} \phi_{j_l}(t_s) \int\limits_t^{t_s} \phi_{j_{s-1}}(t_{s-1}) \ldots \int\limits_t^{t_2} \phi_{j_1}(t_1) dt_1 \ldots dt_{s-1} dt_s \times
$$

$$
\times \left(\int\limits_{t_{s+1}}^{T} \phi_{j_{s+2}}(t_{s+2}) \ldots \int\limits_{t_{l-2}}^{T} \phi_{j_{l-1}}(t_{l-1}) \int\limits_{t_{l-1}}^{T} \phi_{j_l}(t_l) \int\limits_{t_l}^{T} \phi_{j_{l+1}}(t_{l+1}) \ldots \right.
$$

$$
\left. \ldots \int\limits_{t_{k-1}}^{T} \phi_{j_k}(t_k) dt_k \ldots dt_{l+1} dt_l dt_{l-1} \ldots dt_{s+2} \right) dt_{s+1} =
$$

$$
= \int\limits_t^{T} \phi_{j_{s+1}}(t_{s+1}) \int\limits_t^{t_{s+1}} \phi_{j_l}(t_s) \underbrace{\int\limits_t^{t_s} \phi_{j_{s-1}}(t_{s-1}) \ldots \int\limits_t^{t_2} \phi_{j_1}(t_1) dt_1 \ldots dt_{s-1}}_{G_{j_{s-1}\ldots j_1}(t_s)} dt_s \times
$$

$$
\times \int\limits_{t_{s+1}}^{T} \phi_{j_l}(t_l) \underbrace{\int\limits_{t_l}^{T} \phi_{j_{l+1}}(t_{l+1}) \ldots \int\limits_{t_{k-1}}^{T} \phi_{j_k}(t_k) dt_k \ldots dt_{l+1}}_{H_{j_k\ldots j_{l+1}}(t_l)} \times
$$

$$
\times \left(\underbrace{\int\limits_{t_{s+1}}^{t_l} \phi_{j_{l-1}}(t_{l-1}) \ldots \int\limits_{t_{s+1}}^{t_{s+3}} \phi_{j_{s+2}}(t_{s+2}) dt_{s+2} \ldots dt_{l-1}}_{Q_{j_{l-1}\ldots j_{s+2}}(t_l, t_{s+1})} dt_l \right) dt_{s+1} =
$$

$$
= \int\limits_t^{T} \phi_{j_{s+1}}(t_{s+1}) \int\limits_t^{t_{s+1}} \phi_{j_l}(t_s) G_{j_{s-1}\ldots j_1}(t_s) dt_s \times
$$

$$
\times \int\limits_{t_{s+1}}^{T} \phi_{j_l}(t_l) H_{j_k\ldots j_{l+1}}(t_l) Q_{j_{l-1}\ldots j_{s+2}}(t_l, t_{s+1}) dt_l dt_{s+1}. \tag{355}
$$

Using the additive property of the integral, we obtain

$$
Q_{j_{l-1}\ldots j_{s+2}}(t_l, t_{s+1}) =
$$

$$=\int\limits_{t_{s+1}}^{t_l}\phi_{j_{l-1}}(t_{l-1})\ldots\int\limits_{t_{s+1}}^{t_{s+3}}\phi_{j_{s+2}}(t_{s+2})dt_{s+2}\ldots dt_{l-1}=$$

$$=\int\limits_{t_{s+1}}^{t_l}\phi_{j_{l-1}}(t_{l-1})\ldots\int\limits_{t_{s+1}}^{t_{s+4}}\phi_{j_{s+3}}(t_{s+3})\int\limits_{t}^{t_{s+3}}\phi_{j_{s+2}}(t_{s+2})dt_{s+2}dt_{s+3}\ldots dt_{l-1}-$$

$$-\int\limits_{t_{s+1}}^{t_l}\phi_{j_{l-1}}(t_{l-1})\ldots\int\limits_{t_{s+1}}^{t_{s+4}}\phi_{j_{s+3}}(t_{s+3})dt_{s+3}\ldots dt_{l-1}\int\limits_{t}^{t_{s+1}}\phi_{j_{s+2}}(t_{s+2})dt_{s+2}=$$

$$\ldots$$

$$=\sum_{m=1}^{d}h^{(m)}_{j_{l-1}\ldots j_{s+2}}(t_l)q^{(m)}_{j_{l-1}\ldots j_{s+2}}(t_{s+1}),\quad d<\infty. \tag{356}$$

Combining (355) and (356), we have

$$\sum_{j_l=0}^{p}C_{j_k\ldots j_{l+1}j_lj_{l-1}\ldots j_{s+1}j_lj_{s-1}\ldots j_1}=$$

$$=\sum_{m=1}^{d}\left(\int\limits_{t}^{T}\phi_{j_{s+1}}(t_{s+1})q^{(m)}_{j_{l-1}\ldots j_{s+2}}(t_{s+1})\sum_{j_l=0}^{p}\int\limits_{t}^{t_{s+1}}\phi_{j_l}(t_s)G_{j_{s-1}\ldots j_1}(t_s)dt_s\times\right.$$

$$\left.\times\int\limits_{t_{s+1}}^{T}\phi_{j_l}(t_l)H_{j_k\ldots j_{l+1}}(t_l)h^{(m)}_{j_{l-1}\ldots j_{s+2}}(t_l)dt_ldt_{s+1}\right). \tag{357}$$

Using the generalized Parseval equality, we obtain

$$\sum_{j_l=0}^{\infty}\int\limits_{t}^{t_{s+1}}\phi_{j_l}(t_s)G_{j_{s-1}\ldots j_1}(t_s)dt_s\int\limits_{t_{s+1}}^{T}\phi_{j_l}(t_l)H_{j_k\ldots j_{l+1}}(t_l)h^{(m)}_{j_{l-1}\ldots j_{s+2}}(t_l)dt_l=$$

$$=\int\limits_{t}^{T}\mathbf{1}_{\{\tau<t_{s+1}\}}G_{j_{s-1}\ldots j_1}(\tau)\cdot\mathbf{1}_{\{\tau>t_{s+1}\}}H_{j_k\ldots j_{l+1}}(\tau)h^{(m)}_{j_{l-1}\ldots j_{s+2}}(\tau)d\tau=0. \tag{358}$$

From (357) and (358) we get

$$\sum_{j_l=0}^{p}C_{j_k\ldots j_{l+1}j_lj_{l-1}\ldots j_{s+1}j_lj_{s-1}\ldots j_1}=$$

$$=-\sum_{m=1}^{d}\left(\int\limits_{t}^{T}\phi_{j_{s+1}}(t_{s+1})q^{(m)}_{j_{l-1}\ldots j_{s+2}}(t_{s+1})\sum_{j_l=p+1}^{\infty}\int\limits_{t}^{t_{s+1}}\phi_{j_l}(t_s)G_{j_{s-1}\ldots j_1}(t_s)dt_s\times\right.$$

$$\times\int\limits_{t_{s+1}}^{T}\phi_{j_l}(t_l)H_{j_k\ldots j_{l+1}}(t_l)h^{(m)}_{j_{l-1}\ldots j_{s+2}}(t_l)dt_l dt_{s+1}\Biggr). \tag{359}$$

Combining Condition 2 of Theorem 20 and (355)–(357), (359), we have

$$\sum_{j_l=0}^{p}C_{j_k\ldots j_{l+1}j_l j_{l-1}\ldots j_{s+1}j_l j_{s-1}\ldots j_1}=$$

$$=-\sum_{j_l=p+1}^{\infty}\sum_{m=1}^{d}\Biggl(\int\limits_{t}^{T}\phi_{j_{s+1}}(t_{s+1})q^{(m)}_{j_{l-1}\ldots j_{s+2}}(t_{s+1})\int\limits_{t}^{t_{s+1}}\phi_{j_l}(t_s)G_{j_{s-1}\ldots j_1}(t_s)dt_s\times$$

$$\times\int\limits_{t_{s+1}}^{T}\phi_{j_l}(t_l)H_{j_k\ldots j_{l+1}}(t_l)h^{(m)}_{j_{l-1}\ldots j_{s+2}}(t_l)dt_l dt_{s+1}\Biggr)=$$

$$=-\sum_{j_l=p+1}^{\infty}\int\limits_{t}^{T}\phi_{j_k}(t_k)\ldots\int\limits_{t}^{t_{l+2}}\phi_{j_{l+1}}(t_{l+1})\int\limits_{t}^{t_{l+1}}\phi_{j_l}(t_l)\int\limits_{t}^{t_l}\phi_{j_{l-1}}(t_{l-1})\ldots$$

$$\ldots\int\limits_{t}^{t_{s+2}}\phi_{j_{s+1}}(t_{s+1})\int\limits_{t}^{t_{s+1}}\phi_{j_l}(t_s)\int\limits_{t}^{t_s}\phi_{j_{s-1}}(t_{s-1})\ldots$$

$$\ldots\int\limits_{t}^{t_2}\phi_{j_1}(t_1)dt_1\ldots dt_{s-1}dt_s dt_{s+1}\ldots dt_{l-1}dt_l dt_{l+1}\ldots dt_k=$$

$$=-\sum_{j_l=p+1}^{\infty}C_{j_k\ldots j_{l+1}j_l j_{l-1}\ldots j_{s+1}j_l j_{s-1}\ldots j_1}. \tag{360}$$

The equality (360) implies (353), (354).

Step 3. Using Conditions 1 and 2 of Theorem 20, we obtain

$$\sum_{j_l=0}^{p}C_{j_k\ldots j_{l+1}j_l j_l j_{l-2}\ldots j_1}=$$

$$=\int\limits_{t}^{T}\psi_k(t_k)\phi_{j_k}(t_k)\ldots\int\limits_{t}^{t_{l+2}}\psi_{l+1}(t_{l+1})\phi_{j_{l+1}}(t_{l+1})\sum_{j_l=0}^{p}\int\limits_{t}^{t_{l+1}}\psi_l(t_l)\phi_{j_l}(t_l)\int\limits_{t}^{t_l}\psi_{l-1}(t_{l-1})\phi_{j_l}(t_{l-1})\times$$

$$\times\int\limits_{t}^{t_{l-1}}\psi_{l-2}(t_{l-2})\phi_{j_{l-2}}(t_{l-2})\ldots\int\limits_{t}^{t_2}\psi_1(t_1)\phi_{j_1}(t_1)dt_1\ldots dt_{l-2}dt_{l-1}dt_l dt_{l+1}\ldots dt_k=$$

$$= \int\limits_t^T \psi_k(t_k)\phi_{j_k}(t_k)\ldots \int\limits_t^{t_{l+2}} \psi_{l+1}(t_{l+1})\phi_{j_{l+1}}(t_{l+1}) \sum_{j_l=0}^{\infty} \int\limits_t^{t_{l+1}} \psi_l(t_l)\phi_{j_l}(t_l) \int\limits_t^{t_l} \psi_{l-1}(t_{l-1})\phi_{j_l}(t_{l-1})\times$$

$$\times \int\limits_t^{t_{l-1}} \psi_{l-2}(t_{l-2})\phi_{j_{l-2}}(t_{l-2})\ldots \int\limits_t^{t_2} \psi_1(t_1)\phi_{j_1}(t_1)dt_1\ldots dt_{l-2}dt_{l-1}dt_l dt_{l+1}\ldots dt_k -$$

$$- \sum_{j_l=p+1}^{\infty} C_{j_k\ldots j_{l+1}j_l j_l j_{l-2}\ldots j_1} =$$

$$= \frac{1}{2} C_{j_k\ldots j_1}\Biggr|_{(j_l j_l)\curvearrowright(\cdot)} - \sum_{j_l=p+1}^{\infty} C_{j_k\ldots j_{l+1}j_l j_l j_{l-2}\ldots j_1}. \tag{361}$$

Step 4. Passing to the limit $\underset{p\to\infty}{\text{l.i.m.}}$ in (352), we have (see (333))

$$\underset{p\to\infty}{\text{l.i.m.}} \sum_{j_1,\ldots,j_k=0}^{p} C_{j_k\ldots j_1}\zeta_{j_1}^{(i_1)}\ldots\zeta_{j_k}^{(i_k)} = J[\psi^{(k)}]_{T,t}^{(i_1\ldots i_k)} +$$

$$+ \sum_{r=1}^{[k/2]} \sum_{\substack{(\{\{g_1,g_2\},\ldots,\{g_{2r-1},g_{2r}\}\},\{q_1,\ldots,q_{k-2r}\})\\ \{g_1,g_2,\ldots,g_{2r-1},g_{2r},q_1,\ldots,q_{k-2r}\}=\{1,2,\ldots,k\}}} \prod_{s=1}^{r} \mathbf{1}_{\{i_{g_{2s-1}}=\ i_{g_{2s}}\neq 0\}}\times$$

$$\times \underset{p\to\infty}{\text{l.i.m.}} \sum_{j_1,\ldots,j_k=0}^{p} C_{j_k\ldots j_1} \prod_{s=1}^{r} \mathbf{1}_{\{j_{g_{2s-1}}=\ j_{g_{2s}}\}} J'[\phi_{j_{q_1}}\ldots\phi_{j_{q_{k-2r}}}]_{T,t}^{(i_{q_1}\ldots i_{q_{k-2r}})} \quad \text{w. p. 1.} \tag{362}$$

Taking into account (354) and (361), we obtain for $r=1$

$$\mathbf{1}_{\{i_{g_1}=\ i_{g_2}\neq 0\}} \underset{p\to\infty}{\text{l.i.m.}} \sum_{j_1,\ldots,j_k=0}^{p} C_{j_k\ldots j_1}\mathbf{1}_{\{j_{g_1}=\ j_{g_2}\}} J'[\phi_{j_{q_1}}\ldots\phi_{j_{q_{k-2}}}]_{T,t}^{(i_{q_1}\ldots i_{q_{k-2}})} =$$

$$= -\mathbf{1}_{\{i_{g_1}=\ i_{g_2}\neq 0\}} \underset{p\to\infty}{\text{l.i.m.}} \sum_{j_{g_1}=p+1}^{\infty} \sum_{\substack{j_1,\ldots,j_q,\ldots,j_k=0\\ q\neq g_1,g_2}}^{p} C_{j_k\ldots j_1}\Biggr|_{j_{g_1}=\ j_{g_2}} \mathbf{1}_{\{g_2>g_1+1\}}\times$$

$$\times J'[\phi_{j_{q_1}}\ldots\phi_{j_{q_{k-2}}}]_{T,t}^{(i_{q_1}\ldots i_{q_{k-2}})} +$$

$$+ \mathbf{1}_{\{i_{g_1}=\ i_{g_2}\neq 0\}} \underset{p\to\infty}{\text{l.i.m.}} \sum_{\substack{j_1,\ldots,j_q,\ldots,j_k=0\\ q\neq g_1,g_2}}^{p} \frac{1}{2} C_{j_k\ldots j_1}\Biggr|_{(j_{g_2}j_{g_1})\curvearrowright(\cdot),\, j_{g_1}=\ j_{g_2}} \mathbf{1}_{\{g_2=g_1+1\}}\times$$

$$\times J'[\phi_{j_{q_1}}\ldots\phi_{j_{q_{k-2}}}]_{T,t}^{(i_{q_1}\ldots i_{q_{k-2}})} -$$

$$-\mathbf{1}_{\{i_{g_1}=\ i_{g_2}\neq 0\}}\underset{p\to\infty}{\text{l.i.m.}}\ \sum_{j_{g_1}=p+1}^{\infty}\ \sum_{\substack{j_1,\ldots,j_q,\ldots,j_k=0\\ q\neq g_1,g_2}}^{p} C_{j_k\ldots j_1}\Biggl|_{j_{g_1}=\ j_{g_2}} \mathbf{1}_{\{g_2=g_1+1\}}\times$$

$$\times J'[\phi_{j_{q_1}}\ldots\phi_{j_{q_{k-2}}}]_{T,t}^{(i_{q_1}\ldots i_{q_{k-2}})}=$$

$$=-\mathbf{1}_{\{i_{g_1}=\ i_{g_2}\neq 0\}}\underset{p\to\infty}{\text{l.i.m.}}\ \sum_{j_{g_1}=p+1}^{\infty}\ \sum_{\substack{j_1,\ldots,j_q,\ldots,j_k=0\\ q\neq g_1,g_2}}^{p} C_{j_k\ldots j_1}\Biggl|_{j_{g_1}=\ j_{g_2}}\times$$

$$\times J'[\phi_{j_{q_1}}\ldots\phi_{j_{q_{k-2}}}]_{T,t}^{(i_{q_1}\ldots i_{q_{k-2}})}+$$

$$+\mathbf{1}_{\{i_{g_1}=\ i_{g_2}\neq 0\}}\underset{p\to\infty}{\text{l.i.m.}}\ \sum_{\substack{j_1,\ldots,j_q,\ldots,j_k=0\\ q\neq g_1,g_2}}^{p} \frac{1}{2}C_{j_k\ldots j_1}\Biggl|_{(j_{g_2}j_{g_1})\curvearrowright(\cdot),j_{g_1}=\ j_{g_2}} \mathbf{1}_{\{g_2=g_1+1\}}\times$$

$$\times J'[\phi_{j_{q_1}}\ldots\phi_{j_{q_{k-2}}}]_{T,t}^{(i_{q_1}\ldots i_{q_{k-2}})}= \tag{363}$$

$$=\frac{1}{2}\mathbf{1}_{\{g_2=g_1+1\}}J[\psi^{(k)}]_{T,t}^{g_1}+\mathbf{1}_{\{i_{g_1}=\ i_{g_2}\neq 0\}}\underset{p\to\infty}{\text{l.i.m.}}\ R_{T,t}^{(p)1,g_1,g_2}\quad \text{w. p. 1}, \tag{364}$$

where $J[\psi^{(k)}]_{T,t}^{g_1}$ $(g_1=1,2,\ldots,k-1)$ is defined by (319),

$$R_{T,t}^{(p)1,g_1,g_2}=-\sum_{\substack{j_1,\ldots,j_q,\ldots,j_k=0\\ q\neq g_1,g_2}}^{p}\bar{C}_{j_k\ldots j_q\ldots j_1}^{(p)}\Biggl|_{q\neq g_1,g_2} J'[\phi_{j_{q_1}}\ldots\phi_{j_{q_{k-2}}}]_{T,t}^{(i_{q_1}\ldots i_{q_{k-2}})}.$$

Let us explain the transition from (363) to (364). We have for $g_2=g_1+1$

$$\mathbf{1}_{\{i_{g_1}=\ i_{g_2}\neq 0\}}\underset{p\to\infty}{\text{l.i.m.}}\ \sum_{\substack{j_1,\ldots,j_q,\ldots,j_k=0\\ q\neq g_1,g_2}}^{p} \frac{1}{2}C_{j_k\ldots j_1}\Biggl|_{(j_{g_2}j_{g_1})\curvearrowright(\cdot),j_{g_1}=\ j_{g_2}}\times$$

$$\times J'[\phi_{j_{q_1}}\ldots\phi_{j_{q_{k-2}}}]_{T,t}^{(i_{q_1}\ldots i_{q_{k-2}})}=$$

$$=\frac{1}{2}\mathbf{1}_{\{i_{g_1}=\ i_{g_2}\neq 0\}}\underset{p\to\infty}{\text{l.i.m.}}\ \sum_{\substack{j_1,\ldots,j_q,\ldots,j_k=0\\ q\neq g_1,g_2}}^{p} C_{j_k\ldots j_1}\Biggl|_{(j_{g_2}j_{g_1})\curvearrowright 0,j_{g_1}=\ j_{g_2}}\times$$

$$\times\zeta_0^{(0)}J'[\phi_{j_{q_1}}\ldots\phi_{j_{q_{k-2}}}]_{T,t}^{(i_{q_1}\ldots i_{q_{k-2}})}=$$

$$
=\frac{1}{2}\mathbf{1}_{\{i_{g_1}=\ i_{g_2}\ne 0\}}\underset{p\to\infty}{\text{l.i.m.}}\sum_{\substack{j_1,\ldots,j_q,\ldots,j_k=0\\ q\ne g_1,g_2}}^{p}\ \sum_{j_{m_1}=0}^{p}C_{j_k\ldots j_1}\Biggl|_{(j_{g_2}j_{g_1})\frown j_{m_1},j_{g_1}=\ j_{g_2}}\times
$$

$$
\times\zeta_{j_{m_1}}^{(0)}J'[\phi_{j_{q_1}}\ldots\phi_{j_{q_{k-2}}}]_{T,t}^{(i_{q_1}\ldots i_{q_{k-2}})}=
$$

$$
=\frac{1}{2}\mathbf{1}_{\{i_{g_1}=\ i_{g_2}\ne 0\}}\underset{p\to\infty}{\text{l.i.m.}}\sum_{\substack{j_1,\ldots,j_q,\ldots,j_k=0\\ q\ne g_1,g_2}}^{p}\ \sum_{j_{m_1}=0}^{p}C_{j_k\ldots j_1}\Biggl|_{(j_{g_2}j_{g_1})\frown j_{m_1},j_{g_1}=\ j_{g_2}}\times
$$

$$
\times J'[\phi_{j_{m_1}}\phi_{j_{q_1}}\ldots\phi_{j_{q_{k-2}}}]_{T,t}^{(0 i_{q_1}\ldots i_{q_{k-2}})}= \tag{365}
$$

$$
=\frac{1}{2}J[\psi^{(k)}]_{T,t}^{g_1}\quad \text{w. p. 1}, \tag{366}
$$

where

$$
C_{j_k\ldots j_1}\Biggl|_{(j_{g_2}j_{g_1})\frown j_{m_1},j_{g_1}=\ j_{g_2},g_2=g_1+1}=
$$

$$
=\int\limits_t^T\psi_k(t_k)\phi_{j_k}(t_k)\ldots\int\limits_t^{t_{g_1+3}}\psi_l(t_{g_1+2})\phi_{j_{g_1+2}}(t_{g_1+2})\int\limits_t^{t_{g_1+2}}\psi_{g_1+1}(t_{g_1})\psi_{g_1}(t_{g_1})\phi_{j_{m_1}}(t_{g_1})\times
$$

$$
\times\int\limits_t^{t_{g_1}}\psi_l(t_{g_1-1})\phi_{j_{g_1-1}}(t_{g_1-1})\ldots\int\limits_t^{t_2}\psi_1(t_1)\phi_{j_1}(t_1)dt_1\ldots dt_{g_1-1}dt_{g_1}dt_{g_1+2}\ldots dt_k,
$$

$$
\zeta_{j_{m_1}}^{(0)}=\int\limits_t^T\phi_{j_{m_1}}(\tau)d\mathbf{w}_\tau^{(0)}=\int\limits_t^T\phi_{j_{m_1}}(\tau)d\tau=\begin{cases}\sqrt{T-t} & \text{if } j_{m_1}=0\\ 0 & \text{if } j_{m_1}\ne 0\end{cases}, \tag{367}
$$

$$
\phi_0(\tau)=\frac{1}{\sqrt{T-t}}. \tag{368}
$$

The transition from (365) to (366) is based on (333).

By Condition 3 of Theorem 20 we have (also see the property (165) of multiple Wiener stochastic integral)

$$
\lim_{p\to\infty}\mathsf{M}\left\{\left(R_{T,t}^{(p)1,g_1,g_2}\right)^2\right\}\le K\lim_{p\to\infty}\sum_{\substack{j_1,\ldots,j_q,\ldots,j_k=0\\ q\ne g_1,g_2}}^{p}\left(\bar{C}_{j_k\ldots j_q\ldots j_1}^{(p)}\Biggl|_{q\ne g_1,g_2}\right)^2=0,
$$

where constant K does not depend on p.

Thus

$$\mathbf{1}_{\{i_{g_1}=\ i_{g_2}\neq 0\}}\underset{p\to\infty}{\text{l.i.m.}}\ \sum_{j_1,\ldots,j_k=0}^{p} C_{j_k\ldots j_1}\mathbf{1}_{\{j_{g_1}=\ j_{g_2}\}}J'[\phi_{j_{q_1}}\ldots\phi_{j_{q_{k-2}}}]_{T,t}^{(i_{q_1}\ldots i_{q_{k-2}})}=$$

$$=\frac{1}{2}\mathbf{1}_{\{g_2=g_1+1\}}J[\psi^{(k)}]_{T,t}^{g_1}\quad \text{w. p. 1.}$$

Involving into consideration the second pair $\{g_3,g_4\}$ (the first pair is $\{g_1,g_2\}$), we obtain from (363) for $r=2$

$$\prod_{s=1}^{2}\mathbf{1}_{\{i_{g_{2s-1}}=\ i_{g_{2s}}\neq 0\}}\underset{p\to\infty}{\text{l.i.m.}}\ \sum_{j_1,\ldots,j_k=0}^{p} C_{j_k\ldots j_1}\prod_{s=1}^{2}\mathbf{1}_{\{j_{g_{2s-1}}=\ j_{g_{2s}}\}}\times$$

$$\times J'[\phi_{j_{q_1}}\ldots\phi_{j_{q_{k-4}}}]_{T,t}^{(i_{q_1}\ldots i_{q_{k-4}})}=$$

$$=\prod_{s=1}^{2}\mathbf{1}_{\{i_{g_{2s-1}}=\ i_{g_{2s}}\neq 0\}}\times$$

$$\times\underset{p\to\infty}{\text{l.i.m.}}\ \sum_{\substack{j_1,\ldots,j_q,\ldots,j_k=0\\ q\neq g_1,g_2,g_3,g_4}}^{p}\left(\frac{1}{4}C_{j_k\ldots j_1}\Bigg|_{(j_{g_2}j_{g_1})\frown(\cdot)(j_{g_4}j_{g_3})\frown(\cdot),j_{g_1}=\ j_{g_2},j_{g_3}=\ j_{g_4}}\prod_{s=1}^{2}\mathbf{1}_{\{g_{2s}=g_{2s-1}+1\}}-\right.$$

$$-\frac{1}{2}\sum_{j_{g_1}=p+1}^{\infty}C_{j_k\ldots j_1}\Bigg|_{(j_{g_4}j_{g_3})\frown(\cdot),j_{g_1}=\ j_{g_2},j_{g_3}=\ j_{g_4}}\mathbf{1}_{\{g_4=g_3+1\}}-$$

$$-\frac{1}{2}\sum_{j_{g_3}=p+1}^{\infty}C_{j_k\ldots j_1}\Bigg|_{(j_{g_2}j_{g_1})\frown(\cdot),j_{g_1}=\ j_{g_2},j_{g_3}=\ j_{g_4}}\mathbf{1}_{\{g_2=g_1+1\}}+$$

$$\left.+\sum_{j_{g_3}=p+1}^{\infty}\sum_{j_{g_1}=p+1}^{\infty}C_{j_k\ldots j_1}\Bigg|_{j_{g_1}=\ j_{g_2},j_{g_3}=\ j_{g_4}}\right)J'[\phi_{j_{q_1}}\ldots\phi_{j_{q_{k-4}}}]_{T,t}^{(i_{q_1}\ldots i_{q_{k-4}})}=\tag{369}$$

$$=\frac{1}{4}\prod_{s=1}^{2}\mathbf{1}_{\{g_{2s}=g_{2s-1}+1\}}J[\psi^{(k)}]_{T,t}^{s_2,s_1}+\prod_{s=1}^{2}\mathbf{1}_{\{i_{g_{2s-1}}=\ i_{g_{2s}}\neq 0\}}\underset{p\to\infty}{\text{l.i.m.}}\ R_{T,t}^{(p)2,g_1,g_2,g_3,g_4}\tag{370}$$

w. p. 1, where $g_3\stackrel{\text{def}}{=}s_2$, $g_1\stackrel{\text{def}}{=}s_1$, $(s_2,s_1)\in\mathrm{A}_{k,2}$, $J[\psi^{(k)}]_{T,t}^{s_2,s_1}$ is defined by (319) and $\mathrm{A}_{k,2}$ is defined by (320),

$$R_{T,t}^{(p)2,g_1,g_2,g_3,g_4}=\sum_{\substack{j_1,\ldots,j_q,\ldots,j_k=0\\ q\neq g_1,g_2,g_3,g_4}}^{p}\left(\bar{C}_{j_k\ldots j_q\ldots j_1}^{(p)}\Bigg|_{q\neq g_1,g_2,g_3,g_4}-\right.$$

$$\left.-S_1\left\{\bar{C}_{j_k\ldots j_q\ldots j_1}^{(p)}\Bigg|_{q\neq g_1,g_2,g_3,g_4}\right\}-S_2\left\{\bar{C}_{j_k\ldots j_q\ldots j_1}^{(p)}\Bigg|_{q\neq g_1,g_2,g_3,g_4}\right\}\right)\times$$

$$\times J'[\phi_{j_{q_1}}\ldots\phi_{j_{q_{k-4}}}]_{T,t}^{(i_{q_1}\ldots i_{q_{k-4}})}.$$

Let us explain the transition from (369) to (370). We have for $g_2=g_1+1,\ g_4=g_3+1$

$$\underset{p\to\infty}{\text{l.i.m.}}\sum_{\substack{j_1,\ldots,j_q,\ldots,j_k=0\\ q\ne g_1,g_2,g_3,g_4}}^{p}\frac{1}{4}C_{j_k\ldots j_1}\Biggl|_{(j_{g_2}j_{g_1})\curvearrowright(\cdot)(j_{g_4}j_{g_3})\curvearrowright(\cdot),j_{g_1}=\,j_{g_2},j_{g_3}=\,j_{g_4}}\times$$

$$\times\prod_{s=1}^{2}\mathbf{1}_{\{i_{g_{2s-1}}=\,i_{g_{2s}}\ne 0\}}J'[\phi_{j_{q_1}}\ldots\phi_{j_{q_{k-4}}}]_{T,t}^{(i_{q_1}\ldots i_{q_{k-4}})}=$$

$$=\frac{1}{4}\underset{p\to\infty}{\text{l.i.m.}}\sum_{\substack{j_1,\ldots,j_q,\ldots,j_k=0\\ q\ne g_1,g_2,g_3,g_4}}^{p}C_{j_k\ldots j_1}\Biggl|_{(j_{g_2}j_{g_1})\curvearrowright 0(j_{g_4}j_{g_3})\curvearrowright 0,j_{g_1}=\,j_{g_2},j_{g_3}=\,j_{g_4}}\times$$

$$\times\prod_{s=1}^{2}\mathbf{1}_{\{i_{g_{2s-1}}=\,i_{g_{2s}}\ne 0\}}\zeta_0^{(0)}\zeta_0^{(0)}J'[\phi_{j_{q_1}}\ldots\phi_{j_{q_{k-4}}}]_{T,t}^{(i_{q_1}\ldots i_{q_{k-4}})}=$$

$$=\frac{1}{4}\underset{p\to\infty}{\text{l.i.m.}}\sum_{\substack{j_1,\ldots,j_q,\ldots,j_k=0\\ q\ne g_1,g_2,g_3,g_4}}^{p}\sum_{j_{m_1},j_{m_3}=0}^{p}C_{j_k\ldots j_1}\Biggl|_{(j_{g_2}j_{g_1})\curvearrowright j_{m_1}(j_{g_4}j_{g_3})\curvearrowright j_{m_3},j_{g_1}=\,j_{g_2},j_{g_3}=\,j_{g_4}}\times$$

$$\times\prod_{s=1}^{2}\mathbf{1}_{\{i_{g_{2s-1}}=\,i_{g_{2s}}\ne 0\}}\zeta_{j_{m_1}}^{(0)}\zeta_{j_{m_3}}^{(0)}J'[\phi_{j_{q_1}}\ldots\phi_{j_{q_{k-4}}}]_{T,t}^{(i_{q_1}\ldots i_{q_{k-4}})}=$$

$$=\frac{1}{4}\underset{p\to\infty}{\text{l.i.m.}}\sum_{\substack{j_1,\ldots,j_q,\ldots,j_k=0\\ q\ne g_1,g_2,g_3,g_4}}^{p}\sum_{j_{m_1},j_{m_3}=0}^{p}C_{j_k\ldots j_1}\Biggl|_{(j_{g_2}j_{g_1})\curvearrowright j_{m_1}(j_{g_4}j_{g_3})\curvearrowright j_{m_3},j_{g_1}=\,j_{g_2},j_{g_3}=\,j_{g_4}}\times$$

$$\times\prod_{s=1}^{2}\mathbf{1}_{\{i_{g_{2s-1}}=\,i_{g_{2s}}\ne 0\}}J'[\phi_{j_{m_1}}\phi_{j_{m_3}}\phi_{j_{q_1}}\ldots\phi_{j_{q_{k-4}}}]_{T,t}^{(00i_{q_1}\ldots i_{q_{k-4}})}= \tag{371}$$

$$=\frac{1}{4}J[\psi^{(k)}]_{T,t}^{s_2,s_1}\quad\text{w. p. 1.} \tag{372}$$

The transition from (371) to (372) is based on (333).

Note that

$$C_{j_k\ldots j_1}\Biggl|_{(j_{g_2}j_{g_1})\curvearrowright j_{m_1},j_{g_1}=\,j_{g_2}}=C_{j_k\ldots j_1}\Biggl|_{(j_{g_1}j_{g_1})\curvearrowright j_{m_1},j_{g_1}=\,j_{g_2}}$$

is the Fourier coefficient, where $g_2 = g_1 + 1$. Therefore, the value

$$C_{j_k\ldots j_1}\Bigg|_{(j_{g_2}j_{g_1})\curvearrowright j_{m_1}(j_{g_4}j_{g_3})\curvearrowright j_{m_3},j_{g_1}=\ j_{g_2},j_{g_3}=\ j_{g_4}} =$$

$$= C_{j_k\ldots j_1}\Bigg|_{(j_{g_1}j_{g_1})\curvearrowright j_{m_1}(j_{g_3}j_{g_3})\curvearrowright j_{m_3},j_{g_1}=\ j_{g_2},j_{g_3}=\ j_{g_4}}$$

is determined recursively using (324) in an obvious way for $g_2 = g_1 + 1$ and $g_4 = g_3 + 1$.

By Condition 3 of Theorem 20 we have (also see the property (165) of multiple Wiener stochastic integral)

$$\lim_{p\to\infty} \mathsf{M}\left\{\left(R_{T,t}^{(p)2,g_1,g_2,g_3,g_4}\right)^2\right\} \le K \lim_{p\to\infty} \sum_{\substack{j_1,\ldots,j_q,\ldots,j_k=0\\ q\ne g_1,g_2,g_3,g_4}}^{p} \left(\left(\bar{C}^{(p)}_{j_k\ldots j_q\ldots j_1}\Bigg|_{q\ne g_1,g_2,g_3,g_4}\right)^2 +\right.$$

$$\left. + \left(S_1\left\{\bar{C}^{(p)}_{j_k\ldots j_q\ldots j_1}\Bigg|_{q\ne g_1,g_2,g_3,g_4}\right\}\right)^2 + \left(S_2\left\{\bar{C}^{(p)}_{j_k\ldots j_q\ldots j_1}\Bigg|_{q\ne g_1,g_2,g_3,g_4}\right\}\right)^2\right) = 0,$$

where constant K is independent of p.

Thus

$$\prod_{s=1}^{2} \mathbf{1}_{\{i_{g_{2s-1}}=\ i_{g_{2s}}\ne 0\}} \underset{p\to\infty}{\text{l.i.m.}} \sum_{j_1,\ldots,j_k=0}^{p} C_{j_k\ldots j_1} \prod_{s=1}^{2} \mathbf{1}_{\{j_{g_{2s-1}}=\ j_{g_{2s}}\}} \times$$

$$\times J'[\phi_{j_{q_1}}\ldots\phi_{j_{q_{k-4}}}]_{T,t}^{(i_{q_1}\ldots i_{q_{k-4}})} = \frac{1}{4}\prod_{s=1}^{2} \mathbf{1}_{\{g_{2s}=g_{2s-1}+1\}} J[\psi^{(k)}]_{T,t}^{s_2,s_1} \quad \text{w. p. 1},$$

where $g_3 \stackrel{\sf def}{=} s_2$, $g_1 \stackrel{\sf def}{=} s_1$, $(s_2, s_1) \in \mathrm{A}_{k,2}$, $J[\psi^{(k)}]_{T,t}^{s_2,s_1}$ is defined by (319) and $\mathrm{A}_{k,2}$ is defined by (320).

Involving into consideration the third pair $\{g_6, g_5\}$ ($\{g_1, g_2\}$ is the first pair and $\{g_4, g_3\}$ is the second pair), we obtain from (369) for $r = 3$

$$\prod_{s=1}^{3} \mathbf{1}_{\{i_{g_{2s-1}}=\ i_{g_{2s}}\ne 0\}} \underset{p\to\infty}{\text{l.i.m.}} \sum_{j_1,\ldots,j_k=0}^{p} C_{j_k\ldots j_1} \prod_{s=1}^{3} \mathbf{1}_{\{j_{g_{2s-1}}=\ j_{g_{2s}}\}} \times$$

$$\times J'[\phi_{j_{q_1}}\ldots\phi_{j_{q_{k-6}}}]_{T,t}^{(i_{q_1}\ldots i_{q_{k-6}})} = \prod_{s=1}^{3} \mathbf{1}_{\{i_{g_{2s-1}}=\ i_{g_{2s}}\ne 0\}} \times$$

$$\times \underset{p\to\infty}{\text{l.i.m.}} \sum_{\substack{j_1,\ldots,j_q,\ldots,j_k=0\\ q\ne g_1,g_2,g_3,g_4,g_5,g_6}}^{p} \left(\frac{1}{2^3} C_{j_k\ldots j_1}\Bigg|_{(j_{g_2}j_{g_1})\curvearrowright(\cdot)(j_{g_4}j_{g_3})\curvearrowright(\cdot)(j_{g_6}j_{g_5})\curvearrowright(\cdot),j_{g_1}=\ j_{g_2},j_{g_3}=\ j_{g_4},j_{g_5}=\ j_{g_6}} \times\right.$$

$$\times \prod_{s=1}^{3} \mathbf{1}_{\{g_{2s}=g_{2s-1}+1\}} -$$

$$-\frac{1}{2^2}\sum_{j_{g_1}=p+1}^{\infty} C_{j_k\ldots j_1}\Bigl|_{(j_{g_4}j_{g_3})\curvearrowright(\cdot)(j_{g_6}j_{g_5})\curvearrowright(\cdot),j_{g_1}=\,j_{g_2},j_{g_3}=\,j_{g_4},j_{g_5}=\,j_{g_6}}\mathbf{1}_{\{g_4=g_3+1\}}\mathbf{1}_{\{g_6=g_5+1\}}-$$

$$-\frac{1}{2^2}\sum_{j_{g_3}=p+1}^{\infty} C_{j_k\ldots j_1}\Bigl|_{(j_{g_2}j_{g_1})\curvearrowright(\cdot)(j_{g_6}j_{g_5})\curvearrowright(\cdot),j_{g_1}=\,j_{g_2},j_{g_3}=\,j_{g_4},j_{g_5}=\,j_{g_6}}\mathbf{1}_{\{g_2=g_1+1\}}\mathbf{1}_{\{g_6=g_5+1\}}-$$

$$\times C_{j_k\ldots j_1}\Bigl|_{(j_{g_2}j_{g_1})\curvearrowright j_{m_1}\ldots(j_{g_{2r}}j_{g_{2r-1}})\curvearrowright j_{m_{2r-1}},j_{g_1}=\,j_{g_2},\ldots,j_{g_{2r-1}}=\,j_{g_{2r}}} \times$$

$$\times \zeta_{j_{m_1}}^{(0)} \zeta_{j_{m_3}}^{(0)} \ldots \zeta_{j_{m_{2r-1}}}^{(0)} J'[\phi_{j_{q_1}} \ldots \phi_{j_{q_{k-2r}}}]_{T,t}^{(i_{q_1}\ldots i_{q_{k-2r}})} =$$

$$= \frac{1}{2^r}\underset{p\to\infty}{\text{l.i.m.}} \sum_{\substack{j_1,\ldots,j_q,\ldots,j_k=0\\ q\ne g_1,g_2,\ldots,g_{2r-1},g_{2r}}}^{p} \sum_{j_{m_1},j_{m_3}\ldots,j_{m_{2r-1}}=0}^{p} \prod_{s=1}^{r} \mathbf{1}_{\{i_{g_{2s-1}}=\,i_{g_{2s}}\ne 0\}} \times$$

$$\times C_{j_k\ldots j_1}\Bigl|_{(j_{g_2}j_{g_1})\curvearrowright j_{m_1}\ldots(j_{g_{2r}}j_{g_{2r-1}})\curvearrowright j_{m_{2r-1}},j_{g_1}=\,j_{g_2},\ldots,j_{g_{2r-1}}=\,j_{g_{2r}}} \times$$

$$\times J'[\phi_{j_{m_1}} \phi_{j_{m_3}} \ldots \phi_{j_{m_{2r-1}}} \phi_{j_{q_1}} \ldots \phi_{j_{q_{k-2r}}}]_{T,t}^{(00\ldots 0 i_{q_1}\ldots i_{q_{k-2r}})} = \tag{376}$$

$$= \frac{1}{2^r} J[\psi^{(k)}]_{T,t}^{s_r,\ldots,s_1} \quad \text{w. p. 1.} \tag{377}$$

The transition from (376) to (377) is based on (333).

Note that

$$C_{j_k\ldots j_1}\Bigg|_{(j_{g_2}j_{g_1})\curvearrowright j_{m_1}, j_{g_1}=\ j_{g_2}} = C_{j_k\ldots j_1}\Bigg|_{(j_{g_1}j_{g_1})\curvearrowright j_{m_1}, j_{g_1}=\ j_{g_2}}$$

is the Fourier coefficient, where $g_2 = g_1 + 1$. Therefore, the value

$$C_{j_k\ldots j_1}\Bigg|_{(j_{g_2}j_{g_1})\curvearrowright j_{m_1}\ldots(j_{g_{2d}}j_{g_{2d-1}})\curvearrowright j_{m_{2d-1}}, j_{g_1}=\ j_{g_2},\ldots,j_{g_{2d-1}}=\ j_{g_{2d}}} =$$

$$= C_{j_k\ldots j_1}\Bigg|_{(j_{g_1}j_{g_1})\curvearrowright j_{m_1}\ldots(j_{g_{2d-1}}j_{g_{2d-1}})\curvearrowright j_{m_{2d-1}}, j_{g_1}=\ j_{g_2},\ldots,j_{g_{2d-1}}=\ j_{g_{2d}}}$$

is determined recursively using (324) in an obvious way for $g_2 = g_1 + 1, \ldots, g_{2d} = g_{2d-1} + 1$ and $d = 2, \ldots, r$.

By Condition 3 of Theorem 20 we have (also see the property (165) of multiple Wiener stochastic integral)

$$\lim_{p\to\infty} \mathsf{M}\left\{\left(R_{T,t}^{(p)r,g_1,g_2,\ldots,g_{2r-1},g_{2r}}\right)^2\right\} \le$$

$$\le K \lim_{p\to\infty} \sum_{\substack{j_1,\ldots,j_q,\ldots,j_k=0\\ q\ne g_1,g_2,\ldots,g_{2r-1},g_{2r}}}^{p} \left(\left(\bar{C}^{(p)}_{j_k\ldots j_q\ldots j_1}\Bigg|_{q\ne g_1,g_2,\ldots,g_{2r-1},g_{2r}}\right)^2 +\right.$$

$$+\sum_{l_1=1}^{r}\left(S_{l_1}\left\{\bar{C}^{(p)}_{j_k\ldots j_q\ldots j_1}\Bigg|_{q\ne g_1,g_2,\ldots,g_{2r-1},g_{2r}}\right\}\right)^2 +$$

$$+\sum_{\substack{l_1,l_2=1\\ l_1>l_2}}^{r}\left(S_{l_1}S_{l_2}\left\{\bar{C}^{(p)}_{j_k\ldots j_q\ldots j_1}\Bigg|_{q\ne g_1,g_2,\ldots,g_{2r-1},g_{2r}}\right\}\right)^2 +$$

$$\ldots$$

$$\left.+\sum_{\substack{l_1,l_2,\ldots,l_{r-1}=1\\ l_1>l_2>\ldots>l_{r-1}}}^{r}\left(S_{l_1}S_{l_2}\ldots S_{l_{r-1}}\left\{\bar{C}^{(p)}_{j_k\ldots j_q\ldots j_1}\Bigg|_{q\ne g_1,g_2,\ldots,g_{2r-1},g_{2r}}\right\}\right)^2\right) = 0,$$

where constant K does not depend on p.

So we have

$$\prod_{s=1}^{r}\mathbf{1}_{\{i_{g_{2s-1}}=\ i_{g_{2s}}\ne 0\}}\underset{p\to\infty}{\text{l.i.m.}}\sum_{j_1,\ldots,j_k=0}^{p} C_{j_k\ldots j_1}\prod_{s=1}^{r}\mathbf{1}_{\{j_{g_{2s-1}}=\ j_{g_{2s}}\}}\times$$

$$\times J'[\phi_{j_{q_1}}\ldots\phi_{j_{q_{k-2r}}}]_{T,t}^{(i_{q_1}\ldots i_{q_{k-2r}})} =$$

$$= \frac{1}{2^r}\prod_{s=1}^{r}\mathbf{1}_{\{g_{2s}=g_{2s-1}+1\}} J[\psi^{(k)}]_{T,t}^{s_r,\ldots,s_1} \quad \text{w. p. 1,} \tag{378}$$

where $g_{2i-1} \stackrel{\sf def}{=} s_i;\ i = 1, 2, \ldots, r;\ r = 1, 2, \ldots, [k/2]\,,\ (s_r, \ldots, s_1) \in \mathrm{A}_{k,r},\ J[\psi^{(k)}]_{T,t}^{s_r,\ldots,s_1}$ is defined by (319) and $\mathrm{A}_{k,r}$ is defined by (320).

Note that

$$\sum_{\substack{(\{\{g_1,g_2\},\ldots,\{g_{2r-1},g_{2r}\}\},\{q_1,\ldots,q_{k-2r}\})\\ \{g_1,g_2,\ldots,g_{2r-1},g_{2r},q_1,\ldots,q_{k-2r}\}=\{1,2,\ldots,k\}}} \Biggl.\Biggr|_{g_2=g_1+1,g_3=g_2+1,\ldots,g_{2r}=g_{2r-1}+1} A_{g_1,g_3,\ldots,g_{2r-1}} =$$

$$= \sum_{(s_r,\ldots,s_1)\in\mathrm{A}_{k,r}} A_{s_1,s_2,\ldots,s_r}, \tag{379}$$

where $A_{g_1,g_3,\ldots,g_{2r-1}},\ A_{s_1,s_2,\ldots,s_r}$ are scalar values, $g_{2i-1} = s_i;\ i = 1, 2, \ldots, r;\ r = 1, 2, \ldots, [k/2]\,,\ \mathrm{A}_{k,r}$ is defined by (320):

$$\mathrm{A}_{k,r} = \bigl\{(s_r, \ldots, s_1):\ s_r > s_{r-1} + 1, \ldots, s_2 > s_1 + 1,\ s_r, \ldots, s_1 = 1, \ldots, k-1\bigr\}.$$

Using (362), (378), (379), and Theorem 19, we finally get

$$\underset{p\to\infty}{\text{l.i.m.}} \sum_{j_1,\ldots,j_k=0}^{p} C_{j_k\ldots j_1}\prod_{l=1}^{k}\zeta_{j_l}^{(i_l)} = \underset{p\to\infty}{\text{l.i.m.}} \sum_{j_1,\ldots,j_k=0}^{p} C_{j_k\ldots j_1}\zeta_{j_1}^{(i_1)}\ldots\zeta_{j_k}^{(i_k)} =$$

$$= J[\psi^{(k)}]_{T,t}^{(i_1\ldots i_k)} + \sum_{r=1}^{[k/2]}\frac{1}{2^r}\sum_{(s_r,\ldots,s_1)\in\mathrm{A}_{k,r}} J[\psi^{(k)}]_{T,t}^{s_r,\ldots,s_1} = J^*[\psi^{(k)}]_{T,t}^{(i_1\ldots i_k)} \tag{380}$$

w. p. 1, where (see (319))

$$J[\psi^{(k)}]_{T,t}^{s_r,\ldots,s_1} \stackrel{\rm def}{=} \prod_{p=1}^{r}\mathbf{1}_{\{i_{s_p}=i_{s_p+1}\neq 0\}}\ \times$$

$$\times \int\limits_t^T \psi_k(t_k)\ldots \int\limits_t^{t_{s_r+3}} \psi_{s_r+2}(t_{s_r+2}) \int\limits_t^{t_{s_r+2}} \psi_{s_r}(t_{s_r+1})\psi_{s_r+1}(t_{s_r+1})\times$$

$$\times \int\limits_t^{t_{s_r+1}} \psi_{s_r-1}(t_{s_r-1})\ldots \int\limits_t^{t_{s_1+3}} \psi_{s_1+2}(t_{s_1+2}) \int\limits_t^{t_{s_1+2}} \psi_{s_1}(t_{s_1+1})\psi_{s_1+1}(t_{s_1+1})\times$$

$$\times \int\limits_t^{t_{s_1+1}} \psi_{s_1-1}(t_{s_1-1})\ldots \int\limits_t^{t_2} \psi_1(t_1)d\mathbf{w}_{t_1}^{(i_1)}\ldots d\mathbf{w}_{t_{s_1-1}}^{(i_{s_1-1})} dt_{s_1+1} d\mathbf{w}_{t_{s_1+2}}^{(i_{s_1+2})}\ldots$$

$$\ldots\ d\mathbf{w}_{t_{s_r-1}}^{(i_{s_r-1})}dt_{s_r+1}d\mathbf{w}_{t_{s_r+2}}^{(i_{s_r+2})}\ldots d\mathbf{w}_{t_k}^{(i_k)}. \tag{381}$$

Theorem 20 is proved.

Let us make a number of remarks about Theorem 20. An expansion similar to (331) was obtained in [66], where the author used a definition of the Stratonovich stochastic integral, which differs from the definition from [2]. The proof from [66] is somewhat simpler than the proof proposed in this section. However, the results from [66] were obtained under the condition of convergence of trace series. The verification of this condition for the kernel (4) is a separate problem. In our proof we essentially use the structure of the Fourier coefficients (332) corresponding to the kernel (4). This circumstance actually made it possible to prove Theorem 20 using not the condition of finiteness of trace series, but using the condition of convergence to zero of explicit expressions for the remainders of the mentioned series. This leaves hope that it is possible to prove an analogue of Theorems 12–14 for the case of arbitrary k ($k\in\mathbb{N}$) (see Theorems 26–29 below).

Note that under the conditions of Theorem 20 (also see (354), (361)) the sequential order of the series

$$\sum_{j_{g_{2r-1}}=p+1}^{\infty}\sum_{j_{g_{2r-3}}=p+1}^{\infty}\ldots\sum_{j_{g_3}=p+1}^{\infty}\sum_{j_{g_1}=p+1}^{\infty}$$

is not important.

We also note that the first and second conditions of Theorem 20 are satisfied for complete orthonormal systems of Legendre polynomials and trigonometric functions in the space $L_2([t,T])$ (see the proofs of Theorems 1–4 and Theorems 23–25 below). Moreover, (329) is true for an arbitrary basis in $L_2([t,T])$ (see (195)). It is easy to see that in the proofs of Theorems 1–4, 23–25 the conditions of Theorem 20 are verified for various special cases of iterated Stratonovich stochastic integrals of multiplicities 2–5 with respect to components of the multidimensional Wiener process.

Taking into account Theorem 5, we can formulate an analogue of Theorem 20 for the case of integration interval $[t,s]$ ($s\in(t,T]$) of iterated Stratonovich stochastic integrals of multiplicity k ($k\in\mathbb{N}$).

Denote

$$\bar{C}_{j_k\ldots j_q\ldots j_1}^{(p)}(s)\Biggl|_{q\ne g_1,g_2,\ldots,g_{2r-1},g_{2r}}\stackrel{\sf def}{=}$$

$$\stackrel{\sf def}{=}\sum_{j_{g_{2r-1}}=p+1}^{\infty}\sum_{j_{g_{2r-3}}=p+1}^{\infty}\ldots\sum_{j_{g_3}=p+1}^{\infty}\sum_{j_{g_1}=p+1}^{\infty}C_{j_k\ldots j_1}(s)\Biggl|_{j_{g_1}=j_{g_2},\ldots,j_{g_{2r-1}}=j_{g_{2r}}}$$

and introduce the following notation

$$S_l\left\{\bar{C}_{j_k\ldots j_q\ldots j_1}^{(p)}(s)\Biggl|_{q\ne g_1,g_2,\ldots,g_{2r-1},g_{2r}}\right\}\stackrel{\sf def}{=}\frac{1}{2}\mathbf{1}_{\{g_{2l}=g_{2l-1}+1\}}\sum_{j_{g_{2r-1}}=p+1}^{\infty}\sum_{j_{g_{2r-3}}=p+1}^{\infty}\ldots$$

$$\ldots\sum_{j_{g_{2l+1}}=p+1}^{\infty}\sum_{j_{g_{2l-3}}=p+1}^{\infty}\ldots\sum_{j_{g_3}=p+1}^{\infty}\sum_{j_{g_1}=p+1}^{\infty}C_{j_k\ldots j_1}(s)\Biggl|_{(j_{g_{2l}}j_{g_{2l-1}})\curvearrowright(\cdot),j_{g_1}=j_{g_2},\ldots,j_{g_{2r-1}}=j_{g_{2r}}},$$

where $l=1,2,\ldots,r$,

$$
C_{j_k\ldots j_1}(s)\Biggl|_{(j_{g_{2l}}j_{g_{2l-1}})\curvearrowright(\cdot)}
$$

is defined by analogy with (323),

$$
C_{j_k\ldots j_1}(s)=\int\limits_t^s\psi_k(t_k)\phi_{j_k}(t_k)\ldots\int\limits_t^{t_2}\psi_1(t_1)\phi_{j_1}(t_1)dt_1\ldots dt_k. \tag{382}
$$

Theorem 22 [26], [34], [50], [72]. *Assume that the continuously differentiable functions $\psi_l(\tau)$ $(l=1,\ldots,k)$ and the complete orthonormal system $\{\phi_j(x)\}_{j=0}^{\infty}$ of continuous functions $(\phi_0(x)=1/\sqrt{T-t})$ in the space $L_2([t,T])$ are such that the following conditions are satisfied*:

1. *The equality*

$$
\frac{1}{2}\int\limits_t^s\Phi_1(t_1)\Phi_2(t_1)dt_1=\sum_{j_1=0}^{\infty}\int\limits_t^s\Phi_2(t_2)\phi_{j_1}(t_2)\int\limits_t^{t_2}\Phi_1(t_1)\phi_{j_1}(t_1)dt_1dt_2 \tag{383}
$$

holds for all $s\in(t,T]$, where the nonrandom functions $\Phi_1(\tau)$, $\Phi_2(\tau)$ are continuously differentiable on $[t,T]$ and the series on the right-hand side of (383) converges absolutely.

2. *The estimates*

$$
\left|\int\limits_t^s\phi_j(\tau)\Phi_1(\tau)d\tau\right|\le\frac{\Psi_1(s)}{j^{1/2+\alpha}},\quad \left|\int\limits_\tau^s\phi_j(\theta)\Phi_2(\theta)d\theta\right|\le\frac{\Psi_2(s,\tau)}{j^{1/2+\alpha}},
$$

$$
\left|\sum_{j=p+1}^{\infty}\int\limits_t^s\Phi_2(\tau)\phi_j(\tau)\int\limits_t^{\tau}\Phi_1(\theta)\phi_j(\theta)d\theta d\tau\right|\le\frac{\Psi_3(s)}{p^{\beta}}
$$

hold for all s,τ such that $t<\tau<s<T$ and for some $\alpha,\beta>0$, where $\Phi_1(\tau)$, $\Phi_2(\tau)$ are continuously differentiable nonrandom functions on $[t,T]$, $j,p\in\mathbb{N}$, and

$$
\int\limits_t^s|\Psi_1(\tau)\Psi_2(s,\tau)|\,d\tau<\infty,\quad \int\limits_t^s|\Psi_3(\tau)|\,d\tau<\infty
$$

for all $s\in(t,T)$.

3. *The condition*

$$
\lim_{p\to\infty}\sum_{\substack{j_1,\ldots,j_q,\ldots,j_k=0\\ q\ne g_1,g_2,\ldots,g_{2r-1},g_{2r}}}^{p}\left(S_{l_1}S_{l_2}\ldots S_{l_d}\left\{\bar C_{j_k\ldots j_q\ldots j_1}^{(p)}(s)\Biggl|_{q\ne g_1,g_2,\ldots,g_{2r-1},g_{2r}}\right\}\right)^2=0
$$

holds for all possible $g_1,g_2,\ldots,g_{2r-1},g_{2r}$ (see (315)) and $l_1,l_2,\ldots,l_d$ such that $l_1,l_2,\ldots,l_d\in\{1,2,\ldots,r\}$, $l_1>l_2>\ldots>l_d$, $d=0,1,2,\ldots,r-1$, where $r=1,2,\ldots,[k/2]$ and

$$S_{l_1}S_{l_2}\ldots S_{l_d}\left\{\bar C^{(p)}_{j_k\ldots j_q\ldots j_1}(s)\Biggr|_{q\ne g_1,g_2,\ldots,g_{2r-1},g_{2r}}\right\}\stackrel{\sf def}{=}\bar C^{(p)}_{j_k\ldots j_q\ldots j_1}(s)\Biggr|_{q\ne g_1,g_2,\ldots,g_{2r-1},g_{2r}}$$

for $d=0$.

Then, for the iterated Stratonovich stochastic integral of arbitrary multiplicity k

$$J^*[\psi^{(k)}]_{s,t}^{(i_1\ldots i_k)}=\int\limits_t^{*s}\psi_k(t_k)\ldots\int\limits_t^{*t_2}\psi_1(t_1)d{\bf w}_{t_1}^{(i_1)}\ldots d{\bf w}_{t_k}^{(i_k)} \qquad (384)$$

the following expansion

$$J^*[\psi^{(k)}]_{s,t}^{(i_1\ldots i_k)}=\underset{p\to\infty}{\text{l.i.m.}}\sum_{j_1,\ldots,j_k=0}^{p}C_{j_k\ldots j_1}(s)\prod_{l=1}^{k}\zeta_{j_l}^{(i_l)}$$

that converges in the mean-square sense is valid, where $C_{j_k\ldots j_1}(s)$ *is the Fourier coefficient* (382), l.i.m. *is a limit in the mean-square sense,* $i_1,\ldots,i_k=0,1,\ldots,m,$ $s\in(t,T)$,

$$\zeta_j^{(i)}=\int\limits_t^T\phi_j(s)d{\bf w}_s^{(i)}$$

are independent standard Gaussian random variables for various i *or* j (*in the case when* $i\ne 0$), ${\bf w}_\tau^{(i)}={\bf f}_\tau^{(i)}$ *for* $i=1,\ldots,m$ *and* ${\bf w}_\tau^{(0)}=\tau$.

It is easy to see that the estimates (87), (95), (214), (217) and the results of Sect. 12 imply the fulfillment of Conditions 2 of Theorem 22 for complete orthonormal systems of Legendre polynomials and trigonometric functions in the space $L_2([t,T])$.

Also the equality (195) guarantees the fulfillment of Condition 1 of Theorem 22 for these two systems of functions.

It should be noted that (see (375))

$$(-1)^r\bar C^{(p)}_{j_k\ldots j_q\ldots j_1}\Biggr|_{q\ne g_1,g_2,\ldots,g_{2r-1},g_{2r}}+$$

$$+(-1)^{r-1}\sum_{l_1=1}^{r}S_{l_1}\left\{\bar C^{(p)}_{j_k\ldots j_q\ldots j_1}\Biggr|_{q\ne g_1,g_2,\ldots,g_{2r-1},g_{2r}}\right\}+$$

$$+(-1)^{r-2}\sum_{\substack{l_1,l_2=1\\ l_1>l_2}}^{r}S_{l_1}S_{l_2}\left\{\bar C^{(p)}_{j_k\ldots j_q\ldots j_1}\Biggr|_{q\ne g_1,g_2,\ldots,g_{2r-1},g_{2r}}\right\}+$$

$$\ldots$$

$$+(-1)^{1}\sum_{\substack{l_1,l_2,\ldots,l_{r-1}=1\\ l_1>l_2>\ldots>l_{r-1}}}^{r}S_{l_1}S_{l_2}\ldots S_{l_{r-1}}\left\{\bar C^{(p)}_{j_k\ldots j_q\ldots j_1}\Biggr|_{q\ne g_1,g_2,\ldots,g_{2r-1},g_{2r}}\right\}=$$

$$= \sum_{j_{g_1}=0}^{p} \ldots \sum_{j_{g_{2r-1}}=0}^{p} C_{j_k \ldots j_1}\Biggl|_{j_{g_1}=j_{g_2},\ldots,j_{g_{2r-1}}=j_{g_{2r}}} -$$

$$-\frac{1}{2^r}\prod_{l=1}^{r} \mathbf{1}_{\{g_{2l}=g_{2l-1}+1\}} C_{j_k \ldots j_1}\Biggl|_{(j_{g_2}j_{g_1})\curvearrowright(\cdot)\ldots(j_{g_{2r}}j_{g_{2r-1}})\curvearrowright(\cdot),\, j_{g_1}=\, j_{g_2},\ldots,j_{g_{2r-1}}=\, j_{g_{2r}}}, \tag{385}$$

where the meaning of the notations used in (375) is preserved.

For example, from (385) for the case $r=2$ we get

$$\sum_{j_{g_3}=p+1}^{\infty}\sum_{j_{g_1}=p+1}^{\infty} C_{j_k \ldots j_1}\Biggl|_{j_{g_1}=\, j_{g_2},j_{g_3}=\, j_{g_4}} -$$

$$-\frac{1}{2}\mathbf{1}_{\{g_4=g_3+1\}}\sum_{j_{g_1}=p+1}^{\infty} C_{j_k \ldots j_1}\Biggl|_{(j_{g_4}j_{g_3})\curvearrowright(\cdot),\, j_{g_1}=\, j_{g_2},j_{g_3}=\, j_{g_4}} -$$

$$-\frac{1}{2}\mathbf{1}_{\{g_2=g_1+1\}}\sum_{j_{g_3}=p+1}^{\infty} C_{j_k \ldots j_1}\Biggl|_{(j_{g_2}j_{g_1})\curvearrowright(\cdot),\, j_{g_1}=\, j_{g_2},j_{g_3}=\, j_{g_4}} =$$

$$= \sum_{j_{g_1}=0}^{p}\sum_{j_{g_3}=0}^{p} C_{j_k \ldots j_1}\Biggl|_{j_{g_1}=j_{g_2},j_{g_3}=j_{g_4}} -$$

$$-\frac{1}{4}\mathbf{1}_{\{g_2=g_1+1\}}\mathbf{1}_{\{g_4=g_3+1\}} C_{j_k \ldots j_1}\Biggl|_{(j_{g_2}j_{g_1})\curvearrowright(\cdot)(j_{g_4}j_{g_3})\curvearrowright(\cdot),\, j_{g_1}=\, j_{g_2},j_{g_3}=\, j_{g_4}}.$$

As a result, Condition 3 of Theorem 20 can be replaced by a weaker condition

$$\lim_{p\to\infty}\sum_{\substack{j_1,\ldots,j_q,\ldots,j_k=0\\ q\ne g_1,g_2,\ldots,g_{2r-1},g_{2r}}}^{p}\Biggl(\sum_{j_{g_1}=0}^{p}\ldots\sum_{j_{g_{2r-1}}=0}^{p} C_{j_k \ldots j_1}\Biggl|_{j_{g_1}=j_{g_2},\ldots,j_{g_{2r-1}}=j_{g_{2r}}} -$$

$$-\frac{1}{2^r}\prod_{l=1}^{r} \mathbf{1}_{\{g_{2l}=g_{2l-1}+1\}} C_{j_k \ldots j_1}\Biggl|_{(j_{g_2}j_{g_1})\curvearrowright(\cdot)\ldots(j_{g_{2r}}j_{g_{2r-1}})\curvearrowright(\cdot),\, j_{g_1}=\, j_{g_2},\ldots,j_{g_{2r-1}}=\, j_{g_{2r}}}\Biggr)^2 = 0, \tag{386}$$

where $r=1,2,\ldots,[k/2]$.

However, Condition 3 of Theorem 20 itself contains a way of proving of the condition (386), which is partially realized in the proof of Theorems 23–25, 30 (see below).

In fact, when proving Theorem 25 (the case $r=3$ is proved in Theorem 30 for $\psi_1(\tau),\ldots,\psi_6(\tau)\equiv 1$), we proved the following equality

$$\lim_{p\to\infty}\sum_{j_{g_1}=0}^{p}\sum_{j_{g_3}=0}^{p} C_{j_k \ldots j_1}\Biggl|_{j_{g_1}=j_{g_2},j_{g_3}=j_{g_4}} =$$

$$= \frac{1}{4} \mathbf{1}_{\{g_2=g_1+1\}} \mathbf{1}_{\{g_4=g_3+1\}} C_{j_k \ldots j_1} \Bigg|_{(j_{g_2} j_{g_1}) \curvearrowright (\cdot) (j_{g_4} j_{g_3}) \curvearrowright (\cdot), j_{g_1} = j_{g_2}, j_{g_3} = j_{g_4}}.$$

On the other hand, iterative application of (361) gives

$$\sum_{j_{g_1}=0}^{\infty} \ldots \sum_{j_{g_{2r-1}}=0}^{\infty} C_{j_k \ldots j_1} \Bigg|_{j_{g_1}=j_{g_2}, \ldots, j_{g_{2r-1}}=j_{g_{2r}}} =$$

$$= \frac{1}{2^r} \prod_{l=1}^{r} \mathbf{1}_{\{g_{2l}=g_{2l-1}+1\}} C_{j_k \ldots j_1} \Bigg|_{(j_{g_2} j_{g_1}) \curvearrowright (\cdot) \ldots (j_{g_{2r}} j_{g_{2r-1}}) \curvearrowright (\cdot), j_{g_1} = j_{g_2}, \ldots, j_{g_{2r-1}} = j_{g_{2r}}},$$

where $r = 1, 2, \ldots, [k/2]$.

14. Expansion of Iterated Stratonovich Stochastic Integrals of Multiplicity 3. The Case $p_1 = p_2 = p_3 \to \infty$ and Continuously Differentiable Weight Functions $\psi_1(\tau)$, $\psi_2(\tau)$, $\psi_3(\tau)$ (The Cases of Legendre Polynomials and Trigonometric Functions)

In this section, we present a simple proof of Theorem 3 based on Theorem 20. In this case, the conditions of Theorem 3 will be weakened.

First, consider the following equalities

$$\frac{1}{2} \int_{t_1}^{t_2} \Phi_1(\tau)\Phi_2(\tau) d\tau = \sum_{j=0}^{\infty} \int_{t_1}^{t_2} \Phi_2(\tau)\phi_j(\tau) \int_{t_1}^{\tau} \Phi_1(\theta)\phi_j(\theta) d\theta d\tau, \tag{387}$$

$$\frac{1}{2} \int_{t_1}^{t_2} \Phi_1(\tau)\Phi_2(\tau) d\tau = \sum_{j=0}^{\infty} \int_{t_1}^{t_2} \Phi_1(\theta)\phi_j(\theta) \int_{\theta}^{t_2} \Phi_2(\tau)\phi_j(\tau) d\tau d\theta \tag{388}$$

that will be used further, where $t \le t_1 < t_2 \le T$, $\Phi_1(\tau), \Phi_2(\tau) \in L_2([t,T])$, $\{\phi_j(x)\}_{j=0}^{\infty}$ is an arbitrary complete orthonormal system of funtions in $L_2([t,T])$. The equality (388) has already been proved (see (206)). Using (388) and Fubini's Theorem, we get (387).

Theorem 23 [26], [34], [50], [72]. *Suppose that $\{\phi_j(x)\}_{j=0}^{\infty}$ is a complete orthonormal system of Legendre polynomials or trigonometric functions in the space $L_2([t,T])$. Furthermore, let $\psi_1(\tau), \psi_2(\tau)$, $\psi_3(\tau)$ are continuously differentiable nonrandom functions on $[t,T]$. Then, for the iterated Stratonovich stochastic integral of third multiplicity*

$$J^*[\psi^{(3)}]_{T,t} = \int\limits_t^{*T} \psi_3(t_3) \int\limits_t^{*t_3} \psi_2(t_2) \int\limits_t^{*t_2} \psi_1(t_1) d\mathbf{w}_{t_1}^{(i_1)} d\mathbf{w}_{t_2}^{(i_2)} d\mathbf{w}_{t_3}^{(i_3)} \tag{389}$$

the following expansion

$$J^*[\psi^{(3)}]_{T,t} = \underset{p\to\infty}{\text{l.i.m.}} \sum_{j_1,j_2,j_3=0}^{p} C_{j_3 j_2 j_1} \zeta_{j_1}^{(i_1)} \zeta_{j_2}^{(i_2)} \zeta_{j_3}^{(i_3)}$$

that converges in the mean-square sense is valid, where $i_1, i_2, i_3 = 0, 1, \ldots, m$,

$$C_{j_3j_2j_1} = \int\limits_t^T \psi_3(t_3)\phi_{j_3}(t_3) \int\limits_t^{t_3} \psi_2(t_2)\phi_{j_2}(t_2) \int\limits_t^{t_2} \psi_1(t_1)\phi_{j_1}(t_1)dt_1dt_2dt_3$$

and

$$\zeta_j^{(i)} = \int\limits_t^T \phi_j(s)d\mathbf{w}_s^{(i)}$$

are independent standard Gaussian random variables for various i *or* j *(in the case when* $i \neq 0$*),* $\mathbf{w}_\tau^{(i)} = \mathbf{f}_\tau^{(i)}$ *for* $i = 1, \ldots, m$ *and* $\mathbf{w}_\tau^{(0)} = \tau$.

Proof. As follows from the previous sections, Conditions 1 and 2 of Theorem 20 are satisfied for complete orthonormal systems of Legendre polynomials and trigonometric functions in the space $L_2([t, T])$. Let us verify Condition 3 of Theorem 20 for the iterated Stratonovich stochastic integral (389). Thus, we have to check the following conditions

$$\lim_{p\to\infty} \sum_{j_3=0}^{p} \left(\sum_{j_1=p+1}^{\infty} C_{j_3j_1j_1} \right)^2 = 0, \tag{390}$$

$$\lim_{p\to\infty} \sum_{j_1=0}^{p} \left(\sum_{j_3=p+1}^{\infty} C_{j_3j_3j_1} \right)^2 = 0, \tag{391}$$

$$\lim_{p\to\infty} \sum_{j_2=0}^{p} \left(\sum_{j_1=p+1}^{\infty} C_{j_1j_2j_1} \right)^2 = 0. \tag{392}$$

We have

$$\sum_{j_3=0}^{p} \left(\sum_{j_1=p+1}^{\infty} C_{j_3j_1j_1} \right)^2 =$$

$$= \sum_{j_3=0}^{p} \left(\sum_{j_1=p+1}^{\infty} \int\limits_t^T \psi_3(t_3)\phi_{j_3}(t_3) \int\limits_t^{t_3} \psi_2(t_2)\phi_{j_1}(t_2) \int\limits_t^{t_2} \psi_1(t_1)\phi_{j_1}(t_1)dt_1dt_2dt_3 \right)^2 = \tag{393}$$

$$= \sum_{j_3=0}^{p} \left(\int\limits_t^T \psi_3(t_3)\phi_{j_3}(t_3) \sum_{j_1=p+1}^{\infty} \int\limits_t^{t_3} \psi_2(t_2)\phi_{j_1}(t_2) \int\limits_t^{t_2} \psi_1(t_1)\phi_{j_1}(t_1)dt_1dt_2dt_3 \right)^2 \le \tag{394}$$

$$\le \sum_{j_3=0}^{\infty} \left(\int\limits_t^T \psi_3(t_3)\phi_{j_3}(t_3) \sum_{j_1=p+1}^{\infty} \int\limits_t^{t_3} \psi_2(t_2)\phi_{j_1}(t_2) \int\limits_t^{t_2} \psi_1(t_1)\phi_{j_1}(t_1)dt_1dt_2dt_3 \right)^2 = \tag{395}$$

$$= \int\limits_t^T \psi_3^2(t_3) \left(\sum_{j_1=p+1}^{\infty} \int\limits_t^{t_3} \psi_2(t_2)\phi_{j_1}(t_2) \int\limits_t^{t_2} \psi_1(t_1)\phi_{j_1}(t_1)dt_1dt_2 \right)^2 dt_3 \le \tag{396}$$

$$\leq \frac{K}{p^2} \ \to \ 0 \tag{397}$$

if $p \to \infty$, where constant K does not depend on p.

Note that the transition from (393) to (394) is based on the estimate (314) for the polynomial case and its analogue for the trigonometric case, the transition from (395) to (396) is based on the Parseval equality, and the transition from (396) to (397) is also based on the estimate (314) and its analogue for the trigonometric case.

By analogy with the previous case we have

$$\sum_{j_1=0}^{p}\left(\sum_{j_3=p+1}^{\infty} C_{j_3j_3j_1}\right)^2 =$$

$$= \sum_{j_1=0}^{p}\left(\sum_{j_3=p+1}^{\infty}\int\limits_t^T \psi_3(t_3)\phi_{j_3}(t_3)\int\limits_t^{t_3}\psi_2(t_2)\phi_{j_3}(t_2)\int\limits_t^{t_2}\psi_1(t_1)\phi_{j_1}(t_1)dt_1dt_2dt_3\right)^2 =$$

$$= \sum_{j_1=0}^{p}\left(\sum_{j_3=p+1}^{\infty}\int\limits_t^T \psi_1(t_1)\phi_{j_1}(t_1)\int\limits_{t_1}^{T}\psi_2(t_2)\phi_{j_3}(t_2)\int\limits_{t_2}^{T}\psi_3(t_3)\phi_{j_3}(t_3)dt_3dt_2dt_1\right)^2 = \tag{398}$$

$$= \sum_{j_1=0}^{p}\left(\int\limits_t^T \psi_1(t_1)\phi_{j_1}(t_1)\sum_{j_3=p+1}^{\infty}\int\limits_{t_1}^{T}\psi_2(t_2)\phi_{j_3}(t_2)\int\limits_{t_2}^{T}\psi_3(t_3)\phi_{j_3}(t_3)dt_3dt_2dt_1\right)^2 \leq \tag{399}$$

$$\leq \sum_{j_1=0}^{\infty}\left(\int\limits_t^T \psi_1(t_1)\phi_{j_1}(t_1)\sum_{j_3=p+1}^{\infty}\int\limits_{t_1}^{T}\psi_2(t_2)\phi_{j_3}(t_2)\int\limits_{t_2}^{T}\psi_3(t_3)\phi_{j_3}(t_3)dt_3dt_2dt_1\right)^2 =$$

$$= \int\limits_t^T \psi_1^2(t_1)\left(\sum_{j_3=p+1}^{\infty}\int\limits_{t_1}^{T}\psi_2(t_2)\phi_{j_3}(t_2)\int\limits_{t_2}^{T}\psi_1(t_3)\phi_{j_3}(t_3)dt_3dt_2\right)^2 dt_1 \leq \tag{400}$$

$$\leq \frac{K}{p^2} \ \to \ 0 \tag{401}$$

if $p \to \infty$, where constant K is independent of p.

The transition from (398) to (399) is based on an analogue of the estimate (314) for the value

$$\left|\sum_{j_3=p+1}^{\infty}\int\limits_{t_1}^{T}\psi_2(t_2)\phi_{j_3}(t_2)\int\limits_{t_2}^{T}\psi_3(t_3)\phi_{j_3}(t_3)dt_3dt_2\right|$$

for the polynomial and trigonometric cases, the transition from (400) to (401) is also based on the mentioned analogue of the estimate (314).

Further, we have

$$\sum_{j_2=0}^{p}\left(\sum_{j_1=p+1}^{\infty} C_{j_1j_2j_1}\right)^2 =$$

$$= \sum_{j_2=0}^{p} \left(\sum_{j_1=p+1}^{\infty} \int_t^T \psi_3(t_3)\phi_{j_1}(t_3) \int_t^{t_3} \psi_2(t_2)\phi_{j_2}(t_2) \int_t^{t_2} \psi_1(t_1)\phi_{j_1}(t_1)dt_1dt_2dt_3 \right)^2 =$$

$$= \sum_{j_2=0}^{p} \left(\sum_{j_1=p+1}^{\infty} \int_t^T \psi_2(t_2)\phi_{j_2}(t_2) \int_t^{t_2} \psi_1(t_1)\phi_{j_1}(t_1)dt_1 \int_{t_2}^{T} \psi_3(t_3)\phi_{j_1}(t_3)dt_3dt_2 \right)^2 = \tag{402}$$

$$= \sum_{j_2=0}^{p} \left(\int_t^T \psi_2(t_2)\phi_{j_2}(t_2) \sum_{j_1=p+1}^{\infty} \int_t^{t_2} \psi_1(t_1)\phi_{j_1}(t_1)dt_1 \int_{t_2}^{T} \psi_3(t_3)\phi_{j_1}(t_3)dt_3dt_2 \right)^2 \le \tag{403}$$

$$\le \sum_{j_2=0}^{\infty} \left(\int_t^T \psi_2(t_2)\phi_{j_2}(t_2) \sum_{j_1=p+1}^{\infty} \int_t^{t_2} \psi_1(t_1)\phi_{j_1}(t_1)dt_1 \int_{t_2}^{T} \psi_3(t_3)\phi_{j_1}(t_3)dt_3dt_2 \right)^2 =$$

$$= \int_t^T \psi_2^2(t_2) \left(\sum_{j_1=p+1}^{\infty} \int_t^{t_2} \psi_1(t_1)\phi_{j_1}(t_1)dt_1 \int_{t_2}^{T} \psi_3(t_3)\phi_{j_1}(t_3)dt_3 \right)^2 dt_2. \tag{404}$$

The transition from (402) to (403) is based on the estimate (88) and its obvious analogue for the trigonometric case. However, the estimate (88) cannot be used to estimate the right-hand side of (404), since we get the divergent integral. For this reason, we will obtain a new estimate based on the relation (86).

From (29) and the estimate $|P_j(y)| \le 1$, $y \in [-1,1]$ we obtain

$$|P_j(y)| = |P_j(y)|^{\varepsilon} \cdot |P_j(y)|^{1-\varepsilon} \le |P_j(y)|^{1-\varepsilon} < \frac{C}{j^{1/2-\varepsilon/2}(1-y^2)^{1/4-\varepsilon/4}}, \tag{405}$$

where $y \in (-1,1)$, $j \in \mathbb{N}$, and ε is an arbitrary small positive real number.

Combining (86) and (405), we have the following estimate

$$\left| \int_t^s \psi_1(\tau)\phi_{j_1}(\tau)d\tau \right| < \frac{C}{(j_1)^{1-\varepsilon/2}} \left(\frac{1}{(1-z^2(s))^{1/4-\varepsilon/4}} + 1 \right), \tag{406}$$

where $s \in (t,T)$, $z(s)$ is defined by (26), constant C does not depend on j_1.

Similarly to (406) we obtain

$$\left| \int_s^T \psi_3(\tau)\phi_{j_1}(\tau)d\tau \right| < \frac{C}{(j_1)^{1-\varepsilon/2}} \left(\frac{1}{(1-z^2(s))^{1/4-\varepsilon/4}} + 1 \right), \tag{407}$$

where $s \in (t,T)$, constant C does not depend on j_1.

Combining (87) and (407), we have

$$\left| \int_t^s \psi_1(\tau)\phi_{j_1}(\tau)d\tau \int_s^T \psi_3(\tau)\phi_{j_1}(\tau)d\tau \right| <$$

$$< \frac{L}{(j_1)^{2-\varepsilon/2}}\left(\frac{1}{(1-z^2(s))^{1/4-\varepsilon/4}}+1\right)\left(\frac{1}{(1-z^2(s))^{1/4}}+1\right), \tag{408}$$

where $s \in (t,T)$, $z(s)$ is defined by (26), constant L does not depend on j_1.

Observe that

$$\sum_{j_1=p+1}^{\infty}\frac{1}{(j_1)^{2-\varepsilon/2}} \le \int\limits_{p}^{\infty}\frac{dx}{x^{2-\varepsilon/2}} = \frac{1}{(1-\varepsilon/2)p^{1-\varepsilon/2}}. \tag{409}$$

Applying (408) and (409) to estimate the right-hand side of (404) gives

$$\sum_{j_2=0}^{p}\left(\sum_{j_1=p+1}^{\infty}C_{j_1j_2j_1}\right)^2 \le \frac{K}{p^{2-\varepsilon}} \ \to\ 0 \tag{410}$$

if $p\to\infty$, where ε is an arbitrary small positive real number, constant K is independent of p.

The estimation of the right-hand side of (404) for the trigonometric case is carried out using the estimates (95), (96). At that we obtain the estimate (410) with $\varepsilon = 0$. Theorem 23 is proved.

15. Expansion of Iterated Stratonovich Stochastic Integrals of Multiplicity 4. The Case $p_1 = \ldots = p_4 \to \infty$ and Continuously Differentiable Weight Functions $\psi_1(\tau)$, $\ldots$, $\psi_4(\tau)$ (The Cases of Legendre Polynomials and Trigonometric Functions)

Theorem 24 [26], [34], [50], [72]. *Suppose that $\{\phi_j(x)\}_{j=0}^{\infty}$ is a complete orthonormal system of Legendre polynomials or trigonometric functions in the space $L_2([t,T])$. Furthermore, let $\psi_1(\tau),\ldots,$ $\psi_4(\tau)$ are continuously differentiable nonrandom functions on $[t,T]$. Then, for the iterated Stratonovich stochastic integral of fourth multiplicity*

$$J^*[\psi^{(4)}]_{T,t} = \int\limits_t^{*T}\psi_4(t_4)\int\limits_t^{*t_4}\psi_3(t_3)\int\limits_t^{*t_3}\psi_2(t_2)\int\limits_t^{*t_2}\psi_1(t_1)d\mathbf{w}_{t_1}^{(i_1)}d\mathbf{w}_{t_2}^{(i_2)}d\mathbf{w}_{t_3}^{(i_3)}d\mathbf{w}_{t_4}^{(i_4)} \tag{411}$$

the following expansion

$$J^*[\psi^{(4)}]_{T,t} = \underset{p\to\infty}{\text{l.i.m.}}\sum_{j_1,j_2,j_3,j_4=0}^{p}C_{j_4j_3j_2j_1}\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}\zeta_{j_3}^{(i_3)}\zeta_{j_4}^{(i_4)}$$

that converges in the mean-square sense is valid, where $i_1,i_2,i_3,i_4 = 0,1,\ldots,m$,

$$C_{j_4j_3j_2j_1} = \int\limits_t^T\psi_4(t_4)\phi_{j_4}(t_4)\int\limits_t^{t_4}\psi_3(t_3)\phi_{j_3}(t_3)\int\limits_t^{t_3}\psi_2(t_2)\phi_{j_2}(t_2)\int\limits_t^{t_2}\psi_1(t_1)\phi_{j_1}(t_1)dt_1\times$$

$$\times dt_2dt_3dt_4$$

and

$$\zeta_j^{(i)} = \int\limits_t^T \phi_j(s)d\mathbf{w}_s^{(i)}$$

are independent standard Gaussian random variables for various i *or* j *(in the case when* $i \neq 0$*),* $\mathbf{w}_\tau^{(i)} = \mathbf{f}_\tau^{(i)}$ *for* $i = 1, \ldots, m$ *and* $\mathbf{w}_\tau^{(0)} = \tau$*.*

Proof. As follows from the previous sections, Conditions 1 and 2 of Theorem 20 are satisfied for complete orthonormal systems of Legendre polynomials and trigonometric functions in the space $L_2([t,T])$. Let us verify Condition 3 of Theorem 20 for the iterated Stratonovich stochastic integral (411). Thus, we have to check the following conditions

$$\lim_{p\to\infty} \sum_{j_3,j_4=0}^{p} \left(\sum_{j_1=p+1}^{\infty} C_{j_4j_3j_1j_1}\right)^2 = 0, \tag{412}$$

$$\lim_{p\to\infty} \sum_{j_2,j_4=0}^{p} \left(\sum_{j_1=p+1}^{\infty} C_{j_4j_1j_2j_1}\right)^2 = 0, \tag{413}$$

$$\lim_{p\to\infty} \sum_{j_2,j_3=0}^{p} \left(\sum_{j_1=p+1}^{\infty} C_{j_1j_3j_2j_1}\right)^2 = 0, \tag{414}$$

$$\lim_{p\to\infty} \sum_{j_1,j_4=0}^{p} \left(\sum_{j_2=p+1}^{\infty} C_{j_4j_2j_2j_1}\right)^2 = 0, \tag{415}$$

$$\lim_{p\to\infty} \sum_{j_1,j_3=0}^{p} \left(\sum_{j_2=p+1}^{\infty} C_{j_2j_3j_2j_1}\right)^2 = 0, \tag{416}$$

$$\lim_{p\to\infty} \sum_{j_1,j_2=0}^{p} \left(\sum_{j_3=p+1}^{\infty} C_{j_3j_3j_2j_1}\right)^2 = 0, \tag{417}$$

$$\lim_{p\to\infty} \left(\sum_{j_2=p+1}^{\infty} \sum_{j_1=p+1}^{\infty} C_{j_2j_1j_2j_1}\right)^2 = 0, \tag{418}$$

$$\lim_{p\to\infty} \left(\sum_{j_2=p+1}^{\infty} \sum_{j_1=p+1}^{\infty} C_{j_1j_2j_2j_1}\right)^2 = 0, \tag{419}$$

$$\lim_{p\to\infty} \left(\sum_{j_3=p+1}^{\infty} \sum_{j_1=p+1}^{\infty} C_{j_3j_3j_1j_1}\right)^2 = 0, \tag{420}$$

$$\lim_{p\to\infty} \left(\sum_{j_3=p+1}^{\infty} C_{j_3j_3j_1j_1}\Biggl.\Biggr|_{(j_1j_1)\frown(\cdot)}\right)^2 = 0, \tag{421}$$

$$\lim_{p\to\infty}\left(\sum_{j_1=p+1}^{\infty} C_{j_3j_3j_1j_1}\Biggr|_{(j_3j_3)\curvearrowright(\cdot)}\right)^2=0, \tag{422}$$

$$\lim_{p\to\infty}\left(\sum_{j_1=p+1}^{\infty} C_{j_1j_2j_2j_1}\Biggr|_{(j_2j_2)\curvearrowright(\cdot)}\right)^2=0, \tag{423}$$

where in (421)–(423) we use the notation (323).

Applying arguments similar to those we used in the proof of Theorem 23, we obtain for (412)

$$\sum_{j_3,j_4=0}^{p}\left(\sum_{j_1=p+1}^{\infty} C_{j_4j_3j_1j_1}\right)^2=\sum_{j_3,j_4=0}^{p}\left(\sum_{j_1=p+1}^{\infty}\int\limits_t^T\psi_4(t_4)\phi_{j_4}(t_4)\int\limits_t^{t_4}\psi_3(t_3)\phi_{j_3}(t_3)\times\right.$$

$$\left.\times\int\limits_t^{t_3}\psi_2(t_2)\phi_{j_1}(t_2)\int\limits_t^{t_2}\psi_1(t_1)\phi_{j_1}(t_1)dt_1dt_2dt_3dt_4\right)^2= \tag{424}$$

$$=\sum_{j_3,j_4=0}^{p}\left(\int\limits_t^T\psi_4(t_4)\phi_{j_4}(t_4)\int\limits_t^{t_4}\psi_3(t_3)\phi_{j_3}(t_3)\times\right.$$

$$\left.\times\sum_{j_1=p+1}^{\infty}\int\limits_t^{t_3}\psi_2(t_2)\phi_{j_1}(t_2)\int\limits_t^{t_2}\psi_1(t_1)\phi_{j_1}(t_1)dt_1dt_2dt_3dt_4\right)^2\le \tag{425}$$

$$\le\sum_{j_3,j_4=0}^{\infty}\left(\int\limits_t^T\psi_4(t_4)\phi_{j_4}(t_4)\int\limits_t^{t_4}\psi_3(t_3)\phi_{j_3}(t_3)\times\right.$$

$$\left.\times\sum_{j_1=p+1}^{\infty}\int\limits_t^{t_3}\psi_2(t_2)\phi_{j_1}(t_2)\int\limits_t^{t_2}\psi_1(t_1)\phi_{j_1}(t_1)dt_1dt_2dt_3dt_4\right)^2= \tag{426}$$

$$=\int\limits_{[t,T]^2}\mathbf{1}_{\{t_3<t_4\}}\psi_4^2(t_4)\psi_3^2(t_3)\times$$

$$\times\left(\sum_{j_1=p+1}^{\infty}\int\limits_t^{t_3}\psi_2(t_2)\phi_{j_1}(t_2)\int\limits_t^{t_2}\psi_1(t_1)\phi_{j_1}(t_1)dt_1dt_2\right)^2dt_3dt_4\le \tag{427}$$

$$\le\frac{K}{p^2}\ \to\ 0 \tag{428}$$

if $p\to\infty$, where constant K is independent of p.

Note that the transition from (424) to (425) is based on the estimate (314) for the polynomial case and its analogue for the trigonometric case, the transition from (426) to (427) is based on the Parseval equality, and the transition from (427) to (428) is also based on the estimate (314) and its analogue for the trigonometric case.

Further, we have for (413)

$$\sum_{j_2,j_4=0}^{p}\left(\sum_{j_1=p+1}^{\infty}C_{j_4j_1j_2j_1}\right)^2=\sum_{j_2,j_4=0}^{p}\left(\sum_{j_1=p+1}^{\infty}\int\limits_t^T\psi_4(t_4)\phi_{j_4}(t_4)\int\limits_t^{t_4}\psi_3(t_3)\phi_{j_1}(t_3)\times\right.$$

$$\left.\times\int\limits_t^{t_3}\psi_2(t_2)\phi_{j_2}(t_2)\int\limits_t^{t_2}\psi_1(t_1)\phi_{j_1}(t_1)dt_1dt_2dt_3dt_4\right)^2= \tag{429}$$

$$=\sum_{j_2,j_4=0}^{p}\left(\sum_{j_1=p+1}^{\infty}\int\limits_t^T\psi_4(t_4)\phi_{j_4}(t_4)\int\limits_t^{t_4}\psi_2(t_2)\phi_{j_2}(t_2)\times\right.$$

$$\left.\times\int\limits_t^{t_2}\psi_1(t_1)\phi_{j_1}(t_1)dt_1\int\limits_{t_2}^{t_4}\psi_3(t_3)\phi_{j_1}(t_3)dt_3dt_2dt_4\right)^2= \tag{430}$$

$$=\sum_{j_2,j_4=0}^{p}\left(\int\limits_t^T\psi_4(t_4)\phi_{j_4}(t_4)\int\limits_t^{t_4}\psi_2(t_2)\phi_{j_2}(t_2)\times\right.$$

$$\left.\times\sum_{j_1=p+1}^{\infty}\int\limits_t^{t_2}\psi_1(t_1)\phi_{j_1}(t_1)dt_1\int\limits_{t_2}^{t_4}\psi_3(t_3)\phi_{j_1}(t_3)dt_3dt_2dt_4\right)^2\le$$

$$\le\sum_{j_2,j_4=0}^{\infty}\left(\int\limits_t^T\psi_4(t_4)\phi_{j_4}(t_4)\int\limits_t^{t_4}\psi_2(t_2)\phi_{j_2}(t_2)\times\right.$$

$$\left.\times\sum_{j_1=p+1}^{\infty}\int\limits_t^{t_2}\psi_1(t_1)\phi_{j_1}(t_1)dt_1\int\limits_{t_2}^{t_4}\psi_3(t_3)\phi_{j_1}(t_3)dt_3dt_2dt_4\right)^2=$$

$$=\int\limits_{[t,T]^2}\mathbf{1}_{\{t_2<t_4\}}\psi_4^2(t_4)\psi_2^2(t_2)\times$$

$$\times\left(\sum_{j_1=p+1}^{\infty}\int\limits_t^{t_2}\psi_1(t_1)\phi_{j_1}(t_1)dt_1\int\limits_{t_2}^{t_4}\psi_3(t_3)\phi_{j_1}(t_3)dt_3\right)^2dt_2dt_4\le$$

$$\le\frac{K}{p^{2-\varepsilon}}\ \to\ 0 \tag{431}$$

if $p\to\infty$, where ε is an arbitrary small positive real number for the polynomial case and $\varepsilon=0$ for the trigonometric case, constant K does not depend on p.

The relation (431) was obtained by the same method as (428). Note that in obtaining (431) we used the estimates (87) and (214) for the polynomial case and their obvious analogues for the trigonometric case. We also used the integration order replacement in the iterated Riemann integrals (see (429), (430)).

Repeating the previous steps for (414) and (415), we get

$$\sum_{j_2,j_3=0}^{p}\left(\sum_{j_1=p+1}^{\infty}C_{j_1j_3j_2j_1}\right)^2=\sum_{j_2,j_3=0}^{p}\left(\sum_{j_1=p+1}^{\infty}\int\limits_t^T\psi_4(t_4)\phi_{j_1}(t_4)\int\limits_t^{t_4}\psi_3(t_3)\phi_{j_3}(t_3)\times\right.$$

$$\left.\times\int\limits_t^{t_3}\psi_2(t_2)\phi_{j_2}(t_2)\int\limits_t^{t_2}\psi_1(t_1)\phi_{j_1}(t_1)dt_1dt_2dt_3dt_4\right)^2=$$

$$=\sum_{j_2,j_3=0}^{p}\left(\sum_{j_1=p+1}^{\infty}\int\limits_t^T\psi_3(t_3)\phi_{j_3}(t_3)\int\limits_t^{t_3}\psi_2(t_2)\phi_{j_2}(t_2)\times\right.$$

$$\left.\times\int\limits_t^{t_2}\psi_1(t_1)\phi_{j_1}(t_1)dt_1\int\limits_{t_3}^{T}\psi_4(t_4)\phi_{j_1}(t_4)dt_4dt_2dt_3\right)^2=$$

$$=\sum_{j_2,j_3=0}^{p}\left(\int\limits_t^T\psi_3(t_3)\phi_{j_3}(t_3)\int\limits_t^{t_3}\psi_2(t_2)\phi_{j_2}(t_2)\times\right.$$

$$\left.\times\sum_{j_1=p+1}^{\infty}\int\limits_t^{t_2}\psi_1(t_1)\phi_{j_1}(t_1)dt_1\int\limits_{t_3}^{T}\psi_4(t_4)\phi_{j_1}(t_4)dt_4dt_2dt_3\right)^2\le$$

$$\le\sum_{j_2,j_3=0}^{\infty}\left(\int\limits_t^T\psi_3(t_3)\phi_{j_3}(t_3)\int\limits_t^{t_3}\psi_2(t_2)\phi_{j_2}(t_2)\times\right.$$

$$\left.\times\sum_{j_1=p+1}^{\infty}\int\limits_t^{t_2}\psi_1(t_1)\phi_{j_1}(t_1)dt_1\int\limits_{t_3}^{T}\psi_4(t_4)\phi_{j_1}(t_4)dt_4dt_2dt_3\right)^2\le$$

$$=\int\limits_{[t,T]^2}\mathbf{1}_{\{t_2<t_3\}}\psi_3^2(t_3)\psi_2^2(t_2)\times$$

$$\times\left(\sum_{j_1=p+1}^{\infty}\int\limits_t^{t_2}\psi_1(t_1)\phi_{j_1}(t_1)dt_1\int\limits_{t_3}^{T}\psi_4(t_4)\phi_{j_1}(t_4)dt_4\right)^2dt_2dt_3\le$$

$$\le\frac{K}{p^2}\ \to\ 0 \qquad (432)$$

if $p\to\infty$, where constant K does not depend on p;

$$\sum_{j_1,j_4=0}^{p}\left(\sum_{j_2=p+1}^{\infty}C_{j_4j_2j_2j_1}\right)^2=\sum_{j_1,j_4=0}^{p}\left(\sum_{j_2=p+1}^{\infty}\int\limits_t^T\psi_4(t_4)\phi_{j_4}(t_4)\int\limits_t^{t_4}\psi_3(t_3)\phi_{j_2}(t_3)\times\right.$$

$$\left.\times\int\limits_t^{t_3}\psi_2(t_2)\phi_{j_2}(t_2)\int\limits_t^{t_2}\psi_1(t_1)\phi_{j_1}(t_1)dt_1dt_2dt_3dt_4\right)^2=$$

$$
\left. \times \int\limits_{t_1}^{t_4} \psi_2(t_2)\phi_{j_2}(t_2) \int\limits_{t_2}^{t_4} \psi_3(t_3)\phi_{j_2}(t_3) dt_3 dt_2 dt_1 dt_4 \right)^2 =
$$

$$
= \sum_{j_1,j_4=0}^{p} \left(\int\limits_t^T \psi_4(t_4)\phi_{j_4}(t_4) \int\limits_t^{t_4} \psi_1(t_1)\phi_{j_1}(t_1) \times \right.
$$

$$
\left. \times \sum_{j_2=p+1}^{\infty} \int\limits_{t_1}^{t_4} \psi_2(t_2)\phi_{j_2}(t_2) \int\limits_{t_2}^{t_4} \psi_3(t_3)\phi_{j_2}(t_3) dt_3 dt_2 dt_1 dt_4 \right)^2 \le
$$

$$
\le \sum_{j_1,j_4=0}^{\infty} \left(\int\limits_t^T \psi_4(t_4)\phi_{j_4}(t_4) \int\limits_t^{t_4} \psi_1(t_1)\phi_{j_1}(t_1) \times \right.
$$

$$
\left. \times \sum_{j_2=p+1}^{\infty} \int\limits_{t_1}^{t_4} \psi_2(t_2)\phi_{j_2}(t_2) \int\limits_{t_2}^{t_4} \psi_3(t_3)\phi_{j_2}(t_3) dt_3 dt_2 dt_1 dt_4 \right)^2 =
$$

$$
= \int\limits_{[t,T]^2} \mathbf{1}_{\{t_1<t_4\}} \psi_4^2(t_4)\psi_1^2(t_1) \times
$$

$$
\times \left(\sum_{j_2=p+1}^{\infty} \int\limits_{t_1}^{t_4} \psi_2(t_2)\phi_{j_2}(t_2) \int\limits_{t_2}^{t_4} \psi_3(t_3)\phi_{j_2}(t_3) dt_3 dt_2 \right)^2 dt_1 dt_4. \tag{433}
$$

Note that, by virtue of the additivity property of the integral, we have

$$
\sum_{j_2=p+1}^{\infty} \int\limits_{t_1}^{t_4} \psi_2(t_2)\phi_{j_2}(t_2) \int\limits_{t_2}^{t_4} \psi_3(t_3)\phi_{j_2}(t_3) dt_3 dt_2 = \tag{434}
$$

$$
= \sum_{j_2=p+1}^{\infty} \int\limits_t^{t_4} \psi_3(t_3)\phi_{j_2}(t_3) \int\limits_t^{t_3} \psi_2(t_2)\phi_{j_2}(t_2) dt_2 dt_3 -
$$

$$
- \sum_{j_2=p+1}^{\infty} \int\limits_t^{t_1} \psi_3(t_3)\phi_{j_2}(t_3) \int\limits_t^{t_3} \psi_2(t_2)\phi_{j_2}(t_2) dt_2 dt_3 -
$$

$$
- \sum_{j_2=p+1}^{\infty} \int\limits_{t_1}^{t_4} \psi_3(t_3)\phi_{j_2}(t_3) dt_3 \int\limits_t^{t_1} \psi_2(t_2)\phi_{j_2}(t_2) dt_2. \tag{435}
$$

However, all three series on the right-hand side of (435) have already been evaluated in (428) and (431). From (433) and (435) we finally obtain

$$
\sum_{j_1,j_4=0}^{p}\left(\sum_{j_2=p+1}^{\infty}C_{j_4j_2j_2j_1}\right)^2 \le \frac{K}{p^{2-\varepsilon}} \ \to\ 0 \tag{436}
$$

if $p\to\infty$, where ε is an arbitrary small positive real number for the polynomial case and $\varepsilon=0$ for the trigonometric case, constant K does not depend on p.

In complete analogy with (431), we have for (416)

$$
\sum_{j_1,j_3=0}^{p}\left(\sum_{j_2=p+1}^{\infty}C_{j_2j_3j_2j_1}\right)^2 = \sum_{j_1,j_3=0}^{p}\left(\sum_{j_2=p+1}^{\infty}\int\limits_t^T\psi_4(t_4)\phi_{j_2}(t_4)\int\limits_t^{t_4}\psi_3(t_3)\phi_{j_3}(t_3)\times\right.
$$

$$
\left.\times\int\limits_t^{t_3}\psi_2(t_2)\phi_{j_2}(t_2)\int\limits_t^{t_2}\psi_1(t_1)\phi_{j_1}(t_1)dt_1dt_2dt_3dt_4\right)^2 =
$$

$$
=\sum_{j_1,j_3=0}^{p}\left(\sum_{j_2=p+1}^{\infty}\int\limits_t^T\psi_3(t_3)\phi_{j_3}(t_3)\int\limits_t^{t_3}\psi_2(t_2)\phi_{j_2}(t_2)\times\right.
$$

$$
\left.\times\int\limits_t^{t_2}\psi_1(t_1)\phi_{j_1}(t_1)dt_1dt_2\int\limits_{t_3}^{T}\psi_4(t_4)\phi_{j_2}(t_4)dt_4dt_3\right)^2 =
$$

$$
=\sum_{j_1,j_3=0}^{p}\left(\sum_{j_2=p+1}^{\infty}\int\limits_t^T\psi_3(t_3)\phi_{j_3}(t_3)\int\limits_t^{t_3}\psi_1(t_1)\phi_{j_1}(t_1)\times\right.
$$

$$
\left.\times\int\limits_{t_1}^{t_3}\psi_2(t_2)\phi_{j_2}(t_2)dt_2dt_1\int\limits_{t_3}^{T}\psi_4(t_4)\phi_{j_2}(t_4)dt_4dt_3\right)^2 =
$$

$$
=\sum_{j_1,j_3=0}^{p}\left(\int\limits_t^T\psi_3(t_3)\phi_{j_3}(t_3)\int\limits_t^{t_3}\psi_1(t_1)\phi_{j_1}(t_1)\times\right.
$$

$$
\left.\times\sum_{j_2=p+1}^{\infty}\int\limits_{t_1}^{t_3}\psi_2(t_2)\phi_{j_2}(t_2)dt_2dt_1\int\limits_{t_3}^{T}\psi_4(t_4)\phi_{j_2}(t_4)dt_4dt_3\right)^2 \le
$$

$$
\le\sum_{j_1,j_3=0}^{\infty}\left(\int\limits_t^T\psi_3(t_3)\phi_{j_3}(t_3)\int\limits_t^{t_3}\psi_1(t_1)\phi_{j_1}(t_1)\times\right.
$$

$$
\left.\times\sum_{j_2=p+1}^{\infty}\int\limits_{t_1}^{t_3}\psi_2(t_2)\phi_{j_2}(t_2)dt_2\int\limits_{t_3}^{T}\psi_4(t_4)\phi_{j_2}(t_4)dt_4dt_1dt_3\right)^2 =
$$

$$
=\int\limits_{[t,T]^2}\mathbf{1}_{\{t_1<t_3\}}\psi_3^2(t_3)\psi_1^2(t_1)\times
$$

$$\times\left(\sum_{j_2=p+1}^{\infty}\int\limits_{t_1}^{t_3}\psi_2(t_2)\phi_{j_2}(t_2)dt_2\int\limits_{t_3}^{T}\psi_4(t_4)\phi_{j_2}(t_4)dt_4\right)^2 dt_1dt_3 \le$$

$$\le \frac{K}{p^{2-\varepsilon}} \ \to\ 0 \qquad (437)$$

if $p\to\infty$, where ε is an arbitrary small positive real number for the polynomial case and $\varepsilon=0$ for the trigonometric case, constant K does not depend on p.

We have for (417)

$$\sum_{j_1,j_2=0}^{p}\left(\sum_{j_3=p+1}^{\infty}C_{j_3j_3j_2j_1}\right)^2=\sum_{j_1,j_2=0}^{p}\left(\sum_{j_3=p+1}^{\infty}\int\limits_{t}^{T}\psi_4(t_4)\phi_{j_3}(t_4)\int\limits_{t}^{t_4}\psi_3(t_3)\phi_{j_3}(t_3)\times\right.$$

$$\left.\times\int\limits_{t}^{t_3}\psi_2(t_2)\phi_{j_2}(t_2)\int\limits_{t}^{t_2}\psi_1(t_1)\phi_{j_1}(t_1)dt_1dt_2dt_3dt_4\right)^2=$$

$$=\sum_{j_1,j_2=0}^{p}\left(\sum_{j_3=p+1}^{\infty}\int\limits_{t}^{T}\psi_1(t_1)\phi_{j_1}(t_1)\int\limits_{t_1}^{T}\psi_2(t_2)\phi_{j_2}(t_2)\times\right.$$

$$\left.\times\int\limits_{t_2}^{T}\psi_3(t_3)\phi_{j_3}(t_3)\int\limits_{t_3}^{T}\psi_4(t_4)\phi_{j_3}(t_4)dt_4dt_3dt_2dt_1\right)^2=$$

$$=\sum_{j_1,j_2=0}^{p}\left(\int\limits_{t}^{T}\psi_1(t_1)\phi_{j_1}(t_1)\int\limits_{t_1}^{T}\psi_2(t_2)\phi_{j_2}(t_2)\times\right.$$

$$\left.\times\sum_{j_3=p+1}^{\infty}\int\limits_{t_2}^{T}\psi_3(t_3)\phi_{j_3}(t_3)\int\limits_{t_3}^{T}\psi_4(t_4)\phi_{j_3}(t_4)dt_4dt_3dt_2dt_1\right)^2\le$$

$$\le\sum_{j_1,j_2=0}^{\infty}\left(\int\limits_{t}^{T}\psi_1(t_1)\phi_{j_1}(t_1)\int\limits_{t_1}^{T}\psi_2(t_2)\phi_{j_2}(t_2)\times\right.$$

$$\left.\times\sum_{j_3=p+1}^{\infty}\int\limits_{t_2}^{T}\psi_3(t_3)\phi_{j_3}(t_3)\int\limits_{t_3}^{T}\psi_4(t_4)\phi_{j_3}(t_4)dt_4dt_3dt_2dt_1\right)^2=$$

$$=\int\limits_{[t,T]^2}\mathbf{1}_{\{t_1<t_2\}}\psi_1^2(t_1)\psi_2^2(t_2)\times$$

$$\times\left(\sum_{j_3=p+1}^{\infty}\int\limits_{t_2}^{T}\psi_3(t_3)\phi_{j_3}(t_3)\int\limits_{t_3}^{T}\psi_4(t_4)\phi_{j_3}(t_4)dt_4dt_3\right)^2dt_2dt_1. \qquad (438)$$

It is easy to see that the integral (see (438))

$$\int\limits_{t_2}^{T}\psi_3(t_3)\phi_{j_3}(t_3)\int\limits_{t_3}^{T}\psi_4(t_4)\phi_{j_3}(t_4)dt_4dt_3$$

is similar to the integral from the formula (434) if in the last integral we substitute $t_4 = T$. Therefore, by analogy with (436), we obtain

$$\sum_{j_1,j_2=0}^{p}\left(\sum_{j_3=p+1}^{\infty}C_{j_3j_3j_2j_1}\right)^2 \le \frac{K}{p^{2-\varepsilon}} \ \to\ 0 \tag{439}$$

if $p\to\infty$, where ε is an arbitrary small positive real number for the polynomial case and $\varepsilon=0$ for the trigonometric case, constant K does not depend on p.

Now consider (418)–(420). We have for (418) (see **Step 2** in the proof of Theorem 20)

$$\left(\sum_{j_2=p+1}^{\infty}\sum_{j_1=p+1}^{\infty}C_{j_2j_1j_2j_1}\right)^2 = \left(\sum_{j_1=0}^{p}\sum_{j_2=p+1}^{\infty}C_{j_2j_1j_2j_1}\right)^2 \le$$

$$\le (p+1)\sum_{j_1=0}^{p}\left(\sum_{j_2=p+1}^{\infty}C_{j_2j_1j_2j_1}\right)^2. \tag{440}$$

Consider (416) and (437). We have

$$\sum_{j_1=0}^{p}\left(\sum_{j_2=p+1}^{\infty}C_{j_2j_1j_2j_1}\right)^2 = \sum_{j_1,j_3=0}^{p}\left(\sum_{j_2=p+1}^{\infty}C_{j_2j_3j_2j_1}\right)^2\Biggr|_{j_1=j_3} \le$$

$$\le \sum_{j_1,j_3=0}^{p}\left(\sum_{j_2=p+1}^{\infty}C_{j_2j_3j_2j_1}\right)^2 \le \frac{K}{p^{2-\varepsilon}}, \tag{441}$$

where ε is an arbitrary small positive real number for the polynomial case and $\varepsilon=0$ for the trigonometric case, constant K does not depend on p. Combining (440) and (441), we obtain

$$\left(\sum_{j_2=p+1}^{\infty}\sum_{j_1=p+1}^{\infty}C_{j_2j_1j_2j_1}\right)^2 \le \frac{(p+1)K}{p^{2-\varepsilon}} \le \frac{K_1}{p^{1-\varepsilon}} \ \to\ 0$$

if $p\to\infty$, where constant K_1 does not depend on p.

Similarly for (419) we have (see (415), (436))

$$\left(\sum_{j_2=p+1}^{\infty}\sum_{j_1=p+1}^{\infty}C_{j_1j_2j_2j_1}\right)^2 = \left(\sum_{j_1=0}^{p}\sum_{j_2=p+1}^{\infty}C_{j_1j_2j_2j_1}\right)^2 \le$$

$$\le (p+1)\sum_{j_1=0}^{p}\left(\sum_{j_2=p+1}^{\infty}C_{j_1j_2j_2j_1}\right)^2, \tag{442}$$

$$\sum_{j_1=0}^{p}\left(\sum_{j_2=p+1}^{\infty}C_{j_1j_2j_2j_1}\right)^2=\sum_{j_1,j_4=0}^{p}\left(\sum_{j_2=p+1}^{\infty}C_{j_4j_2j_2j_1}\right)^2\Biggr|_{j_1=j_4}\le$$

$$\le\sum_{j_1,j_4=0}^{p}\left(\sum_{j_2=p+1}^{\infty}C_{j_4j_2j_2j_1}\right)^2\le\frac{K}{p^{2-\varepsilon}},\tag{443}$$

where ε is an arbitrary small positive real number for the polynomial case and $\varepsilon=0$ for the trigonometric case, constant K does not depend on p. Combining (442) and (443), we obtain

$$\left(\sum_{j_2=p+1}^{\infty}\sum_{j_1=p+1}^{\infty}C_{j_1j_2j_2j_1}\right)^2\le\frac{(p+1)K}{p^{2-\varepsilon}}\le\frac{K_1}{p^{1-\varepsilon}}\ \to\ 0$$

if $p\to\infty$, where constant K_1 does not depend on p.

Consider (420). Using (361), we obtain

$$\sum_{j_3=p+1}^{\infty}\sum_{j_1=p+1}^{\infty}C_{j_3j_3j_1j_1}=\sum_{j_3=p+1}^{\infty}\sum_{j_1=0}^{\infty}C_{j_3j_3j_1j_1}-\sum_{j_3=p+1}^{\infty}\sum_{j_1=0}^{p}C_{j_3j_3j_1j_1}=$$

$$=\frac{1}{2}\sum_{j_3=p+1}^{\infty}C_{j_3j_3j_1j_1}\Biggr|_{(j_1j_1)\curvearrowright(\cdot)}-\sum_{j_3=p+1}^{\infty}\sum_{j_1=0}^{p}C_{j_3j_3j_1j_1},\tag{444}$$

where (see (323))

$$C_{j_3j_3j_1j_1}\Biggr|_{(j_1j_1)\curvearrowright(\cdot)}=$$

$$=\int\limits_t^T\psi_4(t_4)\phi_{j_3}(t_4)\int\limits_t^{t_4}\psi_3(t_3)\phi_{j_3}(t_3)\int\limits_t^{t_3}\psi_2(t_2)\psi_1(t_2)dt_2dt_3dt_4.$$

From the estimate (43) (polynomial case) and its analogue for the trigonometric case (see the proof of Lemma 1) we get

$$\left|\sum_{j_3=p+1}^{\infty}C_{j_3j_3j_1j_1}\Biggr|_{(j_1j_1)\curvearrowright(\cdot)}\right|\le\frac{C}{p},\tag{445}$$

where constant C is independent of p.

Further, we have (see (439))

$$\left(\sum_{j_1=0}^{p}\sum_{j_3=p+1}^{\infty}C_{j_3j_3j_1j_1}\right)^2\le(p+1)\sum_{j_1=0}^{p}\left(\sum_{j_3=p+1}^{\infty}C_{j_3j_3j_1j_1}\right)^2=$$

$$=(p+1)\sum_{j_1,j_2=0}^{p}\left(\sum_{j_3=p+1}^{\infty}C_{j_3j_3j_2j_1}\right)^2\Biggr|_{j_1=j_2}\le$$

$$\leq (p+1)\sum_{j_1,j_2=0}^{p}\left(\sum_{j_3=p+1}^{\infty} C_{j_3j_3j_2j_1}\right)^2 \leq \frac{(p+1)K}{p^{2-\varepsilon}} \leq \frac{K_1}{p^{1-\varepsilon}}, \tag{446}$$

where constant K_1 does not depend on p.

Combining (444)–(446), we obtain

$$\left(\sum_{j_3=p+1}^{\infty}\sum_{j_1=p+1}^{\infty} C_{j_3j_3j_1j_1}\right)^2 \leq \frac{K_2}{p^{1-\varepsilon}} \ \rightarrow\ 0$$

if $p\rightarrow\infty$, where constant K_2 does not depend on p.

Let us prove (421)–(423). It is not difficult to see that the estimate (445) proves (421).

Using the integration order replacement, we obtain

$$\sum_{j_1=p+1}^{\infty} C_{j_3j_3j_1j_1}\Bigg|_{(j_3j_3)\curvearrowright(\cdot)} =$$

$$\sum_{j_1=p+1}^{\infty}\int\limits_t^T \psi_4(t_4)\psi_3(t_4)\int\limits_t^{t_4}\psi_2(t_2)\phi_{j_1}(t_2)\int\limits_t^{t_2}\psi_1(t_1)\phi_{j_1}(t_1)dt_1dt_2dt_4 =$$

$$= \sum_{j_1=p+1}^{\infty}\int\limits_t^T\left(\psi_2(t_2)\int\limits_{t_2}^{T}\psi_4(t_4)\psi_3(t_4)dt_4\right)\phi_{j_1}(t_2)\int\limits_t^{t_2}\psi_1(t_1)\phi_{j_1}(t_1)dt_1dt_2, \tag{447}$$

$$\sum_{j_1=p+1}^{\infty} C_{j_1j_2j_2j_1}\Bigg|_{(j_2j_2)\curvearrowright(\cdot)} =$$

$$= \sum_{j_1=p+1}^{\infty}\int\limits_t^T \psi_4(t_4)\phi_{j_1}(t_4)\int\limits_t^{t_4}\psi_3(t_3)\psi_2(t_3)\int\limits_t^{t_3}\psi_1(t_1)\phi_{j_1}(t_1)dt_1dt_3dt_4 =$$

$$= \sum_{j_1=p+1}^{\infty}\int\limits_t^T \psi_4(t_4)\phi_{j_1}(t_4)\int\limits_t^{t_4}\psi_1(t_1)\phi_{j_1}(t_1)\int\limits_{t_1}^{t_4}\psi_3(t_3)\psi_2(t_3)dt_3dt_1dt_4 =$$

$$= \sum_{j_1=p+1}^{\infty}\int\limits_t^T \psi_4(t_4)\phi_{j_1}(t_4)\int\limits_t^{t_4}\psi_1(t_1)\phi_{j_1}(t_1)\left(\int\limits_t^{t_4}-\int\limits_t^{t_1}\right)\psi_3(t_3)\psi_2(t_3)dt_3dt_1dt_4 =$$

$$= \sum_{j_1=p+1}^{\infty}\int\limits_t^T\left(\psi_4(t_4)\int\limits_t^{t_4}\psi_3(t_3)\psi_2(t_3)dt_3\right)\phi_{j_1}(t_4)\int\limits_t^{t_4}\psi_1(t_1)\phi_{j_1}(t_1)dt_1dt_4- \tag{448}$$

$$- \sum_{j_1=p+1}^{\infty}\int\limits_t^T \psi_4(t_4)\phi_{j_1}(t_4)\int\limits_t^{t_4}\left(\psi_1(t_1)\int\limits_t^{t_1}\psi_3(t_3)\psi_2(t_3)dt_3\right)\phi_{j_1}(t_1)dt_1dt_4. \tag{449}$$

Applying the estimate (43) (polynomial case) and its analogue for the trigonometric case (see the proof of Lemma 1) to the right-hand sides of (447)–(449), we get

$$\left|\sum_{j_3=p+1}^{\infty} C_{j_3j_3j_1j_1}\Big|_{(j_3j_3)\curvearrowright(\cdot)}\right| \le \frac{C}{p}, \tag{450}$$

$$\left|\sum_{j_1=p+1}^{\infty} C_{j_1j_2j_2j_1}\Big|_{(j_2j_2)\curvearrowright(\cdot)}\right| \le \frac{C}{p}, \tag{451}$$

where constant C is independent of p. The estimates (450), (451) prove (422), (423).

The relations (412)–(423) are proved. Theorem 24 is proved.

16. Expansion of Iterated Stratonovich Stochastic Integrals of Multiplicity 5. The Case $p_1 = \ldots = p_5 \to \infty$ and Continuously Differentiable Weight Functions $\psi_1(\tau)$, $\ldots$, $\psi_5(\tau)$ (The Cases of Legendre Polynomials and Trigonometric Functions)

Theorem 25 [26], [34], [50], [72]. *Suppose that $\{\phi_j(x)\}_{j=0}^{\infty}$ is a complete orthonormal system of Legendre polynomials or trigonometric functions in the space $L_2([t,T])$. Furthermore, let $\psi_1(\tau),\ldots,$ $\psi_5(\tau)$ are continuously differentiable nonrandom functions on $[t,T]$. Then, for the iterated Stratonovich stochastic integral of fifth multiplicity*

$$J^*[\psi^{(5)}]_{T,t} = \int\limits_t^{*T} \psi_5(t_5)\ldots \int\limits_t^{*t_2} \psi_1(t_1) d\mathbf{w}_{t_1}^{(i_1)}\ldots d\mathbf{w}_{t_5}^{(i_5)} \tag{452}$$

the following expansion

$$J^*[\psi^{(5)}]_{T,t} = \underset{p\to\infty}{\text{l.i.m.}} \sum_{j_1,\ldots,j_5=0}^{p} C_{j_5\ldots j_1}\zeta_{j_1}^{(i_1)}\ldots\zeta_{j_5}^{(i_5)}$$

that converges in the mean-square sense is valid, where $i_1,\ldots,i_5 = 0,1,\ldots,m$,

$$C_{j_5\ldots j_1} = \int\limits_t^{T} \psi_5(t_5)\phi_{j_5}(t_5)\ldots \int\limits_t^{t_2} \psi_1(t_1)\phi_{j_1}(t_1)dt_1\ldots dt_5$$

and

$$\zeta_j^{(i)} = \int\limits_t^{T} \phi_j(s) d\mathbf{w}_s^{(i)}$$

are independent standard Gaussian random variables for various i or j (in the case when $i \ne 0$), $\mathbf{w}_\tau^{(i)} = \mathbf{f}_\tau^{(i)}$ for $i = 1,\ldots,m$ and $\mathbf{w}_\tau^{(0)} = \tau$.

Proof. Note that in this proof we write k instead of 5 when this is true for an arbitrary k ($k \in \mathbb{N}$). As follows from the previous sections, Conditions 1 and 2 of Theorem 20 are satisfied for complete orthonormal systems of Legendre polynomials and trigonometric functions in the space $L_2([t,T])$. Let us verify Condition 3 of Theorem 20 for the iterated Stratonovich stochastic integral (452). Thus, we have to check the following conditions

$$\lim_{p\to\infty}\sum_{j_{q_1},j_{q_2},j_{q_3}=0}^{p}\left(\sum_{j_{g_1}=p+1}^{\infty} C_{j_5\ldots j_1}\Bigr|_{j_{g_1}=j_{g_2}}\right)^2=0, \tag{453}$$

$$\lim_{p\to\infty}\sum_{j_{q_1}=0}^{p}\left(\sum_{j_{g_1}=p+1}^{\infty}\sum_{j_{g_3}=p+1}^{\infty} C_{j_5\ldots j_1}\Bigr|_{j_{g_1}=j_{g_2},j_{g_3}=j_{g_4}}\right)^2=0, \tag{454}$$

$$\lim_{p\to\infty}\sum_{j_{q_1}=0}^{p}\left(\sum_{j_{g_3}=p+1}^{\infty} C_{j_5\ldots j_1}\Bigr|_{(j_{g_2}j_{g_1})\curvearrowright(\cdot),j_{g_1}=j_{g_2},j_{g_3}=j_{g_4},g_2=g_1+1}\right)^2=0, \tag{455}$$

where $(\{g_1,g_2\},\{g_3,g_4\},\{q_1\})$ and $(\{g_1,g_2\},\{q_1,q_2,q_3\})$ are partitions of the set $\{1,2,\ldots,5\}$ that is $\{g_1,g_2,g_3,g_4,q_1\}=\{g_1,g_2,q_1,q_2,q_3\}=\{1,2,\ldots,5\}$; braces mean an unordered set, and parentheses mean an ordered set.

Let us find a representation for $C_{j_k\ldots j_1}\bigr|_{j_{g_1}=j_{g_2},\ g_2>g_1+1}$ that will be convenient for further consideration.

Using the integration order replacement in Riemann integrals, we obtain

$$\int\limits_t^T h_k(t_k)\ldots\int\limits_t^{t_{l+2}} h_{l+1}(t_{l+1})\int\limits_t^{t_{l+1}} h_l(t_l)\int\limits_t^{t_l} h_{l-1}(t_{l-1})\ldots\int\limits_t^{t_2} h_1(t_1)dt_1\ldots$$

$$\ldots dt_{l-1}dt_l dt_{l+1}\ldots dt_k=$$

$$=\int\limits_t^T h_k(t_k)\ldots\int\limits_t^{t_{l+2}} h_{l+1}(t_{l+1})\int\limits_t^{t_{l+1}} h_1(t_1)\int\limits_{t_1}^{t_{l+1}} h_2(t_2)\ldots\int\limits_{t_{l-2}}^{t_{l+1}} h_{l-1}(t_{l-1})\int\limits_{t_{l-1}}^{t_{l+1}} h_l(t_l)dt_l\times$$

$$\times dt_{l-1}\ldots dt_2 dt_1 dt_{l+1}\ldots dt_k=$$

$$\ldots \int\limits_{t}^{t_2} h_1(t_1)dt_1 \ldots dt_{l-2}dt_{l-1}dt_{l+1} \ldots dt_k, \tag{456}$$

where $1 < l < k$ and $h_1(\tau), \ldots, h_k(\tau)$ are continuous functions on the interval $[t, T]$. By analogy with (456) we have for $l = k$

$$\int\limits_{t}^{T} h_l(t_l) \int\limits_{t}^{t_l} h_{l-1}(t_{l-1}) \ldots \int\limits_{t}^{t_2} h_1(t_1)dt_1 \ldots dt_{l-1}dt_l =$$

$$= \int\limits_{t}^{T} h_1(t_1) \int\limits_{t_1}^{T} h_2(t_2) \ldots \int\limits_{t_{l-2}}^{T} h_{l-1}(t_{l-1}) \int\limits_{t_{l-1}}^{T} h_l(t_l)dt_l dt_{l-1} \ldots dt_2 dt_1 =$$

$$= \left(\int\limits_{t}^{T} h_l(t_l)dt_l \right) \int\limits_{t}^{T} h_1(t_1) \int\limits_{t_1}^{T} h_2(t_2) \ldots \int\limits_{t_{l-2}}^{T} h_{l-1}(t_{l-1})dt_{l-1} \ldots dt_2 dt_1 -$$

$$- \int\limits_{t}^{T} h_1(t_1) \int\limits_{t_1}^{T} h_2(t_2) \ldots \int\limits_{t_{l-2}}^{T} h_{l-1}(t_{l-1}) \left(\int\limits_{t}^{t_{l-1}} h_l(t_l)dt_l \right) dt_{l-1} \ldots dt_2 dt_1 =$$

$$= \left(\int\limits_{t}^{T} h_l(t_l)dt_l \right) \int\limits_{t}^{T} h_{l-1}(t_{l-1}) \ldots \int\limits_{t}^{t_2} h_1(t_1)dt_1 \ldots dt_{l-1} -$$

$$- \int\limits_{t}^{T} h_{l-1}(t_{l-1}) \left(\int\limits_{t}^{t_{l-1}} h_l(t_l)dt_l \right) \int\limits_{t}^{t_{l-1}} h_{l-2}(t_{l-2}) \ldots \int\limits_{t}^{t_2} h_1(t_1)dt_1 \ldots dt_{l-1}. \tag{457}$$

The formulas (456), (457) will be used further.

Our further proof will not fundamentally depend on the weight functions $\psi_1(\tau), \ldots, \psi_k(\tau)$. Therefore, sometimes in subsequent consideration we assume for simplicity that $\psi_1(\tau), \ldots, \psi_k(\tau) \equiv 1$.

Let us continue the proof. Applying (456) to $C_{j_k \ldots j_{l+1} j_l j_{l-1} \ldots j_{s+1} j_l j_{s-1} \ldots j_1}$ (more precisely to $h_s(t_s) = \psi_s(t_s)\phi_{j_l}(t_s)$), we obtain for $l+1 \le k$, $s-1 \ge 1$, $l-1 \ge s+1$

$$\sum_{j_l=p+1}^{\infty} C_{j_k \ldots j_{l+1} j_l j_{l-1} \ldots j_{s+1} j_l j_{s-1} \ldots j_1} = \tag{458}$$

$$= \sum_{j_l=p+1}^{\infty} \int\limits_t^T \phi_{j_k}(t_k) \ldots \int\limits_t^{t_{l+2}} \phi_{j_{l+1}}(t_{l+1}) \int\limits_t^{t_{l+1}} \phi_{j_l}(t_l) \int\limits_t^{t_l} \phi_{j_{l-1}}(t_{l-1}) \ldots$$

$$\ldots \int\limits_t^{t_{s+2}} \phi_{j_{s+1}}(t_{s+1}) \int\limits_t^{t_{s+1}} \phi_{j_l}(t_s) \int\limits_t^{t_s} \phi_{j_{s-1}}(t_{s-1}) \ldots$$

$$\ldots \int\limits_t^{t_2} \phi_{j_1}(t_1) dt_1 \ldots dt_{s-1} dt_s dt_{s+1} \ldots dt_{l-1} dt_l dt_{l+1} \ldots dt_k =$$

$$= \sum_{j_l=p+1}^{\infty} \int\limits_t^T \phi_{j_k}(t_k) \ldots \int\limits_t^{t_{l+2}} \phi_{j_{l+1}}(t_{l+1}) \int\limits_t^{t_{l+1}} \phi_{j_l}(t_l) \int\limits_t^{t_l} \phi_{j_{l-1}}(t_{l-1}) \ldots$$

$$\ldots \int\limits_t^{t_{s+2}} \phi_{j_{s+1}}(t_{s+1}) \left(\int\limits_t^{t_{s+1}} \phi_{j_l}(t_s) dt_s \right) \int\limits_t^{t_{s+1}} \phi_{j_{s-1}}(t_{s-1}) \ldots$$

$$\ldots \int\limits_t^{t_2} \phi_{j_1}(t_1) dt_1 \ldots dt_{s-1} dt_{s+1} \ldots dt_{l-1} dt_l dt_{l+1} \ldots dt_k -$$

$$- \sum_{j_l=p+1}^{\infty} \int\limits_t^T \phi_{j_k}(t_k) \ldots \int\limits_t^{t_{l+2}} \phi_{j_{l+1}}(t_{l+1}) \int\limits_t^{t_{l+1}} \phi_{j_l}(t_l) \int\limits_t^{t_l} \phi_{j_{l-1}}(t_{l-1}) \ldots$$

$$\ldots \int\limits_t^{t_{s+2}} \phi_{j_{s+1}}(t_{s+1}) \int\limits_t^{t_{s+1}} \phi_{j_{s-1}}(t_{s-1}) \left(\int\limits_t^{t_{s-1}} \phi_{j_l}(t_s) dt_s \right) \int\limits_t^{t_{s-1}} \phi_{j_{s-2}}(t_{s-2}) \ldots$$

$$\ldots \int\limits_t^{t_2} \phi_{j_1}(t_1) dt_1 \ldots dt_{s-2} dt_{s-1} dt_{s+1} \ldots dt_{l-1} dt_l dt_{l+1} \ldots dt_k =$$

$$= \sum_{j_l=p+1}^{\infty} A_{j_k \ldots j_{l+1} j_l j_{l-1} \ldots j_{s+1} j_l j_{s-1} \ldots j_1} - \sum_{j_l=p+1}^{\infty} B_{j_k \ldots j_{l+1} j_l j_{l-1} \ldots j_{s+1} j_l j_{s-1} \ldots j_1}.$$

Now we again apply the formula (456) to $A_{j_k \ldots j_{l+1} j_l j_{l-1} \ldots j_{s+1} j_l j_{s-1} \ldots j_1}$, $B_{j_k \ldots j_{l+1} j_l j_{l-1} \ldots j_{s+1} j_l j_{s-1} \ldots j_1}$ (more precisely to $h_l(t_l) = \psi_l(t_l)\phi_{j_l}(t_l)$). Then we have for $l+1 \le k$, $s-1 \ge 1$, $l-1 \ge s+1$

$$\sum_{j_l=p+1}^{\infty} C_{j_k \ldots j_{l+1} j_l j_{l-1} \ldots j_{s+1} j_l j_{s-1} \ldots j_1} =$$

$$= \int\limits_{[t,T]^{k-2}} \sum_{d=1}^{4} F_p^{(d)}(t_1, \ldots, t_{s-1}, t_{s+1}, \ldots, t_{l-1}, t_{l+1}, \ldots, t_k) \times$$

$$\times \prod_{\substack{g=1 \\ g \ne l,s}}^{k} \psi_g(t_g) \phi_{j_g}(t_g) dt_1 \ldots dt_{s-1} dt_{s+1} \ldots dt_{l-1} dt_{l+1} \ldots dt_k =$$

$$= \sum_{d=1}^{4} C^{*(d)}_{j_k \ldots j_{l+1} j_{l-1} \ldots j_{s+1} j_{s-1} \ldots j_1} = \sum_{d=1}^{4} C^{*(d)}_{j_k \ldots j_q \ldots j_1}\Bigg|_{q \ne l,s}, \tag{459}$$

where

$$F_p^{(1)}(t_1, \ldots, t_{s-1}, t_{s+1}, \ldots, t_{l-1}, t_{l+1}, \ldots, t_k) =$$

$$= \mathbf{1}_{\{t_1 < \ldots < t_{s-1} < t_{s+1} < \ldots < t_{l-1} < t_{l+1} < \ldots < t_k\}} \sum_{j_l=p+1}^{\infty} \int\limits_t^{t_{s+1}} \psi_s(\tau)\phi_{j_l}(\tau)d\tau \int\limits_t^{t_{l+1}} \psi_l(\tau)\phi_{j_l}(\tau)d\tau, \tag{460}$$

$$F_p^{(2)}(t_1, \ldots, t_{s-1}, t_{s+1}, \ldots, t_{l-1}, t_{l+1}, \ldots, t_k) =$$

$$= \mathbf{1}_{\{t_1 < \ldots < t_{s-1} < t_{s+1} < \ldots < t_{l-1} < t_{l+1} < \ldots < t_k\}} \sum_{j_l=p+1}^{\infty} \int\limits_t^{t_{s-1}} \psi_s(\tau)\phi_{j_l}(\tau)d\tau \int\limits_t^{t_{l-1}} \psi_l(\tau)\phi_{j_l}(\tau)d\tau, \tag{461}$$

$$F_p^{(3)}(t_1, \ldots, t_{s-1}, t_{s+1}, \ldots, t_{l-1}, t_{l+1}, \ldots, t_k) =$$

$$= -\mathbf{1}_{\{t_1 < \ldots < t_{s-1} < t_{s+1} < \ldots < t_{l-1} < t_{l+1} < \ldots < t_k\}} \sum_{j_l=p+1}^{\infty} \int\limits_t^{t_{s-1}} \psi_s(\tau)\phi_{j_l}(\tau)d\tau \int\limits_t^{t_{l+1}} \psi_l(\tau)\phi_{j_l}(\tau)d\tau, \tag{462}$$

$$F_p^{(4)}(t_1, \ldots, t_{s-1}, t_{s+1}, \ldots, t_{l-1}, t_{l+1}, \ldots, t_k) =$$

$$= -\mathbf{1}_{\{t_1 < \ldots < t_{s-1} < t_{s+1} < \ldots < t_{l-1} < t_{l+1} < \ldots < t_k\}} \sum_{j_l=p+1}^{\infty} \int\limits_t^{t_{s+1}} \psi_s(\tau)\phi_{j_l}(\tau)d\tau \int\limits_t^{t_{l-1}} \psi_l(\tau)\phi_{j_l}(\tau)d\tau. \tag{463}$$

By analogy with (459) we can consider the expressions

$$\sum_{j_l=p+1}^{\infty} C_{j_l j_{k-1} \ldots j_2 j_l}, \tag{464}$$

$$\sum_{j_l=p+1}^{\infty} C_{j_k \ldots j_{l+1} j_l j_{l-1} \ldots j_2 j_l} \quad (l+1 \le k), \tag{465}$$

$$\sum_{j_l=p+1}^{\infty} C_{j_l j_{k-1} \ldots j_{s+1} j_l j_{s-1} \ldots j_1} \quad (s-1 \ge 1). \tag{466}$$

Then we have for (464)–(466) (see (456), (457))

$$\sum_{j_l=p+1}^{\infty} C_{j_l j_{k-1} \ldots j_2 j_l} = \int\limits_{[t,T]^{k-2}} \sum_{d=1}^{2} G_p^{(d)}(t_2, \ldots, t_{k-1}) \prod_{g=2}^{k-1} \psi_g(t_g)\phi_{j_g}(t_g)dt_2 \ldots dt_{k-1}, \tag{467}$$

$$\sum_{j_l=p+1}^{\infty} C_{j_k\ldots j_{l+1}j_lj_{l-1}\ldots j_2j_l} = \int\limits_{[t,T]^{k-2}} \sum_{d=1}^{2} E_p^{(d)}(t_2,\ldots,t_{l-1},t_{l+1},\ldots,t_k)\times$$

$$\times\prod_{\substack{g=2\\ g\ne l}}^{k} \psi_g(t_g)\phi_{j_g}(t_g)dt_2\ldots dt_{l-1}dt_{l+1}\ldots dt_k, \tag{468}$$

$$\sum_{j_l=p+1}^{\infty} C_{j_lj_{k-1}\ldots j_{s+1}j_lj_{s-1}\ldots j_1} = \int\limits_{[t,T]^{k-2}} \sum_{d=1}^{4} D_p^{(d)}(t_1,\ldots,t_{s-1},t_{s+1},\ldots,t_{k-1})\times$$

$$\times\prod_{\substack{g=1\\ g\ne s}}^{k-1} \psi_g(t_g)\phi_{j_g}(t_g)dt_1\ldots dt_{s-1}dt_{s+1}\ldots dt_{k-1}, \tag{469}$$

where

$$G_p^{(1)}(t_2,\ldots,t_{k-1}) = \mathbf{1}_{\{t_2<\ldots<t_{k-1}\}} \sum_{j_l=p+1}^{\infty} \int\limits_t^T \psi_k(\tau)\phi_{j_l}(\tau)d\tau \int\limits_t^{t_2} \psi_1(\tau)\phi_{j_l}(\tau)d\tau,$$

$$G_p^{(2)}(t_2,\ldots,t_{k-1}) = -\mathbf{1}_{\{t_2<\ldots<t_{k-1}\}} \sum_{j_l=p+1}^{\infty} \int\limits_t^{t_{k-1}} \psi_k(\tau)\phi_{j_l}(\tau)d\tau \int\limits_t^{t_2} \psi_1(\tau)\phi_{j_l}(\tau)d\tau,$$

$$E_p^{(1)}(t_2,\ldots,t_{l-1},t_{l+1},\ldots,t_k) =$$

$$= \mathbf{1}_{\{t_2<\ldots<t_{l-1}<t_{l+1}<\ldots<t_k\}} \sum_{j_l=p+1}^{\infty} \int\limits_t^{t_{l+1}} \psi_l(\tau)\phi_{j_l}(\tau)d\tau \int\limits_t^{t_2} \psi_1(\tau)\phi_{j_l}(\tau)d\tau,$$

$$E_p^{(2)}(t_2,\ldots,t_{l-1},t_{l+1},\ldots,t_k) =$$

where $l+1\le k$, $l-2\ge 1$, and $h_1(\tau),\ldots,h_k(\tau)$ are continuous functions on the interval $[t,T]$.

Applying (470) to $C_{j_k\ldots j_{l+1}j_lj_lj_{l-2}\ldots\ldots j_1}$, we obtain for $l+1\le k$, $l-2\ge 1$

$$\sum_{j_l=p+1}^{\infty} C_{j_k\ldots j_{l+1}j_lj_lj_{l-2}\ldots\ldots j_1}=$$

$$=\int\limits_{[t,T]^{k-2}}\sum_{d=1}^{4} H_p^{(d)}(t_1,\ldots,t_{l-2},t_{l+1},\ldots,t_k)\times$$

$$\times\prod_{\substack{g=1\\ g\ne l-1,l}}^{k}\psi_g(t_g)\phi_{j_g}(t_g)dt_1\ldots dt_{l-2}dt_{l+1}\ldots dt_k=$$

$$= \sum_{d=1}^{4} C^{**(d)}_{j_k\ldots j_{l+1}j_{l-2}\ldots j_1} = \sum_{d=1}^{4} C^{**(d)}_{j_k\ldots j_q\ldots j_1}\Big|_{q\ne l-1,l}, \tag{471}$$

where

$$H_p^{(1)}(t_1,\ldots,t_{l-2},t_{l+1},\ldots,t_k) =$$

$$= \mathbf{1}_{\{t_1<\ldots<t_{l-2}<t_{l+1}<\ldots<t_k\}} \sum_{j_l=p+1}^{\infty} \int\limits_t^{t_{l+1}} \psi_l(\tau)\phi_{j_l}(\tau)d\tau \int\limits_t^{t_{l+1}} \psi_{l-1}(\tau)\phi_{j_l}(\tau)d\tau, \tag{472}$$

$$H_p^{(2)}(t_1,\ldots,t_{l-2},t_{l+1},\ldots,t_k) =$$

$$= -\mathbf{1}_{\{t_1<\ldots<t_{l-2}<t_{l+1}<\ldots<t_k\}} \sum_{j_l=p+1}^{\infty} \int\limits_t^{t_{l+1}} \psi_l(\tau)\phi_{j_l}(\tau)d\tau \int\limits_t^{t_{l-2}} \psi_{l-1}(\tau)\phi_{j_l}(\tau)d\tau, \tag{473}$$

$$H_p^{(3)}(t_1,\ldots,t_{l-2},t_{l+1},\ldots,t_k) =$$

$$= -\mathbf{1}_{\{t_1<\ldots<t_{l-2}<t_{l+1}<\ldots<t_k\}} \sum_{j_l=p+1}^{\infty} \int\limits_t^{t_{l+1}} \psi_{l-1}(\tau)\phi_{j_l}(\tau) \int\limits_t^{\tau} \psi_l(\theta)\phi_{j_l}(\theta)d\theta d\tau, \tag{474}$$

$$H_p^{(4)}(t_1,\ldots,t_{l-2},t_{l+1},\ldots,t_k) =$$

$$= \mathbf{1}_{\{t_1<\ldots<t_{l-2}<t_{l+1}<\ldots<t_k\}} \sum_{j_l=p+1}^{\infty} \int\limits_t^{t_{l-2}} \psi_{l-1}(\tau)\phi_{j_l}(\tau) \int\limits_t^{\tau} \psi_l(\theta)\phi_{j_l}(\theta)d\theta d\tau. \tag{475}$$

By analogy with (471) we can consider the expressions

$$\sum_{j_l=p+1}^{\infty} C_{j_k\ldots j_{l+1}j_lj_l}, \tag{476}$$

$$\sum_{j_l=p+1}^{\infty} C_{j_lj_lj_{k-2}\ldots j_1}. \tag{477}$$

Then we have for (476), (477) (see (470) and its analogue for $t_{l+1}=T$)

$$\sum_{j_l=p+1}^{\infty} C_{j_k\ldots j_{l+1}j_lj_l} = \int\limits_{[t,T]^{k-2}} L_p(t_3,\ldots,t_k) \prod_{g=3}^{k} \psi_g(t_g)\phi_{j_g}(t_g)dt_3\ldots dt_k, \tag{478}$$

$$\sum_{j_l=p+1}^{\infty} C_{j_lj_lj_{k-2}\ldots j_1} = \int\limits_{[t,T]^{k-2}} \sum_{d=1}^{4} M_p^{(d)}(t_1,\ldots,t_{k-2}) \prod_{g=1}^{k-2} \psi_g(t_g)\phi_{j_g}(t_g)dt_1\ldots dt_{k-2}, \tag{479}$$

where

$$L_p(t_3,\ldots,t_k)=\mathbf{1}_{\{t_3<\ldots<t_k\}}\sum_{j_l=p+1}^{\infty}\int\limits_t^{t_3}\psi_2(\tau)\phi_{j_l}(\tau)\int\limits_t^{\tau}\psi_1(\theta)\phi_{j_l}(\theta)d\theta d\tau,$$

$$M_p^{(1)}(t_1,\ldots,t_{k-2})=$$

$$=\mathbf{1}_{\{t_1<\ldots<t_{k-2}\}}\sum_{j_l=p+1}^{\infty}\int\limits_t^{T}\psi_k(\tau)\phi_{j_l}(\tau)d\tau\int\limits_t^{T}\psi_{k-1}(\tau)\phi_{j_l}(\tau)d\tau,$$

$$M_p^{(2)}(t_1,\ldots,t_{k-2})=$$

$$=-\mathbf{1}_{\{t_1<\ldots<t_{k-2}\}}\sum_{j_l=p+1}^{\infty}\int\limits_t^{T}\psi_k(\tau)\phi_{j_l}(\tau)d\tau\int\limits_t^{t_{k-2}}\psi_{k-1}(\tau)\phi_{j_l}(\tau)d\tau,$$

$$M_p^{(3)}(t_1,\ldots,t_{k-2})=$$

$$=-\mathbf{1}_{\{t_1<\ldots<t_{k-2}\}}\sum_{j_l=p+1}^{\infty}\int\limits_t^{T}\psi_{k-1}(\tau)\phi_{j_l}(\tau)\int\limits_t^{\tau}\psi_k(\theta)\phi_{j_l}(\theta)d\theta d\tau,$$

$$M_p^{(4)}(t_1,\ldots,t_{k-2})=$$

$$=\mathbf{1}_{\{t_1<\ldots<t_{k-2}\}}\sum_{j_l=p+1}^{\infty}\int\limits_t^{t_{k-2}}\psi_{k-1}(\tau)\phi_{j_l}(\tau)\int\limits_t^{\tau}\psi_k(\theta)\phi_{j_l}(\theta)d\theta d\tau.$$

It is important to note that $C^{*(d)}_{j_k\ldots j_{l+1}j_{l-2}\ldots j_1}$, $C^{**(d)}_{j_k\ldots j_{l+1}j_{l-2}\ldots j_1}$ $(d=1,\ldots,4)$ are Fourier coefficients (see (459), (471)), that is, we can use Parseval's equality in the further proof.

Combining the equalities (459)–(463) (the case $g_2>g_1+1$), using Parseval's equality and applying the estimates for integrals from basis functions that we used in the proof of Theorems 23, 24, we obtain for (459)

$$\sum_{j_{q_1},\ldots,j_{q_{k-2}}=0}^{p}\left(\sum_{j_{g_1}=p+1}^{\infty}C_{j_k\ldots j_1}\Bigg|_{j_{g_1}=j_{g_2},g_2>g_1+1}\right)^2=$$

$$=\sum_{\substack{j_1,\ldots,j_q,\ldots,j_k=0\\ q\ne g_1,g_2}}^{p}\left(\sum_{j_{g_1}=p+1}^{\infty}C_{j_k\ldots j_1}\Bigg|_{j_{g_1}=j_{g_2},g_2>g_1+1}\right)^2=$$

$$=\sum_{\substack{j_1,\ldots,j_q,\ldots,j_k=0\\ q\ne g_1,g_2}}^{p}\left(\sum_{d=1}^{4}C^{*(d)}_{j_k\ldots j_q\ldots j_1}\Bigg|_{q\ne g_1,g_2}\right)^2\le\sum_{\substack{j_1,\ldots,j_q,\ldots,j_k=0\\ q\ne g_1,g_2}}^{\infty}\left(\sum_{d=1}^{4}C^{*(d)}_{j_k\ldots j_q\ldots j_1}\Bigg|_{q\ne g_1,g_2}\right)^2=$$

$$=\sum_{\substack{j_1,\ldots,j_q,\ldots,j_k=0\\ q\ne g_1,g_2}}^{\infty}\left(\int\limits_{[t,T]^{k-2}}\sum_{d=1}^{4}F_p^{(d)}(t_1,\ldots,t_{g_1-1},t_{g_1+1},\ldots,t_{g_2-1},t_{g_2+1},\ldots,t_k)\times\right.$$

$$\times \prod_{\substack{q=1\\ q\ne g_1,g_2}}^{k} \psi_q(t_q)\phi_{j_q}(t_q)dt_1\ldots dt_{g_1-1}dt_{g_1+1}\ldots dt_{g_2-1}dt_{g_2+1}\ldots dt_k\Biggr)^2 =$$

$$= \int\limits_{[t,T]^{k-2}} \left(\sum_{d=1}^{4} F_p^{(d)}(t_1,\ldots,t_{g_1-1},t_{g_1+1},\ldots,t_{g_2-1},t_{g_2+1},\ldots,t_k) \prod_{\substack{q=1\\ q\ne g_1,g_2}}^{k} \psi_q(t_q)\right)^2 \times$$

$$\times dt_1\ldots dt_{g_1-1}dt_{g_1+1}\ldots dt_{g_2-1}dt_{g_2+1}\ldots dt_k \le$$

$$\le 4\sum_{d=1}^{4} \int\limits_{[t,T]^{k-2}} \left(F_p^{(d)}(t_1,\ldots,t_{g_1-1},t_{g_1+1},\ldots,t_{g_2-1},t_{g_2+1},\ldots,t_k) \prod_{\substack{q=1\\ q\ne g_1,g_2}}^{k} \psi_q(t_q)\right)^2 \times$$

$$\times dt_1\ldots dt_{g_1-1}dt_{g_1+1}\ldots dt_{g_2-1}dt_{g_2+1}\ldots dt_k \le$$

$$\le \frac{K}{p^{2-\varepsilon}} \ \to\ 0 \qquad (480)$$

if $p\to\infty$, where ε is an arbitrary small positive real number for the polynomial case and $\varepsilon=0$ for the trigonometric case, constant K does not depend on p. The cases (464)–(466) are considered analogously.

Absolutely similarly (see (480)) combining the equalities (471)–(475) (the case $g_2=g_1+1$), using Parseval's equality and applying the estimates for integrals from basis functions that we used in the proof of Theorems 23, 24, we get for (471)

$$\sum_{j_{q_1},\ldots,j_{q_{k-2}}=0}^{p} \left(\sum_{j_{g_1}=p+1}^{\infty} C_{j_k\ldots j_1}\Biggr|_{j_{g_1}=j_{g_2},g_2=g_1+1}\right)^2 =$$

$$= \sum_{\substack{j_1,\ldots,j_q,\ldots,j_k=0\\ q\ne g_1,g_2}}^{p} \left(\sum_{j_{g_1}=p+1}^{\infty} C_{j_k\ldots j_1}\Biggr|_{j_{g_1}=j_{g_2},g_2=g_1+1}\right)^2 =$$

$$= \sum_{\substack{j_1,\ldots,j_q,\ldots,j_k=0\\ q\ne g_1,g_2}}^{p} \left(\sum_{d=1}^{4} C_{j_k\ldots j_q\ldots j_1}^{**(d)}\Biggr|_{q\ne g_1,g_2}\right)^2 \le \sum_{\substack{j_1,\ldots,j_q,\ldots,j_k=0\\ q\ne g_1,g_2}}^{\infty} \left(\sum_{d=1}^{4} C_{j_k\ldots j_q\ldots j_1}^{**(d)}\Biggr|_{q\ne g_1,g_2}\right)^2 =$$

$$= \sum_{\substack{j_1,\ldots,j_q,\ldots,j_k=0\\ q\ne g_1,g_2}}^{\infty} \Biggl(\int\limits_{[t,T]^{k-2}} \sum_{d=1}^{4} H_p^{(d)}(t_1,\ldots,t_{g_1-1},t_{g_1+2},\ldots,t_k)\times$$

$$\times \prod_{\substack{q=1\\ q\ne g_1,g_2}}^{k} \psi_q(t_q)\phi_{j_q}(t_q)dt_1\ldots dt_{g_1-1}dt_{g_1+2}\ldots dt_k\Biggr)^2 =$$

$$= \int\limits_{[t,T]^{k-2}} \left(\sum_{d=1}^{4} H_p^{(d)}(t_1,\ldots,t_{g_1-1},t_{g_1+2},\ldots,t_k) \prod_{\substack{q=1\\ q\ne g_1,g_2}}^{k} \psi_q(t_q) \right)^2 dt_1\ldots dt_{g_1-1}dt_{g_1+2}\ldots\ldots dt_k \le$$

$$\le 4\sum_{d=1}^{4} \int\limits_{[t,T]^{k-2}} \left(H_p^{(d)}(t_1,\ldots,t_{g_1-1},t_{g_1+2},\ldots,t_k) \prod_{\substack{q=1\\ q\ne g_1,g_2}}^{k} \psi_q(t_q) \right)^2 dt_1\ldots dt_{g_1-1}dt_{g_1+2}\ldots dt_k \le$$

$$\le \frac{K}{p^{2-\varepsilon}} \ \to\ 0 \tag{481}$$

if $p\to\infty$, where ε is an arbitrary small positive real number for the polynomial case and $\varepsilon=0$ for the trigonometric case, constant K does not depend on p. The cases (476), (477) are considered analogously.

From (480), (481) and their analogues for the cases (464)–(466), (476), (477) we obtain

$$\sum_{j_{q_1},\ldots,j_{q_{k-2}}=0}^{p} \left(\sum_{j_{g_1}=p+1}^{\infty} C_{j_k\ldots j_1}\Bigg|_{j_{g_1}=j_{g_2}} \right)^2 \le \frac{K}{p^{2-\varepsilon}}, \tag{482}$$

where constant K is independent of p. Thus the equality (453) is proved.

Let us prove the equality (454). Consider the following cases

1. $g_2>g_1+1,\ g_4=g_3+1,$ 2. $g_2=g_1+1,\ g_4>g_3+1,$

3. $g_2>g_1+1,\ g_4>g_3+1,$ 4. $g_2=g_1+1,\ g_4=g_3+1.$

The proof for Cases 1–3 will be similar. Consider, for example, Case 2. Using (360), we obtain

$$\sum_{j_{q_1}=0}^{p} \left(\sum_{j_{g_1}=p+1}^{\infty} \sum_{j_{g_3}=p+1}^{\infty} C_{j_5\ldots j_1}\Bigg|_{j_{g_1}=j_{g_2},j_{g_3}=j_{g_4},g_4>g_3+1,g_2=g_1+1} \right)^2 =$$

$$= \sum_{j_{q_1}=0}^{p} \left(\sum_{j_{g_1}=p+1}^{\infty} \sum_{j_{g_3}=0}^{p} C_{j_5\ldots j_1}\Bigg|_{j_{g_1}=j_{g_2},j_{g_3}=j_{g_4},g_4>g_3+1,g_2=g_1+1} \right)^2 =$$

$$= \sum_{j_{q_1}=0}^{p} \left(\sum_{j_{g_3}=0}^{p} \sum_{j_{g_1}=p+1}^{\infty} C_{j_5\ldots j_1}\Bigg|_{j_{g_1}=j_{g_2},j_{g_3}=j_{g_4},g_4>g_3+1,g_2=g_1+1} \right)^2 \le \tag{483}$$

$$\le (p+1)\sum_{j_{q_1}=0}^{p} \sum_{j_{g_3}=0}^{p} \left(\sum_{j_{g_1}=p+1}^{\infty} C_{j_5\ldots j_1}\Bigg|_{j_{g_1}=j_{g_2},j_{g_3}=j_{g_4},g_4>g_3+1,g_2=g_1+1} \right)^2 =$$

$$= (p+1)\sum_{j_{q_1}=0}^{p} \sum_{j_{g_3},j_{g_4}=0}^{p} \left(\sum_{j_{g_1}=p+1}^{\infty} C_{j_5\ldots j_1}\Bigg|_{j_{g_1}=j_{g_2},g_4>g_3+1,g_2=g_1+1} \right)^2 \Bigg|_{j_{g_3}=j_{g_4}} \le$$

$$\leq (p+1)\sum_{j_{q_1}=0}^{p}\sum_{j_{g_3},j_{g_4}=0}^{p}\left(\sum_{j_{g_1}=p+1}^{\infty}C_{j_5\ldots j_1}\Bigg|_{j_{g_1}=j_{g_2},g_4>g_3+1,g_2=g_1+1}\right)^2. \tag{484}$$

It is easy to see that the expression (484) (without the multiplier $p+1$) is a particular case ($g_4>g_3+1, g_2=g_1+1$) of the left-hand side of (482). Combining (482) and (484), we have

$$\sum_{j_{q_1}=0}^{p}\left(\sum_{j_{g_1}=p+1}^{\infty}\sum_{j_{g_3}=p+1}^{\infty}C_{j_5\ldots j_1}\Bigg|_{j_{g_1}=j_{g_2},j_{g_3}=j_{g_4},g_4>g_3+1,g_2=g_1+1}\right)^2\leq$$

$$\leq \frac{(p+1)K}{p^{2-\varepsilon}}\leq \frac{K_1}{p^{1-\varepsilon}}\ \to\ 0 \tag{485}$$

if $p\to\infty$, where constant K_1 does not depend on p.

Consider Case 4 ($g_2=g_1+1$, $g_4=g_3+1$). We have (see (361))

$$\sum_{j_{q_1}=0}^{p}\left(\sum_{j_{g_1}=p+1}^{\infty}\sum_{j_{g_3}=p+1}^{\infty}C_{j_5\ldots j_1}\Bigg|_{j_{g_1}=j_{g_2},j_{g_3}=j_{g_4}}\right)^2=$$

$$=\sum_{j_{q_1}=0}^{p}\left(\sum_{j_{g_1}=p+1}^{\infty}\left(\sum_{j_{g_3}=0}^{\infty}-\sum_{j_{g_3}=0}^{p}\right)C_{j_5\ldots j_1}\Bigg|_{j_{g_1}=j_{g_2},j_{g_3}=j_{g_4}}\right)^2=$$

$$=\sum_{j_{q_1}=0}^{p}\left(\frac{1}{2}\sum_{j_{g_1}=p+1}^{\infty}C_{j_5\ldots j_1}\Bigg|_{j_{g_1}=j_{g_2},(j_{g_3}j_{g_3})\curvearrowright(\cdot)}-\sum_{j_{g_3}=0}^{p}\sum_{j_{g_1}=p+1}^{\infty}C_{j_5\ldots j_1}\Bigg|_{j_{g_1}=j_{g_2},j_{g_3}=j_{g_4}}\right)^2\leq$$

$$\leq\frac{1}{2}\sum_{j_{q_1}=0}^{p}\left(\sum_{j_{g_1}=p+1}^{\infty}C_{j_5\ldots j_1}\Bigg|_{j_{g_1}=j_{g_2},(j_{g_3}j_{g_3})\curvearrowright(\cdot)}\right)^2+ \tag{486}$$

$$+2\sum_{j_{q_1}=0}^{p}\left(\sum_{j_{g_3}=0}^{p}\sum_{j_{g_1}=p+1}^{\infty}C_{j_5\ldots j_1}\Bigg|_{j_{g_1}=j_{g_2},j_{g_3}=j_{g_4}}\right)^2. \tag{487}$$

An expression similar to (487) was estimated (see (483)–(485)). Let us estimate (486). We have

$$\sum_{j_{q_1}=0}^{p}\left(\sum_{j_{g_1}=p+1}^{\infty}C_{j_5\ldots j_1}\Bigg|_{j_{g_1}=j_{g_2},(j_{g_3}j_{g_3})\curvearrowright(\cdot)}\right)^2=$$

$$=(T-t)\sum_{j_{q_1}=0}^{p}\left(\sum_{j_{g_1}=p+1}^{\infty}C_{j_5\ldots j_1}\Bigg|_{j_{g_1}=j_{g_2},(j_{g_3}j_{g_3})\curvearrowright 0}\right)^2\leq$$

$$\leq (T-t)\sum_{j_{q_1}=0}^{p}\sum_{j_{g_3}=0}^{p}\left(\sum_{j_{g_1}=p+1}^{\infty} C_{j_5\ldots j_1}\Bigg|_{j_{g_1}=j_{g_2},(j_{g_3}j_{g_3})\curvearrowright j_{g_3}}\right)^2, \tag{488}$$

where the notations are the same as in the proof of Theorem 20.

The expression (488) without the multiplier $T-t$ is an expression of type (412)–(417) before passing to the limit $\lim\limits_{p\to\infty}$ (the only difference is the replacement of one of the weight functions $\psi_1(\tau),\ldots,\psi_4(\tau)$ in (412)–(417) by the product $\psi_{l+1}(\tau)\psi_l(\tau)$ $(l=1,\ldots,4)$. Therefore, for Case 4 $(g_2=g_1+1,\ g_4=g_3+1)$, we obtain the estimate

$$\sum_{j_{q_1}=0}^{p}\left(\sum_{j_{g_1}=p+1}^{\infty}\sum_{j_{g_3}=p+1}^{\infty} C_{j_5\ldots j_1}\Bigg|_{j_{g_1}=j_{g_2},j_{g_3}=j_{g_4},g_4=g_3+1,g_2=g_1+1}\right)^2 \leq$$

$$\leq \frac{K}{p^{1-\varepsilon}}, \tag{489}$$

where constant K is independent of p.

The estimates (485), (489) prove (454). Let us prove (455). By analogy with (488) we have

$$\sum_{j_{q_1}=0}^{p}\left(\sum_{j_{g_3}=p+1}^{\infty} C_{j_5\ldots j_1}\Bigg|_{(j_{g_2}j_{g_1})\curvearrowright(\cdot),j_{g_1}=j_{g_2},j_{g_3}=j_{g_4},g_2=g_1+1}\right)^2 =$$

$$= \sum_{j_{q_1}=0}^{p}\left(\sum_{j_{g_3}=p+1}^{\infty} C_{j_5\ldots j_1}\Bigg|_{(j_{g_1}j_{g_1})\curvearrowright(\cdot),j_{g_3}=j_{g_4},g_2=g_1+1}\right)^2 =$$

$$= (T-t)\sum_{j_{q_1}=0}^{p}\left(\sum_{j_{g_3}=p+1}^{\infty} C_{j_5\ldots j_1}\Bigg|_{(j_{g_1}j_{g_1})\curvearrowright 0,j_{g_3}=j_{g_4},g_2=g_1+1}\right)^2 \leq$$

$$\leq (T-t)\sum_{j_{q_1}=0}^{p}\sum_{j_{g_1}=0}^{p}\left(\sum_{j_{g_3}=p+1}^{\infty} C_{j_5\ldots j_1}\Bigg|_{(j_{g_1}j_{g_1})\curvearrowright j_{g_1},j_{g_3}=j_{g_4},g_2=g_1+1}\right)^2. \tag{490}$$

Thus, we obtain the estimate (see (488) and the proof of Theorem 24)

$$\sum_{j_{q_1}=0}^{p}\left(\sum_{j_{g_3}=p+1}^{\infty} C_{j_5\ldots j_1}\Bigg|_{(j_{g_2}j_{g_1})\curvearrowright(\cdot),j_{g_1}=j_{g_2},j_{g_3}=j_{g_4},g_2=g_1+1}\right)^2 \leq$$

$$\leq \frac{K}{p^{2-\varepsilon}}, \tag{491}$$

where ε is an arbitrary small positive real number for the polynomial case and $\varepsilon=0$ for the trigonometric case, constant K does not depend on p.

The estimate (491) proves (455). Theorem 25 is proved.

17. Estimates for the Mean-Square Approximation Error of Expansions of Iterated Stratonovich Stochastic Integrals of Multiplicity k in Theorems 20, 22

In this section, we estimate the mean-square approximation error for iterated Stratonovich stochastic integrals of multiplicity k ($k\in\mathbb{N}$) in Theorems 20, 22.

Theorem 26 [26], [34], [50], [72]. *Suppose that every $\psi_l(\tau)$ $(l=1,\ldots,k)$ is a continuously differentiable nonrandom function at the interval $[t,T]$. Furthermore, let $\{\phi_j(x)\}_{j=0}^{\infty}$ is a complete orthonormal system of Legendre polynomials or trigonometric functions in the space $L_2([t,T])$. Then the following estimates*

$$
{\sf M}\left\{\left(J^{*}[\psi^{(k)}]_{T,t}^{(i_1\ldots i_k)}-\sum_{j_1,\ldots,j_k=0}^{p}C_{j_k\ldots j_1}\prod_{l=1}^{k}\zeta_{j_l}^{(i_l)}\right)^2\right\}\le
$$

$$
\le K_1\left(\frac{1}{p}+\sum_{r=1}^{[k/2]}\sum_{\substack{(\{\{g_1,g_2\},\ldots,\{g_{2r-1},g_{2r}\}\},\{q_1,\ldots,q_{k-2r}\})\\ \{g_1,g_2,\ldots,g_{2r-1},g_{2r},q_1,\ldots,q_{k-2r}\}=\{1,2,\ldots,k\}}}{\sf M}\left\{\left(R_{T,t}^{(p)r,g_1,g_2,\ldots,g_{2r-1},g_{2r}}\right)^2\right\}\right), \tag{492}
$$

$$
{\sf M}\left\{\left(J^{*}[\psi^{(k)}]_{s,t}^{(i_1\ldots i_k)}-\sum_{j_1,\ldots,j_k=0}^{p}C_{j_k\ldots j_1}(s)\prod_{l=1}^{k}\zeta_{j_l}^{(i_l)}\right)^2\right\}\le
$$

$$
\le K_2(s)\left(\frac{1}{p}+\sum_{r=1}^{[k/2]}\sum_{\substack{(\{\{g_1,g_2\},\ldots,\{g_{2r-1},g_{2r}\}\},\{q_1,\ldots,q_{k-2r}\})\\ \{g_1,g_2,\ldots,g_{2r-1},g_{2r},q_1,\ldots,q_{k-2r}\}=\{1,2,\ldots,k\}}}{\sf M}\left\{\left(R_{s,t}^{(p)r,g_1,g_2,\ldots,g_{2r-1},g_{2r}}\right)^2\right\}\right) \tag{493}
$$

hold, where $s\in(t,T]$ (s is fixed), $i_1,\ldots,i_k=1,\ldots,m$,

$$
R_{s,t}^{(p)r,g_1,g_2,\ldots,g_{2r-1},g_{2r}}=R_{T,t}^{(p)r,g_1,g_2,\ldots,g_{2r-1},g_{2r}}\Biggr|_{T=s},
$$

$R_{T,t}^{(p)r,g_1,g_2,\ldots,g_{2r-1},g_{2r}}$ is defined by (375), $J^{*}[\psi^{(k)}]_{T,t}^{(i_1\ldots i_k)}$ and $J^{*}[\psi^{(k)}]_{s,t}^{(i_1\ldots i_k)}$ are iterated Stratonovich stochastic integrals (330) and (384), $C_{j_k\ldots j_1}$ and $C_{j_k\ldots j_1}(s)$ are Fourier coefficients (322) and (382), constants K_1 and $K_2(s)$ are independent of p; another notations are the same as in Theorems 1, 20, 22.

Proof. Note that Conditions 1 and 2 of Theorems 20, 22 are satisfied under the conditions of Theorem 26 (see Remark 2.4 in [26]). Then from the proof of Theorem 20 it follows that the expression (380) before passing to limit $\underset{p\to\infty}{\text{l.i.m.}}$ has the form

$$
\sum_{j_1,\ldots,j_k=0}^{p}C_{j_k\ldots j_1}\prod_{l=1}^{k}\zeta_{j_l}^{(i_l)}=J[\psi^{(k)}]_{T,t}^{(i_1\ldots i_k)p}+
$$

$$+\sum_{r=1}^{[k/2]}\Biggl(\frac{1}{2^r}\sum_{(s_r,\ldots,s_1)\in\mathrm{A}_{k,r}} I[\psi^{(k)}]_{T,t}^{(i_1\ldots i_{s_1-1}i_{s_1+2}\ldots i_{s_r-1}i_{s_r+2}\ldots i_k)p}+$$

$$+\sum_{\substack{(\{\{g_1,g_2\},\ldots,\{g_{2r-1},g_{2r}\}\},\{q_1,\ldots,q_{k-2r}\})\\ \{g_1,g_2,\ldots,g_{2r-1},g_{2r},q_1,\ldots,q_{k-2r}\}=\{1,2,\ldots,k\}}} R_{T,t}^{(p)r,g_1,g_2,\ldots,g_{2r-1},g_{2r}}\Biggr), \tag{494}$$

where $J[\psi^{(k)}]_{T,t}^{(i_1\ldots i_k)p}$ is the approximation for the iterated Ito stochastic integral (2), which is obtained using Theorem 18, i.e.

$$J[\psi^{(k)}]_{T,t}^{(i_1\ldots i_k)p}=\sum_{j_1,\ldots,j_k=0}^{p} C_{j_k\ldots j_1}\Biggl(\prod_{l=1}^{k}\zeta_{j_l}^{(i_l)}+\sum_{r=1}^{[k/2]}(-1)^r\times$$

$$\times\sum_{\substack{(\{\{g_1,g_2\},\ldots,\{g_{2r-1},g_{2r}\}\},\{q_1,\ldots,q_{k-2r}\})\\ \{g_1,g_2,\ldots,g_{2r-1},g_{2r},q_1,\ldots,q_{k-2r}\}=\{1,2,\ldots,k\}}} \prod_{s=1}^{r}\mathbf{1}_{\{i_{g_{2s-1}}=\,i_{g_{2s}}\neq 0\}}\mathbf{1}_{\{j_{g_{2s-1}}=\,j_{g_{2s}}\}}\prod_{l=1}^{k-2r}\zeta_{j_{q_l}}^{(i_{q_l})}\Biggr), \tag{495}$$

$I[\psi^{(k)}]_{T,t}^{(i_1\ldots i_{s_1-1}i_{s_1+2}\ldots i_{s_r-1}i_{s_r+2}\ldots i_k)p}$ is the approximation obtained using (495) for the iterated Ito stochastic integral $J[\psi^{(k)}]_{T,t}^{s_r,\ldots,s_1}$ (see (381)).

Using (494) and Theorem 19, we have

$$\sum_{j_1,\ldots,j_k=0}^{p} C_{j_k\ldots j_1}\prod_{l=1}^{k}\zeta_{j_l}^{(i_l)}=J[\psi^{(k)}]_{T,t}^{(i_1\ldots i_k)}+\sum_{r=1}^{[k/2]}\frac{1}{2^r}\sum_{(s_r,\ldots,s_1)\in\mathrm{A}_{k,r}} I[\psi^{(k)}]_{T,t}^{(i_1\ldots i_{s_1-1}i_{s_1+2}\ldots i_{s_r-1}i_{s_r+2}\ldots i_k)}+$$

$$+\Bigl(J[\psi^{(k)}]_{T,t}^{(i_1\ldots i_k)p}-J[\psi^{(k)}]_{T,t}^{(i_1\ldots i_k)}\Bigr)+$$

$$+\sum_{r=1}^{[k/2]}\sum_{(s_r,\ldots,s_1)\in\mathrm{A}_{k,r}}\frac{1}{2^r}\Biggl(I[\psi^{(k)}]_{T,t}^{(i_1\ldots i_{s_1-1}i_{s_1+2}\ldots i_{s_r-1}i_{s_r+2}\ldots i_k)p}-I[\psi^{(k)}]_{T,t}^{(i_1\ldots i_{s_1-1}i_{s_1+2}\ldots i_{s_r-1}i_{s_r+2}\ldots i_k)}\Biggr)+$$

$$+\sum_{r=1}^{[k/2]}\sum_{\substack{(\{\{g_1,g_2\},\ldots,\{g_{2r-1},g_{2r}\}\},\{q_1,\ldots,q_{k-2r}\})\\ \{g_1,g_2,\ldots,g_{2r-1},g_{2r},q_1,\ldots,q_{k-2r}\}=\{1,2,\ldots,k\}}} R_{T,t}^{(p)r,g_1,g_2,\ldots,g_{2r-1},g_{2r}}=$$

$$=J^*[\psi^{(k)}]_{T,t}^{(i_1\ldots i_k)}+\Bigl(J[\psi^{(k)}]_{T,t}^{(i_1\ldots i_k)p}-J[\psi^{(k)}]_{T,t}^{(i_1\ldots i_k)}\Bigr)+$$

$$+\sum_{r=1}^{[k/2]}\sum_{(s_r,\ldots,s_1)\in\mathrm{A}_{k,r}}\frac{1}{2^r}\Biggl(I[\psi^{(k)}]_{T,t}^{(i_1\ldots i_{s_1-1}i_{s_1+2}\ldots i_{s_r-1}i_{s_r+2}\ldots i_k)p}-I[\psi^{(k)}]_{T,t}^{(i_1\ldots i_{s_1-1}i_{s_1+2}\ldots i_{s_r-1}i_{s_r+2}\ldots i_k)}\Biggr)+$$

$$
+\sum_{r=1}^{[k/2]}\ \sum_{\substack{(\{\{g_1,g_2\},\ldots,\{g_{2r-1},g_{2r}\}\},\{q_1,\ldots,q_{k-2r}\})\\ \{g_1,g_2,\ldots,g_{2r-1},g_{2r},q_1,\ldots,q_{k-2r}\}=\{1,2,\ldots,k\}}} R_{T,t}^{(p)r,g_1,g_2,\ldots,g_{2r-1},g_{2r}} \tag{496}
$$

w. p. 1, where we denote $J[\psi^{(k)}]_{T,t}^{s_r,\ldots,s_1}$ as $I[\psi^{(k)}]_{T,t}^{(i_1\ldots i_{s_1-1}i_{s_1+2}\ldots i_{s_r-1}i_{s_r+2}\ldots i_k)}$.

Applying (263), we obtain the following estimates

$$
\mathsf{M}\left\{\left(J[\psi^{(k)}]_{T,t}^{(i_1\ldots i_k)p}-J[\psi^{(k)}]_{T,t}^{(i_1\ldots i_k)}\right)^2\right\}\le\frac{C}{p}, \tag{497}
$$

$$
\mathsf{M}\left\{\left(I[\psi^{(k)}]_{T,t}^{(i_1\ldots i_{s_1-1}i_{s_1+2}\ldots i_{s_r-1}i_{s_r+2}\ldots i_k)p}-I[\psi^{(k)}]_{T,t}^{(i_1\ldots i_{s_1-1}i_{s_1+2}\ldots i_{s_r-1}i_{s_r+2}\ldots i_k)}\right)^2\right\}\le
$$

$$
\le\frac{C}{p}, \tag{498}
$$

where constant C does not depend on p.

From (496)–(498) and the elementary inequality

$$
(a_1+a_2+\ldots+a_n)^2\le n\left(a_1^2+a_2^2+\ldots+a_n^2\right),\quad n\in\mathbb{N}
$$

we obtain (492).

The estimate (493) is obtained similarly to the estimate (492) using Theorems 5, 22 and (308). Theorem 26 is proved.

18. Rate of the Mean-Square Convergence of Expansions of Iterated Stratonovich Stochastic Integrals of Multiplicities 3–5 in Theorems 23–25

In this section, we consider the rate of convergence of approximations of iterated Stratonovich stochastic integrals in Theorems 23–25. It is easy to see that in Theorems 23–25 the second term in parentheses on the right-hand side of (492) is estimated. Combining these results with Theorem 26, we obtain the following theorems.

Theorem 27 [26], [34], [50], [72]. *Suppose that $\{\phi_j(x)\}_{j=0}^{\infty}$ is a complete orthonormal system of Legendre polynomials or trigonometric functions in the space $L_2([t,T])$. Furthermore, let $\psi_1(\tau),\psi_2(\tau)$, $\psi_3(\tau)$ are continuously differentiable nonrandom functions on $[t,T]$. Then, for the iterated Stratonovich stochastic integral of third multiplicity*

$$
J^*[\psi^{(3)}]_{T,t}=\int\limits_t^{*T}\psi_3(t_3)\int\limits_t^{*t_3}\psi_2(t_2)\int\limits_t^{*t_2}\psi_1(t_1)d\mathbf{f}_{t_1}^{(i_1)}d\mathbf{f}_{t_2}^{(i_2)}d\mathbf{f}_{t_3}^{(i_3)}
$$

the following estimate

$$
\mathsf{M}\left\{\left(J^*[\psi^{(3)}]_{T,t}-\sum_{j_1,j_2,j_3=0}^{p}C_{j_3j_2j_1}\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}\zeta_{j_3}^{(i_3)}\right)^2\right\}\le\frac{C}{p}
$$

is fulfilled, where $i_1, i_2, i_3 = 1, \ldots, m$*, constant* C *is independent of* p*,*

$$
C_{j_3 j_2 j_1} = \int\limits_t^T \psi_3(t_3)\phi_{j_3}(t_3) \int\limits_t^{t_3} \psi_2(t_2)\phi_{j_2}(t_2) \int\limits_t^{t_2} \psi_1(t_1)\phi_{j_1}(t_1) dt_1 dt_2 dt_3
$$

and

$$
\zeta_j^{(i)} = \int\limits_t^T \phi_j(s) d\mathbf{f}_s^{(i)}
$$

are independent standard Gaussian random variables for various i *or* j*.*

Theorem 28 [26], [34], [50], [72]. *Let* $\{\phi_j(x)\}_{j=0}^{\infty}$ *be a complete orthonormal system of Legendre polynomials or trigonometric functions in the space* $L_2([t,T])$*. Furthermore, let* $\psi_1(\tau), \ldots, \psi_4(\tau)$ *be continuously differentiable nonrandom functions on* $[t,T]$*. Then, for the iterated Stratonovich stochastic integral of fourth multiplicity*

$$
J^*[\psi^{(4)}]_{T,t} = \int\limits_t^{*T} \psi_4(t_4) \int\limits_t^{*t_4} \psi_3(t_3) \int\limits_t^{*t_3} \psi_2(t_2) \int\limits_t^{*t_2} \psi_1(t_1) d\mathbf{f}_{t_1}^{(i_1)} d\mathbf{f}_{t_2}^{(i_2)} d\mathbf{f}_{t_3}^{(i_3)} d\mathbf{f}_{t_4}^{(i_4)}
$$

the following estimate

$$
\mathsf{M}\left\{\left(J^*[\psi^{(4)}]_{T,t} - \sum_{j_1,j_2,j_3,j_4=0}^{p} C_{j_4 j_3 j_2 j_1} \zeta_{j_1}^{(i_1)} \zeta_{j_2}^{(i_2)} \zeta_{j_3}^{(i_3)} \zeta_{j_4}^{(i_4)}\right)^2\right\} \le \frac{C}{p^{1-\varepsilon}}
$$

holds, where $i_1, i_2, i_3, i_4 = 1, \ldots, m$*, constant* C *does not depend on* p*,* ε *is an arbitrary small positive real number for the case of complete orthonormal system of Legendre polynomials in the space* $L_2([t,T])$ *and* $\varepsilon = 0$ *for the case of complete orthonormal system of trigonometric functions in the space* $L_2([t,T])$*,*

$$
C_{j_4 j_3 j_2 j_1} = \int\limits_t^T \psi_4(t_4)\phi_{j_4}(t_4) \int\limits_t^{t_4} \psi_3(t_3)\phi_{j_3}(t_3) \int\limits_t^{t_3} \psi_2(t_2)\phi_{j_2}(t_2) \int\limits_t^{t_2} \psi_1(t_1)\phi_{j_1}(t_1) dt_1 \times
$$

$$
\times dt_2 dt_3 dt_4;
$$

another notations are the same as in Theorem 27*.*

Theorem 29 [26], [34], [50], [72]. *Assume that* $\{\phi_j(x)\}_{j=0}^{\infty}$ *is a complete orthonormal system of Legendre polynomials or trigonometric functions in the space* $L_2([t,T])$ *and* $\psi_1(\tau), \ldots, \psi_5(\tau)$ *are continuously differentiable nonrandom functions on* $[t,T]$*. Then, for the iterated Stratonovich stochastic integral of fifth multiplicity*

$$
J^*[\psi^{(5)}]_{T,t} = \int\limits_t^{*T} \psi_5(t_5) \ldots \int\limits_t^{*t_2} \psi_1(t_1) d\mathbf{f}_{t_1}^{(i_1)} \ldots d\mathbf{f}_{t_5}^{(i_5)}
$$

the following estimate

$$\mathsf{M}\left\{\left(J^*[\psi^{(5)}]_{T,t}-\sum_{j_1,\ldots,j_5=0}^{p}C_{j_5\ldots j_1}\zeta_{j_1}^{(i_1)}\ldots\zeta_{j_5}^{(i_5)}\right)^2\right\}\le\frac{C}{p^{1-\varepsilon}}$$

is valid, where $i_1,\ldots,i_5=1,\ldots,m$, *constant* C *is independent of* p, ε *is an arbitrary small positive real number for the case of complete orthonormal system of Legendre polynomials in the space* $L_2([t,T])$ *and* $\varepsilon=0$ *for the case of complete orthonormal system of trigonometric functions in the space* $L_2([t,T])$,

$$C_{j_5\ldots j_1}=\int\limits_t^T\psi_5(t_5)\phi_{j_5}(t_5)\ldots\int\limits_t^{t_2}\psi_1(t_1)\phi_{j_1}(t_1)dt_1\ldots dt_5;$$

another notations are the same as in Theorem 27, 28.

19. Expansion of Iterated Stratonovich Stochastic Integrals of Multiplicity 6. The Case $p_1=\ldots=p_6\to\infty$ and $\psi_1(\tau),\ \ldots,\ \psi_6(\tau)\equiv 1$ (The Cases of Legendre Polynomials and Trigonometric Functions)

Theorem 30 [26], [34], [72], [73]. *Suppose that* $\{\phi_j(x)\}_{j=0}^{\infty}$ *is a complete orthonormal system of Legendre polynomials or trigonometric functions in the space* $L_2([t,T])$. *Then, for the iterated Stratonovich stochastic integral of sixth multiplicity*

$$J_{T,t}^{*(i_1\ldots i_6)}=\int\limits_t^{*T}\ldots\int\limits_t^{*t_2}d\mathbf{w}_{t_1}^{(i_1)}\ldots d\mathbf{w}_{t_6}^{(i_6)}\qquad(499)$$

the following expansion

$$J_{T,t}^{*(i_1\ldots i_6)}=\underset{p\to\infty}{\text{l.i.m.}}\sum_{j_1,\ldots,j_6=0}^{p}C_{j_6\ldots j_1}\zeta_{j_1}^{(i_1)}\ldots\zeta_{j_6}^{(i_6)}$$

that converges in the mean-square sense is valid, where $i_1,\ldots,i_6=0,1,\ldots,m$,

$$C_{j_6\ldots j_1}=\int\limits_t^T\phi_{j_6}(t_6)\ldots\int\limits_t^{t_2}\phi_{j_1}(t_1)dt_1\ldots dt_6$$

and

$$\zeta_j^{(i)}=\int\limits_t^T\phi_j(s)d\mathbf{w}_s^{(i)}$$

are independent standard Gaussian random variables for various i *or* j *(in the case when* $i\ne0$*),* $\mathbf{w}_\tau^{(i)}=\mathbf{f}_\tau^{(i)}$ *for* $i=1,\ldots,m$ *and* $\mathbf{w}_\tau^{(0)}=\tau$.

Proof. As noted in Sect. 13, Conditions 1 and 2 of Theorem 20 are satisfied for complete orthonormal systems of Legendre polynomials and trigonometric functions in the space $L_2([t,T])$. Let us verify Condition 3 of Theorem 20 for the iterated Stratonovich stochastic integral (499). Thus, we have to check the following conditions

$$\lim_{p\to\infty}\sum_{j_{q_1},j_{q_2},j_{q_3},j_{q_4}=0}^{p}\left(\sum_{j_{g_1}=p+1}^{\infty}C_{j_6\ldots j_1}\Bigg|_{j_{g_1}=j_{g_2}}\right)^2=0, \tag{500}$$

$$\lim_{p\to\infty}\sum_{j_{q_1},j_{q_2}=0}^{p}\left(\sum_{j_{g_1}=p+1}^{\infty}\sum_{j_{g_3}=p+1}^{\infty}C_{j_6\ldots j_1}\Bigg|_{j_{g_1}=j_{g_2},j_{g_3}=j_{g_4}}\right)^2=0, \tag{501}$$

$$\lim_{p\to\infty}\sum_{j_{q_1},j_{q_2}=0}^{p}\left(\sum_{j_{g_1}=p+1}^{\infty}C_{j_6\ldots j_1}\Bigg|_{(j_{g_4}j_{g_3})\curvearrowright(\cdot),j_{g_1}=j_{g_2},j_{g_3}=j_{g_4},g_4=g_3+1}\right)^2=0, \tag{502}$$

$$\lim_{p\to\infty}\left(\sum_{j_{g_1}=p+1}^{\infty}\sum_{j_{g_3}=p+1}^{\infty}\sum_{j_{g_5}=p+1}^{\infty}C_{j_6\ldots j_1}\Bigg|_{j_{g_1}=j_{g_2},j_{g_3}=j_{g_4},j_{g_5}=j_{g_6}}\right)^2=0, \tag{503}$$

$$\lim_{p\to\infty}\left(\sum_{j_{g_1}=p+1}^{\infty}\sum_{j_{g_3}=p+1}^{\infty}C_{j_6\ldots j_1}\Bigg|_{(j_{g_6}j_{g_5})\curvearrowright(\cdot),j_{g_1}=j_{g_2},j_{g_3}=j_{g_4},j_{g_5}=j_{g_6},g_6=g_5+1}\right)^2=0, \tag{504}$$

$$\lim_{p\to\infty}\left(\sum_{j_{g_1}=p+1}^{\infty}C_{j_6\ldots j_1}\Bigg|_{(j_{g_4}j_{g_3})\curvearrowright(\cdot)(j_{g_6}j_{g_5})\curvearrowright(\cdot),j_{g_1}=j_{g_2},j_{g_3}=j_{g_4},j_{g_5}=j_{g_6},g_4=g_3+1,g_6=g_5+1}\right)^2=0, \tag{505}$$

where the expressions

$$(\{g_1,g_2\},\{g_3,g_4\},\{g_5,g_6\}\}),\quad (\{g_1,g_2\},\{g_3,g_4\},\{q_1,q_2\}\}),\quad (\{g_1,g_2\},\{q_1,q_2,q_3,q_4\})$$

are partitions of the set $\{1,2,\ldots,6\}$ that is $\{g_1,g_2,g_3,\,g_4,g_5,g_6\}=\{g_1,g_2,g_3,g_4,q_1,q_2\}=\{g_1,g_2,q_1,$ $q_2,q_3,q_4\}=\{1,2,\,\ldots,6\}$; braces mean an unordered set, and parentheses mean an ordered set.

The equalities (500), (502) were proved earlier (see the proof of equalities (482), (488)). The relation (505) follows from the estimate (43) for the polynomial case and its analogue for the trigonometric case. It is easy to see that the equalities (501) and (504) are proved in complete analogy with the proof of (454), (488).

Thus, we have to prove the relation (503). The equality (503) is equivalent to the following equalities

$$\lim_{p\to\infty}\sum_{j_1=p+1}^{\infty}\sum_{j_2=p+1}^{\infty}\sum_{j_3=p+1}^{\infty}C_{j_3j_2j_1j_3j_2j_1}=0, \tag{506}$$

$$\lim_{p\to\infty}\sum_{j_1=p+1}^{\infty}\sum_{j_2=p+1}^{\infty}\sum_{j_3=p+1}^{\infty}C_{j_1j_3j_2j_3j_2j_1}=0, \tag{507}$$

$$\lim_{p\to\infty}\sum_{j_1=p+1}^{\infty}\sum_{j_2=p+1}^{\infty}\sum_{j_3=p+1}^{\infty}C_{j_3j_2j_3j_1j_2j_1}=0, \tag{508}$$

$$\lim_{p\to\infty}\sum_{j_1=p+1}^{\infty}\sum_{j_2=p+1}^{\infty}\sum_{j_3=p+1}^{\infty}C_{j_1j_2j_3j_3j_2j_1}=0, \tag{509}$$

$$\lim_{p\to\infty}\sum_{j_1=p+1}^{\infty}\sum_{j_2=p+1}^{\infty}\sum_{j_3=p+1}^{\infty}C_{j_1j_2j_2j_3j_3j_1}=0, \tag{510}$$

$$\lim_{p\to\infty}\sum_{j_1=p+1}^{\infty}\sum_{j_2=p+1}^{\infty}\sum_{j_3=p+1}^{\infty}C_{j_3j_3j_2j_2j_1j_1}=0, \tag{511}$$

$$\lim_{p\to\infty}\sum_{j_1=p+1}^{\infty}\sum_{j_2=p+1}^{\infty}\sum_{j_3=p+1}^{\infty}C_{j_2j_3j_3j_2j_1j_1}=0, \tag{512}$$

$$\lim_{p\to\infty}\sum_{j_1=p+1}^{\infty}\sum_{j_2=p+1}^{\infty}\sum_{j_3=p+1}^{\infty}C_{j_3j_2j_3j_2j_1j_1}=0, \tag{513}$$

$$\lim_{p\to\infty}\sum_{j_1=p+1}^{\infty}\sum_{j_2=p+1}^{\infty}\sum_{j_3=p+1}^{\infty}C_{j_3j_3j_2j_1j_2j_1}=0, \tag{514}$$

$$\lim_{p\to\infty}\sum_{j_1=p+1}^{\infty}\sum_{j_2=p+1}^{\infty}\sum_{j_3=p+1}^{\infty}C_{j_3j_3j_1j_2j_2j_1}=0, \tag{515}$$

$$\lim_{p\to\infty}\sum_{j_1=p+1}^{\infty}\sum_{j_2=p+1}^{\infty}\sum_{j_3=p+1}^{\infty}C_{j_2j_1j_3j_3j_2j_1}=0, \tag{516}$$

$$\lim_{p\to\infty}\sum_{j_1=p+1}^{\infty}\sum_{j_2=p+1}^{\infty}\sum_{j_3=p+1}^{\infty}C_{j_3j_1j_2j_3j_2j_1}=0, \tag{517}$$

$$\lim_{p\to\infty}\sum_{j_1=p+1}^{\infty}\sum_{j_2=p+1}^{\infty}\sum_{j_3=p+1}^{\infty}C_{j_2j_3j_1j_3j_2j_1}=0, \tag{518}$$

$$\lim_{p\to\infty}\sum_{j_1=p+1}^{\infty}\sum_{j_2=p+1}^{\infty}\sum_{j_3=p+1}^{\infty}C_{j_3j_1j_3j_2j_2j_1}=0, \tag{519}$$

$$\lim_{p\to\infty}\sum_{j_1=p+1}^{\infty}\sum_{j_2=p+1}^{\infty}\sum_{j_3=p+1}^{\infty}C_{j_2j_3j_3j_1j_2j_1}=0. \tag{520}$$

Consider in detail the case of Legendre polynomials (the case of trigonometric functions is considered in complete analogy).

First, we prove the following equality for the Fourier coefficients for the case $\psi_1(\tau),\ldots,\psi_6(\tau)\equiv 1$

$$C_{j_6j_5j_4j_3j_2j_1}+C_{j_1j_2j_3j_4j_5j_6}=C_{j_6}C_{j_5j_4j_3j_2j_1}-C_{j_5j_6}C_{j_4j_3j_2j_1}+$$

$$+C_{j_4j_5j_6}C_{j_3j_2j_1}-C_{j_3j_4j_5j_6}C_{j_2j_1}+C_{j_2j_3j_4j_5j_6}C_{j_1}. \tag{521}$$

Using the integration order replacement, we have

$$C_{j_6j_5j_4j_3j_2j_1}=$$

$$=\int\limits_t^T\phi_{j_6}(t_6)\int\limits_t^{t_6}\phi_{j_5}(t_5)\ldots\int\limits_t^{t_2}\phi_{j_1}(t_1)dt_1\ldots dt_5dt_6=$$

$$=\int\limits_t^T\phi_{j_6}(t_6)\int\limits_t^{T}\phi_{j_5}(t_5)\int\limits_t^{t_5}\phi_{j_4}(t_4)\ldots\int\limits_t^{t_2}\phi_{j_1}(t_1)dt_1\ldots dt_4dt_5dt_6-$$

$$-\int\limits_t^T\phi_{j_6}(t_6)\int\limits_{t_6}^{T}\phi_{j_5}(t_5)\int\limits_t^{t_5}\phi_{j_4}(t_4)\ldots\int\limits_t^{t_2}\phi_{j_1}(t_1)dt_1\ldots dt_4dt_5dt_6=$$

$$=C_{j_6}C_{j_5j_4j_3j_2j_1}-$$

$$-\int\limits_t^T\phi_{j_6}(t_6)\int\limits_{t_6}^{T}\phi_{j_5}(t_5)\int\limits_t^{T}\phi_{j_4}(t_4)\int\limits_t^{t_4}\phi_{j_3}(t_3)\ldots\int\limits_t^{t_2}\phi_{j_1}(t_1)dt_1\ldots dt_3dt_4dt_5dt_6+$$

$$+\int\limits_t^T\phi_{j_6}(t_6)\int\limits_{t_6}^{T}\phi_{j_5}(t_5)\int\limits_{t_5}^{T}\phi_{j_4}(t_4)\int\limits_t^{t_4}\phi_{j_3}(t_3)\ldots\int\limits_t^{t_2}\phi_{j_1}(t_1)dt_1\ldots dt_3dt_4dt_5dt_6=$$

$$=C_{j_6}C_{j_5j_4j_3j_2j_1}-$$

$$-\int\limits_t^T\phi_{j_6}(t_6)\int\limits_{t_6}^{T}\phi_{j_5}(t_5)dt_5dt_6\ C_{j_4j_3j_2j_1}+$$

$$+\int\limits_t^T\phi_{j_6}(t_6)\int\limits_{t_6}^{T}\phi_{j_5}(t_5)\int\limits_{t_5}^{T}\phi_{j_4}(t_4)\int\limits_t^{t_4}\phi_{j_3}(t_3)\ldots\int\limits_t^{t_2}\phi_{j_1}(t_1)dt_1\ldots dt_3dt_4dt_5dt_6=$$

$$=C_{j_6}C_{j_5j_4j_3j_2j_1}-C_{j_5j_6}C_{j_4j_3j_2j_1}+$$

$$+\int\limits_t^T\phi_{j_6}(t_6)\int\limits_{t_6}^{T}\phi_{j_5}(t_5)\int\limits_{t_5}^{T}\phi_{j_4}(t_4)\int\limits_t^{t_4}\phi_{j_3}(t_3)\ldots\int\limits_t^{t_2}\phi_{j_1}(t_1)dt_1\ldots dt_3dt_4dt_5dt_6=$$

$$\ldots$$

$$=C_{j_6}C_{j_5j_4j_3j_2j_1}-C_{j_5j_6}C_{j_4j_3j_2j_1}+C_{j_4j_5j_6}C_{j_3j_2j_1}-C_{j_3j_4j_5j_6}C_{j_2j_1}+C_{j_2j_3j_4j_5j_6}C_{j_1}-$$

$$-\int\limits_t^T \phi_{j_6}(t_6)\int\limits_{t_6}^T \phi_{j_5}(t_5)\ldots\int\limits_{t_2}^T \phi_{j_1}(t_1)dt_1\ldots dt_5dt_6 =$$

$$= C_{j_6}C_{j_5j_4j_3j_2j_1} - C_{j_5j_6}C_{j_4j_3j_2j_1} + C_{j_4j_5j_6}C_{j_3j_2j_1} -$$

$$-C_{j_3j_4j_5j_6}C_{j_2j_1} + C_{j_2j_3j_4j_5j_6}C_{j_1} - C_{j_1j_2j_3j_4j_5j_6}. \tag{522}$$

The equality (522) completes the proof of the relation (521).

Let us consider (506). From (354) we obtain

$$\sum_{j_1=p+1}^{\infty}\sum_{j_2=p+1}^{\infty}\sum_{j_3=p+1}^{\infty} C_{j_3j_2j_1j_3j_2j_1} = -\sum_{j_1=0}^{p}\sum_{j_2=0}^{p}\sum_{j_3=0}^{p} C_{j_3j_2j_1j_3j_2j_1}. \tag{523}$$

Applying (521), we get

$$\sum_{j_1,j_2,j_3=0}^{p} C_{j_3j_2j_1j_3j_2j_1} + \sum_{j_1,j_2,j_3=0}^{p} C_{j_1j_2j_3j_1j_2j_3} = 2\sum_{j_1,j_2,j_3=0}^{p} C_{j_3j_2j_1j_3j_2j_1} =$$

$$= \sum_{j_1,j_2,j_3=0}^{p}\Biggl(C_{j_3}C_{j_2j_1j_3j_2j_1} - C_{j_2j_3}C_{j_1j_3j_2j_1} + C_{j_1j_2j_3}C_{j_3j_2j_1} -$$

$$-C_{j_3j_1j_2j_3}C_{j_2j_1} + C_{j_2j_3j_1j_2j_3}C_{j_1}\Biggr). \tag{524}$$

Recall that the complete orthonormal system of Legendre polynomials in the space $L_2([t,T])$ looks as follows

$$\phi_j(x) = \sqrt{\frac{2j+1}{T-t}}P_j\left(\left(x-\frac{T+t}{2}\right)\frac{2}{T-t}\right), \quad j=0,1,2,\ldots,$$

where

$$P_j(x) = \frac{1}{2^j j!}\frac{d^j}{dx^j}\left(x^2-1\right)^j$$

is the Legendre polynomial.

Note that

$$C_{j_2j_1} = \int\limits_t^T \phi_{j_2}(\tau)\int\limits_t^{\tau}\phi_{j_1}(\theta)d\theta d\tau =$$

$$
= \frac{T-t}{2} \begin{cases} 1/\sqrt{(2j_1+1)(2j_1+3)} & \text{if } j_2 = j_1+1,\ j_1 = 0,1,2,\ldots \\ -1/\sqrt{4j_1^2-1} & \text{if } j_2 = j_1-1,\ j_1 = 1,2,\ldots \\ 1 & \text{if } j_1 = j_2 = 0 \\ 0 & \text{otherwise} \end{cases}, \tag{525}
$$

$$
C_{j_1} = \int\limits_t^T \phi_{j_1}(\tau)d\tau = \begin{cases} \sqrt{T-t} & \text{if } j_1 = 0 \\ 0 & \text{if } j_1 \neq 0 \end{cases}. \tag{526}
$$

Moreover, the generalized Parseval equality gives

$$
\lim_{p\to\infty}\sum_{j_1,j_2,j_3=0}^{p} C_{j_1j_2j_3}C_{j_3j_2j_1} =
$$

$$
= \lim_{p\to\infty}\sum_{j_1,j_2,j_3=0}^{p} \int\limits_t^T \phi_{j_1}(t_3)\int\limits_t^{t_3}\phi_{j_2}(t_2)\int\limits_t^{t_2}\phi_{j_3}(t_1)dt_1dt_2dt_3 \times
$$

$$
\times \int\limits_t^T \phi_{j_3}(t_3)\int\limits_t^{t_3}\phi_{j_2}(t_2)\int\limits_t^{t_2}\phi_{j_1}(t_1)dt_1dt_2dt_3 =
$$

$$
= \lim_{p\to\infty}\sum_{j_1,j_2,j_3=0}^{p} \int\limits_t^T \phi_{j_3}(t_3)\int\limits_{t_3}^{T}\phi_{j_2}(t_2)\int\limits_{t_2}^{T}\phi_{j_1}(t_1)dt_1dt_2dt_3 \times
$$

$$
\times \int\limits_t^T \phi_{j_3}(t_3)\int\limits_t^{t_3}\phi_{j_2}(t_2)\int\limits_t^{t_2}\phi_{j_1}(t_1)dt_1dt_2dt_3 =
$$

$$
= \lim_{p\to\infty}\sum_{j_1,j_2,j_3=0}^{p} \int\limits_{[t,T]^3} \mathbf{1}_{\{t_3<t_2<t_1\}}\prod_{l=1}^{3}\phi_{j_l}(t_l)dt_1dt_2dt_3 \times
$$

$$
\times \int\limits_{[t,T]^3} \mathbf{1}_{\{t_1<t_2<t_3\}}\prod_{l=1}^{3}\phi_{j_l}(t_l)dt_1dt_2dt_3 =
$$

$$
= \int\limits_{[t,T]^3} \mathbf{1}_{\{t_3<t_2<t_1\}}\mathbf{1}_{\{t_1<t_2<t_3\}}dt_1dt_2dt_3 = 0. \tag{527}
$$

Using the above arguments and also (354), (523), and (524), we get

$$-\lim_{p\to\infty}\sum_{j_1=p+1}^{\infty}\sum_{j_2=p+1}^{\infty}\sum_{j_3=p+1}^{\infty}C_{j_3j_2j_1j_3j_2j_1}=\lim_{p\to\infty}\sum_{j_1,j_2,j_3=0}^{p}C_{j_3j_2j_1j_3j_2j_1}=$$

$$=\frac{1}{2}\lim_{p\to\infty}\sum_{j_1,j_2,j_3=0}^{p}\Biggl(C_{j_3}C_{j_2j_1j_3j_2j_1}-C_{j_2j_3}C_{j_1j_3j_2j_1}-$$

$$-C_{j_3j_1j_2j_3}C_{j_2j_1}+C_{j_2j_3j_1j_2j_3}C_{j_1}\Biggr)=$$

$$=\lim_{p\to\infty}\sum_{j_1,j_2,j_3=0}^{p}\Biggl(C_{j_3}C_{j_2j_1j_3j_2j_1}-C_{j_3j_1j_2j_3}C_{j_2j_1}\Biggr)=$$

$$=\sqrt{T-t}\lim_{p\to\infty}\sum_{j_1,j_2=0}^{p}C_{j_2j_10j_2j_1}-\lim_{p\to\infty}\sum_{j_1,j_2,j_3=0}^{p}C_{j_3j_1j_2j_3}C_{j_2j_1}=$$

$$=\sqrt{T-t}\lim_{p\to\infty}\sum_{j_1,j_2=0}^{p}C_{j_2j_10j_2j_1}+\lim_{p\to\infty}\sum_{j_1,j_2=0}^{p}\sum_{j_3=p+1}^{\infty}C_{j_3j_1j_2j_3}C_{j_2j_1}. \tag{528}$$

By analogy with the proof of (418) (see the proof of Theorem 24) we obtain

$$\lim_{p\to\infty}\sum_{j_1,j_2=0}^{p}C_{j_2j_10j_2j_1}=\lim_{p\to\infty}\sum_{j_1=p+1}^{\infty}\sum_{j_2=p+1}^{\infty}C_{j_2j_10j_2j_1}=0, \tag{529}$$

where we used the following representation

$$C_{j_2j_10j_2j_1}=$$

$$=\frac{1}{\sqrt{T-t}}\int\limits_t^T\phi_{j_2}(t_5)\int\limits_t^{t_5}\phi_{j_1}(t_4)\int\limits_t^{t_4}\int\limits_t^{t_3}\phi_{j_2}(t_2)\int\limits_t^{t_2}\phi_{j_1}(t_1)dt_1dt_2dt_3dt_4dt_5=$$

$$=\frac{1}{\sqrt{T-t}}\int\limits_t^T\phi_{j_2}(t_5)\int\limits_t^{t_5}\phi_{j_1}(t_4)\int\limits_t^{t_4}\phi_{j_2}(t_2)\int\limits_t^{t_2}\phi_{j_1}(t_1)dt_1\int\limits_{t_2}^{t_4}dt_3dt_2dt_4dt_5=$$

$$=\frac{1}{\sqrt{T-t}}\int\limits_t^T\phi_{j_2}(t_5)\int\limits_t^{t_5}\phi_{j_1}(t_4)(t_4-t)\int\limits_t^{t_4}\phi_{j_2}(t_2)\int\limits_t^{t_2}\phi_{j_1}(t_1)dt_1dt_2dt_4dt_5+$$

$$+\frac{1}{\sqrt{T-t}}\int\limits_t^T\phi_{j_2}(t_5)\int\limits_t^{t_5}\phi_{j_1}(t_4)\int\limits_t^{t_4}\phi_{j_2}(t_2)(t-t_2)\int\limits_t^{t_2}\phi_{j_1}(t_1)dt_1dt_2dt_4dt_5\stackrel{\sf def}{=}$$

$$\stackrel{\sf def}{=}\bar C_{j_2j_1j_2j_1}+\tilde C_{j_2j_1j_2j_1}.$$

Further, we have (see (525))

$$\lim_{p\to\infty}\sum_{j_1,j_2=0}^{p}\sum_{j_3=p+1}^{\infty}C_{j_3j_1j_2j_3}C_{j_2j_1} = \lim_{p\to\infty}\sum_{j_3=p+1}^{\infty}\Biggl(C_{00}C_{j_300j_3}+$$

$$+\sum_{j_1=1}^{p}C_{j_1-1,j_1}C_{j_3j_1,j_1-1,j_3}+\sum_{j_1=1}^{p-1}C_{j_1+1,j_1}C_{j_3j_1,j_1+1,j_3}+C_{1,0}C_{j_301j_3}\Biggr). \tag{530}$$

Observe that

$$|C_{j_1-1,j_1}|+|C_{j_1+1,j_1}|\le\frac{K}{j_1}\quad (j_1=1,\ldots,p), \tag{531}$$

$$|C_{j_300j_3}|+|C_{j_3j_1,j_1-1,j_3}|+|C_{j_3j_1,j_1+1,j_3}|+|C_{j_301j_3}|\le\frac{K_1}{j_3^2}\quad (j_3\ge p+1), \tag{532}$$

where constants K, K_1 do not depend on j_1, j_3.

The estimate (531) follow from (525). At the same time, the estimate (532) can be obtained using the following reasoning. First note that the integration order replacement gives

$$C_{j_3j_1j_2j_3}=\int\limits_t^T\phi_{j_3}(t_4)\int\limits_t^{t_4}\phi_{j_1}(t_3)\int\limits_t^{t_3}\phi_{j_2}(t_2)\int\limits_t^{t_2}\phi_{j_3}(t_1)dt_1dt_2dt_3dt_4=$$

$$=\int\limits_t^T\phi_{j_1}(t_3)\int\limits_t^{t_3}\phi_{j_2}(t_2)\left(\int\limits_t^{t_2}\phi_{j_3}(t_1)dt_1\right)dt_2\left(\int\limits_{t_3}^{T}\phi_{j_3}(t_4)dt_4\right)dt_3. \tag{533}$$

Note analogues of the estimate (87)

$$\left|\int\limits_t^x\phi_{j_1}(s)ds\right|<\frac{C}{j_1(1-(z(x))^2)^{1/4}},\quad \left|\int\limits_x^T\phi_{j_1}(s)ds\right|<\frac{C}{j_1(1-(z(x))^2)^{1/4}},\quad x\in(t,T), \tag{534}$$

where $j_1>0$, constant C does not depend on j_1.

Applying the estimates (89) and (534) to (533) gives the estimate (532). Using (530), (531), and (532), we obtain

$$\left|\sum_{j_1,j_2=0}^{p}\sum_{j_3=p+1}^{\infty}C_{j_3j_1j_2j_3}C_{j_2j_1}\right|\le K\sum_{j_3=p+1}^{\infty}\frac{1}{j_3^2}\left(1+\sum_{j_1=1}^{p}\frac{1}{j_1}\right)\le$$

$$\le K\int\limits_p^{\infty}\frac{dx}{x^2}\left(2+\int\limits_1^p\frac{dx}{x}\right)=\frac{K(2+lnp)}{p}\to 0 \tag{535}$$

if $p\to\infty$, where constant K is independent of p. Thus, the equality (506) is proved (see (528), (529), (535)).

The relation (507) is proved in complete analogy with the proof of equality (506). For (507) we have (see (521))

$$\lim_{p\to\infty}\left(\sum_{j_1,j_2,j_3=0}^{p} C_{j_1j_3j_2j_3j_2j_1}+\sum_{j_1,j_2,j_3=0}^{p} C_{j_1j_2j_3j_2j_3j_1}\right)=2\lim_{p\to\infty}\sum_{j_1,j_2,j_3=0}^{p} C_{j_1j_3j_2j_3j_2j_1}=$$

$$=\lim_{p\to\infty}\sum_{j_1,j_2,j_3=0}^{p}\Bigl(C_{j_1}C_{j_3j_2j_3j_2j_1}-C_{j_3j_1}C_{j_2j_3j_2j_1}+C_{j_2j_3j_1}C_{j_3j_2j_1}-$$

$$-C_{j_3j_2j_3j_1}C_{j_2j_1}+C_{j_2j_3j_2j_3j_1}C_{j_1}\Bigr)=$$

$$=2\lim_{p\to\infty}\left(\sqrt{T-t}\sum_{j_2,j_3=0}^{p} C_{j_3j_2j_3j_20}-\sum_{j_1,j_2,j_3=0}^{p} C_{j_2j_1}C_{j_3j_2j_3j_1}\right)=$$

$$=-2\lim_{p\to\infty}\sum_{j_1,j_2,j_3=0}^{p} C_{j_2j_1}C_{j_3j_2j_3j_1}.$$

To estimate the Fourier coefficient $C_{j_3j_2j_3j_1}$, we use the following (see the proof of (506) for more details)

$$C_{j_3j_2j_3j_1}=\int_t^T\phi_{j_3}(t_4)\int_t^{t_4}\phi_{j_2}(t_3)\int_t^{t_3}\phi_{j_3}(t_2)\int_t^{t_2}\phi_{j_1}(t_1)dt_1dt_2dt_3dt_4=$$

$$=\int_t^T\phi_{j_3}(t_4)\int_t^{t_4}\phi_{j_2}(t_3)\int_t^{t_3}\phi_{j_1}(t_1)\int_{t_1}^{t_3}\phi_{j_3}(t_2)dt_2dt_1dt_3dt_4=$$

$$=\int_t^T\phi_{j_3}(t_4)\int_t^{t_4}\phi_{j_2}(t_3)\left(\int_t^{t_3}\phi_{j_3}(t_2)dt_2\right)\int_t^{t_3}\phi_{j_1}(t_1)dt_1dt_3dt_4-$$

$$-\int_t^T\phi_{j_3}(t_4)\int_t^{t_4}\phi_{j_2}(t_3)\int_t^{t_3}\phi_{j_1}(t_1)\left(\int_t^{t_1}\phi_{j_3}(t_2)dt_2\right)dt_1dt_3dt_4=$$

$$=\int_t^T\phi_{j_2}(t_3)\left(\int_t^{t_3}\phi_{j_3}(t_2)dt_2\right)\int_t^{t_3}\phi_{j_1}(t_1)dt_1\left(\int_{t_3}^T\phi_{j_3}(t_4)dt_4\right)dt_3-$$

$$-\int_t^T\phi_{j_2}(t_3)\int_t^{t_3}\phi_{j_1}(t_1)\left(\int_t^{t_1}\phi_{j_3}(t_2)dt_2\right)dt_1\left(\int_{t_3}^T\phi_{j_3}(t_4)dt_4\right)dt_3.$$

Let us prove (508). From (354) we obtain

$$\sum_{j_1=p+1}^{\infty}\sum_{j_2=p+1}^{\infty}\sum_{j_3=p+1}^{\infty}C_{j_3j_2j_3j_1j_2j_1}=-\sum_{j_1=0}^{p}\sum_{j_2=0}^{p}\sum_{j_3=0}^{p}C_{j_3j_2j_3j_1j_2j_1}. \tag{536}$$

Applying (521) and (536), we get (we replaced j_3 by j_4)

$$\sum_{j_1,j_2,j_4=0}^{p}C_{j_4j_2j_4j_1j_2j_1}+\sum_{j_1,j_2,j_4=0}^{p}C_{j_1j_2j_1j_4j_2j_4}=2\sum_{j_1,j_2,j_4=0}^{p}C_{j_4j_2j_4j_1j_2j_1}=$$

$$=\sum_{j_1,j_2,j_4=0}^{p}\Biggl(C_{j_4}C_{j_2j_4j_1j_2j_1}-C_{j_2j_4}C_{j_4j_1j_2j_1}+C_{j_4j_2j_4}C_{j_1j_2j_1}-$$

$$-C_{j_1j_4j_2j_4}C_{j_2j_1}+C_{j_2j_1j_4j_2j_4}C_{j_1}\Biggr)=$$

$$=2\sum_{j_1,j_2,j_4=0}^{p}\Biggl(C_{j_2j_1j_4j_2j_4}C_{j_1}-C_{j_1j_4j_2j_4}C_{j_2j_1}\Biggr)+$$

$$+\sum_{j_1,j_2,j_4=0}^{p}C_{j_4j_2j_4}C_{j_1j_2j_1}. \tag{537}$$

Further, we have (see (354))

$$\lim_{p\to\infty}\sum_{j_1,j_2,j_4=0}^{p}C_{j_4j_2j_4}C_{j_1j_2j_1}=\lim_{p\to\infty}\sum_{j_2=0}^{p}\left(\sum_{j_1=0}^{p}C_{j_1j_2j_1}\right)^2=$$

$$=\lim_{p\to\infty}\sum_{j_2=0}^{p}\left(\sum_{j_1=p+1}^{\infty}C_{j_1j_2j_1}\right)^2=0, \tag{538}$$

where we applied the equality (392).

Furthermore, by analogy with the proof of (506), we have

$$\lim_{p\to\infty}\sum_{j_1,j_2,j_4=0}^{p}\Biggl(C_{j_2j_1j_4j_2j_4}C_{j_1}-C_{j_1j_4j_2j_4}C_{j_2j_1}\Biggr)=0. \tag{539}$$

To estimate the Fourier coefficient $C_{j_1j_4j_2j_4}$ in (539), we use the following (see the proof of (506) for more details)

$$C_{j_1j_4j_2j_4}=\int\limits_t^T\phi_{j_1}(t_4)\int\limits_t^{t_4}\phi_{j_4}(t_3)\int\limits_t^{t_3}\phi_{j_2}(t_2)\left(\int\limits_t^{t_2}\phi_{j_4}(t_1)dt_1\right)dt_2dt_3dt_4=$$

$$= \int_t^T \phi_{j_1}(t_4) \int_t^{t_4} \phi_{j_2}(t_2) \left(\int_t^{t_2} \phi_{j_4}(t_1) dt_1 \right) \int_{t_2}^{t_4} \phi_{j_4}(t_3) dt_3 dt_2 dt_4 =$$

$$= \int_t^T \phi_{j_1}(t_4) \left(\int_t^{t_4} \phi_{j_4}(t_3) dt_3 \right) \int_t^{t_4} \phi_{j_2}(t_2) \left(\int_t^{t_2} \phi_{j_4}(t_1) dt_1 \right) dt_2 dt_4 -$$

$$- \int_t^T \phi_{j_1}(t_4) \int_t^{t_4} \phi_{j_2}(t_2) \left(\int_t^{t_2} \phi_{j_4}(t_3) dt_3 \right) \left(\int_t^{t_2} \phi_{j_4}(t_1) dt_1 \right) dt_2 dt_4.$$

The relations (536)–(539) complete the proof of equality (508).
Let us prove (509). Using (354), we get

$$\sum_{j_1=p+1}^{\infty} \sum_{j_2=p+1}^{\infty} \sum_{j_3=p+1}^{\infty} C_{j_1 j_2 j_3 j_3 j_2 j_1} = \sum_{j_1=0}^{p} \sum_{j_2=0}^{p} \sum_{j_3=p+1}^{\infty} C_{j_1 j_2 j_3 j_3 j_2 j_1}. \tag{540}$$

Applying (521) and (540), we obtain

$$2 \sum_{j_1,j_2=0}^{p} \sum_{j_3=p+1}^{\infty} C_{j_1 j_2 j_3 j_3 j_2 j_1} =$$

$$= \sum_{j_1,j_2=0}^{p} \sum_{j_3=p+1}^{\infty} \Biggl(C_{j_1} C_{j_2 j_3 j_3 j_2 j_1} - C_{j_2 j_1} C_{j_3 j_3 j_2 j_1} + \left(C_{j_3 j_2 j_1}\right)^2 -$$

$$- C_{j_3 j_3 j_2 j_1} C_{j_2 j_1} + C_{j_2 j_3 j_3 j_2 j_1} C_{j_1} \Biggr) =$$

$$= 2 \sum_{j_1,j_2=0}^{p} \sum_{j_3=p+1}^{\infty} \left(C_{j_1} C_{j_2 j_3 j_3 j_2 j_1} - C_{j_2 j_1} C_{j_3 j_3 j_2 j_1} \right) +$$

$$+ \sum_{j_1,j_2=0}^{p} \sum_{j_3=p+1}^{\infty} \left(C_{j_3 j_2 j_1}\right)^2. \tag{541}$$

In [26] (Sect. 1.7.2) the following estimate

$$\sum_{j_1=0}^{\infty} \ldots \sum_{j_{s-1}=0}^{\infty} \sum_{j_s=p+1}^{\infty} \sum_{j_{s+1}=0}^{\infty} \ldots \sum_{j_k=0}^{\infty} C_{j_k \ldots j_1}^2 \le$$

$$\le L_k \sum_{j_s=p+1}^{\infty} \frac{1}{j_s^2} \le L_k \int_p^{\infty} \frac{dx}{x^2} = \frac{L_k}{p} \tag{542}$$

is proved for the polynomial and trigonometric cases, where $s = 1, \ldots, k$, constant L_k depends on k and $T - t$.

Using the estimate (542), we get

$$\lim_{p\to\infty}\sum_{j_1,j_2=0}^{p}\sum_{j_3=p+1}^{\infty}\left(C_{j_3j_2j_1}\right)^2 = 0. \tag{543}$$

By analogy with the proof of (506), we have

$$\lim_{p\to\infty}\sum_{j_1,j_2=0}^{p}\sum_{j_3=p+1}^{\infty}\Bigl(C_{j_1}C_{j_2j_3j_3j_2j_1} - C_{j_2j_1}C_{j_3j_3j_2j_1}\Bigr) = 0, \tag{544}$$

where we applied the equality (419). To estimate the Fourier coefficient $C_{j_3j_3j_2j_1}$ in (544), we used the following (see the proof of (506) for more details)

$$C_{j_3j_3j_2j_1} = \int\limits_t^T \phi_{j_3}(t_4)\int\limits_t^{t_4}\phi_{j_3}(t_3)\int\limits_t^{t_3}\phi_{j_2}(t_2)\int\limits_t^{t_2}\phi_{j_1}(t_1)dt_1dt_2dt_3dt_4 =$$

$$= \int\limits_t^T \phi_{j_1}(t_1)\int\limits_{t_1}^{T}\phi_{j_2}(t_2)\int\limits_{t_2}^{T}\phi_{j_3}(t_3)\int\limits_{t_3}^{T}\phi_{j_3}(t_4)dt_4dt_3dt_2dt_1 =$$

$$= \frac{1}{2}\int\limits_t^T \phi_{j_1}(t_1)\int\limits_{t_1}^{T}\phi_{j_2}(t_2)\left(\int\limits_{t_2}^{T}\phi_{j_3}(t_3)dt_3\right)^2 dt_2dt_1. \tag{545}$$

Combining the equalities (540)–(544), we obtain (509).

Let us prove (510) (we replace j_2 by j_4 and j_3 by j_2 in (510)). As noted in Sect. 13, the sequential order of the series

$$\sum_{j_1=p+1}^{\infty}\sum_{j_2=p+1}^{\infty}\sum_{j_4=p+1}^{\infty}$$

is not important. This follows directly from the formulas (361) and (354).

Applying the mentioned property and (354), we get

$$\sum_{j_1=p+1}^{\infty}\sum_{j_2=p+1}^{\infty}\sum_{j_4=p+1}^{\infty} C_{j_1j_4j_4j_2j_2j_1} = -\sum_{j_1=0}^{p}\sum_{j_2=p+1}^{\infty}\sum_{j_4=p+1}^{\infty} C_{j_1j_4j_4j_2j_2j_1}. \tag{546}$$

Observe that (see the above reasoning)

$$\sum_{j_2=p+1}^{\infty}\sum_{j_4=p+1}^{\infty} C_{j_1j_4j_4j_2j_2j_1} = \sum_{j_4=p+1}^{\infty}\sum_{j_2=p+1}^{\infty} C_{j_1j_4j_4j_2j_2j_1}. \tag{547}$$

Using (521) and (547), we obtain

$$\sum_{j_1=0}^{p}\sum_{j_2=p+1}^{\infty}\sum_{j_4=p+1}^{\infty}\Bigl(C_{j_1j_4j_4j_2j_2j_1}+C_{j_1j_2j_2j_4j_4j_1}\Bigr)=2\sum_{j_1=0}^{p}\sum_{j_2=p+1}^{\infty}\sum_{j_4=p+1}^{\infty}C_{j_1j_4j_4j_2j_2j_1}=$$

$$=\sum_{j_1=0}^{p}\sum_{j_2=p+1}^{\infty}\sum_{j_4=p+1}^{\infty}\Bigl(C_{j_1}C_{j_4j_4j_2j_2j_1}-C_{j_4j_1}C_{j_4j_2j_2j_1}+C_{j_4j_4j_1}C_{j_2j_2j_1}-$$

$$-C_{j_2j_4j_4j_1}C_{j_2j_1}+C_{j_2j_2j_4j_4j_1}C_{j_1}\Bigr)=$$

$$=\sum_{j_1=0}^{p}\sum_{j_2=p+1}^{\infty}\sum_{j_4=p+1}^{\infty}\Bigl(C_{j_1}C_{j_4j_4j_2j_2j_1}-C_{j_4j_1}C_{j_4j_2j_2j_1}-C_{j_2j_4j_4j_1}C_{j_2j_1}+C_{j_2j_2j_4j_4j_1}C_{j_1}\Bigr)+$$

$$+\sum_{j_1=0}^{p}\left(\sum_{j_2=p+1}^{\infty}C_{j_2j_2j_1}\right)^2. \tag{548}$$

The equality

$$\lim_{p\to\infty}\sum_{j_1=0}^{p}\left(\sum_{j_2=p+1}^{\infty}C_{j_2j_2j_1}\right)^2=0 \tag{549}$$

follows from the relation (391).

By analogy with the proof of equality (506) we obtain

$$\lim_{p\to\infty}\sum_{j_1=0}^{p}\sum_{j_2=p+1}^{\infty}\sum_{j_4=p+1}^{\infty}\Bigl(C_{j_1}C_{j_4j_4j_2j_2j_1}-C_{j_4j_1}C_{j_4j_2j_2j_1}-$$

$$-C_{j_2j_4j_4j_1}C_{j_2j_1}+C_{j_2j_2j_4j_4j_1}C_{j_1}\Bigr)=0, \tag{550}$$

where we applied the equality (420). To estimate the Fourier coefficient $C_{j_2j_4j_4j_1}$ in (550), we used the following (see the proof of (506) for more details)

$$C_{j_2j_4j_4j_1}=\int_t^T\phi_{j_2}(t_4)\int_t^{t_4}\phi_{j_4}(t_3)\int_t^{t_3}\phi_{j_4}(t_2)\int_t^{t_2}\phi_{j_1}(t_1)dt_1dt_2dt_3dt_4=$$

$$=\int_t^T\phi_{j_2}(t_4)\int_t^{t_4}\phi_{j_1}(t_1)\int_{t_1}^{t_4}\phi_{j_4}(t_2)\int_{t_2}^{t_4}\phi_{j_4}(t_3)dt_3dt_2dt_1dt_4=$$

$$=\frac{1}{2}\int_t^T\phi_{j_2}(t_4)\int_t^{t_4}\phi_{j_1}(t_1)\left(\int_{t_1}^{t_4}\phi_{j_4}(t_2)dt_2\right)^2dt_1dt_4=$$

$$=\frac{1}{2}\int\limits_t^T\phi_{j_2}(t_4)\left(\int\limits_t^{t_4}\phi_{j_4}(t_2)dt_2\right)^2\int\limits_t^{t_4}\phi_{j_1}(t_1)dt_1dt_4+$$

$$+\frac{1}{2}\int\limits_t^T\phi_{j_2}(t_4)\int\limits_t^{t_4}\phi_{j_1}(t_1)\left(\int\limits_t^{t_1}\phi_{j_4}(t_2)dt_2\right)^2dt_1dt_4-$$

$$-\int\limits_t^T\phi_{j_2}(t_4)\left(\int\limits_t^{t_4}\phi_{j_4}(t_2)dt_2\right)\int\limits_t^{t_4}\phi_{j_1}(t_1)\left(\int\limits_t^{t_1}\phi_{j_4}(t_2)dt_2\right)dt_1dt_4.$$

The relation (510) follows from (546), (548)–(550).

Consider (511). Using the integration order replacement, we obtain

$$C_{j_3j_3j_2j_2j_1j_1}=$$

$$=\frac{1}{2}\int\limits_t^T\phi_{j_3}(t_6)\int\limits_t^{t_6}\phi_{j_3}(t_5)\int\limits_t^{t_5}\phi_{j_2}(t_4)\int\limits_t^{t_4}\phi_{j_2}(t_3)\left(\int\limits_t^{t_3}\phi_{j_1}(t_1)dt_1\right)^2dt_3dt_4dt_5dt_6=$$

$$=\frac{1}{2}\int\limits_t^T\phi_{j_2}(t_3)\left(\int\limits_t^{t_3}\phi_{j_1}(t_1)dt_1\right)^2\int\limits_{t_3}^T\phi_{j_2}(t_4)\int\limits_{t_4}^T\phi_{j_3}(t_5)\int\limits_{t_5}^T\phi_{j_3}(t_6)dt_6dt_5dt_4dt_3=$$

$$=\frac{1}{4}\int\limits_t^T\phi_{j_2}(t_3)\left(\int\limits_t^{t_3}\phi_{j_1}(t_1)dt_1\right)^2\int\limits_{t_3}^T\phi_{j_2}(t_4)\left(\int\limits_{t_4}^T\phi_{j_3}(t_5)dt_5\right)^2dt_4dt_3. \tag{551}$$

Applying the estimates (534) to (551) gives the following estimate

$$\left|C_{j_3j_3j_2j_2j_1j_1}\right|\le\frac{K}{j_1^2j_3^2}\quad(j_1,j_3>0,\ j_2\ge 0), \tag{552}$$

where constant K does not depend on j_1,j_2,j_3.

Further, we get (see (361))

$$\sum_{j_1=p+1}^{\infty}\sum_{j_2=p+1}^{\infty}\sum_{j_3=p+1}^{\infty}C_{j_3j_3j_2j_2j_1j_1}=\sum_{j_1=p+1}^{\infty}\sum_{j_3=p+1}^{\infty}\sum_{j_2=p+1}^{\infty}C_{j_3j_3j_2j_2j_1j_1}=$$

$$=\frac{1}{2}\sum_{j_1=p+1}^{\infty}\sum_{j_3=p+1}^{\infty}C_{j_3j_3j_2j_2j_1j_1}\Bigg|_{(j_2j_2)\frown(\cdot)}-\sum_{j_2=0}^{p}\sum_{j_1=p+1}^{\infty}\sum_{j_3=p+1}^{\infty}C_{j_3j_3j_2j_2j_1j_1}, \tag{553}$$

where

$$C_{j_3j_3j_2j_2j_1j_1}\Bigg|_{(j_2j_2)\frown(\cdot)}=$$

$$=\int\limits_t^T\phi_{j_3}(t_6)\int\limits_t^{t_6}\phi_{j_3}(t_5)\int\limits_t^{t_5}\int\limits_t^{t_4}\phi_{j_1}(t_2)\int\limits_t^{t_2}\phi_{j_1}(t_1)dt_1dt_2dt_4dt_5dt_6=$$

$$=\int\limits_t^T\phi_{j_3}(t_6)\int\limits_t^{t_6}\phi_{j_3}(t_5)\int\limits_t^{t_5}\phi_{j_1}(t_2)\int\limits_t^{t_2}\phi_{j_1}(t_1)dt_1\int\limits_{t_2}^{t_5}dt_4dt_2dt_5dt_6=$$

$$=\int\limits_t^T\phi_{j_3}(t_6)\int\limits_t^{t_6}\phi_{j_3}(t_5)(t_5-t)\int\limits_t^{t_5}\phi_{j_1}(t_2)\int\limits_t^{t_2}\phi_{j_1}(t_1)dt_1dt_2dt_5dt_6+$$

$$+\int\limits_t^T\phi_{j_3}(t_6)\int\limits_t^{t_6}\phi_{j_3}(t_5)\int\limits_t^{t_5}\phi_{j_1}(t_2)(t-t_2)\int\limits_t^{t_2}\phi_{j_1}(t_1)dt_1dt_2dt_5dt_6\stackrel{\sf def}{=}$$

(554) $$\stackrel{\sf def}{=}C'_{j_3j_3j_1j_1}+C''_{j_3j_3j_1j_1}.$$

Let us substitute (554) into (553)

$$\sum_{j_1=p+1}^{\infty}\sum_{j_2=p+1}^{\infty}\sum_{j_3=p+1}^{\infty}C_{j_3j_3j_2j_2j_1j_1}=\frac{1}{2}\sum_{j_1=p+1}^{\infty}\sum_{j_3=p+1}^{\infty}C'_{j_3j_3j_1j_1}+$$

(555) $$+\frac{1}{2}\sum_{j_1=p+1}^{\infty}\sum_{j_3=p+1}^{\infty}C''_{j_3j_3j_1j_1}-\sum_{j_2=0}^{p}\sum_{j_1=p+1}^{\infty}\sum_{j_3=p+1}^{\infty}C_{j_3j_3j_2j_2j_1j_1}.$$

The relation (420) implies that

(556) $$\lim_{p\to\infty}\sum_{j_1=p+1}^{\infty}\sum_{j_3=p+1}^{\infty}C'_{j_3j_3j_1j_1}=0,\quad \lim_{p\to\infty}\sum_{j_1=p+1}^{\infty}\sum_{j_3=p+1}^{\infty}C''_{j_3j_3j_1j_1}=0.$$

From the estimate (552) we get

$$\left|\sum_{j_2=0}^{p}\sum_{j_1=p+1}^{\infty}\sum_{j_3=p+1}^{\infty}C_{j_3j_3j_2j_2j_1j_1}\right|\le K(p+1)\sum_{j_1=p+1}^{\infty}\frac{1}{j_1^2}\sum_{j_3=p+1}^{\infty}\frac{1}{j_3^2}\le$$

(557) $$\le K(p+1)\left(\int\limits_p^{\infty}\frac{dx}{x^2}\right)^2\le\frac{K(p+1)}{p^2}\ \to\ 0$$

if $p\to\infty$, where constant K is independent of p.

The relations (555)–(557) complete the proof of (511).

Let us prove (512). Using the integration order replacement, we get

$$C_{j_2j_3j_3j_2j_1j_1}=$$

$$
=\frac{1}{2}\int\limits_t^T\phi_{j_2}(t_6)\int\limits_t^{t_6}\phi_{j_3}(t_5)\int\limits_t^{t_5}\phi_{j_3}(t_4)\int\limits_t^{t_4}\phi_{j_2}(t_3)\left(\int\limits_t^{t_3}\phi_{j_1}(t_1)dt_1\right)^2 dt_3dt_4dt_5dt_6=
$$

$$
=\frac{1}{2}\int\limits_t^T\phi_{j_2}(t_3)\left(\int\limits_t^{t_3}\phi_{j_1}(t_1)dt_1\right)^2\int\limits_{t_3}^T\phi_{j_3}(t_4)\int\limits_{t_4}^T\phi_{j_3}(t_5)\int\limits_{t_5}^T\phi_{j_2}(t_6)dt_6dt_5dt_4dt_3=
$$

$$
=\frac{1}{2}\int\limits_t^T\phi_{j_2}(t_3)\left(\int\limits_t^{t_3}\phi_{j_1}(t_1)dt_1\right)^2\int\limits_{t_3}^T\phi_{j_3}(t_5)\int\limits_{t_5}^T\phi_{j_2}(t_6)dt_6\int\limits_{t_3}^{t_5}\phi_{j_3}(t_4)dt_4dt_5dt_3=
$$

$$
=\frac{1}{2}\int\limits_t^T\phi_{j_2}(t_3)\left(\int\limits_t^{t_3}\phi_{j_1}(t_1)dt_1\right)^2\int\limits_{t_3}^T\phi_{j_3}(t_5)\left(\int\limits_{t_5}^T\phi_{j_2}(t_6)dt_6\right)\left(\int\limits_t^{t_5}\phi_{j_3}(t_4)dt_4\right)dt_5dt_3-
$$

$$
-\frac{1}{2}\int\limits_t^T\phi_{j_2}(t_3)\left(\int\limits_t^{t_3}\phi_{j_1}(t_1)dt_1\right)^2\left(\int\limits_t^{t_3}\phi_{j_3}(t_4)dt_4\right)\int\limits_{t_3}^T\phi_{j_3}(t_5)\left(\int\limits_{t_5}^T\phi_{j_2}(t_6)dt_6\right)dt_5dt_3. \tag{558}
$$

Applying (354) and (361), we obtain

$$
-\sum_{j_1=p+1}^{\infty}\sum_{j_2=p+1}^{\infty}\sum_{j_3=p+1}^{\infty}C_{j_2j_3j_3j_2j_1j_1}=-\sum_{j_1=p+1}^{\infty}\sum_{j_3=p+1}^{\infty}\sum_{j_2=p+1}^{\infty}C_{j_2j_3j_3j_2j_1j_1}=
$$

$$
=\sum_{j_2=0}^{p}\sum_{j_1=p+1}^{\infty}\sum_{j_3=p+1}^{\infty}C_{j_2j_3j_3j_2j_1j_1}=
$$

$$
=\frac{1}{2}\sum_{j_2=0}^{p}\sum_{j_1=p+1}^{\infty}C_{j_2j_3j_3j_2j_1j_1}\Biggr|_{(j_3j_3)\frown(\cdot)}-\sum_{j_2=0}^{p}\sum_{j_3=0}^{p}\sum_{j_1=p+1}^{\infty}C_{j_2j_3j_3j_2j_1j_1}=
$$

$$
=\frac{1}{2}\sum_{j_2=0}^{p}\sum_{j_1=p+1}^{\infty}C_{j_2j_3j_3j_2j_1j_1}\Biggr|_{(j_3j_3)\frown(\cdot)}-\sum_{j_1=p+1}^{\infty}C_{0000j_1j_1}-
$$

$$
-\sum_{j_3=1}^{p}\sum_{j_1=p+1}^{\infty}C_{0j_3j_30j_1j_1}-\sum_{j_2=1}^{p}\sum_{j_1=p+1}^{\infty}C_{j_200j_2j_1j_1}-
$$

$$
-\sum_{j_2=1}^{p}\sum_{j_3=1}^{p}\sum_{j_1=p+1}^{\infty}C_{j_2j_3j_3j_2j_1j_1}. \tag{559}
$$

The equality

$$
\lim_{p\to\infty}\frac{1}{2}\sum_{j_2=0}^{p}\sum_{j_1=p+1}^{\infty}C_{j_2j_3j_3j_2j_1j_1}\Biggr|_{(j_3j_3)\frown(\cdot)}=0 \tag{560}
$$

follows from the inequality similar to (446) (see the proof of Theorem 24), where we used the following representation

$$C_{j_2j_3j_3j_2j_1j_1}\Biggl|_{(j_3j_3)\frown(\cdot)}=$$

$$=\int\limits_t^T\phi_{j_2}(t_6)\int\limits_t^{t_6}\int\limits_t^{t_4}\phi_{j_2}(t_3)\int\limits_t^{t_3}\phi_{j_1}(t_2)\int\limits_t^{t_2}\phi_{j_1}(t_1)dt_1dt_2dt_3dt_4dt_6=$$

$$=\int\limits_t^T\phi_{j_2}(t_6)\int\limits_t^{t_6}\phi_{j_2}(t_3)\int\limits_t^{t_3}\phi_{j_1}(t_2)\int\limits_t^{t_2}\phi_{j_1}(t_1)dt_1dt_2\int\limits_{t_3}^{t_6}dt_4dt_3dt_6=$$

$$+\int\limits_t^T\phi_{j_2}(t_6)(t_6-t)\int\limits_t^{t_6}\phi_{j_2}(t_3)\int\limits_t^{t_3}\phi_{j_1}(t_2)\int\limits_t^{t_2}\phi_{j_1}(t_1)dt_1dt_2dt_3dt_6+$$

$$+\int\limits_t^T\phi_{j_2}(t_6)\int\limits_t^{t_6}\phi_{j_2}(t_3)(t-t_3)\int\limits_t^{t_3}\phi_{j_1}(t_2)\int\limits_t^{t_2}\phi_{j_1}(t_1)dt_1dt_2dt_3dt_6\stackrel{\mathsf{def}}{=}$$

$$\stackrel{\mathsf{def}}{=}C^{*}_{j_2j_2j_1j_1}+C^{**}_{j_2j_2j_1j_1}. \tag{561}$$

Applying the estimates (534) and (406) ($\varepsilon=1/2$) to (558) gives the following estimates

$$|C_{j_2j_3j_3j_2j_1j_1}|\le\frac{K}{j_1^2j_2j_3^{3/4}}\quad(j_1,j_2,j_3>0), \tag{562}$$

$$|C_{j_200j_2j_1j_1}|\le\frac{K}{j_1^2j_2}\quad(j_1,j_2>0), \tag{563}$$

$$|C_{0j_3j_30j_1j_1}|\le\frac{K}{j_1^2j_3}\quad(j_1,j_3>0), \tag{564}$$

$$|C_{0000j_1j_1}|\le\frac{K}{j_1^2}\quad(j_1>0). \tag{565}$$

Using the estimate (562), we have

$$\left|\sum_{j_2=1}^p\sum_{j_3=1}^p\sum_{j_1=p+1}^\infty C_{j_2j_3j_3j_2j_1j_1}\right|\le K\sum_{j_1=p+1}^\infty\frac{1}{j_1^2}\sum_{j_2=1}^p\frac{1}{j_2}\sum_{j_3=1}^p\frac{1}{j_3^{3/4}}\le$$

$$\le K\int\limits_p^\infty\frac{dx}{x^2}\left(1+\int\limits_1^p\frac{dx}{x}\right)\left(1+\int\limits_1^p\frac{dx}{x^{3/4}}\right)\le K_1\frac{1+lnp}{p^{3/4}}\ \to 0 \tag{566}$$

if $p\to\infty$, where constants K,K_1 do not depend on p.

Similarly we get (see (563)–(565))

$$
\left|\sum_{j_1=p+1}^{\infty} C_{0000j_1j_1}\right| + \left|\sum_{j_3=1}^{p}\sum_{j_1=p+1}^{\infty} C_{0j_3j_30j_1j_1}\right| + \left|\sum_{j_2=1}^{p}\sum_{j_1=p+1}^{\infty} C_{j_200j_2j_1j_1}\right| \to 0 \tag{567}
$$

if $p\to\infty$.

The relations (559), (560), (566), (567) prove (512).

Consider (513). Using the integration order replacement, we get

$$
C_{j_3j_2j_3j_2j_1j_1} =
$$

$$
= \frac{1}{2}\int\limits_t^T \phi_{j_3}(t_6)\int\limits_t^{t_6} \phi_{j_2}(t_5)\int\limits_t^{t_5} \phi_{j_3}(t_4)\int\limits_t^{t_4} \phi_{j_2}(t_3)\left(\int\limits_t^{t_3} \phi_{j_1}(t_1)dt_1\right)^2 dt_3dt_4dt_5dt_6 =
$$

$$
= \frac{1}{2}\int\limits_t^T \phi_{j_2}(t_3)\left(\int\limits_t^{t_3} \phi_{j_1}(t_1)dt_1\right)^2 \int\limits_{t_3}^T \phi_{j_3}(t_4)\int\limits_{t_4}^T \phi_{j_2}(t_5)\int\limits_{t_5}^T \phi_{j_3}(t_6)dt_6dt_5dt_4dt_3 =
$$

$$
= \frac{1}{2}\int\limits_t^T \phi_{j_2}(t_3)\left(\int\limits_t^{t_3} \phi_{j_1}(t_1)dt_1\right)^2 \int\limits_{t_3}^T \phi_{j_2}(t_5)\int\limits_{t_5}^T \phi_{j_3}(t_6)dt_6\int\limits_{t_3}^{t_5} \phi_{j_3}(t_4)dt_4dt_5dt_3 =
$$

$$
= \frac{1}{2}\int\limits_t^T \phi_{j_2}(t_3)\left(\int\limits_t^{t_3} \phi_{j_1}(t_1)dt_1\right)^2 \int\limits_{t_3}^T \phi_{j_2}(t_5)\left(\int\limits_t^{t_5} \phi_{j_3}(t_4)dt_4\right)\left(\int\limits_{t_5}^T \phi_{j_3}(t_6)dt_6\right)dt_5dt_3 -
$$

$$
-\frac{1}{2}\int\limits_t^T \phi_{j_2}(t_3)\left(\int\limits_t^{t_3} \phi_{j_1}(t_1)dt_1\right)^2 \left(\int\limits_t^{t_3} \phi_{j_3}(t_4)dt_4\right)\int\limits_{t_3}^T \phi_{j_2}(t_5)\left(\int\limits_{t_5}^T \phi_{j_3}(t_6)dt_6\right)dt_5dt_3. \tag{568}
$$

Applying (354), we obtain

$$
\sum_{j_1=p+1}^{\infty}\sum_{j_2=p+1}^{\infty}\sum_{j_3=p+1}^{\infty} C_{j_3j_2j_3j_2j_1j_1} = \sum_{j_1=p+1}^{\infty}\sum_{j_3=p+1}^{\infty}\sum_{j_2=p+1}^{\infty} C_{j_3j_2j_3j_2j_1j_1} =
$$

$$
= -\sum_{j_2=0}^{p}\sum_{j_1=p+1}^{\infty}\sum_{j_3=p+1}^{\infty} C_{j_3j_2j_3j_2j_1j_1}. \tag{569}
$$

Further proof of the equality (513) is based on the relations (568), (569) and is similar to the proof of the formula (512).

Let us prove (514). Applying the integration order replacement, we obtain

$$
C_{j_3j_3j_2j_1j_2j_1} =
$$

$$
=\int\limits_t^T \phi_{j_3}(t_6)\int\limits_t^{t_6}\phi_{j_3}(t_5)\int\limits_t^{t_5}\phi_{j_2}(t_4)\int\limits_t^{t_4}\phi_{j_1}(t_3)\int\limits_t^{t_3}\phi_{j_2}(t_2)\int\limits_t^{t_2}\phi_{j_1}(t_1)dt_1dt_2dt_3dt_4dt_5dt_6 =
$$

$$
=\int\limits_t^T \phi_{j_1}(t_1)\int\limits_{t_1}^{T}\phi_{j_2}(t_2)\int\limits_{t_2}^{T}\phi_{j_1}(t_3)\int\limits_{t_3}^{T}\phi_{j_2}(t_4)\int\limits_{t_4}^{T}\phi_{j_3}(t_5)\int\limits_{t_5}^{T}\phi_{j_3}(t_6)dt_6dt_5dt_4dt_3dt_2dt_1 =
$$

$$
=\frac{1}{2}\int\limits_t^T \phi_{j_1}(t_1)\int\limits_{t_1}^{T}\phi_{j_2}(t_2)\int\limits_{t_2}^{T}\phi_{j_1}(t_3)\int\limits_{t_3}^{T}\phi_{j_2}(t_4)\left(\int\limits_{t_4}^{T}\phi_{j_3}(t_5)dt_5\right)^2 dt_4dt_3dt_2dt_1 =
$$

$$
=\frac{1}{2}\int\limits_t^T \phi_{j_2}(t_4)\left(\int\limits_{t_4}^{T}\phi_{j_3}(t_5)dt_5\right)^2\int\limits_t^{t_4}\phi_{j_1}(t_3)\int\limits_t^{t_3}\phi_{j_2}(t_2)\int\limits_t^{t_2}\phi_{j_1}(t_1)dt_1dt_2dt_3dt_4 =
$$

$$
=\frac{1}{2}\int\limits_t^T \phi_{j_2}(t_4)\left(\int\limits_{t_4}^{T}\phi_{j_3}(t_5)dt_5\right)^2\int\limits_t^{t_4}\phi_{j_2}(t_2)\int\limits_t^{t_2}\phi_{j_1}(t_1)dt_1\int\limits_{t_2}^{t_4}\phi_{j_1}(t_3)dt_3dt_2dt_4 =
$$

$$
=\frac{1}{2}\int\limits_t^T \phi_{j_2}(t_4)\left(\int\limits_{t_4}^{T}\phi_{j_3}(t_5)dt_5\right)^2\left(\int\limits_t^{t_4}\phi_{j_1}(t_3)dt_3\right)\int\limits_t^{t_4}\phi_{j_2}(t_2)\left(\int\limits_t^{t_2}\phi_{j_1}(t_1)dt_1\right)dt_2dt_4-
$$

$$
-\frac{1}{2}\int\limits_t^T \phi_{j_2}(t_4)\left(\int\limits_{t_4}^{T}\phi_{j_3}(t_5)dt_5\right)^2\int\limits_t^{t_4}\phi_{j_2}(t_2)\left(\int\limits_t^{t_2}\phi_{j_1}(t_1)dt_1\right)^2 dt_2dt_4. \tag{570}
$$

Using (354), we get

$$
\sum_{j_1=p+1}^{\infty}\sum_{j_2=p+1}^{\infty}\sum_{j_3=p+1}^{\infty}C_{j_3j_3j_2j_1j_2j_1} = \sum_{j_1=p+1}^{\infty}\sum_{j_3=p+1}^{\infty}\sum_{j_2=p+1}^{\infty}C_{j_3j_3j_2j_1j_2j_1} =
$$

$$
= -\sum_{j_2=0}^{p}\sum_{j_1=p+1}^{\infty}\sum_{j_3=p+1}^{\infty}C_{j_3j_3j_2j_1j_2j_1}. \tag{571}
$$

Further proof of the equality (514) is based on the relations (570), (571) and is similar to the proof of the relations (512), (513).

Consider (515). Using the integration order replacement, we have

$$
C_{j_3j_3j_1j_2j_2j_1} =
$$

$$
=\int\limits_t^T \phi_{j_3}(t_6)\int\limits_t^{t_6}\phi_{j_3}(t_5)\int\limits_t^{t_5}\phi_{j_1}(t_4)\int\limits_t^{t_4}\phi_{j_2}(t_3)\int\limits_t^{t_3}\phi_{j_2}(t_2)\int\limits_t^{t_2}\phi_{j_1}(t_1)dt_1dt_2dt_3dt_4dt_5dt_6 =
$$

$$=\int\limits_t^T \phi_{j_1}(t_1)\int\limits_{t_1}^T \phi_{j_2}(t_2)\int\limits_{t_2}^T \phi_{j_2}(t_3)\int\limits_{t_3}^T \phi_{j_1}(t_4)\int\limits_{t_4}^T \phi_{j_3}(t_5)\int\limits_{t_5}^T \phi_{j_3}(t_6)dt_6dt_5dt_4dt_3dt_2dt_1 =$$

$$= \frac{1}{2}\int\limits_t^T \phi_{j_1}(t_1)\int\limits_{t_1}^T \phi_{j_2}(t_2)\int\limits_{t_2}^T \phi_{j_2}(t_3)\int\limits_{t_3}^T \phi_{j_1}(t_4)\left(\int\limits_{t_4}^T \phi_{j_3}(t_5)dt_5\right)^2 dt_4dt_3dt_2dt_1 =$$

$$= \frac{1}{2}\int\limits_t^T \phi_{j_1}(t_4)\left(\int\limits_{t_4}^T \phi_{j_3}(t_5)dt_5\right)^2 \int\limits_t^{t_4} \phi_{j_2}(t_3)\int\limits_t^{t_3} \phi_{j_2}(t_2)\int\limits_t^{t_2} \phi_{j_1}(t_1)dt_1dt_2dt_3dt_4 =$$

$$= \frac{1}{2}\int\limits_t^T \phi_{j_1}(t_4)\left(\int\limits_{t_4}^T \phi_{j_3}(t_5)dt_5\right)^2 \int\limits_t^{t_4} \phi_{j_2}(t_2)\int\limits_t^{t_2} \phi_{j_1}(t_1)dt_1\int\limits_{t_2}^{t_4} \phi_{j_2}(t_3)dt_3dt_2dt_4 =$$

$$= \frac{1}{2}\int\limits_t^T \phi_{j_1}(t_4)\left(\int\limits_{t_4}^T \phi_{j_3}(t_5)dt_5\right)^2 \left(\int\limits_t^{t_4} \phi_{j_2}(t_3)dt_3\right)\int\limits_t^{t_4} \phi_{j_2}(t_2)\left(\int\limits_t^{t_2} \phi_{j_1}(t_1)dt_1\right)dt_2dt_4-$$

$$-\frac{1}{2}\int\limits_t^T \phi_{j_1}(t_4)\left(\int\limits_{t_4}^T \phi_{j_3}(t_5)dt_5\right)^2 \int\limits_t^{t_4} \phi_{j_2}(t_2)\left(\int\limits_t^{t_2} \phi_{j_1}(t_1)dt_1\right)\left(\int\limits_t^{t_2} \phi_{j_2}(t_3)dt_3\right)dt_2dt_4. \tag{572}$$

Applying (354) and (361), we obtain

$$-\sum_{j_1=p+1}^{\infty}\sum_{j_2=p+1}^{\infty}\sum_{j_3=p+1}^{\infty} C_{j_3j_3j_1j_2j_2j_1} = -\sum_{j_2=p+1}^{\infty}\sum_{j_3=p+1}^{\infty}\sum_{j_1=p+1}^{\infty} C_{j_2j_3j_1j_2j_2j_1} =$$

$$=\sum_{j_1=0}^{p}\sum_{j_2=p+1}^{\infty}\sum_{j_3=p+1}^{\infty} C_{j_2j_3j_1j_2j_2j_1} = \sum_{j_1=0}^{p}\sum_{j_3=p+1}^{\infty}\sum_{j_2=p+1}^{\infty} C_{j_2j_3j_1j_2j_2j_1} =$$

$$=\frac{1}{2}\sum_{j_1=0}^{p}\sum_{j_3=p+1}^{\infty} C_{j_3j_3j_1j_2j_2j_1}\Biggr|_{(j_2j_2)\frown(\cdot)} - \sum_{j_1=0}^{p}\sum_{j_2=0}^{p}\sum_{j_3=p+1}^{\infty} C_{j_3j_3j_1j_2j_2j_1}. \tag{573}$$

The equality

$$\lim_{p\to\infty}\frac{1}{2}\sum_{j_1=0}^{p}\sum_{j_3=p+1}^{\infty} C_{j_3j_3j_1j_2j_2j_1}\Biggr|_{(j_2j_2)\frown(\cdot)} = 0 \tag{574}$$

follows from the inequality (446), where we proceed similarly to the proof of equality (560) (see (561)).

The relation

$$\lim_{p\to\infty}\sum_{j_1=0}^{p}\sum_{j_2=0}^{p}\sum_{j_3=p+1}^{\infty} C_{j_3j_3j_1j_2j_2j_1} = 0 \tag{575}$$

is proved on the basis of (572) and similarly with the proof of (512). The equalities (573)–(575) prove (515).

Let us prove (516). Using (354) and (361), we get

$$\sum_{j_1=p+1}^{\infty}\sum_{j_2=p+1}^{\infty}\sum_{j_3=p+1}^{\infty} C_{j_2j_1j_3j_3j_2j_1} = \sum_{j_3=p+1}^{\infty}\sum_{j_1,j_2=0}^{p} C_{j_2j_1j_3j_3j_2j_1} =$$

$$= \frac{1}{2}\sum_{j_1,j_2=0}^{p} C_{j_2j_1j_3j_3j_2j_1}\Biggl|_{(j_3j_3)\curvearrowright(\cdot)} - \sum_{j_1,j_2,j_3=0}^{p} C_{j_2j_1j_3j_3j_2j_1}. \tag{576}$$

Using the equality (418) we have

$$\lim_{p\to\infty}\frac{1}{2}\sum_{j_1,j_2=0}^{p} C_{j_2j_1j_3j_3j_2j_1}\Biggl|_{(j_3j_3)\curvearrowright(\cdot)} = 0, \tag{577}$$

where we proceed similarly to the proof of equality (560) (see (561)).

Further, we will prove the following relation

$$\lim_{p\to\infty}\sum_{j_1,j_2,j_3=0}^{p} C_{j_2j_1j_3j_3j_2j_1} = 0 \tag{578}$$

using the equality (521). From (521) we have

$$\sum_{j_1,j_2,j_3=0}^{p} C_{j_2j_1j_3j_3j_2j_1} = \frac{1}{2}\sum_{j_1,j_2,j_3=0}^{p}\Bigl(C_{j_2j_1j_3j_3j_2j_1} + C_{j_1j_2j_3j_3j_1j_2}\Bigr) =$$

$$= \frac{1}{2}\sum_{j_1,j_2,j_3=0}^{p}\Bigl(C_{j_2}C_{j_1j_3j_3j_2j_1} - C_{j_1j_2}C_{j_3j_3j_2j_1} + C_{j_3j_1j_2}C_{j_3j_2j_1} -$$

$$-C_{j_3j_3j_1j_2}C_{j_2j_1} + C_{j_2j_3j_3j_1j_2}C_{j_1}\Bigr) =$$

$$= \sum_{j_1,j_2,j_3=0}^{p}\Bigl(C_{j_2j_3j_3j_1j_2}C_{j_1} - C_{j_3j_3j_1j_2}C_{j_2j_1}\Bigr) +$$

$$+\frac{1}{2}\sum_{j_1,j_2,j_3=0}^{p} C_{j_3j_1j_2}C_{j_3j_2j_1}. \tag{579}$$

The generalized Parseval equality gives (by analogy with (527))

$$\lim_{p\to\infty}\frac{1}{2}\sum_{j_1,j_2,j_3=0}^{p} C_{j_3j_1j_2}C_{j_3j_2j_1} = 0. \tag{580}$$

Let us prove the following equality

$$\lim_{p\to\infty}\sum_{j_1,j_2,j_3=0}^{p}\Biggl(C_{j_2j_3j_3j_1j_2}C_{j_1}-C_{j_3j_3j_1j_2}C_{j_2j_1}\Biggr)=0. \tag{581}$$

The relation

$$\lim_{p\to\infty}\sum_{j_1,j_2,j_3=0}^{p}C_{j_2j_3j_3j_1j_2}C_{j_1}=0 \tag{582}$$

is proved by the same methods as in the proof of equality (506) and also using Theorem 24 and (361).
Further, we have (see (361))

$$\sum_{j_3=0}^{p}C_{j_3j_3j_1j_2}=\frac{1}{2}C_{j_3j_3j_1j_2}\Biggl|_{(j_3j_3)\frown(\cdot)}-\sum_{j_3=p+1}^{\infty}C_{j_3j_3j_1j_2}. \tag{583}$$

Moreover,

$$C_{j_3j_3j_1j_2}\Biggl|_{(j_3j_3)\frown(\cdot)}=\int\limits_t^T\int\limits_t^{t_3}\phi_{j_1}(t_2)\int\limits_t^{t_2}\phi_{j_2}(t_1)dt_1dt_2dt_3=$$

$$=\int\limits_t^T\phi_{j_1}(t_2)\int\limits_t^{t_2}\phi_{j_2}(t_1)dt_1\int\limits_{t_2}^T dt_3dt_2=\int\limits_t^T(T-t_2)\phi_{j_1}(t_2)\int\limits_t^{t_2}\phi_{j_2}(t_1)dt_1dt_2=$$

$$=\int\limits_t^T\phi_{j_2}(t_1)\int\limits_{t_1}^T(T-t_2)\phi_{j_1}(t_2)dt_2dt_1=\int\limits_t^T\phi_{j_2}(t_2)\int\limits_{t_2}^T(T-t_1)\phi_{j_1}(t_1)dt_1dt_2=$$

$$=\int\limits_{[t,T]^2}(T-t_1)\mathbf{1}_{\{t_2<t_1\}}\phi_{j_1}(t_1)\phi_{j_2}(t_2)dt_1dt_2\stackrel{\mathsf{def}}{=}\tilde C_{j_2j_1}. \tag{584}$$

Using (583), (584), and the generalized Parseval equality, we obtain

$$\lim_{p\to\infty}\sum_{j_1,j_2,j_3=0}^{p}C_{j_3j_3j_1j_2}C_{j_2j_1}=\frac{1}{2}\lim_{p\to\infty}\sum_{j_1,j_2=0}^{p}C_{j_2j_1}\tilde C_{j_2j_1}-$$

$$-\lim_{p\to\infty}\sum_{j_1,j_2=0}^{p}\sum_{j_3=p+1}^{\infty}C_{j_3j_3j_1j_2}C_{j_2j_1}=-\lim_{p\to\infty}\sum_{j_1,j_2=0}^{p}\sum_{j_3=p+1}^{\infty}C_{j_3j_3j_1j_2}C_{j_2j_1}. \tag{585}$$

We have (see (545))

$$C_{j_3j_3j_1j_2}=\frac{1}{2}\int\limits_t^T\phi_{j_2}(t_1)\int\limits_{t_1}^T\phi_{j_1}(t_2)\Biggl(\int\limits_{t_2}^T\phi_{j_3}(t_3)dt_3\Biggr)^2dt_2dt_1. \tag{586}$$

By analogy with (535) and also using (586), we get

$$\lim_{p\to\infty}\sum_{j_1,j_2=0}^{p}\sum_{j_3=p+1}^{\infty}C_{j_3j_3j_1j_2}C_{j_2j_1}=0. \tag{587}$$

Combining (585) and (587), we obtain

$$\lim_{p\to\infty}\sum_{j_1,j_2,j_3=0}^{p}C_{j_3j_3j_1j_2}C_{j_2j_1}=0. \tag{588}$$

The relation (581) follows from (582) and (588). From (579)–(581) we get (578). The equalities (576)–(578) complete the proof of (516).

For the proof of (517)–(520) we will use a new idea. More precisely, we will consider the sums of expressions (517)–(520) with the expressions already studied throughout this proof.

Let us begin from (517). Applying the integration order replacement, we obtain

$$C_{j_3j_1j_2j_3j_2j_1}+C_{j_3j_1j_2j_3j_1j_2}=$$

$$=\int\limits_t^T\phi_{j_3}(t_6)\int\limits_t^{t_6}\phi_{j_1}(t_5)\int\limits_t^{t_5}\phi_{j_2}(t_4)\int\limits_t^{t_4}\phi_{j_3}(t_3)\left(\int\limits_t^{t_3}\phi_{j_2}(t_2)dt_2\right)\left(\int\limits_t^{t_3}\phi_{j_1}(t_1)dt_1\right)dt_3dt_4dt_5dt_6=$$

$$=\int\limits_t^T\phi_{j_3}(t_6)\int\limits_t^{t_6}\phi_{j_1}(t_5)\int\limits_t^{t_5}\phi_{j_3}(t_3)\left(\int\limits_t^{t_3}\phi_{j_2}(t_2)dt_2\right)\left(\int\limits_t^{t_3}\phi_{j_1}(t_1)dt_1\right)\int\limits_{t_3}^{t_5}\phi_{j_2}(t_4)dt_4dt_3dt_5dt_6=$$

$$=\int\limits_t^T\phi_{j_3}(t_6)\int\limits_t^{t_6}\phi_{j_1}(t_5)\left(\int\limits_t^{t_5}\phi_{j_2}(t_4)dt_4\right)\int\limits_t^{t_5}\phi_{j_3}(t_3)\left(\int\limits_t^{t_3}\phi_{j_2}(t_2)dt_2\right)\left(\int\limits_t^{t_3}\phi_{j_1}(t_1)dt_1\right)dt_3dt_5dt_6-$$

$$-\int\limits_t^T\phi_{j_3}(t_6)\int\limits_t^{t_6}\phi_{j_1}(t_5)\int\limits_t^{t_5}\phi_{j_3}(t_3)\left(\int\limits_t^{t_3}\phi_{j_2}(t_2)dt_2\right)^2\left(\int\limits_t^{t_3}\phi_{j_1}(t_1)dt_1\right)dt_3dt_5dt_6=$$

$$=\int\limits_t^T\phi_{j_1}(t_5)\left(\int\limits_t^{t_5}\phi_{j_2}(t_4)dt_4\right)\int\limits_t^{t_5}\phi_{j_3}(t_3)\left(\int\limits_t^{t_3}\phi_{j_2}(t_2)dt_2\right)\left(\int\limits_t^{t_3}\phi_{j_1}(t_1)dt_1\right)dt_3\left(\int\limits_{t_5}^{T}\phi_{j_3}(t_6)dt_6\right)dt_5-$$

$$-\int\limits_t^T\phi_{j_1}(t_5)\int\limits_t^{t_5}\phi_{j_3}(t_3)\left(\int\limits_t^{t_3}\phi_{j_2}(t_2)dt_2\right)^2\left(\int\limits_t^{t_3}\phi_{j_1}(t_1)dt_1\right)dt_3\left(\int\limits_{t_5}^{T}\phi_{j_3}(t_6)dt_6\right)dt_5. \tag{589}$$

Using (354), we get

$$\sum_{j_1=p+1}^{\infty}\sum_{j_2=p+1}^{\infty}\sum_{j_3=p+1}^{\infty}\left(C_{j_3j_1j_2j_3j_2j_1}+C_{j_3j_1j_2j_3j_1j_2}\right)=$$

(590)
$$=\sum_{j_1=0}^{p}\sum_{j_3=0}^{p}\sum_{j_2=p+1}^{\infty}\left(C_{j_3j_1j_2j_3j_2j_1}+C_{j_3j_1j_2j_3j_1j_2}\right).$$

Further, by analogy with the proof of equality (512) and using (589), we obtain

(591)
$$\lim_{p\to\infty}\sum_{j_1=0}^{p}\sum_{j_3=0}^{p}\sum_{j_2=p+1}^{\infty}\left(C_{j_3j_1j_2j_3j_2j_1}+C_{j_3j_1j_2j_3j_1j_2}\right)=0.$$

From (590) and (591) we get

(592)
$$\lim_{p\to\infty}\sum_{j_1=p+1}^{\infty}\sum_{j_2=p+1}^{\infty}\sum_{j_3=p+1}^{\infty}\left(C_{j_3j_1j_2j_3j_2j_1}+C_{j_3j_1j_2j_3j_1j_2}\right)=0.$$

Moreover (see (506)),

(593)
$$\lim_{p\to\infty}\sum_{j_1=p+1}^{\infty}\sum_{j_2=p+1}^{\infty}\sum_{j_3=p+1}^{\infty}C_{j_3j_1j_2j_3j_1j_2}=0.$$

Combining (592) and (593), we have

$$\lim_{p\to\infty}\sum_{j_1=p+1}^{\infty}\sum_{j_2=p+1}^{\infty}\sum_{j_3=p+1}^{\infty}C_{j_3j_1j_2j_3j_2j_1}=0.$$

The equality (517) is proved.

Consider (518). Using the integration order replacement, we have

$$C_{j_2j_3j_1j_3j_2j_1}+C_{j_2j_3j_1j_3j_1j_2}=$$

$$=\int\limits_t^T\phi_{j_2}(t_6)\int\limits_t^{t_6}\phi_{j_3}(t_5)\int\limits_t^{t_5}\phi_{j_1}(t_4)\int\limits_t^{t_4}\phi_{j_3}(t_3)\left(\int\limits_t^{t_3}\phi_{j_2}(t_2)dt_2\right)\left(\int\limits_t^{t_3}\phi_{j_1}(t_1)dt_1\right)dt_3dt_4dt_5dt_6=$$

$$=\int\limits_t^T\phi_{j_2}(t_6)\int\limits_t^{t_6}\phi_{j_3}(t_5)\int\limits_t^{t_5}\phi_{j_3}(t_3)\left(\int\limits_t^{t_3}\phi_{j_2}(t_2)dt_2\right)\left(\int\limits_t^{t_3}\phi_{j_1}(t_1)dt_1\right)\int\limits_{t_3}^{t_5}\phi_{j_1}(t_4)dt_4dt_3dt_5dt_6=$$

$$=\int\limits_t^T\phi_{j_2}(t_6)\int\limits_t^{t_6}\phi_{j_3}(t_5)\left(\int\limits_t^{t_5}\phi_{j_1}(t_4)dt_4\right)\int\limits_t^{t_5}\phi_{j_3}(t_3)\left(\int\limits_t^{t_3}\phi_{j_2}(t_2)dt_2\right)\left(\int\limits_t^{t_3}\phi_{j_1}(t_1)dt_1\right)dt_3dt_5dt_6-$$

$$
-\int\limits_t^T \phi_{j_2}(t_6)\int\limits_t^{t_6}\phi_{j_3}(t_5)\int\limits_t^{t_5}\phi_{j_3}(t_3)\left(\int\limits_t^{t_3}\phi_{j_2}(t_2)dt_2\right)\left(\int\limits_t^{t_3}\phi_{j_1}(t_1)dt_1\right)^2 dt_3dt_5dt_6 =
$$

$$
=\int\limits_t^T \phi_{j_3}(t_5)\left(\int\limits_t^{t_5}\phi_{j_1}(t_4)dt_4\right)\int\limits_t^{t_5}\phi_{j_3}(t_3)\left(\int\limits_t^{t_3}\phi_{j_2}(t_2)dt_2\right)\left(\int\limits_t^{t_3}\phi_{j_1}(t_1)dt_1\right)dt_3\left(\int\limits_{t_5}^{T}\phi_{j_2}(t_6)dt_6\right)dt_5-
$$

$$
-\int\limits_t^T \phi_{j_3}(t_5)\int\limits_t^{t_5}\phi_{j_3}(t_3)\left(\int\limits_t^{t_3}\phi_{j_2}(t_2)dt_2\right)\left(\int\limits_t^{t_3}\phi_{j_1}(t_1)dt_1\right)^2 dt_3\left(\int\limits_{t_5}^{T}\phi_{j_2}(t_6)dt_6\right)dt_5. \tag{594}
$$

Using (354), we obtain

$$
-\sum_{j_1=p+1}^{\infty}\sum_{j_2=p+1}^{\infty}\sum_{j_3=p+1}^{\infty}\Bigl(C_{j_2j_3j_1j_3j_2j_1}+C_{j_2j_3j_1j_3j_1j_2}\Bigr)=
$$

$$
=\sum_{j_3=0}^{p}\sum_{j_1=p+1}^{\infty}\sum_{j_2=p+1}^{\infty}\Bigl(C_{j_2j_3j_1j_3j_2j_1}+C_{j_2j_3j_1j_3j_1j_2}\Bigr). \tag{595}
$$

By analogy with the proof of (512) and applying (594), we get

$$
\lim_{p\to\infty}\sum_{j_3=0}^{p}\sum_{j_1=p+1}^{\infty}\sum_{j_2=p+1}^{\infty}\Bigl(C_{j_2j_3j_1j_3j_2j_1}+C_{j_2j_3j_1j_3j_1j_2}\Bigr)=0. \tag{596}
$$

From (595) and (596) we have

$$
\lim_{p\to\infty}\sum_{j_1=p+1}^{\infty}\sum_{j_2=p+1}^{\infty}\sum_{j_3=p+1}^{\infty}\Bigl(C_{j_2j_3j_1j_3j_2j_1}+C_{j_2j_3j_1j_3j_1j_2}\Bigr)=0. \tag{597}
$$

Moreover (see (507)),

$$
\lim_{p\to\infty}\sum_{j_1=p+1}^{\infty}\sum_{j_2=p+1}^{\infty}\sum_{j_3=p+1}^{\infty}C_{j_2j_3j_1j_3j_1j_2}=0. \tag{598}
$$

Combining (597) and (598), we finally obtain

$$
\lim_{p\to\infty}\sum_{j_1=p+1}^{\infty}\sum_{j_2=p+1}^{\infty}\sum_{j_3=p+1}^{\infty}C_{j_2j_3j_1j_3j_2j_1}=0.
$$

The equality (518) is proved.

Now consider (519). Using the integration order replacement, we obtain

$$
C_{j_3j_1j_3j_2j_2j_1}+C_{j_3j_1j_3j_2j_1j_2}=
$$

$$= \int\limits_t^T \phi_{j_3}(t_6) \int\limits_t^{t_6} \phi_{j_1}(t_5) \int\limits_t^{t_5} \phi_{j_3}(t_4) \int\limits_t^{t_4} \phi_{j_2}(t_3) \left(\int\limits_t^{t_3} \phi_{j_2}(t_2)dt_2\right) \left(\int\limits_t^{t_3} \phi_{j_1}(t_1)dt_1\right) dt_3dt_4dt_5dt_6 =$$

$$= \int\limits_t^T \phi_{j_3}(t_6) \int\limits_t^{t_6} \phi_{j_1}(t_5) \int\limits_t^{t_5} \phi_{j_2}(t_3) \left(\int\limits_t^{t_3} \phi_{j_2}(t_2)dt_2\right) \left(\int\limits_t^{t_3} \phi_{j_1}(t_1)dt_1\right) \int\limits_{t_3}^{t_5} \phi_{j_3}(t_4)dt_4dt_3dt_5dt_6 =$$

$$= \int\limits_t^T \phi_{j_3}(t_6) \int\limits_t^{t_6} \phi_{j_1}(t_5) \left(\int\limits_t^{t_5} \phi_{j_3}(t_4)dt_4\right) \int\limits_t^{t_5} \phi_{j_2}(t_3) \left(\int\limits_t^{t_3} \phi_{j_2}(t_2)dt_2\right) \left(\int\limits_t^{t_3} \phi_{j_1}(t_1)dt_1\right) dt_3dt_5dt_6 -$$

$$- \int\limits_t^T \phi_{j_3}(t_6) \int\limits_t^{t_6} \phi_{j_1}(t_5) \int\limits_t^{t_5} \phi_{j_2}(t_3) \left(\int\limits_t^{t_3} \phi_{j_2}(t_2)dt_2\right) \left(\int\limits_t^{t_3} \phi_{j_1}(t_1)dt_1\right) \left(\int\limits_t^{t_3} \phi_{j_3}(t_4)dt_4\right) dt_3dt_5dt_6 =$$

$$= \int\limits_t^T \phi_{j_1}(t_5) \left(\int\limits_t^{t_5} \phi_{j_3}(t_4)dt_4\right) \int\limits_t^{t_5} \phi_{j_2}(t_3) \left(\int\limits_t^{t_3} \phi_{j_2}(t_2)dt_2\right) \left(\int\limits_t^{t_3} \phi_{j_1}(t_1)dt_1\right) dt_3 \left(\int\limits_{t_5}^{T} \phi_{j_3}(t_6)dt_6\right) dt_5 -$$

(599)
$$- \int\limits_t^T \phi_{j_1}(t_5) \int\limits_t^{t_5} \phi_{j_2}(t_3) \left(\int\limits_t^{t_3} \phi_{j_2}(t_2)dt_2\right) \left(\int\limits_t^{t_3} \phi_{j_1}(t_1)dt_1\right) \left(\int\limits_t^{t_3} \phi_{j_3}(t_4)dt_4\right) dt_3 \left(\int\limits_{t_5}^{T} \phi_{j_3}(t_6)dt_6\right) dt_5.$$

Applying (354) and (361), we obtain

$$\sum_{j_1=p+1}^{\infty} \sum_{j_2=p+1}^{\infty} \sum_{j_3=p+1}^{\infty} \Bigl(C_{j_3j_1j_3j_2j_2j_1} + C_{j_3j_1j_3j_2j_1j_2}\Bigr) =$$

$$= -\sum_{j_1=0}^{p} \sum_{j_3=p+1}^{\infty} \sum_{j_2=p+1}^{\infty} \Bigl(C_{j_3j_1j_3j_2j_2j_1} + C_{j_3j_1j_3j_2j_1j_2}\Bigr) =$$

$$= \sum_{j_1=0}^{p} \sum_{j_2=0}^{p} \sum_{j_3=p+1}^{\infty} \Bigl(C_{j_3j_1j_3j_2j_2j_1} + C_{j_3j_1j_3j_2j_1j_2}\Bigr) -$$

(600)
$$-\frac{1}{2} \sum_{j_1=0}^{p} \sum_{j_3=p+1}^{\infty} C_{j_3j_1j_3j_2j_2j_1}\Bigr|_{(j_2j_2)\frown(\cdot)}.$$

The equality

(601)
$$\lim_{p\to\infty} \frac{1}{2} \sum_{j_1=0}^{p} \sum_{j_3=p+1}^{\infty} C_{j_3j_1j_3j_2j_2j_1}\Bigr|_{(j_2j_2)\frown(\cdot)} = 0$$

follows from the equality (418), where we proceed similarly to the proof of equality (560) (see (561)).

By analogy with the proof of (512) and applying (599), we get

$$\lim_{p\to\infty}\sum_{j_1=0}^{p}\sum_{j_2=0}^{p}\sum_{j_3=p+1}^{\infty}\left(C_{j_3j_1j_3j_2j_2j_1}+C_{j_3j_1j_3j_2j_1j_2}\right)=0. \tag{602}$$

From (600)–(602) we have

$$\lim_{p\to\infty}\sum_{j_1=p+1}^{\infty}\sum_{j_2=p+1}^{\infty}\sum_{j_3=p+1}^{\infty}\left(C_{j_3j_1j_3j_2j_2j_1}+C_{j_3j_1j_3j_2j_1j_2}\right)=0. \tag{603}$$

Moreover (see (508)),

$$\lim_{p\to\infty}\sum_{j_1=p+1}^{\infty}\sum_{j_2=p+1}^{\infty}\sum_{j_3=p+1}^{\infty}C_{j_3j_1j_3j_2j_1j_2}=0. \tag{604}$$

Combining (603) and (604), we finally obtain

$$\lim_{p\to\infty}\sum_{j_1=p+1}^{\infty}\sum_{j_2=p+1}^{\infty}\sum_{j_3=p+1}^{\infty}C_{j_3j_1j_3j_2j_2j_1}=0.$$

The equality (519) is proved.

Finally consider (520). Using the integration order replacement, we have

$$C_{j_2j_3j_3j_1j_2j_1}+C_{j_2j_3j_3j_1j_1j_2}=$$

$$=\int\limits_t^T\phi_{j_2}(t_6)\int\limits_t^{t_6}\phi_{j_3}(t_5)\int\limits_t^{t_5}\phi_{j_3}(t_4)\int\limits_t^{t_4}\phi_{j_1}(t_3)\left(\int\limits_t^{t_3}\phi_{j_2}(t_2)dt_2\right)\left(\int\limits_t^{t_3}\phi_{j_1}(t_1)dt_1\right)dt_3dt_4dt_5dt_6=$$

$$=\int\limits_t^T\phi_{j_2}(t_6)\int\limits_t^{t_6}\phi_{j_3}(t_5)\int\limits_t^{t_5}\phi_{j_1}(t_3)\left(\int\limits_t^{t_3}\phi_{j_2}(t_2)dt_2\right)\left(\int\limits_t^{t_3}\phi_{j_1}(t_1)dt_1\right)\int\limits_{t_3}^{t_5}\phi_{j_3}(t_4)dt_4dt_3dt_5dt_6=$$

$$=\int\limits_t^T\phi_{j_2}(t_6)\int\limits_t^{t_6}\phi_{j_3}(t_5)\left(\int\limits_t^{t_5}\phi_{j_3}(t_4)dt_4\right)\int\limits_t^{t_5}\phi_{j_1}(t_3)\left(\int\limits_t^{t_3}\phi_{j_2}(t_2)dt_2\right)\left(\int\limits_t^{t_3}\phi_{j_1}(t_1)dt_1\right)dt_3dt_5dt_6-$$

$$-\int\limits_t^T\phi_{j_2}(t_6)\int\limits_t^{t_6}\phi_{j_3}(t_5)\int\limits_t^{t_5}\phi_{j_1}(t_3)\left(\int\limits_t^{t_3}\phi_{j_2}(t_2)dt_2\right)\left(\int\limits_t^{t_3}\phi_{j_1}(t_1)dt_1\right)\left(\int\limits_t^{t_3}\phi_{j_3}(t_4)dt_4\right)dt_3dt_5dt_6=$$

$$=\int\limits_t^T\phi_{j_3}(t_5)\left(\int\limits_t^{t_5}\phi_{j_3}(t_4)dt_4\right)\int\limits_t^{t_5}\phi_{j_1}(t_3)\left(\int\limits_t^{t_3}\phi_{j_2}(t_2)dt_2\right)\left(\int\limits_t^{t_3}\phi_{j_1}(t_1)dt_1\right)dt_3\left(\int\limits_{t_5}^{T}\phi_{j_2}(t_6)dt_6\right)dt_5-$$

(605)
$$-\int\limits_t^T \phi_{j_3}(t_5)\int\limits_t^{t_5} \phi_{j_1}(t_3)\left(\int\limits_t^{t_3}\phi_{j_2}(t_2)dt_2\right)\left(\int\limits_t^{t_3}\phi_{j_1}(t_1)dt_1\right)\left(\int\limits_t^{t_3}\phi_{j_3}(t_4)dt_4\right)dt_3\left(\int\limits_{t_5}^{T}\phi_{j_2}(t_6)dt_6\right)dt_5.$$

Using (354) and (361), we get

$$\sum_{j_1=p+1}^{\infty}\sum_{j_2=p+1}^{\infty}\sum_{j_3=p+1}^{\infty}\left(C_{j_2j_3j_3j_1j_2j_1}+C_{j_2j_3j_3j_1j_1j_2}\right)=$$

$$=\frac{1}{2}\sum_{j_1=p+1}^{\infty}\sum_{j_2=p+1}^{\infty}\left(C_{j_2j_3j_3j_1j_2j_1}\Biggl|_{(j_3j_3)\curvearrowright(\cdot)}+C_{j_2j_3j_3j_1j_1j_2}\Biggl|_{(j_3j_3)\curvearrowright(\cdot)}\right)-$$

$$-\sum_{j_3=0}^{p}\sum_{j_1=p+1}^{\infty}\sum_{j_2=p+1}^{\infty}\left(C_{j_2j_3j_3j_1j_2j_1}+C_{j_2j_3j_3j_1j_1j_2}\right)=$$

$$=\frac{1}{2}\sum_{j_1=p+1}^{\infty}\sum_{j_2=p+1}^{\infty}\left(C_{j_2j_3j_3j_1j_2j_1}\Biggl|_{(j_3j_3)\curvearrowright(\cdot)}+C_{j_2j_3j_3j_1j_1j_2}\Biggl|_{(j_3j_3)\curvearrowright(\cdot)}\right)+$$

$$+\sum_{j_1=0}^{p}\sum_{j_3=0}^{p}\sum_{j_2=p+1}^{\infty}\left(C_{j_2j_3j_3j_1j_2j_1}+C_{j_2j_3j_3j_1j_1j_2}\right)-$$

$$-\frac{1}{2}\sum_{j_3=0}^{p}\sum_{j_2=p+1}^{\infty}C_{j_2j_3j_3j_1j_1j_2}\Biggl|_{(j_1j_1)\curvearrowright(\cdot)}. \tag{606}$$

The equalities

$$\lim_{p\to\infty}\frac{1}{2}\sum_{j_1=p+1}^{\infty}\sum_{j_2=p+1}^{\infty}\left(C_{j_2j_3j_3j_1j_2j_1}\Biggl|_{(j_3j_3)\curvearrowright(\cdot)}+C_{j_2j_3j_3j_1j_1j_2}\Biggl|_{(j_3j_3)\curvearrowright(\cdot)}\right)=0, \tag{607}$$

$$\lim_{p\to\infty}\frac{1}{2}\sum_{j_3=0}^{p}\sum_{j_2=p+1}^{\infty}C_{j_2j_3j_3j_1j_1j_2}\Biggl|_{(j_1j_1)\curvearrowright(\cdot)}=$$

$$=\lim_{p\to\infty}\frac{1}{4}\sum_{j_2=p+1}^{\infty}C_{j_2j_3j_3j_1j_1j_2}\Biggl|_{(j_1j_1)\curvearrowright(\cdot)(j_3j_3)\curvearrowright(\cdot)}-$$

$$-\lim_{p\to\infty}\frac{1}{2}\sum_{j_3=p+1}^{\infty}\sum_{j_2=p+1}^{\infty}C_{j_2j_3j_3j_1j_1j_2}\Biggl|_{(j_1j_1)\curvearrowright(\cdot)}=0 \tag{608}$$

follows from the equalities (418), (419), where we used the same technique as in (561). When proving (608), we also applied (361) and (43).

By analogy with the proof of (512) and applying (605), we obtain

$$\lim_{p\to\infty}\sum_{j_1=0}^{p}\sum_{j_3=0}^{p}\sum_{j_2=p+1}^{\infty}\Bigl(C_{j_2j_3j_3j_1j_2j_1}+C_{j_2j_3j_3j_1j_1j_2}\Bigr)=0. \tag{609}$$

From (606)–(609) we have

$$\lim_{p\to\infty}\sum_{j_1=p+1}^{\infty}\sum_{j_2=p+1}^{\infty}\sum_{j_3=p+1}^{\infty}\Bigl(C_{j_2j_3j_3j_1j_2j_1}+C_{j_2j_3j_3j_1j_1j_2}\Bigr)=0. \tag{610}$$

Furthermore (see (510)),

$$\lim_{p\to\infty}\sum_{j_1=p+1}^{\infty}\sum_{j_2=p+1}^{\infty}\sum_{j_3=p+1}^{\infty}C_{j_2j_3j_3j_1j_1j_2}=0. \tag{611}$$

Combining (610) and (611), we finally obtain

$$\lim_{p\to\infty}\sum_{j_1=p+1}^{\infty}\sum_{j_2=p+1}^{\infty}\sum_{j_3=p+1}^{\infty}C_{j_2j_3j_3j_1j_2j_1}=0.$$

The equality (520) is proved. Theorem 30 is proved.

20. Generalization of Theorem 23. The Case $p_1,\ p_2,\ p_3\to\infty$ and Continuously Differetiable Weight Functions (The Cases of Legendre Polynomials and Trigonometric Functions)

This section is devoted to the following theorem.

Theorem 31 [26], [34], [72]. *Suppose that $\{\phi_j(x)\}_{j=0}^{\infty}$ is a complete orthonormal system of Legendre polynomials or trigonometric functions in the space $L_2([t,T])$. Furthermore, let $\psi_1(\tau),\psi_2(\tau),\ \psi_3(\tau)$ are continuously differentiable nonrandom functions on $[t,T]$. Then, for the iterated Stratonovich stochastic integral of third multiplicity*

$$J^*[\psi^{(3)}]_{T,t}^{(i_1i_2i_3)}=\int\limits_t^{*T}\psi_3(t_3)\int\limits_t^{*t_3}\psi_2(t_2)\int\limits_t^{*t_2}\psi_1(t_1)d\mathbf{w}_{t_1}^{(i_1)}d\mathbf{w}_{t_2}^{(i_2)}d\mathbf{w}_{t_3}^{(i_3)}$$

the following expansion

$$J^*[\psi^{(3)}]_{T,t}^{(i_1i_2i_3)}=\underset{p_1,p_2,p_3\to\infty}{\text{l.i.m.}}\sum_{j_1=0}^{p_1}\sum_{j_2=0}^{p_2}\sum_{j_3=0}^{p_3}C_{j_3j_2j_1}\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}\zeta_{j_3}^{(i_3)} \tag{612}$$

that converges in the mean-square sense is valid, where $i_1,i_2,i_3=0,1,\ldots,m$,

$$C_{j_3j_2j_1}=\int\limits_t^{T}\psi_3(t_3)\phi_{j_3}(t_3)\int\limits_t^{t_3}\psi_2(t_2)\phi_{j_2}(t_2)\int\limits_t^{t_2}\psi_1(t_1)\phi_{j_1}(t_1)dt_1dt_2dt_3$$

and

$$\zeta_j^{(i)} = \int\limits_t^T \phi_j(s) d\mathbf{w}_s^{(i)}$$

are independent standard Gaussian random variables for various i *or* j *(in the case when* $i \ne 0$*),* $\mathbf{w}_\tau^{(i)} = \mathbf{f}_\tau^{(i)}$ *for* $i = 1, \ldots, m$ *and* $\mathbf{w}_\tau^{(0)} = \tau$*.*

Proof. Let us consider the case of Legendre polynomials (the trigonometric case is simpler and can be considered similarly). Applying (348), we obtain

$$\sum_{j_1=0}^{p_1}\sum_{j_2=0}^{p_2}\sum_{j_3=0}^{p_3} C_{j_3j_2j_1}\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}\zeta_{j_3}^{(i_3)} = J'[K_{p_1p_2p_3}]_{T,t}^{(i_1i_2i_3)}+$$

$$+\mathbf{1}_{\{i_1=i_2\ne 0\}}\sum_{j_3=0}^{p_3}\sum_{j_1=0}^{\min\{p_1,p_2\}} C_{j_3j_1j_1} J'[\phi_{j_3}]_{T,t}^{(i_3)}+$$

$$+\mathbf{1}_{\{i_2=i_3\ne 0\}}\sum_{j_1=0}^{p_1}\sum_{j_3=0}^{\min\{p_2,p_3\}} C_{j_3j_3j_1} J'[\phi_{j_1}]_{T,t}^{(i_1)}+$$

$$+\mathbf{1}_{\{i_1=i_3\ne 0\}}\sum_{j_2=0}^{p_2}\sum_{j_1=0}^{\min\{p_1,p_3\}} C_{j_1j_2j_1} J'[\phi_{j_2}]_{T,t}^{(i_2)} \tag{613}$$

w. p. 1, where notations are the same as in (348).

Using Theorem 19 (see (321) for the case $k=3$), Theorem 1 (see (333)) as well as (366) (see the derivation of (366)) and (361), we get

$$J^*[\psi^{(3)}]_{T,t}^{(i_1i_2i_3)} = J[\psi^{(3)}]_{T,t}^{(i_1i_2i_3)} + \frac{1}{2}\mathbf{1}_{\{i_1=i_2\ne 0\}}\int\limits_t^T \psi_3(t_3)\int\limits_t^{t_3}\psi_2(t_2)\psi_1(t_2)dt_2 d\mathbf{w}_{t_3}^{(i_3)}+$$

$$+\frac{1}{2}\mathbf{1}_{\{i_2=i_3\ne 0\}}\int\limits_t^T \psi_3(t_3)\psi_2(t_3)\int\limits_t^{t_3}\psi_1(t_1)d\mathbf{w}_{t_1}^{(i_1)}dt_3 =$$

$$= J[\psi^{(3)}]_{T,t}^{(i_1i_2i_3)} + \frac{1}{2}J[\psi^{(3)}]_{T,t}^{1} + \frac{1}{2}J[\psi^{(3)}]_{T,t}^{2} =$$

$$= \underset{p_1,p_2,p_3\to\infty}{\text{l.i.m.}}\ J'[K_{p_1p_2p_3}]_{T,t}^{(i_1i_2i_3)}+$$

$$+\mathbf{1}_{\{i_1=i_2\ne 0\}}\underset{p_3\to\infty}{\text{l.i.m.}}\ \frac{1}{2}\sum_{j_3=0}^{p_3} C_{j_3j_2j_1}\Bigg|_{(j_2j_1)\curvearrowright(\cdot),\, j_1=j_2} J'[\phi_{j_3}]_{T,t}^{(i_3)}+$$

$$+\mathbf{1}_{\{i_2=i_3\ne 0\}}\underset{p_1\to\infty}{\text{l.i.m.}}\ \frac{1}{2}\sum_{j_1=0}^{p_1} C_{j_3j_2j_1}\Bigg|_{(j_3j_2)\curvearrowright(\cdot),\, j_2=j_3} J'[\phi_{j_1}]_{T,t}^{(i_1)} =$$

$$
= \underset{p_1,p_2,p_3\to\infty}{\text{l.i.m.}}\ J'[K_{p_1p_2p_3}]_{T,t}^{(i_1i_2i_3)}+
$$

$$
+\mathbf{1}_{\{i_1=i_2\ne 0\}}\underset{p_3\to\infty}{\text{l.i.m.}}\sum_{j_3=0}^{p_3}\sum_{j_1=0}^{\infty}C_{j_3j_1j_1}J'[\phi_{j_3}]_{T,t}^{(i_3)}+
$$

$$
+\mathbf{1}_{\{i_2=i_3\ne 0\}}\underset{p_1\to\infty}{\text{l.i.m.}}\sum_{j_1=0}^{p_1}\sum_{j_3=0}^{\infty}C_{j_3j_3j_1}J'[\phi_{j_1}]_{T,t}^{(i_1)} \tag{614}
$$

w. p. 1.

Using (613), (614) and the elementary inequality

$$
(a+b+c+d)^2\le 4\left(a^2+b^2+c^2+d^2\right),
$$

we obtain

$$
\mathsf{M}\left\{\left(J^{*}[\psi^{(3)}]_{T,t}^{(i_1i_2i_3)}-\sum_{j_1=0}^{p_1}\sum_{j_2=0}^{p_2}\sum_{j_3=0}^{p_3}C_{j_3j_2j_1}\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}\zeta_{j_3}^{(i_3)}\right)^2\right\}\le
$$

$$
\le 4\mathsf{M}\left\{\left(J[\psi^{(3)}]_{T,t}^{(i_1i_2i_3)}-J'[K_{p_1p_2p_3}]_{T,t}^{(i_1i_2i_3)}\right)^2\right\}+
$$

$$
+4\cdot\mathbf{1}_{\{i_1=i_2\ne 0\}}\times
$$

$$
\times\mathsf{M}\left\{\left(\underset{p_3\to\infty}{\text{l.i.m.}}\sum_{j_3=0}^{p_3}\sum_{j_1=0}^{\infty}C_{j_3j_1j_1}J'[\phi_{j_3}]_{T,t}^{(i_3)}-\sum_{j_3=0}^{p_3}\sum_{j_1=0}^{\min\{p_1,p_2\}}C_{j_3j_1j_1}J'[\phi_{j_3}]_{T,t}^{(i_3)}\right)^2\right\}+
$$

$$
+4\cdot\mathbf{1}_{\{i_2=i_3\ne 0\}}\times
$$

$$
\times\mathsf{M}\left\{\left(\underset{p_1\to\infty}{\text{l.i.m.}}\sum_{j_1=0}^{p_1}\sum_{j_3=0}^{\infty}C_{j_3j_3j_1}J'[\phi_{j_1}]_{T,t}^{(i_1)}-\sum_{j_1=0}^{p_1}\sum_{j_3=0}^{\min\{p_2,p_3\}}C_{j_3j_3j_1}J'[\phi_{j_1}]_{T,t}^{(i_1)}\right)^2\right\}+
$$

$$
+4\cdot\mathbf{1}_{\{i_1=i_3\ne 0\}}\mathsf{M}\left\{\left(\sum_{j_2=0}^{p_2}\sum_{j_1=0}^{\min\{p_1,p_3\}}C_{j_1j_2j_1}J'[\phi_{j_2}]_{T,t}^{(i_2)}\right)^2\right\}=
$$

$$
=4A_{p_1p_2p_3}+4\cdot\mathbf{1}_{\{i_1=i_2\ne 0\}}B_{p_1p_2p_3}+4\cdot\mathbf{1}_{\{i_2=i_3\ne 0\}}C_{p_1p_2p_3}+4\cdot\mathbf{1}_{\{i_1=i_3\ne 0\}}D_{p_1p_2p_3}. \tag{615}
$$

Theorem 1 gives (see (333))

$$\lim_{p_1,p_2,p_3\to\infty} A_{p_1p_2p_3}=0. \tag{616}$$

Further, in complete analogy with (410) and using (354), we obtain

$$D_{p_1p_2p_3}=\sum_{j_2=0}^{p_2}\left(\sum_{j_1=0}^{\min\{p_1,p_3\}}C_{j_1j_2j_1}\right)^2=\sum_{j_2=0}^{p_2}\left(\sum_{j_1=\min\{p_1,p_3\}+1}^{\infty}C_{j_1j_2j_1}\right)^2\le$$

$$\le\sum_{j_2=0}^{\infty}\left(\sum_{j_1=\min\{p_1,p_3\}+1}^{\infty}C_{j_1j_2j_1}\right)^2\le\frac{K}{\left(\min\{p_1,p_3\}\right)^{2-\varepsilon}}\ \to\ 0 \tag{617}$$

if $p_1,p_2,p_3\to\infty$, where ε is an arbitrary small positive real number, constant K is independent of p.

We have

$$B_{p_1p_2p_3}=\mathsf{M}\left\{\left(\left(\underset{p_3\to\infty}{\text{l.i.m.}}\sum_{j_3=0}^{p_3}\sum_{j_1=0}^{\infty}C_{j_3j_1j_1}J'[\phi_{j_3}]_{T,t}^{(i_3)}-\sum_{j_3=0}^{p_3}\sum_{j_1=0}^{\infty}C_{j_3j_1j_1}J'[\phi_{j_3}]_{T,t}^{(i_3)}\right)+\right.\right.$$

$$\left.\left.+\left(\sum_{j_3=0}^{p_3}\sum_{j_1=0}^{\infty}C_{j_3j_1j_1}J'[\phi_{j_3}]_{T,t}^{(i_3)}-\sum_{j_3=0}^{p_3}\sum_{j_1=0}^{\min\{p_1,p_2\}}C_{j_3j_1j_1}J'[\phi_{j_3}]_{T,t}^{(i_3)}\right)\right)^2\right\}\le$$

$$\le 2E_{p_3}+2F_{p_1p_2p_3}, \tag{618}$$

where

$$E_{p_3}=\mathsf{M}\left\{\left(\underset{p_3\to\infty}{\text{l.i.m.}}\sum_{j_3=0}^{p_3}\sum_{j_1=0}^{\infty}C_{j_3j_1j_1}J'[\phi_{j_3}]_{T,t}^{(i_3)}-\sum_{j_3=0}^{p_3}\sum_{j_1=0}^{\infty}C_{j_3j_1j_1}J'[\phi_{j_3}]_{T,t}^{(i_3)}\right)^2\right\},$$

$$F_{p_1p_2p_3}=\mathsf{M}\left\{\left(\sum_{j_3=0}^{p_3}\sum_{j_1=0}^{\infty}C_{j_3j_1j_1}J'[\phi_{j_3}]_{T,t}^{(i_3)}-\sum_{j_3=0}^{p_3}\sum_{j_1=0}^{\min\{p_1,p_2\}}C_{j_3j_1j_1}J'[\phi_{j_3}]_{T,t}^{(i_3)}\right)^2\right\}=$$

$$=\mathsf{M}\left\{\left(\sum_{j_3=0}^{p_3}\sum_{j_1=\min\{p_1,p_2\}+1}^{\infty}C_{j_3j_1j_1}J'[\phi_{j_3}]_{T,t}^{(i_3)}\right)^2\right\}=$$

$$=\sum_{j_3=0}^{p_3}\left(\sum_{j_1=\min\{p_1,p_2\}+1}^{\infty}C_{j_3j_1j_1}\right)^2. \tag{619}$$

By analogy with (397) we get

$$\sum_{j_3=0}^{p_3}\left(\sum_{j_1=\min\{p_1,p_2\}+1}^{\infty} C_{j_3j_1j_1}\right)^2 \le \sum_{j_3=0}^{\infty}\left(\sum_{j_1=\min\{p_1,p_2\}+1}^{\infty} C_{j_3j_1j_1}\right)^2 \le$$

$$\le \frac{K}{\left(\min\{p_1,p_2\}\right)^2} \ \to\ 0 \tag{620}$$

if $p_1, p_2, p_3 \to \infty$, where constant K does not depend on p.

Moreover,

$$\lim_{p_3\to\infty} E_{p_3} = \lim_{p_1,p_2,p_3\to\infty} E_{p_3} = 0. \tag{621}$$

Combining (618)–(621), we obtain

$$\lim_{p_1,p_2,p_3\to\infty} B_{p_1p_2p_3} = 0. \tag{622}$$

Consider $C_{p_1p_2p_3}$. We have

$$C_{p_1p_2p_3} = \mathsf{M}\left\{\left(\left(\underset{p_1\to\infty}{\text{l.i.m.}}\ \sum_{j_1=0}^{p_1}\sum_{j_3=0}^{\infty} C_{j_3j_3j_1} J'[\phi_{j_1}]_{T,t}^{(i_1)} - \sum_{j_1=0}^{p_1}\sum_{j_3=0}^{\infty} C_{j_3j_3j_1} J'[\phi_{j_1}]_{T,t}^{(i_1)}\right)+\right.\right.$$

$$\left.\left.+\left(\sum_{j_1=0}^{p_1}\sum_{j_3=0}^{\infty} C_{j_3j_3j_1} J'[\phi_{j_1}]_{T,t}^{(i_1)} - \sum_{j_1=0}^{p_1}\sum_{j_3=0}^{\min\{p_2,p_3\}} C_{j_3j_3j_1} J'[\phi_{j_1}]_{T,t}^{(i_1)}\right)\right)^2\right\} \le$$

$$\le 2G_{p_1} + 2H_{p_1p_2p_3}, \tag{623}$$

where

$$G_{p_1} = \mathsf{M}\left\{\left(\underset{p_1\to\infty}{\text{l.i.m.}}\ \sum_{j_1=0}^{p_1}\sum_{j_3=0}^{\infty} C_{j_3j_3j_1} J'[\phi_{j_1}]_{T,t}^{(i_1)} - \sum_{j_1=0}^{p_1}\sum_{j_3=0}^{\infty} C_{j_3j_3j_1} J'[\phi_{j_1}]_{T,t}^{(i_1)}\right)^2\right\},$$

$$H_{p_1p_2p_3} = \mathsf{M}\left\{\left(\sum_{j_1=0}^{p_1}\sum_{j_3=0}^{\infty} C_{j_3j_3j_1} J'[\phi_{j_1}]_{T,t}^{(i_1)} - \sum_{j_1=0}^{p_1}\sum_{j_3=0}^{\min\{p_2,p_3\}} C_{j_3j_3j_1} J'[\phi_{j_1}]_{T,t}^{(i_1)}\right)^2\right\} =$$

$$= \mathsf{M}\left\{\left(\sum_{j_1=0}^{p_1}\sum_{j_3=\min\{p_2,p_3\}+1}^{\infty} C_{j_3j_3j_1} J'[\phi_{j_1}]_{T,t}^{(i_1)}\right)^2\right\} =$$

$$= \sum_{j_1=0}^{p_1}\left(\sum_{j_3=\min\{p_2,p_3\}+1}^{\infty} C_{j_3j_3j_1}\right)^2. \tag{624}$$

By analogy with (401) we get

$$
\sum_{j_1=0}^{p_1}\left(\sum_{j_3=\min\{p_2,p_3\}+1}^{\infty}C_{j_3j_3j_1}\right)^2\le\sum_{j_1=0}^{\infty}\left(\sum_{j_3=\min\{p_2,p_3\}+1}^{\infty}C_{j_3j_3j_1}\right)^2\le
$$

$$
\le\frac{K}{\left(\min\{p_2,p_3\}\right)^2}\ \to\ 0 \tag{625}
$$

if $p_1,p_2,p_3\to\infty$, where constant K does not depend on p.
Moreover,

$$
\lim_{p_1\to\infty}G_{p_1}=\lim_{p_1,p_2,p_3\to\infty}G_{p_1}=0. \tag{626}
$$

Combining (623)–(626), we obtain

$$
\lim_{p_1,p_2,p_3\to\infty}C_{p_1p_2p_3}=0. \tag{627}
$$

The relations (615)–(617), (622), (627) complete the proof of Theorem 31. Theorem 31 is proved.

21. Modification of Condition 3 of Theorem 20 Using Parseval's Equality

First, note that (see the proof of Theorem 20 and (377))

$$
\underset{p\to\infty}{\text{l.i.m.}}\sum_{j_1,\ldots,j_k=0}^{p}C_{j_k\ldots j_1}\prod_{s=1}^{r}\mathbf{1}_{\{j_{g_{2s-1}}=\ j_{g_{2s}}\}}\prod_{s=1}^{r}\mathbf{1}_{\{i_{g_{2s-1}}=\ i_{g_{2s}}\ne 0\}}J'[\phi_{j_{q_1}}\ldots\phi_{j_{q_{k-2r}}}]_{T,t}^{(i_{q_1}\ldots i_{q_{k-2r}})}=
$$

$$
=\underset{p\to\infty}{\text{l.i.m.}}\sum_{\substack{j_1,\ldots,j_q,\ldots,j_k=0\\ q\ne g_1,g_2,\ldots,g_{2r-1},g_{2r}}}^{p}\ \sum_{j_{g_1},j_{g_3},\ldots,j_{g_{2r-1}}=0}^{p}C_{j_k\ldots j_1}\Bigg|_{j_{g_1}=\ j_{g_2},\ldots,j_{g_{2r-1}}=\ j_{g_{2r}}}\times
$$

$$
\times\prod_{s=1}^{r}\mathbf{1}_{\{i_{g_{2s-1}}=\ i_{g_{2s}}\ne 0\}}J'[\phi_{j_{q_1}}\ldots\phi_{j_{q_{k-2r}}}]_{T,t}^{(i_{q_1}\ldots i_{q_{k-2r}})}=
$$

$$
=\underset{p\to\infty}{\text{l.i.m.}}\sum_{\substack{j_1,\ldots,j_q,\ldots,j_k=0\\ q\ne g_1,g_2,\ldots,g_{2r-1},g_{2r}}}^{p}\left(\sum_{j_{g_1},j_{g_3},\ldots,j_{g_{2r-1}}=0}^{p}C_{j_k\ldots j_1}\Bigg|_{j_{g_1}=\ j_{g_2},\ldots,j_{g_{2r-1}}=\ j_{g_{2r}}}-\right.
$$

$$
\left.-\frac{1}{2^r}\prod_{l=1}^{r}\mathbf{1}_{\{g_{2l}=g_{2l-1}+1\}}C_{j_k\ldots j_1}\Bigg|_{(j_{g_2}j_{g_1})\curvearrowright(\cdot)\ldots(j_{g_{2r}}j_{g_{2r-1}})\curvearrowright(\cdot),j_{g_1}=\ j_{g_2},\ldots,j_{g_{2r-1}}=\ j_{g_{2r}}}\right)\times
$$

$$\times \prod_{s=1}^{r} \mathbf{1}_{\{i_{g_{2s-1}}=~i_{g_{2s}}\ne 0\}} J'[\phi_{j_{q_1}}\ldots\phi_{j_{q_{k-2r}}}]_{T,t}^{(i_{q_1}\ldots i_{q_{k-2r}})}+$$

$$+\underset{p\to\infty}{\text{l.i.m.}} \sum_{\substack{j_1,\ldots,j_q,\ldots,j_k=0\\ q\ne g_1,g_2,\ldots,g_{2r-1},g_{2r}}}^{p} \frac{1}{2^r} C_{j_k\ldots j_1}\Biggl|_{(j_{g_2}j_{g_1})\curvearrowright(\cdot)\ldots(j_{g_{2r}}j_{g_{2r-1}})\curvearrowright(\cdot),j_{g_1}=~j_{g_2},\ldots,j_{g_{2r-1}}=~j_{g_{2r}}}\times$$

$$\times \prod_{s=1}^{r} \mathbf{1}_{\{i_{g_{2s-1}}=~i_{g_{2s}}\ne 0\}} \prod_{s=1}^{r} \mathbf{1}_{\{g_{2s}=g_{2s-1}+1\}} J'[\phi_{j_{q_1}}\ldots\phi_{j_{q_{k-2r}}}]_{T,t}^{(i_{q_1}\ldots i_{q_{k-2r}})}=$$

$$=\underset{p\to\infty}{\text{l.i.m.}} \sum_{\substack{j_1,\ldots,j_q,\ldots,j_k=0\\ q\ne g_1,g_2,\ldots,g_{2r-1},g_{2r}}}^{p} \left(\sum_{j_{g_1},j_{g_3},\ldots,j_{g_{2r-1}}=0}^{p} C_{j_k\ldots j_1}\Biggl|_{j_{g_1}=~j_{g_2},\ldots,j_{g_{2r-1}}=~j_{g_{2r}}} - \right.$$

$$\left. -\frac{1}{2^r}\prod_{l=1}^{r} \mathbf{1}_{\{g_{2l}=g_{2l-1}+1\}} C_{j_k\ldots j_1}\Biggl|_{(j_{g_2}j_{g_1})\curvearrowright(\cdot)\ldots(j_{g_{2r}}j_{g_{2r-1}})\curvearrowright(\cdot),j_{g_1}=~j_{g_2},\ldots,j_{g_{2r-1}}=~j_{g_{2r}}}\right)\times$$

$$\times \prod_{s=1}^{r} \mathbf{1}_{\{i_{g_{2s-1}}=~i_{g_{2s}}\ne 0\}} J'[\phi_{j_{q_1}}\ldots\phi_{j_{q_{k-2r}}}]_{T,t}^{(i_{q_1}\ldots i_{q_{k-2r}})}+$$

$$+\frac{1}{2^r}\prod_{s=1}^{r} \mathbf{1}_{\{g_{2s}=g_{2s-1}+1\}} J[\psi^{(k)}]_{T,t}^{s_r,\ldots,s_1} \quad \text{w. p. 1.} \tag{628}$$

Using (628) and the condition (386), we obtain (378). This means that we get (380). Thus the expansion (331) is proved.

Analyzing the proof of Theorems 20, 19 and taking into account the above arguments, it is easy to see that the following theorem is true.

Theorem 32 [26], [34], [72]. *Assume that the continuous functions $\psi_1(\tau),\ldots,\psi_k(\tau)$ at the interval $[t,T]$ and the complete orthonormal system $\{\phi_j(x)\}_{j=0}^{\infty}$ of functions ($\phi_0(x)=1/\sqrt{T-t}$) in the space $L_2([t,T])$ are such that the following condition*

$$\lim_{p_1,\ldots,p_k\to\infty} \sum_{j_1=0}^{p_1}\ldots\sum_{j_q=0}^{p_q}\ldots\sum_{j_k=0}^{p_k}\Biggl|_{q\ne g_1,g_2,\ldots,g_{2r-1},g_{2r}} \times$$

$$\times\left(\sum_{j_{g_1}=0}^{\min\{p_{g_1},p_{g_2}\}}\ldots\sum_{j_{g_{2r-1}}=0}^{\min\{p_{g_{2r-1}},p_{g_{2r}}\}} C_{j_k\ldots j_1}\Biggl|_{j_{g_1}=j_{g_2},\ldots,j_{g_{2r-1}}=j_{g_{2r}}} - \right.$$

$$\left. -\frac{1}{2^r}\prod_{l=1}^{r} \mathbf{1}_{\{g_{2l}=g_{2l-1}+1\}} C_{j_k\ldots j_1}\Biggl|_{(j_{g_2}j_{g_1})\curvearrowright(\cdot)\ldots(j_{g_{2r}}j_{g_{2r-1}})\curvearrowright(\cdot),j_{g_1}=~j_{g_2},\ldots,j_{g_{2r-1}}=~j_{g_{2r}}}\right)^2 = 0 \tag{629}$$

is satisfied for all $r = 1, 2, \ldots, [k/2]$. *Then, for the iterated Stratonovich stochastic integral of arbitrary multiplicity* k

$$J^*[\psi^{(k)}]_{T,t}^{(i_1\ldots i_k)} = \int\limits_t^{*T} \psi_k(t_k) \ldots \int\limits_t^{*t_2} \psi_1(t_1) d\mathbf{w}_{t_1}^{(i_1)} \ldots d\mathbf{w}_{t_k}^{(i_k)}$$

the following expansion

$$J^*[\psi^{(k)}]_{T,t}^{(i_1\ldots i_k)} = \underset{p_1,\ldots,p_k\to\infty}{\text{l.i.m.}} \sum_{j_1=0}^{p_1} \ldots \sum_{j_k=0}^{p_k} C_{j_k\ldots j_1} \prod_{l=1}^{k} \zeta_{j_l}^{(i_l)}$$

that converges in the mean-square sense is valid, where

$$C_{j_k\ldots j_1} = \int\limits_t^T \psi_k(t_k)\phi_{j_k}(t_k) \ldots \int\limits_t^{t_2} \psi_1(t_1)\phi_{j_1}(t_1) dt_1 \ldots dt_k$$

is the Fourier coefficient, l.i.m. *is a limit in the mean-square sense,* $i_1, \ldots, i_k = 0, 1, \ldots, m$,

$$\zeta_j^{(i)} = \int\limits_t^T \phi_j(\tau) d\mathbf{w}_\tau^{(i)}$$

are independent standard Gaussian random variables for various i *or* j (*in the case when* $i \neq 0$), $\mathbf{w}_\tau^{(i)} = \mathbf{f}_\tau^{(i)}$ *for* $i = 1, \ldots, m$ *and* $\mathbf{w}_\tau^{(0)} = \tau$.

Let us consider the special case $k = 2$ of Theorem 32 in more detail. In this case, the condition (629) takes the following form (compare with (53))

$$\sum_{j_1=0}^{\infty} C_{j_1 j_1} = \frac{1}{2} \int\limits_t^T \psi_1(t_1)\psi_2(t_1) dt_1. \qquad (630)$$

It is easy to see that the condition $\phi_0(x) = 1/\sqrt{T-t}$ can be omitted in Theorems 32 for the case $k = 2$ (see the proof of Theorem 20).

Summing up the above arguments, we obtain the following generalization of Theorem 2.

Theorem 33. *Suppose that* $\{\phi_j(x)\}_{j=0}^{\infty}$ *is an arbitrary complete orthonormal system of functions in the space* $L_2([t, T])$. *Moreover,* $\psi_1(\tau), \psi_2(\tau)$ *are continuous functions on* $[t, T]$. *Then, for the iterated Stratonovich stochastic integral*

$$J^*[\psi^{(2)}]_{T,t} = \int\limits_t^{*T} \psi_2(t_2) \int\limits_t^{*t_2} \psi_1(t_1) d\mathbf{f}_{t_1}^{(i_1)} d\mathbf{f}_{t_2}^{(i_2)} \quad (i_1, i_2 = 1, \ldots, m)$$

the following expansion

$$J^*[\psi^{(2)}]_{T,t} = \underset{p_1,p_2\to\infty}{\text{l.i.m.}} \sum_{j_1=0}^{p_1} \sum_{j_2=0}^{p_2} C_{j_2 j_1} \zeta_{j_1}^{(i_1)} \zeta_{j_2}^{(i_2)}$$

that converges in the mean-square sence is valid, where the notations are the same as in Theorem 2.

The condition of continuity of the functions $\psi_1(\tau), \psi_2(\tau)$ is related to the definition [2] of the Stratonovich stochastic integral that we use.

Theorem 33 can be generalized to the case $\psi_1(\tau), \psi_2(\tau) \in L_2([t, T]$ if instead of the definition from [2] we will use another definition of the Stratonovich stochastic integral (see [26] (Sect. 2.18, Theorem 2.44) for details).

Let us make some remarks about the development of the approach based on Theorem 20 and describe the algorithm of the verification of Condition 3 of Theorem 20. First, consider the case $k = 2n + 1,\ n = 3, 4, \ldots$ (k is the multiplicity of the iterated Stratonovich stochastic integral (330)). Let Conditions 1 and 2 of Theorem 20 be satisfied. Consider the equality (385). The right-hand side of (385) has the form

$$\sum_{j_{g_1}=0}^{p} \ldots \sum_{j_{g_{2r-1}}=0}^{p} C_{j_k \ldots j_1}\Biggl|_{j_{g_1}=j_{g_2},\ldots,j_{g_{2r-1}}=j_{g_{2r}}} -$$

$$-\frac{1}{2^r}\prod_{l=1}^{r} \mathbf{1}_{\{g_{2l}=g_{2l-1}+1\}} C_{j_k \ldots j_1}\Biggl|_{(j_{g_2} j_{g_1})\curvearrowright(\cdot)\ldots(j_{g_{2r}} j_{g_{2r-1}})\curvearrowright(\cdot),\, j_{g_1}=\, j_{g_2},\ldots,j_{g_{2r-1}}=\, j_{g_{2r}}}.$$

Iterated application of the formulas (456), (457), (470) separately to the values

$$\sum_{j_{g_1}=0}^{p} \ldots \sum_{j_{g_{2r-1}}=0}^{p} C_{j_k \ldots j_1}\Biggl|_{j_{g_1}=j_{g_2},\ldots,j_{g_{2r-1}}=j_{g_{2r}}}$$

and

$$\frac{1}{2^r}\prod_{l=1}^{r} \mathbf{1}_{\{g_{2l}=g_{2l-1}+1\}} C_{j_k \ldots j_1}\Biggl|_{(j_{g_2} j_{g_1})\curvearrowright(\cdot)\ldots(j_{g_{2r}} j_{g_{2r-1}})\curvearrowright(\cdot),\, j_{g_1}=\, j_{g_2},\ldots,j_{g_{2r-1}}=\, j_{g_{2r}}}$$

($g_1, g_2, \ldots, g_{2r-1}, g_{2r}$ as in (315), $r = 1, 2, \ldots, [k/2]$, $2r < k$) gives the following representation (see (386))

$$\sum_{\substack{j_1,\ldots,j_q,\ldots,j_k=0\\ q\ne g_1,g_2,\ldots,g_{2r-1},g_{2r}}}^{p}\left(\sum_{j_{g_1}=0}^{p} \ldots \sum_{j_{g_{2r-1}}=0}^{p} C_{j_k \ldots j_1}\Biggl|_{j_{g_1}=j_{g_2},\ldots,j_{g_{2r-1}}=j_{g_{2r}}} -\right.$$

$$\left.-\frac{1}{2^r}\prod_{l=1}^{r} \mathbf{1}_{\{g_{2l}=g_{2l-1}+1\}} C_{j_k \ldots j_1}\Biggl|_{(j_{g_2} j_{g_1})\curvearrowright(\cdot)\ldots(j_{g_{2r}} j_{g_{2r-1}})\curvearrowright(\cdot),\, j_{g_1}=\, j_{g_2},\ldots,j_{g_{2r-1}}=\, j_{g_{2r}}}\right)^2 \le$$

$$\le \sum_{\substack{j_1,\ldots,j_q,\ldots,j_k=0\\ q\ne g_1,g_2,\ldots,g_{2r-1},g_{2r}}}^{\infty}\left(\sum_{j_{g_1}=0}^{p} \ldots \sum_{j_{g_{2r-1}}=0}^{p} C_{j_k \ldots j_1}\Biggl|_{j_{g_1}=j_{g_2},\ldots,j_{g_{2r-1}}=j_{g_{2r}}} -\right.$$

$$\left.-\frac{1}{2^r}\prod_{l=1}^{r} \mathbf{1}_{\{g_{2l}=g_{2l-1}+1\}} C_{j_k \ldots j_1}\Biggl|_{(j_{g_2} j_{g_1})\curvearrowright(\cdot)\ldots(j_{g_{2r}} j_{g_{2r-1}})\curvearrowright(\cdot),\, j_{g_1}=\, j_{g_2},\ldots,j_{g_{2r-1}}=\, j_{g_{2r}}}\right)^2 =$$

$$
= \sum_{\substack{j_1,\ldots,j_q,\ldots,j_k=0\\ q\ne g_1,g_2,\ldots,g_{2r-1},g_{2r}}}^{\infty} \Biggl(\int\limits_{[t,T]^{k-2r}} R_p(t_1,\ldots,t_{g_1-1},t_{g_1+1},\ldots,t_{g_{2r}-1},t_{g_{2r}+1},\ldots,t_k)\times
$$

$$
\times \prod_{\substack{q=1\\ q\ne g_1,g_2,\ldots,g_{2r-1},g_{2r}}}^{k} \psi_q(t_q)\phi_{j_q}(t_q)\ dt_1\ldots dt_{g_1-1}dt_{g_1+1}\ldots dt_{g_{2r}-1}dt_{g_{2r}+1}\ldots dt_k \Biggr)^2, \tag{631}
$$

where

$$
R_p(t_1,\ldots,t_{g_1-1},t_{g_1+1},\ldots,t_{g_{2r}-1},t_{g_{2r}+1},\ldots,t_k) =
$$

$$
= \sum_{d=1}^{4^r} \bar{R}_p^{(d)}(t_1,\ldots,t_{g_1-1},t_{g_1+1},\ldots,t_{g_{2r}-1},t_{g_{2r}+1},\ldots,t_k) -
$$

$$
- \sum_{d=1}^{2^r} \tilde{R}_p^{(d)}(t_1,\ldots,t_{g_1-1},t_{g_1+1},\ldots,t_{g_{2r}-1},t_{g_{2r}+1},\ldots,t_k) \in L_2([t,T]^{k-2r})
$$

and

$$
\int\limits_{[t,T]^{k-2r}} R_p(t_1,\ldots,t_{g_1-1},t_{g_1+1},\ldots,t_{g_{2r}-1},t_{g_{2r}+1},\ldots,t_k)\times
$$

$$
\times \prod_{\substack{q=1\\ q\ne g_1,g_2,\ldots,g_{2r-1},g_{2r}}}^{k} \psi_q(t_q)\phi_{j_q}(t_q)\ dt_1\ldots dt_{g_1-1}dt_{g_1+1}\ldots dt_{g_{2r}-1}dt_{g_{2r}+1}\ldots dt_k
$$

is the Fourier coefficient of

$$
\hat{R}_p(t_1,\ldots,t_{g_1-1},t_{g_1+1},\ldots,t_{g_{2r}-1},t_{g_{2r}+1},\ldots,t_k) =
$$

$$
= R_p(t_1,\ldots,t_{g_1-1},t_{g_1+1},\ldots,t_{g_{2r}-1},t_{g_{2r}+1},\ldots,t_k) \prod_{\substack{q=1\\ q\ne g_1,g_2,\ldots,g_{2r-1},g_{2r}}}^{k} \psi_q(t_q).
$$

Also note that some of the functions

$$
\bar{R}_p^{(d)}(t_1,\ldots,t_{g_1-1},t_{g_1+1},\ldots,t_{g_{2r}-1},t_{g_{2r}+1},\ldots,t_k)
$$

and

$$
\tilde{R}_p^{(d)}(t_1,\ldots,t_{g_1-1},t_{g_1+1},\ldots,t_{g_{2r}-1},t_{g_{2r}+1},\ldots,t_k)
$$

can be identically equal to zero.

Obviously, we could use another representation for the function

$$R_p(t_1,\ldots,t_{g_1-1},t_{g_1+1},\ldots,t_{g_{2r}-1},t_{g_{2r}+1},\ldots,t_k) \tag{632}$$

based on the left-hand side of the equality (385) and (456), (457), (470) (see Sect. 13, 16 for details). In Sect. 16, we considered the function (632) in detail for the case $k\ge 5$, $r=1$.

Parseval's equality gives

$$\sum_{\substack{j_1,\ldots,j_q,\ldots,j_k=0\\ q\ne g_1,g_2,\ldots,g_{2r-1},g_{2r}}}^{\infty}\Biggl(\int\limits_{[t,T]^{k-2r}} R_p(t_1,\ldots,t_{g_1-1},t_{g_1+1},\ldots,t_{g_{2r}-1},t_{g_{2r}+1},\ldots,t_k)\times$$

$$\times\prod_{\substack{q=1\\ q\ne g_1,g_2,\ldots,g_{2r-1},g_{2r}}}^{k}\psi_q(t_q)\phi_{j_q}(t_q)\ dt_1\ldots dt_{g_1-1}dt_{g_1+1}\ldots dt_{g_{2r}-1}dt_{g_{2r}+1}\ldots dt_k\Biggr)^2=$$

$$=\int\limits_{[t,T]^{k-2r}}\left(\hat R_p(t_1,\ldots,t_{g_1-1},t_{g_1+1},\ldots,t_{g_{2r}-1},t_{g_{2r}+1},\ldots,t_k)\right)^2\times$$

$$\times dt_1\ldots dt_{g_1-1}dt_{g_1+1}\ldots dt_{g_{2r}-1}dt_{g_{2r}+1}\ldots dt_k=$$

$$=\left\|\hat R_p\right\|^2_{L_2([t,T]^{k-2r})}. \tag{633}$$

Combining (631) and (633), we obtain

$$\sum_{\substack{j_1,\ldots,j_q,\ldots,j_k=0\\ q\ne g_1,g_2,\ldots,g_{2r-1},g_{2r}}}^{p}\Biggl(\sum_{j_{g_1}=0}^{p}\ldots\sum_{j_{g_{2r-1}}=0}^{p}C_{j_k\ldots j_1}\Bigr|_{j_{g_1}=j_{g_2},\ldots,j_{g_{2r-1}}=j_{g_{2r}}}-$$

$$-\frac{1}{2^r}\prod_{l=1}^{r}\mathbf{1}_{\{g_{2l}=g_{2l-1}+1\}}C_{j_k\ldots j_1}\Bigr|_{(j_{g_2}j_{g_1})\curvearrowright(\cdot)\ldots(j_{g_{2r}}j_{g_{2r-1}})\curvearrowright(\cdot),\,j_{g_1}=\,j_{g_2},\ldots,j_{g_{2r-1}}=\,j_{g_{2r}}}\Biggr)^2\le$$

$$\le\left\|\hat R_p\right\|^2_{L_2([t,T]^{k-2r})}. \tag{634}$$

Assume that we have succeeded in proving the following equality

$$\lim_{p\to\infty}\left\|\hat R_p\right\|^2_{L_2([t,T]^{k-2r})}=0. \tag{635}$$

Applying (634) and (635), we get (compare with (386))

$$\lim_{p\to\infty}\sum_{\substack{j_1,\ldots,j_q,\ldots,j_k=0\\ q\ne g_1,g_2,\ldots,g_{2r-1},g_{2r}}}^{p}\left(\sum_{j_{g_1}=0}^{p}\ldots\sum_{j_{g_{2r-1}}=0}^{p}C_{j_k\ldots j_1}\Biggl|_{j_{g_1}=j_{g_2},\ldots,j_{g_{2r-1}}=j_{g_{2r}}}-\right.$$

$$-\frac{1}{2^r}\prod_{l=1}^{r}\mathbf{1}_{\{g_{2l}=g_{2l-1}+1\}}C_{j_k\ldots j_1}\Biggl|_{(j_{g_2}j_{g_1})\frown(\cdot)\ldots(j_{g_{2r}}j_{g_{2r-1}})\frown(\cdot),j_{g_1}=\,j_{g_2},\ldots,j_{g_{2r-1}}=\,j_{g_{2r}}}\left.\vphantom{\sum}\right)^2=0. \tag{636}$$

As noted in Sect. 13, Condition 3 of Theorem 20 can be replaced by a weaker condition (386) (or (636)). Also Condition 3 of Theorem 20 can be replaced by (635). From (636) we obviously obtain

$$\lim_{p\to\infty}\sum_{j_{g_1}=0}^{p}\ldots\sum_{j_{g_{2r-1}}=0}^{p}C_{j_k\ldots j_1}\Biggl|_{j_{g_1}=j_{g_2},\ldots,j_{g_{2r-1}}=j_{g_{2r}}}=$$

$$=\frac{1}{2^r}\prod_{l=1}^{r}\mathbf{1}_{\{g_{2l}=g_{2l-1}+1\}}C_{j_k\ldots j_1}\Biggl|_{(j_{g_2}j_{g_1})\frown(\cdot)\ldots(j_{g_{2r}}j_{g_{2r-1}})\frown(\cdot),j_{g_1}=\,j_{g_2},\ldots,j_{g_{2r-1}}=\,j_{g_{2r}}}. \tag{637}$$

According to (385), the equality (637) will be satisfied if

$$\lim_{p\to\infty}S_{l_1}S_{l_2}\ldots S_{l_d}\left\{\bar{C}^{(p)}_{j_k\ldots j_q\ldots j_1}\Biggl|_{q\ne g_1,g_2,\ldots,g_{2r-1},g_{2r}}\right\}=0, \tag{638}$$

where $g_1,g_2,\ldots,g_{2r-1},g_{2r}$ as in (315), $l_1,l_2,\ldots,l_d$ such that $l_1,l_2,\ldots,l_d\in\{1,2,\ldots,r\}$, $l_1>l_2>\ldots>l_d$, $d=0,1,2,\ldots,r-1$, $r=1,2,\ldots,[k/2]$,

$$S_{l_1}S_{l_2}\ldots S_{l_d}\left\{\bar{C}^{(p)}_{j_k\ldots j_q\ldots j_1}\Biggl|_{q\ne g_1,g_2,\ldots,g_{2r-1},g_{2r}}\right\}\stackrel{\mathsf{def}}{=}\bar{C}^{(p)}_{j_k\ldots j_q\ldots j_1}\Biggl|_{q\ne g_1,g_2,\ldots,g_{2r-1},g_{2r}}$$

for $d=0$, where

$$\bar{C}^{(p)}_{j_k\ldots j_q\ldots j_1}\Biggl|_{q\ne g_1,g_2,\ldots,g_{2r-1},g_{2r}},\quad S_l\left\{\bar{C}^{(p)}_{j_k\ldots j_q\ldots j_1}\Biggl|_{q\ne g_1,g_2,\ldots,g_{2r-1},g_{2r}}\right\}$$

are defined by (325), (326), $l=1,2,\ldots,r$ (see Sect. 13 for details).

Let us make some remarks about the function (632) for the case $k>5$, $r=2$. In this case, using the left-hand side of the equality (385) and (456), (457), (470), we represent the function (632) as the sum of several functions. In particular, among these functions will be the following functions

$$Q_p(t_1,\ldots,t_{s-1},t_{s+1},\ldots,t_{l-1},t_{l+1},\ldots,t_{q-1},t_{q+1},\ldots,t_{g-1},t_{g+1},\ldots,t_k)=$$

$$=\mathbf{1}_{\{t_1<\ldots<t_{s-1}<t_{s+1}<\ldots<t_{l-1}<t_{l+1}<\ldots<t_{q-1}<t_{q+1}<\ldots<t_{g-1}<t_{g+1}<\ldots<t_k\}}\times$$

$$\times \sum_{j_l=p+1}^{\infty} \int\limits_t^{t_{s+1}} \psi_s(\tau)\phi_{j_l}(\tau)d\tau \int\limits_t^{t_{l-1}} \psi_l(\tau)\phi_{j_l}(\tau)d\tau \times$$

$$\times \sum_{j_q=p+1}^{\infty} \int\limits_t^{t_{q+1}} \psi_q(\tau)\phi_{j_q}(\tau)d\tau \int\limits_t^{t_{g-1}} \psi_g(\tau)\phi_{j_q}(\tau)d\tau, \tag{639}$$

$$\bar{Q}_p(t_1,\ldots,t_{l-2},t_{l+3},\ldots,t_k) = \mathbf{1}_{\{t_1<\ldots<t_{l-2}<t_{l+3}<\ldots<t_k\}}\times$$

$$\times \sum_{j_l=p+1}^{\infty} \left(\int\limits_t^{t_{l-2}} \psi_{l-1}(\theta)\phi_{j_l}(\theta)\int\limits_t^{\theta} \psi_l(u)\phi_{j_l}(u)dud\theta\right)\times$$

$$\times \sum_{j_q=p+1}^{\infty} \left(\int\limits_t^{t_{l-2}} \psi_{l+1}(\theta)\phi_{j_q}(\theta)\int\limits_t^{\theta} \psi_{l+2}(u)\phi_{j_q}(u)dud\theta\right), \tag{640}$$

$$\tilde{Q}_p(t_1,\ldots,t_{l-2},t_{l+3},\ldots,t_k) = \mathbf{1}_{\{t_1<\ldots<t_{l-2}<t_{l+3}<\ldots<t_k\}}\times$$

$$\times \sum_{j_l=p+1}^{\infty}\sum_{j_q=p+1}^{\infty} \int\limits_t^{t_{l+3}} \psi_{l+1}(\tau)\phi_{j_q}(\tau)\left(\int\limits_t^{\tau} \psi_{l-1}(\theta)\phi_{j_l}(\theta)\int\limits_t^{\theta} \psi_l(u)\phi_{j_l}(u)dud\theta\right)\times$$

$$\times \int\limits_t^{\tau} \psi_{l+2}(u)\phi_{j_q}(u)dud\tau, \tag{641}$$

$$\hat{Q}_p(t_1,\ldots,t_{l-1},t_{l+2},\ldots,t_{q-1},t_{q+2},\ldots,t_k) =$$

$$= \mathbf{1}_{\{t_1<\ldots<t_{l-1}<t_{l+2}<\ldots<t_{q-1}<t_{q+2}<\ldots<t_k\}}\times$$

$$\times \sum_{j_l=p+1}^{\infty}\sum_{j_{l+1}=p+1}^{\infty} \left(\int\limits_t^{t_{l+2}} \psi_{l+1}(\theta)\phi_{j_{l+1}}(\theta)\int\limits_t^{\theta} \psi_l(u)\phi_{j_l}(u)dud\theta\right)\times$$

$$\times \left(\int\limits_t^{t_{q+2}} \psi_{q+1}(\theta)\phi_{j_{l+1}}(\theta)\int\limits_t^{\theta} \psi_q(u)\phi_{j_l}(u)dud\theta\right). \tag{642}$$

Note that the pairs (g_1,g_2), (g_3,g_4) for the functions (640) and (641) have the property: $g_2 = g_1+1$, $g_4 = g_3+1$, $g_3 = g_2+1$. At the same time, the pairs (g_1,g_2), (g_3,g_4) for the function (639) have the following property: $g_2 > g_1+1$, $g_4 > g_3+1$, $g_3 \ge g_2+1$. For the function (642), the pairs (g_1,g_2), (g_3,g_4) chosen as follows: $g_2 > g_1+1$, $g_4 > g_3+1$, $g_4 = g_2+1$, $g_3 = g_1+1$. Generally speaking, all possible pairs (g_1,g_2), (g_3,g_4) must be considered. We consider the functions (639)–(642) only as an example.

Suppose that $s+1=l-1$, $l+1=q-1$, $q+1=g-1$ in (639). Let us show that (we consider the case of Legendre polynomials; the trigonometric case is simpler and can be considered similarly)

$$\lim_{p\to\infty}\left\|Q_p\right\|^2_{L_2([t,T]^{k-4})}=0, \tag{643}$$

$$\lim_{p\to\infty}\left\|\bar Q_p\right\|^2_{L_2([t,T]^{k-4})}=0, \tag{644}$$

$$\lim_{p\to\infty}\left\|\tilde Q_p\right\|^2_{L_2([t,T]^{k-4})}=0, \tag{645}$$

$$\lim_{p\to\infty}\left\|\hat Q_p\right\|^2_{L_2([t,T]^{k-4})}=0. \tag{646}$$

First consider the proof of (643). We have ($s+1=l-1$, $l+1=q-1$, $q+1=g-1$)

$$\left(Q_p(t_1,\ldots,t_{l-3},t_{l-1},t_{l+1},t_{l+3},t_{l+5},\ldots,t_k)\right)^2=$$

$$=\mathbf{1}_{\{t_1<\ldots<t_{l-3}<t_{l-1}<t_{l+1}<t_{l+3}<t_{l+5}<\ldots<t_k\}}\times$$

$$\times\left(\sum_{j_l=p+1}^{\infty}\int\limits_t^{t_{l-1}}\psi_{l-2}(\tau)\phi_{j_l}(\tau)d\tau\int\limits_t^{t_{l-1}}\psi_l(\tau)\phi_{j_l}(\tau)d\tau\times\right.$$

$$\left.\times\sum_{j_q=p+1}^{\infty}\int\limits_t^{t_{l+3}}\psi_{l+2}(\tau)\phi_{j_q}(\tau)d\tau\int\limits_t^{t_{l+3}}\psi_{l+4}(\tau)\phi_{j_q}(\tau)d\tau\right)^2. \tag{647}$$

Using the estimate (406), we obtain

$$\left|\int\limits_t^{s}\psi(\tau)\phi_j(\tau)d\tau\right|<\frac{K}{j^{1-\varepsilon/2}(1-z^2(s))^{1/4-\varepsilon/4}}, \tag{648}$$

where $j\in\mathbb{N}$, $s\in(t,T)$, $z(s)$ is defined by (26), $\varepsilon\in(0,1)$, constant K does not depend on j, $\{\phi_j(x)\}_{j=0}^{\infty}$ is a complete orthonormal system of Legendre polynomials in the space $L_2([t,T])$, $\psi(\tau)$ is a continuously differentiable nonrandom function on $[t,T]$.

Applying (648) and (409) (we take ε instead of $\varepsilon/2$ in (409)), we get

$$\left(\sum_{j_l=p+1}^{\infty}\int\limits_t^{t_{l-1}}\psi_{l-2}(\tau)\phi_{j_l}(\tau)d\tau\int\limits_t^{t_{l-1}}\psi_l(\tau)\phi_{j_l}(\tau)d\tau\times\right.$$

$$\left.\times\sum_{j_q=p+1}^{\infty}\int\limits_t^{t_{l+3}}\psi_{l+2}(\tau)\phi_{j_q}(\tau)d\tau\int\limits_t^{t_{l+3}}\psi_{l+4}(\tau)\phi_{j_q}(\tau)d\tau\right)^2\le$$

$$\leq \frac{K_1}{p^{4(1-\varepsilon)}(1-z^2(t_{l-1}))^{1-\varepsilon}(1-z^2(t_{l+3}))^{1-\varepsilon}}, \tag{649}$$

where $t_{l-1}, t_{l+3} \in (t, T)$, constant K_1 is independent of p. Combining (647) and (649), we have (643).

Let us prove (644). Applying the estimate (405) in (311) and taking into account the boundedness of the functions $\psi_1(\tau)$, $\psi_2(\tau)$ and their derivatives, we obtain

$$\left|\sum_{j=m+1}^{n} C_{jj}(s)\right| \leq C_1\left(\frac{1}{n^{1-\varepsilon}}+\frac{1}{m^{1-\varepsilon}}\right)\int\limits_{-1}^{z(s)}\frac{dx}{\left(1-x^2\right)^{1/2-\varepsilon/2}}+$$

$$+C_2\sum_{j=m+1}^{n}\frac{1}{j^{2-\varepsilon}}\left(\int\limits_{-1}^{z(s)}\frac{dy}{\left(1-y^2\right)^{1/2-\varepsilon/2}}+\frac{1}{\left(1-z^2(s)\right)^{1/4-\varepsilon/4}}\int\limits_{-1}^{z(s)}\frac{dy}{\left(1-y^2\right)^{1/4-\varepsilon/4}}+\right.$$

$$\left.+\int\limits_{-1}^{z(s)}\frac{1}{\left(1-y^2\right)^{1/4-\varepsilon/4}}\int\limits_{y}^{z(s)}\frac{dx}{\left(1-x^2\right)^{1/4-\varepsilon/4}}dy\right), \tag{650}$$

where

$$C_{jj}(s)=\int\limits_{t}^{s}\psi_2(\tau)\phi_j(\tau)\int\limits_{t}^{\tau}\psi_1(\theta)\phi_j(\theta)d\theta d\tau,$$

$s \in (t, T)$, constants C_1, C_2 do not depend on n and m.

From (650) we have

$$\left|\sum_{j=m+1}^{\infty} C_{jj}(s)\right| \leq \frac{K_1}{m^{1-\varepsilon}}+K_2\sum_{j=m+1}^{\infty}\frac{1}{j^{2-\varepsilon}}\left(1+\frac{1}{\left(1-z^2(s)\right)^{1/4-\varepsilon/4}}\right), \tag{651}$$

where $s \in (t, T)$, constants K_1, K_2 do not depend on m.

Applying (409) (we take ε instead of $\varepsilon/2$ in (409)) in (651), we get

$$\left|\sum_{j=m+1}^{\infty} C_{jj}(s)\right| \leq \frac{K}{m^{1-\varepsilon}\left(1-z^2(s)\right)^{1/4-\varepsilon/4}}, \tag{652}$$

where $s \in (t, T)$, constant K is independent of m.

Using the estimate (652), we obtain (see (640))

$$\left(\bar{Q}_p(t_1,\ldots,t_{l-2},t_{l+3},\ldots,t_k)\right)^2 = \mathbf{1}_{\{t_1<\ldots<t_{l-2}<t_{l+3}<\ldots<t_k\}}\times$$

$$\times\left(\sum_{j_l=p+1}^{\infty}\left(\int\limits_{t}^{t_{l-2}}\psi_{l-1}(\theta)\phi_{j_l}(\theta)\int\limits_{t}^{\theta}\psi_l(u)\phi_{j_l}(u)dud\theta\right)\times\right.$$

$$\times\sum_{j_q=p+1}^{\infty}\left(\int\limits_t^{t_{l-2}}\psi_{l+1}(\theta)\phi_{j_q}(\theta)\int\limits_t^{\theta}\psi_{l+2}(u)\phi_{j_q}(u)dud\theta\right)\Biggr)^2\le$$

$$\le\frac{K_1}{p^{4(1-\varepsilon)}(1-z^2(t_{l-2}))^{1-\varepsilon}},\qquad (653)$$

where $t_{l-2}\in(t,T)$, constant K_1 is independent of p. The inequality (653) completes the proof of (644).

Let us prove (645). Applying (310) in (641), we get

$$\left(\tilde{Q}_p(t_1,\ldots,t_{l-2},t_{l+3},\ldots,t_k)\right)^2\le$$

$$\le\Biggl(\sum_{j_l=p+1}^{\infty}\sum_{j_q=p+1}^{\infty}\int\limits_t^{t_{l+3}}\psi_{l+1}(\tau)\phi_{j_q}(\tau)\left(\int\limits_t^{\tau}\psi_{l-1}(\theta)\phi_{j_l}(\theta)\int\limits_t^{\theta}\psi_l(u)\phi_{j_l}(u)dud\theta\right)\times$$

$$\times\int\limits_t^{\tau}\psi_{l+2}(u)\phi_{j_q}(u)dud\tau\Biggr)^2=$$

$$=\Biggl(\frac{1}{2}\sum_{j_l=p+1}^{\infty}\int\limits_t^{t_{l+3}}\psi_{l+1}(\tau)\left(\int\limits_t^{\tau}\psi_{l-1}(\theta)\phi_{j_l}(\theta)\int\limits_t^{\theta}\psi_l(u)\phi_{j_l}(u)dud\theta\right)\psi_{l+2}(\tau)d\tau-$$

$$-\sum_{j_q=0}^{p}\int\limits_t^{t_{l+3}}\psi_{l+1}(\tau)\phi_{j_q}(\tau)\sum_{j_l=p+1}^{\infty}\left(\int\limits_t^{\tau}\psi_{l-1}(\theta)\phi_{j_l}(\theta)\int\limits_t^{\theta}\psi_l(u)\phi_{j_l}(u)dud\theta\right)\times$$

$$\times\int\limits_t^{\tau}\psi_{l+2}(u)\phi_{j_q}(u)dud\tau\Biggr)^2=$$

$$=(a-b)^2\le 2(|a|^2+|b|^2).\qquad (654)$$

Further, we have

$$|a|\le\frac{1}{2}\int\limits_t^{t_{l+3}}|\psi_{l+1}(\tau)|\left|\sum_{j_l=p+1}^{\infty}\int\limits_t^{\tau}\psi_{l-1}(\theta)\phi_{j_l}(\theta)\int\limits_t^{\theta}\psi_l(u)\phi_{j_l}(u)dud\theta\right||\psi_{l+2}(\tau)|\,d\tau,\qquad (655)$$

$$|b|\le\sum_{j_q=0}^{p}\int\limits_t^{t_{l+3}}|\psi_{l+1}(\tau)\phi_{j_q}(\tau)|\left|\sum_{j_l=p+1}^{\infty}\int\limits_t^{\tau}\psi_{l-1}(\theta)\phi_{j_l}(\theta)\int\limits_t^{\theta}\psi_l(u)\phi_{j_l}(u)dud\theta\right|\times$$

$$\times \left| \int\limits_t^{\tau} \psi_{l+2}(u)\phi_{j_q}(u)du \right| d\tau. \tag{656}$$

Combining (652) and (655), we obtain

$$|a| \le \frac{C}{p^{1-\varepsilon}}, \tag{657}$$

where constant C is independent of p.

Separating in (656) the term with the number $j_q = 0$ and then applying (89), (87), (652), we obtain

$$|b| \le \frac{K}{p^{1-\varepsilon}} \left(\int\limits_t^{t_{l+3}} \frac{d\tau}{\left(1-z^2(\tau)\right)^{1/2-\varepsilon/4}} + \sum_{j_q=1}^{p} \frac{1}{j_q} \int\limits_t^{t_{l+3}} \frac{d\tau}{\left(1-z^2(\tau)\right)^{3/4-\varepsilon/4}} \right) \le$$

$$\le \frac{K_1}{p^{1-\varepsilon}} \left(1 + \sum_{j_q=1}^{p} \frac{1}{j_q} \right) \le \frac{K_1}{p^{1-\varepsilon}} \left(2 + \int\limits_1^p \frac{dx}{x} \right) =$$

$$= \frac{K_1\left(2 + lnp\right)}{p^{1-\varepsilon}} \ \to \ 0 \tag{658}$$

if $p \to \infty$. The estimates (654), (657), (658) complete the proof of (645).

Finally, consider the proof of (646). Using the elementary inequality $|ab| \le (a^2+b^2)/2$ and Parseval's equality, we have

$$\left(\hat{Q}_p(t_1,\ldots,t_{l-1},t_{l+2},\ldots,t_{q-1},t_{q+2},\ldots,t_k)\right)^2 \le$$

$$\le \left(\sum_{j_l=p+1}^{\infty} \sum_{j_{l+1}=p+1}^{\infty} \left| \int\limits_t^{t_{l+2}} \psi_{l+1}(\theta)\phi_{j_{l+1}}(\theta) \int\limits_t^{\theta} \psi_l(u)\phi_{j_l}(u)dud\theta \right| \times \right.$$

$$\left. \times \left| \int\limits_t^{t_{q+2}} \psi_{q+1}(\theta)\phi_{j_{l+1}}(\theta) \int\limits_t^{\theta} \psi_q(u)\phi_{j_l}(u)dud\theta \right| \right)^2 \le$$

$$\le \frac{1}{4} \left(\sum_{j_l=p+1}^{\infty} \sum_{j_{l+1}=p+1}^{\infty} \left(\int\limits_t^{t_{l+2}} \psi_{l+1}(\theta)\phi_{j_{l+1}}(\theta) \int\limits_t^{\theta} \psi_l(u)\phi_{j_l}(u)dud\theta \right)^2 + \right.$$

$$\left. + \sum_{j_l=p+1}^{\infty} \sum_{j_{l+1}=p+1}^{\infty} \left(\int\limits_t^{t_{q+2}} \psi_{q+1}(\theta)\phi_{j_{l+1}}(\theta) \int\limits_t^{\theta} \psi_q(u)\phi_{j_l}(u)dud\theta \right)^2 \right)^2 \le$$

$$\leq \frac{1}{4}\left(\sum_{j_l=p+1}^{\infty}\sum_{j_{l+1}=0}^{\infty}\left(\int\limits_t^{t_{l+2}}\psi_{l+1}(\theta)\phi_{j_{l+1}}(\theta)\int\limits_t^{\theta}\psi_l(u)\phi_{j_l}(u)dud\theta\right)^2+\right.$$

$$\left.+\sum_{j_l=p+1}^{\infty}\sum_{j_{l+1}=0}^{\infty}\left(\int\limits_t^{t_{q+2}}\psi_{q+1}(\theta)\phi_{j_{l+1}}(\theta)\int\limits_t^{\theta}\psi_q(u)\phi_{j_l}(u)dud\theta\right)^2\right)^2\leq$$

$$\leq \frac{1}{4}\left(\sum_{j_l=p+1}^{\infty}\int\limits_t^{t_{l+2}}\psi_{l+1}^2(\theta)\left(\int\limits_t^{\theta}\psi_l(u)\phi_{j_l}(u)du\right)^2d\theta+\right.$$

$$\left.+\sum_{j_l=p+1}^{\infty}\int\limits_t^{t_{q+2}}\psi_{q+1}^2(\theta)\left(\int\limits_t^{\theta}\psi_q(u)\phi_{j_l}(u)du\right)^2d\theta\right)^2. \qquad (659)$$

From (659) and (31), (87) we obtain

$$\left(\hat{Q}_p(t_1,\ldots,t_{l-1},t_{l+2},\ldots,t_{q-1},t_{q+2},\ldots,t_k)\right)^2\leq$$

$$\leq \frac{K}{p^2}\ \to\ 0$$

if $p\to\infty$, where constant K does not depend on p. Thus the equalities (643)–(646) are proved.

Recall that the function (632) (this function is defined using the left-hand side of the equality (385)) for the case $k>5,\ r=2$ is represented as the sum of several functions. Four of them, namely Q_p, $\bar{Q}_p$, $\tilde{Q}_p$, $\hat{Q}_p$ (these functions correspond to the particular case of choosing the pairs (g_1,g_2), (g_3,g_4); generally speaking, all possible pairs (g_1,g_2), (g_3,g_4) must be considered), have been studied above. Absolutely similarly, we can consider the remaining functions (for all possible pairs (g_1,g_2), (g_3,g_4)) whose sum is the function (632) for the case $k>5,\ r=2$. As a result, we will have

$$\lim_{p\to\infty}\left\|\hat{R}_p\right\|^2_{L_2([t,T]^{k-2r})}=0\quad (k>5,\ r=2).$$

After that, we can go to the function (632) for the case $k>5,\ r=3,\ 2r<k$ (this function is defined using the left-hand side of the equality (385)) and follow the same steps as above. This will lead us to the following equality

$$\lim_{p\to\infty}\left\|\hat{R}_p\right\|^2_{L_2([t,T]^{k-2r})}=0\quad (k>5,\ r=3,\ 2r<k).$$

Then we can move on to the next step and so on. As a result, we get the equality (635) ($r=1,2,\ldots,[k/2]$). Thus the condition (386) is satisfied for the case $k=2n+1,\ n=3,4,\ldots$ (recall that the condition (386) is weaker than Condition 3 of Theorem 20 and the condition (386) can be used in Theorem 20 instead of Condition 3).

For the case $k=2n,\ n=3,4,\ldots$ we follow the above steps for $r=1,2,\ldots,[k/2]-1$ $(2r\leq k-2)$. For $2r=k$ we use the same technique as in the proof of the equalities (418)–(420). Recall that we used (354), (361) and Parseval's equality in the proof of (418)–(420).

The obvious disadvantage of the proposed algorithm is the drastic increase of complexity of the proof when moving from $r = 1$ to $r = 2$, $r = 2$ to $r = 3$ and so on.

The proofs of Theorems 24 and 25 contain a rather simple trick of passing from $r = 1$ to $r = 2$. Unfortunately, this procedure cannot be applied already at the transition from $r = 2$ to $r = 3$.

Note that the case $k = 6$, $r = 3$ was successfully considered in Theorem 30 under the following simplifying assumption: $\psi_1(\tau), \ldots, \psi_6(\tau) \equiv 1$.

Nevertheless, the results obtained in this paper are quite sufficient for practical needs (see Chapters 4 and 5 [26] for details).

EXPANSION OF ITERATED STRATONOVICH STOCHASTIC INTEGRALS OF MULTIPLICITY 3 BASED ON GENERALIZED MULTIPLE FOURIER SERIES CONVERGING IN THE MEAN: GENERAL CASE OF SERIES SUMMATION

DMITRIY F. KUZNETSOV

Abstract. The article is devoted to the development of the method of expansion and mean-square approximation of iterated Ito stochastic integrals based on generalized multiple Fourier series converging in the mean. We adapt this method for iterated Stratonovich stochastic integrals of multiplicity 3 from the Taylor–Stratonovich expansion. The main result of the article has been derived using the triple Fourier–Legendre series and triple trigonometric Fourier series for the general case of series summation. Some recent results on the expansion of iterated Stratonovich stochastic integrals of multiplicities 3 to 6 are given. The results of the article can be applied to the numerical integration of Ito stochastic differential equations in accordance with the strong criterion of convergence.

Contents

Mathematics Subject Classification: 60H05, 60H10, 42B05, 42C10.
Keywords: Iterated Ito stochastic integral, Iterated Stratonovich stochastic integral, Generalized multiple Fourier series, Multiple Fourier–Legendre series, Multiple trigonometric Fourier series, Legendre Polynomial, Mean-square approximation, Expansion.

1. Introduction

Let $(\Omega, \mathrm{F}, \mathsf{P})$ be a complete probability space, let $\{\mathrm{F}_t, t \in [0,T]\}$ be a nondecreasing right-continous family of σ-algebras of F, and let $\mathbf{f}_t$ be a standard m-dimensional Wiener stochastic process, which is F_t-measurable for any $t \in [0,T]$. We assume that the components $\mathbf{f}_t^{(i)}$ $(i = 1, \ldots, m)$ of this process are independent. Consider an Ito stochastic differential equation (SDE) in the integral form

$$\mathbf{x}_t = \mathbf{x}_0 + \int\limits_0^t \mathbf{a}(\mathbf{x}_\tau, \tau) d\tau + \int\limits_0^t B(\mathbf{x}_\tau, \tau) d\mathbf{f}_\tau, \quad \mathbf{x}_0 = \mathbf{x}(0, \omega). \tag{1}$$

Here $\mathbf{x}_t$ is some n-dimensional stochastic process satisfying the equation (1). The non-random functions $\mathbf{a} : \mathbb{R}^n \times [0,T] \to \mathbb{R}^n$, $B : \mathbb{R}^n \times [0,T] \to \mathbb{R}^{n \times m}$ guarantee the existence and uniqueness up to stochastic equivalence of a solution of (1) [1]. The second integral on the right-hand side of (1) is interpreted as an Ito stochastic integral. Let $\mathbf{x}_0$ be an n-dimensional random variable, which is F_0-measurable and $\mathsf{M}\{|\mathbf{x}_0|^2\} < \infty$ (M denotes a mathematical expectation). We assume that $\mathbf{x}_0$ and $\mathbf{f}_t - \mathbf{f}_0$ are independent when $t > 0$.

It is well known that one of the effective approaches to the numerical integration of Ito SDEs is an approach based on the Taylor–Ito and Taylor–Stratonovich expansions [2]-[5]. The most important feature of such expansions is a presence in them of the so-called iterated Ito and Stratonovich stochastic integrals, which play the key role for solving the problem of numerical integration of Ito SDEs and have the following form

$$J[\psi^{(k)}]_{T,t} = \int\limits_t^T \psi_k(t_k) \ldots \int\limits_t^{t_2} \psi_1(t_1) d\mathbf{w}_{t_1}^{(i_1)} \ldots d\mathbf{w}_{t_k}^{(i_k)}, \tag{2}$$

$$J^*[\psi^{(k)}]_{T,t} = \int\limits_t^{*T} \psi_k(t_k) \ldots \int\limits_t^{*t_2} \psi_1(t_1) d\mathbf{w}_{t_1}^{(i_1)} \ldots d\mathbf{w}_{t_k}^{(i_k)}, \tag{3}$$

where every $\psi_l(\tau)$ $(l = 1, \ldots, k)$ is a non-random function on $[t,T]$, $\mathbf{w}_\tau^{(i)} = \mathbf{f}_\tau^{(i)}$ for $i = 1, \ldots, m$ and $\mathbf{w}_\tau^{(0)} = \tau$, and

$$\int \text{ and } \int\limits^{*}$$

denote Ito and Stratonovich stochastic integrals, respectively; $i_1, \ldots, i_k = 0, 1, \ldots, m$. In this paper we use the definition of the Stratonovich stochastic integral from [2].

Note that $\psi_l(\tau) \equiv 1$ $(l = 1, \ldots, k)$ and $i_1, \ldots, i_k = 0, 1, \ldots, m$ in [2]-[5]. At the same time $\psi_l(\tau) \equiv (t - \tau)^{q_l}$ $(l = 1, \ldots, k;\ q_1, \ldots, q_k = 0, 1, 2, \ldots)$ and $i_1, \ldots, i_k = 1, \ldots, m$ in [6]-[27].

The construction of effective expansions (that converge in the mean-square sense) for the iterated Stratonovich stochastic integrals (3) of multiplicity 3 composes the subject of this article.

The problem of effective jointly numerical modeling (in accordance with the mean-square convergence criterion) of iterated Ito and Stratonovich stochastic integrals (2) and (3) is difficult from theoretical and computing point of view [2]-[61]. The only exception is connected with a narrow particular case, when $i_1 = \ldots = i_k \neq 0$ and $\psi_1(\tau), \ldots, \psi_k(\tau) \equiv \psi(\tau)$. This case allows the investigation with using the Ito formula [2]-[5].

Seems that iterated stochastic integrals can be approximated by multiple integral sums of different types [3], [5], [58]. However, this approach implies partitioning of the integration interval $[t,T]$ of iterated stochastic integrals (the length $T - t$ of this interval is a rather small value, because it is the integration step of numerical methods for Ito SDEs) and according to numerical experiments this additional partitioning leads to unacceptably high computational cost and accumulation of computation errors [10].

In [3] (also see [2], [4], [5], [59], [60]) Milstein G.N. proposed to expand (2), (3) into iterated series of products of standard Gaussian random variables by representing the Brownian bridge process as the trigonometric Fourier series with random coefficients (version of the so-called Karhunen–Loeve expansion). To obtain the Milstein expansion of (3), the truncated Fourier expansions of components of the Wiener process $\mathbf{f}_s$ must be iteratively substituted in the single integrals, and the integrals must be calculated, starting from the innermost integral. This is a complicated procedure that does not lead to a general expansion of (3) valid for an arbitrary multiplicity k. For this reason, only expansions of simplest single, double, and triple stochastic integrals (3) were presented in [2], [4], [59], [60] ($k = 1, 2, 3$) and in [3], [5] ($k = 1, 2$) for the case $\psi_1(\tau), \psi_2(\tau), \psi_3(\tau) \equiv 1$; $i_1, i_2, i_3 = 0, 1, \ldots, m$.

Moreover, the authors of the works [2] (Sect. 5.8, pp. 202–204), [4] (pp. 82-84), [59] (pp. 438-439), [60] (pp. 263-264) use the Wong–Zakai approximation [62]-[64] (without rigorous proof) within the frames of the Milstein approach [3] based on the series expansion of the Brownian bridge process. See discussion in Sect. 9 of this paper for detail.

Note that in [61] the method (similar to the Milstein approach) of expansion of double Ito stochastic integrals (2) ($k = 2$; $\psi_1(\tau), \psi_2(\tau) \equiv 1$; $i_1, i_2 = 1, \ldots, m$) based on the series expansion of the Wiener process [65] using Haar basis functions and trigonometric basis functions has been considered.

It is necessary to note that the approach based on the Karhunen–Loeve expansion [3] excelled in several times (or even in several orders) the methods of integral sums [3], [5], [58] considering computational costs in the sense of their diminishing.

An alternative strong approximation method was proposed for (3) in [6], [7] (also see [14]-[19], [22], [24], [25]-[27]), where $J^*[\psi^{(k)}]_{T,t}$ was represented as the multiple stochastic integral from the certain discontinuous non-random function of k variables, and the function was then expressed as the generalized iterated Fourier series by complete systems of continuously differentiable functions that are orthonormal in the space $L_2([t, T])$. As a result, the general iterated series expansion of products of standard Gaussian random variables was obtained in [6], [7] (also see [14]-[19], [22], [24], [25]-[27]) for (3) with an arbitrary multiplicity k. Hereinafter, this method is referred to as the method of generalized iterated Fourier series. It was shown [6], [7] (also see [14]-[19], [22], [24], [25]-[27]) that the method of generalized iterated Fourier series leads to the approach based on the Karhunen–Loeve expansion [3] in the case of trigonometric system of functions and to a substantially simpler expansion of (3) in the case of Legendre polynomial system.

Obviously, the approach based on the Karhunen–Loeve expansion [3] and the method of generalized iterated Fourier series [6], [7] (also see [14]-[19], [22], [24], [25]-[27]) lead to iterated application of the operation of limit transition. So, these methods may not converge in the mean-square sense to appropriate integrals (3) for some methods of series summation. The mentioned problem not appears in the method, which is proposed for (2) in Theorems 1, 2 (see below).

2. Method of Expansion of Iterated Ito Stochastic Integrals Based on Generalized Multiple Fourier Series

Let us consider another approach to the expansion of iterated Ito stochastic integrals (2) [10]-[22], [24]-[57] (the so-called method of generalized multiple Fourier series). The idea of this method is as follows: the iterated Ito stochastic integral (2) of the multiplicity k is represented as the multiple stochastic integral from the certain discontinuous non-random function of k variables defined on the hypercube $[t, T]^k$, where $[t, T]$ is the interval of integration of the iterated Ito stochastic integral (2). Then, the indicated non-random function of k variables is expanded in the hypercube $[t, T]^k$ into the generalized multiple Fourier series that converges in the mean-square sense in the space $L_2([t, T]^k)$.

After a number of nontrivial transformations we come (see Theorems 1, 2 below) to the mean-square convergening expansion of the iterated Ito stochastic integral (2) into the multiple series of products of standard Gaussian random variables. Coefficients of this series are coefficients of the generalized multiple Fourier series for the mentioned non-random function of k variables, which can be calculated using the explicit formula regardless of the multiplicity k of the iterated Ito stochastic integral (2).

Suppose that every $\psi_l(\tau)$ $(l=1,\ldots,k)$ is a non-random function from the space $L_2([t,T])$. Define the following function on the hypercube $[t,T]^k$

$$K(t_1,\ldots,t_k)=\begin{cases}\psi_1(t_1)\ldots\psi_k(t_k) & \text{for}\ \ t_1<\ldots<t_k\\ \\ 0 & \text{otherwise}\end{cases},\qquad t_1,\ldots,t_k\in[t,T],\qquad k\ge 2, \tag{4}$$

and $K(t_1)\equiv\psi_1(t_1)$ for $t_1\in[t,T]$.

Suppose that $\{\phi_j(x)\}_{j=0}^{\infty}$ is a complete orthonormal system of functions in the space $L_2([t,T])$. The function $K(t_1,\ldots,t_k)$ belongs to the space $L_2([t,T]^k)$. At this situation it is well known that the generalized multiple Fourier series of $K(t_1,\ldots,t_k)\in L_2([t,T]^k)$ is converging to $K(t_1,\ldots,t_k)$ in the hypercube $[t,T]^k$ in the mean-square sense, i.e.

$$\lim_{p_1,\ldots,p_k\to\infty}\left\|K(t_1,\ldots,t_k)-\sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k}C_{j_k\ldots j_1}\prod_{l=1}^{k}\phi_{j_l}(t_l)\right\|_{L_2([t,T]^k)}=0,$$

where

$$C_{j_k\ldots j_1}=\int\limits_{[t,T]^k}K(t_1,\ldots,t_k)\prod_{l=1}^{k}\phi_{j_l}(t_l)dt_1\ldots dt_k, \tag{5}$$

$$\|f\|_{L_2([t,T]^k)}=\left(\int\limits_{[t,T]^k}f^2(t_1,\ldots,t_k)dt_1\ldots dt_k\right)^{1/2}.$$

Consider the partition $\{\tau_j\}_{j=0}^{N}$ of $[t,T]$ such that

$$t=\tau_0<\ldots<\tau_N=T,\quad \Delta_N=\max_{0\le j\le N-1}\Delta\tau_j\to 0\ \text{ if }\ N\to\infty,\quad \Delta\tau_j=\tau_{j+1}-\tau_j. \tag{6}$$

Theorem 1 [10] (2006) (also see [11]-[22], [24]-[57]). *Suppose that every $\psi_l(\tau)$ $(l=1,\ldots,k)$ is a continuous non-random function on $[t,T]$ and $\{\phi_j(x)\}_{j=0}^{\infty}$ is a complete orthonormal system of continuous functions in the space $L_2([t,T])$. Then*

$$J[\psi^{(k)}]_{T,t}\ =\ \underset{p_1,\ldots,p_k\to\infty}{\text{l.i.m.}}\sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k}C_{j_k\ldots j_1}\Biggl(\prod_{l=1}^{k}\zeta_{j_l}^{(i_l)}\ -$$

$$-\ \underset{N\to\infty}{\text{l.i.m.}}\sum_{(l_1,\ldots,l_k)\in\mathrm{G}_k}\phi_{j_1}(\tau_{l_1})\Delta\mathbf{w}_{\tau_{l_1}}^{(i_1)}\ldots\phi_{j_k}(\tau_{l_k})\Delta\mathbf{w}_{\tau_{l_k}}^{(i_k)}\Biggr), \tag{7}$$

where $J[\psi^{(k)}]_{T,t}$ *is defined by* (2),

$$\mathrm{G}_k = \mathrm{H}_k \backslash \mathrm{L}_k, \quad \mathrm{H}_k = \{(l_1, \ldots, l_k) : \ l_1, \ldots, l_k = 0, \ 1, \ldots, N-1\},$$

$$\mathrm{L}_k = \{(l_1, \ldots, l_k) : \ l_1, \ldots, l_k = 0, \ 1, \ldots, N-1; \ l_g \neq l_r \ (g \neq r); \ g, r = 1, \ldots, k\},$$

l.i.m. *is a limit in the mean-square sense*, $i_1, \ldots, i_k = 0, 1, \ldots, m$,

$$\zeta_j^{(i)} = \int\limits_t^T \phi_j(s) d\mathbf{w}_s^{(i)} \tag{8}$$

are independent standard Gaussian random variables for various i *or* j (*if* $i \neq 0$), $C_{j_k \ldots j_1}$ *is the Fourier coefficient* (5), $\Delta \mathbf{w}_{\tau_j}^{(i)} = \mathbf{w}_{\tau_{j+1}}^{(i)} - \mathbf{w}_{\tau_j}^{(i)}$ $(i = 0, 1, \ldots, m)$, $\{\tau_j\}_{j=0}^{N}$ *is the partition of the interval* $[t, T]$, *which satisfies the condition* (6).

In [12]-[19], [22], [24]-[27], [35] it was shown that Theorem 1 is valid for convergence in the mean of degree $2n$ $(n \in \mathbb{N})$. The convergence with probability 1 in Theorem 1 is proved in [25]-[28] for complete orthonormal systems of Legendre polynomials and trigonometric functions in the space $L_2([t, T])$. Moreover, the complete orthonormal systems of Haar and Rademacher–Walsh functions in the space $L_2([t, T])$ can also be applied in Theorem 1 [10]-[19], [22], [24]-[27], [35]. The modification of Theorem 1 for complete orthonormal with weigth $r(t_1) \ldots r(t_k) \geq 0$ systems of functions in the space $L_2([t, T]^k)$ can be found in [24]-[27], [36]. Note that Theorem 1 and Theorem 2 (see below) have been applied to the approximation of iterated stochastic integrals with respect to the infinite-dimensional Q-Wiener process in [25]-[27] (Chapter 7), [54]-[57].

In order to evaluate the significance of Theorem 1 for practice we will demonstrate its transformed particular cases for $k = 1, \ldots, 6$ [10]-[22], [24]-[57]

$$J[\psi^{(1)}]_{T,t} = \underset{p_1 \to \infty}{\text{l.i.m.}} \sum_{j_1=0}^{p_1} C_{j_1} \zeta_{j_1}^{(i_1)}, \tag{9}$$

$$J[\psi^{(2)}]_{T,t} = \underset{p_1, p_2 \to \infty}{\text{l.i.m.}} \sum_{j_1=0}^{p_1} \sum_{j_2=0}^{p_2} C_{j_2 j_1} \left(\zeta_{j_1}^{(i_1)} \zeta_{j_2}^{(i_2)} - \mathbf{1}_{\{i_1 = i_2 \neq 0\}} \mathbf{1}_{\{j_1 = j_2\}} \right), \tag{10}$$

$$J[\psi^{(3)}]_{T,t} = \underset{p_1, \ldots, p_3 \to \infty}{\text{l.i.m.}} \sum_{j_1=0}^{p_1} \sum_{j_2=0}^{p_2} \sum_{j_3=0}^{p_3} C_{j_3 j_2 j_1} \Biggl(\zeta_{j_1}^{(i_1)} \zeta_{j_2}^{(i_2)} \zeta_{j_3}^{(i_3)} -$$

$$-\mathbf{1}_{\{i_1 = i_2 \neq 0\}} \mathbf{1}_{\{j_1 = j_2\}} \zeta_{j_3}^{(i_3)} - \mathbf{1}_{\{i_2 = i_3 \neq 0\}} \mathbf{1}_{\{j_2 = j_3\}} \zeta_{j_1}^{(i_1)} - \mathbf{1}_{\{i_1 = i_3 \neq 0\}} \mathbf{1}_{\{j_1 = j_3\}} \zeta_{j_2}^{(i_2)} \Biggr), \tag{11}$$

$$J[\psi^{(4)}]_{T,t} = \underset{p_1, \ldots, p_4 \to \infty}{\text{l.i.m.}} \sum_{j_1=0}^{p_1} \ldots \sum_{j_4=0}^{p_4} C_{j_4 \ldots j_1} \Biggl(\prod_{l=1}^{4} \zeta_{j_l}^{(i_l)} -$$

$$-\mathbf{1}_{\{i_1 = i_2 \neq 0\}} \mathbf{1}_{\{j_1 = j_2\}} \zeta_{j_3}^{(i_3)} \zeta_{j_4}^{(i_4)} - \mathbf{1}_{\{i_1 = i_3 \neq 0\}} \mathbf{1}_{\{j_1 = j_3\}} \zeta_{j_2}^{(i_2)} \zeta_{j_4}^{(i_4)} -$$

$$-\mathbf{1}_{\{i_1 = i_4 \neq 0\}} \mathbf{1}_{\{j_1 = j_4\}} \zeta_{j_2}^{(i_2)} \zeta_{j_3}^{(i_3)} - \mathbf{1}_{\{i_2 = i_3 \neq 0\}} \mathbf{1}_{\{j_2 = j_3\}} \zeta_{j_1}^{(i_1)} \zeta_{j_4}^{(i_4)} -$$

$$-\mathbf{1}_{\{i_2 = i_4 \neq 0\}} \mathbf{1}_{\{j_2 = j_4\}} \zeta_{j_1}^{(i_1)} \zeta_{j_3}^{(i_3)} - \mathbf{1}_{\{i_3 = i_4 \neq 0\}} \mathbf{1}_{\{j_3 = j_4\}} \zeta_{j_1}^{(i_1)} \zeta_{j_2}^{(i_2)} +$$

$$+\mathbf{1}_{\{i_1=i_2\ne 0\}}\mathbf{1}_{\{j_1=j_2\}}\mathbf{1}_{\{i_3=i_4\ne 0\}}\mathbf{1}_{\{j_3=j_4\}}+$$
$$+\mathbf{1}_{\{i_1=i_3\ne 0\}}\mathbf{1}_{\{j_1=j_3\}}\mathbf{1}_{\{i_2=i_4\ne 0\}}\mathbf{1}_{\{j_2=j_4\}}+$$
$$\left.+\mathbf{1}_{\{i_1=i_4\ne 0\}}\mathbf{1}_{\{j_1=j_4\}}\mathbf{1}_{\{i_2=i_3\ne 0\}}\mathbf{1}_{\{j_2=j_3\}}\right), \tag{12}$$

$$J[\psi^{(5)}]_{T,t}=\underset{p_1,\ldots,p_5\to\infty}{\text{l.i.m.}}\sum_{j_1=0}^{p_1}\ldots\sum_{j_5=0}^{p_5}C_{j_5\ldots j_1}\Biggl(\prod_{l=1}^{5}\zeta_{j_l}^{(i_l)}-$$
$$-\mathbf{1}_{\{i_1=i_2\ne 0\}}\mathbf{1}_{\{j_1=j_2\}}\zeta_{j_3}^{(i_3)}\zeta_{j_4}^{(i_4)}\zeta_{j_5}^{(i_5)}-\mathbf{1}_{\{i_1=i_3\ne 0\}}\mathbf{1}_{\{j_1=j_3\}}\zeta_{j_2}^{(i_2)}\zeta_{j_4}^{(i_4)}\zeta_{j_5}^{(i_5)}-$$
$$-\mathbf{1}_{\{i_1=i_4\ne 0\}}\mathbf{1}_{\{j_1=j_4\}}\zeta_{j_2}^{(i_2)}\zeta_{j_3}^{(i_3)}\zeta_{j_5}^{(i_5)}-\mathbf{1}_{\{i_1=i_5\ne 0\}}\mathbf{1}_{\{j_1=j_5\}}\zeta_{j_2}^{(i_2)}\zeta_{j_3}^{(i_3)}\zeta_{j_4}^{(i_4)}-$$
$$-\mathbf{1}_{\{i_2=i_3\ne 0\}}\mathbf{1}_{\{j_2=j_3\}}\zeta_{j_1}^{(i_1)}\zeta_{j_4}^{(i_4)}\zeta_{j_5}^{(i_5)}-\mathbf{1}_{\{i_2=i_4\ne 0\}}\mathbf{1}_{\{j_2=j_4\}}\zeta_{j_1}^{(i_1)}\zeta_{j_3}^{(i_3)}\zeta_{j_5}^{(i_5)}-$$
$$-\mathbf{1}_{\{i_2=i_5\ne 0\}}\mathbf{1}_{\{j_2=j_5\}}\zeta_{j_1}^{(i_1)}\zeta_{j_3}^{(i_3)}\zeta_{j_4}^{(i_4)}-\mathbf{1}_{\{i_3=i_4\ne 0\}}\mathbf{1}_{\{j_3=j_4\}}\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}\zeta_{j_5}^{(i_5)}-$$
$$-\mathbf{1}_{\{i_3=i_5\ne 0\}}\mathbf{1}_{\{j_3=j_5\}}\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}\zeta_{j_4}^{(i_4)}-\mathbf{1}_{\{i_4=i_5\ne 0\}}\mathbf{1}_{\{j_4=j_5\}}\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}\zeta_{j_3}^{(i_3)}+$$
$$+\mathbf{1}_{\{i_1=i_2\ne 0\}}\mathbf{1}_{\{j_1=j_2\}}\mathbf{1}_{\{i_3=i_4\ne 0\}}\mathbf{1}_{\{j_3=j_4\}}\zeta_{j_5}^{(i_5)}+\mathbf{1}_{\{i_1=i_2\ne 0\}}\mathbf{1}_{\{j_1=j_2\}}\mathbf{1}_{\{i_3=i_5\ne 0\}}\mathbf{1}_{\{j_3=j_5\}}\zeta_{j_4}^{(i_4)}+$$
$$+\mathbf{1}_{\{i_1=i_2\ne 0\}}\mathbf{1}_{\{j_1=j_2\}}\mathbf{1}_{\{i_4=i_5\ne 0\}}\mathbf{1}_{\{j_4=j_5\}}\zeta_{j_3}^{(i_3)}+\mathbf{1}_{\{i_1=i_3\ne 0\}}\mathbf{1}_{\{j_1=j_3\}}\mathbf{1}_{\{i_2=i_4\ne 0\}}\mathbf{1}_{\{j_2=j_4\}}\zeta_{j_5}^{(i_5)}+$$
$$+\mathbf{1}_{\{i_1=i_3\ne 0\}}\mathbf{1}_{\{j_1=j_3\}}\mathbf{1}_{\{i_2=i_5\ne 0\}}\mathbf{1}_{\{j_2=j_5\}}\zeta_{j_4}^{(i_4)}+\mathbf{1}_{\{i_1=i_3\ne 0\}}\mathbf{1}_{\{j_1=j_3\}}\mathbf{1}_{\{i_4=i_5\ne 0\}}\mathbf{1}_{\{j_4=j_5\}}\zeta_{j_2}^{(i_2)}+$$

where $\mathbf{1}_A$ is the indicator of the set A.

Thus, we obtain the following useful possibilities and advantages of the method of generalized multiple Fourier series.

1. There is the explicit formula (see (5)) for calculation of expansion coefficients of the iterated Ito stochastic integral (2) with any fixed multiplicity k.

2. We have new possibilities for exact calculation of the mean-square error of approximation of the iterated Ito stochastic integral (2) (see [20], [22], [24]-[27], [34]).

3. Since the used multiple Fourier series is a generalized in the sense that it is built using various complete orthonormal systems of functions in the space $L_2([t,T])$, then we have new possibilities for approximation — we can use not only trigonometric functions as in [2]-[5] but Legendre polynomials.

4. As it turned out (see [6]-[22], [24]-[57]), it is more convenient to work with Legendre polynomials for construction the approximations of iterated Ito stochastic integrals (2). Approximations based on the Legendre polynomials essentially simpler than their analogues based on the trigonometric functions (see [6]-[22], [24]-[57]). Another advantages of the application of Legendre polynomials in the framework of the mentioned problem are considered in [25]-[27] (Sect. 5.3), [39], [40].

5. The approach based on the Karhunen–Loeve expansion of the Brownian bridge process (also see [61]) leads to iterated application of the operation of limit transition (the operation of limit transition is implemented only once in Theorem 1 and Theorem 2 (see below)) starting from the second multiplicity (in the general case) and third multiplicity (for the case $\psi_1(\tau),\psi_2(\tau),\psi_3(\tau)\equiv 1$; $i_1,i_2,i_3=0,1,\ldots,m$) of iterated stochastic integrals. Multiple series (the operation of limit transition is implemented only once) are more convenient for approximation than the iterated ones (iterated application of the operation of limit transition), since partial sums of multiple series converge for any possible case of convergence to infinity of their upper limits of summation (let us denote them as $p_1,\ldots,p_k$). For example, when $p_1=\ldots=p_k=p\to\infty$. For iterated series, the condition $p_1=\ldots=p_k=p\to\infty$ obviously does not guarantee the convergence of this series. However, in [2] (Sect. 5.8, pp. 202–204), [4] (pp. 82-84), [59] (pp. 438-439), [60] (pp. 263-264) the authors use (without rigorous proof) the condition $p_1=p_2=p_3=p\to\infty$ within the frames of the mentioned approach based on the Karhunen–Loeve expansion of the Brownian bridge process [3] together with the Wong–Zakai approximation [62]-[64] (see discussion in Sect. 9 of this paper for detail).

Note that the correctness of formulas (9)–(14) can be verified by the fact that if $i_1=\ldots=i_6=i=1,\ldots,m$ and $\psi_1(\tau),\ldots,\psi_6(\tau)\equiv\psi(\tau)$, then we can derive from (9)–(14) the well known equalities, which be fulfilled w. p. 1 [11]-[19], [22], [24]-[27]

$$J[\psi^{(1)}]_{T,t}=\frac{1}{1!}\delta_{T,t},$$

$$J[\psi^{(2)}]_{T,t}=\frac{1}{2!}\left(\delta_{T,t}^2-\Delta_{T,t}\right),$$

$$J[\psi^{(3)}]_{T,t}=\frac{1}{3!}\left(\delta_{T,t}^3-3\delta_{T,t}\Delta_{T,t}\right),$$

$$J[\psi^{(4)}]_{T,t}=\frac{1}{4!}\left(\delta_{T,t}^4-6\delta_{T,t}^2\Delta_{T,t}+3\Delta_{T,t}^2\right),$$

$$J[\psi^{(5)}]_{T,t}=\frac{1}{5!}\left(\delta_{T,t}^5-10\delta_{T,t}^3\Delta_{T,t}+15\delta_{T,t}\Delta_{T,t}^2\right),$$

$$J[\psi^{(6)}]_{T,t} = \frac{1}{6!}\left(\delta_{T,t}^6 - 15\delta_{T,t}^4\Delta_{T,t} + 45\delta_{T,t}^2\Delta_{T,t}^2 - 15\Delta_{T,t}^3\right),$$

where

$$\delta_{T,t} = \int\limits_t^T \psi(\tau)d\mathbf{f}_\tau^{(i)}, \quad \Delta_{T,t} = \int\limits_t^T \psi^2(\tau)d\tau.$$

The above relations can be independently obtained using the Ito formula and Hermite polynomials.

3. Generalization of Theorem 1 to the Case of an Arbitrary Complete Orthonormal System of Functions in the Space $L_2([t,T])$ and $\psi_1(\tau),\ldots,\psi_k(\tau) \in L_2([t,T])$

For further consideration, let us consider the generalization of formulas (9)–(14) for the case of an arbitrary multiplicity k ($k \in \mathbb{N}$) of the iterated Ito stochastic integral $J[\psi^{(k)}]_{T,t}$ defined by (2). In order to do this, let us introduce some notations. Consider the unordered set $\{1,2,\ldots,k\}$ and separate it into two parts: the first part consists of r unordered pairs (sequence order of these pairs is also unimportant) and the second one consists of the remaining $k-2r$ numbers. So, we have

$$(\{\underbrace{\{g_1,g_2\},\ldots,\{g_{2r-1},g_{2r}\}}_{\text{part 1}}\},\{\underbrace{q_1,\ldots,q_{k-2r}}_{\text{part 2}}\}), \tag{15}$$

where

$$\{g_1,g_2,\ldots,g_{2r-1},g_{2r},q_1,\ldots,q_{k-2r}\} = \{1,2,\ldots,k\},$$

braces mean an unordered set, and parentheses mean an ordered set.

We will say that (15) is a partition and consider the sum with respect to all possible partitions

$$\sum_{\substack{(\{\{g_1,g_2\},\ldots,\{g_{2r-1},g_{2r}\}\},\{q_1,\ldots,q_{k-2r}\})\\ \{g_1,g_2,\ldots,g_{2r-1},g_{2r},q_1,\ldots,q_{k-2r}\}=\{1,2,\ldots,k\}}} a_{g_1g_2,\ldots,g_{2r-1}g_{2r},q_1\ldots q_{k-2r}}. \tag{16}$$

Below there are several examples of sums in the form (16)

$$\sum_{\substack{(\{g_1,g_2\})\\ \{g_1,g_2\}=\{1,2\}}} a_{g_1g_2} = a_{12},$$

$$\sum_{\substack{(\{\{g_1,g_2\},\{g_3,g_4\}\})\\ \{g_1,g_2,g_3,g_4\}=\{1,2,3,4\}}} a_{g_1g_2g_3g_4} = a_{1234} + a_{1324} + a_{2314},$$

$$\sum_{\substack{(\{g_1,g_2\},\{q_1,q_2\})\\ \{g_1,g_2,q_1,q_2\}=\{1,2,3,4\}}} a_{g_1g_2,q_1q_2} =$$

$$= a_{12,34} + a_{13,24} + a_{14,23} + a_{23,14} + a_{24,13} + a_{34,12},$$

$$\sum_{\substack{(\{g_1,g_2\},\{q_1,q_2,q_3\})\\ \{g_1,g_2,q_1,q_2,q_3\}=\{1,2,3,4,5\}}} a_{g_1g_2,q_1q_2q_3} =$$

$$= a_{12,345} + a_{13,245} + a_{14,235} + a_{15,234} + a_{23,145} + a_{24,135} +$$
$$+ a_{25,134} + a_{34,125} + a_{35,124} + a_{45,123},$$

$$\sum_{\substack{(\{\{g_1,g_2\},\{g_3,g_4\}\},\{q_1\})\\ \{g_1,g_2,g_3,g_4,q_1\}=\{1,2,3,4,5\}}} a_{g_1g_2,g_3g_4,q_1} =$$

$$= a_{12,34,5} + a_{13,24,5} + a_{14,23,5} + a_{12,35,4} + a_{13,25,4} + a_{15,23,4} +$$
$$+ a_{12,54,3} + a_{15,24,3} + a_{14,25,3} + a_{15,34,2} + a_{13,54,2} + a_{14,53,2} +$$
$$+ a_{52,34,1} + a_{53,24,1} + a_{54,23,1}.$$

Now we can write (7) as

$$J[\psi^{(k)}]_{T,t} = \underset{p_1,\ldots,p_k\to\infty}{\text{l.i.m.}} \sum_{j_1=0}^{p_1} \ldots \sum_{j_k=0}^{p_k} C_{j_k\ldots j_1} \left(\prod_{l=1}^{k} \zeta_{j_l}^{(i_l)} + \sum_{r=1}^{[k/2]} (-1)^r \times \right.$$

$$\left. \times \sum_{\substack{(\{\{g_1,g_2\},\ldots,\{g_{2r-1},g_{2r}\}\},\{q_1,\ldots,q_{k-2r}\})\\ \{g_1,g_2,\ldots,g_{2r-1},g_{2r},q_1,\ldots,q_{k-2r}\}=\{1,2,\ldots,k\}}} \prod_{s=1}^{r} \mathbf{1}_{\{i_{g_{2s-1}} = i_{g_{2s}} \neq 0\}} \mathbf{1}_{\{j_{g_{2s-1}} = j_{g_{2s}}\}} \prod_{l=1}^{k-2r} \zeta_{j_{q_l}}^{(i_{q_l})} \right), \tag{17}$$

where $[x]$ is an integer part of a real number x; another notations are the same as in Theorem **1**.

In particular, from (17) for $k = 5$ we obtain

$$J[\psi^{(5)}]_{T,t} = \underset{p_1,\ldots,p_5\to\infty}{\text{l.i.m.}} \sum_{j_1=0}^{p_1} \ldots \sum_{j_5=0}^{p_5} C_{j_5\ldots j_1} \left(\prod_{l=1}^{5} \zeta_{j_l}^{(i_l)} - \right.$$

$$- \sum_{\substack{(\{g_1,g_2\},\{q_1,q_2,q_3\})\\ \{g_1,g_2,q_1,q_2,q_3\}=\{1,2,3,4,5\}}} \mathbf{1}_{\{i_{g_1} = i_{g_2} \neq 0\}} \mathbf{1}_{\{j_{g_1} = j_{g_2}\}} \prod_{l=1}^{3} \zeta_{j_{q_l}}^{(i_{q_l})} +$$

$$\left. + \sum_{\substack{(\{\{g_1,g_2\},\{g_3,g_4\}\},\{q_1\})\\ \{g_1,g_2,g_3,g_4,q_1\}=\{1,2,3,4,5\}}} \mathbf{1}_{\{i_{g_1} = i_{g_2} \neq 0\}} \mathbf{1}_{\{j_{g_1} = j_{g_2}\}} \mathbf{1}_{\{i_{g_3} = i_{g_4} \neq 0\}} \mathbf{1}_{\{j_{g_3} = j_{g_4}\}} \zeta_{j_{q_1}}^{(i_{q_1})} \right).$$

The last equality obviously agrees with (13).

Let us consider the generalization of Theorem 1 for the case of an arbitrary complete orthonormal system of functions in the space $L_2([t,T])$ and $\psi_1(\tau),\ldots,\psi_k(\tau)\in L_2([t,T])$.

Theorem 2 [25] (Sect. 1.11), [35] (Sect. 15). *Suppose that $\psi_1(\tau),\ldots,\psi_k(\tau)\in L_2([t,T])$ and $\{\phi_j(x)\}_{j=0}^{\infty}$ is an arbitrary complete orthonormal system of functions in the space $L_2([t,T])$. Then the following expansion*

$$J[\psi^{(k)}]_{T,t}=\underset{p_1,\ldots,p_k\to\infty}{\text{l.i.m.}}\sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k}C_{j_k\ldots j_1}\Biggl(\prod_{l=1}^{k}\zeta_{j_l}^{(i_l)}+\sum_{r=1}^{[k/2]}(-1)^r\times$$

$$\times\sum_{\substack{(\{\{g_1,g_2\},\ldots,\{g_{2r-1},g_{2r}\}\},\{q_1,\ldots,q_{k-2r}\})\\ \{g_1,g_2,\ldots,g_{2r-1},g_{2r},q_1,\ldots,q_{k-2r}\}=\{1,2,\ldots,k\}}}\prod_{s=1}^{r}\mathbf{1}_{\{i_{g_{2s-1}}=\,i_{g_{2s}}\ne 0\}}\mathbf{1}_{\{j_{g_{2s-1}}=\,j_{g_{2s}}\}}\prod_{l=1}^{k-2r}\zeta_{j_{q_l}}^{(i_{q_l})}\Biggr) \qquad (18)$$

converging in the mean-square sense is valid, where $[x]$ is an integer part of a real number x; another notations are the same as in Theorem 1.

It should be noted that an analogue of Theorem 2 was considered in [67]. Note that we use another notations [25] (Sect. 1.11), [35] (Sect. 15) in comparison with [67]. Moreover, the proof of an analogue of Theorem 2 from [67] is somewhat different from the proof given in [25] (Sect. 1.11), [35] (Sect. 15).

As it turned out, the adaptation of the method of generalized multiple Fourier series (Theorems 1, 2) to the iterated Stratonovich stochastic integrals (3) leads simpler expansions than (9)–(14). The article is devoted to deriving the analogues of Theorems 1, 2 for triple Stratonovich stochastic integrals from the so-called Taylor–Stratonovich expansion [2]. In this work, we use triple Fourier–Legendre series as well as triple trigonometric Fourier series for construction of expansions of the iterated Stratonovich stochastic integrals (3). At that, we consider the general case of series summation (Sect. 4–6).

The rest of the article is organized as follows. In Sect. 4, we formulate and prove Theorem 3 on expansion of iterated Stratonovich stochastic integrals (3) of third multiplicity with constant weight functions using triple Fourier–Legendre series. Sect. 5 is devoted to the generalization of Theorem 3 for the case of binomial weight functions. In Sect. 6, we obtain an analogue of Theorem 3 using triple trigonometric Fourier series. Sect. 7 is devoted to modifications of Theorems 3–5. In Sect. 8, we consider some recent results on expansions of iterated Stratonovich stochastic integrals of multiplicities 3 to 6. Sect. 9 is devoted to the discussion of main results of this article from point of view of the Wong–Zakai approximation [62]-[64].

4. Expansion of Iterated Stratonovich Stochastic Integrals of Multiplicity 3. The Case of Legendre Polynomials

Theorem 3 [15]-[19], [22], [24]-[27]. *Suppose that $\{\phi_j(x)\}_{j=0}^{\infty}$ is a complete orthonormal system of Legendre polynomials in the space $L_2([t,T])$. Then, for the iterated Stratonovich stochastic integral of third multiplicity*

$$\int\limits_t^{*T}\int\limits_t^{*t_3}\int\limits_t^{*t_2}d\mathbf{f}_{t_1}^{(i_1)}d\mathbf{f}_{t_2}^{(i_2)}d\mathbf{f}_{t_3}^{(i_3)}\quad (i_1,i_2,i_3=1,\ldots,m)$$

the following expansion

(19) $$\int\limits_t^{*T}\int\limits_t^{*t_3}\int\limits_t^{*t_2} d\mathbf{f}_{t_1}^{(i_1)}d\mathbf{f}_{t_2}^{(i_2)}d\mathbf{f}_{t_3}^{(i_3)} = \underset{p_1,p_2,p_3\to\infty}{\text{l.i.m.}} \sum_{j_1=0}^{p_1}\sum_{j_2=0}^{p_2}\sum_{j_3=0}^{p_3} C_{j_3j_2j_1}\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}\zeta_{j_3}^{(i_3)}$$

converging in the mean-square sense is valid, where

$$C_{j_3j_2j_1} = \int\limits_t^T \phi_{j_3}(s)\int\limits_t^s \phi_{j_2}(s_1)\int\limits_t^{s_1}\phi_{j_1}(s_2)ds_2ds_1ds.$$

Proof. If we prove w. p. 1 the following equalities

(20) $$\underset{p_1,p_3\to\infty}{\text{l.i.m.}} \sum_{j_1=0}^{p_1}\sum_{j_3=0}^{p_3} C_{j_3j_1j_1}\zeta_{j_3}^{(i_3)} = \frac{1}{4}(T-t)^{3/2}\left(\zeta_0^{(i_3)}+\frac{1}{\sqrt{3}}\zeta_1^{(i_3)}\right),$$

(21) $$\underset{p_1,p_3\to\infty}{\text{l.i.m.}} \sum_{j_1=0}^{p_1}\sum_{j_3=0}^{p_3} C_{j_3j_3j_1}\zeta_{j_1}^{(i_1)} = \frac{1}{4}(T-t)^{3/2}\left(\zeta_0^{(i_1)}-\frac{1}{\sqrt{3}}\zeta_1^{(i_1)}\right),$$

(22) $$\underset{p_1,p_3\to\infty}{\text{l.i.m.}} \sum_{j_1=0}^{p_1}\sum_{j_3=0}^{p_3} C_{j_1j_3j_1}\zeta_{j_3}^{(i_2)} = 0,$$

then in accordance with Theorems 1, 2 (see (11)), formulas (20)–(22), standard relations between iterated Ito and Stratonovich stochastic integrals as well as in accordance with the formulas (they also follow from Theorems 1, 2)

$$\frac{1}{2}\int\limits_t^T\int\limits_t^\tau ds d\mathbf{f}_\tau^{(i_3)} = \frac{1}{4}(T-t)^{3/2}\left(\zeta_0^{(i_3)}+\frac{1}{\sqrt{3}}\zeta_1^{(i_3)}\right) \quad \text{w. p. 1},$$

$$\frac{1}{2}\int\limits_t^T\int\limits_t^\tau d\mathbf{f}_s^{(i_1)} d\tau = \frac{1}{4}(T-t)^{3/2}\left(\zeta_0^{(i_1)}-\frac{1}{\sqrt{3}}\zeta_1^{(i_1)}\right) \quad \text{w. p. 1}$$

we will have

$$\int\limits_t^T\int\limits_t^{t_3}\int\limits_t^{t_2} d\mathbf{f}_{t_1}^{(i_1)}d\mathbf{f}_{t_2}^{(i_2)}d\mathbf{f}_{t_3}^{(i_3)} = \underset{p_1,p_2,p_3\to\infty}{\text{l.i.m.}} \sum_{j_1=0}^{p_1}\sum_{j_2=0}^{p_2}\sum_{j_3=0}^{p_3} C_{j_3j_2j_1}\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}\zeta_{j_3}^{(i_3)} -$$

$$-\mathbf{1}_{\{i_1=i_2\}}\frac{1}{2}\int\limits_t^T\int\limits_t^\tau ds d\mathbf{f}_\tau^{(i_3)} - \mathbf{1}_{\{i_2=i_3\}}\frac{1}{2}\int\limits_t^T\int\limits_t^\tau d\mathbf{f}_s^{(i_1)}d\tau.$$

It means that the expansion (19) will be proved.

First let us prove that

$$\sum_{j_1=0}^{\infty} C_{0j_1j_1} = \frac{1}{4}(T-t)^{3/2}, \tag{23}$$

$$\sum_{j_1=0}^{\infty} C_{1j_1j_1} = \frac{1}{4\sqrt{3}}(T-t)^{3/2}. \tag{24}$$

We have

$$C_{000} = \frac{(T-t)^{3/2}}{6},$$

$$C_{0j_1j_1} = \int\limits_t^T \phi_0(s) \int\limits_t^s \phi_{j_1}(s_1) \int\limits_t^{s_1} \phi_{j_1}(s_2) ds_2 ds_1 ds =$$

$$= \frac{1}{2} \int\limits_t^T \phi_0(s) \left(\int\limits_t^s \phi_{j_1}(s_1) ds_1 \right)^2 ds, \quad j_1 \ge 1. \tag{25}$$

Here $\phi_j(s)$ looks as follows

$$\phi_j(s) = \sqrt{\frac{2j+1}{T-t}} P_j \left(\left(s - \frac{T+t}{2} \right) \frac{2}{T-t} \right), \quad j \ge 0, \tag{26}$$

where $P_j(x)$ is the Legendre polynomial.

Let us substitute (26) into (25) and calculate $C_{0j_1j_1}$ $(j_1 \ge 1)$

$$C_{0j_1j_1} = \frac{2j_1+1}{2(T-t)^{3/2}} \int\limits_t^T \left(\int\limits_{-1}^{z(s)} P_{j_1}(y) \frac{T-t}{2} dy \right)^2 ds =$$

$$= \frac{(2j_1+1)\sqrt{T-t}}{8} \int\limits_t^T \left(\int\limits_{-1}^{z(s)} \frac{1}{2j_1+1} \left(P'_{j_1+1}(y) - P'_{j_1-1}(y) \right) dy \right)^2 ds =$$

$$= \frac{\sqrt{T-t}}{8(2j_1+1)} \int\limits_t^T \left(P_{j_1+1}(z(s)) - P_{j_1-1}(z(s)) \right)^2 ds, \tag{27}$$

where here and further

$$z(s) = \left(s - \frac{T+t}{2} \right) \frac{2}{T-t},$$

and we used the following well-known properties of the Legendre polynomials

$$P_j(y) = \frac{1}{2j+1} \left(P'_{j+1}(y) - P'_{j-1}(y) \right), \quad P_j(-1) = (-1)^j, \quad j \ge 1.$$

Also we denote

$$\frac{dP_j}{dy}(y) \stackrel{\rm def}{=} P_j^{'}(y).$$

From (27) using the property of orthogonality of the Legendre polynomials, we get the following relation

$$C_{0j_1j_1} = \frac{(T-t)^{3/2}}{16(2j_1+1)}\int\limits_{-1}^{1}\left(P_{j_1+1}^2(y)+P_{j_1-1}^2(y)\right)dy =$$

$$= \frac{(T-t)^{3/2}}{8(2j_1+1)}\left(\frac{1}{2j_1+3}+\frac{1}{2j_1-1}\right),$$

where we used the property

$$\int\limits_{-1}^{1}P_j^2(y)dy = \frac{2}{2j+1}, \quad j\ge 0.$$

Then

$$\sum_{j_1=0}^{\infty}C_{0j_1j_1} = \frac{(T-t)^{3/2}}{6}+\frac{(T-t)^{3/2}}{8}\left(\sum_{j_1=1}^{\infty}\frac{1}{(2j_1+1)(2j_1+3)}+\sum_{j_1=1}^{\infty}\frac{1}{4j_1^2-1}\right) =$$

$$= \frac{(T-t)^{3/2}}{6}+\frac{(T-t)^{3/2}}{8}\left(\sum_{j_1=1}^{\infty}\frac{1}{4j_1^2-1}-\frac{1}{3}+\sum_{j_1=1}^{\infty}\frac{1}{4j_1^2-1}\right) =$$

$$= \frac{(T-t)^{3/2}}{6}+\frac{(T-t)^{3/2}}{8}\left(\frac{1}{2}-\frac{1}{3}+\frac{1}{2}\right) = \frac{(T-t)^{3/2}}{4}.$$

The relation (23) is proved.

Let us check the correctness of (24). Let us represent $C_{1j_1j_1}$ in the form

$$C_{1j_1j_1} = \frac{1}{2}\int\limits_t^T\phi_1(s)\left(\int\limits_t^s\phi_{j_1}(s_1)ds_1\right)^2 ds =$$

$$= \frac{(T-t)^{3/2}(2j_1+1)\sqrt{3}}{16}\int\limits_{-1}^{1}P_1(y)\left(\int\limits_{-1}^{y}P_{j_1}(y_1)dy_1\right)^2 dy, \quad j_1\ge 1.$$

Since the functions

$$\left(\int\limits_{-1}^{y}P_{j_1}(y_1)dy_1\right)^2, \quad j_1\ge 1$$

are even, then, correspondently the functions

$$P_1(y)\left(\int\limits_{-1}^{y} P_{j_1}(y_1)dy_1\right)^2 dy, \quad j_1 \ge 1$$

are uneven.

It means that $C_{1j_1j_1}=0$ $(j_1\ge 1)$. From the other hand

$$C_{100}=\frac{\sqrt{3}(T-t)^{3/2}}{16}\int\limits_{-1}^{1} y(y+1)^2dy=\frac{(T-t)^{3/2}}{4\sqrt{3}}.$$

Then

$$\sum_{j_1=0}^{\infty} C_{1j_1j_1}=C_{100}+\sum_{j_1=1}^{\infty} C_{1j_1j_1}=\frac{(T-t)^{3/2}}{4\sqrt{3}}.$$

The relation (24) is proved.

Let us prove the equality (20). Using (24), we get

$$\sum_{j_1=0}^{p_1}\sum_{j_3=0}^{p_3} C_{j_3j_1j_1}\zeta_{j_3}^{(i_3)}=\sum_{j_1=0}^{p_1} C_{0j_1j_1}\zeta_{0}^{(i_3)}+\frac{(T-t)^{3/2}}{4\sqrt{3}}\zeta_{1}^{(i_3)}+\sum_{j_1=0}^{p_1}\sum_{j_3=2}^{p_3} C_{j_3j_1j_1}\zeta_{j_3}^{(i_3)}=$$

$$=\sum_{j_1=0}^{p_1} C_{0j_1j_1}\zeta_{0}^{(i_3)}+\frac{(T-t)^{3/2}}{4\sqrt{3}}\zeta_{1}^{(i_3)}+\sum_{j_1=0}^{p_1}\ \sum_{j_3=2, j_3-\text{even}}^{2j_1+2} C_{j_3j_1j_1}\zeta_{j_3}^{(i_3)}. \tag{28}$$

Since

$$C_{j_3j_1j_1}=\frac{(T-t)^{3/2}(2j_1+1)\sqrt{2j_3+1}}{16}\int\limits_{-1}^{1} P_{j_3}(y)\left(\int\limits_{-1}^{y} P_{j_1}(y_1)dy_1\right)^2 dy$$

and degree of the polynomial

$$\left(\int\limits_{-1}^{y} P_{j_1}(y_1)dy_1\right)^2$$

equals to $2j_1+2$, then $C_{j_3j_1j_1}=0$ for $j_3>2j_1+2$. It explains the circumstance that we put $2j_1+2$ instead of p_3 on the right-hand side of the formula (28).

Moreover, the function

$$\left(\int\limits_{-1}^{y} P_{j_1}(y_1)dy_1\right)^2$$

is even. It means that the function

$$P_{j_3}(y)\left(\int\limits_{-1}^{y} P_{j_1}(y_1)dy_1\right)^2$$

is uneven for uneven j_3. It means that $C_{j_3j_1j_1}=0$ for uneven j_3. That is why we summarize using even j_3 on the right-hand side of the formula (28).

Then we have

$$\sum_{j_1=0}^{p_1}\sum_{j_3=2,j_3-\text{even}}^{2j_1+2}C_{j_3j_1j_1}\zeta_{j_3}^{(i_3)}=\sum_{j_3=2,j_3-\text{even}}^{2p_1+2}\sum_{j_1=(j_3-2)/2}^{p_1}C_{j_3j_1j_1}\zeta_{j_3}^{(i_3)}=$$

$$=\sum_{j_3=2,j_3-\text{even}}^{2p_1+2}\sum_{j_1=0}^{p_1}C_{j_3j_1j_1}\zeta_{j_3}^{(i_3)}. \tag{29}$$

We replaced $(j_3-2)/2$ by zero on the right-hand side of the formula (29), since $C_{j_3j_1j_1}=0$ for $0\le j_1<(j_3-2)/2$.

Let us substitute (29) into (28)

$$\sum_{j_1=0}^{p_1}\sum_{j_3=0}^{p_3}C_{j_3j_1j_1}\zeta_{j_3}^{(i_3)}=\sum_{j_1=0}^{p_1}C_{0j_1j_1}\zeta_0^{(i_3)}+\frac{(T-t)^{3/2}}{4\sqrt{3}}\zeta_1^{(i_3)}+$$

$$+\sum_{j_3=2,j_3-\text{even}}^{2p_1+2}\sum_{j_1=0}^{p_1}C_{j_3j_1j_1}\zeta_{j_3}^{(i_3)}. \tag{30}$$

It is easy to see that the right-hand side of the formula (30) does not depend on p_3.

If we prove that

$$\lim_{p_1\to\infty}\mathsf{M}\left\{\left(\sum_{j_1=0}^{p_1}\sum_{j_3=0}^{p_3}C_{j_3j_1j_1}\zeta_{j_3}^{(i_3)}-\frac{1}{4}(T-t)^{3/2}\left(\zeta_0^{(i_3)}+\frac{1}{\sqrt{3}}\zeta_1^{(i_3)}\right)\right)^2\right\}=0, \tag{31}$$

then the relaion (20) will be proved.

Using (30) and (23), we can write the left-hand side of (31) in the following form

$$\lim_{p_1\to\infty}\mathsf{M}\left\{\left(\left(\sum_{j_1=0}^{p_1}C_{0j_1j_1}-\frac{(T-t)^{3/2}}{4}\right)\zeta_0^{(i_3)}+\sum_{j_3=2,j_3-\text{even}}^{2p_1+2}\sum_{j_1=0}^{p_1}C_{j_3j_1j_1}\zeta_{j_3}^{(i_3)}\right)^2\right\}=$$

$$=\lim_{p_1\to\infty}\left(\sum_{j_1=0}^{p_1}C_{0j_1j_1}-\frac{(T-t)^{3/2}}{4}\right)^2+\lim_{p_1\to\infty}\sum_{j_3=2,j_3-\text{even}}^{2p_1+2}\left(\sum_{j_1=0}^{p_1}C_{j_3j_1j_1}\right)^2=$$

$$=\lim_{p_1\to\infty}\sum_{j_3=2,j_3-\text{even}}^{2p_1+2}\left(\sum_{j_1=0}^{p_1}C_{j_3j_1j_1}\right)^2. \tag{32}$$

If we prove that

$$\lim_{p_1\to\infty}\sum_{j_3=2,j_3-\text{even}}^{2p_1+2}\left(\sum_{j_1=0}^{p_1}C_{j_3j_1j_1}\right)^2=0, \tag{33}$$

then the relation (20) will be proved.

We have

$$\sum_{j_3=2,j_3-\text{even}}^{2p_1+2}\left(\sum_{j_1=0}^{p_1}C_{j_3j_1j_1}\right)^2=$$

$$=\frac{1}{4}\sum_{j_3=2,j_3-\text{even}}^{2p_1+2}\left(\int\limits_t^T\phi_{j_3}(s)\sum_{j_1=0}^{p_1}\left(\int\limits_t^s\phi_{j_1}(s_1)ds_1\right)^2ds\right)^2=$$

$$=\frac{1}{4}\sum_{j_3=2,j_3-\text{even}}^{2p_1+2}\left(\int\limits_t^T\phi_{j_3}(s)\left((s-t)-\sum_{j_1=p_1+1}^{\infty}\left(\int\limits_t^s\phi_{j_1}(s_1)ds_1\right)^2\right)ds\right)^2=$$

$$=\frac{1}{4}\sum_{j_3=2,j_3-\text{even}}^{2p_1+2}\left(\int\limits_t^T\phi_{j_3}(s)\sum_{j_1=p_1+1}^{\infty}\left(\int\limits_t^s\phi_{j_1}(s_1)ds_1\right)^2ds\right)^2\le$$

$$\le\frac{1}{4}\sum_{j_3=2,j_3-\text{even}}^{2p_1+2}\left(\int\limits_t^T|\phi_{j_3}(s)|\sum_{j_1=p_1+1}^{\infty}\left(\int\limits_t^s\phi_{j_1}(s_1)ds_1\right)^2ds\right)^2. \tag{34}$$

Obtaining (34), we used the Parseval equality in the form

$$\sum_{j_1=0}^{\infty}\left(\int\limits_t^s\phi_{j_1}(s_1)ds_1\right)^2=\int\limits_t^T\left(\mathbf{1}_{\{s_1<s\}}\right)^2ds_1=s-t \tag{35}$$

and a property of othogonality of the Legendre polynomials

$$\int\limits_t^T\phi_{j_3}(s)(s-t)ds=0,\quad j_3\ge 2. \tag{36}$$

Then we have for $j_1\in\mathbb{N}$

$$\left(\int\limits_t^s\phi_{j_1}(s_1)ds_1\right)^2=\frac{(T-t)(2j_1+1)}{4}\left(\int\limits_{-1}^{z(s)}P_{j_1}(y)dy\right)^2=$$

$$=\frac{T-t}{4(2j_1+1)}\left(\int\limits_{-1}^{z(s)}\left(P_{j_1+1}^{'}(y)-P_{j_1-1}^{'}(y)\right)dy\right)^2=$$

$$=\frac{T-t}{4(2j_1+1)}\left(P_{j_1+1}\left(z(s)\right)-P_{j_1-1}\left(z(s)\right)\right)^2\le$$

$$\le\frac{T-t}{2(2j_1+1)}\left(P_{j_1+1}^2\left(z(s)\right)+P_{j_1-1}^2\left(z(s)\right)\right). \tag{37}$$

For the Legendre polynomials the following well-known estimate is correct

$$|P_n(y)|<\frac{K}{\sqrt{n+1}(1-y^2)^{1/4}},\quad y\in(-1,1),\quad n\in\mathbb{N}, \tag{38}$$

where constant K does not depend on y and n.

The estimate (38) can be written for the function $\phi_n(s)$ in the following form

$$|\phi_n(s)|<\sqrt{\frac{2n+1}{n+1}}\frac{K}{\sqrt{T-t}}\frac{1}{\left(1-z^2(s)\right)^{1/4}}<$$

$$<\frac{K_1}{\sqrt{T-t}}\frac{1}{\left(1-z^2(s)\right)^{1/4}}, \tag{39}$$

where $n\in\mathbb{N}$, $K_1=K\sqrt{2}$, $s\in(t,T)$.

Let us estimate the right-hand side of (37) using the estimate (38)

$$\left(\int\limits_t^s\phi_{j_1}(s_1)ds_1\right)^2<\frac{T-t}{2(2j_1+1)}\left(\frac{K^2}{j_1+2}+\frac{K^2}{j_1}\right)\frac{1}{(1-(z(s))^2)^{1/2}}<$$

$$<\frac{(T-t)K^2}{2j_1^2}\frac{1}{(1-(z(s))^2)^{1/2}}, \tag{40}$$

where $j_1\in\mathbb{N}$, $s\in(t,T)$.

Substituting the estimate (40) into the relation (34) and using in (34) the estimate (39) for $|\phi_{j_3}(s)|$, we obtain

$$\sum_{j_3=2,j_3-\text{even}}^{2p_1+2}\left(\sum_{j_1=0}^{p_1}C_{j_3j_1j_1}\right)^2<$$

$$<\frac{(T-t)K^4K_1^2}{16}\sum_{j_3=2,j_3-\text{even}}^{2p_1+2}\left(\int\limits_t^T\frac{ds}{\left(1-(z(s))^2\right)^{3/4}}\sum_{j_1=p_1+1}^{\infty}\frac{1}{j_1^2}\right)^2=$$

$$= \frac{(T-t)^3 K^4 K_1^2 (p_1+1)}{64} \left(\int_{-1}^{1} \frac{dy}{(1-y^2)^{3/4}} \right)^2 \left(\sum_{j_1=p_1+1}^{\infty} \frac{1}{j_1^2} \right)^2. \tag{41}$$

Since

$$\int_{-1}^{1} \frac{dy}{(1-y^2)^{3/4}} < \infty \tag{42}$$

and

$$\sum_{j_1=p_1+1}^{\infty} \frac{1}{j_1^2} \le \int_{p_1}^{\infty} \frac{dx}{x^2} = \frac{1}{p_1}, \tag{43}$$

then from (41) we obtain

$$\sum_{j_3=2, j_3-\text{even}}^{2p_1+2} \left(\sum_{j_1=0}^{p_1} C_{j_3 j_1 j_1} \right)^2 < \frac{C(T-t)^3 (p_1+1)}{p_1^2} \ \to\ 0 \quad \text{if} \ \ p_1 \to \infty, \tag{44}$$

where constant C does not depend on p_1 and $T-t$. From (44) it follows (33), and the relation (33) implies the formula (20).

Let us prove the equaity (21). First let us prove that

$$\sum_{j_3=0}^{\infty} C_{j_3 j_3 0} = \frac{1}{4}(T-t)^{3/2}, \tag{45}$$

$$\sum_{j_3=0}^{\infty} C_{j_3 j_3 j_1} = -\frac{1}{4\sqrt{3}}(T-t)^{3/2}. \tag{46}$$

We have

$$\sum_{j_3=0}^{\infty} C_{j_3 j_3 0} = C_{000} + \sum_{j_3=1}^{\infty} C_{j_3 j_3 0},$$

$$C_{000} = \frac{(T-t)^{3/2}}{6},$$

$$C_{j_3 j_3 0} = \frac{(T-t)^{3/2}}{16(2j_3+1)} \int_{-1}^{1} \left(P_{j_3+1}^2(y) + P_{j_3-1}^2(y) \right) dy =$$

$$= \frac{(T-t)^{3/2}}{8(2j_3+1)} \left(\frac{1}{2j_3+3} + \frac{1}{2j_3-1} \right), \quad j_3 \ge 1.$$

Then

$$\sum_{j_3=0}^{\infty} C_{j_3 j_3 0} = \frac{(T-t)^{3/2}}{6} + \frac{(T-t)^{3/2}}{8} \left(\sum_{j_3=1}^{\infty} \frac{1}{(2j_3+1)(2j_3+3)} + \sum_{j_3=1}^{\infty} \frac{1}{4j_3^2-1} \right) =$$

$$= \frac{(T-t)^{3/2}}{6} + \frac{(T-t)^{3/2}}{8} \left(\sum_{j_3=1}^{\infty} \frac{1}{4j_3^2-1} - \frac{1}{3} + \sum_{j_3=1}^{\infty} \frac{1}{4j_3^2-1} \right) =$$

$$= \frac{(T-t)^{3/2}}{6} + \frac{(T-t)^{3/2}}{8} \left(\frac{1}{2} - \frac{1}{3} + \frac{1}{2} \right) = \frac{(T-t)^{3/2}}{4}.$$

The relation (45) is proved. Let us check the equality (46). We have

$$C_{j_3 j_3 j_1} = \int\limits_t^T \phi_{j_3}(s) \int\limits_t^s \phi_{j_3}(s_1) \int\limits_t^{s_1} \phi_{j_1}(s_2) ds_2 ds_1 ds =$$

$$= \int\limits_t^T \phi_{j_1}(s_2) ds_2 \int\limits_{s_2}^T \phi_{j_3}(s_1) ds_1 \int\limits_{s_1}^T \phi_{j_3}(s) ds =$$

$$= \frac{1}{2} \int\limits_t^T \phi_{j_1}(s_2) \left(\int\limits_{s_2}^T \phi_{j_3}(s_1) ds_1 \right)^2 ds_2 =$$

$$= \frac{(T-t)^{3/2}(2j_3+1)\sqrt{2j_1+1}}{16} \int\limits_{-1}^{1} P_{j_1}(y) \left(\int\limits_y^1 P_{j_3}(y_1) dy_1 \right)^2 dy, \quad j_3 \ge 1. \tag{47}$$

Since the functions

$$\left(\int\limits_y^1 P_{j_3}(y_1) dy_1 \right)^2, \quad j_3 \ge 1$$

are even, then the functions

$$P_1(y) \left(\int\limits_y^1 P_{j_3}(y_1) dy_1 \right)^2 dy, \quad j_3 \ge 1$$

are uneven. It means that $C_{j_3 j_3 1} = 0$ $(j_3 \ge 1)$.

Moreover,

$$C_{001} = \frac{\sqrt{3}(T-t)^{3/2}}{16} \int\limits_{-1}^{1} y(1-y)^2 dy = -\frac{(T-t)^{3/2}}{4\sqrt{3}}.$$

Then

$$\sum_{j_3=0}^{\infty} C_{j_3 j_3 1} = C_{001} + \sum_{j_3=1}^{\infty} C_{j_3 j_3 1} = -\frac{(T-t)^{3/2}}{4\sqrt{3}}.$$

The relation (46) is proved.

Using the obtained results, we have

$$\sum_{j_1=0}^{p_1}\sum_{j_3=0}^{p_3} C_{j_3j_3j_1}\zeta_{j_1}^{(i_1)} = \sum_{j_3=0}^{p_3} C_{j_3j_30}\zeta_0^{(i_1)} - \frac{(T-t)^{3/2}}{4\sqrt{3}}\zeta_1^{(i_1)} + \sum_{j_3=0}^{p_3}\sum_{j_1=2}^{p_1} C_{j_3j_3j_1}\zeta_{j_1}^{(i_1)} =$$

$$= \sum_{j_3=0}^{p_3} C_{j_3j_30}\zeta_0^{(i_1)} - \frac{(T-t)^{3/2}}{4\sqrt{3}}\zeta_1^{(i_1)} + \sum_{j_3=0}^{p_3}\ \sum_{j_1=2, j_1-\text{even}}^{2j_3+2} C_{j_3j_3j_1}\zeta_{j_1}^{(i_1)}. \tag{48}$$

Since

$$C_{j_3j_3j_1} = \frac{(T-t)^{3/2}(2j_3+1)\sqrt{2j_1+1}}{16}\int\limits_{-1}^{1} P_{j_1}(y)\left(\int\limits_{y}^{1} P_{j_3}(y_1)dy_1\right)^2 dy, \quad j_3 \ge 1,$$

and degree of the polynomial

$$\left(\int\limits_{y}^{1} P_{j_3}(y_1)dy_1\right)^2$$

equals to $2j_3+2$, then $C_{j_3j_3j_1}=0$ for $j_1 > 2j_3+2$. It explains the circumstance that we put $2j_3+2$ instead of p_1 on the right-hand side of the formula (48).

Moreover, the function

$$\left(\int\limits_{y}^{1} P_{j_3}(y_1)dy_1\right)^2$$

is even. It means that the function

$$P_{j_1}(y)\left(\int\limits_{y}^{1} P_{j_3}(y_1)dy_1\right)^2$$

is uneven for uneven j_1. It means that $C_{j_3j_3j_1}=0$ for uneven j_1. It explains the summation with respect to even j_1 on the right-hand side of (48).

Then we have

$$\sum_{j_3=0}^{p_3}\ \sum_{j_1=2, j_1-\text{even}}^{2j_3+2} C_{j_3j_3j_1}\zeta_{j_1}^{(i_1)} = \sum_{j_1=2, j_1-\text{even}}^{2p_3+2}\ \sum_{j_3=(j_1-2)/2}^{p_3} C_{j_3j_3j_1}\zeta_{j_1}^{(i_1)} =$$

$$= \sum_{j_1=2, j_1-\text{even}}^{2p_3+2}\ \sum_{j_3=0}^{p_3} C_{j_3j_3j_1}\zeta_{j_1}^{(i_1)}. \tag{49}$$

We replaced $(j_1-2)/2$ by zero on the right-hand side of (49), since $C_{j_3j_3j_1}=0$ for $0 \le j_3 < (j_1-2)/2$.

Let us substitute (49) into (48)

$$\sum_{j_1=0}^{p_1}\sum_{j_3=0}^{p_3} C_{j_3j_3j_1}\zeta_{j_1}^{(i_1)} = \sum_{j_3=0}^{p_3} C_{j_3j_30}\zeta_0^{(i_1)} - \frac{(T-t)^{3/2}}{4\sqrt{3}}\zeta_1^{(i_1)} +$$

$$+\sum_{j_1=2,j_1-\text{even}}^{2p_3+2}\ \sum_{j_3=0}^{p_3} C_{j_3j_3j_1}\zeta_{j_1}^{(i_1)}. \tag{50}$$

It is easy to see that the right-hand side of the formula (50) does not depend on p_1.

If we prove that

$$\lim_{p_3\to\infty} \mathsf{M}\left\{\left(\sum_{j_1=0}^{p_1}\sum_{j_3=0}^{p_3} C_{j_3j_3j_1}\zeta_{j_1}^{(i_1)} - \frac{1}{4}(T-t)^{3/2}\left(\zeta_0^{(i_1)} - \frac{1}{\sqrt{3}}\zeta_1^{(i_1)}\right)\right)^2\right\} = 0, \tag{51}$$

then (21) will be proved.

Using (50) and (45), (46), we can write the left-hand side of the formula (51) in the following form

$$\lim_{p_3\to\infty} \mathsf{M}\left\{\left(\left(\sum_{j_3=0}^{p_3} C_{j_3j_30} - \frac{(T-t)^{3/2}}{4}\right)\zeta_0^{(i_1)} + \sum_{j_1=2,j_1-\text{even}}^{2p_3+2}\ \sum_{j_3=0}^{p_3} C_{j_3j_3j_1}\zeta_{j_1}^{(i_1)}\right)^2\right\} =$$

$$= \lim_{p_3\to\infty}\left(\sum_{j_3=0}^{p_1} C_{j_3j_30} - \frac{(T-t)^{3/2}}{4}\right)^2 + \lim_{p_3\to\infty}\sum_{j_1=2,j_1-\text{even}}^{2p_3+2}\left(\sum_{j_3=0}^{p_3} C_{j_3j_3j_1}\right)^2 =$$

$$= \lim_{p_3\to\infty}\sum_{j_1=2,j_1-\text{even}}^{2p_3+2}\left(\sum_{j_3=0}^{p_3} C_{j_3j_3j_1}\right)^2.$$

If we prove that

$$\lim_{p_3\to\infty}\sum_{j_1=2,j_1-\text{even}}^{2p_3+2}\left(\sum_{j_3=0}^{p_3} C_{j_3j_3j_1}\right)^2 = 0, \tag{52}$$

then the relation (21) will be proved.

From (47) we obtain

$$\sum_{j_1=2,j_1-\text{even}}^{2p_3+2}\left(\sum_{j_3=0}^{p_3} C_{j_3j_3j_1}\right)^2 =$$

$$= \frac{1}{4}\sum_{j_1=2,j_1-\text{even}}^{2p_3+2}\left(\int\limits_t^T \phi_{j_1}(s_2)\sum_{j_3=0}^{p_3}\left(\int\limits_{s_2}^T \phi_{j_3}(s_1)ds_1\right)^2 ds_2\right)^2 =$$

$$
= \frac{1}{4} \sum_{j_1=2, j_1-\text{even}}^{2p_3+2} \left(\int\limits_t^T \phi_{j_1}(s_2) \left((T-s_2) - \sum_{j_3=p_3+1}^{\infty} \left(\int\limits_{s_2}^T \phi_{j_3}(s_1) ds_1 \right)^2 \right) ds_2 \right)^2 =
$$

$$
= \frac{1}{4} \sum_{j_1=2, j_1-\text{even}}^{2p_3+2} \left(\int\limits_t^T \phi_{j_1}(s_2) \sum_{j_3=p_3+1}^{\infty} \left(\int\limits_{s_2}^T \phi_{j_3}(s_1) ds_1 \right)^2 ds_2 \right)^2 \le
$$

$$
\le \frac{1}{4} \sum_{j_1=2, j_1-\text{even}}^{2p_3+2} \left(\int\limits_t^T |\phi_{j_1}(s_2)| \sum_{j_3=p_3+1}^{\infty} \left(\int\limits_{s_2}^T \phi_{j_3}(s_1) ds_1 \right)^2 ds_2 \right)^2. \tag{53}
$$

In order to get (53) we used the Parseval equality in the form

$$
\sum_{j_1=0}^{\infty} \left(\int\limits_s^T \phi_{j_1}(s_1) ds_1 \right)^2 = \int\limits_t^T \left(\mathbf{1}_{\{s<s_1\}} \right)^2 ds_1 = T - s \tag{54}
$$

and a property of othogonality of the Legendre polynomials

$$
\int\limits_t^T \phi_{j_3}(s)(T-s) ds = 0, \quad j_3 \ge 2. \tag{55}
$$

Then we have for $j_3 \in \mathbb{N}$

$$
\left(\int\limits_{s_2}^T \phi_{j_3}(s_1) ds_1 \right)^2 = \frac{(T-t)}{4(2j_3+1)} \left(P_{j_3+1}(z(s_2)) - P_{j_3-1}(z(s_2)) \right)^2 \le
$$

$$
\le \frac{T-t}{2(2j_3+1)} \left(P_{j_3+1}^2(z(s_2)) + P_{j_3-1}^2(z(s_2)) \right) <
$$

$$
< \frac{T-t}{2(2j_3+1)} \left(\frac{K^2}{j_3+2} + \frac{K^2}{j_3} \right) \frac{1}{(1-(z(s_2))^2)^{1/2}} <
$$

$$
< \frac{(T-t)K^2}{2j_3^2} \frac{1}{(1-(z(s_2))^2)^{1/2}}, \quad s \in (t, T). \tag{56}
$$

In order to get (56) we used the estimate (38).

Substituting the estimate (56) into the relation (53) and using in (53) the estimate (39) for $|\phi_{j_1}(s_2)|$, we obtain

$$
\sum_{j_1=2, j_1-\text{even}}^{2p_3+2} \left(\sum_{j_3=0}^{p_3} C_{j_3 j_3 j_1} \right)^2 <
$$

$$< \frac{(T-t)K^4K_1^2}{16}\sum_{j_1=2,j_1-\text{even}}^{2p_3+2}\left(\int\limits_t^T\frac{ds_2}{(1-z^2(s_2))^{3/4}}\sum_{j_3=p_3+1}^{\infty}\frac{1}{j_3^2}\right)^2 =$$

$$= \frac{(T-t)^3K^4K_1^2(p_3+1)}{64}\left(\int\limits_{-1}^{1}\frac{dy}{(1-y^2)^{3/4}}\right)^2\left(\sum_{j_3=p_3+1}^{\infty}\frac{1}{j_3^2}\right)^2. \tag{57}$$

Using (42) and (43) in (57), we get

$$\sum_{j_1=2,j_1-\text{even}}^{2p_3+2}\left(\sum_{j_3=0}^{p_3}C_{j_3j_3j_1}\right)^2 < \frac{C(T-t)^3(p_3+1)}{p_3^2} \quad\to\ 0 \quad \text{with} \quad p_3\to\infty, \tag{58}$$

where constant C does not depend on p_3 and $T-t$.

From (58) it follows (52), and the relation (52) implies the formula (21). The relation (21) is proved.

Let us prove the equality (22). Since $\psi_1(\tau)$, $\psi_2(\tau)$, $\psi_3(\tau)\equiv 1$, then the following relation for the Fourier coefficients is correct

$$C_{j_1j_1j_3}+C_{j_1j_3j_1}+C_{j_3j_1j_1}=\frac{1}{2}C_{j_1}^2C_{j_3},$$

where $C_j=0$ for $j\ge 1$ and $C_0=\sqrt{T-t}$. Then w. p. 1

$$\underset{p_1,p_3\to\infty}{\text{l.i.m.}}\sum_{j_1=0}^{p_1}\sum_{j_3=0}^{p_3}C_{j_1j_3j_1}\zeta_{j_3}^{(i_2)}=\underset{p_1,p_3\to\infty}{\text{l.i.m.}}\sum_{j_1=0}^{p_1}\sum_{j_3=0}^{p_3}\left(\frac{1}{2}C_{j_1}^2C_{j_3}-C_{j_1j_1j_3}-C_{j_3j_1j_1}\right)\zeta_{j_3}^{(i_2)}. \tag{59}$$

Therefore, considering (20) and (21), we can write w. p. 1

$$\underset{p_1,p_3\to\infty}{\text{l.i.m.}}\sum_{j_1=0}^{p_1}\sum_{j_3=0}^{p_3}C_{j_1j_3j_1}\zeta_{j_3}^{(i_2)}=$$

$$=\frac{1}{2}C_0^3\zeta_0^{(i_2)}-\underset{p_1,p_3\to\infty}{\text{l.i.m.}}\sum_{j_1=0}^{p_1}\sum_{j_3=0}^{p_3}C_{j_1j_1j_3}\zeta_{j_3}^{(i_2)}-\underset{p_1,p_3\to\infty}{\text{l.i.m.}}\sum_{j_1=0}^{p_1}\sum_{j_3=0}^{p_3}C_{j_3j_1j_1}\zeta_{j_3}^{(i_2)}=$$

$$=\frac{1}{2}(T-t)^{3/2}\zeta_0^{(i_2)}-\frac{1}{4}(T-t)^{3/2}\left(\zeta_0^{(i_2)}-\frac{1}{\sqrt{3}}\zeta_1^{(i_2)}\right)-$$

$$-\frac{1}{4}(T-t)^{3/2}\left(\zeta_0^{(i_2)}+\frac{1}{\sqrt{3}}\zeta_1^{(i_2)}\right)=0. \tag{60}$$

The relation (22) is proved. Theorem 3 is proved.

It is easy to see that the formula (19) can be proved for the case $i_1=i_2=i_3$ using the Ito formula

$$\int_t^{*T}\int_t^{*t_3}\int_t^{*t_2} d\mathbf{f}_{t_1}^{(i_1)}d\mathbf{f}_{t_2}^{(i_1)}d\mathbf{f}_{t_3}^{(i_1)} = \frac{1}{6}\left(\int_t^T d\mathbf{f}_s^{(i_1)}\right)^3 = \frac{1}{6}\left(C_0\zeta_0^{(i_1)}\right)^3 =$$

$$= C_{000}\zeta_0^{(i_1)}\zeta_0^{(i_1)}\zeta_0^{(i_1)},$$

where the equality is fulfilled w. p. 1.

5. Generalization of Theorem 3

Let us consider the following generalization of Theorem 3.

Theorem 4 [15]-[19], [22], [24]-[27]. *Suppose that* $\{\phi_j(x)\}_{j=0}^{\infty}$ *is a complete orthonormal system of Legendre polynomials in the space* $L_2([t,T])$. *Then, for the iterated Stratonovich stochastic integral of third multiplicity*

$$I_{l_1 l_2 l_3 T,t}^{*(i_1 i_2 i_3)} = \int_t^{*T}(t-t_3)^{l_3}\int_t^{*t_3}(t-t_2)^{l_2}\int_t^{*t_2}(t-t_1)^{l_1}d\mathbf{f}_{t_1}^{(i_1)}d\mathbf{f}_{t_2}^{(i_2)}d\mathbf{f}_{t_3}^{(i_3)}\quad (i_1,i_2,i_3=1,\ldots,m)$$

the following expansion

$$I_{l_1 l_2 l_3 T,t}^{*(i_1 i_2 i_3)} = \underset{p_1,p_2,p_3\to\infty}{\text{l.i.m.}}\sum_{j_1=0}^{p_1}\sum_{j_2=0}^{p_2}\sum_{j_3=0}^{p_3} C_{j_3 j_2 j_1}\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}\zeta_{j_3}^{(i_3)} \tag{61}$$

converging in the mean-square sense is valid for each of the following cases

1. $i_1\ne i_2,\ i_2\ne i_3,\ i_1\ne i_3$ *and* $l_1,l_2,l_3=0,1,2,\ldots$
2. $i_1=i_2\ne i_3$ *and* $l_1=l_2\ne l_3$ *and* $l_1,l_2,l_3=0,1,2,\ldots$
3. $i_1\ne i_2=i_3$ *and* $l_1\ne l_2=l_3$ *and* $l_1,l_2,l_3=0,1,2,\ldots$
4. $i_1,i_2,i_3=1,\ldots,m$; $l_1=l_2=l_3=l$ *and* $l=0,1,2,\ldots,$

where

$$C_{j_3 j_2 j_1} = \int_t^T (t-s)^{l_3}\phi_{j_3}(s)\int_t^s (t-s_1)^{l_2}\phi_{j_2}(s_1)\int_t^{s_1}(t-s_2)^{l_1}\phi_{j_1}(s_2)ds_2 ds_1 ds.$$

Proof. Case 1 directly follows from (11).

Let us consider Case 2 ($i_1=i_2\ne i_3,\ l_1=l_2=l\ne l_3$ and $l_1,l_3=0,1,2,\ldots$). So, we prove the following expansion

$$I_{l_1 l_1 l_3 T,t}^{*(i_1 i_1 i_3)} = \underset{p_1,p_2,p_3\to\infty}{\text{l.i.m.}}\sum_{j_1=0}^{p_1}\sum_{j_2=0}^{p_2}\sum_{j_3=0}^{p_3} C_{j_3 j_2 j_1}\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_1)}\zeta_{j_3}^{(i_3)}\quad (i_1,i_2,i_3=1,\ldots,m), \tag{62}$$

where $l,l_3=0,1,2,\ldots$, and

$$C_{j_3j_2j_1}=\int\limits_t^T\phi_{j_3}(s)(t-s)^{l_3}\int\limits_t^s(t-s_1)^l\phi_{j_2}(s_1)\int\limits_t^{s_1}(t-s_2)^l\phi_{j_1}(s_2)ds_2ds_1ds. \tag{63}$$

If we prove w. p. 1 the formula

$$\underset{p_1,p_3\to\infty}{\text{l.i.m.}}\sum_{j_1=0}^{p_1}\sum_{j_3=0}^{p_3}C_{j_3j_1j_1}\zeta_{j_3}^{(i_3)}=\frac{1}{2}\int\limits_t^T(t-s)^{l_3}\int\limits_t^s(t-s_1)^{2l}ds_1d\mathbf{f}_s^{(i_3)}, \tag{64}$$

where coefficients $C_{j_3j_1j_1}$ has the form (63), then using Theorems 1, 2 and standard relations between iterated Ito and Stratonovich stochastic integrals we obtain the expansion (62).

Using Theorems 1 and 2, we can write

$$\frac{1}{2}\int\limits_t^T(t-s)^{l_3}\int\limits_t^s(t-s_1)^{2l}ds_1d\mathbf{f}_s^{(i_3)}=\frac{1}{2}\sum_{j_3=0}^{2l+l_3+1}\tilde{C}_{j_3}\zeta_{j_3}^{(i_3)}\quad \text{w. p. 1},$$

where

$$\tilde{C}_{j_3}=\int\limits_t^T\phi_{j_3}(s)(t-s)^{l_3}\int\limits_t^s(t-s_1)^{2l}ds_1ds.$$

Then

$$\sum_{j_3=0}^{p_3}\sum_{j_1=0}^{p_1}C_{j_3j_1j_1}\zeta_{j_3}^{(i_3)}-\frac{1}{2}\sum_{j_3=0}^{2l+l_3+1}\tilde{C}_{j_3}\zeta_{j_3}^{(i_3)}=$$

$$=\sum_{j_3=0}^{2l+l_3+1}\left(\sum_{j_1=0}^{p_1}C_{j_3j_1j_1}-\frac{1}{2}\tilde{C}_{j_3}\right)\zeta_{j_3}^{(i_3)}+\sum_{j_3=2l+l_3+2}^{p_3}\sum_{j_1=0}^{p_1}C_{j_3j_1j_1}\zeta_{j_3}^{(i_3)}.$$

Therefore,

$$\lim_{p_1,p_3\to\infty}\mathsf{M}\left\{\left(\sum_{j_3=0}^{p_3}\sum_{j_1=0}^{p_1}C_{j_3j_1j_1}\zeta_{j_3}^{(i_3)}-\frac{1}{2}\int\limits_t^T(t-s)^{l_3}\int\limits_t^s(t-s_1)^{2l}ds_1d\mathbf{f}_s^{(i_3)}\right)^2\right\}=$$

$$=\lim_{p_1\to\infty}\sum_{j_3=0}^{2l+l_3+1}\left(\sum_{j_1=0}^{p_1}C_{j_3j_1j_1}-\frac{1}{2}\tilde{C}_{j_3}\right)^2+\lim_{p_1,p_3\to\infty}\mathsf{M}\left\{\left(\sum_{j_3=2l+l_3+2}^{p_3}\sum_{j_1=0}^{p_1}C_{j_3j_1j_1}\zeta_{j_3}^{(i_3)}\right)^2\right\}. \tag{65}$$

Let us prove that

$$\lim_{p_1\to\infty}\left(\sum_{j_1=0}^{p_1}C_{j_3j_1j_1}-\frac{1}{2}\tilde{C}_{j_3}\right)^2=0. \tag{66}$$

We have

$$\left(\sum_{j_1=0}^{p_1} C_{j_3 j_1 j_1} - \frac{1}{2}\tilde{C}_{j_3}\right)^2 =$$

$$= \left(\frac{1}{2}\sum_{j_1=0}^{p_1}\int_t^T \phi_{j_3}(s)(t-s)^{l_3}\left(\int_t^s \phi_{j_1}(s_1)(t-s_1)^l ds_1\right)^2 ds - \frac{1}{2}\int_t^T \phi_{j_3}(s)(t-s)^{l_3}\int_t^s (t-s_1)^{2l} ds_1 ds\right)^2$$

$$= \frac{1}{4}\left(\int_t^T \phi_{j_3}(s)(t-s)^{l_3}\left(\sum_{j_1=0}^{p_1}\left(\int_t^s \phi_{j_1}(s_1)(t-s_1)^l ds_1\right)^2 - \int_t^s (t-s_1)^{2l} ds_1\right) ds\right)^2 =$$

$$= \frac{1}{4}\left(\int_t^T \phi_{j_3}(s)(t-s)^{l_3}\left(\int_t^s (t-s_1)^{2l} ds_1 - \sum_{j_1=p_1+1}^{\infty}\left(\int_t^s \phi_{j_1}(s_1)(t-s_1)^l ds_1\right)^2 - \right.\right.$$

$$\left.\left. - \int_t^s (t-s_1)^{2l} ds_1\right) ds\right)^2 =$$

$$= \frac{1}{4}\left(\int_t^T \phi_{j_3}(s)(t-s)^{l_3}\sum_{j_1=p_1+1}^{\infty}\left(\int_t^s \phi_{j_1}(s_1)(t-s_1)^l ds_1\right)^2 ds\right)^2. \tag{67}$$

In order to get (67) we used the Parseval equality, which looks as follows

$$\sum_{j_1=0}^{\infty}\left(\int_t^s \phi_{j_1}(s_1)(t-s_1)^l ds_1\right)^2 = \int_t^T K^2(s,s_1) ds_1, \tag{68}$$

where

$$K(s,s_1) = (t-s_1)^l \mathbf{1}_{\{s_1<s\}}, \quad s, s_1 \in [t,T].$$

Taking into account the nondecreasing of the functional sequence

$$u_n(s) = \sum_{j_1=0}^{n}\left(\int_t^s \phi_{j_1}(s_1)(t-s_1)^l ds_1\right)^2,$$

continuity of its members and continuity of the limit function

$$u(s) = \int_t^s (t-s_1)^{2l} ds_1$$

at the interval $[t,T]$ in accordance with the Dini Theorem we have uniform convergence of the functional sequences $u_n(s)$ to the limit function $u(s)$ at the interval $[t,T]$.

From (67) using the inequality of Cauchy–Bunyakovsky, we obtain

$$\left(\sum_{j_1=0}^{p_1} C_{j_3j_1j_1} - \frac{1}{2}\tilde{C}_{j_3}\right)^2 \le$$

$$\le \frac{1}{4}\int\limits_t^T \phi_{j_3}^2(s)(t-s)^{2l_3}ds \int\limits_t^T \left(\sum_{j_1=p_1+1}^{\infty}\left(\int\limits_t^s \phi_{j_1}(s_1)(t-s_1)^l ds_1\right)^2\right)^2 ds \le$$

$$\le \frac{1}{4}\varepsilon^2 (T-t)^{2l_3}\int\limits_t^T \phi_{j_3}^2(s)ds(T-t) = \frac{1}{4}(T-t)^{2l_3+1}\varepsilon^2 \tag{69}$$

when $p_1 > N(\varepsilon)$, where $N(\varepsilon)$ exists for any $\varepsilon > 0$. From (69) it follows (66).

Further,

$$\sum_{j_1=0}^{p_1}\sum_{j_3=2l+l_3+2}^{p_3} C_{j_3j_1j_1}\zeta_{j_3}^{(i_3)} = \sum_{j_1=0}^{p_1}\sum_{j_3=2l+l_3+2}^{2(j_1+l+1)+l_3} C_{j_3j_1j_1}\zeta_{j_3}^{(i_3)}. \tag{70}$$

We put $2(j_1+l+1)+l_3$ instead of p_3, since $C_{j_3j_1j_1} = 0$ for $j_3 > 2(j_1+l+1)+l_3$. This conclusion follows from the relation

$$C_{j_3j_1j_1} = \frac{1}{2}\int\limits_t^T \phi_{j_3}(s)(t-s)^{l_3}\left(\int\limits_t^s \phi_{j_1}(s_1)(t-s_1)^l ds_1\right)^2 ds =$$

$$= \frac{1}{2}\int\limits_t^T \phi_{j_3}(s)Q_{2(j_1+l+1)+l_3}(s)ds,$$

where $Q_{2(j_1+l+1)+l_3}(s)$ is a polynomial of the degree $2(j_1+l+1)+l_3$.

It is easy to see that

$$\sum_{j_1=0}^{p_1}\sum_{j_3=2l+l_3+2}^{2(j_1+l+1)+l_3} C_{j_3j_1j_1}\zeta_{j_3}^{(i_3)} = \sum_{j_3=2l+l_3+2}^{2(p_1+l+1)+l_3}\sum_{j_1=0}^{p_1} C_{j_3j_1j_1}\zeta_{j_3}^{(i_3)}. \tag{71}$$

Note that we included some zero coefficients $C_{j_3j_1j_1}$ into the sum $\sum\limits_{j_1=0}^{p_1}$. From (70) and (71) we have

$$\mathsf{M}\left\{\left(\sum_{j_1=0}^{p_1}\sum_{j_3=2l+l_3+2}^{p_3} C_{j_3j_1j_1}\zeta_{j_3}^{(i_3)}\right)^2\right\} =$$

$$= \mathsf{M}\left\{\left(\sum_{j_3=2l+l_3+2}^{2(p_1+l+1)+l_3}\sum_{j_1=0}^{p_1} C_{j_3j_1j_1}\zeta_{j_3}^{(i_3)}\right)^2\right\} = \sum_{j_3=2l+l_3+2}^{2(p_1+l+1)+l_3}\left(\sum_{j_1=0}^{p_1} C_{j_3j_1j_1}\right)^2 =$$

$$=\sum_{j_3=2l+l_3+2}^{2(p_1+l+1)+l_3}\left(\frac{1}{2}\sum_{j_1=0}^{p_1}\int\limits_t^T\phi_{j_3}(s)(t-s)^{l_3}\left(\int\limits_t^s\phi_{j_1}(s_1)(t-s_1)^l ds_1\right)^2 ds\right)^2=$$

$$=\frac{1}{4}\sum_{j_3=2l+l_3+2}^{2(p_1+l+1)+l_3}\left(\int\limits_t^T\phi_{j_3}(s)(t-s)^{l_3}\sum_{j_1=0}^{p_1}\left(\int\limits_t^s\phi_{j_1}(s_1)(t-s_1)^l ds_1\right)^2 ds\right)^2=$$

$$=\frac{1}{4}\sum_{j_3=2l+l_3+2}^{2(p_1+l+1)+l_3}\left(\int\limits_t^T\phi_{j_3}(s)(t-s)^{l_3}\left(\int\limits_t^s(t-s_1)^{2l}ds_1-\sum_{j_1=p_1+1}^{\infty}\left(\int\limits_t^s\phi_{j_1}(s_1)(t-s_1)^l ds_1\right)^2\right)ds\right)^2$$

$$=\frac{1}{4}\sum_{j_3=2l+l_3+2}^{2(p_1+l+1)+l_3}\left(\int\limits_t^T\phi_{j_3}(s)(t-s)^{l_3}\sum_{j_1=p_1+1}^{\infty}\left(\int\limits_t^s\phi_{j_1}(s_1)(t-s_1)^l ds_1\right)^2 ds\right)^2. \tag{72}$$

In order to get (72) we used the Parseval equality (68) and the following relation

$$\int\limits_t^T\phi_{j_3}(s)Q_{2l+1+l_3}(s)ds=0;\ \ j_3>2l+1+l_3,$$

where $Q_{2l+1+l_3}(s)$ is a polynomial of degree $2l+1+l_3$.

Further, we have for $j_1\in\mathbb{N}$

$$\left(\int\limits_t^s\phi_{j_1}(s_1)(t-s_1)^l ds_1\right)^2=\frac{(T-t)^{2l+1}(2j_1+1)}{2^{2l+2}}\left(\int\limits_{-1}^{z(s)}P_{j_1}(y)(1+y)^l dy\right)^2=$$

$$=\frac{(T-t)^{2l+1}}{2^{2l+2}(2j_1+1)}\left((1+z(s))^l R_{j_1}(s)-l\int\limits_{-1}^{z(s)}\left(P_{j_1+1}(y)-P_{j_1-1}(y)\right)(1+y)^{l-1}dy\right)^2\le$$

$$\le\frac{(T-t)^{2l+1}2}{2^{2l+2}(2j_1+1)}\left(\left(\frac{2(s-t)}{T-t}\right)^{2l}R_{j_1}^2(s)+l^2\left(\int\limits_{-1}^{z(s)}\left(P_{j_1+1}(y)-P_{j_1-1}(y)\right)(1+y)^{l-1}dy\right)^2\right)\le$$

$$\le\frac{(T-t)^{2l+1}}{2^{2l+1}(2j_1+1)}\left(2^{2l+1}Z_{j_1}(s)+l^2\int\limits_{-1}^{z(s)}(1+y)^{2l-2}dy\int\limits_{-1}^{z(s)}\left(P_{j_1+1}(y)-P_{j_1-1}(y)\right)^2dy\right)\le$$

$$\le\frac{(T-t)^{2l+1}}{2^{2l+1}(2j_1+1)}\left(2^{2l+1}Z_{j_1}(s)+\frac{2l^2}{2l-1}\left(\frac{2(s-t)}{T-t}\right)^{2l-1}\int\limits_{-1}^{z(s)}\left(P_{j_1+1}^2(y)+P_{j_1-1}^2(y)\right)dy\right)\le$$

$$\leq \frac{(T-t)^{2l+1}}{2(2j_1+1)}\left(2Z_{j_1}(s)+\frac{l^2}{2l-1}\int\limits_{-1}^{z(s)}\left(P_{j_1+1}^2(y)+P_{j_1-1}^2(y)\right)dy\right), \tag{73}$$

where

$$R_{j_1}(s)=P_{j_1+1}(z(s))-P_{j_1-1}(z(s)),$$

$$Z_{j_1}(s)=P_{j_1+1}^2(z(s))+P_{j_1-1}^2(z(s)).$$

Let us estimate the right-hand side of (73) using (38)

$$\left(\int\limits_t^s \phi_{j_1}(s_1)(t-s_1)^l ds_1\right)^2<$$

$$<\frac{(T-t)^{2l+1}}{2(2j_1+1)}\left(\frac{K^2}{j_1+2}+\frac{K^2}{j_1}\right)\left(\frac{2}{(1-(z(s))^2)^{1/2}}+\frac{l^2}{2l-1}\int\limits_{-1}^{z(s)}\frac{dy}{(1-y^2)^{1/2}}\right)<$$

$$<\frac{(T-t)^{2l+1}K^2}{2j_1^2}\left(\frac{2}{(1-(z(s))^2)^{1/2}}+\frac{l^2\pi}{2l-1}\right), \quad s\in(t,T). \tag{74}$$

From (72) and (74) we obtain

$$\mathsf{M}\left\{\left(\sum_{j_1=0}^{p_1}\sum_{j_3=2l+l_3+2}^{p_3}C_{j_3j_1j_1}\zeta_{j_3}^{(i_3)}\right)^2\right\}\leq$$

$$\leq\frac{1}{4}\sum_{j_3=2l+l_3+2}^{2(p_1+l+1)+l_3}\left(\int\limits_t^T|\phi_{j_3}(s)|(t-s)^{l_3}\sum_{j_1=p_1+1}^{\infty}\left(\int\limits_t^s\phi_{j_1}(s_1)(t-s_1)^l ds_1\right)^2 ds\right)^2\leq$$

$$\leq\frac{1}{4}(T-t)^{2l_3}\sum_{j_3=2l+l_3+2}^{2(p_1+l+1)+l_3}\left(\int\limits_t^T|\phi_{j_3}(s)|\sum_{j_1=p_1+1}^{\infty}\left(\int\limits_t^s\phi_{j_1}(s_1)(t-s_1)^l ds_1\right)^2 ds\right)^2<$$

$$<\frac{(T-t)^{4l+2l_3+1}K^4K_1^2}{16}\times$$

$$\times\sum_{j_3=2l+l_3+2}^{2(p_1+l+1)+l_3}\left(\left(\int\limits_t^T\frac{2ds}{\left(1-(z(s))^2\right)^{3/4}}+\frac{l^2\pi}{2l-1}\int\limits_t^T\frac{ds}{\left(1-(z(s))^2\right)^{1/4}}\right)\sum_{j_1=p_1+1}^{\infty}\frac{1}{j_1^2}\right)^2\leq$$

$$\le \frac{(T-t)^{4l+2l_3+3}K^4K_1^2}{64}\cdot\frac{2p_1+1}{p_1^2}\left(\int\limits_{-1}^{1}\frac{2dy}{(1-y^2)^{3/4}}+\frac{l^2\pi}{2l-1}\int\limits_{-1}^{1}\frac{dy}{(1-y^2)^{1/4}}\right)^2\le$$

$$\le (T-t)^{4l+2l_3+3}C\frac{2p_1+1}{p_1^2}\to 0\quad\text{when}\ \ p_1\ \to\ \infty, \tag{75}$$

where constant C does not depend on p_1 and $T-t$.

From (65), (66), and (75) it follows (64), and the relation (64) implies the formula (62).

Let us consider Case 3 ($i_2=i_3\ne i_1$, $l_2=l_3=l\ne l_1$, and $l_1,l_3=0,1,2,\ldots$). So, we prove the following expansion

$$I_{l_1l_3l_3T,t}^{*(i_1i_3i_3)}=\underset{p_1,p_2,p_3\to\infty}{\text{l.i.m.}}\sum_{j_1=0}^{p_1}\sum_{j_2=0}^{p_2}\sum_{j_3=0}^{p_3}C_{j_3j_2j_1}\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_3)}\zeta_{j_3}^{(i_3)}\quad(i_1,i_2,i_3=1,\ldots,m), \tag{76}$$

where $l,l_1=0,1,2,\ldots$, and

$$C_{j_3j_2j_1}=\int\limits_t^T\phi_{j_3}(s)(t-s)^l\int\limits_t^s(t-s_1)^l\phi_{j_2}(s_1)\int\limits_t^{s_1}(t-s_2)^{l_1}\phi_{j_1}(s_2)ds_2ds_1ds. \tag{77}$$

If we prove w. p. 1 the formula

$$\underset{p_1,p_3\to\infty}{\text{l.i.m.}}\sum_{j_1=0}^{p_1}\sum_{j_3=0}^{p_3}C_{j_3j_3j_1}\zeta_{j_1}^{(i_1)}=\frac{1}{2}\int\limits_t^T(t-s)^{2l}\int\limits_t^s(t-s_1)^{l_1}d\mathbf{f}_{s_1}^{(i_1)}ds, \tag{78}$$

where coefficients $C_{j_3j_3j_1}$ has the form (77), then using Theorems 1, 2 and standard relations between iterated Ito and Stratonovich stochastic integrals we obtain the expansion (76).

Using Theorems 1, 2 and the Ito formula we can write

$$\frac{1}{2}\int\limits_t^T(t-s)^{2l}\int\limits_t^s(t-s_1)^{l_1}d\mathbf{f}_{s_1}^{(i_1)}ds=\frac{1}{2}\int\limits_t^T(t-s_1)^{l_1}\int\limits_{s_1}^T(t-s)^{2l}dsd\mathbf{f}_{s_1}^{(i_1)}=$$

$$=\frac{1}{2}\sum_{j_1=0}^{2l+l_1+1}\tilde{C}_{j_1}\zeta_{j_1}^{(i_1)}\quad\text{w. p. 1},$$

where

$$\tilde{C}_{j_1}=\int\limits_t^T\phi_{j_1}(s_1)(t-s_1)^{l_1}\int\limits_{s_1}^T(t-s)^{2l}dsds_1.$$

Then

$$\sum_{j_1=0}^{p_1}\sum_{j_3=0}^{p_3}C_{j_3j_3j_1}\zeta_{j_1}^{(i_1)}-\frac{1}{2}\sum_{j_1=0}^{2l+l_1+1}\tilde{C}_{j_1}\zeta_{j_1}^{(i_1)}=$$

$$
=\sum_{j_1=0}^{2l+l_1+1}\left(\sum_{j_3=0}^{p_3}C_{j_3j_3j_1}-\frac{1}{2}\tilde{C}_{j_1}\right)\zeta_{j_1}^{(i_1)}+\sum_{j_1=2l+l_1+2}^{p_1}\sum_{j_3=0}^{p_3}C_{j_3j_3j_1}\zeta_{j_1}^{(i_1)}.
$$

Therefore,

$$
\lim_{p_1,p_3\to\infty}\mathsf{M}\left\{\left(\sum_{j_1=0}^{p_1}\sum_{j_3=0}^{p_3}C_{j_3j_3j_1}\zeta_{j_1}^{(i_1)}-\frac{1}{2}\int\limits_t^T(t-s)^{2l}\int\limits_t^s(t-s_1)^{l_1}d\mathbf{f}_{s_1}^{(i_1)}ds\right)^2\right\}=
$$

$$
=\lim_{p_3\to\infty}\sum_{j_1=0}^{2l+l_1+1}\left(\sum_{j_3=0}^{p_3}C_{j_3j_3j_1}-\frac{1}{2}\tilde{C}_{j_1}\right)^2+\lim_{p_1,p_3\to\infty}\mathsf{M}\left\{\left(\sum_{j_1=2l+l_1+2}^{p_1}\sum_{j_3=0}^{p_3}C_{j_3j_3j_1}\zeta_{j_1}^{(i_1)}\right)^2\right\}. \tag{79}
$$

Let us prove that

$$
\lim_{p_3\to\infty}\left(\sum_{j_3=0}^{p_3}C_{j_3j_3j_1}-\frac{1}{2}\tilde{C}_{j_1}\right)^2=0. \tag{80}
$$

We have

$$
\left(\sum_{j_3=0}^{p_3}C_{j_3j_3j_1}-\frac{1}{2}\tilde{C}_{j_1}\right)^2=
$$

$$
=\left(\sum_{j_3=0}^{p_3}\int\limits_t^T\phi_{j_1}(s_2)(t-s_2)^{l_1}ds_2\int\limits_{s_2}^T\phi_{j_3}(s_1)(t-s_1)^{l}ds_1\int\limits_{s_1}^T\phi_{j_3}(s)(t-s)^{l}ds-\right.
$$

$$
\left.-\frac{1}{2}\int\limits_t^T\phi_{j_1}(s_1)(t-s_1)^{l_1}\int\limits_{s_1}^T(t-s)^{2l}dsds_1\right)^2=
$$

$$
=\left(\frac{1}{2}\sum_{j_3=0}^{p_3}\int\limits_t^T\phi_{j_1}(s_2)(t-s_2)^{l_1}\left(\int\limits_{s_2}^T\phi_{j_3}(s_1)(t-s_1)^{l}ds_1\right)^2ds_2-\right.
$$

$$
\left.-\frac{1}{2}\int\limits_t^T\phi_{j_1}(s_1)(t-s_1)^{l_1}\int\limits_{s_1}^T(t-s)^{2l}dsds_1\right)^2=
$$

$$
=\frac{1}{4}\left(\int\limits_t^T\phi_{j_1}(s_1)(t-s_1)^{l_1}\left(\sum_{j_3=0}^{p_3}\left(\int\limits_{s_1}^T\phi_{j_3}(s)(t-s)^{l}ds\right)^2-\int\limits_{s_1}^T(t-s)^{2l}ds\right)ds_1\right)^2=
$$

$$
=\frac{1}{4}\left(\int\limits_t^T\phi_{j_1}(s_1)(t-s_1)^{l_1}\left(\int\limits_{s_1}^T(t-s)^{2l}ds-\sum_{j_3=p_3+1}^{\infty}\left(\int\limits_{s_1}^T\phi_{j_3}(s)(t-s)^{l}ds\right)^2-\int\limits_{s_1}^T(t-s)^{2l}ds\right)ds_1\right)^2
$$

$$
= \frac{1}{4}\left(\int\limits_t^T \phi_{j_1}(s_1)(t-s_1)^{l_1}\sum_{j_3=p_3+1}^{\infty}\left(\int\limits_{s_1}^T \phi_{j_3}(s)(t-s)^l ds\right)^2 ds_1\right)^2. \tag{81}
$$

In order to get (81) we used the Parseval equality, which looks as follows

$$
\sum_{j_3=0}^{\infty}\left(\int\limits_{s_1}^T \phi_{j_3}(s)(t-s)^l ds\right)^2 = \int\limits_t^T K^2(s,s_1)ds, \tag{82}
$$

where

$$
K(s,s_1)=(t-s)^l\mathbf{1}_{\{s_1<s\}},\quad s,s_1\in[t,T].
$$

Taking into account nondecreasing of the functional sequence

$$
u_n(s_1)=\sum_{j_3=0}^{n}\left(\int\limits_{s_1}^T \phi_{j_3}(s)(t-s)^l ds\right)^2,
$$

continuity of its members and continuity of the limit function

$$
u(s_1)=\int\limits_{s_1}^T (t-s)^{2l}ds
$$

at the interval $[t,T]$ according to the Dini Theorem we have uniform convergence of the functional sequence $u_n(s_1)$ to the limit function $u(s_1)$ at the interval $[t,T]$.

From (81) using the inequality of Cauchy–Bunyakovsky, we obtain

$$
\left(\sum_{j_3=0}^{p_3} C_{j_3j_3j_1}-\frac{1}{2}\tilde{C}_{j_1}\right)^2\le
$$

$$
\le \frac{1}{4}\int\limits_t^T \phi_{j_1}^2(s_1)(t-s_1)^{2l_1}ds_1\int\limits_t^T\left(\sum_{j_3=p_3+1}^{\infty}\left(\int\limits_{s_1}^T \phi_{j_3}(s)(t-s)^l ds\right)^2\right)^2 ds_1\le
$$

$$
\le \frac{1}{4}\varepsilon^2(T-t)^{2l_1}\int\limits_t^T \phi_{j_1}^2(s_1)ds_1(T-t)=\frac{1}{4}(T-t)^{2l_1+1}\varepsilon^2 \tag{83}
$$

when $p_3>N(\varepsilon)$, where $N(\varepsilon)$ exists for any $\varepsilon>0$.

From (83) it follows (80).

We have

$$
\sum_{j_3=0}^{p_3}\sum_{j_1=2l+l_1+2}^{p_1} C_{j_3j_3j_1}\zeta_{j_1}^{(i_1)}=\sum_{j_3=0}^{p_3}\sum_{j_1=2l+l_1+2}^{2(j_3+l+1)+l_1} C_{j_3j_3j_1}\zeta_{j_1}^{(i_1)}. \tag{84}
$$

We put $2(j_3+l+1)+l_1$ instead of p_1, since $C_{j_3j_3j_1}=0$ when $j_1>2(j_3+l+1)+l_1$. This conclusion follows from the relation

$$C_{j_3j_3j_1}=\frac{1}{2}\int\limits_t^T\phi_{j_1}(s_2)(t-s_2)^{l_1}\left(\int\limits_{s_2}^T\phi_{j_3}(s_1)(t-s_1)^l ds_1\right)^2 ds_2=$$

$$=\frac{1}{2}\int\limits_t^T\phi_{j_1}(s_2)Q_{2(j_3+l+1)+l_1}(s_2)ds_2,$$

where $Q_{2(j_3+l+1)+l_1}(s)$ is a polynomial of degree $2(j_3+l+1)+l_1$.

It is easy to see that

$$\sum_{j_3=0}^{p_3}\sum_{j_1=2l+l_1+2}^{2(j_3+l+1)+l_1}C_{j_3j_3j_1}\zeta_{j_1}^{(i_1)}=\sum_{j_1=2l+l_1+2}^{2(p_3+l+1)+l_1}\sum_{j_3=0}^{p_3}C_{j_3j_3j_1}\zeta_{j_1}^{(i_1)}. \tag{85}$$

Note that we included some zero coefficients $C_{j_3j_3j_1}$ into the sum $\sum\limits_{j_3=0}^{p_3}$.

From (84) and (85) we have

$$\mathsf{M}\left\{\left(\sum_{j_3=0}^{p_3}\sum_{j_1=2l+l_1+2}^{p_1}C_{j_3j_3j_1}\zeta_{j_1}^{(i_1)}\right)^2\right\}=$$

$$=\mathsf{M}\left\{\left(\sum_{j_1=2l+l_1+2}^{2(p_3+l+1)+l_1}\sum_{j_3=0}^{p_3}C_{j_3j_3j_1}\zeta_{j_1}^{(i_1)}\right)^2\right\}=\sum_{j_1=2l+l_1+2}^{2(p_3+l+1)+l_1}\left(\sum_{j_3=0}^{p_3}C_{j_3j_3j_1}\right)^2=$$

$$=\sum_{j_1=2l+l_1+2}^{2(p_3+l+1)+l_1}\left(\frac{1}{2}\sum_{j_3=0}^{p_3}\int\limits_t^T\phi_{j_1}(s_2)(t-s_2)^{l_1}\left(\int\limits_{s_2}^T\phi_{j_3}(s_1)(t-s_1)^l ds_1\right)^2 ds_2\right)^2=$$

$$=\frac{1}{4}\sum_{j_1=2l+l_1+2}^{2(p_3+l+1)+l_1}\left(\int\limits_t^T\phi_{j_1}(s_2)(t-s_2)^{l_1}\sum_{j_3=0}^{p_3}\left(\int\limits_{s_2}^T\phi_{j_3}(s_1)(t-s_1)^l ds_1\right)^2 ds_2\right)^2=$$

$$=\frac{1}{4}\sum_{j_1=2l+l_1+2}^{2(p_3+l+1)+l_1}\left(\int\limits_t^T\phi_{j_1}(s_2)(t-s_2)^{l_1}\left(\int\limits_{s_2}^T(t-s_1)^{2l}ds_1-\sum_{j_3=p_3+1}^{\infty}\left(\int\limits_{s_2}^T\phi_{j_3}(s_1)(t-s_1)^l ds_1\right)^2\right)ds_2\right)^2$$

$$=\frac{1}{4}\sum_{j_1=2l+l_1+2}^{2(p_3+l+1)+l_1}\left(\int\limits_t^T\phi_{j_1}(s_2)(t-s_2)^{l_1}\sum_{j_3=p_3+1}^{\infty}\left(\int\limits_{s_2}^T\phi_{j_3}(s_1)(t-s_1)^l ds_1\right)^2 ds_2\right)^2. \tag{86}$$

In order to get (86) we used the Parseval equality (82) and the following relation

$$\int\limits_t^T \phi_{j_1}(s)Q_{2l+1+l_1}(s)ds = 0, \quad j_1 > 2l+1+l_1,$$

where $Q_{2l+1+l_1}(s)$ is a polynomial of degree $2l+1+l_1$.

Further, we have for $j_3 \in \mathbb{N}$

$$\left(\int\limits_{s_2}^T \phi_{j_3}(s_1)(t-s_1)^l ds_1\right)^2 = \frac{(T-t)^{2l+1}(2j_3+1)}{2^{2l+2}}\left(\int\limits_{z(s_2)}^1 P_{j_3}(y)(1+y)^l dy\right)^2 =$$

$$= \frac{(T-t)^{2l+1}}{2^{2l+2}(2j_3+1)}\left((1+z(s_2))^l Q_{j_3}(s_2) - l\int\limits_{z(s_2)}^1 \left(P_{j_3+1}(y)-P_{j_3-1}(y)\right)(1+y)^{l-1}dy\right)^2 \le$$

$$\le \frac{(T-t)^{2l+1}2}{2^{2l+2}(2j_3+1)}\left(\left(\frac{2(s_2-t)}{T-t}\right)^{2l} Q_{j_3}^2(s_2)) + l^2\left(\int\limits_{z(s_2)}^1 \left(P_{j_3+1}(y)-P_{j_3-1}(y)\right)(1+y)^{l-1}dy\right)^2\right) \le$$

$$\le \frac{(T-t)^{2l+1}}{2^{2l+1}(2j_3+1)}\left(2^{2l+1}H_{j_3}(s_2) + l^2\int\limits_{z(s_2)}^1 (1+y)^{2l-2}dy \int\limits_{z(s_2)}^1 \left(P_{j_3+1}(y)-P_{j_3-1}(y)\right)^2 dy\right) \le$$

$$\le \frac{(T-t)^{2l+1}}{2^{2l+1}(2j_3+1)}\left(2^{2l+1}H_{j_3}(s_2) + \frac{2^{2l}l^2}{2l-1}\left(1-\left(\frac{(s_2-t)}{T-t}\right)^{2l-1}\right)\int\limits_{z(s_2)}^1 \left(P_{j_3+1}^2(y)+P_{j_3-1}^2(y)\right)dy\right) \le$$

$$\le \frac{(T-t)^{2l+1}}{2(2j_3+1)}\left(2H_{j_3}(s_2) + \frac{l^2}{2l-1}\int\limits_{z(s_2)}^1 \left(P_{j_3+1}^2(y)+P_{j_3-1}^2(y)\right)dy\right), \tag{87}$$

where

$$Q_{j_3}(s_2) = P_{j_3-1}(z(s_2)) - P_{j_3+1}(z(s_2)),$$

$$H_{j_3}(s_2) = P_{j_3-1}^2(z(s_2)) + P_{j_3+1}^2(z(s_2)).$$

Let us estimate the right-hand side of (87) using (38)

$$\left(\int\limits_{s_2}^T \phi_{j_3}(s_1)(t-s_1)^l ds_1\right)^2 <$$

$$< \frac{(T-t)^{2l+1}}{2(2j_3+1)}\left(\frac{K^2}{j_3+2}+\frac{K^2}{j_3}\right)\left(\frac{2}{(1-(z(s_2))^2)^{1/2}}+\frac{l^2}{2l-1}\int\limits_{z(s_2)}^{1}\frac{dy}{(1-y^2)^{1/2}}\right) <$$

$$< \frac{(T-t)^{2l+1}K^2}{2j_3^2}\left(\frac{2}{(1-(z(s_2))^2)^{1/2}}+\frac{l^2\pi}{2l-1}\right), \quad s\in(t,T). \tag{88}$$

From (86) and (88) we obtain

$$\mathrm{M}\left\{\left(\sum_{j_3=0}^{p_3}\sum_{j_1=2l+l_1+2}^{p_1}C_{j_3j_3j_1}\zeta_{j_1}^{(i_1)}\right)^2\right\}\le$$

$$\le \frac{1}{4}\sum_{j_1=2l+l_1+2}^{2(p_3+l+1)+l_1}\left(\int\limits_t^T|\phi_{j_1}(s_2)|(t-s_2)^{l_1}\sum_{j_3=p_3+1}^{\infty}\left(\int\limits_{s_2}^T\phi_{j_3}(s_1)(t-s_1)^l ds_1\right)^2 ds_2\right)^2\le$$

$$\le \frac{1}{4}(T-t)^{2l_1}\sum_{j_1=2l+l_1+2}^{2(p_3+l+1)+l_1}\left(\int\limits_t^T|\phi_{j_1}(s_2)|\sum_{j_3=p_3+1}^{\infty}\left(\int\limits_{s_2}^T\phi_{j_3}(s_1)(t-s_1)^l ds_1\right)^2 ds_2\right)^2<$$

$$< \frac{(T-t)^{4l+2l_1+1}K^4K_1^2}{16}\times$$

$$\times\sum_{j_1=2l+l_1+2}^{2(p_3+l+1)+l_1}\left(\left(\int\limits_t^T\frac{2ds_2}{(1-(z(s_2))^2)^{3/4}}+\frac{l^2\pi}{2l-1}\int\limits_t^T\frac{ds_2}{(1-(z(s_2))^2)^{1/4}}\right)\sum_{j_3=p_3+1}^{\infty}\frac{1}{j_3^2}\right)^2\le$$

$$\le \frac{(T-t)^{4l+2l_1+3}K^4K_1^2}{64}\cdot\frac{2p_3+1}{p_3^2}\left(\int\limits_{-1}^1\frac{2dy}{(1-y^2)^{3/4}}+\frac{l^2\pi}{2l-1}\int\limits_{-1}^1\frac{dy}{(1-y^2)^{1/4}}\right)^2\le$$

$$\le (T-t)^{4l+2l_1+3}C\frac{2p_3+1}{p_3^2}\to 0 \quad \text{when} \quad p_3\ \to\ \infty, \tag{89}$$

where constant C does not depend on p_3 and $T-t$.

From (79), (80), and (89) it follows (78), and the relation (78) implies the expansion (76).

Let us consider Case 4 ($l_1=l_2=l_3=l=0,1,2,\ldots$ and $i_1,i_2,i_3=1,\ldots,m$). So, we will prove the following expansion for iterated Stratonovich stochastic integral of third multiplicity

$$I_{lll_{T,t}}^{*(i_1i_2i_3)}=\underset{p_1,p_2,p_3\to\infty}{\text{l.i.m.}}\sum_{j_1=0}^{p_1}\sum_{j_2=0}^{p_2}\sum_{j_3=0}^{p_3}C_{j_3j_2j_1}\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}\zeta_{j_3}^{(i_3)}\quad (i_1,i_2,i_3=1,\ldots,m), \tag{90}$$

where the series converges in the mean-square sense, $l=0,1,2,\ldots$, and

$$C_{j_3j_2j_1}=\int\limits_t^T\phi_{j_3}(s)(t-s)^l\int\limits_t^s(t-s_1)^l\phi_{j_2}(s_1)\int\limits_t^{s_1}(t-s_2)^l\phi_{j_1}(s_2)ds_2ds_1ds. \tag{91}$$

If we prove w. p. 1 the following formula

$$\underset{p_1,p_3\to\infty}{\text{l.i.m.}}\sum_{j_1=0}^{p_1}\sum_{j_3=0}^{p_3}C_{j_1j_3j_1}\zeta_{j_3}^{(i_2)}=0, \tag{92}$$

where coefficients $C_{j_3j_2j_1}$ have the form (91), then using Theorems 1, 2, relations (64), (78) when $l_1=l_3=l$ and standard relations between iterated Ito and Stratonovich stochastic integrals we will have the expansion (90).

Since $\psi_1(s),\ \psi_2(s),\ \psi_3(s)\equiv(t-s)^l$, then the following equality for the Fourier coefficients takes place

$$C_{j_1j_1j_3}+C_{j_1j_3j_1}+C_{j_3j_1j_1}=\frac{1}{2}C_{j_1}^2C_{j_3},$$

where $C_{j_3j_2j_1}$ has the form (91) and

$$C_{j_1}=\int\limits_t^T\phi_{j_1}(s)(t-s)^lds.$$

Then w. p. 1

$$\underset{p_1,p_3\to\infty}{\text{l.i.m.}}\sum_{j_1=0}^{p_1}\sum_{j_3=0}^{p_3}C_{j_1j_3j_1}\zeta_{j_3}^{(i_2)}=\underset{p_1,p_3\to\infty}{\text{l.i.m.}}\sum_{j_1=0}^{p_1}\sum_{j_3=0}^{p_3}\left(\frac{1}{2}C_{j_1}^2C_{j_3}-C_{j_1j_1j_3}-C_{j_3j_1j_1}\right)\zeta_{j_3}^{(i_2)}. \tag{93}$$

Taking into account (64) and (78) when $l_3=l_1=l$ and the Ito formula, we have w. p. 1

$$\underset{p_1,p_3\to\infty}{\text{l.i.m.}}\sum_{j_1=0}^{p_1}\sum_{j_3=0}^{p_3}C_{j_1j_3j_1}\zeta_{j_3}^{(i_2)}=$$

$$=\frac{1}{2}\sum_{j_1=0}^{l}C_{j_1}^2\sum_{j_3=0}^{l}C_{j_3}\zeta_{j_3}^{(i_2)}-\underset{p_1,p_3\to\infty}{\text{l.i.m.}}\sum_{j_1=0}^{p_1}\sum_{j_3=0}^{p_3}C_{j_1j_1j_3}\zeta_{j_3}^{(i_2)}-\underset{p_1,p_3\to\infty}{\text{l.i.m.}}\sum_{j_1=0}^{p_1}\sum_{j_3=0}^{p_3}C_{j_3j_1j_1}\zeta_{j_3}^{(i_2)}=$$

$$=\frac{1}{2}\sum_{j_1=0}^{l}C_{j_1}^2\int\limits_t^T(t-s)^ld\mathbf{f}_s^{(i_2)}-\frac{1}{2}\int\limits_t^T(t-s)^l\int\limits_t^s(t-s_1)^{2l}ds_1d\mathbf{f}_s^{(i_2)}-$$

$$-\frac{1}{2}\int\limits_t^T(t-s)^{2l}\int\limits_t^s(t-s_1)^ld\mathbf{f}_{s_1}^{(i_2)}ds=$$

$$
=\frac{1}{2}\sum_{j_1=0}^{l}C_{j_1}^2\int\limits_t^T(t-s)^l d\mathbf{f}_s^{(i_2)}+\frac{1}{2(2l+1)}\int\limits_t^T(t-s)^{3l+1}d\mathbf{f}_s^{(i_2)}-
$$

$$
-\frac{1}{2}\int\limits_t^T(t-s_1)^l\int\limits_{s_1}^T(t-s)^{2l}dsd\mathbf{f}_{s_1}^{(i_2)}=
$$

$$
=\frac{1}{2}\sum_{j_1=0}^{l}C_{j_1}^2\int\limits_t^T(t-s)^l d\mathbf{f}_s^{(i_2)}+\frac{1}{2(2l+1)}\int\limits_t^T(t-s)^{3l+1}d\mathbf{f}_s^{(i_2)}-
$$

$$
-\frac{1}{2(2l+1)}\left((T-t)^{2l+1}\int\limits_t^T(t-s)^l d\mathbf{f}_s^{(i_2)}+\int\limits_t^T(t-s)^{3l+1}d\mathbf{f}_s^{(i_2)}\right)=
$$

$$
=\frac{1}{2}\sum_{j_1=0}^{l}C_{j_1}^2\int\limits_t^T(t-s)^l d\mathbf{f}_s^{(i_2)}-\frac{(T-t)^{2l+1}}{2(2l+1)}\int\limits_t^T(t-s)^l d\mathbf{f}_s^{(i_2)}=
$$

$$
=\frac{1}{2}\left(\sum_{j_1=0}^{l}C_{j_1}^2-\int\limits_t^T(t-s)^{2l}ds\right)\int\limits_t^T(t-s)^l d\mathbf{f}_s^{(i_2)}=0.
$$

Here, the Parseval equality looks as follows

$$
\sum_{j_1=0}^{\infty}C_{j_1}^2=\sum_{j_1=0}^{l}C_{j_1}^2=\int\limits_t^T(t-s)^{2l}ds=\frac{(T-t)^{2l+1}}{2l+1}
$$

and

$$
\int\limits_t^T(t-s)^l d\mathbf{f}_s^{(i_2)}=\sum_{j_3=0}^{l}C_{j_3}\zeta_{j_3}^{(i_2)}\quad \text{w. p. 1.}
$$

The expansion (90) is proved. Theorem 4 is proved.

It is easy to see that using the Ito formula, we obtain for the case $i_1=i_2=i_3$

$$
\int\limits_t^{*T}(t-s)^l\int\limits_t^{*s}(t-s_1)^l\int\limits_t^{*s_1}(t-s_2)^l d\mathbf{f}_{s_2}^{(i_1)}d\mathbf{f}_{s_1}^{(i_1)}d\mathbf{f}_s^{(i_1)}=
$$

$$
=\frac{1}{6}\left(\int\limits_t^T(t-s)^l d\mathbf{f}_s^{(i_1)}\right)^3=\frac{1}{6}\left(\sum_{j_1=0}^{l}C_{j_1}\zeta_{j_1}^{(i_1)}\right)^3=
$$

$$
=\sum_{j_1,j_2,j_3=0}^{l}C_{j_3j_2j_1}\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_1)}\zeta_{j_3}^{(i_1)}\quad \text{w. p. 1.} \tag{94}
$$

6. Expansion of Iterated Stratonovich Stochastic Integrals of Multiplicity 3. The Case of Trigonometric Functions

In this section we will prove the following theorem.

Theorem 5 [15]-[19], [22], [24]-[27]. *Suppose that $\{\phi_j(x)\}_{j=0}^{\infty}$ is a complete orthonormal system of trigonometric functions in the space $L_2([t,T])$. Then, for the iterated Stratonovich stochastic integral of third multiplicity*

$$\int\limits_t^{*T}\int\limits_t^{*t_3}\int\limits_t^{*t_2} d\mathbf{f}_{t_1}^{(i_1)}d\mathbf{f}_{t_2}^{(i_2)}d\mathbf{f}_{t_3}^{(i_3)}\quad (i_1,i_2,i_3=1,\ldots,m)$$

the following expansion

$$\int\limits_t^{*T}\int\limits_t^{*t_3}\int\limits_t^{*t_2} d\mathbf{f}_{t_1}^{(i_1)}d\mathbf{f}_{t_2}^{(i_2)}d\mathbf{f}_{t_3}^{(i_3)} = \underset{p_1,p_2,p_3\to\infty}{\text{l.i.m.}}\sum_{j_1=0}^{p_1}\sum_{j_2=0}^{p_2}\sum_{j_3=0}^{p_3} C_{j_3j_2j_1}\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}\zeta_{j_3}^{(i_3)} \tag{95}$$

converging in the mean-square sense is valid, where

$$C_{j_3j_2j_1}=\int\limits_t^T\phi_{j_3}(s)\int\limits_t^s\phi_{j_2}(s_1)\int\limits_t^{s_1}\phi_{j_1}(s_2)ds_2ds_1ds.$$

Proof. If we prove w. p. 1 the following formulas

$$\underset{p_1,p_3\to\infty}{\text{l.i.m.}}\sum_{j_1=0}^{p_1}\sum_{j_3=0}^{p_3} C_{j_3j_1j_1}\zeta_{j_3}^{(i_3)}=\frac{1}{2}\int\limits_t^T\int\limits_t^{\tau} ds d\mathbf{f}_{\tau}^{(i_3)}, \tag{96}$$

$$\underset{p_1,p_3\to\infty}{\text{l.i.m.}}\sum_{j_1=0}^{p_1}\sum_{j_3=0}^{p_3} C_{j_3j_3j_1}\zeta_{j_1}^{(i_1)}=\frac{1}{2}\int\limits_t^T\int\limits_t^{\tau} d\mathbf{f}_{s}^{(i_1)}d\tau, \tag{97}$$

$$\underset{p_1,p_3\to\infty}{\text{l.i.m.}}\sum_{j_1=0}^{p_1}\sum_{j_3=0}^{p_3} C_{j_1j_3j_1}\zeta_{j_3}^{(i_2)}=0, \tag{98}$$

then from the equalities (96)–(98), Theorems 1, 2, and standard relations between iterated Ito and Stratonovich stochastic integrals we will obtain the expansion (95).

We have

$$S_{p_1,p_3}\stackrel{\mathsf{def}}{=}\sum_{j_3=0}^{p_3}\sum_{j_1=0}^{p_1} C_{j_3j_1j_1}\zeta_{j_3}^{(i_3)}=\frac{(T-t)^{3/2}}{6}\zeta_0^{(i_3)}+$$

$$+\sum_{j_1=1}^{p_1} C_{0,2j_1,2j_1}\zeta_0^{(i_3)}+\sum_{j_1=1}^{p_1} C_{0,2j_1-1,2j_1-1}\zeta_0^{(i_3)}+\sum_{j_3=1}^{p_1} C_{2j_3,0,0}\zeta_{2j_3}^{(i_3)}+$$

$$+\sum_{j_3=1}^{p_3}\sum_{j_1=1}^{p_1} C_{2j_3,2j_1,2j_1}\zeta_{2j_3}^{(i_3)}+\sum_{j_3=1}^{p_3}\sum_{j_1=1}^{p_1} C_{2j_3,2j_1-1,2j_1-1}\zeta_{2j_3}^{(i_3)}+\sum_{j_3=1}^{p_3} C_{2j_3-1,0,0}\zeta_{2j_3-1}^{(i_3)}+$$

$$+\sum_{j_3=1}^{p_3}\sum_{j_1=1}^{p_1} C_{2j_3-1,2j_1,2j_1}\zeta_{2j_3-1}^{(i_3)}+\sum_{j_3=1}^{p_3}\sum_{j_1=1}^{p_1} C_{2j_3-1,2j_1-1,2j_1-1}\zeta_{2j_3-1}^{(i_3)}, \tag{99}$$

where the summation is stopped, when $2j_1,\ 2j_1-1>p_1$ or $2j_3,\ 2j_3-1>p_3$ and

$$C_{0,2l,2l}=\frac{(T-t)^{3/2}}{8\pi^2 l^2},\quad C_{0,2l-1,2l-1}=\frac{3(T-t)^{3/2}}{8\pi^2 l^2},\quad C_{2l,0,0}=\frac{\sqrt{2}(T-t)^{3/2}}{4\pi^2 l^2}, \tag{100}$$

$$C_{2r-1,2l,2l}=0,\quad C_{2l-1,0,0}=-\frac{\sqrt{2}(T-t)^{3/2}}{4\pi l},\quad C_{2r-1,2l-1,2l-1}=0, \tag{101}$$

$$C_{2r,2l,2l}=\begin{cases}-\sqrt{2}(T-t)^{3/2}/(16\pi^2l^2), & r=2l\\ \\ 0, & r\neq 2l\end{cases}, \tag{102}$$

$$C_{2r,2l-1,2l-1}=\begin{cases}\sqrt{2}(T-t)^{3/2}/(16\pi^2l^2), & r=2l\\ \\ -\sqrt{2}(T-t)^{3/2}/(4\pi^2l^2), & r=l\\ \\ 0, & r\neq l,\ r\neq 2l\end{cases}. \tag{103}$$

Let us show that

$$\underset{p_1,p_3\to\infty}{\text{l.i.m.}}\ S_{2p_1,2p_3}=\underset{p_1,p_3\to\infty}{\text{l.i.m.}}\ S_{2p_1,2p_3-1}=\underset{p_1,p_3\to\infty}{\text{l.i.m.}}\ S_{2p_1-1,2p_3-1}=\underset{p_1,p_3\to\infty}{\text{l.i.m.}}\ S_{2p_1-1,2p_3}. \tag{104}$$

We have

$$S_{2p_1,2p_3}=S_{2p_1,2p_3-1}+\sum_{j_1=0}^{2p_1} C_{2p_3,j_1,j_1}\zeta_{2p_3}^{(i_3)}. \tag{105}$$

Using the relations (100), (102), and (103), we obtain

$$\sum_{j_1=0}^{2p_1} C_{2p_3,j_1,j_1}=C_{2p_3,0,0}+\sum_{j_1=1}^{2p_1} C_{2p_3,j_1,j_1}=$$

$$=C_{2p_3,0,0}+\sum_{j_1=1}^{p_1}\Bigl(C_{2p_3,2j_1-1,2j_1-1}+C_{2p_3,2j_1,2j_1}\Bigr)=$$

$$=\frac{\sqrt{2}(T-t)^{3/2}}{4\pi^2p_3^2}\left(1-\mathbf{1}_{\{p_1\ge p_3\}}\right). \tag{106}$$

From (105), (106) we get

$$\underset{p_1,p_3\to\infty}{\text{l.i.m.}}\ S_{2p_1,2p_3}=\underset{p_1,p_3\to\infty}{\text{l.i.m.}}\ S_{2p_1,2p_3-1}. \tag{107}$$

Further, we have (see (100)–(102))

$$S_{2p_1,2p_3-1}=S_{2p_1-1,2p_3-1}+\sum_{j_3=0}^{2p_3-1}C_{j_3,2p_1,2p_1}\zeta_{j_3}^{(i_3)}, \tag{108}$$

$$\sum_{j_3=0}^{2p_3-1}C_{j_3,2p_1,2p_1}\zeta_{j_3}^{(i_3)}=C_{0,2p_1,2p_1}\zeta_0^{(i_3)}+\sum_{j_3=1}^{2p_3}C_{j_3,2p_1,2p_1}\zeta_{j_3}^{(i_3)}-C_{2p_3,2p_1,2p_1}\zeta_{2p_3}^{(i_3)}=$$

$$=C_{0,2p_1,2p_1}\zeta_0^{(i_3)}+\sum_{j_3=1}^{p_3}\left(C_{2j_3-1,2p_1,2p_1}\zeta_{2j_3-1}^{(i_3)}+C_{2j_3,2p_1,2p_1}\zeta_{2j_3}^{(i_3)}\right)-C_{2p_3,2p_1,2p_1}\zeta_{2p_3}^{(i_3)}=$$

$$=\frac{(T-t)^{3/2}}{8\pi^2p_1^2}\zeta_0^{(i_3)}+\frac{\sqrt{2}(T-t)^{3/2}}{16\pi^2p_1^2}\left(\mathbf{1}_{\{p_3=2p_1\}}-\mathbf{1}_{\{p_3\ge 2p_1\}}\right)\zeta_{4p_1}^{(i_3)}. \tag{109}$$

From (108), (109) we obtain

$$\underset{p_1,p_3\to\infty}{\text{l.i.m.}}\ S_{2p_1,2p_3-1}=\underset{p_1,p_3\to\infty}{\text{l.i.m.}}\ S_{2p_1-1,2p_3-1}. \tag{110}$$

Further, we have

$$S_{2p_1,2p_3}=S_{2p_1-1,2p_3}+\sum_{j_3=0}^{2p_3}C_{j_3,2p_1,2p_1}\zeta_{j_3}^{(i_3)}, \tag{111}$$

$$\sum_{j_3=0}^{2p_3}C_{j_3,2p_1,2p_1}\zeta_{j_3}^{(i_3)}=C_{0,2p_1,2p_1}\zeta_0^{(i_3)}+\sum_{j_3=1}^{2p_3}C_{j_3,2p_1,2p_1}\zeta_{j_3}^{(i_3)}=$$

$$=C_{0,2p_1,2p_1}\zeta_0^{(i_3)}+\sum_{j_3=1}^{p_3}\left(C_{2j_3-1,2p_1,2p_1}\zeta_{2j_3-1}^{(i_3)}+C_{2j_3,2p_1,2p_1}\zeta_{2j_3}^{(i_3)}\right). \tag{112}$$

From (112), (100)–(102) we obtain

$$\sum_{j_3=0}^{2p_3} C_{j_3,2p_1,2p_1}\zeta_{j_3}^{(i_3)} = \frac{(T-t)^{3/2}}{8\pi^2 p_1^2}\zeta_0^{(i_3)} - \frac{\sqrt{2}(T-t)^{3/2}}{16\pi^2 p_1^2}\mathbf{1}_{\{p_3\ge 2p_1\}}\zeta_{4p_1}^{(i_3)}. \tag{113}$$

The relations (111), (113) mean that

$$\underset{p_1,p_3\to\infty}{\text{l.i.m.}}\ S_{2p_1,2p_3} = \underset{p_1,p_3\to\infty}{\text{l.i.m.}}\ S_{2p_1-1,2p_3}. \tag{114}$$

The equalities (107), (110), and (114) imply (104). This means that instead of (96) it is enough to prove the following equality

$$\underset{p_1,p_3\to\infty}{\text{l.i.m.}} \sum_{j_1=0}^{2p_1}\sum_{j_3=0}^{2p_3} C_{j_3j_1j_1}\zeta_{j_3}^{(i_3)} = \frac{1}{2}\int\limits_t^T\int\limits_t^\tau ds d\mathbf{f}_\tau^{(i_3)} \quad \text{w. p. 1.} \tag{115}$$

We have

$$S_{2p_1,2p_3} = \sum_{j_3=0}^{2p_3}\sum_{j_1=0}^{2p_1} C_{j_3j_1j_1}\zeta_{j_3}^{(i_3)} = \frac{(T-t)^{3/2}}{6}\zeta_0^{(i_3)} +$$

$$+\sum_{j_1=1}^{p_1} C_{0,2j_1,2j_1}\zeta_0^{(i_3)} + \sum_{j_1=1}^{p_1} C_{0,2j_1-1,2j_1-1}\zeta_0^{(i_3)} + \sum_{j_3=1}^{p_3} C_{2j_3,0,0}\zeta_{2j_3}^{(i_3)} +$$

$$+\sum_{j_3=1}^{p_3}\sum_{j_1=1}^{p_1} C_{2j_3,2j_1,2j_1}\zeta_{2j_3}^{(i_3)} + \sum_{j_3=1}^{p_3}\sum_{j_1=1}^{p_1} C_{2j_3,2j_1-1,2j_1-1}\zeta_{2j_3}^{(i_3)} + \sum_{j_3=1}^{p_3} C_{2j_3-1,0,0}\zeta_{2j_3-1}^{(i_3)} +$$

$$+\sum_{j_3=1}^{p_3}\sum_{j_1=1}^{p_1} C_{2j_3-1,2j_1,2j_1}\zeta_{2j_3-1}^{(i_3)} + \sum_{j_3=1}^{p_3}\sum_{j_1=1}^{p_1} C_{2j_3-1,2j_1-1,2j_1-1}\zeta_{2j_3-1}^{(i_3)}. \tag{116}$$

After substituting (100)–(103) into (116), we obtain

$$\sum_{j_3=0}^{2p_3}\sum_{j_1=0}^{2p_1} C_{j_3j_1j_1}\zeta_{j_3}^{(i_3)} = (T-t)^{3/2}\left(\frac{1}{6}\zeta_0^{(i_3)} + \frac{1}{2\pi^2}\sum_{j_1=1}^{p_1}\frac{1}{j_1^2}\ \zeta_0^{(i_3)} -\right.$$

$$\left. -\frac{\sqrt{2}}{4\pi}\sum_{j_3=1}^{p_3}\frac{1}{j_3}\zeta_{2j_3-1}^{(i_3)} - \frac{\sqrt{2}}{4\pi^2}\sum_{j_3=1}^{\min\{p_1,p_3\}}\frac{1}{j_3^2}\zeta_{2j_3}^{(i_3)} + \frac{\sqrt{2}}{4\pi^2}\sum_{j_3=1}^{p_3}\frac{1}{j_3^2}\zeta_{2j_3}^{(i_3)}\right). \tag{117}$$

From (117) we have w. p. 1

$$\underset{p_1,p_3\to\infty}{\text{l.i.m.}} \sum_{j_3=0}^{2p_3}\sum_{j_1=0}^{2p_1} C_{j_3j_1j_1}\zeta_{j_3}^{(i_3)} = (T-t)^{3/2}\left(\frac{1}{6}\zeta_0^{(i_3)} + \frac{1}{2\pi^2}\sum_{j_1=1}^{\infty}\frac{1}{j_1^2}\ \zeta_0^{(i_3)} -\right.$$

$$
-\underset{p_3\to\infty}{\text{l.i.m.}}\ \frac{\sqrt{2}}{4\pi}\sum_{j_3=1}^{p_3}\frac{1}{j_3}\zeta_{2j_3-1}^{(i_3)}\Biggr). \tag{118}
$$

Using Theorems 1, 2 and the system of trigonometric functions, we get w. p. 1

$$
\frac{1}{2}\int\limits_t^T\int\limits_t^s d\tau d\mathbf{f}_s^{(i_3)}=\frac{1}{2}\int\limits_t^T(s-t)d\mathbf{f}_s^{(i_3)}=
$$

$$
=\frac{(T-t)^{3/2}}{4}\underset{p_3\to\infty}{\text{l.i.m.}}\left(\zeta_0^{(i_3)}-\frac{\sqrt{2}}{\pi}\sum_{j_3=1}^{p_3}\frac{1}{j_3}\zeta_{2j_3-1}^{(i_3)}\right). \tag{119}
$$

From (118) and (119) it follows that

$$
\underset{p_1,p_3\to\infty}{\text{l.i.m.}}\sum_{j_3=0}^{2p_3}\sum_{j_1=0}^{2p_1}C_{j_3j_1j_1}\zeta_{j_3}^{(i_3)}=
$$

$$
=(T-t)^{3/2}\left(\frac{1}{6}\zeta_0^{(i_3)}+\frac{1}{12}\zeta_0^{(i_3)}-\underset{p_3\to\infty}{\text{l.i.m.}}\ \frac{\sqrt{2}}{4\pi}\sum_{j_3=1}^{p_3}\frac{1}{j_3}\zeta_{2j_3-1}^{(i_3)}\right)=
$$

$$
=(T-t)^{3/2}\left(\frac{1}{4}\zeta_0^{(i_3)}-\underset{p_3\to\infty}{\text{l.i.m.}}\ \frac{\sqrt{2}}{4\pi}\sum_{j_3=1}^{p_3}\frac{1}{j_3}\zeta_{2j_3-1}^{(i_3)}\right)=
$$

$$
=\frac{1}{2}\int\limits_t^T\int\limits_t^s d\tau d\mathbf{f}_s^{(i_3)},
$$

where the equality is fulfilled w. p. 1.

So, the relations (115) and (96) are proved for the case of trigonometric system of functions.

Let us prove the relation (97). We have

$$
S'_{p_1,p_3}\stackrel{\mathsf{def}}{=}\sum_{j_1=0}^{p_1}\sum_{j_3=0}^{p_3}C_{j_3j_3j_1}\zeta_{j_1}^{(i_1)}=\frac{(T-t)^{3/2}}{6}\zeta_0^{(i_1)}+
$$

$$
+\sum_{j_3=1}^{p_3}C_{2j_3,2j_3,0}\zeta_0^{(i_1)}+\sum_{j_3=1}^{p_3}C_{2j_3-1,2j_3-1,0}\zeta_0^{(i_1)}+\sum_{j_1=1}^{p_1}\sum_{j_3=1}^{p_3}C_{2j_3,2j_3,2j_1-1}\zeta_{2j_1-1}^{(i_1)}+
$$

$$
+\sum_{j_1=1}^{p_1}\sum_{j_3=1}^{p_3}C_{2j_3-1,2j_3-1,2j_1-1}\zeta_{2j_1-1}^{(i_1)}+\sum_{j_1=1}^{p_1}C_{0,0,2j_1-1}\zeta_{2j_1-1}^{(i_1)}+\sum_{j_1=1}^{p_1}\sum_{j_3=1}^{p_3}C_{2j_3,2j_3,2j_1}\zeta_{2j_1}^{(i_1)}+
$$

$$+\sum_{j_1=1}^{p_1}\sum_{j_3=1}^{p_3} C_{2j_3-1,2j_3-1,2j_1}\zeta_{2j_1}^{(i_1)}+\sum_{j_1=1}^{p_1} C_{0,0,2j_1}\zeta_{2j_1}^{(i_1)}, \tag{120}$$

where the summation is stopped, when $2j_3,\ 2j_3-1>p_3$ or $2j_1,\ 2j_1-1>p_1$ and

$$C_{2l,2l,0}=\frac{(T-t)^{3/2}}{8\pi^2 l^2},\quad C_{2l-1,2l-1,0}=\frac{3(T-t)^{3/2}}{8\pi^2 l^2},\quad C_{0,0,2r}=\frac{\sqrt{2}(T-t)^{3/2}}{4\pi^2 r^2}, \tag{121}$$

$$C_{2l-1,2l-1,2r-1}=0,\quad C_{0,0,2r-1}=\frac{\sqrt{2}(T-t)^{3/2}}{4\pi r},\quad C_{2l,2l,2r-1}=0, \tag{122}$$

$$C_{2l,2l,2r}=\begin{cases}-\sqrt{2}(T-t)^{3/2}/(16\pi^2 l^2), & r=2l\\ \\ 0, & r\ne 2l\end{cases}, \tag{123}$$

$$C_{2l-1,2l-1,2r}=\begin{cases}\sqrt{2}(T-t)^{3/2}/(16\pi^2 l^2), & r=2l\\ \\ -\sqrt{2}(T-t)^{3/2}/(4\pi^2 l^2), & r=l\\ \\ 0, & r\ne l,\ r\ne 2l\end{cases}. \tag{124}$$

Let us show that

$$\underset{p_1,p_3\to\infty}{\text{l.i.m.}}\ S'_{2p_1,2p_3}=\underset{p_1,p_3\to\infty}{\text{l.i.m.}}\ S'_{2p_1,2p_3-1}=\underset{p_1,p_3\to\infty}{\text{l.i.m.}}\ S'_{2p_1-1,2p_3-1}=\underset{p_1,p_3\to\infty}{\text{l.i.m.}}\ S'_{2p_1-1,2p_3}. \tag{125}$$

We have

$$S'_{2p_1,2p_3}=S'_{2p_1-1,2p_3}+\sum_{j_3=0}^{2p_3} C_{j_3,j_3,2p_1}\zeta_{2p_1}^{(i_1)}. \tag{126}$$

Using the relations (121), (123), and (124), we obtain

$$\sum_{j_1=0}^{2p_3} C_{j_3,j_3,2p_1}=C_{0,0,2p_1}+\sum_{j_3=1}^{2p_3} C_{j_3,j_3,2p_1}=$$

$$=C_{0,0,2p_1}+\sum_{j_3=1}^{p_3}\Bigl(C_{2j_3-1,2j_3-1,2p_1}+C_{2j_3,2j_3,2p_1}\Bigr)=$$

$$=\frac{\sqrt{2}(T-t)^{3/2}}{4\pi^2 p_1^2}\bigl(1-\mathbf{1}_{\{p_3\ge p_1\}}\bigr). \tag{127}$$

From (126), (127) we obtain

$$\underset{p_1,p_3\to\infty}{\text{l.i.m.}}\ S'_{2p_1,2p_3} = \underset{p_1,p_3\to\infty}{\text{l.i.m.}}\ S'_{2p_1-1,2p_3}. \tag{128}$$

Further, we get (see (121)–(123))

$$S'_{2p_1-1,2p_3} = S'_{2p_1-1,2p_3-1} + \sum_{j_1=0}^{2p_1-1} C_{2p_3,2p_3,j_1}\zeta_{j_1}^{(i_1)}, \tag{129}$$

$$\sum_{j_1=0}^{2p_1-1} C_{2p_3,2p_3,j_1}\zeta_{j_1}^{(i_1)} = C_{2p_3,2p_3,0}\zeta_0^{(i_1)} + \sum_{j_1=1}^{2p_1} C_{2p_3,2p_3,j_1}\zeta_{j_1}^{(i_1)} - C_{2p_3,2p_3,2p_1}\zeta_{2p_1}^{(i_1)} =$$

$$= C_{2p_3,2p_3,0}\zeta_0^{(i_1)} + \sum_{j_1=1}^{p_1}\left(C_{2p_3,2p_3,2j_1-1}\zeta_{2j_1-1}^{(i_1)} + C_{2p_3,2p_3,2j_1}\zeta_{2j_1}^{(i_1)}\right) - C_{2p_3,2p_3,2p_1}\zeta_{2p_1}^{(i_1)} =$$

$$= \frac{(T-t)^{3/2}}{8\pi^2 p_3^2}\zeta_0^{(i_1)} + \frac{\sqrt{2}(T-t)^{3/2}}{16\pi^2 p_3^2}\left(\mathbf{1}_{\{p_1=2p_3\}} - \mathbf{1}_{\{p_1\ge 2p_3\}}\right)\zeta_{4p_3}^{(i_1)}. \tag{130}$$

From (129), (130) we obtain

$$\underset{p_1,p_3\to\infty}{\text{l.i.m.}}\ S'_{2p_1-1,2p_3} = \underset{p_1,p_3\to\infty}{\text{l.i.m.}}\ S'_{2p_1-1,2p_3-1}. \tag{131}$$

Further, we have

$$S'_{2p_1,2p_3} = S'_{2p_1,2p_3-1} + \sum_{j_1=0}^{2p_1} C_{2p_3,2p_3,j_1}\zeta_{j_1}^{(i_1)}, \tag{132}$$

$$\sum_{j_1=0}^{2p_1} C_{2p_3,2p_3,j_1}\zeta_{j_1}^{(i_1)} = C_{2p_3,2p_3,0}\zeta_0^{(i_1)} + \sum_{j_1=1}^{2p_1} C_{2p_3,2p_3,j_1}\zeta_{j_1}^{(i_1)} =$$

$$= C_{2p_3,2p_3,0}\zeta_0^{(i_1)} + \sum_{j_1=1}^{p_1}\left(C_{2p_3,2p_3,2j_1-1}\zeta_{2j_1-1}^{(i_1)} + C_{2p_3,2p_3,2j_1}\zeta_{2j_1}^{(i_1)}\right). \tag{133}$$

From (133), (121)–(123) we obtain

$$\sum_{j_1=0}^{2p_1} C_{2p_3,2p_3,j_1}\zeta_{j_1}^{(i_1)} = \frac{(T-t)^{3/2}}{8\pi^2 p_3^2}\zeta_0^{(i_1)} - \frac{\sqrt{2}(T-t)^{3/2}}{16\pi^2 p_3^2}\mathbf{1}_{\{p_1\ge 2p_3\}}\zeta_{4p_3}^{(i_1)}. \tag{134}$$

The relations (132), (134) mean that

$$\underset{p_1,p_3\to\infty}{\text{l.i.m.}}\ S'_{2p_1,2p_3} = \underset{p_1,p_3\to\infty}{\text{l.i.m.}}\ S'_{2p_1,2p_3-1}. \tag{135}$$

The equalities (128), (131), and (135) imply (125). This means that instead of (97) it is enough to prove the following equality

$$\underset{p_1,p_3\to\infty}{\text{l.i.m.}}\sum_{j_1=0}^{2p_1}\sum_{j_3=0}^{2p_3}C_{j_3j_3j_1}\zeta_{j_1}^{(i_1)}=\frac{1}{2}\int\limits_t^T\int\limits_t^{\tau}d\mathbf{f}_s^{(i_1)}d\tau\quad\text{w. p. 1.}\tag{136}$$

We have

$$S'_{2p_1,2p_3}=\sum_{j_1=0}^{2p_1}\sum_{j_3=0}^{2p_3}C_{j_3j_3j_1}\zeta_{j_1}^{(i_1)}=\frac{(T-t)^{3/2}}{6}\zeta_0^{(i_1)}+$$

$$+\sum_{j_3=1}^{p_3}C_{2j_3,2j_3,0}\zeta_0^{(i_1)}+\sum_{j_3=1}^{p_3}C_{2j_3-1,2j_3-1,0}\zeta_0^{(i_1)}+\sum_{j_1=1}^{p_1}\sum_{j_3=1}^{p_3}C_{2j_3,2j_3,2j_1-1}\zeta_{2j_1-1}^{(i_1)}+$$

$$+\sum_{j_1=1}^{p_1}\sum_{j_3=1}^{p_3}C_{2j_3-1,2j_3-1,2j_1-1}\zeta_{2j_1-1}^{(i_1)}+\sum_{j_1=1}^{p_1}C_{0,0,2j_1-1}\zeta_{2j_1-1}^{(i_1)}+\sum_{j_1=1}^{p_1}\sum_{j_3=1}^{p_3}C_{2j_3,2j_3,2j_1}\zeta_{2j_1}^{(i_1)}+$$

$$+\sum_{j_1=1}^{p_1}\sum_{j_3=1}^{p_3}C_{2j_3-1,2j_3-1,2j_1}\zeta_{2j_1}^{(i_1)}+\sum_{j_1=1}^{p_1}C_{0,0,2j_1}\zeta_{2j_1}^{(i_1)}.\tag{137}$$

After substituting (121)–(124) into (137), we obtain

$$\sum_{j_1=0}^{2p_1}\sum_{j_3=0}^{2p_3}C_{j_3j_3j_1}\zeta_{j_1}^{(i_1)}=(T-t)^{3/2}\Biggl(\frac{1}{6}\zeta_0^{(i_1)}+\frac{1}{2\pi^2}\sum_{j_3=1}^{p_3}\frac{1}{j_3^2}\ \zeta_0^{(i_1)}+$$

$$+\frac{\sqrt{2}}{4\pi}\sum_{j_1=1}^{p_1}\frac{1}{j_1}\zeta_{2j_1-1}^{(i_1)}-\frac{\sqrt{2}}{4\pi^2}\sum_{j_1=1}^{\min\{p_1,p_3\}}\frac{1}{j_1^2}\zeta_{2j_1}^{(i_1)}+\frac{\sqrt{2}}{4\pi^2}\sum_{j_1=1}^{p_1}\frac{1}{j_1^2}\zeta_{2j_1}^{(i_1)}\Biggr).\tag{138}$$

From (138) we have w. p. 1

$$\underset{p_1,p_3\to\infty}{\text{l.i.m.}}\sum_{j_1=0}^{2p_1}\sum_{j_3=0}^{2p_3}C_{j_3j_3j_1}\zeta_{j_1}^{(i_1)}=(T-t)^{3/2}\Biggl(\frac{1}{6}\zeta_0^{(i_3)}+\frac{1}{2\pi^2}\sum_{j_3=1}^{\infty}\frac{1}{j_3^2}\ \zeta_0^{(i_1)}+$$

$$+\underset{p_1\to\infty}{\text{l.i.m.}}\frac{\sqrt{2}}{4\pi}\sum_{j_1=1}^{p_1}\frac{1}{j_1}\zeta_{2j_1-1}^{(i_1)}\Biggr).\tag{139}$$

Using the Ito formula and Theorems 1, 2 for the case of trigonometric system of functions, we obtain w. p. 1

$$\frac{1}{2}\int\limits_t^T\int\limits_t^{\tau} d\mathbf{f}_s^{(i_1)}d\tau=\frac{1}{2}\left((T-t)\int\limits_t^T d\mathbf{f}_s^{(i_1)}+\int\limits_t^T (t-s)d\mathbf{f}_s^{(i_1)}\right)=$$

$$=\frac{1}{4}(T-t)^{3/2}\left(\zeta_0^{(i_1)}+\underset{p_1\to\infty}{\text{l.i.m.}}\ \frac{\sqrt{2}}{\pi}\sum_{j_1=1}^{p_1}\frac{1}{j_1}\zeta_{2j_1-1}^{(i_1)}\right). \qquad (140)$$

From (139) and (140) it follows that

$$\underset{p_1,p_3\to\infty}{\text{l.i.m.}}\ \sum_{j_1=0}^{2p_1}\sum_{j_3=0}^{2p_3}C_{j_3j_3j_1}\zeta_{j_1}^{(i_1)}=$$

$$=(T-t)^{3/2}\left(\frac{1}{6}\zeta_0^{(i_1)}+\frac{1}{12}\zeta_0^{(i_1)}+\underset{p_1\to\infty}{\text{l.i.m.}}\ \frac{\sqrt{2}}{4\pi}\sum_{j_1=1}^{p_1}\frac{1}{j_1}\zeta_{2j_1-1}^{(i_1)}\right)=$$

$$=(T-t)^{3/2}\left(\frac{1}{4}\zeta_0^{(i_1)}+\underset{p_1\to\infty}{\text{l.i.m.}}\ \frac{\sqrt{2}}{4\pi}\sum_{j_1=1}^{p_1}\frac{1}{j_1}\zeta_{2j_1-1}^{(i_1)}\right)=$$

$$=\frac{1}{2}\int\limits_t^T\int\limits_t^{\tau} d\mathbf{f}_s^{(i_1)}d\tau,$$

where the equality is fulfilled w. p. 1.

So, the relations (136) and (97) are proved for the case of trigonometric system of functions.

Let us prove the equality (98). Since $\psi_1(\tau)$, $\psi_2(\tau)$, $\psi_3(\tau)\equiv 1$, then the following relation for the Fourier coefficients is correct

$$C_{j_1j_1j_3}+C_{j_1j_3j_1}+C_{j_3j_1j_1}=\frac{1}{2}C_{j_1}^2C_{j_3}.$$

Then w. p. 1

$$\underset{p_1,p_3\to\infty}{\text{l.i.m.}}\ \sum_{j_1=0}^{p_1}\sum_{j_3=0}^{p_3}C_{j_1j_3j_1}\zeta_{j_3}^{(i_2)}=$$

$$=\underset{p_1,p_3\to\infty}{\text{l.i.m.}}\ \sum_{j_1=0}^{p_1}\sum_{j_3=0}^{p_3}\left(\frac{1}{2}C_{j_1}^2C_{j_3}-C_{j_1j_1j_3}-C_{j_3j_1j_1}\right)\zeta_{j_3}^{(i_2)}. \qquad (141)$$

Taking into account (96) and (97), we can write w. p. 1

$$\underset{p_1,p_3\to\infty}{\text{l.i.m.}}\ \sum_{j_1=0}^{p_1}\sum_{j_3=0}^{p_3}C_{j_1j_3j_1}\zeta_{j_3}^{(i_2)}=$$

$$
=\frac{1}{2}C_0^3\zeta_0^{(i_2)}-\underset{p_1,p_3\to\infty}{\text{l.i.m.}}\sum_{j_1=0}^{p_1}\sum_{j_3=0}^{p_3}C_{j_1j_1j_3}\zeta_{j_3}^{(i_2)}-
$$

$$
-\underset{p_1,p_3\to\infty}{\text{l.i.m.}}\sum_{j_1=0}^{p_1}\sum_{j_3=0}^{p_3}C_{j_3j_1j_1}\zeta_{j_3}^{(i_2)}=
$$

$$
=\frac{1}{2}(T-t)^{3/2}\zeta_0^{(i_2)}-\frac{1}{4}(T-t)^{3/2}\left(\zeta_0^{(i_2)}+\underset{p_1\to\infty}{\text{l.i.m.}}\frac{\sqrt{2}}{\pi}\sum_{j_1=1}^{p_1}\frac{1}{j_1}\zeta_{2j_1-1}^{(i_2)}\right)-
$$

$$
-\frac{1}{4}(T-t)^{3/2}\left(\zeta_0^{(i_2)}-\underset{p_1\to\infty}{\text{l.i.m.}}\frac{\sqrt{2}}{\pi}\sum_{j_1=1}^{p_1}\frac{1}{j_1}\zeta_{2j_1-1}^{(i_2)}\right)=0.
$$

From Theorems 1, 2 and (96)–(98) we obtain the expansion (95). Theorem 5 is proved.

7. Modifications of Theorems 3–5

Let us consider the following modification of Theorem 4.

Theorem 6 [17]-[19], [22], [24]-[27]. *Assume that $\{\phi_j(x)\}_{j=0}^{\infty}$ is a complete orthonormal system of Legendre polynomials in the space $L_2([t,T])$ and $\psi_1(\tau),\ \psi_2(\tau),\ \psi_3(\tau)$ are continuously differentiable functions at the interval $[t,T]$. Then, for the iterated Stratonovich stochastic integral of third multiplicity*

$$
J^*[\psi^{(3)}]_{T,t}=\int\limits_t^{*T}\psi_3(t_3)\int\limits_t^{*t_3}\psi_2(t_2)\int\limits_t^{*t_2}\psi_1(t_1)d\mathbf{f}_{t_1}^{(i_1)}d\mathbf{f}_{t_2}^{(i_2)}d\mathbf{f}_{t_3}^{(i_3)}\quad (i_1,i_2,i_3=1,\ldots,m)
$$

the following expansion

$$
J^*[\psi^{(3)}]_{T,t}=\underset{p\to\infty}{\text{l.i.m.}}\sum_{j_1,j_2,j_3=0}^{p}C_{j_3j_2j_1}\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}\zeta_{j_3}^{(i_3)} \tag{142}
$$

converging in the mean-square sense is valid for each of the following cases

1. $i_1\ne i_2,\ i_2\ne i_3,\ i_1\ne i_3,$
2. $i_1=i_2\ne i_3$ *and* $\psi_1(\tau)\equiv\psi_2(\tau),$
3. $i_1\ne i_2=i_3$ *and* $\psi_2(\tau)\equiv\psi_3(\tau),$
4. $i_1,i_2,i_3=1,\ldots,m$ *and* $\psi_1(\tau)\equiv\psi_2(\tau)\equiv\psi_3(\tau),$

where

$$
C_{j_3j_2j_1}=\int\limits_t^T\psi_3(s)\phi_{j_3}(s)\int\limits_t^s\psi_2(s_1)\phi_{j_2}(s_1)\int\limits_t^{s_1}\psi_1(s_2)\phi_{j_1}(s_2)ds_2ds_1ds.
$$

Proof. Case 1 directly follows from Theorems 1, 2. Let us consider Case 2. We will prove w. p. 1 the following relation

$$\underset{p\to\infty}{\text{l.i.m.}}\ \sum_{j_1=0}^{p}\sum_{j_3=0}^{p} C_{j_3j_1j_1}\zeta_{j_3}^{(i_3)} = \frac{1}{2}\int\limits_t^T \psi_3(s)\int\limits_t^s \psi^2(s_1)ds_1 d\mathbf{f}_s^{(i_3)},$$

where

$$C_{j_3j_1j_1} = \int\limits_t^T \psi_3(s)\phi_{j_3}(s)\int\limits_t^s \psi(s_1)\phi_{j_1}(s_1)\int\limits_t^{s_1}\psi(s_2)\phi_{j_1}(s_2)ds_2ds_1ds.$$

Using Theorems 1, 2 we can write the following

$$\frac{1}{2}\int\limits_t^T \psi_3(s)\int\limits_t^s \psi^2(s_1)ds_1 d\mathbf{f}_s^{(i_3)} = \frac{1}{2}\underset{p_3\to\infty}{\text{l.i.m.}}\ \sum_{j_3=0}^{p_3}\tilde{C}_{j_3}\zeta_{j_3}^{(i_3)},$$

where

$$\tilde{C}_{j_3} = \int\limits_t^T \phi_{j_3}(s)\psi_3(s)\int\limits_t^s \psi^2(s_1)ds_1ds.$$

We have

$$\mathsf{M}\left\{\left(\sum_{j_3=0}^{p}\left(\sum_{j_1=0}^{p} C_{j_3j_1j_1}-\frac{1}{2}\tilde{C}_{j_3}\right)\zeta_{j_3}^{(i_3)}\right)^2\right\} = \sum_{j_3=0}^{p}\left(\sum_{j_1=0}^{p} C_{j_3j_1j_1}-\frac{1}{2}\tilde{C}_{j_3}\right)^2 =$$

$$= \sum_{j_3=0}^{p}\left(\frac{1}{2}\sum_{j_1=0}^{p}\int\limits_t^T \phi_{j_3}(s)\psi_3(s)\left(\int\limits_t^s \phi_{j_1}(s_1)\psi(s_1)ds_1\right)^2 ds - \frac{1}{2}\int\limits_t^T \phi_{j_3}(s)\psi_3(s)\int\limits_t^s \psi^2(s_1)ds_1ds\right)^2 =$$

$$= \frac{1}{4}\sum_{j_3=0}^{p}\left(\int\limits_t^T \phi_{j_3}(s)\psi_3(s)\left(\sum_{j_1=0}^{p}\left(\int\limits_t^s \phi_{j_1}(s_1)\psi(s_1)ds_1\right)^2 - \int\limits_t^s \psi^2(s_1)ds_1\right)ds\right)^2 =$$

$$= \frac{1}{4}\sum_{j_3=0}^{p}\left(\int\limits_t^T \phi_{j_3}(s)\psi_3(s)\sum_{j_1=p+1}^{\infty}\left(\int\limits_t^s \phi_{j_1}(s_1)\psi(s_1)ds_1\right)^2 ds\right)^2. \tag{143}$$

In order to get (143) we used the Parseval equality in the form

$$\sum_{j_1=0}^{\infty}\left(\int\limits_t^s \phi_{j_1}(s_1)\psi(s_1)ds_1\right)^2 = \int\limits_t^T K^2(s,s_1)ds_1 = \int\limits_t^s \psi^2(s_1)ds_1,$$

where

$$K(s,s_1) = \psi(s_1)\mathbf{1}_{\{s_1<s\}},\quad s,s_1\in[t,T].$$

We have for $j_1 \in \mathbb{N}$

$$\left(\int\limits_t^s \psi(s_1)\phi_{j_1}(s_1)ds_1\right)^2 =$$

$$= \frac{(T-t)(2j_1+1)}{4}\left(\int\limits_{-1}^{z(s)} P_{j_1}(y)\psi\left(\frac{T-t}{2}y+\frac{T+t}{2}\right)dy\right)^2 =$$

$$= \frac{T-t}{4(2j_1+1)}\Biggl(\left(P_{j_1+1}(z(s))-P_{j_1-1}(z(s))\right)\psi(s)-$$

$$-\frac{T-t}{2}\int\limits_{-1}^{z(s)}\left(\left(P_{j_1+1}(y)-P_{j_1-1}(y)\right)\psi'\left(\frac{T-t}{2}y+\frac{T+t}{2}\right)dy\right)^2, \tag{144}$$

where

$$z(s) = \left(s - \frac{T+t}{2}\right)\frac{2}{T-t},$$

and ψ' is a derivative of the function $\psi(s)$ with respect to the variable

$$\frac{T-t}{2}y + \frac{T+t}{2}.$$

Further consideration is similar to the proof of Case 2 from Theorem 4. Finally, from (143) and (144) we obtain

$$\mathsf{M}\left\{\left(\sum_{j_3=0}^{p}\left(\sum_{j_1=0}^{p} C_{j_3j_1j_1} - \frac{1}{2}\tilde{C}_{j_3}\right)\zeta_{j_3}^{(i_3)}\right)^2\right\} <$$

$$< K\frac{p}{p^2}\left(\int\limits_{-1}^{1}\frac{dy}{(1-y^2)^{3/4}} + \int\limits_{-1}^{1}\frac{dy}{(1-y^2)^{1/4}}\right)^2 \le$$

$$\le \frac{K_1}{p} \to 0 \quad \text{if} \quad p \to \infty,$$

where K, K_1 are constants. Case 2 is proved.

Let us consider Case 3. In this case we will prove w. p. 1 the following relation

$$\underset{p\to\infty}{\text{l.i.m.}}\sum_{j_1=0}^{p}\sum_{j_3=0}^{p} C_{j_3j_3j_1}\zeta_{j_1}^{(i_1)} = \frac{1}{2}\int\limits_t^T \psi^2(s)\int\limits_t^s \psi_1(s_1)d\mathbf{f}_{s_1}^{(i_1)}ds,$$

where

$$C_{j_3j_3j_1} = \int\limits_t^T \psi(s)\phi_{j_3}(s)\int\limits_t^s \psi(s_1)\phi_{j_3}(s_1)\int\limits_t^{s_1}\psi_1(s_2)\phi_{j_1}(s_2)ds_2ds_1ds.$$

Using the Ito formula, we obtain w. p. 1

$$\frac{1}{2}\int\limits_t^T \psi^2(s)\int\limits_t^s \psi_1(s_1)d\mathbf{f}_{s_1}^{(i_1)}ds = \frac{1}{2}\int\limits_t^T \psi_1(s_1)\int\limits_{s_1}^T \psi^2(s)dsd\mathbf{f}_{s_1}^{(i_1)}. \tag{145}$$

Applying Theorems 1 and 2, we have

$$\frac{1}{2}\int\limits_t^T \psi_1(s_1)\int\limits_{s_1}^T \psi^2(s)dsd\mathbf{f}_{s_1}^{(i_1)} = \frac{1}{2}\underset{p_1\to\infty}{\text{l.i.m.}}\sum_{j_1=0}^{p_1} C_{j_1}^*\zeta_{j_1}^{(i_1)}, \tag{146}$$

where

$$C_{j_1}^* = \int\limits_t^T \phi_{j_1}(s_1)\psi_1(s_1)\int\limits_{s_1}^T \psi^2(s)dsds_1.$$

Moreover,

$$C_{j_3j_3j_1} = \int\limits_t^T \psi(s)\phi_{j_3}(s)\int\limits_t^s \psi(s_1)\phi_{j_3}(s_1)\int\limits_t^{s_1} \psi_1(s_2)\phi_{j_1}(s_2)ds_2ds_1ds =$$

$$= \int\limits_t^T \psi_1(s_2)\phi_{j_1}(s_2)\int\limits_{s_2}^T \psi(s_1)\phi_{j_3}(s_1)\int\limits_{s_1}^T \psi(s)\phi_{j_3}(s)dsds_1ds_2 =$$

$$= \frac{1}{2}\int\limits_t^T \psi_1(s_2)\phi_{j_1}(s_2)\left(\int\limits_{s_2}^T \psi(s_1)\phi_{j_3}(s_1)ds_1\right)^2 ds_2. \tag{147}$$

From (145)–(147) we obtain

$$\mathsf{M}\left\{\left(\sum_{j_1=0}^{p}\left(\sum_{j_3=0}^{p} C_{j_3j_3j_1} - \frac{1}{2}C_{j_1}^*\right)\zeta_{j_1}^{(i_1)}\right)^2\right\} = \sum_{j_1=0}^{p}\left(\sum_{j_3=0}^{p} C_{j_3j_3j_1} - \frac{1}{2}C_{j_1}^*\right)^2 =$$

$$= \frac{1}{4}\sum_{j_1=0}^{p}\left(\int\limits_t^T \phi_{j_1}(s_1)\psi_1(s_1)\left(\sum_{j_3=0}^{p}\left(\int\limits_{s_1}^T \phi_{j_3}(s)\psi(s)ds_1\right)^2 - \int\limits_{s_1}^T \psi^2(s)ds\right)ds_1\right)^2$$

$$= \frac{1}{4}\sum_{j_1=0}^{p}\left(\int\limits_t^T \phi_{j_1}(s_1)\psi_1(s_1)\sum_{j_3=p+1}^{\infty}\left(\int\limits_{s_1}^T \phi_{j_3}(s)\psi(s)ds\right)^2 ds_1\right)^2. \tag{148}$$

In order to get (148) we used the Parseval equality in the form

$$\sum_{j_3=0}^{\infty}\left(\int\limits_{s_1}^{T}\phi_{j_3}(s)\psi(s)ds\right)^2=\int\limits_{t}^{T}K^2(s,s_1)ds=\int\limits_{s_1}^{T}\psi^2(s)ds,$$

where

$$K(s,s_1)=\psi(s)\mathbf{1}_{\{s>s_1\}},\quad s,s_1\in[t,T].$$

Further consideration is similar to the proof of Case 3 from Theorem 4. Finally, from (148) we get

$$\mathsf{M}\left\{\left(\sum_{j_1=0}^{p}\left(\sum_{j_3=0}^{p}C_{j_3j_3j_1}-\frac{1}{2}C^*_{j_1}\right)\zeta_{j_1}^{(i_1)}\right)^2\right\}<$$

$$<K\frac{p}{p^2}\left(\int\limits_{-1}^{1}\frac{dy}{(1-y^2)^{3/4}}+\int\limits_{-1}^{1}\frac{dy}{(1-y^2)^{1/4}}\right)^2\le$$

$$\le\frac{K_1}{p}\quad\to 0\quad \text{if } p\ \to\infty,$$

where K,K_1 are constants. Case 3 is proved.

Let us consider Case 4. We will prove w. p. 1 the following relation

$$\underset{p\to\infty}{\text{l.i.m.}}\ \sum_{j_1=0}^{p}\sum_{j_3=0}^{p}C_{j_1j_3j_1}\zeta_{j_3}^{(i_2)}=0\quad(\psi_1(s),\psi_2(s),\psi_3(s)\equiv\psi(s)).$$

In Case 4 we obtain w. p. 1

$$\underset{p\to\infty}{\text{l.i.m.}}\ \sum_{j_1,j_3=0}^{p}C_{j_1j_3j_1}\zeta_{j_3}^{(i_2)}=$$

$$=\underset{p\to\infty}{\text{l.i.m.}}\ \sum_{j_1,j_3=0}^{p}\left(\frac{1}{2}C_{j_1}^2C_{j_3}-C_{j_1j_1j_3}-C_{j_3j_1j_1}\right)\zeta_{j_3}^{(i_2)}=$$

$$=\underset{p\to\infty}{\text{l.i.m.}}\ \frac{1}{2}\sum_{j_1=0}^{p}C_{j_1}^2\sum_{j_3=0}^{p}C_{j_3}\zeta_{j_3}^{(i_2)}-\underset{p\to\infty}{\text{l.i.m.}}\ \sum_{j_1,j_3=0}^{p}C_{j_1j_1j_3}\zeta_{j_3}^{(i_2)}-$$

$$-\underset{p\to\infty}{\text{l.i.m.}}\ \sum_{j_1,j_3=0}^{p}C_{j_3j_1j_1}\zeta_{j_3}^{(i_2)}=$$

$$=\frac{1}{2}\sum_{j_1=0}^{\infty}C_{j_1}^2\int\limits_{t}^{T}\psi(s)d\mathbf{f}_s^{(i_2)}-\frac{1}{2}\int\limits_{t}^{T}\psi^2(s)\int\limits_{t}^{s}\psi(s_1)d\mathbf{f}_{s_1}^{(i_2)}ds-$$

$$-\frac{1}{2}\int\limits_{t}^{T}\psi(s)\int\limits_{t}^{s}\psi^2(s_1)ds_1d\mathbf{f}_s^{(i_2)}=\frac{1}{2}\int\limits_{t}^{T}\psi^2(s)ds\int\limits_{t}^{T}\psi(s)d\mathbf{f}_s^{(i_2)}-$$

$$
-\frac{1}{2}\int\limits_t^T \psi(s_1)\int\limits_{s_1}^T \psi^2(s)dsd\mathbf{f}_{s_1}^{(i_2)}-\frac{1}{2}\int\limits_t^T \psi(s_1)\int\limits_t^{s_1} \psi^2(s)dsd\mathbf{f}_{s_1}^{(i_2)}=
$$

$$
=\frac{1}{2}\int\limits_t^T \psi^2(s)ds\int\limits_t^T \psi(s)d\mathbf{f}_s^{(i_2)}-\frac{1}{2}\int\limits_t^T \psi(s_1)\int\limits_t^T \psi^2(s)dsd\mathbf{f}_{s_1}^{(i_2)}=0,
$$

where we used the Parseval equality in the form

$$
\sum_{j_1=0}^{\infty}C_j^2=\sum_{j=0}^{\infty}\left(\int\limits_t^T \psi(s)\phi_j(s)ds\right)^2=\int\limits_t^T \psi^2(s)ds.
$$

Case 4 and Theorem 6 are proved.

Let us consider the trigonometric version of Theorem 6.

Theorem 7 [19], [22], [24]-[27]. *Suppose that $\{\phi_j(x)\}_{j=0}^{\infty}$ is a complete orthonormal system of trigonometric functions in the space $L_2([t,T])$ and $\psi_1(\tau)$, $\psi_2(\tau)$, $\psi_3(\tau)$ are continuously differentiable functions at the interval $[t,T]$. Then, for the iterated Stratonovich stochastic integral of third multiplicity*

$$
J^*[\psi^{(3)}]_{T,t}=\int\limits_t^{*T}\psi_3(t_3)\int\limits_t^{*t_3}\psi_2(t_2)\int\limits_t^{*t_2}\psi_1(t_1)d\mathbf{f}_{t_1}^{(i_1)}d\mathbf{f}_{t_2}^{(i_2)}d\mathbf{f}_{t_3}^{(i_3)}\quad (i_1,i_2,i_3=1,\ldots,m)
$$

the following expansion

$$
J^*[\psi^{(3)}]_{T,t}=\underset{p\to\infty}{\text{l.i.m.}}\sum_{j_1,j_2,j_3=0}^{p}C_{j_3j_2j_1}\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}\zeta_{j_3}^{(i_3)}
$$

converging in the mean-square sense is valid for each of the following cases

1. $i_1\ne i_2,\ i_2\ne i_3,\ i_1\ne i_3,$
2. $i_1=i_2\ne i_3$ *and* $\psi_1(\tau)\equiv\psi_2(\tau),$
3. $i_1\ne i_2=i_3$ *and* $\psi_2(\tau)\equiv\psi_3(\tau),$
4. $i_1,i_2,i_3=1,\ldots,m$ *and* $\psi_1(\tau)\equiv\psi_2(\tau)\equiv\psi_3(\tau),$

where

$$
C_{j_3j_2j_1}=\int\limits_t^T \psi_3(s)\phi_{j_3}(s)\int\limits_t^s \psi_2(s_1)\phi_{j_2}(s_1)\int\limits_t^{s_1} \psi_1(s_2)\phi_{j_1}(s_2)ds_2ds_1ds.
$$

Proof. We have

$$
\int\limits_t^s \phi_{j_1}(\theta)\psi(\theta)d\theta=\frac{\sqrt{2}}{\sqrt{T-t}}\int\limits_t^s \begin{cases}\psi(\theta)\,\sin\left((2\pi j_1(\theta-t))/(T-t)\right)d\theta\\ \\ \psi(\theta)\,\cos\left((2\pi j_1(\theta-t))/(T-t)\right)d\theta\end{cases}=
$$

$$
=\sqrt{\frac{T-t}{2}}\frac{1}{\pi j_1}\left(\begin{cases}-\psi(s)\ \cos\left((2\pi j_1(s-t))/(T-t)\right)+\psi(t)\\ \\ \psi(s)\ \sin\left((2\pi j_1(s-t))/(T-t)\right)\end{cases}\right. +
$$

$$
\left.+\int\limits_t^s\begin{cases}\psi'(\theta)\ \cos\left((2\pi j_1(\theta-t))/(T-t)\right)d\theta\\ \\ -\psi'(\theta)\ \sin\left((2\pi j_1(\theta-t))/(T-t)\right)d\theta\end{cases}\right),
$$

where $j_1\ne 0$ and $\{\phi_j(x)\}_{j=0}^{\infty}$ is a complete orthonormal system of trigonometric functions in $L_2([t,T])$.

Then

$$
\left|\int\limits_t^s\phi_{j_1}(\theta)\psi(\theta)d\theta\right|\le\frac{K}{j_1}\quad (j_1\ne 0). \tag{149}
$$

Analogously, we get

$$
\left|\int\limits_s^T\phi_{j_1}(\theta)\psi(\theta)d\theta\right|\le\frac{K}{j_1}\quad (j_1\ne 0). \tag{150}
$$

Using (143), (148)–(150), we obtain

$$
\mathsf{M}\left\{\left(\sum_{j_3=0}^{p}\left(\sum_{j_1=0}^{p}C_{j_3j_1j_1}-\frac{1}{2}\tilde C_{j_3}\right)\zeta_{j_3}^{(i_3)}\right)^2\right\}\le\frac{K_1}{p}\ \to 0\quad\text{if}\quad p\ \to\infty,
$$

$$
\mathsf{M}\left\{\left(\sum_{j_1=0}^{p}\left(\sum_{j_3=0}^{p}C_{j_3j_3j_1}-\frac{1}{2}C^{*}_{j_1}\right)\zeta_{j_1}^{(i_1)}\right)^2\right\}\le\frac{K_1}{p}\ \to 0\quad\text{if}\quad p\ \to\infty,
$$

where constant K_1 does not depend on p.

The consideration of Case 4 is similar to the case of Legendre polynomials (see Theorem 6). Theorem 7 is proved.

Note that the analogues of Theorems 6 and 7 have been proved in [29] without the restrictions 1–4 (see the formulations of Theorems 6 and 7). However, in [29] the additional smoothness assumptions were used.

8. Expansions of Iterated Stratonovich Stochastic Integrals of Multiplicities 3 to 6. Some Recent Results

Recently, a new approach to the expansion and mean-square approximation of iterated Stratonovich stochastic integrals has been obtained [25] (Sect. 2.10–2.19), [29] (Sect. 13–21), [33] (Sect. 5–12), [45] (Sect. 7–14), [74], [75]. Let us formulate five theorems that were proved using this approach.

Theorem 8 [25], [29], [33], [45], [74]. *Suppose that* $\{\phi_j(x)\}_{j=0}^{\infty}$ *is a complete orthonormal system of Legendre polynomials or trigonometric functions in the space* $L_2([t,T])$*. Furthermore, let* $\psi_1(\tau), \psi_2(\tau)$, $\psi_3(\tau)$ *are continuously differentiable nonrandom functions on* $[t,T]$*. Then, for the iterated Stratonovich stochastic integral of third multiplicity*

$$J^*[\psi^{(3)}]_{T,t} = \int\limits_t^{*T} \psi_3(t_3) \int\limits_t^{*t_3} \psi_2(t_2) \int\limits_t^{*t_2} \psi_1(t_1) d\mathbf{w}_{t_1}^{(i_1)} d\mathbf{w}_{t_2}^{(i_2)} d\mathbf{w}_{t_3}^{(i_3)} \quad (i_1, i_2, i_3 = 0, 1, \ldots, m)$$

the following relations

$$J^*[\psi^{(3)}]_{T,t} = \underset{p\to\infty}{\text{l.i.m.}} \sum_{j_1,j_2,j_3=0}^{p} C_{j_3j_2j_1} \zeta_{j_1}^{(i_1)} \zeta_{j_2}^{(i_2)} \zeta_{j_3}^{(i_3)}, \tag{151}$$

$$\mathsf{M}\left\{\left(J^*[\psi^{(3)}]_{T,t} - \sum_{j_1,j_2,j_3=0}^{p} C_{j_3j_2j_1} \zeta_{j_1}^{(i_1)} \zeta_{j_2}^{(i_2)} \zeta_{j_3}^{(i_3)}\right)^2\right\} \le \frac{C}{p} \tag{152}$$

are fulfilled, where $i_1, i_2, i_3 = 0, 1, \ldots, m$ *in* (151) *and* $i_1, i_2, i_3 = 1, \ldots, m$ *in* (152)*, constant* C *is independent of* p,

$$C_{j_3j_2j_1} = \int\limits_t^{T} \psi_3(t_3)\phi_{j_3}(t_3) \int\limits_t^{t_3} \psi_2(t_2)\phi_{j_2}(t_2) \int\limits_t^{t_2} \psi_1(t_1)\phi_{j_1}(t_1) dt_1 dt_2 dt_3$$

and

$$\zeta_j^{(i)} = \int\limits_t^{T} \phi_j(\tau) d\mathbf{f}_\tau^{(i)}$$

are independent standard Gaussian random variables for various i *or* j *(in the case when* $i \neq 0$*); another notations are the same as in Theorems* 1, 2*.*

Theorem 9 [25], [29], [33], [45], [74]. *Let* $\{\phi_j(x)\}_{j=0}^{\infty}$ *be a complete orthonormal system of Legendre polynomials or trigonometric functions in the space* $L_2([t,T])$*. Furthermore, let* $\psi_1(\tau), \ldots, \psi_4(\tau)$ *be continuously differentiable nonrandom functions on* $[t,T]$*. Then, for the iterated Stratonovich stochastic integral of fourth multiplicity*

$$J^*[\psi^{(4)}]_{T,t} = \int\limits_t^{*T} \psi_4(t_4) \int\limits_t^{*t_4} \psi_3(t_3) \int\limits_t^{*t_3} \psi_2(t_2) \int\limits_t^{*t_2} \psi_1(t_1) d\mathbf{w}_{t_1}^{(i_1)} d\mathbf{w}_{t_2}^{(i_2)} d\mathbf{w}_{t_3}^{(i_3)} d\mathbf{w}_{t_4}^{(i_4)} \tag{153}$$

the following relations

$$J^*[\psi^{(4)}]_{T,t} = \underset{p\to\infty}{\text{l.i.m.}} \sum_{j_1,j_2,j_3,j_4=0}^{p} C_{j_4j_3j_2j_1} \zeta_{j_1}^{(i_1)} \zeta_{j_2}^{(i_2)} \zeta_{j_3}^{(i_3)} \zeta_{j_4}^{(i_4)}, \tag{154}$$

$$\mathsf{M}\left\{\left(J^*[\psi^{(4)}]_{T,t}-\sum_{j_1,j_2,j_3,j_4=0}^{p}C_{j_4j_3j_2j_1}\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}\zeta_{j_3}^{(i_3)}\zeta_{j_4}^{(i_4)}\right)^2\right\}\le\frac{C}{p^{1-\varepsilon}} \tag{155}$$

are fulfilled, where $i_1,\ldots,i_4=0,1,\ldots,m$ *in* (153), (154) *and* $i_1,\ldots,i_4=1,\ldots,m$ *in* (155)*, constant* C *does not depend on* p, ε *is an arbitrary small positive real number for the case of complete orthonormal system of Legendre polynomials in the space* $L_2([t,T])$ *and* $\varepsilon=0$ *for the case of complete orthonormal system of trigonometric functions in the space* $L_2([t,T])$,

$$C_{j_4j_3j_2j_1}=$$

$$=\int\limits_t^T\psi_4(t_4)\phi_{j_4}(t_4)\int\limits_t^{t_4}\psi_3(t_3)\phi_{j_3}(t_3)\int\limits_t^{t_3}\psi_2(t_2)\phi_{j_2}(t_2)\int\limits_t^{t_2}\psi_1(t_1)\phi_{j_1}(t_1)dt_1dt_2dt_3dt_4;$$

another notations are the same as in Theorem 8*.*

Theorem 10 [25], [29], [33], [45], [74]. *Assume that* $\{\phi_j(x)\}_{j=0}^{\infty}$ *is a complete orthonormal system of Legendre polynomials or trigonometric functions in the space* $L_2([t,T])$ *and* $\psi_1(\tau),\ldots,\psi_5(\tau)$ *are continuously differentiable nonrandom functions on* $[t,T]$*. Then, for the iterated Stratonovich stochastic integral of fifth multiplicity*

$$J^*[\psi^{(5)}]_{T,t}=\int\limits_t^{*T}\psi_5(t_5)\ldots\int\limits_t^{*t_2}\psi_1(t_1)d\mathbf{w}_{t_1}^{(i_1)}\ldots d\mathbf{w}_{t_5}^{(i_5)} \tag{156}$$

the following relations

$$J^*[\psi^{(5)}]_{T,t}=\underset{p\to\infty}{\text{l.i.m.}}\sum_{j_1,\ldots,j_5=0}^{p}C_{j_5\ldots j_1}\zeta_{j_1}^{(i_1)}\ldots\zeta_{j_5}^{(i_5)}, \tag{157}$$

$$\mathsf{M}\left\{\left(J^*[\psi^{(5)}]_{T,t}-\sum_{j_1,\ldots,j_5=0}^{p}C_{j_5\ldots j_1}\zeta_{j_1}^{(i_1)}\ldots\zeta_{j_5}^{(i_5)}\right)^2\right\}\le\frac{C}{p^{1-\varepsilon}} \tag{158}$$

are fulfilled, where $i_1,\ldots,i_5=0,1,\ldots,m$ *in* (156), (157) *and* $i_1,\ldots,i_5=1,\ldots,m$ *in* (158)*, constant* C *is independent of* p, ε *is an arbitrary small positive real number for the case of complete orthonormal system of Legendre polynomials in the space* $L_2([t,T])$ *and* $\varepsilon=0$ *for the case of complete orthonormal system of trigonometric functions in the space* $L_2([t,T])$,

$$C_{j_5\ldots j_1}=\int\limits_t^T\psi_5(t_5)\phi_{j_5}(t_5)\ldots\int\limits_t^{t_2}\psi_1(t_1)\phi_{j_1}(t_1)dt_1\ldots dt_5;$$

another notations are the same as in Theorems 8, 9*.*

Theorem 11 [25], [29], [33], [45], [74]. *Suppose that* $\{\phi_j(x)\}_{j=0}^{\infty}$ *is a complete orthonormal system of Legendre polynomials or trigonometric functions in the space* $L_2([t,T])$. *Then, for the iterated Stratonovich stochastic integral of sixth multiplicity*

the following expansion

$$J^*[\psi^{(3)}]_{T,t}^{(i_1i_2i_3)}=\underset{p_1,p_2,p_3\to\infty}{\text{l.i.m.}}\sum_{j_1=0}^{p_1}\sum_{j_2=0}^{p_2}\sum_{j_3=0}^{p_3}C_{j_3j_2j_1}\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}\zeta_{j_3}^{(i_3)}$$

that converges in the mean-square sense is valid, where $i_1,i_2,i_3=0,1,\ldots,m,$

$$C_{j_3j_2j_1}=\int\limits_t^{T}\psi_3(t_3)\phi_{j_3}(t_3)\int\limits_t^{t_3}\psi_2(t_2)\phi_{j_2}(t_2)\int\limits_t^{t_2}\psi_1(t_1)\phi_{j_1}(t_1)dt_1dt_2dt_3$$

another notations are the same as in Theorems 8–11.

Obviously, Theorem 12 generalizes the main results of this article for iterated Stratonovich stochastic integrals of third multiplicity.

9. Theorems 1–12 from Point of View of the Wong–Zakai Approximation

The iterated Ito stochastic integrals and solutions of Ito SDEs are complex and important functionals from the independent components $\mathbf{f}_s^{(i)}$, $i=1,\ldots,m$ of the multidimensional Wiener process $\mathbf{f}_s$, $s\in[0,T]$. Let $\mathbf{f}_s^{(i)p}$, $p\in\mathbb{N}$ be some approximation of $\mathbf{f}_s^{(i)}$, $i=1,\ldots,m$. Suppose that $\mathbf{f}_s^{(i)p}$ converges to $\mathbf{f}_s^{(i)}$, $i=1,\ldots,m$ if $p\to\infty$ in some sense and has differentiable sample trajectories.

A natural question arises: if we replace $\mathbf{f}_s^{(i)}$ by $\mathbf{f}_s^{(i)p}$, $i=1,\ldots,m$ in the functionals mentioned above, will the resulting functionals converge to the original functionals from the components $\mathbf{f}_s^{(i)}$, $i=1,\ldots,m$ of the multidimentional Wiener process $\mathbf{f}_s$? The answere to this question is negative in the general case. However, in the pioneering works of Wong E. and Zakai M. [62], [63], it was shown that under the special conditions and for some types of approximations of the Wiener process the answere is affirmative with one peculiarity: the convergence takes place to the iterated Stratonovich stochastic integrals and solutions of Stratonovich SDEs and not to iterated Ito stochastic integrals and solutions of Ito SDEs. The piecewise linear approximation as well as the regularization by convolution [62]-[64] relate the mentioned types of approximations of the Wiener process. The above approximation of stochastic integrals and solutions of SDEs is often called the Wong–Zakai approximation.

Let $\mathbf{f}_s$, $s\in[0,T]$ be an m-dimensional standard Wiener process with independent components $\mathbf{f}_s^{(i)}$, $i=1,\ldots,m$. It is well known that the following representation takes place [65], [66]

$$\mathbf{f}_\tau^{(i)}-\mathbf{f}_t^{(i)}=\sum_{j=0}^{\infty}\int\limits_t^{\tau}\phi_j(s)ds\ \zeta_j^{(i)},\quad \zeta_j^{(i)}=\int\limits_t^{T}\phi_j(s)d\mathbf{f}_s^{(i)}, \tag{160}$$

where $\tau\in[t,T]$, $t\geq 0$, $\{\phi_j(x)\}_{j=0}^{\infty}$ is an arbitrary complete orthonormal system of functions in the space $L_2([t,T])$, and $\zeta_j^{(i)}$ are independent standard Gaussian random variables for various i or j. Moreover, the series (160) converges for any $\tau\in[t,T]$ in the mean-square sense.

Let $\mathbf{f}_\tau^{(i)p}-\mathbf{f}_t^{(i)p}$ be the mean-square approximation of the process $\mathbf{f}_\tau^{(i)}-\mathbf{f}_t^{(i)}$, which has the following form

$$\mathbf{f}_\tau^{(i)p}-\mathbf{f}_t^{(i)p}=\sum_{j=0}^{p}\int\limits_t^{\tau}\phi_j(s)ds\ \zeta_j^{(i)}. \tag{161}$$

From (161) we obtain

$$d\mathbf{f}_\tau^{(i)p}=\sum_{j=0}^{p}\phi_j(\tau)\zeta_j^{(i)}d\tau. \tag{162}$$

Consider the following iterated Riemann–Stieltjes integral

$$\int\limits_t^{T}\psi_k(t_k)\ldots\int\limits_t^{t_2}\psi_1(t_1)d\mathbf{w}_{t_1}^{(i_1)p_1}\ldots d\mathbf{w}_{t_k}^{(i_k)p_k}, \tag{163}$$

where $p_1,\ldots,p_k\in\mathbb{N},\ \ i_1,\ldots,i_k=0,1,\ldots,m,$

$$
d\mathbf{w}_{\tau}^{(i)p}=\begin{cases} d\mathbf{f}_{\tau}^{(i)p} & \text{for} \quad i=1,\ldots,m\\ \\ d\tau & \text{for} \quad i=0\end{cases}, \tag{164}
$$

and $d\mathbf{f}_{\tau}^{(i)p}$ in defined by the relation (162).

Let us substitute (162) into (163)

$$
\int\limits_t^T \psi_k(t_k)\ldots\int\limits_t^{t_2}\psi_1(t_1)d\mathbf{w}_{t_1}^{(i_1)p_1}\ldots d\mathbf{w}_{t_k}^{(i_k)p_k}=\sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k}C_{j_k\ldots j_1}\prod_{l=1}^{k}\zeta_{j_l}^{(i_l)}, \tag{165}
$$

where

$$
\zeta_j^{(i)}=\int\limits_t^T\phi_j(s)d\mathbf{w}_s^{(i)}
$$

are independent standard Gaussian random variables for various i or j (in the case when $i\neq 0$), $\mathbf{w}_s^{(i)}=\mathbf{f}_s^{(i)}$ for $i=1,\ldots,m$ and $\mathbf{w}_s^{(0)}=s$,

$$
C_{j_k\ldots j_1}=\int\limits_t^T\psi_k(t_k)\phi_{j_k}(t_k)\ldots\int\limits_t^{t_2}\psi_1(t_1)\phi_{j_1}(t_1)dt_1\ldots dt_k
$$

is the Fourier coefficient.

To best of our knowledge [62]-[64] the approximations of the Wiener process in the Wong–Zakai approximation must satisfy fairly strong restrictions [64] (see Definition 7.1, pp. 480–481). Moreover, approximations of the Wiener process that are similar to (161) were not considered in [62], [63] (also see [64], Theorems 7.1, 7.2). Therefore, the proof of analogs of Theorems 7.1 and 7.2 [64] for approximations of the Wiener process based on its series expansion (160) should be carried out separately. Thus, the mean-square convergence of the right-hand side of (165) to the iterated Stratonovich stochastic integral (3) does not follow from the results of the papers [62], [63] (also see [64], Theorems 7.1, 7.2).

From the other hand, Theorems 1, 2 and Theorems 3–12 from this paper (also see Chapters 1 and 2 from [25]) can be considered as the proof of the Wong–Zakai approximation for the iterated Stratonovich stochastic integrals (3) of multiplicities 1 to 6 based on the approximation (161) of the Wiener process. At that, the iterated Riemann–Stieltjes integrals (163) converge (according to Theorems 1–12 from this article and Chapters 1, 2 from [25]) to the appropriate iterated Stratonovich stochastic integrals (3). Recall that $\{\phi_j(x)\}_{j=0}^{\infty}$ (see (160), (161), and Theorems 3–12) is a complete orthonormal system of Legendre polynomials or trigonometric functions in the space $L_2([t,T])$.

To illustrate the above reasoning, consider two examples for the case $k=2$, $\psi_1(s)$, $\psi_2(s)\equiv 1$; $i_1,i_2=1,\ldots,m$.

The first example relates to the piecewise linear approximation of the multidimensional Wiener process (these approximations were considered in [62]-[64]).

Let $\mathbf{b}_{\Delta}^{(i)}(t)$, $t\in[0,T]$ be the piecewise linear approximation of the ith component $\mathbf{f}_t^{(i)}$ of the multidimensional standard Wiener process $\mathbf{f}_t$, $t\in[0,T]$ with independent components $\mathbf{f}_t^{(i)}$, $i=1,\ldots,m$, i.e.

$$\mathbf{b}_{\Delta}^{(i)}(t)=\mathbf{f}_{k\Delta}^{(i)}+\frac{t-k\Delta}{\Delta}\Delta\mathbf{f}_{k\Delta}^{(i)},$$

where

$$\Delta\mathbf{f}_{k\Delta}^{(i)}=\mathbf{f}_{(k+1)\Delta}^{(i)}-\mathbf{f}_{k\Delta}^{(i)},\quad t\in[k\Delta,(k+1)\Delta),\quad k=0,1,\ldots,N-1.$$

Note that w. p. 1

$$\frac{d\mathbf{b}_{\Delta}^{(i)}}{dt}(t)=\frac{\Delta\mathbf{f}_{k\Delta}^{(i)}}{\Delta},\quad t\in[k\Delta,(k+1)\Delta),\quad k=0,1,\ldots,N-1. \tag{166}$$

Consider the following iterated Riemann–Stieltjes integral

$$\int\limits_0^T\int\limits_0^s d\mathbf{b}_{\Delta}^{(i_1)}(\tau)d\mathbf{b}_{\Delta}^{(i_2)}(s),\quad i_1,i_2=1,\ldots,m.$$

Using (166) and additive property of Riemann–Stieltjes integrals, we can write w. p. 1

$$\int\limits_0^T\int\limits_0^s d\mathbf{b}_{\Delta}^{(i_1)}(\tau)d\mathbf{b}_{\Delta}^{(i_2)}(s)=\int\limits_0^T\int\limits_0^s \frac{d\mathbf{b}_{\Delta}^{(i_1)}}{d\tau}(\tau)d\tau\frac{d\mathbf{b}_{\Delta}^{(i_2)}}{ds}(s)ds=$$

$$=\sum_{l=0}^{N-1}\int\limits_{l\Delta}^{(l+1)\Delta}\left(\sum_{q=0}^{l-1}\int\limits_{q\Delta}^{(q+1)\Delta}\frac{\Delta\mathbf{f}_{q\Delta}^{(i_1)}}{\Delta}d\tau+\int\limits_{l\Delta}^{s}\frac{\Delta\mathbf{f}_{l\Delta}^{(i_1)}}{\Delta}d\tau\right)\frac{\Delta\mathbf{f}_{l\Delta}^{(i_2)}}{\Delta}ds=$$

$$=\sum_{l=0}^{N-1}\sum_{q=0}^{l-1}\Delta\mathbf{f}_{q\Delta}^{(i_1)}\Delta\mathbf{f}_{l\Delta}^{(i_2)}+\frac{1}{\Delta^2}\sum_{l=0}^{N-1}\Delta\mathbf{f}_{l\Delta}^{(i_1)}\Delta\mathbf{f}_{l\Delta}^{(i_2)}\int\limits_{l\Delta}^{(l+1)\Delta}\int\limits_{l\Delta}^{s}d\tau ds=$$

$$=\sum_{l=0}^{N-1}\sum_{q=0}^{l-1}\Delta\mathbf{f}_{q\Delta}^{(i_1)}\Delta\mathbf{f}_{l\Delta}^{(i_2)}+\frac{1}{2}\sum_{l=0}^{N-1}\Delta\mathbf{f}_{l\Delta}^{(i_1)}\Delta\mathbf{f}_{l\Delta}^{(i_2)}. \tag{167}$$

Using (167) and standard relations between Ito and Stratonovich stochastic integrals, it is not difficult to show that

$$\underset{N\to\infty}{\text{l.i.m.}}\int\limits_0^T\int\limits_0^s d\mathbf{b}_{\Delta}^{(i_1)}(\tau)d\mathbf{b}_{\Delta}^{(i_2)}(s)=\int\limits_0^T\int\limits_0^s d\mathbf{f}_{\tau}^{(i_1)}d\mathbf{f}_{s}^{(i_2)}+\frac{1}{2}\mathbf{1}_{\{i_1=i_2\}}\int\limits_0^T ds=$$

$$=\int\limits_0^{*T}\int\limits_0^{*s} d\mathbf{f}_{\tau}^{(i_1)}d\mathbf{f}_{s}^{(i_2)}, \tag{168}$$

where $\Delta \to 0$ if $N \to \infty$ $(N\Delta = T)$.

Obviously, (168) agrees with Theorem 7.1 (see [64], p. 486).

The next example relates to the approximation of the Wiener process based on its series expansion (160) for $t = 0$, where $\{\phi_j(x)\}_{j=0}^{\infty}$ is a complete orthonormal system of Legendre polynomials or trigonometric functions in the space $L_2([0, T])$.

Consider the following iterated Riemann–Stieltjes integral

$$\int\limits_0^T \int\limits_0^s d\mathbf{f}_\tau^{(i_1)p} d\mathbf{f}_s^{(i_2)p}, \quad i_1, i_2 = 1, \ldots, m, \tag{169}$$

where $d\mathbf{f}_\tau^{(i)p}$ is defined by the relation (162).

Let us substitute (162) into (169)

$$\int\limits_0^T \int\limits_0^s d\mathbf{f}_\tau^{(i_1)p} d\mathbf{f}_s^{(i_2)p} = \sum_{j_1, j_2 = 0}^{p} C_{j_2 j_1} \zeta_{j_1}^{(i_1)} \zeta_{j_2}^{(i_2)}, \tag{170}$$

where

$$C_{j_2 j_1} = \int\limits_0^T \phi_{j_2}(s) \int\limits_0^s \phi_{j_1}(\tau) d\tau ds$$

is the Fourier coefficient; another notations are the same as in (165).

As we noted above, approximations of the Wiener process that are similar to (161) were not considered in [62], [63] (also see Theorems 7.1, 7.2 in [64]). Furthermore, the extension of the results of Theorems 7.1 and 7.2 [64] to the case under consideration is not obvious.

On the other hand, we can apply the theory built in Chapters 1 and 2 of the monographs [25]-[27]. More precisely, using Theorem 2.2 [25], we obtain from (170) the desired result

$$\underset{p\to\infty}{\text{l.i.m.}} \int\limits_0^T \int\limits_0^s d\mathbf{f}_\tau^{(i_1)p} d\mathbf{f}_s^{(i_2)p} = \underset{p\to\infty}{\text{l.i.m.}} \sum_{j_1, j_2 = 0}^{p} C_{j_2 j_1} \zeta_{j_1}^{(i_1)} \zeta_{j_2}^{(i_2)} =$$

$$= \int\limits_0^{*T} \int\limits_0^{*s} d\mathbf{f}_\tau^{(i_1)} d\mathbf{f}_s^{(i_2)}. \tag{171}$$

From the other hand, by Theorems 1, 2 (see (10)) for the case $k = 2$ we obtain from (170) the following relation

$$\underset{p\to\infty}{\text{l.i.m.}} \int\limits_0^T \int\limits_0^s d\mathbf{f}_\tau^{(i_1)p} d\mathbf{f}_s^{(i_2)p} = \underset{p\to\infty}{\text{l.i.m.}} \sum_{j_1, j_2 = 0}^{p} C_{j_2 j_1} \zeta_{j_1}^{(i_1)} \zeta_{j_2}^{(i_2)} =$$

$$= \underset{p\to\infty}{\text{l.i.m.}} \sum_{j_1, j_2 = 0}^{p} C_{j_2 j_1} \left(\zeta_{j_1}^{(i_1)} \zeta_{j_2}^{(i_2)} - \mathbf{1}_{\{i_1 = i_2\}} \mathbf{1}_{\{j_1 = j_2\}} \right) + \mathbf{1}_{\{i_1 = i_2\}} \sum_{j_1 = 0}^{\infty} C_{j_1 j_1} =$$

$$= \int\limits_0^T \int\limits_0^s d\mathbf{f}_\tau^{(i_1)} d\mathbf{f}_s^{(i_2)} + \mathbf{1}_{\{i_1=i_2\}} \sum_{j_1=0}^{\infty} C_{j_1 j_1}. \tag{172}$$

Since

$$\sum_{j_1=0}^{\infty} C_{j_1 j_1} = \frac{1}{2} \sum_{j_1=0}^{\infty} \left(\int\limits_0^T \phi_j(\tau) d\tau \right)^2 = \frac{1}{2} \left(\int\limits_0^T \phi_0(\tau) d\tau \right)^2 = \frac{1}{2} \int\limits_0^T ds,$$

then using standard relations between Ito and Stratonovich stochastic integrals and (172) we obtain (171).

EXPANSION OF ITERATED STRATONOVICH STOCHASTIC INTEGRALS OF ARBITRARY MULTIPLICITY BASED ON GENERALIZED ITERATED FOURIER SERIES CONVERGING POINTWISE

DMITRIY F. KUZNETSOV

Abstract. The article is devoted to the expansion of iterated Stratonovich stochastic integrals of arbitrary multiplicity k ($k \in \mathbb{N}$) based on iterated trigonometric Fourier series converging pointwise. The case of iterated Fourier–Legendre series is considered in details for $k = 2$. The obtained expansions provide a possibility to represent the iterated Stratonovich stochastic integral in the form of iterated series of products of standard Gaussian random variables. Convergence in the mean of degree $2n$ ($n \in \mathbb{N}$) of the expansions is proved. Some recent results on the expansion of iterated Stratonovich stochastic integrals of multiplicities 3 to 6 are given. The results of the article can be applied to the numerical solution of Ito stochastic differential equations.

Keywords: Iterated Stratonovich stochastic integral, Iterated Ito stochastic integral, Generalized iterated Fourier series, Generalized multiple Fourier series, Fourier–Legendre series, Trigonometric Fourier series, Approximation, Expansion.

1. Introduction

The idea of representing of iterated Ito and Stratonovich stochastic integrals in the form of multiple stochastic integrals from specific discontinuous nonrandom functions of several variables and following expansion of these functions using generalized iterated and multiple Fourier series in order to get effective mean-square approximations of the mentioned stochastic integrals was proposed and developed in a lot of publications of the author [1]-[41]. The terms "generalized iterated Fourier series" and "generalized multiple Fourier series" mean that these series are constructed using various complete orthonormal systems of functions in the space $L_2([t,T])$, and not only using the trigonometric system of functions. Here $[t,T]$ is an interval of integration of iterated Ito and Stratonovich stochastic integrals. For the first time approach of generalized iterated and multiple Fourier series is considered in [1] (1997), [2] (1998), and [4] (2006) (also see references to early publications (1994-1996) in [1], [2], [4], [18]-[21]). Usage of the Fourier–Legendre series for approximation of iterated Ito and Stratonovich stochastic integrals took place for the first time in [1] (1997) (also see [2]-[41]). The results from [1]-[41] and this work convincingly testify that there is a doubtless relation between the multiplier factor $1/2$, which is typical for Stratonovich stochastic integral and included into the sum connecting Stratonovich and Ito stochastic integrals, and the fact that in the point of finite discontinuity of piecewise smooth function $f(x)$ its generalized Fourier series converges to the value $(f(x+0)+f(x-0))/2$. In addition, as it is demonstrated in [1]-[41], the final formulas for expansions of iterated Stratonovich stochastic integrals based on the Fourier–Legendre series are essentially simpler than its analogues based on the trigonometric Fourier series. Note that another approaches to approximation of iterated Ito and Stratonovich stochastic integrals can be found in [42]-[58]. For example, in [4]-[40] the method of expansion of iterated Ito stochastic integrals based on generalized multiple Fourier series is proposed and developed. The ideas underlying this method are close to the ideas of the method considered in this article.

2. Theorem on Expansion of Iterated Stratonovich Stochastic Integrals of Arbitrary Multiplicity

Let $(\Omega, \mathrm{F}, \mathsf{P})$ be a complete probability space, let $\{\mathrm{F}_t, t\in[0,T]\}$ be a nondecreasing right-continous family of σ-algebras of F, and let $\mathbf{f}_t$ be a standard m-dimensional Wiener stochastic process, which is F_t-measurable for any $t\in[0,T]$. We assume that the components $\mathbf{f}_t^{(i)}$ $(i=1,\ldots,m)$ of this process are independent.

Consider the following iterated Stratonovich and Ito stochastic integrals

$$J^*[\psi^{(k)}]_{T,t}=\int\limits_t^{*T}\psi_k(t_k)\ldots\int\limits_t^{*t_2}\psi_1(t_1)d\mathbf{w}_{t_1}^{(i_1)}\ldots d\mathbf{w}_{t_k}^{(i_k)}, \tag{1}$$

$$J[\psi^{(k)}]_{T,t}=\int\limits_t^{T}\psi_k(t_k)\ldots\int\limits_t^{t_2}\psi_1(t_1)d\mathbf{w}_{t_1}^{(i_1)}\ldots d\mathbf{w}_{t_k}^{(i_k)}, \tag{2}$$

where every $\psi_l(\tau)$ $(l=1,\ldots,k)$ is a nonrandom function on $[t,T]$, $\mathbf{w}_\tau^{(i)}=\mathbf{f}_\tau^{(i)}$ for $i=1,\ldots,m$ and $\mathbf{w}_\tau^{(0)}=\tau$, $i_1,\ldots,i_k=0,1,\ldots,m$,

$$\int^{*}\ \text{and}\ \int$$

denote Stratonovich and Ito stochastic integrals, respectively (in this paper, we use the definition of the Stratonovich stochastic integral from [43]).

Further, we will denote the complete orthonormal systems of Legendre polynomials and trigonometric functions in the space $L_2([t,T])$ as $\{\phi_j(x)\}_{j=0}^{\infty}$. We will also pay attention on the following well-known facts about these two systems of functions.

Suppose that the function $f(x)$ is bounded at the interval $[t,T]$. Moreover, its derivative $f'(x)$ is continuous function at the interval $[t,T]$ except may be the finite number of points of the finite discontinuity. Then the generalized Fourier series

$$\sum_{j=0}^{\infty} C_j \phi_j(x)$$

with the Fourier coefficients

$$C_j = \int\limits_t^T f(x)\phi_j(x)dx$$

converges at any internal point x of the interval $[t,T]$ to the value $\left(f(x+0)+f(x-0)\right)/2$ and converges uniformly to $f(x)$ on any closed interval of continuity of the function $f(x)$ laying inside $[t,T]$. At the same time the Fourier–Legendre series converges if $x=t$ and $x=T$ to $f(t+0)$ and $f(T-0)$ correspondently, and the trigonometric Fourier series converges if $x=t$ and $x=T$ to $\left(f(t+0)+f(T-0)\right)/2$ in the case of periodic continuation of the function $f(x)$.

Define the following function on the hypercube $[t,T]^k$

$$K(t_1,\ldots,t_k) = \begin{cases} \psi_1(t_1)\ldots\psi_k(t_k),\ t_1<\ldots<t_k \\ \\ 0,\ \text{otherwise} \end{cases} = \prod_{l=1}^{k}\psi_l(t_l)\ \prod_{l=1}^{k-1}\mathbf{1}_{\{t_l<t_{l+1}\}}, \tag{3}$$

where $t_1,\ldots,t_k \in [t,T]$ $(k \ge 2)$ and $K(t_1) \equiv \psi_1(t_1)$ for $t_1 \in [t,T]$. Here $\mathbf{1}_A$ denotes the indicator of the set A.

Let us formulate the following statement.

Theorem 1 [18] (Sect. 2.4) (also see [1] (1997), [2], [10]-[13], [16], [17], [19]-[21], [41]). *Suppose that every function $\psi_l(\tau)$ $(l=1,\ldots,k)$ is twice continuously differentiable at the interval $[t,T]$ and $\{\phi_j(x)\}_{j=0}^{\infty}$ is a complete orthonormal system of trigonometric functions in the space $L_2([t,T])$. Then, for the iterated Stratonovich stochastic integral $J^*[\psi^{(k)}]_{T,t}$ defined by (1) the following expansion*

$$J^*[\psi^{(k)}]_{T,t} = \sum_{j_1=0}^{\infty}\ldots\sum_{j_k=0}^{\infty} C_{j_k\ldots j_1}\prod_{l=1}^{k}\zeta_{j_l}^{(i_l)} \tag{4}$$

converging in the mean of degree $2n$ $(n \in \mathbb{N})$ is valid, where

$$\zeta_j^{(i)} = \int\limits_t^T \phi_j(s)d\mathbf{w}_s^{(i)}$$

are independent standard Gaussian random variables for various i or j (if $i \ne 0$) and

$$C_{j_k\ldots j_1}=\int\limits_{[t,T]^k}K(t_1,\ldots,t_k)\prod_{l=1}^{k}\phi_{j_l}(t_l)dt_1\ldots dt_k \tag{5}$$

is the Fourier coefficient.

Note that (4) means the following

$$\lim_{p_1\to\infty}\overline{\lim_{p_2\to\infty}}\ldots\overline{\lim_{p_k\to\infty}}\;\mathsf{M}\left\{\left(J^*[\psi^{(k)}]_{T,t}-\sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k}C_{j_k\ldots j_1}\prod_{l=1}^{k}\zeta_{j_l}^{(i_l)}\right)^{2n}\right\}=0, \tag{6}$$

where $\overline{\lim}$ means lim sup.

Proof. Let us condider several lemmas. Define the function $K^*(t_1,\ldots,t_k)$ on the hypercube $[t,T]^k$ as follows

$$K^*(t_1,\ldots,t_k)=\prod_{l=1}^{k}\psi_l(t_l)\prod_{l=1}^{k-1}\left(\mathbf{1}_{\{t_l<t_{l+1}\}}+\frac{1}{2}\mathbf{1}_{\{t_l=t_{l+1}\}}\right)=$$

$$=\prod_{l=1}^{k}\psi_l(t_l)\left(\prod_{l=1}^{k-1}\mathbf{1}_{\{t_l<t_{l+1}\}}+\sum_{r=1}^{k-1}\frac{1}{2^r}\sum_{\substack{s_r,\ldots,s_1=1\\ s_r>\ldots>s_1}}^{k-1}\prod_{l=1}^{r}\mathbf{1}_{\{t_{s_l}=t_{s_l+1}\}}\prod_{\substack{l=1\\ l\ne s_1,\ldots,s_r}}^{k-1}\mathbf{1}_{\{t_l<t_{l+1}\}}\right) \tag{7}$$

for $t_1,\ldots,t_k\in[t,T]$ $(k\ge 2)$ and $K^*(t_1)\equiv\psi_1(t_1)$ for $t_1\in[t,T]$, where $\mathbf{1}_A$ is the indicator of the set A.

Lemma 1 [1] (1997), [2], [10]-[13], [16]-[21], [41]. *Under the conditions of Theorem* 1 *the function* $K^*(t_1,\ldots,t_k)$ *is represented in any internal point of the hypercube* $[t,T]^k$ *by the generalized iterated Fourier series*

$$K^*(t_1,\ldots,t_k)=\lim_{p_1\to\infty}\ldots\lim_{p_k\to\infty}\sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k}C_{j_k\ldots j_1}\prod_{l=1}^{k}\phi_{j_l}(t_l)\stackrel{\mathsf{def}}{=}$$

$$\stackrel{\mathsf{def}}{=}\sum_{j_1=0}^{\infty}\ldots\sum_{j_k=0}^{\infty}C_{j_k\ldots j_1}\prod_{l=1}^{k}\phi_{j_l}(t_l),\quad (t_1,\ldots,t_k)\in(t,T)^k, \tag{8}$$

where $C_{j_k\ldots j_1}$ *has the form* (5). *At that, the iterated series* (8) *converges at the boundary of the hypercube* $[t,T]^k$ *(not necessarily to the function* $K^*(t_1,\ldots,t_k)$*).*

Proof. We will perform the proof using induction. Consider the case $k=2$. Let us expand the function $K^*(t_1,t_2)$ using the variable t_1, when t_2 is fixed, into the generalized Fourier series at the interval (t,T)

$$K^*(t_1,t_2)=\sum_{j_1=0}^{\infty}C_{j_1}(t_2)\phi_{j_1}(t_1)\quad (t_1\ne t,T), \tag{9}$$

where

$$C_{j_1}(t_2)=\int\limits_t^T K^*(t_1,t_2)\phi_{j_1}(t_1)dt_1=\int\limits_t^T K(t_1,t_2)\phi_{j_1}(t_1)dt_1=$$

$$=\psi_2(t_2)\int\limits_t^{t_2}\psi_1(t_1)\phi_{j_1}(t_1)dt_1.$$

The equality (9) is fulfilled pointwise at each point of the interval (t,T) with respect to the variable t_1, when $t_2\in[t,T]$ is fixed, due to the piecewise smoothness of the function $K^*(t_1,t_2)$ with respect to the variable $t_1\in[t,T]$ (t_2 is fixed).

Note also that due to the well-known properties of the Fourier series, the series (9) converges when $t_1=t$ and $t_1=T$ (not necessarily to the function $K^*(t_1,t_2)$).

Obtaining (9) we also used the fact that the right-hand side of (9) converges when $t_1=t_2$ (point of a finite discontinuity of the function $K(t_1,t_2)$) to the value

$$\frac{1}{2}\left(K(t_2-0,t_2)+K(t_2+0,t_2)\right)=\frac{1}{2}\psi_1(t_2)\psi_2(t_2)=K^*(t_2,t_2).$$

The function $C_{j_1}(t_2)$ is a continuously differentiable one at the interval $[t,T]$. Let us expand it into the generalized Fourier series at the interval (t,T)

$$C_{j_1}(t_2)=\sum_{j_2=0}^{\infty}C_{j_2j_1}\phi_{j_2}(t_2)\quad (t_2\ne t,T), \tag{10}$$

where

$$C_{j_2j_1}=\int\limits_t^T C_{j_1}(t_2)\phi_{j_2}(t_2)dt_2=\int\limits_t^T \psi_2(t_2)\phi_{j_2}(t_2)\int\limits_t^{t_2}\psi_1(t_1)\phi_{j_1}(t_1)dt_1dt_2,$$

and the equality (10) is fulfilled pointwise at any point of the interval (t,T). The right-hand side of (10) converges when $t_2=t$ and $t_2=T$ (not necessarily to $C_{j_1}(t_2)$).

Let us substitute (10) into (9)

$$K^*(t_1,t_2)=\sum_{j_1=0}^{\infty}\sum_{j_2=0}^{\infty}C_{j_2j_1}\phi_{j_1}(t_1)\phi_{j_2}(t_2),\quad (t_1,t_2)\in(t,T)^2. \tag{11}$$

Note that the series on the right-hand side of (11) converges at the boundary of the square $[t,T]^2$ (not necessarily to $K^*(t_1,t_2)$). Lemma 1 is proved for the case $k=2$.

Note that proving Lemma 1 for the case $k=2$, we get the following equality (see (9))

$$\psi_1(t_1)\left(\mathbf{1}_{\{t_1<t_2\}}+\frac{1}{2}\mathbf{1}_{\{t_1=t_2\}}\right)=\sum_{j_1=0}^{\infty}\int\limits_t^{t_2}\psi_1(t_1)\phi_{j_1}(t_1)dt_1\cdot\phi_{j_1}(t_1), \tag{12}$$

which is fulfilled pointwise at the interval (t,T), besides the series on the right-hand side of (12) converges when $t_1=t$ and $t_1=T$.

Let us introduce the assumption of induction

$$\sum_{j_1=0}^{\infty}\sum_{j_2=0}^{\infty}\ldots\sum_{j_{k-2}=0}^{\infty}\psi_{k-1}(t_{k-1})\int\limits_t^{t_{k-1}}\psi_{k-2}(t_{k-2})\phi_{j_{k-2}}(t_{k-2})\ldots$$

$$\ldots\int\limits_t^{t_2}\psi_1(t_1)\phi_{j_1}(t_1)dt_1\ldots dt_{k-2}\prod_{l=1}^{k-2}\phi_{j_l}(t_l)=$$

$$=\prod_{l=1}^{k-1}\psi_l(t_l)\prod_{l=1}^{k-2}\left(\mathbf{1}_{\{t_l<t_{l+1}\}}+\frac{1}{2}\mathbf{1}_{\{t_l=t_{l+1}\}}\right). \tag{13}$$

Then

$$\sum_{j_1=0}^{\infty}\sum_{j_2=0}^{\infty}\ldots\sum_{j_{k-1}=0}^{\infty}\psi_{k}(t_{k})\int\limits_t^{t_{k}}\psi_{k-1}(t_{k-1})\phi_{j_{k-1}}(t_{k-1})\ldots$$

$$\ldots\int\limits_t^{t_2}\psi_1(t_1)\phi_{j_1}(t_1)dt_1\ldots dt_{k-1}\prod_{l=1}^{k-1}\phi_{j_l}(t_l)=$$

$$=\sum_{j_1=0}^{\infty}\sum_{j_2=0}^{\infty}\ldots\sum_{j_{k-2}=0}^{\infty}\psi_k(t_k)\left(\mathbf{1}_{\{t_{k-1}<t_k\}}+\frac{1}{2}\mathbf{1}_{\{t_{k-1}=t_k\}}\right)\psi_{k-1}(t_{k-1})\times$$

$$\times\int\limits_t^{t_{k-1}}\psi_{k-2}(t_{k-2})\phi_{j_{k-2}}(t_{k-2})\ldots\int\limits_t^{t_2}\psi_1(t_1)\phi_{j_1}(t_1)dt_1\ldots dt_{k-2}\prod_{l=1}^{k-2}\phi_{j_l}(t_l)=$$

$$=\psi_k(t_k)\left(\mathbf{1}_{\{t_{k-1}<t_k\}}+\frac{1}{2}\mathbf{1}_{\{t_{k-1}=t_k\}}\right)\sum_{j_1=0}^{\infty}\sum_{j_2=0}^{\infty}\ldots\sum_{j_{k-2}=0}^{\infty}\psi_{k-1}(t_{k-1})\times$$

$$\times\int\limits_t^{t_{k-1}}\psi_{k-2}(t_{k-2})\phi_{j_{k-2}}(t_{k-2})\ldots\int\limits_t^{t_2}\psi_1(t_1)\phi_{j_1}(t_1)dt_1\ldots dt_{k-2}\prod_{l=1}^{k-2}\phi_{j_l}(t_l)=$$

$$=\psi_k(t_k)\left(\mathbf{1}_{\{t_{k-1}<t_k\}}+\frac{1}{2}\mathbf{1}_{\{t_{k-1}=t_k\}}\right)\prod_{l=1}^{k-1}\psi_l(t_l)\prod_{l=1}^{k-2}\left(\mathbf{1}_{\{t_l<t_{l+1}\}}+\frac{1}{2}\mathbf{1}_{\{t_l=t_{l+1}\}}\right)=$$

$$=\prod_{l=1}^{k}\psi_l(t_l)\prod_{l=1}^{k-1}\left(\mathbf{1}_{\{t_l<t_{l+1}\}}+\frac{1}{2}\mathbf{1}_{\{t_l=t_{l+1}\}}\right). \tag{14}$$

On the other hand, the left-hand side of (14) can be represented in the following form

$$\sum_{j_1=0}^{\infty}\ldots\sum_{j_k=0}^{\infty}C_{j_k\ldots j_1}\prod_{l=1}^{k}\phi_{j_l}(t_l)$$

by expanding the function

$$\psi_k(t_k)\int\limits_t^{t_k}\psi_{k-1}(t_{k-1})\phi_{j_{k-1}}(t_{k-1})\ldots\int\limits_t^{t_2}\psi_1(t_1)\phi_{j_1}(t_1)dt_1\ldots dt_{k-1}$$

into the generalized Fourier series at the interval (t,T) using the variable t_k. Lemma 1 is proved.

Let us introduce the following notations

$$J[\psi^{(k)}]_{T,t}^{s_l,\ldots,s_1}\ \stackrel{\rm def}{=}\ \prod_{p=1}^{l}\mathbf{1}_{\{i_{s_p}=i_{s_p+1}\ne 0\}}\ \times$$

$$\times\int\limits_t^T\psi_k(t_k)\ldots\int\limits_t^{t_{s_l+3}}\psi_{s_l+2}(t_{s_l+2})\int\limits_t^{t_{s_l+2}}\psi_{s_l}(t_{s_l+1})\psi_{s_l+1}(t_{s_l+1})\ \times$$

$$\times\int\limits_t^{t_{s_l+1}}\psi_{s_l-1}(t_{s_l-1})\ldots\int\limits_t^{t_{s_1+3}}\psi_{s_1+2}(t_{s_1+2})\int\limits_t^{t_{s_1+2}}\psi_{s_1}(t_{s_1+1})\psi_{s_1+1}(t_{s_1+1})\ \times$$

$$\times\int\limits_t^{t_{s_1+1}}\psi_{s_1-1}(t_{s_1-1})\ldots\int\limits_t^{t_2}\psi_1(t_1)d\mathbf{w}_{t_1}^{(i_1)}\ldots d\mathbf{w}_{t_{s_1-1}}^{(i_{s_1-1})}dt_{s_1+1}d\mathbf{w}_{t_{s_1+2}}^{(i_{s_1+2})}\ldots$$

$$\ldots\ d\mathbf{w}_{t_{s_l-1}}^{(i_{s_l-1})}dt_{s_l+1}d\mathbf{w}_{t_{s_l+2}}^{(i_{s_l+2})}\ldots d\mathbf{w}_{t_k}^{(i_k)}, \tag{15}$$

where

$$\mathrm{A}_{k,l}=\left\{(s_l,\ldots,s_1):\ s_l>s_{l-1}+1,\ldots,s_2>s_1+1,\ s_l,\ldots,s_1=1,\ldots,k-1\right\}, \tag{16}$$

$$(s_l,\ldots,s_1)\in\mathrm{A}_{k,l},\quad l=1,\ldots,[k/2],\quad i_s=0,1,\ldots,m,\quad s=1,\ldots,k,$$

$[x]$ is an integer part of a real number x, $\mathbf{1}_A$ is the indicator of the set A.

Let us formulate the statement on relation between iterated Ito and Stratonovich stochastic integrals $J^*[\psi^{(k)}]_{T,t}$, $J[\psi^{(k)}]_{T,t}$ of fixed multiplicity k (see (1), (2)).

Lemma 2 [18] (Sect. 2.4) (also see [1] (1997), [2], [10]-[13], [16], [17], [19]-[21]). *Suppose that every $\psi_l(\tau)$ $(l=1,\ldots,k)$ is a continuous nonrandom function at the interval $[t,T]$. Then, the following relation between iterated Ito and Stratonovich stochastic integrals is correct*

$$J^*[\psi^{(k)}]_{T,t}=J[\psi^{(k)}]_{T,t}+\sum_{r=1}^{[k/2]}\frac{1}{2^r}\sum_{(s_r,\ldots,s_1)\in\mathrm{A}_{k,r}}J[\psi^{(k)}]_{T,t}^{s_r,\ldots,s_1}\quad \text{w. p. 1}, \tag{17}$$

where $\sum\limits_{\emptyset}$ is supposed to be equal to zero; *hereinafter w. p. 1 means "with probability 1".*

Proof. Let us prove the equality (17) using induction. The case $k=1$ is obvious. If $k=2$, then from (17) we get

$$J^*[\psi^{(2)}]_{T,t}=J[\psi^{(2)}]_{T,t}+\frac{1}{2}J[\psi^{(2)}]^1_{T,t}\quad \text{w. p. 1.} \tag{18}$$

Let us demonstrate that the equality (18) is correct w. p. 1. In order to do it let us consider the function $F(x,\tau)=x\psi_2(\tau)$ and the process $F(\eta_{\tau,t},\tau)$, where $\eta_{\tau,t}=J[\psi^{(1)}]_{\tau,t}$, $\tau\in[t,T]$. Then

$$\frac{\partial F}{\partial x}(x,\tau)=\psi_2(\tau),\quad d\eta_{\tau,t}=\psi_1(\tau)d\mathbf{w}_{\tau}^{(i_1)}. \tag{19}$$

From (19) we obtain that the diffusion coefficient of the process $\eta_{\tau,t}$, $\tau\in[t,T]$ equals to $\mathbf{1}_{\{i_1\ne 0\}}\psi_1(\tau)$. Further, using the standard relations between Stratonovich and Ito stochastic integrals [43] (also see [18] (Sect. 2.4)), we obtain the relation (18). Thus, the statement of Lemma 2 is proved for $k=1$ and $k=2$.

Assume that the statement of Lemma 2 is correct for some integer k ($k>2$), and let us prove its correctness when the value k is greater per unit. Using the assumption of induction, we obtain w. p. 1

$$J^*[\psi^{(k+1)}]_{T,t}=$$

$$=\int\limits_t^{*T}\psi_{k+1}(\tau)\left(J[\psi^k]_{\tau,t}+\sum_{r=1}^{[k/2]}\frac{1}{2^r}\sum_{(s_r,\ldots,s_1)\in\mathrm{A}_{k,r}}J[\psi^{(k)}]^{s_r,\ldots,s_1}_{\tau,t}\right)d\mathbf{w}_{\tau}^{(i_{k+1})}=$$

$$=\int\limits_t^{*T}\psi_{k+1}(\tau)J[\psi^{(k)}]_{\tau,t}d\mathbf{w}_{\tau}^{(i_{k+1})}+$$

$$+\sum_{r=1}^{[k/2]}\frac{1}{2^r}\sum_{(s_r,\ldots,s_1)\in\mathrm{A}_{k,r}}\int\limits_t^{*T}\psi_{k+1}(\tau)J[\psi^{(k)}]^{s_r,\ldots,s_1}_{\tau,t}d\mathbf{w}_{\tau}^{(i_{k+1})}. \tag{20}$$

Applying the Ito formula and the standard relation between Stratonovich and Ito stochastic integrals, we get w. p. 1

$$\int\limits_t^{*T}\psi_{k+1}(\tau)J[\psi^{(k)}]_{\tau,t}d\mathbf{w}_{\tau}^{(i_{k+1})}=J[\psi^{(k+1)}]_{T,t}+\frac{1}{2}J[\psi^{(k+1)}]^k_{T,t}, \tag{21}$$

$$\int\limits_t^{*T}\psi_{k+1}(\tau)J[\psi^{(k)}]^{s_r,\ldots,s_1}_{\tau,t}d\mathbf{w}_{\tau}^{(i_{k+1})}=$$

$$
(22) \qquad = \begin{cases} J[\psi^{(k+1)}]_{T,t}^{s_r,\ldots,s_1} & \text{if} \ \ s_r = k-1 \\ \\ J[\psi^{(k+1)}]_{T,t}^{s_r,\ldots,s_1} + J[\psi^{(k+1)}]_{T,t}^{k,s_r,\ldots,s_1}/2 & \text{if} \ \ s_r < k-1 \end{cases}.
$$

After substituting (21) and (22) into (20) and regrouping of summands we pass to the following relations, which are valid w. p. 1

$$
(23) \qquad J^*[\psi^{(k+1)}]_{T,t} = J[\psi^{(k+1)}]_{T,t} + \sum_{r=1}^{[k/2]} \frac{1}{2^r} \sum_{(s_r,\ldots,s_1)\in \mathrm{A}_{k+1,r}} J[\psi^{(k+1)}]_{T,t}^{s_r,\ldots,s_1}
$$

when k is even and

$$
(24) \qquad J^*[\psi^{(k'+1)}]_{T,t} = J[\psi^{(k'+1)}]_{T,t} + \sum_{r=1}^{[k'/2]+1} \frac{1}{2^r} \sum_{(s_r,\ldots,s_1)\in \mathrm{A}_{k'+1,r}} J[\psi^{(k'+1)}]_{T,t}^{s_r,\ldots,s_1}
$$

when $k' = k+1$ is uneven.

From (23) and (24) we have w. p. 1

$$
(25) \qquad J^*[\psi^{(k+1)}]_{T,t} = J[\psi^{(k+1)}]_{T,t} + \sum_{r=1}^{[(k+1)/2]} \frac{1}{2^r} \sum_{(s_r,\ldots,s_1)\in \mathrm{A}_{k+1,r}} J[\psi^{(k+1)}]_{T,t}^{s_r,\ldots,s_1}.
$$

Lemma 2 is proved.

Consider the partition $\{\tau_j\}_{j=0}^N$ of the interval $[t,T]$ such that

$$
(26) \qquad t=\tau_0<\ldots<\tau_N=T, \quad \Delta_N = \max_{0\le j\le N-1} \Delta\tau_j \to 0 \ \ \text{if} \ \ N\to\infty, \quad \Delta\tau_j = \tau_{j+1}-\tau_j.
$$

Lemma 3. *Suppose that every $\psi_l(\tau)$ $(l=1,\ldots,k)$ is a continuous nonrandom function on $[t,T]$. Then*

$$
(27) \qquad J[\psi^{(k)}]_{T,t} = \underset{N\to\infty}{\text{l.i.m.}} \sum_{j_k=0}^{N-1} \ldots \sum_{j_1=0}^{j_2-1} \prod_{l=1}^{k} \psi_l(\tau_{j_l}) \Delta \mathbf{w}_{\tau_{j_l}}^{(i_l)} \quad \text{w. p. 1},
$$

where $J[\psi^{(k)}]_{T,t}$ is the iterated Ito stochastic integral (2), $\Delta\mathbf{w}_{\tau_j}^{(i)} = \mathbf{w}_{\tau_{j+1}}^{(i)} - \mathbf{w}_{\tau_j}^{(i)}$ $(i=0,1,\ldots,m)$, $\{\tau_j\}_{j=0}^N$ is the partition of the interval $[t,T]$ satisfying the condition (26).

Proof. It is easy to notice that using the additive property of stochastic integrals we can write the following

(28) $$J[\psi^{(k)}]_{T,t}=\sum_{j_k=0}^{N-1}\ldots\sum_{j_1=0}^{j_2-1}\prod_{l=1}^{k}J[\psi_l]_{\tau_{j_l+1},\tau_{j_l}}+\varepsilon_N\qquad \hbox{w. p. 1},$$

where

$$\varepsilon_N=\sum_{j_k=0}^{N-1}\int\limits_{\tau_{j_k}}^{\tau_{j_k+1}}\psi_k(s)\int\limits_{\tau_{j_k}}^{s}\psi_{k-1}(\tau)J[\psi^{(k-2)}]_{\tau,t}d{\bf w}_{\tau}^{(i_{k-1})}d{\bf w}_{s}^{(i_k)}+$$

$$+\sum_{r=1}^{k-3}G[\psi_{k-r+1}^{(k)}]_N\sum_{j_{k-r}=0}^{j_{k-r+1}-1}\int\limits_{\tau_{j_{k-r}}}^{\tau_{j_{k-r}+1}}\psi_{k-r}(s)\int\limits_{\tau_{j_{k-r}}}^{s}\psi_{k-r-1}(\tau)J[\psi^{(k-r-2)}]_{\tau,t}d{\bf w}_{\tau}^{(i_{k-r-1})}d{\bf w}_{s}^{(i_{k-r})}+$$

$$+G[\psi_3^{(k)}]_N\sum_{j_2=0}^{j_3-1}J[\psi^{(2)}]_{\tau_{j_2+1},\tau_{j_2}},$$

$$G[\psi_m^{(k)}]_N=\sum_{j_k=0}^{N-1}\sum_{j_{k-1}=0}^{j_k-1}\ldots\sum_{j_m=0}^{j_{m+1}-1}\prod_{l=m}^{k}J[\psi_l]_{\tau_{j_l+1},\tau_{j_l}},$$

$$J[\psi_l]_{s,\theta}=\int\limits_{\theta}^{s}\psi_l(\tau)d{\bf w}_{\tau}^{(i_l)},$$

$$(\psi_m,\psi_{m+1},\ldots,\psi_k)\stackrel{\rm def}{=}\psi_m^{(k)},\quad (\psi_1,\ldots,\psi_k)\stackrel{\rm def}{=}\psi_1^{(k)}=\psi^{(k)}.$$

Using the standard estimates (38), (39) for the moments of stochastic integrals, we obtain w. p. 1

(29) $$\hbox{\vtop{\offinterlineskip\halign{\hfil#\hfil\cr{\rm l.i.m.}\cr\noalign{\vskip1pt}}}}_{N\to\infty}\ \varepsilon_N=0.$$

Comparing (28) and (29), we get

(30) $$J[\psi^{(k)}]_{T,t}=\mathop{\rm l.i.m.}_{N\to\infty}\sum_{j_k=0}^{N-1}\ldots\sum_{j_1=0}^{j_2-1}\prod_{l=1}^{k}J[\psi_l]_{\tau_{j_l+1},\tau_{j_l}}\qquad \hbox{w. p. 1}.$$

Let us write $J[\psi_l]_{\tau_{j_l+1},\tau_{j_l}}$ in the form

$$J[\psi_l]_{\tau_{j_l+1},\tau_{j_l}}=\psi_l(\tau_{j_l})\Delta{\bf w}_{\tau_{j_l}}^{(i_l)}+\int\limits_{\tau_{j_l}}^{\tau_{j_l+1}}(\psi_l(\tau)-\psi_l(\tau_{j_l}))d{\bf w}_{\tau}^{(i_l)}\quad \hbox{w. p. 1}$$

and substitute it into (30). Then, due to the moment properties of stochastic integrals and continuity (which means uniform continuity) of the functions $\psi_l(s)$ $(l=1,\ldots,k)$ it is easy to see that the prelimit expression on the right-hand side of (30) is a sum of the prelimit expression on the right-hand side of (27) and the value which tends to zero in the mean-square sense if $N\to\infty$. Lemma 3 is proved.

Remark 1. *It is easy to see that if* $\Delta\mathbf{w}_{\tau_{j_l}}^{(i_l)}$ *in* (27) *for some* $l \in \{1,\ldots,k\}$ *is replaced with* $\left(\Delta\mathbf{w}_{\tau_{j_l}}^{(i_l)}\right)^p$ $(p=2,\ i_l\ne 0)$, *then the differential* $d\mathbf{w}_{t_l}^{(i_l)}$ *in the integral* $J[\psi^{(k)}]_{T,t}$ *will be replaced with* dt_l. *If* $p=3,4,\ldots,$ *then the right-hand side of the formula* (27) *will become zero w. p. 1. If we replace* $\Delta\mathbf{w}_{\tau_{j_l}}^{(i_l)}$ *in* (27) *for some* $l\in\{1,\ldots,k\}$ *with* $(\Delta\tau_{j_l})^p$ $(p=2,3,\ldots)$, *then the right-hand side of the formula* (27) *also will be equal to zero w. p. 1.*

Let us define the following multiple stochastic integral

$$\underset{N\to\infty}{\text{l.i.m.}}\sum_{j_1,\ldots,j_k=0}^{N-1}\Phi\left(\tau_{j_1},\ldots,\tau_{j_k}\right)\prod_{l=1}^{k}\Delta\mathbf{w}_{\tau_{j_l}}^{(i_l)}\stackrel{\text{def}}{=}J[\Phi]_{T,t}^{(k)}, \tag{31}$$

where $\Phi(t_1,\ldots,t_k):\ [t,T]^k\to\mathbb{R}$ is a nonrandom function (the properties of this function will be specified further).

Denote

$$D_k=\{(t_1,\ldots,t_k):\ t\le t_1<\ldots<t_k\le T\}. \tag{32}$$

We will use the same symbol D_k to denote the open and closed domains corresponding to the domain D_k defined by (32). However, we always specify what domain we consider (open or closed). Also we will write $\Phi(t_1,\ldots,t_k)\in C(D_k)$ if $\Phi(t_1,\ldots,t_k)$ is a continuous nonrandom function of k variables in the closed domain D_k.

Let us consider the iterated Ito stochastic integral

$$I[\Phi]_{T,t}^{(k)}\stackrel{\text{def}}{=}\int\limits_t^T\ldots\int\limits_t^{t_2}\Phi(t_1,\ldots,t_k)d\mathbf{w}_{t_1}^{(i_1)}\ldots d\mathbf{w}_{t_k}^{(i_k)}, \tag{33}$$

where $\Phi(t_1,\ldots,t_k)\in C(D_k)$.

Using the arguments which similar to the arguments used in the proof of Lemma 3 it is easy to demonstrate that if $\Phi(t_1,\ldots,t_k)\in C(D_k)$, then the following equality is fulfilled

$$I[\Phi]_{T,t}^{(k)}=\underset{N\to\infty}{\text{l.i.m.}}\sum_{j_k=0}^{N-1}\ldots\sum_{j_1=0}^{j_2-1}\Phi(\tau_{j_1},\ldots,\tau_{j_k})\prod_{l=1}^{k}\Delta\mathbf{w}_{\tau_{j_l}}^{(i_l)}\quad\text{w. p. 1.} \tag{34}$$

In order to explain this, let us check the correctness of the equality (34) when $k=3$. For definiteness we will suppose that $i_1,i_2,i_3=1,\ldots,m$. We have

$$I[\Phi]_{T,t}^{(3)}\stackrel{\text{def}}{=}\int\limits_t^T\int\limits_t^{t_3}\int\limits_t^{t_2}\Phi(t_1,t_2,t_3)d\mathbf{w}_{t_1}^{(i_1)}d\mathbf{w}_{t_2}^{(i_2)}d\mathbf{w}_{t_3}^{(i_3)}=$$

$$=\underset{N\to\infty}{\text{l.i.m.}}\sum_{j_3=0}^{N-1}\int\limits_t^{\tau_{j_3}}\int\limits_t^{t_2}\Phi(t_1,t_2,\tau_{j_3})d\mathbf{w}_{t_1}^{(i_1)}d\mathbf{w}_{t_2}^{(i_2)}\Delta\mathbf{w}_{\tau_{j_3}}^{(i_3)}=$$

$$=\underset{N\to\infty}{\text{l.i.m.}}\sum_{j_3=0}^{N-1}\sum_{j_2=0}^{j_3-1}\int\limits_{\tau_{j_2}}^{\tau_{j_2+1}}\int\limits_t^{t_2}\Phi(t_1,t_2,\tau_{j_3})d\mathbf{w}_{t_1}^{(i_1)}d\mathbf{w}_{t_2}^{(i_2)}\Delta\mathbf{w}_{\tau_{j_3}}^{(i_3)}=$$

$$= \underset{N\to\infty}{\text{l.i.m.}} \sum_{j_3=0}^{N-1}\sum_{j_2=0}^{j_3-1} \int\limits_{\tau_{j_2}}^{\tau_{j_2+1}} \left(\int\limits_{t}^{\tau_{j_2}} + \int\limits_{\tau_{j_2}}^{t_2} \right) \Phi(t_1,t_2,\tau_{j_3}) d\mathbf{w}_{t_1}^{(i_1)} d\mathbf{w}_{t_2}^{(i_2)} \Delta\mathbf{w}_{\tau_{j_3}}^{(i_3)} =$$

$$= \underset{N\to\infty}{\text{l.i.m.}} \sum_{j_3=0}^{N-1}\sum_{j_2=0}^{j_3-1}\sum_{j_1=0}^{j_2-1} \int\limits_{\tau_{j_2}}^{\tau_{j_2+1}} \int\limits_{\tau_{j_1}}^{\tau_{j_1+1}} \Phi(t_1,t_2,\tau_{j_3}) d\mathbf{w}_{t_1}^{(i_1)} d\mathbf{w}_{t_2}^{(i_2)} \Delta\mathbf{w}_{\tau_{j_3}}^{(i_3)} +$$

$$+ \underset{N\to\infty}{\text{l.i.m.}} \sum_{j_3=0}^{N-1}\sum_{j_2=0}^{j_3-1} \int\limits_{\tau_{j_2}}^{\tau_{j_2+1}} \int\limits_{\tau_{j_2}}^{t_2} \Phi(t_1,t_2,\tau_{j_3}) d\mathbf{w}_{t_1}^{(i_1)} d\mathbf{w}_{t_2}^{(i_2)} \Delta\mathbf{w}_{\tau_{j_3}}^{(i_3)}. \qquad (35)$$

Let us demonstrate that the second limit on the right-hand side of (35) equals to zero. Actually, for the second moment of its prelimit expression we get

$$\sum_{j_3=0}^{N-1}\sum_{j_2=0}^{j_3-1} \int\limits_{\tau_{j_2}}^{\tau_{j_2+1}} \int\limits_{\tau_{j_2}}^{t_2} \Phi^2(t_1,t_2,\tau_{j_3}) dt_1 dt_2 \Delta\tau_{j_3} \le M^2 \sum_{j_3=0}^{N-1}\sum_{j_2=0}^{j_3-1} \frac{1}{2}\left(\Delta\tau_{j_2}\right)^2 \Delta\tau_{j_3} \to 0$$

when $N\to\infty$. Here M is a constant, which restricts the module of the function $\Phi(t_1,t_2,t_3)$ due to its continuity, $\Delta\tau_j = \tau_{j+1}-\tau_j$.

Considering the obtained conclusions, we have

$$I[\Phi]_{T,t}^{(3)} \stackrel{\text{def}}{=} \int\limits_t^T \int\limits_t^{t_3} \int\limits_t^{t_2} \Phi(t_1,t_2,t_3) d\mathbf{w}_{t_1}^{(i_1)} d\mathbf{w}_{t_2}^{(i_2)} d\mathbf{w}_{t_3}^{(i_3)} =$$

$$= \underset{N\to\infty}{\text{l.i.m.}} \sum_{j_3=0}^{N-1}\sum_{j_2=0}^{j_3-1}\sum_{j_1=0}^{j_2-1} \int\limits_{\tau_{j_2}}^{\tau_{j_2+1}} \int\limits_{\tau_{j_1}}^{\tau_{j_1+1}} \Phi(t_1,t_2,\tau_{j_3}) d\mathbf{w}_{t_1}^{(i_1)} d\mathbf{w}_{t_2}^{(i_2)} \Delta\mathbf{w}_{\tau_{j_3}}^{(i_3)} =$$

$$= \underset{N\to\infty}{\text{l.i.m.}} \sum_{j_3=0}^{N-1}\sum_{j_2=0}^{j_3-1}\sum_{j_1=0}^{j_2-1} \int\limits_{\tau_{j_2}}^{\tau_{j_2+1}} \int\limits_{\tau_{j_1}}^{\tau_{j_1+1}} \left(\Phi(t_1,t_2,\tau_{j_3}) - \Phi(t_1,\tau_{j_2},\tau_{j_3})\right) d\mathbf{w}_{t_1}^{(i_1)} d\mathbf{w}_{t_2}^{(i_2)} \Delta\mathbf{w}_{\tau_{j_3}}^{(i_3)} +$$

$$+ \underset{N\to\infty}{\text{l.i.m.}} \sum_{j_3=0}^{N-1}\sum_{j_2=0}^{j_3-1}\sum_{j_1=0}^{j_2-1} \int\limits_{\tau_{j_2}}^{\tau_{j_2+1}} \int\limits_{\tau_{j_1}}^{\tau_{j_1+1}} \left(\Phi(t_1,\tau_{j_2},\tau_{j_3}) - \Phi(\tau_{j_1},\tau_{j_2},\tau_{j_3})\right) d\mathbf{w}_{t_1}^{(i_1)} d\mathbf{w}_{t_2}^{(i_2)} \Delta\mathbf{w}_{\tau_{j_3}}^{(i_3)} +$$

$$+ \underset{N\to\infty}{\text{l.i.m.}} \sum_{j_3=0}^{N-1}\sum_{j_2=0}^{j_3-1}\sum_{j_1=0}^{j_2-1} \Phi(\tau_{j_1},\tau_{j_2},\tau_{j_3}) \Delta\mathbf{w}_{\tau_{j_1}}^{(i_1)} \Delta\mathbf{w}_{\tau_{j_2}}^{(i_2)} \Delta\mathbf{w}_{\tau_{j_3}}^{(i_3)}. \qquad (36)$$

In order to get the sought result, we just have to demonstrate that the first two limits on the right-hand side of (36) equal to zero. Let us prove that the first one of them equals to zero (proof for the second limit is similar).

The second moment of prelimit expression of the first limit on the right-hand side of (36) equals to the following expression

$$\sum_{j_3=0}^{N-1}\sum_{j_2=0}^{j_3-1}\sum_{j_1=0}^{j_2-1}\int\limits_{\tau_{j_2}}^{\tau_{j_2+1}}\int\limits_{\tau_{j_1}}^{\tau_{j_1+1}}\left(\Phi(t_1,t_2,\tau_{j_3})-\Phi(t_1,\tau_{j_2},\tau_{j_3})\right)^2 dt_1dt_2\Delta\tau_{j_3}. \tag{37}$$

Since the function $\Phi(t_1,t_2,t_3)$ is continuous in the closed bounded domain D_3, then it is uniformly continuous in this domain. Therefore, if the distance between two points of the domain D_3 is less than $\delta(\varepsilon)$ ($\delta(\varepsilon)>0$ exists for any $\varepsilon>0$ and it does not depend on mentioned points), then the corresponding oscillation of the function $\Phi(t_1,t_2,t_3)$ for these two points of the domain D_3 is less than ε.

If we assume that $\Delta\tau_j<\delta(\varepsilon)$ ($j=0,1,\ldots,N-1$), then the distance between points (t_1,t_2,τ_{j_3}), $(t_1,\tau_{j_2},\tau_{j_3})$ is obviously less than $\delta(\varepsilon)$. In this case

$$|\Phi(t_1,t_2,\tau_{j_3})-\Phi(t_1,\tau_{j_2},\tau_{j_3})|<\varepsilon.$$

Consequently, when $\Delta\tau_j<\delta(\varepsilon)$ ($j=0,\ 1,\ldots,N-1$) the expression (37) is estimated by the following value

$$\varepsilon^2\sum_{j_3=0}^{N-1}\sum_{j_2=0}^{j_3-1}\sum_{j_1=0}^{j_2-1}\Delta\tau_{j_1}\Delta\tau_{j_2}\Delta\tau_{j_3}<\varepsilon^2\frac{(T-t)^3}{6}.$$

Therefore, the first limit on the right-hand side of (36) equals to zero. Similarly, we can prove that the second limit on the right-hand side of (36) equals to zero.

Consequently, the equality (34) is proved for $k=3$. The cases $k=2$ and $k>3$ are analyzed absolutely similarly.

It is necessary to note that the proof of correctness of (34) is similar when the nonrandom function $\Phi(t_1,\ldots,t_k)$ is continuous in the open domain D_k and bounded at its boundary.

Let us consider the class $\mathrm{M}_2([0,T])$ of functions $\xi:[0,T]\times\Omega\rightarrow\mathbb{R}$, which are measurable with respect to the variables (t,ω) and F_t-measurable for all $t\in[0,T]$. Moreover, $\xi(\tau,\omega)$ is independent with increments $\mathbf{f}_{t+\Delta}-\mathbf{f}_t$ for $t\ge\tau$ ($\Delta>0$),

$$\int\limits_0^T\mathsf{M}\left\{\xi^2(t,\omega)\right\}dt<\infty,$$

and $\mathsf{M}\left\{\xi^2(t,\omega)\right\}<\infty$ for all $t\in[0,T]$.

It is well-known [43], [60] that the Ito stochastic integral exists in the mean-square sense for any $\xi\in\mathrm{M}_2([0,T])$. Further, we will denote $\xi(\tau,\omega)$ as ξ_τ.

Lemma 4. *Suppose that $\Phi(t_1,\ldots,t_k)\in C(D_k)$ or $\Phi(t_1,\ldots,t_k)$ is a continuous nonrandom function in the open domain D_k and bounded at its boundary. Then*

$$\mathsf{M}\left\{\left|I[\Phi]_{T,t}^{(k)}\right|^{2n}\right\}\le C_k\int\limits_t^T\ldots\int\limits_t^{t_2}\Phi^{2n}(t_1,\ldots,t_k)dt_1\ldots dt_k,\quad C_k<\infty,$$

where $I[\Phi]_{T,t}^{(k)}$ is defined by the formula (33).

Proof. Using standard estimates for moments of stochastic integrals, we have [60]

(38) $$\mathsf{M}\left\{\left|\int\limits_t^T \xi_\tau df_\tau\right|^{2n}\right\} \le (T-t)^{n-1}\left(n(2n-1)\right)^n \int\limits_t^T \mathsf{M}\left\{|\xi_\tau|^{2n}\right\}d\tau,$$

(39) $$\mathsf{M}\left\{\left|\int\limits_t^T \xi_\tau d\tau\right|^{2n}\right\} \le (T-t)^{2n-1}\int\limits_t^T \mathsf{M}\left\{|\xi_\tau|^{2n}\right\}d\tau,$$

where the process ξ_τ is such that $(\xi_\tau)^n \in \mathrm{M}_2([t,T])$ and f_t is a scalar standard Wiener process, $n=1,2,\ldots$

Let us denote

$$\xi[\Phi]^{(l)}_{t_{l+1},\ldots,t_k,t} = \int\limits_t^{t_{l+1}}\ldots\int\limits_t^{t_2}\Phi(t_1,\ldots,t_k)d\mathbf{w}^{(i_1)}_{t_1}\ldots d\mathbf{w}^{(i_l)}_{t_l},$$

where $l=1,\ldots,\ k-1$ and $\xi[\Phi]^{(0)}_{t_1,\ldots,t_k,t} \stackrel{\rm def}{=} \Phi(t_1,\ldots,t_k)$.

By induction it is easy to demonstrate that $\left(\xi[\Phi]^{(l)}_{t_{l+1},\ldots,t_k,t}\right)^n \in \mathrm{M}_2([t,T])$ with respect to the variable t_{l+1}. Further, using the estimates (38) and (39) repeatedly we obtain the statement of Lemma 4. Lemma 4 is proved.

Lemma 5 [1] (1997), [2], [10]-[13], [16]-[21]. *Suppose that every $\varphi_l(s)$ $(l=1,\ldots,k)$ is a continuous nonrandom function on $[t,T]$. Then*

(40) $$\prod_{l=1}^k J[\varphi_l]_{T,t} = J[\Phi]^{(k)}_{T,t}\quad \text{w. p. 1},$$

where

$$J[\varphi_l]_{T,t} = \int\limits_t^T \varphi_l(s)d\mathbf{w}^{(i_l)}_s,\quad \Phi(t_1,\ldots,t_k) = \prod_{l=1}^k \varphi_l(t_l),$$

and the integral $J[\Phi]^{(k)}_{T,t}$ is defined by the equality (31).

Proof. Let at first $i_l \ne 0$ $(l=1,\ldots,k)$. Denote

$$J[\varphi_l]_N \stackrel{\rm def}{=} \sum_{j=0}^{N-1}\varphi_l(\tau_j)\Delta\mathbf{w}^{(i_l)}_{\tau_j}.$$

Since

$$\prod_{l=1}^k J[\varphi_l]_N - \prod_{l=1}^k J[\varphi_l]_{T,t} =$$

$$= \sum_{l=1}^k\left(\prod_{g=1}^{l-1}J[\varphi_g]_{T,t}\right)\left(J[\varphi_l]_N - J[\varphi_l]_{T,t}\right)\left(\prod_{g=l+1}^{k}J[\varphi_g]_N\right),$$

then due to the Minkowski inequality and the inequality of Cauchy-Bunyakovsky we obtain

$$\left(\mathsf{M}\left\{\left|\prod_{l=1}^{k} J[\varphi_l]_N - \prod_{l=1}^{k} J[\varphi_l]_{T,t}\right|^2\right\}\right)^{1/2} \le C_k \sum_{l=1}^{k} \left(\mathsf{M}\left\{\left|J[\varphi_l]_N - J[\varphi_l]_{T,t}\right|^4\right\}\right)^{1/4}, \tag{41}$$

where C_k is a constant.

Note that

$$J[\varphi_l]_N - J[\varphi_l]_{T,t} = \sum_{j=0}^{N-1} J[\Delta\varphi_l]_{\tau_{j+1},\tau_j}, \quad J[\Delta\varphi_l]_{\tau_{j+1},\tau_j} = \int\limits_{\tau_j}^{\tau_{j+1}} (\varphi_l(\tau_j) - \varphi_l(s))\, d\mathbf{w}_s^{(i_l)}.$$

Since $J[\Delta\varphi_l]_{\tau_{j+1},\tau_j}$ are independent for various j, then [61]

$$\mathsf{M}\left\{\left|\sum_{j=0}^{N-1} J[\Delta\varphi_l]_{\tau_{j+1},\tau_j}\right|^4\right\} = \sum_{j=0}^{N-1} \mathsf{M}\left\{\left|J[\Delta\varphi_l]_{\tau_{j+1},\tau_j}\right|^4\right\} +$$

$$+6\sum_{j=0}^{N-1} \mathsf{M}\left\{\left|J[\Delta\varphi_l]_{\tau_{j+1},\tau_j}\right|^2\right\} \sum_{q=0}^{j-1} \mathsf{M}\left\{\left|J[\Delta\varphi_l]_{\tau_{q+1},\tau_q}\right|^2\right\}. \tag{42}$$

Moreover, since $J[\Delta\varphi_l]_{\tau_{j+1},\tau_j}$ is a Gaussian random variable, we have

$$\mathsf{M}\left\{\left|J[\Delta\varphi_l]_{\tau_{j+1},\tau_j}\right|^2\right\} = \int\limits_{\tau_j}^{\tau_{j+1}} (\varphi_l(\tau_j) - \varphi_l(s))^2 ds,$$

$$\mathsf{M}\left\{\left|J[\Delta\varphi_l]_{\tau_{j+1},\tau_j}\right|^4\right\} = 3\left(\int\limits_{\tau_j}^{\tau_{j+1}} (\varphi_l(\tau_j) - \varphi_l(s))^2 ds\right)^2.$$

Using these relations and continuity (which means uniform continuity) of the functions $\varphi_l(s)$, we obtain

$$\mathsf{M}\left\{\left|\sum_{j=0}^{N-1} J[\Delta\varphi_l]_{\tau_{j+1},\tau_j}\right|^4\right\} \le$$

$$\le \varepsilon^4 \left(3\sum_{j=0}^{N-1} (\Delta\tau_j)^2 + 6\sum_{j=0}^{N-1} \Delta\tau_j \sum_{q=0}^{j-1} \Delta\tau_q\right) < 3\varepsilon^4 \left(\delta(\varepsilon)(T-t) + (T-t)^2\right),$$

where $\Delta\tau_j < \delta(\varepsilon)$, $j = 0, 1, \ldots, N-1$ ($\forall\ \varepsilon > 0\ \exists\ \delta(\varepsilon) > 0$ which does not depend on points of the interval $[t, T]$ and such that $|\varphi_l(\tau_j) - \varphi_l(s)| < \varepsilon$, $s \in [\tau_j, \tau_{j+1}]$). Then the right-hand side of the formula (42) tends to zero when $N \to \infty$.

Taking into account this fact as well as (41), we obtain (40). If $\mathbf{w}_{t_l}^{(i_l)}=t_l$ for some $l\in\{1,\ldots,k\}$, then the proof of Lemma 5 becomes obviously simpler and it is performed similarly. Lemma 5 is proved.

Using Lemma 2 and (34), we obtain w. p. 1

$$J^*[\psi^{(k)}]_{T,t}=J[\psi^{(k)}]_{T,t}+\sum_{r=1}^{[k/2]}\frac{1}{2^r}\sum_{(s_r,\ldots,s_1)\in\mathrm{A}_{k,r}}J[\psi^{(k)}]_{T,t}^{s_r,\ldots,s_1}=J[K^*]_{T,t}^{(k)},\tag{43}$$

where the stochastic integral $J[K^*]_{T,t}^{(k)}$ is defined in accordance with (31).

Let us subsitute the relation

$$K^*(t_1,\ldots,t_k)=$$

$$=\sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k}C_{j_k\ldots j_1}\prod_{l=1}^{k}\phi_{j_l}(t_l)+K^*(t_1,\ldots,t_k)-\sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k}C_{j_k\ldots j_1}\prod_{l=1}^{k}\phi_{j_l}(t_l)$$

into (43) (here we suppose that $p_1,\ldots,p_k<\infty$).

Then using Lemma 5, we obtain

$$J^*[\psi^{(k)}]_{T,t}=\sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k}C_{j_k\ldots j_1}\prod_{l=1}^{k}\zeta_{j_l}^{(i_l)}+J[R_{p_1\ldots p_k}]_{T,t}^{(k)}\quad\text{w. p. 1},\tag{44}$$

where the stochastic integral $J[R_{p_1\ldots p_k}]_{T,t}^{(k)}$ is defined in accordance with (31) and

$$R_{p_1\ldots p_k}(t_1,\ldots,t_k)=K^*(t_1,\ldots,t_k)-\sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k}C_{j_k\ldots j_1}\prod_{l=1}^{k}\phi_{j_l}(t_l),\tag{45}$$

$$\zeta_{j_l}^{(i_l)}=\int\limits_t^T\phi_{j_l}(s)d\mathbf{w}_s^{(i_l)}.$$

According to Lemma 1, we obtain

$$\lim_{p_1\to\infty}\ldots\lim_{p_k\to\infty}R_{p_1\ldots p_k}(t_1,\ldots,t_k)=0\quad\text{when}\quad(t_1,\ldots,t_k)\in(t,T)^k,\tag{46}$$

where the left-hand side of (46) is bounded on $[t,T]^k$.

Lemma 6. *Under the conditions of Theorem 1 the following equality is correct*

$$\lim_{p_1\to\infty}\overline{\lim_{p_2\to\infty}}\ldots\overline{\lim_{p_k\to\infty}}\mathsf{M}\left\{\left|J[R_{p_1\ldots p_k}]_{T,t}^{(k)}\right|^{2n}\right\}=0,\quad n\in\mathbb{N}.$$

Proof. At first let us analize in detail the cases $k=2,3,4$. Using (80) (see below), we have w. p. 1

$$J[R_{p_1p_2}]_{T,t}^{(2)} = \underset{N\to\infty}{\text{l.i.m.}} \sum_{l_2=0}^{N-1}\sum_{l_1=0}^{N-1} R_{p_1p_2}(\tau_{l_1},\tau_{l_2})\Delta\mathbf{w}_{\tau_{l_1}}^{(i_1)}\Delta\mathbf{w}_{\tau_{l_2}}^{(i_2)} =$$

$$= \underset{N\to\infty}{\text{l.i.m.}} \sum_{l_2=0}^{N-1}\sum_{l_1=0}^{l_2-1} R_{p_1p_2}(\tau_{l_1},\tau_{l_2})\Delta\mathbf{w}_{\tau_{l_1}}^{(i_1)}\Delta\mathbf{w}_{\tau_{l_2}}^{(i_2)} + \underset{N\to\infty}{\text{l.i.m.}} \sum_{l_1=0}^{N-1}\sum_{l_2=0}^{l_1-1} R_{p_1p_2}(\tau_{l_1},\tau_{l_2})\Delta\mathbf{w}_{\tau_{l_1}}^{(i_1)}\Delta\mathbf{w}_{\tau_{l_2}}^{(i_2)} +$$

$$+ \underset{N\to\infty}{\text{l.i.m.}} \sum_{l_1=0}^{N-1} R_{p_1p_2}(\tau_{l_1},\tau_{l_1})\Delta\mathbf{w}_{\tau_{l_1}}^{(i_1)}\Delta\mathbf{w}_{\tau_{l_1}}^{(i_2)} =$$

$$= \int_t^T\int_t^{t_2} R_{p_1p_2}(t_1,t_2)d\mathbf{w}_{t_1}^{(i_1)}d\mathbf{w}_{t_2}^{(i_2)} + \int_t^T\int_t^{t_1} R_{p_1p_2}(t_1,t_2)d\mathbf{w}_{t_2}^{(i_2)}d\mathbf{w}_{t_1}^{(i_1)} +$$

$$+\mathbf{1}_{\{i_1=i_2\neq 0\}}\int_t^T R_{p_1p_2}(t_1,t_1)dt_1, \tag{47}$$

where

$$R_{p_1p_2}(t_1,t_2) = K^*(t_1,t_2) - \sum_{j_1=0}^{p_1}\sum_{j_2=0}^{p_2} C_{j_2j_1}\phi_{j_1}(t_1)\phi_{j_2}(t_2), \quad p_1,\ p_2 < \infty. \tag{48}$$

Using Lemma 4, we obtain

$$\mathsf{M}\left\{\left|J[R_{p_1p_2}]_{T,t}^{(2)}\right|^{2n}\right\} \le C_n\left(\int_t^T\int_t^{t_2}\left(R_{p_1p_2}(t_1,t_2)\right)^{2n}dt_1dt_2 + \right.$$

$$\left. + \int_t^T\int_t^{t_1}\left(R_{p_1p_2}(t_1,t_2)\right)^{2n}dt_2dt_1 + \mathbf{1}_{\{i_1=i_2\neq 0\}}\int_t^T\left(R_{p_1p_2}(t_1,t_1)\right)^{2n}dt_1\right), \tag{49}$$

where constant $C_n < \infty$ depends on n and $T-t$ $(n = 1, 2, \ldots)$.

Further, we have

$$\int_t^T\int_t^{t_2}\left(R_{p_1p_2}(t_1,t_2)\right)^{2n}dt_1dt_2 + \int_t^T\int_t^{t_1}\left(R_{p_1p_2}(t_1,t_2)\right)^{2n}dt_2dt_1 =$$

$$= \int_t^T\int_t^{t_2}\left(R_{p_1p_2}(t_1,t_2)\right)^{2n}dt_1dt_2 + \int_t^T\int_{t_2}^T\left(R_{p_1p_2}(t_1,t_2)\right)^{2n}dt_1dt_2 = \int_{[t,T]^2}\left(R_{p_1p_2}(t_1,t_2)\right)^{2n}dt_1dt_2. \tag{50}$$

Combining (49) and (50), we obtain

$$\mathsf{M}\left\{\left|J[R_{p_1p_2}]_{T,t}^{(2)}\right|^{2n}\right\} \le$$

$$\leq C_n \left(\int\limits_{[t,T]^2} \left(R_{p_1p_2}(t_1,t_2)\right)^{2n} dt_1dt_2 + \mathbf{1}_{\{i_1=i_2\ne 0\}} \int\limits_t^T \left(R_{p_1p_2}(t_1,t_1)\right)^{2n} dt_1 \right), \tag{51}$$

where constant $C_n < \infty$ depends on n and $T-t$ ($n = 1, 2, \ldots$).

Since the integrals on the right-hand side of (51) exist as Riemann integrals, then they are equal to the corresponding Lebesgue integrals. Moreover,

$$\lim_{p_1\to\infty} \lim_{p_2\to\infty} \left(R_{p_1p_2}(t_1,t_2)\right)^{2n} = 0 \quad \text{when} \quad (t_1,t_2) \in (t,T)^2, \tag{52}$$

where $n \in \mathbb{N}$, the left-hand side is bounded on $[t,T]^2$.

According to (9)–(11) and (48), we obtain

$$R_{p_1p_2}(t_1,t_2) = \left(K^*(t_1,t_2) - \sum_{j_1=0}^{p_1} C_{j_1}(t_2)\phi_{j_1}(t_1) \right) +$$

$$+ \left(\sum_{j_1=0}^{p_1} \left(C_{j_1}(t_2) - \sum_{j_2=0}^{p_2} C_{j_2j_1}\phi_{j_2}(t_2) \right) \phi_{j_1}(t_1) \right). \tag{53}$$

Then, applying two times (we mean an iterated passage to the limit $\lim\limits_{p_1\to\infty} \overline{\lim\limits_{p_2\to\infty}}$) the Lebesgue's Dominated Convergence Theorem, we get

$$\lim_{p_1\to\infty} \overline{\lim_{p_2\to\infty}} \int\limits_{[t,T]^2} \left(R_{p_1p_2}(t_1,t_2)\right)^{2n} dt_1dt_2 = 0, \qquad \lim_{p_1\to\infty} \overline{\lim_{p_2\to\infty}} \int\limits_t^T \left(R_{p_1p_2}(t_1,t_1)\right)^{2n} dt_1 = 0. \tag{54}$$

We will discuss the choice of integrable majorants when applying Lebesgue's Dominated Convergence Theorem when we consider the case of arbitrary $k \in \mathbb{N}$ later in this section.

From (51) and (54) we obtain

$$\lim_{p_1\to\infty} \overline{\lim_{p_2\to\infty}} \mathsf{M}\left\{ \left| J[R_{p_1p_2}]_{T,t}^{(2)} \right|^{2n} \right\} = 0, \quad n \in \mathbb{N}.$$

Let us consider the case $k = 3$. Using (81) (see below), we have w. p. 1

$$J[R_{p_1p_2p_3}]_{T,t}^{(3)} = \underset{N\to\infty}{\text{l.i.m.}} \sum_{l_3=0}^{N-1} \sum_{l_2=0}^{N-1} \sum_{l_1=0}^{N-1} R_{p_1p_2p_3}(\tau_{l_1},\tau_{l_2},\tau_{l_3}) \Delta\mathbf{w}_{\tau_{l_1}}^{(i_1)} \Delta\mathbf{w}_{\tau_{l_2}}^{(i_2)} \Delta\mathbf{w}_{\tau_{l_3}}^{(i_3)} =$$

$$= \underset{N\to\infty}{\text{l.i.m.}} \sum_{l_3=0}^{N-1} \sum_{l_2=0}^{l_3-1} \sum_{l_1=0}^{l_2-1} \Biggl(R_{p_1p_2p_3}(\tau_{l_1},\tau_{l_2},\tau_{l_3}) \Delta\mathbf{w}_{\tau_{l_1}}^{(i_1)} \Delta\mathbf{w}_{\tau_{l_2}}^{(i_2)} \Delta\mathbf{w}_{\tau_{l_3}}^{(i_3)} +$$

$$
+R_{p_1p_2p_3}(\tau_{l_1},\tau_{l_3},\tau_{l_2})\Delta\mathbf{w}_{\tau_{l_1}}^{(i_1)}\Delta\mathbf{w}_{\tau_{l_3}}^{(i_2)}\Delta\mathbf{w}_{\tau_{l_2}}^{(i_3)}+R_{p_1p_2p_3}(\tau_{l_2},\tau_{l_1},\tau_{l_3})\Delta\mathbf{w}_{\tau_{l_2}}^{(i_1)}\Delta\mathbf{w}_{\tau_{l_1}}^{(i_2)}\Delta\mathbf{w}_{\tau_{l_3}}^{(i_3)}+
$$

$$
+R_{p_1p_2p_3}(\tau_{l_2},\tau_{l_3},\tau_{l_1})\Delta\mathbf{w}_{\tau_{l_2}}^{(i_1)}\Delta\mathbf{w}_{\tau_{l_3}}^{(i_2)}\Delta\mathbf{w}_{\tau_{l_1}}^{(i_3)}+R_{p_1p_2p_3}(\tau_{l_3},\tau_{l_2},\tau_{l_1})\Delta\mathbf{w}_{\tau_{l_3}}^{(i_1)}\Delta\mathbf{w}_{\tau_{l_2}}^{(i_2)}\Delta\mathbf{w}_{\tau_{l_1}}^{(i_3)}+
$$

$$
\left.+R_{p_1p_2p_3}(\tau_{l_3},\tau_{l_1},\tau_{l_2})\Delta\mathbf{w}_{\tau_{l_3}}^{(i_1)}\Delta\mathbf{w}_{\tau_{l_1}}^{(i_2)}\Delta\mathbf{w}_{\tau_{l_2}}^{(i_3)}\right)+
$$

$$
+\underset{N\to\infty}{\text{l.i.m.}}\sum_{l_3=0}^{N-1}\sum_{l_2=0}^{l_3-1}\Biggl(R_{p_1p_2p_3}(\tau_{l_2},\tau_{l_2},\tau_{l_3})\Delta\mathbf{w}_{\tau_{l_2}}^{(i_1)}\Delta\mathbf{w}_{\tau_{l_2}}^{(i_2)}\Delta\mathbf{w}_{\tau_{l_3}}^{(i_3)}+
$$

$$
\left.+R_{p_1p_2p_3}(\tau_{l_2},\tau_{l_3},\tau_{l_2})\Delta\mathbf{w}_{\tau_{l_2}}^{(i_1)}\Delta\mathbf{w}_{\tau_{l_3}}^{(i_2)}\Delta\mathbf{w}_{\tau_{l_2}}^{(i_3)}+R_{p_1p_2p_3}(\tau_{l_3},\tau_{l_2},\tau_{l_2})\Delta\mathbf{w}_{\tau_{l_3}}^{(i_1)}\Delta\mathbf{w}_{\tau_{l_2}}^{(i_2)}\Delta\mathbf{w}_{\tau_{l_2}}^{(i_3)}\right)+
$$

$$
+\underset{N\to\infty}{\text{l.i.m.}}\sum_{l_3=0}^{N-1}\sum_{l_1=0}^{l_3-1}\Biggl(R_{p_1p_2p_3}(\tau_{l_1},\tau_{l_3},\tau_{l_3})\Delta\mathbf{w}_{\tau_{l_1}}^{(i_1)}\Delta\mathbf{w}_{\tau_{l_3}}^{(i_2)}\Delta\mathbf{w}_{\tau_{l_3}}^{(i_3)}+
$$

$$
\left.+R_{p_1p_2p_3}(\tau_{l_3},\tau_{l_1},\tau_{l_3})\Delta\mathbf{w}_{\tau_{l_3}}^{(i_1)}\Delta\mathbf{w}_{\tau_{l_1}}^{(i_2)}\Delta\mathbf{w}_{\tau_{l_3}}^{(i_3)}+R_{p_1p_2p_3}(\tau_{l_3},\tau_{l_3},\tau_{l_1})\Delta\mathbf{w}_{\tau_{l_3}}^{(i_1)}\Delta\mathbf{w}_{\tau_{l_3}}^{(i_2)}\Delta\mathbf{w}_{\tau_{l_1}}^{(i_3)}\right)+
$$

$$
+\underset{N\to\infty}{\text{l.i.m.}}\sum_{l_3=0}^{N-1}R_{p_1p_2p_3}(\tau_{l_3},\tau_{l_3},\tau_{l_3})\Delta\mathbf{w}_{\tau_{l_3}}^{(i_1)}\Delta\mathbf{w}_{\tau_{l_3}}^{(i_2)}\Delta\mathbf{w}_{\tau_{l_3}}^{(i_3)}=
$$

$$
=\int_t^T\int_t^{t_3}\int_t^{t_2}R_{p_1p_2p_3}(t_1,t_2,t_3)d\mathbf{w}_{t_1}^{(i_1)}d\mathbf{w}_{t_2}^{(i_2)}d\mathbf{w}_{t_3}^{(i_3)}+\int_t^T\int_t^{t_3}\int_t^{t_2}R_{p_1p_2p_3}(t_1,t_3,t_2)d\mathbf{w}_{t_1}^{(i_1)}d\mathbf{w}_{t_2}^{(i_3)}d\mathbf{w}_{t_3}^{(i_2)}+
$$

$$
+\int_t^T\int_t^{t_3}\int_t^{t_2}R_{p_1p_2p_3}(t_2,t_1,t_3)d\mathbf{w}_{t_1}^{(i_2)}d\mathbf{w}_{t_2}^{(i_1)}d\mathbf{w}_{t_3}^{(i_3)}+\int_t^T\int_t^{t_3}\int_t^{t_2}R_{p_1p_2p_3}(t_2,t_3,t_1)d\mathbf{w}_{t_1}^{(i_3)}d\mathbf{w}_{t_2}^{(i_1)}d\mathbf{w}_{t_3}^{(i_2)}+
$$

$$

$$

$$+\mathbf{1}_{\{i_1=i_3\ne 0\}}\int\limits_t^T\int\limits_t^{t_3}R_{p_1p_2p_3}(t_3,t_1,t_3)d\mathbf{w}_{t_1}^{(i_2)}dt_3+\mathbf{1}_{\{i_1=i_2\ne 0\}}\int\limits_t^T\int\limits_t^{t_3}R_{p_1p_2p_3}(t_3,t_3,t_1)d\mathbf{w}_{t_1}^{(i_3)}dt_3. \tag{55}$$

Applying Lemma 4, we obtain

$$\begin{aligned}
\mathsf{M}\left\{\left|J[R_{p_1p_2p_3}]_{T,t}^{(3)}\right|^{2n}\right\}\le C_n\Biggl(\int\limits_t^T\int\limits_t^{t_3}\int\limits_t^{t_2}\Bigl(&\left(R_{p_1p_2p_3}(t_1,t_2,t_3)\right)^{2n}+\left(R_{p_1p_2p_3}(t_1,t_3,t_2)\right)^{2n}+\\
&+\left(R_{p_1p_2p_3}(t_2,t_1,t_3)\right)^{2n}+\left(R_{p_1p_2p_3}(t_2,t_3,t_1)\right)^{2n}+\left(R_{p_1p_2p_3}(t_3,t_2,t_1)\right)^{2n}+\\
&+\left(R_{p_1p_2p_3}(t_3,t_1,t_2)\right)^{2n}\Bigr)dt_1dt_2dt_3+\\
&+\int\limits_t^T\int\limits_t^{t_3}\Bigl(\mathbf{1}_{\{i_1=i_2\ne 0\}}\Bigl(\left(R_{p_1p_2p_3}(t_2,t_2,t_3)\right)^{2n}+\left(R_{p_1p_2p_3}(t_3,t_3,t_2)\right)^{2n}\Bigr)+\\
&+\mathbf{1}_{\{i_1=i_3\ne 0\}}\Bigl(\left(R_{p_1p_2p_3}(t_2,t_3,t_2)\right)^{2n}+\left(R_{p_1p_2p_3}(t_3,t_2,t_3)\right)^{2n}\Bigr)+\\
&+\mathbf{1}_{\{i_2=i_3\ne 0\}}\Bigl(\left(R_{p_1p_2p_3}(t_3,t_2,t_2)\right)^{2n}+\left(R_{p_1p_2p_3}(t_2,t_3,t_3)\right)^{2n}\Bigr)dt_2dt_3\Bigr),\quad C_n<\infty.
\end{aligned} \tag{56}$$

Further, we have

$$\begin{aligned}
&\int\limits_t^T\int\limits_t^{t_3}\int\limits_t^{t_2}\Bigl(\left(R_{p_1p_2p_3}(t_1,t_2,t_3)\right)^{2n}+\left(R_{p_1p_2p_3}(t_1,t_3,t_2)\right)^{2n}+\left(R_{p_1p_2p_3}(t_2,t_1,t_3)\right)^{2n}+\\
&+\left(R_{p_1p_2p_3}(t_2,t_3,t_1)\right)^{2n}+\left(R_{p_1p_2p_3}(t_3,t_2,t_1)\right)^{2n}+\left(R_{p_1p_2p_3}(t_3,t_1,t_2)\right)^{2n}\Bigr)dt_1dt_2dt_3=\\
&=\int\limits_{[t,T]^3}\left(R_{p_1p_2p_3}(t_1,t_2,t_3)\right)^{2n}dt_1dt_2dt_3,
\end{aligned} \tag{57}$$

$$\begin{aligned}
&\int\limits_t^T\int\limits_t^{t_3}\Bigl(\left(R_{p_1p_2p_3}(t_2,t_2,t_3)\right)^{2n}+\left(R_{p_1p_2p_3}(t_3,t_3,t_2)\right)^{2n}\Bigr)dt_2dt_3=\\
&=\int\limits_t^T\int\limits_t^{t_3}\left(R_{p_1p_2p_3}(t_2,t_2,t_3)\right)^{2n}dt_2dt_3+\int\limits_t^T\int\limits_{t_3}^{T}\left(R_{p_1p_2p_3}(t_2,t_2,t_3)\right)^{2n}dt_2dt_3=
\end{aligned}$$

$$= \int\limits_{[t,T]^2} \left(R_{p_1p_2p_3}(t_2,t_2,t_3)\right)^{2n} dt_2 dt_3, \tag{58}$$

$$\int\limits_t^T \int\limits_t^{t_3} \left(\left(R_{p_1p_2p_3}(t_2,t_3,t_2)\right)^{2n} + \left(R_{p_1p_2p_3}(t_3,t_2,t_3)\right)^{2n} \right) dt_2 dt_3 =$$

$$= \int\limits_t^T \int\limits_t^{t_3} \left(R_{p_1p_2p_3}(t_2,t_3,t_2)\right)^{2n} dt_2 dt_3 + \int\limits_t^T \int\limits_{t_3}^{T} \left(R_{p_1p_2p_3}(t_2,t_3,t_2)\right)^{2n} dt_2 dt_3 =$$

$$= \int\limits_{[t,T]^2} \left(R_{p_1p_2p_3}(t_2,t_3,t_2)\right)^{2n} dt_2 dt_3, \tag{59}$$

$$\int\limits_t^T \int\limits_t^{t_3} \left(\left(R_{p_1p_2p_3}(t_3,t_2,t_2)\right)^{2n} + \left(R_{p_1p_2p_3}(t_2,t_3,t_3)\right)^{2n} \right) dt_2 dt_3 =$$

$$= \int\limits_t^T \int\limits_t^{t_3} \left(R_{p_1p_2p_3}(t_3,t_2,t_2)\right)^{2n} dt_2 dt_3 + \int\limits_t^T \int\limits_{t_3}^{T} \left(R_{p_1p_2p_3}(t_3,t_2,t_2)\right)^{2n} dt_2 dt_3 =$$

$$= \int\limits_{[t,T]^2} \left(R_{p_1p_2p_3}(t_3,t_2,t_2)\right)^{2n} dt_2 dt_3. \tag{60}$$

Combining (56) and (57)–(60), we get

$$\mathsf{M}\left\{ \left| J[R_{p_1p_2p_3}]_{T,t}^{(3)} \right|^{2n} \right\} \le C_n \left(\int\limits_{[t,T]^3} \left(R_{p_1p_2p_3}(t_1,t_2,t_3)\right)^{2n} dt_1 dt_2 dt_3 + \right.$$

$$+ \mathbf{1}_{\{i_1=i_2\ne 0\}} \int\limits_{[t,T]^2} \left(R_{p_1p_2p_3}(t_2,t_2,t_3)\right)^{2n} dt_2 dt_3 +$$

$$+ \mathbf{1}_{\{i_1=i_3\ne 0\}} \int\limits_{[t,T]^2} \left(R_{p_1p_2p_3}(t_2,t_3,t_2)\right)^{2n} dt_2 dt_3 +$$

$$\left. + \mathbf{1}_{\{i_2=i_3\ne 0\}} \int\limits_{[t,T]^2} \left(R_{p_1p_2p_3}(t_3,t_2,t_2)\right)^{2n} dt_2 dt_3 \right), \quad C_n < \infty. \tag{61}$$

Since the integrals on the right-hand side of (61) exist as Riemann integrals, then they are equal to the corresponding Lebesgue integrals. Moreover,

$$\lim_{p_1\to\infty}\lim_{p_2\to\infty}\lim_{p_3\to\infty}R_{p_1p_2p_3}(t_1,t_2,t_3)=0\quad\hbox{when}\quad (t_1,t_2,t_3)\in(t,T)^3,$$

where the left-hand side is bounded on $[t,T]^3$.

According to the proof of Lemma 1 and (45) for $k=3$, we have

$$R_{p_1p_2p_3}(t_1,t_2,t_3)=\left(K^{*}(t_1,t_2,t_3)-\sum_{j_1=0}^{p_1}C_{j_1}(t_2,t_3)\phi_{j_1}(t_1)\right)+$$

$$+\left(\sum_{j_1=0}^{p_1}\left(C_{j_1}(t_2,t_3)-\sum_{j_2=0}^{p_2}C_{j_2j_1}(t_3)\phi_{j_2}(t_2)\right)\phi_{j_1}(t_1)\right)+$$

$$+\left(\sum_{j_1=0}^{p_1}\sum_{j_2=0}^{p_2}\left(C_{j_2j_1}(t_3)-\sum_{j_3=0}^{p_3}C_{j_3j_2j_1}\phi_{j_3}(t_3)\right)\phi_{j_2}(t_2)\phi_{j_1}(t_1)\right), \tag{62}$$

where

$$C_{j_1}(t_2,t_3)=\int\limits_t^T K^{*}(t_1,t_2,t_3)\phi_{j_1}(t_1)dt_1,\quad C_{j_2j_1}(t_3)=\int\limits_{[t,T]^2}K^{*}(t_1,t_2,t_3)\phi_{j_1}(t_1)\phi_{j_2}(t_2)dt_1dt_2.$$

Then, applying three times (we mean an iterated passage to the limit $\lim\limits_{p_1\to\infty}\overline{\lim\limits_{p_2\to\infty}}\;\overline{\lim\limits_{p_3\to\infty}}$) the Lebesgue's Dominated Convergence Theorem, we obtain

$$\lim_{p_1\to\infty}\overline{\lim_{p_2\to\infty}}\;\overline{\lim_{p_3\to\infty}}\int\limits_{[t,T]^3}\left(R_{p_1p_2p_3}(t_1,t_2,t_3)\right)^{2n}dt_1dt_2dt_3=0, \tag{63}$$

$$\lim_{p_1\to\infty}\overline{\lim_{p_2\to\infty}}\;\overline{\lim_{p_3\to\infty}}\int\limits_{[t,T]^2}\left(R_{p_1p_2p_3}(t_2,t_2,t_3)\right)^{2n}dt_2dt_3=0, \tag{64}$$

$$\lim_{p_1\to\infty}\overline{\lim_{p_2\to\infty}}\;\overline{\lim_{p_3\to\infty}}\int\limits_{[t,T]^2}\left(R_{p_1p_2p_3}(t_2,t_3,t_2)\right)^{2n}dt_2dt_3=0, \tag{65}$$

$$\lim_{p_1\to\infty}\overline{\lim_{p_2\to\infty}}\;\overline{\lim_{p_3\to\infty}}\int\limits_{[t,T]^2}\left(R_{p_1p_2p_3}(t_3,t_2,t_2)\right)^{2n}dt_2dt_3=0. \tag{66}$$

From (61)–(66) we get

$$\lim_{p_1\to\infty}\overline{\lim_{p_2\to\infty}}\;\overline{\lim_{p_3\to\infty}}\mathsf{M}\left\{\left|J[R_{p_1p_2p_3}]_{T,t}^{(3)}\right|^{2n}\right\}=0,\quad n\in\mathbb{N}.$$

Let us consider the case $k=4$. Using (82) (see below), we have w. p. 1

$$J[R_{p_1p_2p_3p_4}]_{T,t}^{(4)}=$$

$$=\underset{N\to\infty}{\text{l.i.m.}}\sum_{l_4=0}^{N-1}\sum_{l_3=0}^{N-1}\sum_{l_2=0}^{N-1}\sum_{l_1=0}^{N-1}R_{p_1p_2p_3p_4}(\tau_{l_1},\tau_{l_2},\tau_{l_3},\tau_{l_4})\Delta\mathbf{w}_{\tau_{l_1}}^{(i_1)}\Delta\mathbf{w}_{\tau_{l_2}}^{(i_2)}\Delta\mathbf{w}_{\tau_{l_3}}^{(i_3)}\Delta\mathbf{w}_{\tau_{l_4}}^{(i_4)}=$$

$$=\underset{N\to\infty}{\text{l.i.m.}}\sum_{l_4=0}^{N-1}\sum_{l_3=0}^{l_4-1}\sum_{l_2=0}^{l_3-1}\sum_{l_1=0}^{l_2-1}\sum_{(l_1,l_2,l_3,l_4)}\left(R_{p_1p_2p_3p_4}(\tau_{l_1},\tau_{l_2},\tau_{l_3},\tau_{l_4})\Delta\mathbf{w}_{\tau_{l_1}}^{(i_1)}\Delta\mathbf{w}_{\tau_{l_2}}^{(i_2)}\Delta\mathbf{w}_{\tau_{l_3}}^{(i_3)}\Delta\mathbf{w}_{\tau_{l_4}}^{(i_4)}\right)+$$

$$+\underset{N\to\infty}{\text{l.i.m.}}\sum_{l_4=0}^{N-1}\sum_{l_3=0}^{l_4-1}\sum_{l_2=0}^{l_3-1}\sum_{(l_2,l_2,l_3,l_4)}\left(R_{p_1p_2p_3p_4}(\tau_{l_2},\tau_{l_2},\tau_{l_3},\tau_{l_4})\Delta\mathbf{w}_{\tau_{l_2}}^{(i_1)}\Delta\mathbf{w}_{\tau_{l_2}}^{(i_2)}\Delta\mathbf{w}_{\tau_{l_3}}^{(i_3)}\Delta\mathbf{w}_{\tau_{l_4}}^{(i_4)}\right)+$$

$$+\underset{N\to\infty}{\text{l.i.m.}}\sum_{l_4=0}^{N-1}\sum_{l_3=0}^{l_4-1}\sum_{l_1=0}^{l_3-1}\sum_{(l_1,l_3,l_3,l_4)}\left(R_{p_1p_2p_3p_4}(\tau_{l_1},\tau_{l_3},\tau_{l_3},\tau_{l_4})\Delta\mathbf{w}_{\tau_{l_1}}^{(i_1)}\Delta\mathbf{w}_{\tau_{l_3}}^{(i_2)}\Delta\mathbf{w}_{\tau_{l_3}}^{(i_3)}\Delta\mathbf{w}_{\tau_{l_4}}^{(i_4)}\right)+$$

$$+\mathbf{1}_{\{i_1=i_4\ne 0\}}\mathbf{1}_{\{i_2=i_3\ne 0\}}\left(\int\limits_t^T\int\limits_t^{t_4}R_{p_1p_2p_3p_4}(t_2,t_4,t_4,t_2)dt_2dt_4+\right.$$

$$\left.+\int\limits_t^T\int\limits_t^{t_4}R_{p_1p_2p_3p_4}(t_4,t_2,t_2,t_4)dt_2dt_4\right), \tag{67}$$

where the expression

$$\sum\limits_{(a_1,\ldots,a_k)}$$

means the sum with respect to all possible permutations $(a_1,\ldots,a_k)$. Note that an analogue of (67) was obtained in [32], Sect. 6 (also see [18]-[21]) with using a different approach.

By analogy with (61) we obtain

$$\mathsf{M}\left\{\left|J[R_{p_1p_2p_3p_4}]_{T,t}^{(4)}\right|^{2n}\right\} \le C_n \left(\int\limits_{[t,T]^4} \left(R_{p_1p_2p_3p_4}(t_1,t_2,t_3,t_4)\right)^{2n} dt_1dt_2dt_3dt_4 + \right.$$

$$+\mathbf{1}_{\{i_1=i_2\ne 0\}} \int\limits_{[t,T]^3} \left(R_{p_1p_2p_3p_4}(t_2,t_2,t_3,t_4)\right)^{2n} dt_2dt_3dt_4 +$$

$$+\mathbf{1}_{\{i_1=i_3\ne 0\}} \int\limits_{[t,T]^3} \left(R_{p_1p_2p_3p_4}(t_2,t_3,t_2,t_4)\right)^{2n} dt_2dt_3dt_4 +$$

$$+\mathbf{1}_{\{i_1=i_4\ne 0\}} \int\limits_{[t,T]^3} \left(R_{p_1p_2p_3p_4}(t_2,t_3,t_4,t_2)\right)^{2n} dt_2dt_3dt_4 +$$

$$+\mathbf{1}_{\{i_2=i_3\ne 0\}} \int\limits_{[t,T]^3} \left(R_{p_1p_2p_3p_4}(t_3,t_2,t_2,t_4)\right)^{2n} dt_2dt_3dt_4 +$$

$$+\mathbf{1}_{\{i_2=i_4\ne 0\}} \int\limits_{[t,T]^3} \left(R_{p_1p_2p_3p_4}(t_3,t_2,t_4,t_2)\right)^{2n} dt_2dt_3dt_4 +$$

$$+\mathbf{1}_{\{i_3=i_4\ne 0\}} \int\limits_{[t,T]^3} \left(R_{p_1p_2p_3p_4}(t_3,t_4,t_2,t_2)\right)^{2n} dt_2dt_3dt_4 +$$

$$+\mathbf{1}_{\{i_1=i_2\ne 0\}}\mathbf{1}_{\{i_3=i_4\ne 0\}} \int\limits_{[t,T]^2} \left(R_{p_1p_2p_3p_4}(t_2,t_2,t_4,t_4)\right)^{2n} dt_2dt_4 +$$

$$+\mathbf{1}_{\{i_1=i_3\ne 0\}}\mathbf{1}_{\{i_2=i_4\ne 0\}} \int\limits_{[t,T]^2} \left(R_{p_1p_2p_3p_4}(t_2,t_4,t_2,t_4)\right)^{2n} dt_2dt_4 +$$

$$\left. +\mathbf{1}_{\{i_1=i_4\ne 0\}}\mathbf{1}_{\{i_2=i_3\ne 0\}} \int\limits_{[t,T]^2} \left(R_{p_1p_2p_3p_4}(t_2,t_4,t_4,t_2)\right)^{2n} dt_2dt_4 \right), \quad C_n < \infty. \tag{68}$$

Since the integrals on the right-hand side of (68) exist as Riemann integrals, then they are equal to the corresponding Lebesgue integrals. Moreover,

$$\lim_{p_1\to\infty}\lim_{p_2\to\infty}\lim_{p_3\to\infty}\lim_{p_4\to\infty} R_{p_1p_2p_3p_4}(t_1,t_2,t_3,t_4) = 0 \quad \text{when} \quad (t_1,t_2,t_3,t_4) \in (t,T)^4,$$

where the left-hand side is bounded on $[t,T]^4$.

According to the proof of Lemma 1 and (45) for $k=4$, we have

$$R_{p_1p_2p_3p_4}(t_1,t_2,t_3,t_4) = \left(K^*(t_1,t_2,t_3,t_4) - \sum_{j_1=0}^{p_1} C_{j_1}(t_2,t_3,t_4)\phi_{j_1}(t_1)\right) +$$

$$+\left(\sum_{j_1=0}^{p_1}\left(C_{j_1}(t_2,t_3,t_4)-\sum_{j_2=0}^{p_2}C_{j_2j_1}(t_3,t_4)\phi_{j_2}(t_2)\right)\phi_{j_1}(t_1)\right)+$$

$$+\left(\sum_{j_1=0}^{p_1}\sum_{j_2=0}^{p_2}\left(C_{j_2j_1}(t_3,t_4)-\sum_{j_3=0}^{p_3}C_{j_3j_2j_1}(t_4)\phi_{j_3}(t_3)\right)\phi_{j_2}(t_2)\phi_{j_1}(t_1)\right)+$$

$$+\left(\sum_{j_1=0}^{p_1}\sum_{j_2=0}^{p_2}\sum_{j_3=0}^{p_3}\left(C_{j_3j_2j_1}(t_4)-\sum_{j_4=0}^{p_4}C_{j_4j_3j_2j_1}\phi_{j_4}(t_4)\right)\phi_{j_3}(t_3)\phi_{j_2}(t_2)\phi_{j_1}(t_1)\right),$$

where

$$C_{j_1}(t_2,t_3,t_4)=\int\limits_t^T K^*(t_1,t_2,t_3,t_4)\phi_{j_1}(t_1)dt_1,$$

$$C_{j_2j_1}(t_3,t_4)=\int\limits_{[t,T]^2} K^*(t_1,t_2,t_3,t_4)\phi_{j_1}(t_1)\phi_{j_2}(t_2)dt_1dt_2,$$

$$C_{j_3j_2j_1}(t_4)=\int\limits_{[t,T]^3} K^*(t_1,t_2,t_3,t_4)\phi_{j_1}(t_1)\phi_{j_2}(t_2)\phi_{j_3}(t_3)dt_1dt_2dt_3.$$

Then, applying four times (we mean an iterated passage to the limit $\lim\limits_{p_1\to\infty}\overline{\lim\limits_{p_2\to\infty}}\ \overline{\lim\limits_{p_3\to\infty}}\ \overline{\lim\limits_{p_4\to\infty}}$) the Lebesgue's Dominated Convergence Theorem, we obtain

$$\lim_{p_1\to\infty}\overline{\lim_{p_2\to\infty}}\ \overline{\lim_{p_3\to\infty}}\ \overline{\lim_{p_4\to\infty}}\int\limits_{[t,T]^4}\left(R_{p_1p_2p_3p_4}(t_1,t_2,t_3,t_4)\right)^{2n}dt_1dt_2dt_3dt_4=0, \tag{69}$$

$$\lim_{p_1\to\infty}\overline{\lim_{p_2\to\infty}}\ \overline{\lim_{p_3\to\infty}}\ \overline{\lim_{p_4\to\infty}}\int\limits_{[t,T]^3}\left(R_{p_1p_2p_3p_4}(t_2,t_2,t_3,t_4)\right)^{2n}dt_2dt_3dt_4=0, \tag{70}$$

$$\lim_{p_1\to\infty}\overline{\lim_{p_2\to\infty}}\ \overline{\lim_{p_3\to\infty}}\ \overline{\lim_{p_4\to\infty}}\int\limits_{[t,T]^3}\left(R_{p_1p_2p_3p_4}(t_2,t_3,t_2,t_4)\right)^{2n}dt_2dt_3dt_4=0, \tag{71}$$

$$\lim_{p_1\to\infty}\overline{\lim_{p_2\to\infty}}\ \overline{\lim_{p_3\to\infty}}\ \overline{\lim_{p_4\to\infty}}\int\limits_{[t,T]^3}\left(R_{p_1p_2p_3p_4}(t_2,t_3,t_4,t_2)\right)^{2n}dt_2dt_3dt_4=0, \tag{72}$$

$$\lim_{p_1\to\infty}\overline{\lim_{p_2\to\infty}}\ \overline{\lim_{p_3\to\infty}}\ \overline{\lim_{p_4\to\infty}}\int\limits_{[t,T]^3}\left(R_{p_1p_2p_3p_4}(t_3,t_2,t_2,t_4)\right)^{2n}dt_2dt_3dt_4=0, \tag{73}$$

$$\lim_{p_1\to\infty}\overline{\lim_{p_2\to\infty}}\ \overline{\lim_{p_3\to\infty}}\ \overline{\lim_{p_4\to\infty}}\int\limits_{[t,T]^3}\left(R_{p_1p_2p_3p_4}(t_3,t_2,t_4,t_2)\right)^{2n}dt_2dt_3dt_4=0, \tag{74}$$

$$\lim_{p_1\to\infty}\overline{\lim_{p_2\to\infty}}\ \overline{\lim_{p_3\to\infty}}\ \overline{\lim_{p_4\to\infty}}\int\limits_{[t,T]^3}\left(R_{p_1p_2p_3p_4}(t_3,t_4,t_2,t_2)\right)^{2n}dt_2dt_3dt_4=0, \tag{75}$$

$$\lim_{p_1\to\infty}\overline{\lim_{p_2\to\infty}}\ \overline{\lim_{p_3\to\infty}}\ \overline{\lim_{p_4\to\infty}}\int\limits_{[t,T]^3}\left(R_{p_1p_2p_3p_4}(t_2,t_2,t_4,t_4)\right)^{2n}dt_2dt_4=0, \tag{76}$$

$$\lim_{p_1\to\infty}\overline{\lim_{p_2\to\infty}}\ \overline{\lim_{p_3\to\infty}}\ \overline{\lim_{p_4\to\infty}}\int\limits_{[t,T]^3}\left(R_{p_1p_2p_3p_4}(t_2,t_4,t_2,t_4)\right)^{2n}dt_2dt_4=0, \tag{77}$$

$$\lim_{p_1\to\infty}\overline{\lim_{p_2\to\infty}}\ \overline{\lim_{p_3\to\infty}}\ \overline{\lim_{p_4\to\infty}}\int\limits_{[t,T]^3}\left(R_{p_1p_2p_3p_4}(t_2,t_4,t_4,t_2)\right)^{2n}dt_2dt_4=0. \tag{78}$$

Combaining (68) with (69)–(78), we get

$$\lim_{p_1\to\infty}\overline{\lim_{p_2\to\infty}}\ \overline{\lim_{p_3\to\infty}}\ \overline{\lim_{p_4\to\infty}}\ \mathsf{M}\left\{\left|J[R_{p_1p_2p_3p_4}]_{T,t}^{(4)}\right|^{2n}\right\}=0,\quad n\in\mathbb{N}.$$

Lemma 6 is proved for the case $k=4$.

Let us consider the case of arbitrary k ($k\in\mathbb{N}$). Let us analyze the stochastic integral defined by (31) and find its representation convenient for the following consideration. In order to do it we introduce several notations. Suppose that

$$S_N^{(k)}(a)=\sum_{j_k=0}^{N-1}\ldots\sum_{j_1=0}^{j_2-1}\sum_{(j_1,\ldots,j_k)}a_{(j_1,\ldots,j_k)},$$

$$\mathrm{C}_{s_r}\ldots\mathrm{C}_{s_1}S_N^{(k)}(a)=$$

$$=\sum_{j_k=0}^{N-1}\ldots\sum_{j_{s_r+1}=0}^{j_{s_r+2}-1}\sum_{j_{s_r-1}=0}^{j_{s_r+1}-1}\ldots\sum_{j_{s_1+1}=0}^{j_{s_1+2}-1}\sum_{j_{s_1-1}=0}^{j_{s_1+1}-1}\ldots\sum_{j_1=0}^{j_2-1}\sum_{\prod\limits_{l=1}^{r}\mathbf{I}_{j_{s_l},j_{s_l+1}}(j_1,\ldots,j_k)}a_{\prod\limits_{l=1}^{r}\mathbf{I}_{j_{s_l},j_{s_l+1}}(j_1,\ldots,j_k)},$$

where

$$\prod_{l=1}^{r}\mathbf{I}_{j_{s_l},j_{s_l+1}}(j_1,\ldots,j_k)\ \stackrel{\rm def}{=}\ \mathbf{I}_{j_{s_r},j_{s_r+1}}\ldots\mathbf{I}_{j_{s_1},j_{s_1+1}}(j_1,\ldots,j_k),$$

$$\mathrm{C}_{s_0}\ldots\mathrm{C}_{s_1}S_N^{(k)}(a)=S_N^{(k)}(a),\qquad \prod_{l=1}^{0}\mathbf{I}_{j_{s_l},j_{s_l+1}}(j_1,\ldots,j_k)=(j_1,\ldots,j_k),$$

$$\mathbf{I}_{j_l,j_{l+1}}(j_{q_1},\ldots,j_{q_2},j_l,j_{q_3},\ldots,j_{q_{k-2}},j_l,j_{q_{k-1}},\ldots,j_{q_k})\ \stackrel{\rm def}{=}$$

$$\stackrel{\rm def}{=} (j_{q_1},\ldots,j_{q_2},j_{l+1},j_{q_3},\ldots,j_{q_{k-2}},j_{l+1},j_{q_{k-1}},\ldots,j_{g_k}),$$

where $l \in \mathbb{N}$, $l \ne q_1,\ldots,q_2,q_3,\ldots,q_{k-2},q_{k-1},\ldots,q_k$, $s_1,\ldots,s_r = 1,\ldots,k-1$, $s_r > \ldots > s_1$, $a_{(j_{q_1},\ldots,j_{q_k})}$ is a scalar value, $q_1,\ldots,q_k = 1,\ldots,k$, the expression

$$\sum_{(j_{q_1},\ldots,j_{q_k})}$$

means the sum with respect to all possible permutations $(j_{q_1},\ldots,j_{q_k})$.

Using induction it is possible to prove the following equality

$$\sum_{j_k=0}^{N-1}\ldots\sum_{j_1=0}^{N-1} a_{(j_1,\ldots,j_k)} = \sum_{r=0}^{k-1}\ \sum_{\substack{s_r,\ldots,s_1=1\\ s_r>\ldots>s_1}}^{k-1} {\rm C}_{s_r}\ldots {\rm C}_{s_1} S_N^{(k)}(a), \tag{79}$$

where $k=2,3,\ldots$

Hereinafter in this section, we will identify the following records $a_{(j_1,\ldots,j_k)} = a_{(j_1\ldots j_k)} = a_{j_1\ldots j_k}$. In particular, from (79) for $k=2,3,4$ we get the following formulas

$$\sum_{j_2=0}^{N-1}\sum_{j_1=0}^{N-1} a_{(j_1,j_2)} = S_N^{(2)}(a) + {\rm C}_1 S_N^{(2)}(a) =$$

$$= \sum_{j_2=0}^{N-1}\sum_{j_1=0}^{j_2-1}\sum_{(j_1,j_2)} a_{(j_1 j_2)} + \sum_{j_2=0}^{N-1} a_{(j_2 j_2)} = \sum_{j_2=0}^{N-1}\sum_{j_1=0}^{j_2-1}(a_{j_1j_2}+a_{j_2j_1}) +$$

$$+\sum_{j_2=0}^{N-1} a_{j_2j_2}, \tag{80}$$

$$\sum_{j_3=0}^{N-1}\sum_{j_2=0}^{N-1}\sum_{j_1=0}^{N-1} a_{(j_1,j_2,j_3)} = S_N^{(3)}(a) + {\rm C}_1 S_N^{(3)}(a) + {\rm C}_2 S_N^{(3)}(a) + {\rm C}_2{\rm C}_1 S_N^{(3)}(a) =$$

$$= \sum_{j_3=0}^{N-1}\sum_{j_2=0}^{j_3-1}\sum_{j_1=0}^{j_2-1}\sum_{(j_1,j_2,j_3)} a_{(j_1j_2j_3)} + \sum_{j_3=0}^{N-1}\sum_{j_2=0}^{j_3-1}\sum_{(j_2,j_2,j_3)} a_{(j_2j_2j_3)} +$$

$$+\sum_{j_3=0}^{N-1}\sum_{j_1=0}^{j_3-1}\sum_{(j_1,j_3,j_3)} a_{(j_1j_3j_3)} + \sum_{j_3=0}^{N-1} a_{(j_3j_3j_3)} =$$

$$= \sum_{j_3=0}^{N-1}\sum_{j_2=0}^{j_3-1}\sum_{j_1=0}^{j_2-1}(a_{j_1j_2j_3}+a_{j_1j_3j_2}+a_{j_2j_1j_3}+a_{j_2j_3j_1}+a_{j_3j_2j_1}+a_{j_3j_1j_2}) +$$

$$+\sum_{j_3=0}^{N-1}\sum_{j_2=0}^{j_3-1}\left(a_{j_2j_2j_3}+a_{j_2j_3j_2}+a_{j_3j_2j_2}\right)+\sum_{j_3=0}^{N-1}\sum_{j_1=0}^{j_3-1}\left(a_{j_1j_3j_3}+a_{j_3j_1j_3}+a_{j_3j_3j_1}\right)+$$

$$+\sum_{j_3=0}^{N-1}a_{j_3j_3j_3}, \tag{81}$$

$$\sum_{j_4=0}^{N-1}\sum_{j_3=0}^{N-1}\sum_{j_2=0}^{N-1}\sum_{j_1=0}^{N-1}a_{(j_1,j_2,j_3,j_4)}=S_N^{(4)}(a)+\mathrm{C}_1S_N^{(4)}(a)+\mathrm{C}_2S_N^{(4)}(a)+$$

$$+\mathrm{C}_3S_N^{(4)}(a)+\mathrm{C}_2\mathrm{C}_1S_N^{(4)}(a)+\mathrm{C}_3\mathrm{C}_1S_N^{(4)}(a)+\mathrm{C}_3\mathrm{C}_2S_N^{(4)}(a)+\mathrm{C}_3\mathrm{C}_2\mathrm{C}_1S_N^{(4)}(a)=$$

$$=\sum_{j_4=0}^{N-1}\sum_{j_3=0}^{j_4-1}\sum_{j_2=0}^{j_3-1}\sum_{j_1=0}^{j_2-1}\sum_{(j_1,j_2,j_3,j_4)}a_{(j_1j_2j_3j_4)}+\sum_{j_4=0}^{N-1}\sum_{j_3=0}^{j_4-1}\sum_{j_2=0}^{j_3-1}\sum_{(j_2,j_2,j_3,j_4)}a_{(j_2j_2j_3j_4)}$$

$$+\sum_{j_4=0}^{N-1}\sum_{j_3=0}^{j_4-1}\sum_{j_1=0}^{j_3-1}\sum_{(j_1,j_3,j_3,j_4)}a_{(j_1j_3j_3j_4)}+\sum_{j_4=0}^{N-1}\sum_{j_2=0}^{j_4-1}\sum_{j_1=0}^{j_2-1}\sum_{(j_1,j_2,j_4,j_4)}a_{(j_1j_2j_4j_4)}+$$

$$+\sum_{j_4=0}^{N-1}\sum_{j_3=0}^{j_4-1}\sum_{(j_3,j_3,j_3,j_4)}a_{(j_3j_3j_3j_4)}+\sum_{j_4=0}^{N-1}\sum_{j_2=0}^{j_4-1}\sum_{(j_2,j_2,j_4,j_4)}a_{(j_2j_2j_4j_4)}+$$

$$+\sum_{j_4=0}^{N-1}a_{j_4j_4j_4j_4}. \tag{82}$$

Perhaps, the formula (79) for any k $(k\in\mathbb{N})$ was found by the author for the first time [1] (1997). Assume that

$$a_{(j_1,\ldots,j_k)}=\Phi\left(\tau_{j_1},\ldots,\tau_{j_k}\right)\prod_{l=1}^{k}\Delta\mathbf{w}_{\tau_{j_l}}^{(i_l)},$$

where $\Phi\left(t_1,\ldots,t_k\right)$ is a nonrandom function of k variables. Then from (31) and (79) we have

$$J[\Phi]_{T,t}^{(k)}=\sum_{r=0}^{[k/2]}\ \sum_{(s_r,\ldots,s_1)\in\mathrm{A}_{k,r}}\times$$

$$\times\ \underset{N\to\infty}{\text{l.i.m.}}\sum_{j_k=0}^{N-1}\ldots\sum_{j_{s_r+1}=0}^{j_{s_r+2}-1}\sum_{j_{s_r-1}=0}^{j_{s_r+1}-1}\ldots\sum_{j_{s_1+1}=0}^{j_{s_1+2}-1}\sum_{j_{s_1-1}=0}^{j_{s_1+1}-1}\ldots\sum_{j_1=0}^{j_2-1}\ \sum_{\prod\limits_{l=1}^{r}\mathbf{I}_{j_{s_l},j_{s_l+1}}(j_1,\ldots,j_k)}\times$$

$$\times\Biggl[\Phi\biggl(\tau_{j_1},\ldots,\tau_{j_{s_1-1}},\tau_{j_{s_1+1}},\tau_{j_{s_1+1}},\tau_{j_{s_1+2}},\ldots,\tau_{j_{s_r-1}},\tau_{j_{s_r+1}},\tau_{j_{s_r+1}},\tau_{j_{s_r+2}},\ldots,\tau_{j_k}\biggr)\times$$

$$\times\Delta\mathbf{w}_{\tau_{j_1}}^{(i_1)}\ldots\Delta\mathbf{w}_{\tau_{j_{s_1-1}}}^{(i_{s_1-1})}\Delta\mathbf{w}_{\tau_{j_{s_1+1}}}^{(i_{s_1})}\Delta\mathbf{w}_{\tau_{j_{s_1+1}}}^{(i_{s_1+1})}\Delta\mathbf{w}_{\tau_{j_{s_1+2}}}^{(i_{s_1+2})}\ldots$$

$$\ldots\Delta\mathbf{w}_{\tau_{j_{s_r-1}}}^{(i_{s_r-1})}\Delta\mathbf{w}_{\tau_{j_{s_r+1}}}^{(i_{s_r})}\Delta\mathbf{w}_{\tau_{j_{s_r+1}}}^{(i_{s_r+1})}\Delta\mathbf{w}_{\tau_{j_{s_r+2}}}^{(i_{s_r+2})}\ldots\Delta\mathbf{w}_{\tau_{j_k}}^{(i_k)}\Biggr]=$$

$$= \sum_{r=0}^{[k/2]} \sum_{(s_r,\ldots,s_1)\in \mathrm{A}_{k,r}} I[\Phi]_{T,t}^{(k)s_1,\ldots,s_r} \quad \text{w. p. 1,} \tag{83}$$

where

$$I[\Phi]_{T,t}^{(k)s_1,\ldots,s_r} = \int\limits_t^T \ldots \int\limits_t^{t_{s_r+3}} \int\limits_t^{t_{s_r+2}} \int\limits_t^{t_{s_r}} \ldots \int\limits_t^{t_{s_1+3}} \int\limits_t^{t_{s_1+2}} \int\limits_t^{t_{s_1}} \ldots \int\limits_t^{t_2} \sum_{\prod\limits_{l=1}^{r} \mathbf{I}_{t_{s_l},t_{s_l+1}}(t_1,\ldots,t_k)} \times$$

$$\times \Biggl[\Phi\Bigl(t_1,\ldots,t_{s_1-1},t_{s_1+1},t_{s_1+1},t_{s_1+2},\ldots,t_{s_r-1},t_{s_r+1},t_{s_r+1},t_{s_r+2},\ldots,t_k\Bigr) \times$$

$$\times d\mathbf{w}_{t_1}^{(i_1)} \ldots d\mathbf{w}_{t_{s_1-1}}^{(i_{s_1-1})} d\mathbf{w}_{t_{s_1+1}}^{(i_{s_1})} d\mathbf{w}_{t_{s_1+1}}^{(i_{s_1+1})} d\mathbf{w}_{t_{s_1+2}}^{(i_{s_1+2})} \ldots$$

$$\ldots d\mathbf{w}_{t_{s_r-1}}^{(i_{s_r-1})} d\mathbf{w}_{t_{s_r+1}}^{(i_{s_r})} d\mathbf{w}_{t_{s_r+1}}^{(i_{s_r+1})} d\mathbf{w}_{t_{s_r+2}}^{(i_{s_r+2})} \ldots d\mathbf{w}_{t_k}^{(i_k)} \Biggr], \tag{84}$$

where $k \ge 2$, the set $\mathrm{A}_{k,r}$ is defined by (16). We suppose that the right-hand side of (84) exists as the Ito stochastic integral.

Remark 2. *The summands on the right-hand side of* (84) *should be understood as follows: for each permutation from the set*

$$\prod_{l=1}^{r} \mathbf{I}_{t_{s_l},t_{s_l+1}}(t_1,\ldots,t_k) = (t_1,\ldots,t_{s_1-1},t_{s_1+1},t_{s_1+1},t_{s_1+2},\ldots,t_{s_r-1},t_{s_r+1},t_{s_r+1},t_{s_r+2},\ldots,t_k)$$

it is necessary to perform replacement on the right-hand side of (84) *of all pairs* (*their number is equals to* r) *of differentials* $d\mathbf{w}_{t_p}^{(i)} d\mathbf{w}_{t_p}^{(j)}$ *with similar lower indexes by the values* $\mathbf{1}_{\{i=j\ne 0\}} dt_p$.

Note that the term in (83) for $r = 0$ should be understood as follows

$$\int\limits_t^T \ldots \int\limits_t^{t_2} \sum_{(t_1,\ldots,t_k)} \Bigl(\Phi\left(t_1,\ldots,t_k\right) d\mathbf{w}_{t_1}^{(i_1)} \ldots d\mathbf{w}_{t_k}^{(i_k)} \Bigr), \tag{85}$$

where

$$\sum_{(t_1,\ldots,t_k)}$$

means the sum with respect to all possible permutations $(t_1,\ldots,t_k)$. At the same time permutations $(t_1,\ldots,t_k)$ when summing are performed in (85) only in the expression, which is enclosed in parentheses (see [18], Sect. 1.1.3 for details).

Using Lemma 4, we get

$$\mathsf{M}\left\{\left|J[\Phi]_{T,t}^{(k)}\right|^{2n}\right\} \le$$

(86) $$\le C_{nk} \sum_{r=0}^{[k/2]} \sum_{(s_r,\ldots,s_1)\in \mathrm{A}_{k,r}} \mathsf{M}\left\{\left|I[\Phi]_{T,t}^{(k)s_1,\ldots,s_r}\right|^{2n}\right\},$$

where

$$\mathsf{M}\left\{\left|I[\Phi]_{T,t}^{(k)s_1,\ldots,s_r}\right|^{2n}\right\} \le$$

$$\le C_{nk}^{s_1\ldots s_r} \int\limits_t^T \ldots \int\limits_t^{t_{s_r+3}} \int\limits_t^{t_{s_r+2}} \int\limits_t^{t_{s_r}} \ldots \int\limits_t^{t_{s_1+3}} \int\limits_t^{t_{s_1+2}} \int\limits_t^{t_{s_1}} \ldots \int\limits_t^{t_2} \sum_{\prod\limits_{l=1}^{r} \mathbf{I}_{t_{s_l},t_{s_l+1}}(t_1,\ldots,t_k)} \times$$

$$\times \Phi^{2n}\biggl(t_1,\ldots,t_{s_1-1},t_{s_1+1},t_{s_1+1},t_{s_1+2},\ldots,t_{s_r-1},t_{s_r+1},t_{s_r+1},t_{s_r+2},\ldots,t_k\biggr)\times$$

(87) $$\times dt_1\ldots dt_{s_1-1}dt_{s_1+1}dt_{s_1+2}\ldots dt_{s_r-1}dt_{s_r+1}dt_{s_r+2}\ldots dt_k,$$

where C_{nk} and $C_{nk}^{s_1\ldots s_r}$ are constants and permutations when summing in (87) are performed only in the value

$$\Phi^{2n}\biggl(t_1,\ldots,t_{s_1-1},t_{s_1+1},t_{s_1+1},t_{s_1+2},\ldots,t_{s_r-1},t_{s_r+1},t_{s_r+1},t_{s_r+2},\ldots,t_k\biggr).$$

Consider (86), (87) for $\Phi(t_1,\ldots,t_k)=R_{p_1\ldots p_k}(t_1,\ldots,t_k)$

$$\mathsf{M}\left\{\left|J[R_{p_1\ldots p_k}]_{T,t}^{(k)}\right|^{2n}\right\} \le$$

(88) $$\le C_{nk} \sum_{r=0}^{[k/2]} \sum_{(s_r,\ldots,s_1)\in \mathrm{A}_{k,r}} \mathsf{M}\left\{\left|I[R_{p_1\ldots p_k}]_{T,t}^{(k)s_1,\ldots,s_r}\right|^{2n}\right\},$$

$$\mathsf{M}\left\{\left|I[R_{p_1\ldots p_k}]_{T,t}^{(k)s_1,\ldots,s_r}\right|^{2n}\right\} \le$$

$$\leq C_{nk}^{s_1\ldots s_r} \int\limits_t^T \ldots \int\limits_t^{t_{s_r+3}} \int\limits_t^{t_{s_r+2}} \int\limits_t^{t_{s_r}} \ldots \int\limits_t^{t_{s_1+3}} \int\limits_t^{t_{s_1+2}} \int\limits_t^{t_{s_1}} \ldots \int\limits_t^{t_2} \sum_{\prod\limits_{l=1}^{r} \mathbf{I}_{t_{s_l}, t_{s_l+1}}(t_1,\ldots,t_k)} \times$$

$$\times R_{p_1\ldots p_k}^{2n}\left(t_1,\ldots,t_{s_1-1},t_{s_1+1},t_{s_1+1},t_{s_1+2},\ldots,t_{s_r-1},t_{s_r+1},t_{s_r+1},t_{s_r+2},\ldots,t_k\right)\times$$

$$\times dt_1\ldots dt_{s_1-1}dt_{s_1+1}dt_{s_1+2}\ldots dt_{s_r-1}dt_{s_r+1}dt_{s_r+2}\ldots dt_k, \tag{89}$$

where C_{nk} and $C_{nk}^{s_1\ldots s_r}$ are constants and permutations when summing in (89) are performed only in the value

$$R_{p_1\ldots p_k}^{2n}\left(t_1,\ldots,t_{s_1-1},t_{s_1+1},t_{s_1+1},t_{s_1+2},\ldots,t_{s_r-1},t_{s_r+1},t_{s_r+1},t_{s_r+2},\ldots,t_k\right).$$

From the other hand, we can consider the generalization of the formulas (51), (61), (68) for the case of arbitrary k ($k \in \mathbb{N}$). In order to do this, let us consider the unordered set $\{1, 2, \ldots, k\}$ and separate it into two parts: the first part consists of r unordered pairs (sequence order of these pairs is also unimportant) and the second one consists of the remaining $k - 2r$ numbers. So, we have

$$(\{\underbrace{\{g_1, g_2\}, \ldots, \{g_{2r-1}, g_{2r}\}}_{\text{part 1}}\}, \{\underbrace{q_1, \ldots, q_{k-2r}}_{\text{part 2}}\}), \tag{90}$$

where

$$\{g_1, g_2, \ldots, g_{2r-1}, g_{2r}, q_1, \ldots, q_{k-2r}\} = \{1, 2, \ldots, k\},$$

braces mean an unordered set, and parentheses mean an ordered set.

We will say that (90) is a partition and consider the sum with respect to all possible partitions

$$\sum_{\substack{(\{\{g_1,g_2\},\ldots,\{g_{2r-1},g_{2r}\}\},\{q_1,\ldots,q_{k-2r}\}) \\ \{g_1,g_2,\ldots,g_{2r-1},g_{2r},q_1,\ldots,q_{k-2r}\}=\{1,2,\ldots,k\}}} a_{g_1 g_2,\ldots,g_{2r-1} g_{2r},q_1\ldots q_{k-2r}}, \tag{91}$$

where $a_{g_1 g_2,\ldots,g_{2r-1} g_{2r},q_1\ldots q_{k-2r}} \in \mathbb{R}$.

Below there are several examples of sums in the form (91)

$$\sum_{\substack{(\{g_1,g_2\}) \\ \{g_1,g_2\}=\{1,2\}}} a_{g_1 g_2} = a_{12},$$

$$\sum_{\substack{(\{\{g_1,g_2\},\{g_3,g_4\}\}) \\ \{g_1,g_2,g_3,g_4\}=\{1,2,3,4\}}} a_{g_1 g_2,g_3 g_4} = a_{12,34} + a_{13,24} + a_{23,14}, \tag{92}$$

$$\sum_{\substack{(\{g_1,g_2\},\{q_1,q_2\})\\ \{g_1,g_2,q_1,q_2\}=\{1,2,3,4\}}} a_{g_1g_2,q_1q_2} =$$

(93) $$= a_{12,34} + a_{13,24} + a_{14,23} + a_{23,14} + a_{24,13} + a_{34,12},$$

$$\sum_{\substack{(\{g_1,g_2\},\{q_1,q_2,q_3\})\\ \{g_1,g_2,q_1,q_2,q_3\}=\{1,2,3,4,5\}}} a_{g_1g_2,q_1q_2q_3} =$$

$$= a_{12,345} + a_{13,245} + a_{14,235} + a_{15,234} + a_{23,145} + a_{24,135}+$$

$$+a_{25,134} + a_{34,125} + a_{35,124} + a_{45,123},$$

$$\sum_{\substack{(\{\{g_1,g_2\},\{g_3,g_4\}\},\{q_1\})\\ \{g_1,g_2,g_3,g_4,q_1\}=\{1,2,3,4,5\}}} a_{g_1g_2,g_3g_4,q_1} =$$

$$= a_{12,34,5} + a_{13,24,5} + a_{14,23,5} + a_{12,35,4} + a_{13,25,4} + a_{15,23,4}+$$

$$+a_{12,54,3} + a_{15,24,3} + a_{14,25,3} + a_{15,34,2} + a_{13,54,2} + a_{14,53,2}+$$

$$+a_{52,34,1} + a_{53,24,1} + a_{54,23,1}.$$

Now we can generalize the formulas (51), (61), (68) for the case of arbitrary k ($k \in \mathbb{N}$)

$$\mathsf{M}\left\{\left|J[R_{p_1\ldots p_k}]_{T,t}^{(k)}\right|^{2n}\right\} \le C_{nk}\left(\int\limits_{[t,T]^k} \left(R_{p_1\ldots p_k}(t_1,\ldots,t_k)\right)^{2n} dt_1\ldots dt_k+\right.$$

$$+\sum_{r=1}^{[k/2]} \sum_{\substack{(\{\{g_1,g_2\},\ldots,\{g_{2r-1},g_{2r}\}\},\{q_1,\ldots,q_{k-2r}\})\\ \{g_1,g_2,\ldots,g_{2r-1},g_{2r},q_1,\ldots,q_{k-2r}\}=\{1,2,\ldots,k\}}} \mathbf{1}_{\{i_{g_1}=i_{g_2}\ne 0\}}\ldots\mathbf{1}_{\{i_{g_{2r-1}}=i_{g_{2r}}\ne 0\}}\times$$

$$\times\int\limits_{[t,T]^{k-r}}\left(R_{p_1\ldots p_k}\left(t_1,\ldots,t_k\right)\Bigg|_{t_{g_1}=t_{g_2},\ldots,t_{g_{2r-1}}=t_{g_{2r}}}\right)^{2n}\times$$

(94) $$\left.\times\left(dt_1\ldots dt_k\right)\Bigg|_{\left(dt_{g_1}dt_{g_2}\right)\curvearrowright dt_{g_1},\ldots,\left(dt_{g_{2r-1}}dt_{g_{2r}}\right)\curvearrowright dt_{g_{2r-1}}}\right),$$

where C_{nk} is a constant,

$$\left(t_1,\ldots,t_k\right)\Bigg|_{t_{g_1}=t_{g_2},\ldots,t_{g_{2r-1}}=t_{g_{2r}}}$$

means the ordered set $(t_1,\ldots,t_k)$ where we put $t_{g_1}=t_{g_2},\ \ldots,\ t_{g_{2r-1}}=t_{g_{2r}}$.

Moreover,

$$\left(dt_1\ldots dt_k\right)\Bigg|_{\left(dt_{g_1}dt_{g_2}\right)\curvearrowright dt_{g_1},\ldots,\left(dt_{g_{2r-1}}dt_{g_{2r}}\right)\curvearrowright dt_{g_{2r-1}}}$$

means the product $dt_1\ldots dt_k$ where we replace all pairs $dt_{g_1}dt_{g_2},\ldots,dt_{g_{2r-1}}dt_{g_{2r}}$ by $dt_{g_1},\ldots,dt_{g_{2r-1}}$ correspondingly.

Note that the estimate like (94), where all indicators $\mathbf{1}_{\{\cdot\}}$ must be replaced with 1, can be obtained from the estimates (88), (89). The comparison of (94) with the relation (5.36) in [17] (Theorem 5.2, p. A.273) or with the relation (1.54) in [18] (Theorem 1.2, p. 60) shows a similar structure of these formulas.

Let us consider the particular case of (94) for $k=4$

$$\begin{aligned}
\mathsf{M}\left\{\left|J[R_{p_1p_2p_3p_4}]_{T,t}^{(4)}\right|^{2n}\right\}\le C_{n4}\Biggl(&\int\limits_{[t,T]^4}\left(R_{p_1p_2p_3p_4}(t_1,t_2,t_3,t_4)\right)^{2n}dt_1dt_2dt_3dt_4+\\
&+\sum_{\substack{(\{g_1,g_2\},\{q_1,q_2\})\\ \{g_1,g_2,q_1,q_2\}=\{1,2,3,4\}}}\mathbf{1}_{\{i_{g_1}=i_{g_2}\ne 0\}}\int\limits_{[t,T]^3}\left(R_{p_1p_2p_3p_4}\left(t_1,t_2,t_3,t_4\right)\Bigg|_{t_{g_1}=t_{g_2}}\right)^{2n}\times\\
&\times\left(dt_1dt_2dt_3dt_4\right)\Bigg|_{\left(dt_{g_1}dt_{g_2}\right)\curvearrowright dt_{g_1}}+\\
&+\sum_{\substack{(\{\{g_1,g_2\},\{g_3,g_4\}\})\\ \{g_1,g_2,g_3,g_4\}=\{1,2,3,4\}}}\mathbf{1}_{\{i_{g_1}=i_{g_2}\ne 0\}}\mathbf{1}_{\{i_{g_3}=i_{g_4}\ne 0\}}\int\limits_{[t,T]^2}\left(R_{p_1p_2p_3p_4}\left(t_1,t_2,t_3,t_4\right)\Bigg|_{t_{g_1}=t_{g_2},t_{g_3}=t_{g_4}}\right)^{2n}\times\\
&\times\left(dt_1dt_2dt_3dt_4\right)\Bigg|_{\left(dt_{g_1}dt_{g_2}\right)\curvearrowright dt_{g_1},\left(dt_{g_3}dt_{g_4}\right)\curvearrowright dt_{g_3}}\Biggr).
\end{aligned}\tag{95}$$

It is not difficult to notice that (95) is consistent with (68) (see (92), (93)).

According to (7), we have the following expression for all internal points of the hypercube $[t,T]^k$

$$R_{p_1\ldots p_k}(t_1,\ldots,t_k)=$$

$$=\prod_{l=1}^{k}\psi_l(t_l)\left(\prod_{l=1}^{k-1}\mathbf{1}_{\{t_l<t_{l+1}\}}+\sum_{r=1}^{k-1}\frac{1}{2^r}\sum_{\substack{s_r,\ldots,s_1=1\\ s_r>\ldots>s_1}}^{k-1}\prod_{l=1}^{r}\mathbf{1}_{\{t_{s_l}=t_{s_l+1}\}}\prod_{\substack{l=1\\ l\ne s_1,\ldots,s_r}}^{k-1}\mathbf{1}_{\{t_l<t_{l+1}\}}\right)-$$

$$-\sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k}C_{j_k\ldots j_1}\prod_{l=1}^{k}\phi_{j_l}(t_l). \tag{96}$$

Due to (96) the function $R_{p_1\ldots p_k}(t_1,\ldots,t_k)$ is continuous in the open domains of integration of integrals on the right-hand side of (89) and it is bounded at the boundaries of these domains for $p_1,\ldots,p_k<\infty$.

Let us perform the iterated passage to the limit

$$\lim_{p_1\to\infty}\overline{\lim_{p_2\to\infty}}\ldots\overline{\lim_{p_k\to\infty}}$$

under the integral signs in the estimate (94) (like it was performed for the 2-dimensional, 3-dimentional, and 4-dimensional cases (see above)). Then, taking into account (46), we obtain the required result. More precisely, since the integrals on the right-hand side of (94) exist as Riemann integrals, then they are equal to the corresponding Lebesgue integrals. Moreover,

$$\lim_{p_1\to\infty}\ldots\lim_{p_k\to\infty}R_{p_1\ldots p_k}(t_1,\ldots,t_k)=0,\quad \text{when}\quad (t_1,\ldots,t_k)\in(t,T)^k,$$

where the left-hand side is bounded on $[t,T]^k$.

According to the proof of Lemma 1 and (45), we have

$$R_{p_1\ldots p_k}(t_1,\ldots,t_k)=$$

$$=\left(K^*(t_1,\ldots,t_k)-\sum_{j_1=0}^{p_1}C_{j_1}(t_2,\ldots,t_k)\phi_{j_1}(t_1)\right)+$$

$$+\left(\sum_{j_1=0}^{p_1}\left(C_{j_1}(t_2,\ldots,t_k)-\sum_{j_2=0}^{p_2}C_{j_2j_1}(t_3,\ldots,t_k)\phi_{j_2}(t_2)\right)\phi_{j_1}(t_1)\right)+$$

$$\ldots$$

$$+\left(\sum_{j_1=0}^{p_1}\ldots\sum_{j_{k-1}=0}^{p_{k-1}}\left(C_{j_{k-1}\ldots j_1}(t_k)-\sum_{j_k=0}^{p_k}C_{j_k\ldots j_1}\phi_{j_k}(t_k)\right)\phi_{j_{k-1}}(t_{k-1})\ldots\phi_{j_1}(t_1)\right), \tag{97}$$

where

$$C_{j_1}(t_2,\ldots,t_k)=\int\limits_t^T K^*(t_1,\ldots,t_k)\phi_{j_1}(t_1)dt_1,$$

$$C_{j_2 j_1}(t_3,\ldots,t_k)=\int\limits_{[t,T]^2} K^*(t_1,\ldots,t_k)\phi_{j_1}(t_1)\phi_{j_2}(t_2)dt_1dt_2,$$

$$\ldots$$

$$C_{j_{k-1}\ldots j_1}(t_k)=\int\limits_{[t,T]^{k-1}} K^*(t_1,\ldots,t_k)\prod_{l=1}^{k-1}\phi_{j_l}(t_l)dt_1\ldots dt_{k-1}.$$

Then, applying k times (we mean an iterated passage to the limit $\lim\limits_{p_1\to\infty}\overline{\lim\limits_{p_2\to\infty}}\ldots\overline{\lim\limits_{p_k\to\infty}}$) the Lebesgue's Dominated Convergence Theorem in the integrals on the right-hand side of (94), we obtain

$$\lim_{p_1\to\infty}\overline{\lim_{p_2\to\infty}}\ldots\overline{\lim_{p_k\to\infty}}\ \mathsf{M}\left\{\left|J[R_{p_1\ldots p_k}]_{T,t}^{(k)}\right|^{2n}\right\}=0,\quad n\in\mathbb{N}.$$

Let us discuss the choice of integrable majorants when applying Lebesgue's Dominated Convergence Theorem in (94).

It is well known that [62]

$$\left|\sum_{k=1}^{N}\frac{\sin kx}{k}\right|\le C \tag{98}$$

for all N and x, where constant C does not depend on N and x.

Moreover,

$$\sum_{j=1}^{N}\frac{1}{j^2}\le\sum_{j=1}^{\infty}\frac{1}{j^2}=\frac{\pi^2}{6}. \tag{99}$$

Applying double integration by parts (as in (2.28), Sect. 2.1.1 [18]), we estimate the partial sums of one-dimensional trigonometric Fourier series

$$\sum_{j_1=0}^{p_1}C_{j_1}(t_2,\ldots,t_k)\phi_{j_1}(t_1),\quad \sum_{j_2=0}^{p_2}C_{j_2 j_1}(t_3,\ldots,t_k)\phi_{j_2}(t_2),\quad\ldots\quad \sum_{j_k=0}^{p_k}C_{j_k\ldots j_1}\phi_{j_k}(t_k)$$

in (97) using (99) and (see (98))

$$\left|\sum_{k=1}^{N}\frac{1}{k}\sin\frac{2\pi k(x-y)}{T-t}\right|\le C,\quad \left|\sum_{k=1}^{N}\frac{1}{k}\sin\frac{2\pi k(x-t)}{T-t}\right|\le C$$

(here $N\in\mathbb{N}$ and $x,y\in\mathbb{R}$, constant C does not depend on N and x,y) as follows

$$\left|\sum_{j_1=0}^{p_1}C_{j_1}(t_2,\ldots,t_k)\phi_{j_1}(t_1)\right|\le C_1,\quad \left|\sum_{j_1=0}^{p_1}C_{j_1}(t_2,\ldots,t_k)\phi_{j_1}(t_1)\right|\le C_2,\ \ldots\ \left|\sum_{j_k=0}^{p_k}C_{j_k\ldots j_1}\phi_{j_k}(t_k)\right|\le C_k,$$

where constant C_1 does not depend on p_1, constant C_2 does not depend on p_2, etc.

Moreover,

$$|K^*(t_1,\ldots,t_k)| \le \tilde{C}_1, \quad |C_{j_1}(t_2,\ldots,t_k)| \le \tilde{C}_2, \quad \ldots \quad \left|C_{j_{k-1}\ldots j_1}(t_k)\right| \le \tilde{C}_k,$$

where constant $\tilde{C}_1$ does not depend on p_1, constant $\tilde{C}_2$ does not depend on p_2, etc.

Further, the construction of integrable majorants when applying Lebesgue's Dominated Convergence Theorem in (94) is obvious.

For example, to pass to the limit $\overline{\lim\limits_{p_k\to\infty}}$, the integrable majorant has the form (it is constructed on the base of (97))

$$\left(R_{p_1\ldots p_k}(t_1,\ldots,t_k)\right)^{2n} \le$$

$$\le \Biggl(\left(\tilde{C}_1 + C_1\right) +$$

$$+ \sum_{j_1=0}^{p_1}\left(\tilde{C}_2 + C_2\right)|\phi_{j_1}(t_1)| + \ldots$$

$$\ldots + \sum_{j_1=0}^{p_1}\ldots\sum_{j_{k-1}=0}^{p_{k-1}}\left(\tilde{C}_k + C_k\right)\left|\phi_{j_{k-1}}(t_{k-1})\ldots\phi_{j_1}(t_1)\right|\Biggr)^{2n} \le$$

$$\le \Biggl(\left(\tilde{C}_1 + C_1\right) +$$

$$+\sqrt{\frac{2}{T-t}}\,(p_1+1)\left(\tilde{C}_2 + C_2\right) + \ldots$$

$$\ldots + \left(\sqrt{\frac{2}{T-t}}\right)^{k-1}(p_1+1)\ldots(p_{k-1}+1)\left(\tilde{C}_k + C_k\right)\Biggr)^{2n}, \tag{100}$$

where $n \in \mathbb{N}$, the numbers $p_1,\ldots,p_{k-1}$ are fixed and the right-hand side of (100) is independent of p_k.

Theorem 1 is proved.

It easy to notice that if we expand the function $K^*(t_1,\ldots,t_k)$ into the generalized Fourier series at the interval (t,T) at first with respect to the variable t_k, after that with respect to the variable t_{k-1}, etc., then we will have the expansion

$$K^*(t_1,\ldots,t_k) = \sum_{j_k=0}^{\infty}\ldots\sum_{j_1=0}^{\infty} C_{j_k\ldots j_1}\prod_{l=1}^{k}\phi_{j_l}(t_l) \tag{101}$$

instead of the expansion (8).

Let us prove the expansion (101). Similarly with (12) we have the following equality

$$\psi_k(t_k)\left(\mathbf{1}_{\{t_{k-1}<t_k\}} + \frac{1}{2}\mathbf{1}_{\{t_{k-1}=t_k\}}\right) = \sum_{j_k=0}^{\infty}\int\limits_{t_{k-1}}^{T}\psi_k(t_k)\phi_{j_k}(t_k)dt_k\phi_{j_k}(t_k), \tag{102}$$

which is fulfilled pointwise at the interval (t,T), besides the series on the right-hand side of (102) converges when $t_1=t$ and $t_1=T$.

Let us introduce the assumption of induction

$$\sum_{j_k=0}^{\infty}\ldots\sum_{j_3=0}^{\infty}\psi_2(t_2)\int\limits_{t_2}^{T}\psi_3(t_3)\phi_{j_3}(t_3)\ldots\int\limits_{t_{k-1}}^{T}\psi_k(t_k)\phi_{j_k}(t_k)dt_k\ldots dt_3\prod_{l=3}^{k}\phi_{j_l}(t_l)=$$

$$=\prod_{l=2}^{k}\psi_l(t_l)\prod_{l=2}^{k-1}\left(\mathbf{1}_{\{t_l<t_{l+1}\}}+\frac{1}{2}\mathbf{1}_{\{t_l=t_{l+1}\}}\right). \tag{103}$$

Then

$$\sum_{j_k=0}^{\infty}\ldots\sum_{j_3=0}^{\infty}\sum_{j_2=0}^{\infty}\psi_1(t_1)\int\limits_{t_1}^{T}\psi_2(t_2)\phi_{j_2}(t_2)\ldots\int\limits_{t_{k-1}}^{T}\psi_k(t_k)\phi_{j_k}(t_k)dt_k\ldots dt_2\prod_{l=2}^{k}\phi_{j_l}(t_l)=$$

$$=\sum_{j_k=0}^{\infty}\ldots\sum_{j_3=0}^{\infty}\psi_1(t_1)\left(\mathbf{1}_{\{t_1<t_2\}}+\frac{1}{2}\mathbf{1}_{\{t_1=t_2\}}\right)\psi_2(t_2)\times$$

$$\times\int\limits_{t_2}^{T}\psi_3(t_3)\phi_{j_3}(t_3)\ldots\int\limits_{t_{k-1}}^{T}\psi_k(t_k)\phi_{j_k}(t_k)dt_k\ldots dt_3\prod_{l=3}^{k}\phi_{j_l}(t_l)=$$

$$=\psi_1(t_1)\left(\mathbf{1}_{\{t_1<t_2\}}+\frac{1}{2}\mathbf{1}_{\{t_1=t_2\}}\right)\sum_{j_k=0}^{\infty}\ldots\sum_{j_3=0}^{\infty}\psi_2(t_2)\times$$

$$\times\int\limits_{t_2}^{T}\psi_3(t_3)\phi_{j_3}(t_3)\ldots\int\limits_{t_{k-1}}^{T}\psi_k(t_k)\phi_{j_k}(t_k)dt_k\ldots dt_3\prod_{l=3}^{k}\phi_{j_l}(t_l)=$$

$$=\psi_1(t_1)\left(\mathbf{1}_{\{t_1<t_2\}}+\frac{1}{2}\mathbf{1}_{\{t_1=t_2\}}\right)\prod_{l=2}^{k}\psi_l(t_l)\prod_{l=2}^{k-1}\left(\mathbf{1}_{\{t_l<t_{l+1}\}}+\frac{1}{2}\mathbf{1}_{\{t_l=t_{l+1}\}}\right)=$$

$$=\prod_{l=1}^{k}\psi_l(t_l)\prod_{l=1}^{k-1}\left(\mathbf{1}_{\{t_l<t_{l+1}\}}+\frac{1}{2}\mathbf{1}_{\{t_l=t_{l+1}\}}\right). \tag{104}$$

From the other hand, the left-hand side of (104) can be represented in the following form

$$\sum_{j_k=0}^{\infty}\ldots\sum_{j_1=0}^{\infty}C_{j_k\ldots j_1}\prod_{l=1}^{k}\phi_{j_l}(t_l)$$

by expanding the function

$$\psi_1(t_1)\int\limits_{t_1}^{T}\psi_2(t_2)\phi_{j_2}(t_2)\ldots\int\limits_{t_{k-1}}^{T}\psi_k(t_k)\phi_{j_k}(t_k)dt_k\ldots dt_2$$

into the generalized Fourier series at the interval (t,T) using the variable t_1. Here we applied the following replacement of integration order

$$\int\limits_{t}^{T}\psi_1(t_1)\int\limits_{t_1}^{T}\psi_2(t_2)\phi_{j_2}(t_2)\ldots\int\limits_{t_{k-1}}^{T}\psi_k(t_k)\phi_{j_k}(t_k)dt_k\ldots dt_2dt_1=$$

$$=\int\limits_{t}^{T}\psi_k(t_k)\phi_{j_k}(t_k)\ldots\int\limits_{t}^{t_3}\psi_2(t_2)\phi_{j_2}(t_2)\int\limits_{t}^{t_2}\psi_1(t_1)\phi_{j_1}(t_1)dt_1dt_2\ldots dt_k=$$

$$=C_{j_k\ldots j_1}.$$

The expansion (101) is proved. So, we can formulate the following theorem.

Theorem 2 [18] (Sect. 2.4) (also see [1] (1997), [12], [13], [16], [17], [19]-[21]. *Suppose that the conditions of Theorem* 1 *are fulfilled. Then*

$$J^*[\psi^{(k)}]_{T,t}=\sum_{j_k=0}^{\infty}\ldots\sum_{j_1=0}^{\infty}C_{j_k\ldots j_1}\prod_{l=1}^{k}\zeta_{j_l}^{(i_l)}, \tag{105}$$

where notations are the same as in Theorem 1.

Note that (105) means the following

$$\lim_{p_k\to\infty}\overline{\lim_{p_{k-1}\to\infty}}\ldots\overline{\lim_{p_1\to\infty}}\mathsf{M}\left\{\left(J^*[\psi^{(k)}]_{T,t}-\sum_{j_k=0}^{p_k}\ldots\sum_{j_1=0}^{p_1}C_{j_k\ldots j_1}\prod_{l=1}^{k}\zeta_{j_l}^{(i_l)}\right)^{2n}\right\}=0,$$

where $n\in\mathbb{N}$.

Let us make a remark about how one can obtain an analogue of Theorem 1 for the complete orthonormal system of Legendre polynomials in the space $L_2([t,T])$ and $n=1$ (the case of mean-square convergence), $k=2$.

First note the well known estimate for Legendre polynomials [63]

$$|P_j(y)|<\frac{K}{\sqrt{j+1}(1-y^2)^{1/4}},\quad y\in(-1,1),\quad j\in\mathbb{N}, \tag{106}$$

where constant K does not depend on y and j.

By analogy with (51) we have

$$\mathsf{M}\left\{\left(J[R_{p_1p_2}]_{T,t}^{(2)}\right)^2\right\}\le$$

$$\leq 2\int\limits_{[t,T]^2}\left(R_{p_1p_2}(t_1,t_2)\right)^2 dt_1dt_2 + \mathbf{1}_{\{i_1=i_2\ne 0\}}\left(\int\limits_t^T R_{p_1p_2}(t_1,t_1)dt_1\right)^2. \tag{107}$$

From Remark 1.6, Sect. 1.7.2 [18] and (1.72), (2.103) [18] we obtain for the case of Legendre polynomials

$$\lim_{p_1\to\infty}\overline{\lim_{p_2\to\infty}}\int\limits_{[t,T]^2}\left(R_{p_1p_2}(t_1,t_2)\right)^2 dt_1dt_2 = 0.$$

Further, we have (see (53))

$$R_{p_1p_2}(t_1,t_1) = \left(K^*(t_1,t_1) - \sum_{j_1=0}^{p_1} C_{j_1}(t_1)\phi_{j_1}(t_1)\right) +$$

$$+\left(\sum_{j_1=0}^{p_1}\left(C_{j_1}(t_1) - \sum_{j_2=0}^{p_2} C_{j_2j_1}\phi_{j_2}(t_1)\right)\phi_{j_1}(t_1)\right). \tag{108}$$

Then, taking into account (52), (108) and applying two times (we mean here an iterated passage to the limit $\lim\limits_{p_1\to\infty}\overline{\lim\limits_{p_2\to\infty}}$) the Lebesgue's Dominated Convergence Theorem, we obtain

$$\lim_{p_1\to\infty}\overline{\lim_{p_2\to\infty}}\int\limits_t^T R_{p_1p_2}(t_1,t_1)dt_1 = 0.$$

Let us discuss the choice of integrable majorants when applying Lebesgue's Dominated Convergence Theorem in our case.

Using double integration by parts (as in (2.22), Sect. 2.1.1 [18]), we estimate the partial sums of one-dimensional Fourier–Legendre series

$$\sum_{j_1=0}^{p_1} C_{j_1}(t_1)\phi_{j_1}(t_1), \qquad \sum_{j_2=0}^{p_2} C_{j_2j_1}\phi_{j_2}(t_1)$$

in (108) using (106) and (99) as follows

$$\left|\sum_{j_1=0}^{p_1} C_{j_1}(t_1)\phi_{j_1}(t_1)\right| \leq K_1\left(1 + \frac{1}{\left(1-(z(t_1))^2\right)^{1/2}} + \frac{1}{\left(1-(z(t_1))^2\right)^{1/4}}\right), \tag{109}$$

$$\left|\sum_{j_2=0}^{p_2} C_{j_2j_1}\phi_{j_2}(t_1)\right| \leq K_2\left(1 + \frac{1}{\left(1-(z(t_1))^2\right)^{1/4}}\right), \tag{110}$$

where

$$z(s) = \left(s - \frac{T+t}{2}\right)\frac{2}{T-t},$$

constant K_1 does not depend on p_1, and constant K_2 does not depend on p_2.

Thus, integrable majorants in our case can be easily constracted using (108), (109) and (110) (see the proof of Theorem 1 for details).

An analogue of Theorem 1 for the case of Legendre polynomials and $n = 1$ (the case of mean-square convergence), $k = 2$ is obtained.

3. Examples. The Case of Legendre Polynomials

In this section, we provide some practical material (based on an analogue of Theorem 1 for the case of Legendre polynomials and $k = 2$, $n = 1$) on expansions of iterated Stratonovich stochastic integrals of the following form [18]-[21]

$$I^{*(i_1\ldots i_k)}_{(l_1\ldots l_k)T,t} = \int\limits_t^{*T} (t-t_k)^{l_k} \ldots \int\limits_t^{*t_2} (t-t_1)^{l_1} d\mathbf{f}^{(i_1)}_{t_1} \ldots d\mathbf{f}^{(i_k)}_{t_k}, \tag{111}$$

where $i_1, \ldots, i_k = 1, \ldots, m,\ \ l_1, \ldots, l_k = 0, 1, \ldots$

The complete orthonormal system of Legendre polynomials in the space $L_2([t,T])$ looks as follows

$$\phi_j(x) = \sqrt{\frac{2j+1}{T-t}} P_j\left(\left(x - \frac{T+t}{2}\right)\frac{2}{T-t}\right), \quad j = 0, 1, 2, \ldots, \tag{112}$$

where $P_j(x)$ is the Legendre polynomial.

Using an analogue of Theorem 1 for the system of functions (112) and $k = 2$, $n = 1$, we obtain the following expansions of iterated Stratonovich stochastic integrals [1]–[21], [24], [25], [27], [29]-[40]

$$I^{*(i_1)}_{(0)T,t} = \sqrt{T-t}\zeta^{(i_1)}_0,$$

$$I^{*(i_1)}_{(1)T,t} = -\frac{(T-t)^{3/2}}{2}\left(\zeta^{(i_1)}_0 + \frac{1}{\sqrt{3}}\zeta^{(i_1)}_1\right), \tag{113}$$

$$I^{*(i_1)}_{(2)T,t} = \frac{(T-t)^{5/2}}{3}\left(\zeta^{(i_1)}_0 + \frac{\sqrt{3}}{2}\zeta^{(i_1)}_1 + \frac{1}{2\sqrt{5}}\zeta^{(i_1)}_2\right), \tag{114}$$

$$I^{*(i_1 i_2)}_{(00)T,t} = \frac{T-t}{2}\left(\zeta^{(i_1)}_0\zeta^{(i_2)}_0 + \sum_{i=1}^{\infty}\frac{1}{\sqrt{4i^2-1}}\left(\zeta^{(i_1)}_{i-1}\zeta^{(i_2)}_i - \zeta^{(i_1)}_i\zeta^{(i_2)}_{i-1}\right)\right), \tag{115}$$

$$I^{*(i_1 i_2)}_{(01)T,t} = -\frac{T-t}{2} I^{*(i_1 i_2)}_{(00)T,t} - \frac{(T-t)^2}{4}\left(\frac{\zeta^{(i_1)}_0\zeta^{(i_2)}_1}{\sqrt{3}} + \right.$$

$$\left. + \sum_{i=0}^{\infty}\left(\frac{(i+2)\zeta^{(i_1)}_i\zeta^{(i_2)}_{i+2} - (i+1)\zeta^{(i_1)}_{i+2}\zeta^{(i_2)}_i}{\sqrt{(2i+1)(2i+5)}(2i+3)} - \frac{\zeta^{(i_1)}_i\zeta^{(i_2)}_i}{(2i-1)(2i+3)}\right)\right),$$

$$I_{(10)T,t}^{*(i_1 i_2)}=-\frac{T-t}{2}I_{(00)T,t}^{*(i_1 i_2)}-\frac{(T-t)^2}{4}\left(\frac{\zeta_0^{(i_2)}\zeta_1^{(i_1)}}{\sqrt{3}}+\right.$$

$$\left.+\sum_{i=0}^{\infty}\left(\frac{(i+1)\zeta_{i+2}^{(i_2)}\zeta_i^{(i_1)}-(i+2)\zeta_i^{(i_2)}\zeta_{i+2}^{(i_1)}}{\sqrt{(2i+1)(2i+5)}(2i+3)}+\frac{\zeta_i^{(i_1)}\zeta_i^{(i_2)}}{(2i-1)(2i+3)}\right)\right),$$

$$I_{(02)T,t}^{*(i_1 i_2)}=-\frac{(T-t)^2}{4}I_{(00)T,t}^{*(i_1 i_2)}-(T-t)I_{(01)T,t}^{*(i_1 i_2)}+\frac{(T-t)^3}{8}\left(\frac{2\zeta_2^{(i_2)}\zeta_0^{(i_1)}}{3\sqrt{5}}+\right.$$

$$+\frac{1}{3}\zeta_0^{(i_1)}\zeta_0^{(i_2)}+\sum_{i=0}^{\infty}\left(\frac{(i+2)(i+3)\zeta_{i+3}^{(i_2)}\zeta_i^{(i_1)}-(i+1)(i+2)\zeta_i^{(i_2)}\zeta_{i+3}^{(i_1)}}{\sqrt{(2i+1)(2i+7)}(2i+3)(2i+5)}+\right.$$

$$\left.\left.+\frac{(i^2+i-3)\zeta_{i+1}^{(i_2)}\zeta_i^{(i_1)}-(i^2+3i-1)\zeta_i^{(i_2)}\zeta_{i+1}^{(i_1)}}{\sqrt{(2i+1)(2i+3)}(2i-1)(2i+5)}\right)\right),$$

$$I_{(20)T,t}^{*(i_1 i_2)}=-\frac{(T-t)^2}{4}I_{(00)T,t}^{*(i_1 i_2)}-(T-t)I_{(10)T,t}^{*(i_1 i_2)}+\frac{(T-t)^3}{8}\left(\frac{2\zeta_0^{(i_2)}\zeta_2^{(i_1)}}{3\sqrt{5}}+\right.$$

$$+\frac{1}{3}\zeta_0^{(i_1)}\zeta_0^{(i_2)}+\sum_{i=0}^{\infty}\left(\frac{(i+1)(i+2)\zeta_{i+3}^{(i_2)}\zeta_i^{(i_1)}-(i+2)(i+3)\zeta_i^{(i_2)}\zeta_{i+3}^{(i_1)}}{\sqrt{(2i+1)(2i+7)}(2i+3)(2i+5)}+\right.$$

$$\left.\left.+\frac{(i^2+3i-1)\zeta_{i+1}^{(i_2)}\zeta_i^{(i_1)}-(i^2+i-3)\zeta_i^{(i_2)}\zeta_{i+1}^{(i_1)}}{\sqrt{(2i+1)(2i+3)}(2i-1)(2i+5)}\right)\right),$$

$$I_{(11)T,t}^{*(i_1 i_2)}=-\frac{(T-t)^2}{4}I_{(00)T,t}^{*(i_1 i_2)}-\frac{(T-t)}{2}\left(I_{(10)T,t}^{*(i_1 i_2)}+I_{(01)T,t}^{*(i_1 i_2)}\right)+$$

$$+\frac{(T-t)^3}{8}\left(\frac{1}{3}\zeta_1^{(i_1)}\zeta_1^{(i_2)}+\sum_{i=0}^{\infty}\left(\frac{(i+1)(i+3)\left(\zeta_{i+3}^{(i_2)}\zeta_i^{(i_1)}-\zeta_i^{(i_2)}\zeta_{i+3}^{(i_1)}\right)}{\sqrt{(2i+1)(2i+7)}(2i+3)(2i+5)}+\right.\right.$$

$$\left.\left.+\frac{(i+1)^2\left(\zeta_{i+1}^{(i_2)}\zeta_i^{(i_1)}-\zeta_i^{(i_2)}\zeta_{i+1}^{(i_1)}\right)}{\sqrt{(2i+1)(2i+3)}(2i-1)(2i+5)}\right)\right),$$

$$I_{(3)T,t}^{*(i_1)}=-\frac{(T-t)^{7/2}}{4}\left(\zeta_0^{(i_1)}+\frac{3\sqrt{3}}{5}\zeta_1^{(i_1)}+\frac{1}{\sqrt{5}}\zeta_2^{(i_1)}+\frac{1}{5\sqrt{7}}\zeta_3^{(i_1)}\right),$$

where

$$\zeta_j^{(i)} = \int\limits_t^T \phi_j(s) d\mathbf{f}_s^{(i)} \tag{116}$$

are independent standard Gaussian random variables for various i or j $(i = 1, \ldots, m)$.

4. Examples. The Case of Trigonometric Functions

Let us consider the Milstein expansions of the integrals $I_{(1)T,t}^{(i_1)}$, $I_{(00)T,t}^{*(i_1 i_2)}$, $I_{(2)T,t}^{*(i_1)}$ (see [43]-[45]) based on the trigonometric Fourier expansion of the Brownian Bridge process (the version of the so-called Karhunen–Loeve expansion)

$$I_{(1)T,t}^{*(i_1)} = -\frac{(T-t)^{3/2}}{2}\left(\zeta_0^{(i_1)} - \frac{\sqrt{2}}{\pi}\sum_{r=1}^{\infty}\frac{1}{r}\zeta_{2r-1}^{(i_1)}\right), \tag{117}$$

$$I_{(2)T,t}^{*(i_1)} = (T-t)^{5/2}\left(\frac{1}{3}\zeta_0^{(i_1)} + \frac{1}{\sqrt{2}\pi^2}\sum_{r=1}^{\infty}\frac{1}{r^2}\zeta_{2r}^{(i_1)} - \frac{1}{\sqrt{2}\pi}\sum_{r=1}^{\infty}\frac{1}{r}\zeta_{2r-1}^{(i_1)}\right), \tag{118}$$

$$I_{(00)T,t}^{*(i_1 i_2)} = \frac{1}{2}(T-t)\Biggl(\zeta_0^{(i_1)}\zeta_0^{(i_2)} +$$

$$+\frac{1}{\pi}\sum_{r=1}^{\infty}\frac{1}{r}\left(\zeta_{2r}^{(i_1)}\zeta_{2r-1}^{(i_2)} - \zeta_{2r-1}^{(i_1)}\zeta_{2r}^{(i_2)} + \sqrt{2}\left(\zeta_{2r-1}^{(i_1)}\zeta_0^{(i_2)} - \zeta_0^{(i_1)}\zeta_{2r-1}^{(i_2)}\right)\right)\Biggr), \tag{119}$$

where $\zeta_0^{(i)}$, $\zeta_{2r}^{(i)}$, $\zeta_{2r-1}^{(i)}$ $(i = 1, \ldots, m)$ are independent standard Gaussian random variables defined by the relation (116) in which $\{\phi_j(x)\}_{j=0}^{\infty}$ is a complete orthonornal system of trigonometric functions in $L_2([t, T])$.

It is obviously that at least (117)–(119) are significantly more complicated in comparison with (113)–(115). Note that (117)–(119) also can be obtained using Theorem 1 [1], [2], [4]-[13], [16]-[40].

5. Further Remarks

In this section, we consider some approaches on the base of Theorem 1 for the case $k = 2$. Moreover, we explain the potential difficulties associated with the use of generalized multiple Fourier series converging almost everywhere in the hypercube $[t, T]^k$ in the proof of Theorem 1.

First, we show how iterated series can be replaced by multiple one in Theorem 1 (the case $k = 2$ and $n = 1$) and in analogue of Theorem 1 for the case of Legendre polynomials (the case $k = 2$ and $n = 1$).

We have

$$\lim_{p\to\infty} \mathsf{M}\left\{\left(J^*[\psi^{(2)}]_{T,t} - \sum_{j_1=0}^{p}\sum_{j_2=0}^{p} C_{j_2j_1}\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}\right)^2\right\} =$$

$$= \lim_{p\to\infty} \overline{\lim_{q\to\infty}} \mathsf{M}\left\{\left(J^*[\psi^{(2)}]_{T,t} - \sum_{j_1=0}^{p}\sum_{j_2=0}^{p} C_{j_2j_1}\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}\right)^2\right\} \le$$

$$\le \lim_{p\to\infty} \overline{\lim_{q\to\infty}} \left(2\mathsf{M}\left\{\left(J^*[\psi^{(2)}]_{T,t} - \sum_{j_1=0}^{p}\sum_{j_2=0}^{q} C_{j_2j_1}\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}\right)^2\right\} +\right.$$

$$\left. +2\mathsf{M}\left\{\left(\sum_{j_1=0}^{p}\sum_{j_2=0}^{q} C_{j_2j_1}\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)} - \sum_{j_1=0}^{p}\sum_{j_2=0}^{p} C_{j_2j_1}\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}\right)^2\right\}\right) =$$

$$= \lim_{p\to\infty} \overline{\lim_{q\to\infty}} 2\mathsf{M}\left\{\left(\sum_{j_1=0}^{p}\sum_{j_2=p+1}^{q} C_{j_2j_1}\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}\right)^2\right\} =$$

$$= \lim_{p\to\infty} \overline{\lim_{q\to\infty}} 2\sum_{j_1=0}^{p}\sum_{j_1'=0}^{p}\sum_{j_2=p+1}^{q}\sum_{j_2'=p+1}^{q} C_{j_2j_1}C_{j_2'j_1'}\mathsf{M}\left\{\zeta_{j_1}^{(i_1)}\zeta_{j_1'}^{(i_1)}\right\}\mathsf{M}\left\{\zeta_{j_2}^{(i_2)}\zeta_{j_2'}^{(i_2)}\right\} =$$

$$= 2\lim_{p\to\infty}\lim_{q\to\infty}\sum_{j_1=0}^{p}\sum_{j_2=p+1}^{q} C_{j_2j_1}^2 =$$

$$= 2\lim_{p\to\infty}\lim_{q\to\infty}\left(\sum_{j_1=0}^{p}\sum_{j_2=0}^{q} C_{j_2j_1}^2 - \sum_{j_1=0}^{p}\sum_{j_2=0}^{p} C_{j_2j_1}^2\right) = \tag{120}$$

$$= 2\left(\lim_{p,q\to\infty}\sum_{j_1=0}^{p}\sum_{j_2=0}^{q} C_{j_2j_1}^2 - \lim_{p\to\infty}\sum_{j_1=0}^{p}\sum_{j_2=0}^{p} C_{j_2j_1}^2\right) = \tag{121}$$

$$= \int\limits_{[t,T]^2} K^2(t_1,t_2)dt_1dt_2 - \int\limits_{[t,T]^2} K^2(t_1,t_2)dt_1dt_2 = 0, \tag{122}$$

where the function $K(t_1,t_2)$ is defined by (3) for $k=2$.

Note that the transition from (120) to (121) is based on the theorem on reducing of a limit to iterated one. Moreover, the transition from (121) to (122) is based on the Parseval equality.

Thus, we obtain the following Theorem.

Theorem 3. *Assume that $\{\phi_j(x)\}_{j=0}^{\infty}$ is a complete orthonormal system of Legendre polynomials or trigonometric functions in the space $L_2([t,T])$. At the same time $\psi_2(\tau)$ is a continuously differentiable nonrandom function on $[t,T]$ and $\psi_1(\tau)$ is twice continuously differentiable nonrandom function on $[t,T]$. Then, for the iterated Stratonovich stochastic integral* (1) *of multiplicity* 2

$$J^*[\psi^{(2)}]_{T,t}=\int\limits_t^{*T}\psi_2(t_2)\int\limits_t^{*t_2}\psi_1(t_1)d\mathbf{w}_{t_1}^{(i_1)}d\mathbf{w}_{t_2}^{(i_2)}\quad (i_1,i_2=0,1,\ldots,m)$$

the following expansion

$$J^*[\psi^{(2)}]_{T,t}=\underset{p\to\infty}{\text{l.i.m.}}\sum_{j_1,j_2=0}^{p}C_{j_2j_1}\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}$$

converging in the mean-square sense is valid, where the Fourier coefficient $C_{j_2j_1}$ has the form

$$C_{j_2j_1}=\int\limits_t^T\psi_2(t_2)\phi_{j_2}(t_2)\int\limits_t^{t_2}\psi_1(t_1)\phi_{j_1}(t_1)dt_1dt_2$$

and

$$\zeta_j^{(i)}=\int\limits_t^T\phi_j(s)d\mathbf{w}_s^{(i)}$$

are independent standard Gaussian random variables for various i or j (if $i\neq 0$), $\mathbf{w}_\tau^{(i)}=\mathbf{f}_\tau^{(i)}$ are independent standard Wiener processes $(i=1,\ldots,m)$ and $\mathbf{w}_\tau^{(0)}=\tau$.

Note that Theorem 3 is a modification (for the case $p_1=p_2=p$ of series summation) of Theorem 2.1 [18].

From the other hand, Theorem 1 implies the following

$$0\le\left|\lim_{p_1\to\infty}\overline{\lim_{p_2\to\infty}}\ldots\overline{\lim_{p_k\to\infty}}\,\mathsf{M}\left\{\sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k}C_{j_k\ldots j_1}\prod_{l=1}^k\zeta_{j_l}^{(i_l)}-J^*[\psi^{(k)}]_{T,t}\right\}\right|\le$$

$$\le\lim_{p_1\to\infty}\overline{\lim_{p_2\to\infty}}\ldots\overline{\lim_{p_k\to\infty}}\left|\mathsf{M}\left\{\sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k}C_{j_k\ldots j_1}\prod_{l=1}^k\zeta_{j_l}^{(i_l)}-J^*[\psi^{(k)}]_{T,t}\right\}\right|\le$$

$$\le\lim_{p_1\to\infty}\overline{\lim_{p_2\to\infty}}\ldots\overline{\lim_{p_k\to\infty}}\,\mathsf{M}\left\{\left|J^*[\psi^{(k)}]_{T,t}-\sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k}C_{j_k\ldots j_1}\prod_{l=1}^k\zeta_{j_l}^{(i_l)}\right|\right\}\le$$

$$\le\lim_{p_1\to\infty}\overline{\lim_{p_2\to\infty}}\ldots\overline{\lim_{p_k\to\infty}}\left(\mathsf{M}\left\{\left(J^*[\psi^{(k)}]_{T,t}-\sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k}C_{j_k\ldots j_1}\prod_{l=1}^k\zeta_{j_l}^{(i_l)}\right)^2\right\}\right)^{1/2}=0. \tag{123}$$

Moreover,

$$\lim_{p_1\to\infty}\overline{\lim_{p_2\to\infty}}\ldots\overline{\lim_{p_k\to\infty}}\left(\sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k}C_{j_k\ldots j_1}\mathsf{M}\left\{\prod_{l=1}^{k}\zeta_{j_l}^{(i_l)}\right\}-\mathsf{M}\left\{J^*[\psi^{(k)}]_{T,t}\right\}\right)=$$

$$=\lim_{p_1\to\infty}\overline{\lim_{p_2\to\infty}}\ldots\overline{\lim_{p_k\to\infty}}\sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k}C_{j_k\ldots j_1}\mathsf{M}\left\{\prod_{l=1}^{k}\zeta_{j_l}^{(i_l)}\right\}-\mathsf{M}\left\{J^*[\psi^{(k)}]_{T,t}\right\}. \tag{124}$$

Combining (123) and (124), we obtain

$$\mathsf{M}\left\{J^*[\psi^{(k)}]_{T,t}\right\}=\lim_{p_1\to\infty}\overline{\lim_{p_2\to\infty}}\ldots\overline{\lim_{p_k\to\infty}}\sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k}C_{j_k\ldots j_1}\mathsf{M}\left\{\prod_{l=1}^{k}\zeta_{j_l}^{(i_l)}\right\}. \tag{125}$$

The relation (125) with $k=2$ implies the following

$$\mathsf{M}\left\{J^*[\psi^{(2)}]_{T,t}\right\}=\frac{1}{2}\mathbf{1}_{\{i_1=i_2\neq 0\}}\int\limits_t^T\psi_1(\tau)\psi_2(\tau)d\tau=$$

$$=\lim_{p_1\to\infty}\overline{\lim_{p_2\to\infty}}\sum_{j_1=0}^{p_1}\sum_{j_2=0}^{p_2}C_{j_2j_1}\mathsf{M}\left\{\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}\right\}, \tag{126}$$

where $\mathbf{1}_A$ is the indicator of the set A.
Since

$$\mathsf{M}\left\{\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}\right\}=\mathbf{1}_{\{i_1=i_2\neq 0\}}\mathbf{1}_{\{j_1=j_2\}},$$

then from (126) we obtain

$$\mathsf{M}\left\{J^*[\psi^{(2)}]_{T,t}\right\}=\lim_{p_1\to\infty}\overline{\lim_{p_2\to\infty}}\sum_{j_1=0}^{p_1}\sum_{j_2=0}^{p_2}C_{j_2j_1}\mathbf{1}_{\{j_1=j_2\}}\mathbf{1}_{\{i_1=i_2\neq 0\}}=$$

$$=\mathbf{1}_{\{i_1=i_2\neq 0\}}\lim_{p_1\to\infty}\overline{\lim_{p_2\to\infty}}\sum_{j_1=0}^{\min\{p_1,p_2\}}C_{j_1j_1}=\mathbf{1}_{\{i_1=i_2\neq 0\}}\sum_{j_1=0}^{\infty}C_{j_1j_1}, \tag{127}$$

where $C_{j_1j_1}$ is defined by (5) for $k=2$ and $j_1=j_2$, i.e.

$$C_{j_1j_1}=\int\limits_t^T\psi_2(t_2)\phi_{j_1}(t_2)\int\limits_t^{t_2}\psi_1(t_1)\phi_{j_1}(t_1)dt_1dt_2.$$

From (126) and (127) we obtain the following relation

$$\sum_{j_1=0}^{\infty} C_{j_1 j_1} = \frac{1}{2}\int\limits_t^T \psi_1(\tau)\psi_2(\tau)d\tau. \tag{128}$$

Note that the equality (128) and existence of the limit on the left-hand side of (128) are proved in [18] (Sect. 2.1.2, 2.1.4), [23] for the polynomial and trigonometric cases ($\psi_1(\tau), \psi_2(\tau)$ are continuously differentiable functions on $[t, T]$) as well as for an arbitrary complete orthonormal system of functions in $L_2([t, T])$ and $\psi_1(\tau), \psi_2(\tau) \in L_2([t, T])$.

Let us address now to the following theorem on expansion of iterated Ito stochastic integrals (2).

Theorem 4 [4] (2006), [5]-[40]. *Suppose that every $\psi_l(\tau)$ $(l = 1, \ldots, k)$ is a continuous nonrandom function on the interval $[t, T]$ and $\{\phi_j(x)\}_{j=0}^{\infty}$ is a complete orthonormal system of continuous functions in the space $L_2([t, T])$. Then*

$$J[\psi^{(k)}]_{T,t} = \underset{p_1,\ldots,p_k\to\infty}{\text{l.i.m.}} \sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k} C_{j_k\ldots j_1}\Biggl(\prod_{l=1}^{k}\zeta_{j_l}^{(i_l)} -$$

$$- \underset{N\to\infty}{\text{l.i.m.}} \sum_{(l_1,\ldots,l_k)\in \mathrm{G}_k} \phi_{j_1}(\tau_{l_1})\Delta\mathbf{w}_{\tau_{l_1}}^{(i_1)}\ldots\phi_{j_k}(\tau_{l_k})\Delta\mathbf{w}_{\tau_{l_k}}^{(i_k)}\Biggr), \tag{129}$$

where

$$\mathrm{G}_k = \mathrm{H}_k\backslash\mathrm{L}_k, \quad \mathrm{H}_k = \{(l_1,\ldots,l_k):\ l_1,\ldots,l_k = 0,\ 1,\ldots,N-1\},$$

$$\mathrm{L}_k = \{(l_1,\ldots,l_k):\ l_1,\ldots,l_k = 0,\ 1,\ldots,N-1;\ l_g \ne l_r\ (g\ne r);\ g,r = 1,\ldots,k\},$$

l.i.m. *is a limit in the mean-square sense, $i_1, \ldots, i_k = 0, 1, \ldots, m$,*

$$\zeta_j^{(i)} = \int\limits_t^T \phi_j(s)d\mathbf{w}_s^{(i)} \tag{130}$$

are independent standard Gaussian random variables for various i or j (if $i \ne 0$), $C_{j_k\ldots j_1}$ is the Fourier coefficient (5), $\Delta\mathbf{w}_{\tau_j}^{(i)} = \mathbf{w}_{\tau_{j+1}}^{(i)} - \mathbf{w}_{\tau_j}^{(i)}$ $(i = 0,\ 1,\ldots,m)$, $\{\tau_j\}_{j=0}^{N}$ is the partition of the interval $[t, T]$, which satisfies the condition (26).

Consider transformed particular cases for $k = 1, \ldots, 5$ of Theorem 4 [4] (2006), [5]-[40]

$$J[\psi^{(1)}]_{T,t} = \underset{p_1\to\infty}{\text{l.i.m.}} \sum_{j_1=0}^{p_1} C_{j_1}\zeta_{j_1}^{(i_1)}, \tag{131}$$

$$J[\psi^{(2)}]_{T,t} = \underset{p_1,p_2\to\infty}{\text{l.i.m.}} \sum_{j_1=0}^{p_1}\sum_{j_2=0}^{p_2} C_{j_2 j_1}\Biggl(\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)} - \mathbf{1}_{\{i_1=i_2\ne 0\}}\mathbf{1}_{\{j_1=j_2\}}\Biggr), \tag{132}$$

$$J[\psi^{(3)}]_{T,t}=\underset{p_1,\ldots,p_3\to\infty}{\text{l.i.m.}}\sum_{j_1=0}^{p_1}\sum_{j_2=0}^{p_2}\sum_{j_3=0}^{p_3}C_{j_3j_2j_1}\Biggl(\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}\zeta_{j_3}^{(i_3)}-$$

$$-\mathbf{1}_{\{i_1=i_2\ne 0\}}\mathbf{1}_{\{j_1=j_2\}}\zeta_{j_3}^{(i_3)}-\mathbf{1}_{\{i_2=i_3\ne 0\}}\mathbf{1}_{\{j_2=j_3\}}\zeta_{j_1}^{(i_1)}-\mathbf{1}_{\{i_1=i_3\ne 0\}}\mathbf{1}_{\{j_1=j_3\}}\zeta_{j_2}^{(i_2)}\Biggr), \tag{133}$$

$$J[\psi^{(4)}]_{T,t}=\underset{p_1,\ldots,p_4\to\infty}{\text{l.i.m.}}\sum_{j_1=0}^{p_1}\ldots\sum_{j_4=0}^{p_4}C_{j_4\ldots j_1}\Biggl(\prod_{l=1}^{4}\zeta_{j_l}^{(i_l)}-$$
$$-\mathbf{1}_{\{i_1=i_2\ne 0\}}\mathbf{1}_{\{j_1=j_2\}}\zeta_{j_3}^{(i_3)}\zeta_{j_4}^{(i_4)}-\mathbf{1}_{\{i_1=i_3\ne 0\}}\mathbf{1}_{\{j_1=j_3\}}\zeta_{j_2}^{(i_2)}\zeta_{j_4}^{(i_4)}-$$
$$-\mathbf{1}_{\{i_1=i_4\ne 0\}}\mathbf{1}_{\{j_1=j_4\}}\zeta_{j_2}^{(i_2)}\zeta_{j_3}^{(i_3)}-\mathbf{1}_{\{i_2=i_3\ne 0\}}\mathbf{1}_{\{j_2=j_3\}}\zeta_{j_1}^{(i_1)}\zeta_{j_4}^{(i_4)}-$$
$$-\mathbf{1}_{\{i_2=i_4\ne 0\}}\mathbf{1}_{\{j_2=j_4\}}\zeta_{j_1}^{(i_1)}\zeta_{j_3}^{(i_3)}-\mathbf{1}_{\{i_3=i_4\ne 0\}}\mathbf{1}_{\{j_3=j_4\}}\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}+$$
$$+\mathbf{1}_{\{i_1=i_2\ne 0\}}\mathbf{1}_{\{j_1=j_2\}}\mathbf{1}_{\{i_3=i_4\ne 0\}}\mathbf{1}_{\{j_3=j_4\}}+$$
$$+\mathbf{1}_{\{i_1=i_3\ne 0\}}\mathbf{1}_{\{j_1=j_3\}}\mathbf{1}_{\{i_2=i_4\ne 0\}}\mathbf{1}_{\{j_2=j_4\}}+$$
$$+\mathbf{1}_{\{i_1=i_4\ne 0\}}\mathbf{1}_{\{j_1=j_4\}}\mathbf{1}_{\{i_2=i_3\ne 0\}}\mathbf{1}_{\{j_2=j_3\}}\Biggr), \tag{134}$$

$$J[\psi^{(5)}]_{T,t}=\underset{p_1,\ldots,p_5\to\infty}{\text{l.i.m.}}\sum_{j_1=0}^{p_1}\ldots\sum_{j_5=0}^{p_5}C_{j_5\ldots j_1}\Biggl(\prod_{l=1}^{5}\zeta_{j_l}^{(i_l)}-$$
$$-\mathbf{1}_{\{i_1=i_2\ne 0\}}\mathbf{1}_{\{j_1=j_2\}}\zeta_{j_3}^{(i_3)}\zeta_{j_4}^{(i_4)}\zeta_{j_5}^{(i_5)}-\mathbf{1}_{\{i_1=i_3\ne 0\}}\mathbf{1}_{\{j_1=j_3\}}\zeta_{j_2}^{(i_2)}\zeta_{j_4}^{(i_4)}\zeta_{j_5}^{(i_5)}-$$
$$-\mathbf{1}_{\{i_1=i_4\ne 0\}}\mathbf{1}_{\{j_1=j_4\}}\zeta_{j_2}^{(i_2)}\zeta_{j_3}^{(i_3)}\zeta_{j_5}^{(i_5)}-\mathbf{1}_{\{i_1=i_5\ne 0\}}\mathbf{1}_{\{j_1=j_5\}}\zeta_{j_2}^{(i_2)}\zeta_{j_3}^{(i_3)}\zeta_{j_4}^{(i_4)}-$$
$$-\mathbf{1}_{\{i_2=i_3\ne 0\}}\mathbf{1}_{\{j_2=j_3\}}\zeta_{j_1}^{(i_1)}\zeta_{j_4}^{(i_4)}\zeta_{j_5}^{(i_5)}-\mathbf{1}_{\{i_2=i_4\ne 0\}}\mathbf{1}_{\{j_2=j_4\}}\zeta_{j_1}^{(i_1)}\zeta_{j_3}^{(i_3)}\zeta_{j_5}^{(i_5)}-$$
$$-\mathbf{1}_{\{i_2=i_5\ne 0\}}\mathbf{1}_{\{j_2=j_5\}}\zeta_{j_1}^{(i_1)}\zeta_{j_3}^{(i_3)}\zeta_{j_4}^{(i_4)}-\mathbf{1}_{\{i_3=i_4\ne 0\}}\mathbf{1}_{\{j_3=j_4\}}\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}\zeta_{j_5}^{(i_5)}-$$
$$-\mathbf{1}_{\{i_3=i_5\ne 0\}}\mathbf{1}_{\{j_3=j_5\}}\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}\zeta_{j_4}^{(i_4)}-\mathbf{1}_{\{i_4=i_5\ne 0\}}\mathbf{1}_{\{j_4=j_5\}}\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}\zeta_{j_3}^{(i_3)}+$$
$$+\mathbf{1}_{\{i_1=i_2\ne 0\}}\mathbf{1}_{\{j_1=j_2\}}\mathbf{1}_{\{i_3=i_4\ne 0\}}\mathbf{1}_{\{j_3=j_4\}}\zeta_{j_5}^{(i_5)}+\mathbf{1}_{\{i_1=i_2\ne 0\}}\mathbf{1}_{\{j_1=j_2\}}\mathbf{1}_{\{i_3=i_5\ne 0\}}\mathbf{1}_{\{j_3=j_5\}}\zeta_{j_4}^{(i_4)}+$$
$$+\mathbf{1}_{\{i_1=i_2\ne 0\}}\mathbf{1}_{\{j_1=j_2\}}\mathbf{1}_{\{i_4=i_5\ne 0\}}\mathbf{1}_{\{j_4=j_5\}}\zeta_{j_3}^{(i_3)}+\mathbf{1}_{\{i_1=i_3\ne 0\}}\mathbf{1}_{\{j_1=j_3\}}\mathbf{1}_{\{i_2=i_4\ne 0\}}\mathbf{1}_{\{j_2=j_4\}}\zeta_{j_5}^{(i_5)}+$$
$$+\mathbf{1}_{\{i_1=i_3\ne 0\}}\mathbf{1}_{\{j_1=j_3\}}\mathbf{1}_{\{i_2=i_5\ne 0\}}\mathbf{1}_{\{j_2=j_5\}}\zeta_{j_4}^{(i_4)}+\mathbf{1}_{\{i_1=i_3\ne 0\}}\mathbf{1}_{\{j_1=j_3\}}\mathbf{1}_{\{i_4=i_5\ne 0\}}\mathbf{1}_{\{j_4=j_5\}}\zeta_{j_2}^{(i_2)}+$$
$$+\mathbf{1}_{\{i_1=i_4\ne 0\}}\mathbf{1}_{\{j_1=j_4\}}\mathbf{1}_{\{i_2=i_3\ne 0\}}\mathbf{1}_{\{j_2=j_3\}}\zeta_{j_5}^{(i_5)}+\mathbf{1}_{\{i_1=i_4\ne 0\}}\mathbf{1}_{\{j_1=j_4\}}\mathbf{1}_{\{i_2=i_5\ne 0\}}\mathbf{1}_{\{j_2=j_5\}}\zeta_{j_3}^{(i_3)}+$$
$$+\mathbf{1}_{\{i_1=i_4\ne 0\}}\mathbf{1}_{\{j_1=j_4\}}\mathbf{1}_{\{i_3=i_5\ne 0\}}\mathbf{1}_{\{j_3=j_5\}}\zeta_{j_2}^{(i_2)}+\mathbf{1}_{\{i_1=i_5\ne 0\}}\mathbf{1}_{\{j_1=j_5\}}\mathbf{1}_{\{i_2=i_3\ne 0\}}\mathbf{1}_{\{j_2=j_3\}}\zeta_{j_4}^{(i_4)}+$$
$$+\mathbf{1}_{\{i_1=i_5\ne 0\}}\mathbf{1}_{\{j_1=j_5\}}\mathbf{1}_{\{i_2=i_4\ne 0\}}\mathbf{1}_{\{j_2=j_4\}}\zeta_{j_3}^{(i_3)}+\mathbf{1}_{\{i_1=i_5\ne 0\}}\mathbf{1}_{\{j_1=j_5\}}\mathbf{1}_{\{i_3=i_4\ne 0\}}\mathbf{1}_{\{j_3=j_4\}}\zeta_{j_2}^{(i_2)}+$$
$$+\mathbf{1}_{\{i_2=i_3\ne 0\}}\mathbf{1}_{\{j_2=j_3\}}\mathbf{1}_{\{i_4=i_5\ne 0\}}\mathbf{1}_{\{j_4=j_5\}}\zeta_{j_1}^{(i_1)}+\mathbf{1}_{\{i_2=i_4\ne 0\}}\mathbf{1}_{\{j_2=j_4\}}\mathbf{1}_{\{i_3=i_5\ne 0\}}\mathbf{1}_{\{j_3=j_5\}}\zeta_{j_1}^{(i_1)}+$$
$$+\mathbf{1}_{\{i_2=i_5\ne 0\}}\mathbf{1}_{\{j_2=j_5\}}\mathbf{1}_{\{i_3=i_4\ne 0\}}\mathbf{1}_{\{j_3=j_4\}}\zeta_{j_1}^{(i_1)}\Biggr), \tag{135}$$

where $\mathbf{1}_A$ is the indicator of the set A.

Note that in [18], [22], [80] Theorem 4 is generalized to the case of an arbitrary complete orthonormal system of functions in $L_2([t,T])$ and $\psi_1(\tau),\ldots,\psi_k(\tau)\in L_2([t,T])$ (see Theorem 11 below).

From (132) for the case of an arbitrary complete orthonormal system of functions in $L_2([t,T])$, $\psi_1(\tau),\psi_2(\tau)\in L_2([t,T])$ and (128) we obtain

$$
J[\psi^{(2)}]_{T,t} = \underset{p_1,p_2\to\infty}{\text{l.i.m.}} \sum_{j_1=0}^{p_1}\sum_{j_2=0}^{p_2} C_{j_2j_1}\left(\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)} - \mathbf{1}_{\{i_1=i_2\ne 0\}}\mathbf{1}_{\{j_1=j_2\}}\right) =
$$

$$
= \underset{p_1,p_2\to\infty}{\text{l.i.m.}} \sum_{j_1=0}^{p_1}\sum_{j_2=0}^{p_2} C_{j_2j_1}\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)} - \mathbf{1}_{\{i_1=i_2\ne 0\}}\sum_{j_1=0}^{\infty} C_{j_1j_1} =
$$

$$
= \underset{p_1,p_2\to\infty}{\text{l.i.m.}} \sum_{j_1=0}^{p_1}\sum_{j_2=0}^{p_2} C_{j_2j_1}\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)} - \frac{1}{2}\mathbf{1}_{\{i_1=i_2\ne 0\}}\int\limits_t^T \psi_1(\tau)\psi_2(\tau)d\tau. \tag{136}
$$

Since

$$
J^*[\psi^{(2)}]_{T,t} = J[\psi^{(2)}]_{T,t} + \frac{1}{2}\mathbf{1}_{\{i_1=i_2\ne 0\}}\int\limits_t^T \psi_1(\tau)\psi_2(\tau)d\tau \quad \text{w. p. 1}, \tag{137}
$$

where $\psi_1(\tau),\psi_2(\tau)$ are continuous functions on $[t,T]$ (this condition is related to the definition of the Stratonovich stochastic integral that we use [43] (also see [18] (Sect. 2.1.1))), then from (136) we finally get the following expansion

$$
J^*[\psi^{(2)}]_{T,t} = \underset{p_1,p_2\to\infty}{\text{l.i.m.}} \sum_{j_1=0}^{p_1}\sum_{j_2=0}^{p_2} C_{j_2j_1}\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}.
$$

Thus, we obtain the following theorem.

Theorem 5 [18] (Sect. 2.1.4). *Assume that $\{\phi_j(x)\}_{j=0}^{\infty}$ is an arbitrary complete orthonormal system of functions in the space $L_2([t,T])$. Moreover, $\psi_1(\tau),\psi_2(\tau)$ are continuous nonrandom functions on $[t,T]$. Then, for the iterated Stratonovich stochastic integral (1) of multiplicity* 2

$$
J^*[\psi^{(2)}]_{T,t} = \int\limits_t^{*T} \psi_2(t_2)\int\limits_t^{*t_2} \psi_1(t_1)d\mathbf{w}_{t_1}^{(i_1)}d\mathbf{w}_{t_2}^{(i_2)} \quad (i_1,i_2=0,1,\ldots,m)
$$

the following expansion

$$
J^*[\psi^{(2)}]_{T,t} = \underset{p_1,p_2\to\infty}{\text{l.i.m.}} \sum_{j_1=0}^{p_1}\sum_{j_2=0}^{p_2} C_{j_2j_1}\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}
$$

converging in the mean-square sense is valid, where the Fourier coefficient $C_{j_2j_1}$ has the form

$$
C_{j_2j_1} = \int\limits_t^T \psi_2(t_2)\phi_{j_2}(t_2)\int\limits_t^{t_2} \psi_1(t_1)\phi_{j_1}(t_1)dt_1dt_2
$$

and

$$\zeta_j^{(i)} = \int\limits_t^T \phi_j(s) d\mathbf{w}_s^{(i)}$$

are independent standard Gaussian random variables for various i *or* j *(if* $i \ne 0$*),* $\mathbf{w}_\tau^{(i)} = \mathbf{f}_\tau^{(i)}$ *are independent standard Wiener processes* $(i = 1, \ldots, m)$ *and* $\mathbf{w}_\tau^{(0)} = \tau$*.*

Note that analogues of Theorem 5 for the multiplicities 3 to 6 of the iterated Stratonovich stochastic integrals (1) and the systems of Legendre polynomials and trigonometric functions have been formulated and proved in [18], [23], [26], [78], [79] (see Theorems 12–15 below).

We have

$$J^*[\psi^{(2)}]_{T,t}^{p_1,p_2} \stackrel{\text{def}}{=} J[\psi^{(2)}]_{T,t}^{p_1,p_2} + \frac{1}{2}\mathbf{1}_{\{i_1=i_2\ne 0\}} \int\limits_t^T \psi_1(s)\psi_2(s) ds =$$

$$= \sum_{j_1=0}^{p_1}\sum_{j_2=0}^{p_2} C_{j_2 j_1}\left(\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)} - \mathbf{1}_{\{i_1=i_2\ne 0\}}\mathbf{1}_{\{j_1=j_2\}}\right) + \frac{1}{2}\mathbf{1}_{\{i_1=i_2\ne 0\}} \int\limits_t^T \psi_1(s)\psi_2(s) ds =$$

$$= \sum_{j_1=0}^{p_1}\sum_{j_2=0}^{p_2} C_{j_2 j_1}\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)} + \mathbf{1}_{\{i_1=i_2\ne 0\}}\left(\frac{1}{2}\int\limits_t^T \psi_1(s)\psi_2(s) ds - \sum_{j_1=0}^{\min\{p_1,p_2\}} C_{j_1 j_1}\right), \qquad (138)$$

where

$$J[\psi^{(2)}]_{T,t}^{p_1,p_2} = \sum_{j_1=0}^{p_1}\sum_{j_2=0}^{p_2} C_{j_2 j_1}\left(\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)} - \mathbf{1}_{\{i_1=i_2\ne 0\}}\mathbf{1}_{\{j_1=j_2\}}\right)$$

is the approximation of iterated Ito stochastic integral (2) ($k = 2$) based on Theorem 4 (see (132)).

Moreover, from (137) and (138) we obtain

$$\mathsf{M}\left\{\left(J^*[\psi^{(2)}]_{T,t} - J^*[\psi^{(2)}]_{T,t}^{p_1,p_2}\right)^{2n}\right\} = \mathsf{M}\left\{\left(J[\psi^{(2)}]_{T,t} - J[\psi^{(2)}]_{T,t}^{p_1,p_2}\right)^{2n}\right\} \ \to\ 0 \qquad (139)$$

if $p_1, p_2 \to \infty$ $(n \in \mathbb{N})$, where the relation

$$\mathsf{M}\left\{\left(J[\psi^{(2)}]_{T,t} - J[\psi^{(2)}]_{T,t}^{p_1,p_2}\right)^{2n}\right\} \ \to\ 0$$

if $p_1, p_2 \to \infty$ $(n \in \mathbb{N})$ is proved in [18] (see Sect. 1.1.9, 1.12).

Further (see (138)),

$$\mathsf{M}\left\{\left(J^*[\psi^{(2)}]_{T,t} - \sum_{j_1=0}^{p_1}\sum_{j_2=0}^{p_2} C_{j_2 j_1}\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}\right)^{2n}\right\} =$$

$$= \mathsf{M}\left\{\left(J^*[\psi^{(2)}]_{T,t} - J^*[\psi^{(2)}]_{T,t}^{p_1,p_2} + \mathbf{1}_{\{i_1=i_2\ne 0\}}\left(\frac{1}{2}\int\limits_t^T \psi_1(s)\psi_2(s) ds - \sum_{j_1=0}^{\min\{p_1,p_2\}} C_{j_1 j_1}\right)\right)^{2n}\right\} \le$$

(140)

$$\leq K_n\left(\mathsf{M}\left\{\left(J^*[\psi^{(2)}]_{T,t}-J^*[\psi^{(2)}]_{T,t}^{p_1,p_2}\right)^{2n}\right\}+\mathbf{1}_{\{i_1=i_2\neq 0\}}\left(\frac{1}{2}\int\limits_t^T\psi_1(s)\psi_2(s)ds-\sum_{j_1=0}^{\min\{p_1,p_2\}}C_{j_1j_1}\right)^{2n}\right),$$

where constant $K_n<\infty$ depends on n.

Taking into account (128), (139), and (140), we get

$$\lim_{p_1,p_2\to\infty}\mathsf{M}\left\{\left(J^*[\psi^{(2)}]_{T,t}-\sum_{j_1=0}^{p_1}\sum_{j_2=0}^{p_2}C_{j_2j_1}\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}\right)^{2n}\right\}=0. \tag{141}$$

Thus, we obtain the following theorem.

Theorem 6 [18] (Sect. 2.4.2). *Suppose that $\{\phi_j(x)\}_{j=0}^{\infty}$ is a complete orthonormal system of Legendre polynomials or trigonometric functions in the space $L_2([t,T])$. Moreover, $\psi_1(\tau),\psi_2(\tau)$ are continuous nonrandom functions on $[t,T]$. Then, for the iterated Stratonovich stochastic integral* (1) *of multiplicity* 2

$$J^*[\psi^{(2)}]_{T,t}=\int\limits_t^{*T}\psi_2(t_2)\int\limits_t^{*t_2}\psi_1(t_1)d\mathbf{w}_{t_1}^{(i_1)}d\mathbf{w}_{t_2}^{(i_2)}\quad (i_1,i_2=0,1,\ldots,m)$$

the following expansion

$$J^*[\psi^{(2)}]_{T,t}=\sum_{j_1,j_2=0}^{\infty}C_{j_2j_1}\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}$$

that converges in the mean of degree $2n$, $n\in\mathbb{N}$ (see (141)) *is valid, where the Fourier coefficient $C_{j_2j_1}$ is defined by* (5) *and*

$$\zeta_j^{(i)}=\int\limits_t^T\phi_j(s)d\mathbf{w}_s^{(i)}$$

are independent standard Gaussian random variables for various i or j (in the case when $i\neq 0$), $\mathbf{w}_\tau^{(i)}=\mathbf{f}_\tau^{(i)}$ are independent standard Wiener processes $(i=1,\ldots,m)$ and $\mathbf{w}_\tau^{(0)}=\tau$.

Let us consider some other approaches close to the approaches outlined in this section. Now we turn to multiple trigonometric Fourier series converging almost everywhere. Let us formulate the well-known result from the theory of multiple trigonometric Fourier series.

Theorem 7 [64]. *Suppose that*

$$\int\limits_{[0,2\pi]^k}|f(x_1,\ldots,x_k)|\left(\log^+|f(x_1,\ldots,x_k)|\right)^k\log^+\log^+|f(x_1,\ldots,x_k)|dx_1\ldots dx_k<\infty. \tag{142}$$

Then, for the square partial sums

$$\sum_{j_1=0}^{p} \ldots \sum_{j_k=0}^{p} C_{j_k \ldots j_1} \prod_{l=1}^{k} \phi_{j_l}(x_l)$$

of the multiple trigonometric Fourier series we have

$$\lim_{p\to\infty} \sum_{j_1=0}^{p} \ldots \sum_{j_k=0}^{p} C_{j_k \ldots j_1} \prod_{l=1}^{k} \phi_{j_l}(x_l) = f(x_1,\ldots,x_k)$$

almost everywhere in $[0,2\pi]^k$, *where* $\{\phi_j(x)\}_{j=0}^{\infty}$ *is a complete orthonormal system of trigonometric functions in the space* $L_2([0,2\pi])$,

$$C_{j_k \ldots j_1} = \int\limits_{[0,2\pi]^k} f(x_1,\ldots,x_k) \prod_{l=1}^{k} \phi_{j_l}(x_l) dx_1 \ldots dx_k$$

is the Fourier coefficient of the function $f(x_1,\ldots,x_k)$, *and* $\log^+ x = \log\max\{1,\ x\}$.

Obviously, Theorem 7 can be reformulated for the hypercube $[t,T]^k$ instead of the hypercube $[0,2\pi]^k$.

If we tried to apply Theorem 7 in the proof of Theorem 1, then we would encounter the following difficulties. Note that the right-hand side of (94) contains multiple integrals over hypercubes of various dimensions, namely over hypercubes $[t,T]^k$, $[t,T]^{k-1}$, etc. Obviously, the convergence almost everywhere in $[t,T]^k$ does not mean the convergence almost everywhere in $[t,T]^{k-1}$, $[t,T]^{k-2}$, etc. This means that we could not apply the Lebesgue's Dominated Convergence Theorem in the proof of Lemma 6 and thus could not complete the proof of Theorem 1. Although multiple series are more convenient for approximation than iterated series as in Theorem 1.

Suppose that $\psi_1(\tau), \psi_2(\tau)$ are continuously differentiable functions on $[t,T]$ and $\{\phi_j(x)\}_{j=0}^{\infty}$ is a complete orthonormal system of Legendre polynomials or trigonometric functions in the space $L_2([t,T])$. In [18] (Sect. 2.1.2) it was shown that

$$\lim_{p_1,p_2\to\infty} \sum_{j_1=0}^{p_1} \sum_{j_2=0}^{p_2} C_{j_2 j_1} \phi_{j_1}(t_1)\phi_{j_2}(t_1) = \frac{1}{2}\psi_1(t_1)\psi_2(t_1) = K^*(t_1,t_1), \quad t_1 \in (t,T), \tag{143}$$

where $C_{j_2 j_1}$ is defined by (5) ($k=2$).

This means that we can repeat the proof of Theorem 1 for the case $k=2$ and apply the Lebesgue's Dominated Convergence Theorem in the formula (94), since Theorem 7 and (143) implies the convergence almost everywhere in $[t,T]^2$ and almost everywhere in $[t,T]$ ($t_1 = t_2 \in [t,T]$) of the multiple trigonometric Fourier series

$$\lim_{p\to\infty} \sum_{j_1=0}^{p} \sum_{j_2=0}^{p} C_{j_2 j_1} \phi_{j_1}(t_1)\phi_{j_2}(t_2), \quad t_1, t_2 \in [t,T]^2 \tag{144}$$

to the function $K^*(t_1,t_2)$ (the question of finding an integrable majorant for Lebesgue's Dominated Convergence Theorem is omitted here). So, we can obtain the particular case of Theorem 6.

Let us consider the another approach. The following fact is well-known.

Proposition 1. *Let* $\left\{x_{n_1,\ldots,n_k}\right\}_{n_1,\ldots,n_k=1}^{\infty}$ *be a multi-index sequence and let there exists the limit*

$$\lim_{n_1,\ldots,n_k\to\infty} x_{n_1,\ldots,n_k} < \infty.$$

Moreover, let there exists the limit

$$\lim_{n_k\to\infty} x_{n_1,\ldots,n_k} = y_{n_1,\ldots,n_{k-1}} < \infty \quad \textit{for any} \quad n_1,\ldots,n_{k-1}.$$

Then there exists the iterated limit

$$\lim_{n_1,\ldots,n_{k-1}\to\infty}\ \lim_{n_k\to\infty} x_{n_1,\ldots,n_k},$$

and moreover,

$$\lim_{n_1,\ldots,n_{k-1}\to\infty}\ \lim_{n_k\to\infty} x_{n_1,\ldots,n_k} = \lim_{n_1,\ldots,n_k\to\infty} x_{n_1,\ldots,n_k}.$$

Denote

$$C_{j_s\ldots j_1}(t_{s+1},\ldots,t_k) = \int\limits_{[t,T]^s} K(t_1,\ldots,t_k)\prod_{l=1}^{s}\phi_{j_l}(t_l)dt_1\ldots dt_s \quad (s=1,\ldots,k-1).$$

where $K(t_1,\ldots,t_k)$ has the form (3). For $s=k$ we suppose that $C_{j_k\ldots j_1}$ is defined by (5).

Consider the following Fourier series

$$\lim_{p_1,p_2\to\infty}\sum_{j_1=0}^{p_1}\sum_{j_2=0}^{p_2} C_{j_2j_1}(t_3,\ldots,t_k)\phi_{j_1}(t_1)\phi_{j_2}(t_2), \tag{145}$$

$$\lim_{p_1,p_2,p_3\to\infty}\sum_{j_1=0}^{p_1}\sum_{j_1=0}^{p_1}\sum_{j_3=0}^{p_3} C_{j_3j_2j_1}(t_4,\ldots,t_k)\phi_{j_1}(t_1)\phi_{j_2}(t_2)\phi_{j_3}(t_3), \tag{146}$$

$$\ldots$$

$$\lim_{p_1,\ldots,p_{k-1}\to\infty}\sum_{j_1=0}^{p_1}\ldots\sum_{j_{k-1}=0}^{p_{k-1}} C_{j_{k-1}\ldots j_1}(t_k)\phi_{j_1}(t_1)\ldots\phi_{j_{k-1}}(t_{k-1}), \tag{147}$$

$$\lim_{p_1,\ldots,p_k\to\infty}\sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k} C_{j_k\ldots j_1}\phi_{j_1}(t_1)\ldots\phi_{j_k}(t_k), \tag{148}$$

where $\{\phi_j(x)\}_{j=0}^{\infty}$ is a complete orthonormal system of Legendre polynomials or trigonometric functions in the space $L_2([t,T])$.

The author does not know the answere to the question on existence of the limits (145)–(148) even for the case $p_1=\ldots=p_k$ and trigonometric Fourier series. Obviously, at least for the case $k=2$ and $\psi_1(\tau)$, $\psi_2(\tau)\equiv 1$ the answere to the above question is positive for the Fourier–Legendre series as well as for the trigonometric Fourier series.

If we suppose the existence of the limits (145)–(148), then combining Proposition 1 and the proof of Lemma 1 we obtain

$$K^*(t_1,\ldots,t_k)=\sum_{j_1=0}^{\infty}C_{j_1}(t_2,\ldots,t_k)\phi_{j_1}(t_1)=$$

$$=\sum_{j_1=0}^{\infty}\sum_{j_2=0}^{\infty}C_{j_2j_1}(t_3,\ldots,t_k)\phi_{j_1}(t_1)\phi_{j_2}(t_2)= \tag{149}$$

$$=\lim_{p_1,p_2\to\infty}\sum_{j_1=0}^{p_1}\sum_{j_2=0}^{p_2}C_{j_2j_1}(t_3,\ldots,t_k)\phi_{j_1}(t_1)\phi_{j_2}(t_2)=$$

$$=\lim_{p_1,p_2\to\infty}\sum_{j_1=0}^{p_1}\sum_{j_2=0}^{p_2}\sum_{j_3=0}^{\infty}C_{j_3j_2j_1}(t_4,\ldots,t_k)\phi_{j_1}(t_1)\phi_{j_2}(t_2)\phi_{j_3}(t_3)=$$

$$=\lim_{p_1,p_2,p_3\to\infty}\sum_{j_1=0}^{p_1}\sum_{j_2=0}^{p_2}\sum_{j_3=0}^{p_3}C_{j_3j_2j_1}(t_4,\ldots,t_k)\phi_{j_1}(t_1)\phi_{j_2}(t_2)\phi_{j_3}(t_3)= \tag{150}$$

$$=\sum_{j_1=0}^{\infty}\sum_{j_2=0}^{\infty}\sum_{j_3=0}^{\infty}C_{j_3j_2j_1}(t_4,\ldots,t_k)\phi_{j_1}(t_1)\phi_{j_2}(t_2)\phi_{j_3}(t_3)= \tag{151}$$

$$=\lim_{p_1,p_2,p_3\to\infty}\sum_{j_1=0}^{p_1}\sum_{j_2=0}^{p_2}\sum_{j_3=0}^{p_3}\sum_{j_4=0}^{\infty}C_{j_4\ldots j_1}(t_5,\ldots,t_k)\phi_{j_1}(t_1)\phi_{j_3}(t_4)= \tag{152}$$

$$=\ldots=$$

$$=\lim_{p_1,\ldots,p_k\to\infty}\sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k}C_{j_k\ldots j_1}\phi_{j_1}(t_1)\ldots\phi_{j_k}(t_k). \tag{153}$$

Note that the transition from (150) to (151) is based on (149) and the proof of Lemma 1. The transition from (151) to (152) is based on (150) and the proof of Lemma 1.

Using (153) we could get the version of Theorem 1 with multiple series instead of iterated ones.

6. Refinement of Theorems 1 and 2 for Iterated Stratonovich Stochastic Integrals of Multiplicities 2 and 3 ($i_1,i_2,i_3=1,\ldots,m$). The Case of Mean-Square Convergence

In this section, it will be shown that the upper limits in Theorems 1 and 2 (the cases $k=2$, $k=3$ and $n=1$) can be replaced by the usual limits.

Theorem 8 [18] (Sect. 2.4). *Suppose that every $\psi_l(\tau)$ $(l=1,2,3)$ is twice continuously differentiable function at the interval $[t,T]$ and $\{\phi_j(x)\}_{j=0}^{\infty}$ is a complete orthonormal system of trigonometric functions in the space $L_2([t,T])$. Then, the iterated Stratonovich stochastic integrals $J^*[\psi^{(2)}]_{T,t}$ and*

$J^*[\psi^{(3)}]_{T,t}$ $(i_1, i_2, i_3 = 1, \ldots, m)$ *defined by* (1) *are expanded into the converging in the mean-square sense iterated series*

$$\lim_{p_1\to\infty}\lim_{p_2\to\infty} \mathsf{M}\left\{\left(J^*[\psi^{(2)}]_{T,t} - \sum_{j_1=0}^{p_1}\sum_{j_2=0}^{p_2} C_{j_2j_1}\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}\right)^2\right\} = 0, \tag{154}$$

$$\lim_{p_2\to\infty}\lim_{p_1\to\infty} \mathsf{M}\left\{\left(J^*[\psi^{(2)}]_{T,t} - \sum_{j_2=0}^{p_2}\sum_{j_1=0}^{p_1} C_{j_2j_1}\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}\right)^2\right\} = 0, \tag{155}$$

$$\lim_{p_1\to\infty}\lim_{p_2\to\infty}\lim_{p_3\to\infty} \mathsf{M}\left\{\left(J^*[\psi^{(3)}]_{T,t} - \sum_{j_1=0}^{p_1}\sum_{j_2=0}^{p_2}\sum_{j_3=0}^{p_3} C_{j_3j_2j_1}\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}\zeta_{j_3}^{(i_3)}\right)^2\right\} = 0, \tag{156}$$

$$\lim_{p_3\to\infty}\lim_{p_2\to\infty}\lim_{p_1\to\infty} \mathsf{M}\left\{\left(J^*[\psi^{(3)}]_{T,t} - \sum_{j_3=0}^{p_3}\sum_{j_2=0}^{p_2}\sum_{j_1=0}^{p_1} C_{j_3j_2j_1}\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}\zeta_{j_3}^{(i_3)}\right)^2\right\} = 0, \tag{157}$$

where

$$\zeta_j^{(i)} = \int\limits_t^T \phi_j(s)d\mathbf{f}_s^{(i)} \quad (i = 1, \ldots, m, \quad j = 0, 1, \ldots)$$

are independent standard Gaussian random variables for various i or j and $C_{j_2j_1}$, $C_{j_3j_2j_1}$ are defined by (5).

Proof. We will prove the equalities (154) and (156) (the equalities (155) and (157) can be proved similarly using the expansion (101) instead of the expansion (8)).

From (47) we have w. p. 1

$$J^*[\psi^{(2)}]_{T,t} - \sum_{j_1=0}^{p_1}\sum_{j_2=0}^{p_2} C_{j_2j_1}\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)} = J[R_{p_1p_2}]_{T,t}^{(2)} =$$

$$= \int\limits_t^T\int\limits_t^{t_2} R_{p_1p_2}(t_1,t_2)d\mathbf{f}_{t_1}^{(i_1)}d\mathbf{f}_{t_2}^{(i_2)} + \int\limits_t^T\int\limits_t^{t_1} R_{p_1p_2}(t_1,t_2)d\mathbf{f}_{t_2}^{(i_2)}d\mathbf{f}_{t_1}^{(i_1)} +$$

$$+\mathbf{1}_{\{i_1=i_2\}}\int\limits_t^T R_{p_1p_2}(t_1,t_1)dt_1, \tag{158}$$

where we used the same notations as in (47).

Uning (158), we obtain

$$\mathsf{M}\left\{\left(J[R_{p_1p_2}]_{T,t}^{(2)}\right)^2\right\} = \int\limits_t^T\int\limits_t^{t_2} R_{p_1p_2}^2(t_1,t_2)dt_1dt_2 + \int\limits_t^T\int\limits_t^{t_1} R_{p_1p_2}^2(t_1,t_2)dt_2dt_1 +$$

$$+\mathbf{1}_{\{i_1=i_2\}}\left(2\int\limits_t^T\int\limits_t^{t_2}R_{p_1p_2}(t_1,t_2)R_{p_1p_2}(t_2,t_1)dt_1dt_2+\left(\int\limits_t^T R_{p_1p_2}(t_1,t_1)dt_1\right)^2\right)=$$

$$=\int\limits_t^T\int\limits_t^{t_2}R_{p_1p_2}^2(t_1,t_2)dt_1dt_2+\int\limits_t^T\int\limits_{t_2}^T R_{p_1p_2}^2(t_1,t_2)dt_1dt_2+$$

$$+\mathbf{1}_{\{i_1=i_2\}}\left(\int\limits_t^T\int\limits_t^{t_2}R_{p_1p_2}(t_1,t_2)R_{p_1p_2}(t_2,t_1)dt_1dt_2+\right.$$

$$\left.+\int\limits_t^T\int\limits_{t_1}^T R_{p_1p_2}(t_1,t_2)R_{p_1p_2}(t_2,t_1)dt_2dt_1\right)+\mathbf{1}_{\{i_1=i_2\}}\left(\int\limits_t^T R_{p_1p_2}(t_1,t_1)dt_1\right)^2=$$

$$=\int\limits_{[t,T]^2}R_{p_1p_2}^2(t_1,t_2)dt_1dt_2+$$

$$+\mathbf{1}_{\{i_1=i_2\}}\left(\int\limits_t^T\int\limits_t^{t_2}R_{p_1p_2}(t_1,t_2)R_{p_1p_2}(t_2,t_1)dt_1dt_2+\right.$$

$$\left.+\int\limits_t^T\int\limits_{t_2}^T R_{p_1p_2}(t_1,t_2)R_{p_1p_2}(t_2,t_1)dt_1dt_2\right)+\mathbf{1}_{\{i_1=i_2\}}\left(\int\limits_t^T R_{p_1p_2}(t_1,t_1)dt_1\right)^2=$$

$$=\int\limits_{[t,T]^2}R_{p_1p_2}^2(t_1,t_2)dt_1dt_2+$$

$$+\mathbf{1}_{\{i_1=i_2\}}\left(\int\limits_{[t,T]^2}R_{p_1p_2}(t_1,t_2)R_{p_1p_2}(t_2,t_1)dt_1dt_2+\left(\int\limits_t^T R_{p_1p_2}(t_1,t_1)dt_1\right)^2\right). \tag{159}$$

Since the integrals on the right-hand side of (159) exist as Riemann integrals, then they are equal to the corresponding Lebesgue integrals. Moreover,

$$\lim_{p_1\to\infty}\lim_{p_2\to\infty}R_{p_1p_2}(t_1,t_2)=0\quad\text{when}\quad(t_1,t_2)\in(t,T)^2,$$

where the left-hand side is bounded on $[t,T]^2$ (see (46)).

Then, applying two times (we mean an iterated passage to the limit $\lim\limits_{p_1\to\infty}\lim\limits_{p_2\to\infty}$) the Lebesgue's Dominated Convergence Theorem and taking into account (9), (10), and (53), we obtain

$$\lim_{p_1\to\infty}\lim_{p_2\to\infty}\int\limits_{[t,T]^2}R_{p_1p_2}^2(t_1,t_2)dt_1dt_2=0, \tag{160}$$

$$\lim_{p_1\to\infty}\lim_{p_2\to\infty}\int\limits_{[t,T]^2} R_{p_1p_2}(t_1,t_2)R_{p_1p_2}(t_2,t_1)dt_1dt_2=0, \tag{161}$$

$$\lim_{p_1\to\infty}\lim_{p_2\to\infty}\int\limits_t^T R_{p_1p_2}(t_1,t_1)dt_1=0. \tag{162}$$

The relations (159)–(162) imply the following equality

$$\lim_{p_1\to\infty}\lim_{p_2\to\infty}\mathsf{M}\left\{\left(J[R_{p_1p_2}]^{(2)}_{T,t}\right)^2\right\}=0.$$

The relation (154) is proved.

Let us prove the relation (156). Using (55) and the integration order replacement technique for iterated Ito stochastic integrals (see Chapter 3 in [18]-[21]), we get w. p. 1

$$J^*[\psi^{(3)}]_{T,t}-\sum_{j_1=0}^{p_1}\sum_{j_2=0}^{p_2}\sum_{j_3=0}^{p_3}C_{j_3j_2j_1}\zeta^{(i_1)}_{j_1}\zeta^{(i_2)}_{j_2}\zeta^{(i_3)}_{j_3}=J[R_{p_1p_2p_3}]^{(3)}_{T,t}=$$

$$=\int\limits_t^T\int\limits_t^{t_3}\int\limits_t^{t_2}R_{p_1p_2p_3}(t_1,t_2,t_3)d\mathbf{f}^{(i_1)}_{t_1}d\mathbf{f}^{(i_2)}_{t_2}d\mathbf{f}^{(i_3)}_{t_3}+$$

$$+\int\limits_t^T\int\limits_t^{t_3}\int\limits_t^{t_2}R_{p_1p_2p_3}(t_1,t_3,t_2)d\mathbf{f}^{(i_1)}_{t_1}d\mathbf{f}^{(i_3)}_{t_2}d\mathbf{f}^{(i_2)}_{t_3}+$$

$$+\int\limits_t^T\int\limits_t^{t_3}\int\limits_t^{t_2}R_{p_1p_2p_3}(t_2,t_1,t_3)d\mathbf{f}^{(i_2)}_{t_1}d\mathbf{f}^{(i_1)}_{t_2}d\mathbf{f}^{(i_3)}_{t_3}+$$

$$+\int\limits_t^T\int\limits_t^{t_3}\int\limits_t^{t_2}R_{p_1p_2p_3}(t_2,t_3,t_1)d\mathbf{f}^{(i_3)}_{t_1}d\mathbf{f}^{(i_1)}_{t_2}d\mathbf{f}^{(i_2)}_{t_3}+$$

$$+\int\limits_t^T\int\limits_t^{t_3}\int\limits_t^{t_2}R_{p_1p_2p_3}(t_3,t_2,t_1)d\mathbf{f}^{(i_3)}_{t_1}d\mathbf{f}^{(i_2)}_{t_2}d\mathbf{f}^{(i_1)}_{t_3}+$$

$$+\int\limits_t^T\int\limits_t^{t_3}\int\limits_t^{t_2}R_{p_1p_2p_3}(t_3,t_1,t_2)d\mathbf{f}^{(i_2)}_{t_1}d\mathbf{f}^{(i_3)}_{t_2}d\mathbf{f}^{(i_1)}_{t_3}+$$

$$+\mathbf{1}_{\{i_1=i_2\}}\int\limits_t^T\left(\int\limits_t^T R_{p_1p_2p_3}(t_2,t_2,t_3)dt_2\right)d\mathbf{f}^{(i_3)}_{t_3}+$$

$$+\mathbf{1}_{\{i_2=i_3\}}\int\limits_t^T\left(\int\limits_t^T R_{p_1p_2p_3}(t_1,t_2,t_2)dt_2\right)d\mathbf{f}^{(i_1)}_{t_1}+$$

$$+\mathbf{1}_{\{i_1=i_3\}}\int\limits_t^T\left(\int\limits_t^T R_{p_1p_2p_3}(t_3,t_2,t_3)dt_3\right)d\mathbf{f}_{t_2}^{(i_2)}. \tag{163}$$

Let us calculate the second moment of $J[R_{p_1p_2p_3}]_{T,t}^{(3)}$ using (163). We have

$$\mathsf{M}\left\{\left(J[R_{p_1p_2p_3}]_{T,t}^{(3)}\right)^2\right\}=$$

$$=\int\limits_t^T\int\limits_t^{t_3}\int\limits_t^{t_2}\left(\sum_{(t_1,t_2,t_3)}R_{p_1p_2p_3}^2(t_1,t_2,t_3)\right)dt_1dt_2dt_3+ \tag{164}$$

$$+2\left(\mathbf{1}_{\{i_1=i_2\}}\int\limits_t^T\int\limits_t^{t_3}\int\limits_t^{t_2}G_{p_1p_2p_3}^{(1)}(t_1,t_2,t_3)dt_1dt_2dt_3+\right.$$

$$+\mathbf{1}_{\{i_1=i_3\}}\int\limits_t^T\int\limits_t^{t_3}\int\limits_t^{t_2}G_{p_1p_2p_3}^{(2)}(t_1,t_2,t_3)dt_1dt_2dt_3+$$

$$+\mathbf{1}_{\{i_2=i_3\}}\int\limits_t^T\int\limits_t^{t_3}\int\limits_t^{t_2}G_{p_1p_2p_3}^{(3)}(t_1,t_2,t_3)dt_1dt_2dt_3+$$

$$\left.+\mathbf{1}_{\{i_1=i_2=i_3\}}\int\limits_t^T\int\limits_t^{t_3}\int\limits_t^{t_2}G_{p_1p_2p_3}^{(4)}(t_1,t_2,t_3)dt_1dt_2dt_3\right)+$$

$$+\int\limits_{[t,T]^3}\left(\mathbf{1}_{\{i_1=i_2\}}R_{p_1p_2p_3}(t_1,t_1,t_3)R_{p_1p_2p_3}(t_2,t_2,t_3)+\right.$$

$$+\mathbf{1}_{\{i_2=i_3\}}R_{p_1p_2p_3}(t_3,t_1,t_1)R_{p_1p_2p_3}(t_3,t_2,t_2)+$$

$$+\mathbf{1}_{\{i_1=i_3\}}R_{p_1p_2p_3}(t_1,t_3,t_1)R_{p_1p_2p_3}(t_2,t_3,t_2)+$$

$$+2\cdot\mathbf{1}_{\{i_1=i_2=i_3\}}\Biggl(R_{p_1p_2p_3}(t_1,t_1,t_3)R_{p_1p_2p_3}(t_3,t_2,t_2)+$$

$$+R_{p_1p_2p_3}(t_1,t_1,t_3)R_{p_1p_2p_3}(t_2,t_3,t_2)+$$

$$\left.\left.+R_{p_1p_2p_3}(t_3,t_1,t_1)R_{p_1p_2p_3}(t_2,t_3,t_2)\right)\right)dt_1dt_2dt_3, \tag{165}$$

where permutation (t_1,t_2,t_3) when summing in (164) are performed only in the value $R_{p_1p_2p_3}^2(t_1,t_2,t_3)$ and the functions $G_{p_1p_2p_3}^{(i)}(t_1,t_2,t_3)$ $(i=1,\ldots,4)$ are defined by the following relations

$$G_{p_1p_2p_3}^{(1)}(t_1,t_2,t_3)=R_{p_1p_2p_3}(t_1,t_2,t_3)R_{p_1p_2p_3}(t_2,t_1,t_3)+$$

$$+R_{p_1p_2p_3}(t_1,t_3,t_2)R_{p_1p_2p_3}(t_3,t_1,t_2)+$$

$$+R_{p_1p_2p_3}(t_2,t_3,t_1)R_{p_1p_2p_3}(t_3,t_2,t_1),$$

$$G_{p_1p_2p_3}^{(2)}(t_1,t_2,t_3)=R_{p_1p_2p_3}(t_1,t_2,t_3)R_{p_1p_2p_3}(t_3,t_2,t_1)+$$

$$+R_{p_1p_2p_3}(t_1,t_3,t_2)R_{p_1p_2p_3}(t_2,t_3,t_1)+$$

$$+R_{p_1p_2p_3}(t_2,t_1,t_3)R_{p_1p_2p_3}(t_3,t_1,t_2),$$

$$G_{p_1p_2p_3}^{(3)}(t_1,t_2,t_3)=R_{p_1p_2p_3}(t_1,t_2,t_3)R_{p_1p_2p_3}(t_1,t_3,t_2)+$$

$$+R_{p_1p_2p_3}(t_2,t_1,t_3)R_{p_1p_2p_3}(t_2,t_3,t_1)+$$

$$+R_{p_1p_2p_3}(t_3,t_2,t_1)R_{p_1p_2p_3}(t_3,t_1,t_2),$$

$$G_{p_1p_2p_3}^{(4)}(t_1,t_2,t_3)=R_{p_1p_2p_3}(t_1,t_2,t_3)R_{p_1p_2p_3}(t_2,t_3,t_1)+$$

$$+R_{p_1p_2p_3}(t_1,t_2,t_3)R_{p_1p_2p_3}(t_3,t_1,t_2)+$$

$$+R_{p_1p_2p_3}(t_1,t_3,t_2)R_{p_1p_2p_3}(t_2,t_1,t_3)+$$

$$+R_{p_1p_2p_3}(t_1,t_3,t_2)R_{p_1p_2p_3}(t_3,t_2,t_1)+$$

$$+R_{p_1p_2p_3}(t_2,t_1,t_3)R_{p_1p_2p_3}(t_3,t_2,t_1)+$$

$$+R_{p_1p_2p_3}(t_2,t_3,t_1)R_{p_1p_2p_3}(t_3,t_1,t_2).$$

Further,

$$\int\limits_t^T\int\limits_t^{t_3}\int\limits_t^{t_2}\left(\sum_{(t_1,t_2,t_3)}R_{p_1p_2p_3}^2(t_1,t_2,t_3)\right)dt_1dt_2dt_3=$$

(166)
$$=\int\limits_{[t,T]^3}R_{p_1p_2p_3}^2(t_1,t_2,t_3)dt_1dt_2dt_3.$$

We will say that the function $\Phi(t_1,t_2,t_3)$ is symmetric if

$$\Phi(t_1,t_2,t_3)=\Phi(t_1,t_3,t_2)=\Phi(t_2,t_1,t_3)=\Phi(t_2,t_3,t_1)=$$

$$=\Phi(t_3,t_1,t_2)=\Phi(t_3,t_2,t_1).$$

For the symmetric function $\Phi(t_1,t_2,t_3)$, we have

$$\int\limits_t^T\int\limits_t^{t_3}\int\limits_t^{t_2}\left(\sum_{(t_1,t_2,t_3)}\Phi(t_1,t_2,t_3)\right)dt_1dt_2dt_3=$$

$$=6\int\limits_t^T\int\limits_t^{t_3}\int\limits_t^{t_2}\Phi(t_1,t_2,t_3)dt_1dt_2dt_3=$$

$$=\int\limits_{[t,T]^3}\Phi(t_1,t_2,t_3)dt_1dt_2dt_3. \tag{167}$$

The relation (167) implies that

$$\int\limits_t^T\int\limits_t^{t_3}\int\limits_t^{t_2}\Phi(t_1,t_2,t_3)dt_1dt_2dt_3=\frac{1}{6}\int\limits_{[t,T]^3}\Phi(t_1,t_2,t_3)dt_1dt_2dt_3. \tag{168}$$

It is easy to check that the functions $G^{(i)}_{p_1p_2p_3}(t_1,t_2,t_3)$ $(i=1,\ldots,4)$ are symmetric. Using this property as well as (165), (166), and (168), we obtain

$$\mathsf{M}\left\{\left(J[R_{p_1p_2p_3}]^{(3)}_{T,t}\right)^2\right\}=\int\limits_{[t,T]^3}R^2_{p_1p_2p_3}(t_1,t_2,t_3)dt_1dt_2dt_3+$$

$$+\frac{1}{3}\int\limits_{[t,T]^3}\Biggl(\mathbf{1}_{\{i_1=i_2\}}G^{(1)}_{p_1p_2p_3}(t_1,t_2,t_3)dt_1dt_2dt_3+$$

$$+\mathbf{1}_{\{i_1=i_3\}}G^{(2)}_{p_1p_2p_3}(t_1,t_2,t_3)dt_1dt_2dt_3+$$

$$+\mathbf{1}_{\{i_2=i_3\}}G^{(3)}_{p_1p_2p_3}(t_1,t_2,t_3)dt_1dt_2dt_3+$$

$$+\mathbf{1}_{\{i_1=i_2=i_3\}}G^{(4)}_{p_1p_2p_3}(t_1,t_2,t_3)dt_1dt_2dt_3\Biggr)dt_1dt_2dt_3+$$

$$+\int\limits_{[t,T]^3}\Biggl(\mathbf{1}_{\{i_1=i_2\}}R_{p_1p_2p_3}(t_1,t_1,t_3)R_{p_1p_2p_3}(t_2,t_2,t_3)+$$

$$+\mathbf{1}_{\{i_2=i_3\}}R_{p_1p_2p_3}(t_3,t_1,t_1)R_{p_1p_2p_3}(t_3,t_2,t_2)+$$

$$+\mathbf{1}_{\{i_1=i_3\}}R_{p_1p_2p_3}(t_1,t_3,t_1)R_{p_1p_2p_3}(t_2,t_3,t_2)+$$

$$+2\cdot\mathbf{1}_{\{i_1=i_2=i_3\}}\Biggl(R_{p_1p_2p_3}(t_1,t_1,t_3)R_{p_1p_2p_3}(t_3,t_2,t_2)+$$

$$+R_{p_1p_2p_3}(t_1,t_1,t_3)R_{p_1p_2p_3}(t_2,t_3,t_2)+$$

$$+R_{p_1p_2p_3}(t_3,t_1,t_1)R_{p_1p_2p_3}(t_2,t_3,t_2)\Biggr)\Biggr)dt_1dt_2dt_3. \tag{169}$$

Since the integrals on the right-hand side of (169) exist as Riemann integrals, then they are equal to the corresponding Lebesgue integrals. Moreover,

$$\lim_{p_1\to\infty}\lim_{p_2\to\infty}\lim_{p_3\to\infty}R_{p_1p_2p_3}(t_1,t_2,t_3)=0\quad\text{when}\quad (t_1,t_2,t_3)\in(t,T)^3,$$

where the left-hand side is bounded on $[t,T]^3$ (see (46)).

Using (62) and applying three times (we mean an iterated passage to the limit $\lim\limits_{p_1\to\infty}\lim\limits_{p_2\to\infty}\lim\limits_{p_3\to\infty}$) the Lebesgue's Dominated Convergence Theorem in the equality (169), we obtain

$$\lim_{p_1\to\infty}\lim_{p_2\to\infty}\lim_{p_3\to\infty}\mathsf{M}\left\{\left(J[R_{p_1p_2p_3}]_{T,t}^{(3)}\right)^2\right\}=0.$$

The relation (156) is proved. Theorem 8 is proved.

Developing the approach used in the proof of Theorem 8, we can in principle prove the following formulas

$$\lim_{p_1\to\infty}\ldots\lim_{p_k\to\infty}\mathsf{M}\left\{\left(J^*[\psi^{(k)}]_{T,t}-\sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k}C_{j_k\ldots j_1}\zeta_{j_1}^{(i_1)}\ldots\zeta_{j_k}^{(i_k)}\right)^2\right\}=0,$$

$$\lim_{p_k\to\infty}\ldots\lim_{p_1\to\infty}\mathsf{M}\left\{\left(J^*[\psi^{(k)}]_{T,t}-\sum_{j_k=0}^{p_k}\ldots\sum_{j_1=0}^{p_1}C_{j_k\ldots j_1}\zeta_{j_1}^{(i_1)}\ldots\zeta_{j_k}^{(i_k)}\right)^2\right\}=0,$$

which are correct under the conditions of Theorem 1.

7. Expansion of Iterated Stratonovich Stochastic Integrals of Multiplicity k. The Case $i_1=\ldots=i_k\ne 0$ and Different Weight Functions $\psi_1(\tau),\ldots,\psi_k(\tau)$

In this section, we generalize the approach considered in [34] (also see [18], Sect. 2.1.2) to the case $i_1=\ldots=i_k\ne 0$ and different weight functions $\psi_1(\tau),\ldots,\psi_k(\tau)$ $(k>2)$.

Let us formulate the following theorem.

Theorem 9 [18] (Sect. 2.22). *Suppose that $\{\phi_j(x)\}_{j=0}^{\infty}$ is a complete orthonormal system of Legendre polynomials or trigonometric functions in the space $L_2([t,T])$. Moreover, $\psi_1(\tau),\ldots,\psi_k(\tau)$ $(k\ge 2)$ are continuously differentiable nonrandom functions on $[t,T]$. Then, for the iterated Stratonovich stochastic integral*

$$J^*[\psi^{(k)}]_{T,t} = \int\limits_t^{*T} \psi_k(t_k) \ldots \int\limits_t^{*t_2} \psi_1(t_1) d\mathbf{f}_{t_1}^{(i_1)} \ldots d\mathbf{f}_{t_k}^{(i_1)} \quad (i_1 = 1, \ldots, m)$$

the following equality

$$\lim_{p\to\infty} \mathsf{M}\left\{\left(J^*[\psi^{(k)}]_{T,t} - \sum_{j_1=0}^{p} \ldots \sum_{j_k=0}^{p} C_{j_k\ldots j_1} \zeta_{j_1}^{(i_1)} \ldots \zeta_{j_k}^{(i_1)}\right)^{2n}\right\} = 0$$

is valid, where $n \in \mathbb{N}$,

$$C_{j_k\ldots j_1} = \int\limits_t^{T} \psi_k(t_k)\phi_{j_k}(t_k) \ldots \int\limits_t^{t_2} \psi_1(t_1)\phi_{j_1}(t_1) dt_1 \ldots dt_k$$

is the Fourier coefficient and

$$\zeta_j^{(i_1)} = \int\limits_t^{T} \phi_j(\tau) d\mathbf{f}_\tau^{(i_1)} \quad (i_1 = 1, \ldots, m)$$

are independent standard Gaussian random variables for various j.

Proof. The case $k = 2$ is proved in Theorem 6. Consider the case $k > 2$. First, consider the case $k = 3$ in detail. Define the auxiliary function

$$K'(t_1, t_2, t_3) = \frac{1}{6}\begin{cases} \psi_1(t_1)\psi_2(t_2)\psi_3(t_3), & t_1 \le t_2 \le t_3 \\ \psi_1(t_1)\psi_2(t_3)\psi_3(t_2), & t_1 \le t_3 \le t_2 \\ \psi_1(t_2)\psi_2(t_1)\psi_3(t_3), & t_2 \le t_1 \le t_3 \\ \psi_1(t_2)\psi_2(t_3)\psi_3(t_1), & t_2 \le t_3 \le t_1 \\ \psi_1(t_3)\psi_2(t_2)\psi_3(t_1), & t_3 \le t_2 \le t_1 \\ \psi_1(t_3)\psi_2(t_1)\psi_3(t_2), & t_3 \le t_1 \le t_2 \end{cases}, \quad t_1, t_2, t_3 \in [t, T].$$

Using Lemma 3, Remark 1, and (17), we obtain w. p. 1

$$J[K']_{T,t}^{(3)} = \underset{N\to\infty}{\text{l.i.m.}} \sum_{l_3=0}^{N-1} \sum_{l_2=0}^{N-1} \sum_{l_1=0}^{N-1} K'(\tau_{l_1}, \tau_{l_2}, \tau_{l_3}) \Delta\mathbf{f}_{\tau_{l_1}}^{(i_1)} \Delta\mathbf{f}_{\tau_{l_2}}^{(i_1)} \Delta\mathbf{f}_{\tau_{l_3}}^{(i_1)} =$$

$$= \underset{N\to\infty}{\text{l.i.m.}} \left(\sum_{l_3=0}^{N-1} \sum_{l_2=0}^{l_3-1} \sum_{l_1=0}^{l_2-1} K'(\tau_{l_1}, \tau_{l_2}, \tau_{l_3}) \Delta\mathbf{f}_{\tau_{l_1}}^{(i_1)} \Delta\mathbf{f}_{\tau_{l_2}}^{(i_1)} \Delta\mathbf{f}_{\tau_{l_3}}^{(i_1)} + \right.$$

$$+ \sum_{l_3=0}^{N-1} \sum_{l_1=0}^{l_3-1} \sum_{l_2=0}^{l_1-1} K'(\tau_{l_1}, \tau_{l_2}, \tau_{l_3}) \Delta\mathbf{f}_{\tau_{l_1}}^{(i_1)} \Delta\mathbf{f}_{\tau_{l_2}}^{(i_1)} \Delta\mathbf{f}_{\tau_{l_3}}^{(i_1)} +$$

$$+\sum_{l_2=0}^{N-1}\sum_{l_1=0}^{l_2-1}\sum_{l_3=0}^{l_1-1}K'(\tau_{l_1},\tau_{l_2},\tau_{l_3})\Delta\mathbf{f}_{\tau_{l_1}}^{(i_1)}\Delta\mathbf{f}_{\tau_{l_2}}^{(i_1)}\Delta\mathbf{f}_{\tau_{l_3}}^{(i_1)}+$$

$$+\sum_{l_2=0}^{N-1}\sum_{l_3=0}^{l_2-1}\sum_{l_1=0}^{l_3-1}K'(\tau_{l_1},\tau_{l_2},\tau_{l_3})\Delta\mathbf{f}_{\tau_{l_1}}^{(i_1)}\Delta\mathbf{f}_{\tau_{l_2}}^{(i_1)}\Delta\mathbf{f}_{\tau_{l_3}}^{(i_1)}+$$

$$+\sum_{l_1=0}^{N-1}\sum_{l_2=0}^{l_1-1}\sum_{l_3=0}^{l_2-1}K'(\tau_{l_1},\tau_{l_2},\tau_{l_3})\Delta\mathbf{f}_{\tau_{l_1}}^{(i_1)}\Delta\mathbf{f}_{\tau_{l_2}}^{(i_1)}\Delta\mathbf{f}_{\tau_{l_3}}^{(i_1)}+$$

$$+\sum_{l_1=0}^{N-1}\sum_{l_3=0}^{l_1-1}\sum_{l_2=0}^{l_3-1}K'(\tau_{l_1},\tau_{l_2},\tau_{l_3})\Delta\mathbf{f}_{\tau_{l_1}}^{(i_1)}\Delta\mathbf{f}_{\tau_{l_2}}^{(i_1)}\Delta\mathbf{f}_{\tau_{l_3}}^{(i_1)}+$$

$$+\sum_{l_2=0}^{N-1}\sum_{l_1=0}^{l_2-1}K'(\tau_{l_1},\tau_{l_2},\tau_{l_1})\left(\Delta\mathbf{f}_{\tau_{l_1}}^{(i_1)}\right)^2\Delta\mathbf{f}_{\tau_{l_2}}^{(i_1)}+\sum_{l_3=0}^{N-1}\sum_{l_1=0}^{l_3-1}K'(\tau_{l_1},\tau_{l_3},\tau_{l_3})\left(\Delta\mathbf{f}_{\tau_{l_3}}^{(i_1)}\right)^2\Delta\mathbf{f}_{\tau_{l_1}}^{(i_1)}+$$

$$+\sum_{l_1=0}^{N-1}\sum_{l_2=0}^{l_1-1}K'(\tau_{l_1},\tau_{l_2},\tau_{l_2})\left(\Delta\mathbf{f}_{\tau_{l_2}}^{(i_1)}\right)^2\Delta\mathbf{f}_{\tau_{l_1}}^{(i_1)}+\sum_{l_3=0}^{N-1}\sum_{l_2=0}^{l_3-1}K'(\tau_{l_3},\tau_{l_2},\tau_{l_3})\left(\Delta\mathbf{f}_{\tau_{l_3}}^{(i_1)}\right)^2\Delta\mathbf{f}_{\tau_{l_2}}^{(i_1)}+$$

$$\left.+\sum_{l_3=0}^{N-1}\sum_{l_2=0}^{l_3-1}K'(\tau_{l_2},\tau_{l_2},\tau_{l_3})\left(\Delta\mathbf{f}_{\tau_{l_2}}^{(i_1)}\right)^2\Delta\mathbf{f}_{\tau_{l_3}}^{(i_1)}+\sum_{l_2=0}^{N-1}\sum_{l_3=0}^{l_2-1}K'(\tau_{l_2},\tau_{l_2},\tau_{l_3})\left(\Delta\mathbf{f}_{\tau_{l_2}}^{(i_1)}\right)^2\Delta\mathbf{f}_{\tau_{l_3}}^{(i_1)}\right)=$$

$$=\frac{1}{6}\left(\int\limits_t^T\psi_3(t_3)\int\limits_t^{t_3}\psi_2(t_2)\int\limits_t^{t_2}\psi_1(t_1)d\mathbf{f}_{t_1}^{(i_1)}d\mathbf{f}_{t_2}^{(i_1)}d\mathbf{f}_{t_3}^{(i_1)}+\int\limits_t^T\psi_3(t_2)\int\limits_t^{t_2}\psi_2(t_1)\int\limits_t^{t_1}\psi_1(t_3)d\mathbf{f}_{t_3}^{(i_1)}d\mathbf{f}_{t_1}^{(i_1)}d\mathbf{f}_{t_2}^{(i_1)}+\right.$$

$$+\int\limits_t^T\psi_3(t_2)\int\limits_t^{t_2}\psi_2(t_3)\int\limits_t^{t_3}\psi_1(t_1)d\mathbf{f}_{t_1}^{(i_1)}d\mathbf{f}_{t_3}^{(i_1)}d\mathbf{f}_{t_2}^{(i_1)}+\int\limits_t^T\psi_3(t_3)\int\limits_t^{t_3}\psi_2(t_1)\int\limits_t^{t_1}\psi_1(t_2)d\mathbf{f}_{t_2}^{(i_1)}d\mathbf{f}_{t_1}^{(i_1)}d\mathbf{f}_{t_3}^{(i_1)}+$$

$$+\int\limits_t^T\psi_3(t_1)\int\limits_t^{t_1}\psi_2(t_2)\int\limits_t^{t_2}\psi_1(t_3)d\mathbf{f}_{t_3}^{(i_1)}d\mathbf{f}_{t_2}^{(i_1)}d\mathbf{f}_{t_1}^{(i_1)}+\int\limits_t^T\psi_3(t_1)\int\limits_t^{t_1}\psi_2(t_3)\int\limits_t^{t_3}\psi_1(t_2)d\mathbf{f}_{t_2}^{(i_1)}d\mathbf{f}_{t_3}^{(i_1)}d\mathbf{f}_{t_1}^{(i_1)}+$$

$$+\int\limits_t^T\psi_3(t_2)\int\limits_t^{t_2}\psi_2(t_1)\psi_1(t_1)dt_1d\mathbf{f}_{t_2}^{(i_1)}+\int\limits_t^T\psi_3(t_1)\int\limits_t^{t_1}\psi_2(t_2)\psi_1(t_2)dt_2d\mathbf{f}_{t_1}^{(i_1)}+$$

$$+\int\limits_t^T\psi_3(t_3)\int\limits_t^{t_3}\psi_2(t_1)\psi_1(t_1)dt_1d\mathbf{f}_{t_3}^{(i_1)}+\int\limits_t^T\psi_3(t_3)\psi_2(t_3)\int\limits_t^{t_3}\psi_1(t_1)d\mathbf{f}_{t_1}^{(i_1)}dt_3+$$

$$+\int\limits_t^T \psi_3(t_3)\psi_2(t_3)\int\limits_t^{t_3}\psi_1(t_2)d\mathbf{f}_{t_2}^{(i_1)}dt_3+\int\limits_t^T \psi_3(t_2)\psi_2(t_2)\int\limits_t^{t_2}\psi_1(t_3)d\mathbf{f}_{t_3}^{(i_1)}dt_2\Biggr)=$$

$$=\int\limits_t^T \psi_3(t_3)\int\limits_t^{t_3}\psi_2(t_2)\int\limits_t^{t_2}\psi_1(t_1)d\mathbf{f}_{t_1}^{(i_1)}d\mathbf{f}_{t_2}^{(i_1)}d\mathbf{f}_{t_3}^{(i_1)}+$$

$$+\frac{1}{2}\int\limits_t^T \psi_3(t_3)\int\limits_t^{t_3}\psi_2(t_1)\psi_1(t_1)dt_1d\mathbf{f}_{t_3}^{(i_1)}+\frac{1}{2}\int\limits_t^T \psi_3(t_3)\psi_2(t_3)\int\limits_t^{t_3}\psi_1(t_1)d\mathbf{f}_{t_1}^{(i_1)}dt_3=$$

$$=\int\limits_t^{*T}\psi_3(t_3)\int\limits_t^{*t_3}\psi_2(t_2)\int\limits_t^{*t_2}\psi_1(t_1)d\mathbf{f}_{t_1}^{(i_1)}d\mathbf{f}_{t_2}^{(i_1)}d\mathbf{f}_{t_3}^{(i_1)}\stackrel{\sf def}{=}J^*[\psi^{(3)}]_{T,t}, \tag{170}$$

where the multiple stochastic integral $J[K']_{T,t}^{(3)}$ is defined by (31) and $\{\tau_j\}_{j=0}^{N}$ is a partition of $[t,T]$, which satisfies the condition (26).

For each $\delta>0$ let us call the exact upper edge of difference $|f(\mathbf{t}')-f(\mathbf{t}'')|$ in the set of all points $\mathbf{t}'$, $\mathbf{t}''$ which belong to the domain D as the module of continuity of the function $f(\mathbf{t})$ $(\mathbf{t}=(t_1,\ldots,t_k))$ in the k-dimentional domain D $(k\ge 1)$ if the distance between $\mathbf{t}',\mathbf{t}''$ satisfies the condition $\rho(\mathbf{t}',\mathbf{t}'')<\delta$.

We will say that the function of k $(k\ge 1)$ variables $f(\mathbf{t})$ $(\mathbf{t}=(t_1,\ldots,t_k))$ belongs to the Hölder class with the parameter $\alpha\in(0,1]$ $(f(\mathbf{t})\in C^{\alpha}(D))$ in the domain D if the module of continuity of the function $f(\mathbf{t})$ $(\mathbf{t}=(t_1,\ldots,t_k))$ in the domain D have the orders $o(\delta^{\alpha})$ $(\alpha\in(0,1))$ and $O(\delta)$ $(\alpha=1)$.

In 1967, Zhizhiashvili L.V. proved that the rectangular sums of multiple trigonometric Fourier series of the function of k variables in the hypercube $[t,T]^k$ converge uniformly to this function in the hypercube $[t,T]^k$ if the function belongs to $C^{\alpha}([t,T]^k)$, $\alpha>0$ (definition of the Hölder class with any parameter $\alpha>0$ can be found in the well known mathematical analysis tutorials [76]).

More precisely, the following statement is correct.

Theorem 10 [76]. *If the function $f(x_1,\ldots,x_n)$ is periodic with period 2π with respect to each variable and belongs in $\mathbb{R}^n$ to the Hölder class $C^{\alpha}(\mathbb{R}^n)$ for any $\alpha>0$, then the rectangular partial sums of multiple trigonometric Fourier series of the function $f(x_1,\ldots,x_n)$ converge to this function uniformly in $\mathbb{R}^n$.*

In [34] (also see [18], Sect. 2.1.2) it was shown that the following function

$$K'(t_1,t_2)=\begin{cases}\psi_1(t_1)\psi_2(t_2), & t_1\le t_2\\ \\ \psi_1(t_2)\psi_2(t_1), & t_2\le t_1\end{cases},\qquad t_1,t_2\in[t,T]$$

belongs to the class $C^1([t,T]^2)$. Moreover, the following Fourier–Legendre expansion

$$K'(t_1,t_2)=\lim_{p\to\infty}\sum_{j_1=0}^{p}\sum_{j_2=0}^{p}\int\limits_t^T\int\limits_t^T K'(t_1,t_2)\phi_{j_1}(t_1)\phi_{j_2}(t_2)dt_1dt_2\cdot\phi_{j_1}(t_1)\phi_{j_2}(t_2)=$$

$$= \lim_{p\to\infty}\sum_{j_1=0}^{p}\sum_{j_2=0}^{p}\left(C_{j_2j_1}+C_{j_1j_2}\right)\phi_{j_1}(t_1)\phi_{j_2}(t_2) \tag{171}$$

is valid for $(t_1,t_2)\in(t,T)^2$.

Using Theorem 10 for $n=3$ and generalizing the Fourier–Legendre expansion (171) for the function $K'(t_1,t_2,t_3)$, we obtain

$$K'(t_1,t_2,t_3)=\lim_{p\to\infty}\sum_{j_1=0}^{p}\sum_{j_2=0}^{p}\sum_{j_3=0}^{p}\frac{1}{6}\Biggl(C_{j_3j_2j_1}+C_{j_3j_1j_2}+C_{j_2j_1j_3}+$$

$$+C_{j_2j_3j_1}+C_{j_1j_2j_3}+C_{j_1j_3j_2}\Biggr)\phi_{j_1}(t_1)\phi_{j_2}(t_2)\phi_{j_3}(t_3), \tag{172}$$

where the multiple Fourier series (172) converges to the function $K'(t_1,t_2,t_3)$ in $(t,T)^3$ and the partial sums of the series (172) have an integrable majorant on $[t,T]^3$ that does not depend on p. For the trigonomertic case, the above statement follows from Theorem 10 (the proof that the function $K'(t_1,t_2,t_3)$ belongs to the Hölder class with parameter 1 in $[t,T]^3$ is omitted and can be carried out in the same way as for the function $K'(t_1,t_2)$ in the two-dimensional case [34] (also see [18], Sect. 2.1.2)). The proof of generalization of the Fourier–Legendre expansion (171) to the three-dimensional case (see (172)) is omitted. The proof that the partial sums of the series (172) have an integrable majorant on $[t,T]^3$ is also omitted.

Denote

$$R'_{ppp}(t_1,t_2,t_3)=K'(t_1,t_2,t_3)-\sum_{j_1=0}^{p}\sum_{j_2=0}^{p}\sum_{j_3=0}^{p}\frac{1}{6}\Biggl(C_{j_3j_2j_1}+C_{j_3j_1j_2}+C_{j_2j_1j_3}+$$

$$+C_{j_2j_3j_1}+C_{j_1j_2j_3}+C_{j_1j_3j_2}\Biggr)\phi_{j_1}(t_1)\phi_{j_2}(t_2)\phi_{j_3}(t_3).$$

Using Lemma 5 and (170), we get w. p. 1

$$J^*[\psi^{(3)}]_{T,t}=J[K']_{T,t}^{(3)}=\sum_{j_1=0}^{p}\sum_{j_2=0}^{p}\sum_{j_3=0}^{p}\frac{1}{6}\Biggl(C_{j_3j_2j_1}+C_{j_3j_1j_2}+C_{j_2j_1j_3}+$$

$$+C_{j_2j_3j_1}+C_{j_1j_2j_3}+C_{j_1j_3j_2}\Biggr)\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_1)}\zeta_{j_3}^{(i_1)}+J[R'_{ppp}]_{T,t}^{(3)}=$$

$$=\sum_{j_1=0}^{p}\sum_{j_2=0}^{p}\sum_{j_3=0}^{p}C_{j_3j_2j_1}\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_1)}\zeta_{j_3}^{(i_1)}+J[R'_{ppp}]_{T,t}^{(3)}.$$

Then

$$\mathsf{M}\left\{\left(J[R'_{ppp}]_{T,t}^{(3)}\right)^{2n}\right\}=\mathsf{M}\left\{\left(J^*[\psi^{(3)}]_{T,t}-\sum_{j_1=0}^{p}\sum_{j_2=0}^{p}\sum_{j_3=0}^{p}C_{j_3j_2j_1}\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_1)}\zeta_{j_3}^{(i_1)}\right)^{2n}\right\},$$

where $n\in\mathbb{N}$.

Applying (we mean here the passage to the limit $\lim\limits_{p\to\infty}$) the Lebesgue's Dominated Convergence Theorem to the integrals on the right-hand side of (94) for $k = 3$ and $R'_{ppp}(t_1, t_2, t_3)$ instead of $R_{p_1p_2p_3}(t_1, t_2, t_3)$, we obtain

$$\lim_{p\to\infty} \mathsf{M}\left\{\left(J[R'_{ppp}]^{(3)}_{T,t}\right)^{2n}\right\} = 0.$$

Theorems 9 is proved for the case $k = 3$.

To prove Theorem 9 for the case $k > 3$, consider the auxiliary function

$$K'(t_1,\ldots,t_k) = \frac{1}{k!}\begin{cases} \psi_1(t_1)\ldots\psi_k(t_k), & t_1 \le \ldots \le t_k \\ \ldots & \\ \psi_1(t_{g_1})\ldots\psi_k(t_{g_k}), & t_{g_1} \le \ldots \le t_{g_k} \\ \ldots & \\ \psi_1(t_k)\ldots\psi_k(t_1), & t_k \le \ldots \le t_1 \end{cases}, \quad t_1,\ldots,t_k \in [t,T], \tag{173}$$

where $\{g_1,\ldots,g_k\} = \{1,\ldots,k\}$ and we take into account all possible permutations $(g_1,\ldots,g_k)$ on the right-hand side of the formula (173).

Further, we have w. p. 1

$$J[K']^{(k)}_{T,t} = J[\psi^{(k)}]_{T,t} + \sum_{r=1}^{[k/2]} \frac{1}{2^r} \sum_{(s_r,\ldots,s_1)\in \mathrm{A}_{k,r}} J[\psi^{(k)}]^{s_r,\ldots,s_1}_{T,t}, \tag{174}$$

where the function $K'(t_1,\ldots,t_k)$ is defined by (173); another notations are the same as in (15) and Lemma 2 ($i_1 = \ldots = i_k \ne 0$ in (15)).

From (174) and Lemma 2 we obtain w. p. 1

$$J^*[\psi^{(k)}]_{T,t} = J[K']^{(k)}_{T,t}, \tag{175}$$

where $i_1 = \ldots = i_k \ne 0$.

Generalizing the above reasoning to the case $k > 3$ and taking into account (175), we get

$$J^*[\psi^{(k)}]_{T,t} = \sum_{j_1=0}^{p}\ldots\sum_{j_k=0}^{p} \frac{1}{k!}\left(\sum_{(j_1,\ldots,j_k)} C_{j_k\ldots j_1}\right)\zeta^{(i_1)}_{j_1}\ldots\zeta^{(i_1)}_{j_k} + J[R'_{p\ldots p}]^{(k)}_{T,t} =$$

$$= \sum_{j_1=0}^{p}\ldots\sum_{j_k=0}^{p} C_{j_k\ldots j_1}\zeta^{(i_1)}_{j_1}\ldots\zeta^{(i_1)}_{j_k} + J[R'_{p\ldots p}]^{(k)}_{T,t},$$

where

$$R'_{p\ldots p}(t_1,\ldots,t_k) \stackrel{\mathsf{def}}{=} K'(t_1,\ldots,t_k) -$$

$$
-\sum_{j_1=0}^{p}\ldots\sum_{j_k=0}^{p}\frac{1}{k!}\left(\sum_{(j_1,\ldots,j_k)}C_{j_k\ldots j_1}\right)\phi_{j_1}(t_1)\ldots\phi_{j_k}(t_k),
$$

the expression

$$
\sum_{(j_1,\ldots,j_k)}
$$

means the sum with respect to all possible permutations $(j_1,\ldots,j_k)$.

Further,

$$
\mathsf{M}\left\{\left(J[R'_{p\ldots p}]^{(k)}_{T,t}\right)^{2n}\right\}=\mathsf{M}\left\{\left(J^*[\psi^{(k)}]_{T,t}-\sum_{j_1=0}^{p}\ldots\sum_{j_k=0}^{p}C_{j_k\ldots j_1}\zeta^{(i_1)}_{j_1}\ldots\zeta^{(i_1)}_{j_k}\right)^{2n}\right\},
$$

where $n\in\mathbb{N}$.

Applying (we mean here the passage to the limit $\lim\limits_{p\to\infty}$) the Lebesgue's Dominated Convergence Theorem to the integrals on the right-hand side of (94) for the function $R'_{p\ldots p}(t_1,\ldots,t_k)$ instead of the function $R_{p_1\ldots,p_k}(t_1,\ldots,t_k)$, we obtain

$$
\lim_{p\to\infty}\mathsf{M}\left\{\left(J[R'_{p\ldots p}]^{(k)}_{T,t}\right)^{2n}\right\}=0.
$$

Theorems 9 is proved.

8. Recent Results on Expansion of Iterated Ito and Stratonovich Stochastic Integrals

Using (91), we can write (129) as

$$
J[\psi^{(k)}]_{T,t}=\underset{p_1,\ldots,p_k\to\infty}{\text{l.i.m.}}\sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k}C_{j_k\ldots j_1}\Biggl(\prod_{l=1}^{k}\zeta^{(i_l)}_{j_l}+\sum_{r=1}^{[k/2]}(-1)^r\times
$$

$$
\times\sum_{\substack{(\{\{g_1,g_2\},\ldots,\{g_{2r-1},g_{2r}\}\},\{q_1,\ldots,q_{k-2r}\})\\ \{g_1,g_2,\ldots,g_{2r-1},g_{2r},q_1,\ldots,q_{k-2r}\}=\{1,2,\ldots,k\}}}\prod_{s=1}^{r}\mathbf{1}_{\{i_{g_{2s-1}}=\,i_{g_{2s}}\ne 0\}}\mathbf{1}_{\{j_{g_{2s-1}}=\,j_{g_{2s}}\}}\prod_{l=1}^{k-2r}\zeta^{(i_{q_l})}_{j_{q_l}}\Biggr),\tag{176}
$$

where $[x]$ is an integer part of a real number x, $\prod\limits_{\emptyset}\stackrel{\sf def}{=}1$, $\sum\limits_{\emptyset}\stackrel{\sf def}{=}0$; another notations are the same as in Theorem **4**.

In particular, from (176) for $k=5$ we obtain

$$J[\psi^{(5)}]_{T,t} = \underset{p_1,\ldots,p_5\to\infty}{\text{l.i.m.}} \sum_{j_1=0}^{p_1}\ldots\sum_{j_5=0}^{p_5} C_{j_5\ldots j_1}\Biggl(\prod_{l=1}^{5}\zeta_{j_l}^{(i_l)} -$$

$$-\sum_{\substack{(\{g_1,g_2\},\{q_1,q_2,q_3\})\\ \{g_1,g_2,q_1,q_2,q_3\}=\{1,2,3,4,5\}}} \mathbf{1}_{\{i_{g_1}=\ i_{g_2}\neq 0\}}\mathbf{1}_{\{j_{g_1}=\ j_{g_2}\}}\prod_{l=1}^{3}\zeta_{j_{q_l}}^{(i_{q_l})}+$$

$$+\sum_{\substack{(\{\{g_1,g_2\},\{g_3,g_4\}\},\{q_1\})\\ \{g_1,g_2,g_3,g_4,q_1\}=\{1,2,3,4,5\}}} \mathbf{1}_{\{i_{g_1}=\ i_{g_2}\neq 0\}}\mathbf{1}_{\{j_{g_1}=\ j_{g_2}\}}\mathbf{1}_{\{i_{g_3}=\ i_{g_4}\neq 0\}}\mathbf{1}_{\{j_{g_3}=\ j_{g_4}\}}\zeta_{j_{q_1}}^{(i_{q_1})}\Biggr).$$

The last equality obviously agrees with (135).

Let us consider the generalization of Theorem 4 for the case of an arbitrary complete orthonormal systems of functions in the space $L_2([t,T])$ and $\psi_1(\tau),\ldots,\psi_k(\tau)\in L_2([t,T])$.

Theorem 11 [18] (Sect. 1.11), [22] (Sect. 15). *Suppose that $\psi_1(\tau),\ldots,\psi_k(\tau)\in L_2([t,T])$ and $\{\phi_j(x)\}_{j=0}^{\infty}$ is an arbitrary complete orthonormal system of functions in the space $L_2([t,T])$. Then the following expansion*

$$J[\psi^{(k)}]_{T,t} = \underset{p_1,\ldots,p_k\to\infty}{\text{l.i.m.}} \sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k} C_{j_k\ldots j_1}\Biggl(\prod_{l=1}^{k}\zeta_{j_l}^{(i_l)} + \sum_{r=1}^{[k/2]}(-1)^r\times$$

$$\times\sum_{\substack{(\{\{g_1,g_2\},\ldots,\{g_{2r-1},g_{2r}\}\},\{q_1,\ldots,q_{k-2r}\})\\ \{g_1,g_2,\ldots,g_{2r-1},g_{2r},q_1,\ldots,q_{k-2r}\}=\{1,2,\ldots,k\}}} \prod_{s=1}^{r}\mathbf{1}_{\{i_{g_{2s-1}}=\ i_{g_{2s}}\neq 0\}}\mathbf{1}_{\{j_{g_{2s-1}}=\ j_{g_{2s}}\}}\prod_{l=1}^{k-2r}\zeta_{j_{q_l}}^{(i_{q_l})}\Biggr)$$

converging in the mean-square sense is valid, where $[x]$ is an integer part of a real number x, $\prod_{\emptyset}\stackrel{\sf def}{=}1$, $\sum_{\emptyset}\stackrel{\sf def}{=}0$; another notations are the same as in Theorem 4.

It should be noted that an analogue of Theorem 11 was considered in [77]. Note that we use another notations [18] (Sect. 1.11), [22] (Sect. 15) in comparison with [77]. Moreover, the proof of an analogue of Theorem 11 from [77] is different from the proof given in [18] (Sect. 1.11), [22] (Sect. 15).

Recently, a new approach to the expansion and mean-square approximation of iterated Stratonovich stochastic integrals has been obtained [18] (Sect. 2.10–2.16), [23] (Sect. 13–19), [26] (Sect. 5–11), [78] (Sect. 7–13), [79] (Sect. 4–9). Let us formulate four theorems that were obtained using this approach.

Theorem 12 [18], [23], [26], [78], [79]. *Suppose that $\{\phi_j(x)\}_{j=0}^{\infty}$ is a complete orthonormal system of Legendre polynomials or trigonometric functions in the space $L_2([t,T])$. Furthermore, let $\psi_1(\tau),\psi_2(\tau)$, $\psi_3(\tau)$ are continuously differentiable nonrandom functions on $[t,T]$. Then, for the iterated Stratonovich stochastic integral of third multiplicity*

$$J^*[\psi^{(3)}]_{T,t} = \int\limits_t^{*T}\psi_3(t_3)\int\limits_t^{*t_3}\psi_2(t_2)\int\limits_t^{*t_2}\psi_1(t_1)d\mathbf{w}_{t_1}^{(i_1)}d\mathbf{w}_{t_2}^{(i_2)}d\mathbf{w}_{t_3}^{(i_3)}\quad (i_1,i_2,i_3=0,1,\ldots,m)$$

the following relations

(177) $$J^*[\psi^{(3)}]_{T,t} = \underset{p\to\infty}{\text{l.i.m.}} \sum_{j_1,j_2,j_3=0}^{p} C_{j_3j_2j_1}\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}\zeta_{j_3}^{(i_3)},$$

(178) $$\mathsf{M}\left\{\left(J^*[\psi^{(3)}]_{T,t} - \sum_{j_1,j_2,j_3=0}^{p} C_{j_3j_2j_1}\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}\zeta_{j_3}^{(i_3)}\right)^2\right\} \le \frac{C}{p}$$

are fulfilled, where $i_1, i_2, i_3 = 0, 1, \ldots, m$ *in* (177) *and* $i_1, i_2, i_3 = 1, \ldots, m$ *in* (178)*, constant* C *is independent of* p,

$$C_{j_3j_2j_1} = \int\limits_t^T \psi_3(t_3)\phi_{j_3}(t_3)\int\limits_t^{t_3}\psi_2(t_2)\phi_{j_2}(t_2)\int\limits_t^{t_2}\psi_1(t_1)\phi_{j_1}(t_1)dt_1dt_2dt_3$$

and

$$\zeta_j^{(i)} = \int\limits_t^T \phi_j(\tau)d\mathbf{f}_\tau^{(i)}$$

are independent standard Gaussian random variables for various i *or* j *(in the case when* $i \ne 0$*); another notations are the same as in Theorems* 4, 11.

Theorem 13 [18], [23], [26], [78], [79]. *Let* $\{\phi_j(x)\}_{j=0}^{\infty}$ *be a complete orthonormal system of Legendre polynomials or trigonometric functions in the space* $L_2([t,T])$*. Furthermore, let* $\psi_1(\tau), \ldots, \psi_4(\tau)$ *be continuously differentiable nonrandom functions on* $[t,T]$*. Then, for the iterated Stratonovich stochastic integral of fourth multiplicity*

(179) $$J^*[\psi^{(4)}]_{T,t} = \int\limits_t^{*T}\psi_4(t_4)\int\limits_t^{*t_4}\psi_3(t_3)\int\limits_t^{*t_3}\psi_2(t_2)\int\limits_t^{*t_2}\psi_1(t_1)d\mathbf{w}_{t_1}^{(i_1)}d\mathbf{w}_{t_2}^{(i_2)}d\mathbf{w}_{t_3}^{(i_3)}d\mathbf{w}_{t_4}^{(i_4)}$$

the following relations

(180) $$J^*[\psi^{(4)}]_{T,t} = \underset{p\to\infty}{\text{l.i.m.}} \sum_{j_1,j_2,j_3,j_4=0}^{p} C_{j_4j_3j_2j_1}\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}\zeta_{j_3}^{(i_3)}\zeta_{j_4}^{(i_4)},$$

(181) $$\mathsf{M}\left\{\left(J^*[\psi^{(4)}]_{T,t} - \sum_{j_1,j_2,j_3,j_4=0}^{p} C_{j_4j_3j_2j_1}\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}\zeta_{j_3}^{(i_3)}\zeta_{j_4}^{(i_4)}\right)^2\right\} \le \frac{C}{p^{1-\varepsilon}}$$

are fulfilled, where $i_1, \ldots, i_4 = 0, 1, \ldots, m$ *in* (179), (180) *and* $i_1, \ldots, i_4 = 1, \ldots, m$ *in* (181)*, constant* C *does not depend on* p*,* ε *is an arbitrary small positive real number for the case of complete orthonormal system of Legendre polynomials in the space* $L_2([t,T])$ *and* $\varepsilon = 0$ *for the case of complete orthonormal system of trigonometric functions in the space* $L_2([t,T])$,

$$C_{j_4j_3j_2j_1} =$$

$$= \int\limits_t^T \psi_4(t_4)\phi_{j_4}(t_4)\int\limits_t^{t_4} \psi_3(t_3)\phi_{j_3}(t_3)\int\limits_t^{t_3} \psi_2(t_2)\phi_{j_2}(t_2)\int\limits_t^{t_2} \psi_1(t_1)\phi_{j_1}(t_1)dt_1dt_2dt_3dt_4;$$

another notations are the same as in Theorem 12.

Theorem 14 [18], [23], [26], [78], [79]. *Assume that* $\{\phi_j(x)\}_{j=0}^{\infty}$ *is a complete orthonormal system of Legendre polynomials or trigonometric functions in the space* $L_2([t,T])$ *and* $\psi_1(\tau),\ldots,\psi_5(\tau)$ *are continuously differentiable nonrandom functions on* $[t,T]$. *Then, for the iterated Stratonovich stochastic integral of fifth multiplicity*

$$J^*[\psi^{(5)}]_{T,t} = \int\limits_t^{*T} \psi_5(t_5)\ldots\int\limits_t^{*t_2} \psi_1(t_1)d\mathbf{w}_{t_1}^{(i_1)}\ldots d\mathbf{w}_{t_5}^{(i_5)} \tag{182}$$

the following relations

$$J^*[\psi^{(5)}]_{T,t} = \underset{p\to\infty}{\text{l.i.m.}} \sum_{j_1,\ldots,j_5=0}^{p} C_{j_5\ldots j_1}\zeta_{j_1}^{(i_1)}\ldots\zeta_{j_5}^{(i_5)}, \tag{183}$$

$$\mathsf{M}\left\{\left(J^*[\psi^{(5)}]_{T,t} - \sum_{j_1,\ldots,j_5=0}^{p} C_{j_5\ldots j_1}\zeta_{j_1}^{(i_1)}\ldots\zeta_{j_5}^{(i_5)}\right)^2\right\} \le \frac{C}{p^{1-\varepsilon}} \tag{184}$$

are fulfilled, where $i_1,\ldots,i_5 = 0,1,\ldots,m$ *in* (182), (183) *and* $i_1,\ldots,i_5 = 1,\ldots,m$ *in* (184), *constant* C *is independent of* p, ε *is an arbitrary small positive real number for the case of complete orthonormal system of Legendre polynomials in the space* $L_2([t,T])$ *and* $\varepsilon = 0$ *for the case of complete orthonormal system of trigonometric functions in the space* $L_2([t,T])$,

$$C_{j_5\ldots j_1} = \int\limits_t^T \psi_5(t_5)\phi_{j_5}(t_5)\ldots\int\limits_t^{t_2} \psi_1(t_1)\phi_{j_1}(t_1)dt_1\ldots dt_5;$$

another notations are the same as in Theorems 12, 13.

Theorem 15 [18], [23], [26], [78]. *Suppose that* $\{\phi_j(x)\}_{j=0}^{\infty}$ *is a complete orthonormal system of Legendre polynomials or trigonometric functions in the space* $L_2([t,T])$. *Then, for the iterated Stratonovich stochastic integral of sixth multiplicity*

$$J_{T,t}^{*(i_1\ldots i_6)} = \int\limits_t^{*T} \ldots\int\limits_t^{*t_2} d\mathbf{w}_{t_1}^{(i_1)}\ldots d\mathbf{w}_{t_6}^{(i_6)} \tag{185}$$

the following expansion

$$J_{T,t}^{*(i_1\ldots i_6)}=\underset{p\to\infty}{\text{l.i.m.}}\sum_{j_1,\ldots,j_6=0}^{p}C_{j_6\ldots j_1}\zeta_{j_1}^{(i_1)}\ldots\zeta_{j_6}^{(i_6)}$$

that converges in the mean-square sense is valid, where $i_1,\ldots,i_6=0,1,\ldots,m,$

$$C_{j_6\ldots j_1}=\int\limits_t^T\phi_{j_6}(t_6)\ldots\int\limits_t^{t_2}\phi_{j_1}(t_1)dt_1\ldots dt_6;$$

another notations are the same as in Theorems 12–14.

9. Theorems 3–5, 12–15 from Point of View of the Wong–Zakai Approximation

The iterated Ito stochastic integrals and solutions of Ito SDEs are complex and important functionals from the independent components $\mathbf{f}_s^{(i)}$, $i=1,\ldots,m$ of the multidimensional Wiener process $\mathbf{f}_s$, $s\in[0,T]$. Let $\mathbf{f}_s^{(i)p}$, $p\in\mathbb{N}$ be some approximation of $\mathbf{f}_s^{(i)}$, $i=1,\ldots,m$. Suppose that $\mathbf{f}_s^{(i)p}$ converges to $\mathbf{f}_s^{(i)}$, $i=1,\ldots,m$ if $p\to\infty$ in some sense and has differentiable sample trajectories.

A natural question arises: if we replace $\mathbf{f}_s^{(i)}$ by $\mathbf{f}_s^{(i)p}$, $i=1,\ldots,m$ in the functionals mentioned above, will the resulting functionals converge to the original functionals from the components $\mathbf{f}_s^{(i)}$, $i=1,\ldots,m$ of the multidimentional Wiener process $\mathbf{f}_s$? The answere to this question is negative in the general case. However, in the pioneering works of Wong E. and Zakai M. [66], [67], it was shown that under the special conditions and for some types of approximations of the Wiener process the answere is affirmative with one peculiarity: the convergence takes place to the iterated Stratonovich stochastic integrals and solutions of Stratonovich SDEs and not to iterated Ito stochastic integrals and solutions of Ito SDEs. The piecewise linear approximation as well as the regularization by convolution [66]-[68] relate the mentioned types of approximations of the Wiener process. The above approximation of stochastic integrals and solutions of SDEs is often called the Wong–Zakai approximation.

Let $\mathbf{f}_s$, $s\in[0,T]$ be an m-dimensional standard Wiener process with independent components $\mathbf{f}_s^{(i)}$, $i=1,\ldots,m$. It is well known that the following representation takes place [69], [70]

$$\mathbf{f}_\tau^{(i)}-\mathbf{f}_t^{(i)}=\sum_{j=0}^{\infty}\int\limits_t^\tau\phi_j(s)ds\ \zeta_j^{(i)},\quad \zeta_j^{(i)}=\int\limits_t^T\phi_j(s)d\mathbf{f}_s^{(i)}, \tag{186}$$

where $\tau\in[t,T]$, $t\geq 0$, $\{\phi_j(x)\}_{j=0}^{\infty}$ is an arbitrary complete orthonormal system of functions in the space $L_2([t,T])$, and $\zeta_j^{(i)}$ are independent standard Gaussian random variables for various i or j. Moreover, the series (186) converges for any $\tau\in[t,T]$ in the mean-square sense.

Let $\mathbf{f}_\tau^{(i)p}-\mathbf{f}_t^{(i)p}$ be the mean-square approximation of the process $\mathbf{f}_\tau^{(i)}-\mathbf{f}_t^{(i)}$, which has the following form

$$\mathbf{f}_\tau^{(i)p}-\mathbf{f}_t^{(i)p}=\sum_{j=0}^{p}\int\limits_t^\tau\phi_j(s)ds\ \zeta_j^{(i)}. \tag{187}$$

From (187) we obtain

$$d\mathbf{f}_{\tau}^{(i)p} = \sum_{j=0}^{p} \phi_j(\tau)\zeta_j^{(i)} d\tau. \tag{188}$$

Consider the following iterated Riemann–Stieltjes integral

$$\int_t^T \psi_k(t_k) \ldots \int_t^{t_2} \psi_1(t_1) d\mathbf{w}_{t_1}^{(i_1)p_1} \ldots d\mathbf{w}_{t_k}^{(i_k)p_k}, \tag{189}$$

where $i_1, \ldots, i_k = 0, 1, \ldots, m,\ \ p_1, \ldots, p_k \in \mathbb{N}$,

$$d\mathbf{w}_{\tau}^{(i)p} = \begin{cases} d\mathbf{f}_{\tau}^{(i)p} & \text{for} \quad i = 1, \ldots, m \\ \\ d\tau & \text{for} \quad i = 0 \end{cases}, \tag{190}$$

and $d\mathbf{f}_{\tau}^{(i)p}$ in defined by the relation (188).

Let us substitute (188) into (189)

$$\int_t^T \psi_k(t_k) \ldots \int_t^{t_2} \psi_1(t_1) d\mathbf{w}_{t_1}^{(i_1)p_1} \ldots d\mathbf{w}_{t_k}^{(i_k)p_k} = \sum_{j_1=0}^{p_1} \ldots \sum_{j_k=0}^{p_k} C_{j_k \ldots j_1} \prod_{l=1}^{k} \zeta_{j_l}^{(i_l)}, \tag{191}$$

where

$$\zeta_j^{(i)} = \int_t^T \phi_j(s) d\mathbf{w}_s^{(i)}$$

are independent standard Gaussian random variables for various i or j (in the case when $i \neq 0$), $\mathbf{w}_s^{(i)} = \mathbf{f}_s^{(i)}$ for $i = 1, \ldots, m$ and $\mathbf{w}_s^{(0)} = s$,

$$C_{j_k \ldots j_1} = \int_t^T \psi_k(t_k)\phi_{j_k}(t_k) \ldots \int_t^{t_2} \psi_1(t_1)\phi_{j_1}(t_1) dt_1 \ldots dt_k$$

is the Fourier coefficient.

To best of our knowledge [66]-[68] the approximations of the Wiener process in the Wong–Zakai approximation must satisfy fairly strong restrictions [68] (see Definition 7.1, pp. 480–481). Moreover, approximations of the Wiener process that are similar to (187) were not considered in [66], [67] (also see [68], Theorems 7.1, 7.2). Therefore, the proof of analogs of Theorems 7.1 and 7.2 [68] for approximations of the Wiener process based on its series expansion (186) should be carried out separately. Thus, the mean-square convergence of the right-hand side of (191) to the iterated Stratonovich stochastic integral (1) does not follow from the results of the papers [66], [67] (also see [68], Theorems 7.1, 7.2).

Nevertheless, the authors of the works [43] (Sect. 5.8, pp. 202–204), [46] (pp. 438-439), [47] (pp. 82-84), [54] (pp. 263-264) use the Wong–Zakai approximation [66]-[68] (without rigorous proof) within the frames of the method of expansion of iterated stochastic integrals based on the trigonometric series expansion of the Brownian bridge process (version of the so-called Karhunen–Loeve expansion).

From the other hand, Theorems 3–5, 12–15 from this paper can be considered as the proof of the Wong–Zakai approximation based on the iterated Riemann–Stieltjes integrals (189) of multiplicities 1 to 6 and the Wiener process approximation (187) on the base of its series expansion. At that, the mentioned Riemann–Stieltjes integrals converge (according to Theorems 3–5, 12–15) to the appropriate Stratonovich stochastic integrals (1) of multiplicities 1 to 6. Recall that $\{\phi_j(x)\}_{j=0}^{\infty}$ (see (186), (187), and Theorems 3, 12–15) is a complete orthonormal system of Legendre polynomials or trigonometric functions in the space $L_2([t,T])$.

To illustrate the above reasoning, consider two examples for the case $k=2$, $\psi_1(s)$, $\psi_2(s)\equiv 1$; $i_1,i_2=1,\ldots,m$.

The first example relates to the piecewise linear approximation of the multidimensional Wiener process (these approximations were considered in [66]-[68]).

Let $\mathbf{b}_{\Delta}^{(i)}(t)$, $t\in[0,T]$ be the piecewise linear approximation of the ith component $\mathbf{f}_t^{(i)}$ of the multidimensional standard Wiener process $\mathbf{f}_t$, $t\in[0,T]$ with independent components $\mathbf{f}_t^{(i)}$, $i=1,\ldots,m$, i.e.

$$\mathbf{b}_{\Delta}^{(i)}(t)=\mathbf{f}_{k\Delta}^{(i)}+\frac{t-k\Delta}{\Delta}\Delta\mathbf{f}_{k\Delta}^{(i)},$$

where

$$\Delta\mathbf{f}_{k\Delta}^{(i)}=\mathbf{f}_{(k+1)\Delta}^{(i)}-\mathbf{f}_{k\Delta}^{(i)},\quad t\in[k\Delta,(k+1)\Delta),\quad k=0,1,\ldots,N-1.$$

Note that w. p. 1

$$\frac{d\mathbf{b}_{\Delta}^{(i)}}{dt}(t)=\frac{\Delta\mathbf{f}_{k\Delta}^{(i)}}{\Delta},\quad t\in[k\Delta,(k+1)\Delta),\quad k=0,1,\ldots,N-1. \tag{192}$$

Consider the following iterated Riemann–Stieltjes integral

$$\int\limits_0^T\int\limits_0^s d\mathbf{b}_{\Delta}^{(i_1)}(\tau)d\mathbf{b}_{\Delta}^{(i_2)}(s),\quad i_1,i_2=1,\ldots,m.$$

Using (192) and additive property of Riemann–Stieltjes integrals, we can write w. p. 1

$$\int\limits_0^T\int\limits_0^s d\mathbf{b}_{\Delta}^{(i_1)}(\tau)d\mathbf{b}_{\Delta}^{(i_2)}(s)=\int\limits_0^T\int\limits_0^s \frac{d\mathbf{b}_{\Delta}^{(i_1)}}{d\tau}(\tau)d\tau\frac{d\mathbf{b}_{\Delta}^{(i_2)}}{ds}(s)ds=$$

$$=\sum_{l=0}^{N-1}\int\limits_{l\Delta}^{(l+1)\Delta}\left(\sum_{q=0}^{l-1}\int\limits_{q\Delta}^{(q+1)\Delta}\frac{\Delta\mathbf{f}_{q\Delta}^{(i_1)}}{\Delta}d\tau+\int\limits_{l\Delta}^{s}\frac{\Delta\mathbf{f}_{l\Delta}^{(i_1)}}{\Delta}d\tau\right)\frac{\Delta\mathbf{f}_{l\Delta}^{(i_2)}}{\Delta}ds=$$

$$=\sum_{l=0}^{N-1}\sum_{q=0}^{l-1}\Delta\mathbf{f}_{q\Delta}^{(i_1)}\Delta\mathbf{f}_{l\Delta}^{(i_2)}+\frac{1}{\Delta^2}\sum_{l=0}^{N-1}\Delta\mathbf{f}_{l\Delta}^{(i_1)}\Delta\mathbf{f}_{l\Delta}^{(i_2)}\int\limits_{l\Delta}^{(l+1)\Delta}\int\limits_{l\Delta}^{s}d\tau ds=$$

$$
=\sum_{l=0}^{N-1}\sum_{q=0}^{l-1}\Delta\mathbf{f}_{q\Delta}^{(i_1)}\Delta\mathbf{f}_{l\Delta}^{(i_2)}+\frac{1}{2}\sum_{l=0}^{N-1}\Delta\mathbf{f}_{l\Delta}^{(i_1)}\Delta\mathbf{f}_{l\Delta}^{(i_2)}. \tag{193}
$$

Using (193) and standard relation between Stratonovich and Ito stochastic integrals, it is not difficult to show that

$$
\underset{N\to\infty}{\text{l.i.m.}}\int\limits_0^T\int\limits_0^s d\mathbf{b}_{\Delta}^{(i_1)}(\tau)d\mathbf{b}_{\Delta}^{(i_2)}(s)=\int\limits_0^T\int\limits_0^s d\mathbf{f}_{\tau}^{(i_1)}d\mathbf{f}_{s}^{(i_2)}+\frac{1}{2}\mathbf{1}_{\{i_1=i_2\}}\int\limits_0^T ds=
$$

$$
=\int\limits_0^{*T}\int\limits_0^{*s} d\mathbf{f}_{\tau}^{(i_1)}d\mathbf{f}_{s}^{(i_2)}, \tag{194}
$$

where $\Delta\to 0$ if $N\to\infty$ $(N\Delta=T)$.

Obviously, (194) agrees with Theorem 7.1 (see [68], p. 486).

The next example relates to the approximation of the Wiener process based on its series expansion (186) for $t=0$, where $\{\phi_j(x)\}_{j=0}^{\infty}$ is a complete orthonormal system of Legendre polynomials or trigonometric functions in the space $L_2([0,T])$.

Consider the following iterated Riemann–Stieltjes integral

$$
\int\limits_0^T\int\limits_0^s d\mathbf{f}_{\tau}^{(i_1)p}d\mathbf{f}_{s}^{(i_2)p},\quad i_1,i_2=1,\ldots,m, \tag{195}
$$

where $d\mathbf{f}_{\tau}^{(i)p}$ is defined by the relation (188).

Let us substitute (188) into (195)

$$
\int\limits_0^T\int\limits_0^s d\mathbf{f}_{\tau}^{(i_1)p}d\mathbf{f}_{s}^{(i_2)p}=\sum_{j_1,j_2=0}^{p}C_{j_2j_1}\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}, \tag{196}
$$

where

$$
C_{j_2j_1}=\int\limits_0^T\phi_{j_2}(s)\int\limits_0^s\phi_{j_1}(\tau)d\tau ds
$$

is the Fourier coefficient; another notations are the same as in (191).

As we noted above, approximations of the Wiener process that are similar to (187) were not considered in [66], [67] (also see Theorems 7.1, 7.2 in [68]). Furthermore, the extension of the results of Theorems 7.1 and 7.2 [68] to the case under consideration is not obvious.

On the other hand, we can apply the theory built in Chapters 1 and 2 of the monographs [18]-[21]. More precisely, using Theorems 3, 5 from this paper, we obtain from (196) the desired result

$$
\underset{p\to\infty}{\text{l.i.m.}}\int\limits_0^T\int\limits_0^s d\mathbf{f}_{\tau}^{(i_1)p}d\mathbf{f}_{s}^{(i_2)p}=\underset{p\to\infty}{\text{l.i.m.}}\sum_{j_1,j_2=0}^{p}C_{j_2j_1}\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}=
$$

$$= \int\limits_0^{*T} \int\limits_0^{*s} d\mathbf{f}_\tau^{(i_1)} d\mathbf{f}_s^{(i_2)}. \tag{197}$$

From the other hand, by Theorem 4 (see (132)) for the case $k = 2$ we obtain from (196) the following relation

$$\underset{p\to\infty}{\text{l.i.m.}} \int\limits_0^T \int\limits_0^s d\mathbf{f}_\tau^{(i_1)p} d\mathbf{f}_s^{(i_2)p} = \underset{p\to\infty}{\text{l.i.m.}} \sum_{j_1,j_2=0}^{p} C_{j_2j_1} \zeta_{j_1}^{(i_1)} \zeta_{j_2}^{(i_2)} =$$

$$= \underset{p\to\infty}{\text{l.i.m.}} \sum_{j_1,j_2=0}^{p} C_{j_2j_1} \left(\zeta_{j_1}^{(i_1)} \zeta_{j_2}^{(i_2)} - \mathbf{1}_{\{i_1=i_2\}} \mathbf{1}_{\{j_1=j_2\}} \right) + \mathbf{1}_{\{i_1=i_2\}} \sum_{j_1=0}^{\infty} C_{j_1j_1} =$$

$$= \int\limits_0^T \int\limits_0^s d\mathbf{f}_\tau^{(i_1)} d\mathbf{f}_s^{(i_2)} + \mathbf{1}_{\{i_1=i_2\}} \sum_{j_1=0}^{\infty} C_{j_1j_1}. \tag{198}$$

Since

$$\sum_{j_1=0}^{\infty} C_{j_1j_1} = \frac{1}{2} \sum_{j_1=0}^{\infty} \left(\int\limits_0^T \phi_j(\tau) d\tau \right)^2 = \frac{1}{2} \left(\int\limits_0^T \phi_0(\tau) d\tau \right)^2 = \frac{1}{2} \int\limits_0^T ds,$$

then from (198) we obtain (197).

EXPANSIONS OF ITERATED STRATONOVICH STOCHASTIC INTEGRALS OF MULTIPLICITIES 1 TO 4. COMBAINED APPROACH BASED ON GENERALIZED MULTIPLE AND ITERATED FOURIER SERIES

DMITRIY F. KUZNETSOV

Abstract. The article is devoted to the expansions of iterated Stratonovich stochastic integrals of multiplicities 1 to 4 on the base of the combined approach of generalized multiple and iterated Fourier series. We consider two different parts of the expansion of iterated Stratonovich stochastic integrals. The mean-square convergence of the first part is proved on the base of generalized multiple Fourier series that are converge in the sense of norm in Hilbert space $L_2([t,T]^k)$, $k=1,2,3,4$. The mean-square convergence of the second part is proved on the base of generalized iterated Fourier series that are converge pointwise. At that, we do not use the iterated Ito stochastic integrals as a tool of the proof and directly consider the iterated Stratonovich stochastic integrals. The cases of multiple Fourier–Legendre series and multiple trigonometric Fourier series are considered in detail. The considered expansions contain only one operation of the limit transition in contrast to its existing analogues. This property is very important for the mean-square approximation of iterated stochastic integrals. The results of the article can be applied to the numerical integration of Ito stochastic differential equations.

Keywords: Iterated Stratonovich stochastic integral, Iterated Ito stochastic integral, Generalized multiple Fourier series, Multiple Fourier–Legendre series, Multiple trigonometric Fourier series, Expansion, Mean-square convergence.

1. Introduction

Let $(\Omega, \mathrm{F}, \mathsf{P})$ be a complete probability space, let $\{\mathrm{F}_t, t \in [0,T]\}$ be a nondecreasing right-continous family of σ-algebras of F, and let $\mathbf{f}_t$ be a standard m-dimensional Wiener stochastic process, which is F_t-measurable for any $t \in [0,T]$. We assume that the components $\mathbf{f}_t^{(i)}$ $(i = 1, \ldots, m)$ of this process are independent. Consider an Ito stochastic differential equation (SDE) in the integral form

$$\mathbf{x}_t = \mathbf{x}_0 + \int\limits_0^t \mathbf{a}(\mathbf{x}_\tau, \tau) d\tau + \int\limits_0^t B(\mathbf{x}_\tau, \tau) d\mathbf{f}_\tau, \quad \mathbf{x}_0 = \mathbf{x}(0, \omega). \tag{1}$$

Here $\mathbf{x}_t$ is some n-dimensional stochastic process satisfying the equation (1). The nonrandom functions $\mathbf{a} : \mathbb{R}^n \times [0,T] \to \mathbb{R}^n$, $B : \mathbb{R}^n \times [0,T] \to \mathbb{R}^{n\times m}$ guarantee the existence and uniqueness up to stochastic equivalence of a solution of (1) [1]. The second integral on the right-hand side of (1) is interpreted as an Ito stochastic integral. Let $\mathbf{x}_0$ be an n-dimensional random variable, which is F_0-measurable and $\mathsf{M}\{|\mathbf{x}_0|^2\} < \infty$ (M denotes a mathematical expectation). We assume that $\mathbf{x}_0$ and $\mathbf{f}_t - \mathbf{f}_0$ are independent when $t > 0$.

It is well known that one of the effective approaches to the numerical integration of Ito SDEs is an approach based on the Taylor–Ito and Taylor–Stratonovich expansions [2]-[5]. The most important feature of such expansions is a presence in them of the so-called iterated Ito and Stratonovich stochastic integrals, which play the key role for solving the problem of numerical integration of Ito SDEs and have the following form

$$J[\psi^{(k)}]_{T,t} = \int\limits_t^T \psi_k(t_k) \ldots \int\limits_t^{t_2} \psi_1(t_1) d\mathbf{w}_{t_1}^{(i_1)} \ldots d\mathbf{w}_{t_k}^{(i_k)}, \tag{2}$$

$$J^*[\psi^{(k)}]_{T,t} = \int\limits_t^{*T} \psi_k(t_k) \ldots \int\limits_t^{*t_2} \psi_1(t_1) d\mathbf{w}_{t_1}^{(i_1)} \ldots d\mathbf{w}_{t_k}^{(i_k)}, \tag{3}$$

where every $\psi_l(\tau)$ $(l = 1, \ldots, k)$ is a nonrandom function on $[t,T]$, $\mathbf{w}_\tau^{(i)} = \mathbf{f}_\tau^{(i)}$ for $i = 1, \ldots, m$ and $\mathbf{w}_\tau^{(0)} = \tau$, and

$$\int \text{ and } \int^{*}$$

denote Ito and Stratonovich stochastic integrals, respectively; $i_1, \ldots, i_k = 0, 1, \ldots, m$. In this paper we use the definition of the Stratonovich stochastic integral from [2].

Note that $\psi_l(\tau) \equiv 1$ $(l = 1, \ldots, k)$ and $i_1, \ldots, i_k = 0, 1, \ldots, m$ in [2]-[5]. At the same time $\psi_l(\tau) \equiv (t-\tau)^{q_l}$ $(l = 1, \ldots, k;\ q_1, \ldots, q_k = 0, 1, 2, \ldots)$ and $i_1, \ldots, i_k = 1, \ldots, m$ in [6]-[24].

The construction of effective expansions (converging in the mean-square sense) for collections of the iterated Stratonovich stochastic integrals (3) of multiplicities 1 to 6 composes the subject of this article.

The problem of effective jointly numerical modeling (with respect to the mean-square convergence criterion) of iterated Ito and Stratonovich stochastic integrals (2) and (3) is difficult from theoretical and computing point of view [2]-[50]. The only exception is connected with a narrow particular case, when $i_1 = \ldots = i_k \neq 0$ and $\psi_1(s), \ldots, \psi_k(s) \equiv \psi(s)$. This case allows the investigation with using of the Ito formula [2]-[5].

Consider a brief review of the mean-square approximation methods for the iterated stochastic integrals (2) and (3).

Seems that iterated stochastic integrals can be approximated by multiple integral sums of different types [3], [5], [47]. However, this approach implies partitioning of the interval of integration $[t,T]$ of iterated stochastic integrals (the length $T-t$ of this interval is a small value, because it is a step of integration of numerical methods for Ito SDEs) and according to numerical experiments this additional partitioning leads to significant computational costs [10].

In [3] (also see [2], [4], [5], [48], [49]) Milstein G.N. proposed to expand (2) or (3) into iterated series of products of standard Gaussian random variables by representing the Brownian bridge process as a trigonometric Fourier series with random coefficients (version of the so-called Karhunen–Loeve expansion). To obtain the Milstein expansion of (3), the truncated Fourier expansions of components of the Wiener process $\mathbf{f}_s$ must be iteratively substituted in the single integrals, and the integrals must be calculated, starting from the innermost integral. This is a complicated procedure that does not lead to a general expansion of (3) valid for an arbitrary multiplicity k. For this reason, only expansions of single, double, and triple stochastic integrals (2), (3) were presented in [2], [4], [48], [49] ($k=1,2,3$) and in [3], [5] ($k=1,2$) for the case $\psi_1(s),\psi_2(s),\psi_3(s)\equiv 1$; $i_1,i_2,i_3=0,1,\ldots,m$.

Moreover, the authors of the works [2] (Sect. 5.8, pp. 202–204), [4] (pp. 82-84), [48] (pp. 438-439), [49] (pp. 263-264) use the Wong–Zakai approximation [51]-[53] (without rigorous proof) within the frames of the Milstein approach [3] based on the series expansion of the Brownian bridge process. See discussion in Sect. 7 of this paper for details.

Note that in [50] the method (similar to the Milstein approach) of expansion of iterated (double) Ito stochastic integrals (2) ($k=2$; $\psi_1(s),\psi_2(s)\equiv 1$; $i_1,i_2=1,\ldots,m$) based on expansion of the Wiener process using Haar functions and trigonometric functions has been considered.

It is necessary to note that the approach based on the Karhunen–Loeve expansion [3] excelled in several times (or even in several orders) the methods of multiple integral sums [3], [5], [47] considering computational costs in the sense of their diminishing.

An alternative strong approximation method was proposed for (3) in [6], [7] (also see [14]-[19], [22], [24]-[27]), where $J^*[\psi^{(k)}]_{T,t}$ was represented as the multiple stochastic integral from the certain discontinuous nonrandom function of k variables, and the function was then expressed as the generalized iterated Fourier series by complete systems of continuously differentiable functions that are orthonormal in the space $L_2([t,T])$. As a result, the general iterated series expansion of products of standard Gaussian random variables was obtained in [6], [7] (also see [14]-[19], [22], [24]-[27]) for (3) with an arbitrary multiplicity k. Hereinafter, this method is referred to as the method of generalized iterated Fourier series. It was shown [6], [7] (also see [14]-[19], [22], [24]-[27]) that the method of generalized iterated Fourier series leads to the Milstein approach based on the Karhunen–Loeve expansion [3] in the case of trigonometric system of functions and to a substantially simpler expansions of (3) in the case of Legendre polynomial system.

As we mentioned above, the Milstein approach based on the Karhunen–Loeve expansion [3] and the method of generalized iterated Fourier series [6], [7] (also see [14]-[19], [22], [24]-[27]) lead to iterated application of the operation of limit transition. So, these methods may not converge in the mean-square sense to the appropriate iterated Stratonovich stochastic integrals (3) for some methods of series summation.

The mentioned problem (iterated application of the operation of limit transition) not appears in the method, which is proposed for (2) in Theorems 1, 2 (see below) [10]-[22], [24]-[44]. The idea of this method is as follows: the iterated Ito stochastic integral (2) of multiplicity k is represented as the multiple stochastic integral from the certain discontinuous nonrandom function of k variables defined on the hypercube $[t,T]^k$, where $[t,T]$ is the interval of integration of the iterated Ito stochastic integral (2). Then, the nonrandom function of k variables is expanded in the hypercube $[t,T]^k$ into the generalized multiple Fourier series converging in the mean-square sense in the space $L_2([t,T]^k)$. After a number of nontrivial transformations we obtain (see Theorems 1, 2 below) the mean-square convergening expansion of the iterated Ito stochastic integral (2) into the multiple series of products of standard Gaussian random variables. The coefficients of this series are the coefficients of generalized multiple Fourier series for the mentioned nonrandom function of k variables, which can be calculated using the explicit formula regardless of the multiplicity k of the iterated Ito stochastic integral (2). We will call this method as the method of generalized multiple Fourier series.

2. Method of Expansion of Iterated Ito Stochastic Integrals Based on Generalized Multiple Fourier Series

Suppose that every $\psi_l(\tau)$ $(l=1,\ldots,k)$ is a nonrandom function from the space $L_2([t,T])$. Define the following function on the hypercube $[t,T]^k$

$$K(t_1,\ldots,t_k)=\begin{cases}\psi_1(t_1)\ldots\psi_k(t_k) & \text{for}\ \ t_1<\ldots<t_k\\ & \\ 0 & \text{otherwise}\end{cases},\quad t_1,\ldots,t_k\in[t,T],\quad k\ge 2, \tag{4}$$

and $K(t_1)\equiv\psi_1(t_1)$ for $t_1\in[t,T]$.

Suppose that $\{\phi_j(x)\}_{j=0}^{\infty}$ is a complete orthonormal system of functions in the space $L_2([t,T])$. The function $K(t_1,\ldots,t_k)$ belongs to the space $L_2([t,T]^k)$. At this situation it is well known that the generalized multiple Fourier series of $K(t_1,\ldots,t_k)\in L_2([t,T]^k)$ is converging to $K(t_1,\ldots,t_k)$ in the hypercube $[t,T]^k$ in the mean-square sense, i.e.

$$\lim_{p_1,\ldots,p_k\to\infty}\left\|K(t_1,\ldots,t_k)-\sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k}C_{j_k\ldots j_1}\prod_{l=1}^{k}\phi_{j_l}(t_l)\right\|_{L_2([t,T]^k)}=0,$$

where

$$C_{j_k\ldots j_1}=\int\limits_{[t,T]^k}K(t_1,\ldots,t_k)\prod_{l=1}^{k}\phi_{j_l}(t_l)dt_1\ldots dt_k, \tag{5}$$

$$\|f\|_{L_2([t,T]^k)}=\left(\int\limits_{[t,T]^k}f^2(t_1,\ldots,t_k)dt_1\ldots dt_k\right)^{1/2}.$$

Consider the partition $\{\tau_j\}_{j=0}^{N}$ of $[t,T]$ such that

$$t=\tau_0<\ldots<\tau_N=T,\quad \Delta_N=\max_{0\le j\le N-1}\Delta\tau_j\to 0\ \ \text{if}\ \ N\to\infty,\quad \Delta\tau_j=\tau_{j+1}-\tau_j. \tag{6}$$

Theorem 1 [10] (2006), [11]-[22], [24]-[44]. *Suppose that every $\psi_l(\tau)$ $(l=1,\ldots,k)$ is a continuous nonrandom function on $[t,T]$ and $\{\phi_j(x)\}_{j=0}^{\infty}$ is a complete orthonormal system of continuous functions in the space $L_2([t,T])$. Then*

$$J[\psi^{(k)}]_{T,t}=\underset{p_1,\ldots,p_k\to\infty}{\text{l.i.m.}}\sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k}C_{j_k\ldots j_1}\left(\prod_{l=1}^{k}\zeta_{j_l}^{(i_l)}-\right.$$

$$\left.-\ \underset{N\to\infty}{\text{l.i.m.}}\sum_{(l_1,\ldots,l_k)\in\text{G}_k}\phi_{j_1}(\tau_{l_1})\Delta\mathbf{w}_{\tau_{l_1}}^{(i_1)}\ldots\phi_{j_k}(\tau_{l_k})\Delta\mathbf{w}_{\tau_{l_k}}^{(i_k)}\right), \tag{7}$$

where $J[\psi^{(k)}]_{T,t}$ *is defined by* (2),

$$\mathrm{G}_k=\mathrm{H}_k\backslash\mathrm{L}_k,\quad \mathrm{H}_k=\{(l_1,\ldots,l_k):\ l_1,\ldots,l_k=0,\ 1,\ldots,N-1\},$$

$$\mathrm{L}_k=\{(l_1,\ldots,l_k):\ l_1,\ldots,l_k=0,\ 1,\ldots,N-1;\ l_g\ne l_r\ (g\ne r);\ g,r=1,\ldots,k\},$$

l.i.m. *is a limit in the mean-square sense*, $i_1,\ldots,i_k=0,1,\ldots,m$,

$$\zeta_j^{(i)}=\int\limits_t^T\phi_j(s)d\mathbf{w}_s^{(i)} \tag{8}$$

are independent standard Gaussian random variables for various i *or* j *(if* $i\ne 0$*),* $C_{j_k\ldots j_1}$ *is the Fourier coefficient* (5), $\Delta\mathbf{w}_{\tau_j}^{(i)}=\mathbf{w}_{\tau_{j+1}}^{(i)}-\mathbf{w}_{\tau_j}^{(i)}$ $(i=0,1,\ldots,m)$, $\{\tau_j\}_{j=0}^N$ *is a partition of the interval* $[t,T]$, *which satisfies the condition* (6).

It was shown [12]-[19], [22], [24]-[27], [35] that Theorem 1 is valid for convergence in the mean of degree $2n$ ($n\in\mathbb{N}$) and for convergence with probability 1 [25]-[28].

Moreover, the complete orthonormal systems of Haar and Rademacher–Walsh functions in $L_2([t,T])$ can also be applied in Theorem 1 [12]-[19], [22], [24]-[27], [35]. The modification of Theorem 1 for complete orthonormal with weigth $r(x)\ge 0$ systems of functions in the space $L_2([t,T])$ can be found in [24]-[27], [36].

In order to evaluate the significance of Theorem 1 for practice we will demonstrate its transformed particular cases for $k=1,\ldots,6$ [10]-[22], [24]-[44]

$$J[\psi^{(1)}]_{T,t}=\underset{p_1\to\infty}{\text{l.i.m.}}\sum_{j_1=0}^{p_1}C_{j_1}\zeta_{j_1}^{(i_1)}, \tag{9}$$

$$J[\psi^{(2)}]_{T,t}=\underset{p_1,p_2\to\infty}{\text{l.i.m.}}\sum_{j_1=0}^{p_1}\sum_{j_2=0}^{p_2}C_{j_2j_1}\Biggl(\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}-\mathbf{1}_{\{i_1=i_2\ne 0\}}\mathbf{1}_{\{j_1=j_2\}}\Biggr), \tag{10}$$

$$J[\psi^{(3)}]_{T,t}=\underset{p_1,\ldots,p_3\to\infty}{\text{l.i.m.}}\sum_{j_1=0}^{p_1}\sum_{j_2=0}^{p_2}\sum_{j_3=0}^{p_3}C_{j_3j_2j_1}\Biggl(\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}\zeta_{j_3}^{(i_3)}-$$

$$-\mathbf{1}_{\{i_1=i_2\ne 0\}}\mathbf{1}_{\{j_1=j_2\}}\zeta_{j_3}^{(i_3)}-\mathbf{1}_{\{i_2=i_3\ne 0\}}\mathbf{1}_{\{j_2=j_3\}}\zeta_{j_1}^{(i_1)}-\mathbf{1}_{\{i_1=i_3\ne 0\}}\mathbf{1}_{\{j_1=j_3\}}\zeta_{j_2}^{(i_2)}\Biggr), \tag{11}$$

$$J[\psi^{(4)}]_{T,t}=\underset{p_1,\ldots,p_4\to\infty}{\text{l.i.m.}}\sum_{j_1=0}^{p_1}\ldots\sum_{j_4=0}^{p_4}C_{j_4\ldots j_1}\Biggl(\prod_{l=1}^{4}\zeta_{j_l}^{(i_l)}-$$

\tag{14}
$$

where $\mathbf{1}_A$ is the indicator of the set A.

Thus, we obtain the following useful possibilities of the method of generalized multiple Fourier series.

1. There is the explicit formula (see (5)) for calculation of expansion coefficients of the iterated Ito stochastic integral (2) with any fixed multiplicity k.

2. We have new possibilities for exact calculation of the mean-square approximation error for the iterated Ito stochastic integrals (2) (see [20], [22], [24]-[27], [34]).

3. Since the used multiple Fourier series is a generalized in the sense that it is built using various complete orthonormal systems of functions in the space $L_2([t,T])$, then we have new possibilities for approximation — we can use not only trigonometric functions as in [2]-[5] but Legendre polynomials.

4. As it turned out (see [6]-[22], [24]-[44]), it is more convenient to work with the Legendre polynomials for constructing of approximations of the iterated Ito stochastic integrals (2). Approximations based on the Legendre polynomials essentially simpler than their analogues based on the trigonometric functions (see [6]-[22], [24]-[44]). Another advantages of the application of Legendre polynomials in the framework of the mentioned problem are considered in [25]-[27], [39], [40].

5. The approach based on the Karhunen–Loeve expansion of the Brownian bridge process [3] (also see [50]) leads to iterated application of the operation of limit transition (the operation of limit transition is implemented only once in Theorem 1 and Theorem 2 (see below)) starting from the second multiplicity (in the general case) and third multiplicity (for the case $\psi_1(s),\psi_2(s),\psi_3(s)\equiv 1;\ i_1,i_2,i_3=1,\ldots,m$) of iterated Ito stochastic integrals. Multiple series (the operation of limit transition is implemented only once) are more convenient for approximation than the iterated ones (iterated application of the operation of limit transition), since partial sums of multiple series converge for any possible case of convergence to infinity of their upper limits of summation (let us denote them as $p_1,\ldots,p_k$). For example, when $p_1=\ldots=p_k=p\to\infty$. For iterated series, the condition $p_1=\ldots=p_k=p\to\infty$ obviously does not guarantee the convergence of this series. However, in [2] (Sect. 5.8, pp. 202–204), [4] (pp. 82-84), [48] (pp. 438-439), [49] (pp. 263-264) the authors use (without rigorous proof) the condition $p_1=p_2=p_3=p\to\infty$ within the frames of the mentioned approach based on the Karhunen–Loeve expansion of the Brownian bridge process [3] together with the Wong–Zakai approximation [51]-[53] (see discussion in Sect. 7 of this paper for details).

For further consideration, let us consider the generalization of formulas (9)–(14) for the case of an arbitrary multiplicity k ($k\in\mathbb{N}$) of the iterated Ito stochastic integral $J[\psi^{(k)}]_{T,t}$ defined by (2). In order to do this, let us introduce some notations. Consider the unordered set $\{1,2,\ldots,k\}$ and separate it into two parts: the first part consists of r unordered pairs (sequence order of these pairs is also unimportant) and the second one consists of the remaining $k-2r$ numbers. So, we have

$$(\{\underbrace{\{g_1,g_2\},\ldots,\{g_{2r-1},g_{2r}\}}_{\text{part 1}}\},\{\underbrace{q_1,\ldots,q_{k-2r}}_{\text{part 2}}\}), \tag{15}$$

where

$$\{g_1,g_2,\ldots,g_{2r-1},g_{2r},q_1,\ldots,q_{k-2r}\}=\{1,2,\ldots,k\},$$

braces mean an unordered set, and parentheses mean an ordered set.

We will say that (15) is a partition and consider the sum with respect to all possible partitions

$$\sum_{\substack{(\{\{g_1,g_2\},\ldots,\{g_{2r-1},g_{2r}\}\},\{q_1,\ldots,q_{k-2r}\})\\ \{g_1,g_2,\ldots,g_{2r-1},g_{2r},q_1,\ldots,q_{k-2r}\}=\{1,2,\ldots,k\}}} a_{g_1g_2,\ldots,g_{2r-1}g_{2r},q_1\ldots q_{k-2r}}. \tag{16}$$

Below there are several examples of sums in the form (16)

$$\sum_{\substack{(\{g_1,g_2\})\\ \{g_1,g_2\}=\{1,2\}}} a_{g_1g_2}=a_{12},$$

$$\sum_{\substack{(\{\{g_1,g_2\},\{g_3,g_4\}\})\\ \{g_1,g_2,g_3,g_4\}=\{1,2,3,4\}}} a_{g_1g_2g_3g_4}=a_{1234}+a_{1324}+a_{2314},$$

$$\sum_{\substack{(\{g_1,g_2\},\{q_1,q_2\})\\ \{g_1,g_2,q_1,q_2\}=\{1,2,3,4\}}} a_{g_1g_2,q_1q_2}=$$

$$=a_{12,34}+a_{13,24}+a_{14,23}+a_{23,14}+a_{24,13}+a_{34,12},$$

$$\sum_{\substack{(\{g_1,g_2\},\{q_1,q_2,q_3\})\\ \{g_1,g_2,q_1,q_2,q_3\}=\{1,2,3,4,5\}}} a_{g_1g_2,q_1q_2q_3}=$$

$$=a_{12,345}+a_{13,245}+a_{14,235}+a_{15,234}+a_{23,145}+a_{24,135}+$$
$$+a_{25,134}+a_{34,125}+a_{35,124}+a_{45,123},$$

$$\sum_{\substack{(\{\{g_1,g_2\},\{g_3,g_4\}\},\{q_1\})\\ \{g_1,g_2,g_3,g_4,q_1\}=\{1,2,3,4,5\}}} a_{g_1g_2,g_3g_4,q_1}=$$

$$=a_{12,34,5}+a_{13,24,5}+a_{14,23,5}+a_{12,35,4}+a_{13,25,4}+a_{15,23,4}+$$
$$+a_{12,54,3}+a_{15,24,3}+a_{14,25,3}+a_{15,34,2}+a_{13,54,2}+a_{14,53,2}+$$
$$+a_{52,34,1}+a_{53,24,1}+a_{54,23,1}.$$

Now we can write (7) as

$$J[\psi^{(k)}]_{T,t}=\underset{p_1,\ldots,p_k\to\infty}{\text{l.i.m.}}\sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k}C_{j_k\ldots j_1}\Biggl(\prod_{l=1}^{k}\zeta_{j_l}^{(i_l)}+\sum_{r=1}^{[k/2]}(-1)^r\times$$

$$\times\sum_{\substack{(\{\{g_1,g_2\},\ldots,\{g_{2r-1},g_{2r}\}\},\{q_1,\ldots,q_{k-2r}\})\\ \{g_1,g_2,\ldots,g_{2r-1},g_{2r},q_1,\ldots,q_{k-2r}\}=\{1,2,\ldots,k\}}}\prod_{s=1}^{r}\mathbf{1}_{\{i_{g_{2s-1}}=\,i_{g_{2s}}\ne 0\}}\mathbf{1}_{\{j_{g_{2s-1}}=\,j_{g_{2s}}\}}\prod_{l=1}^{k-2r}\zeta_{j_{q_l}}^{(i_{q_l})}\Biggr),\qquad(17)$$

where $[x]$ is an integer part of a real number x; another notations are the same as in Theorem **1**.

In particular, from (17) for $k=5$ we obtain

$$J[\psi^{(5)}]_{T,t}=\underset{p_1,\ldots,p_5\to\infty}{\text{l.i.m.}}\sum_{j_1=0}^{p_1}\ldots\sum_{j_5=0}^{p_5}C_{j_5\ldots j_1}\Biggl(\prod_{l=1}^{5}\zeta_{j_l}^{(i_l)}-$$

$$-\sum_{\substack{(\{g_1,g_2\},\{q_1,q_2,q_3\})\\ \{g_1,g_2,q_1,q_2,q_3\}=\{1,2,3,4,5\}}}\mathbf{1}_{\{i_{g_1}=\,i_{g_2}\ne 0\}}\mathbf{1}_{\{j_{g_1}=\,j_{g_2}\}}\prod_{l=1}^{3}\zeta_{j_{q_l}}^{(i_{q_l})}+$$

$$
+\sum_{\substack{(\{\{g_1,g_2\},\{g_3,g_4\}\},\{q_1\})\\ \{g_1,g_2,g_3,g_4,q_1\}=\{1,2,3,4,5\}}} \mathbf{1}_{\{i_{g_1}=\ i_{g_2}\ne 0\}}\mathbf{1}_{\{j_{g_1}=\ j_{g_2}\}}\mathbf{1}_{\{i_{g_3}=\ i_{g_4}\ne 0\}}\mathbf{1}_{\{j_{g_3}=\ j_{g_4}\}}\zeta_{j_{q_1}}^{(i_{q_1})}\Biggr).
$$

The last equality obviously agrees with (13).

Let us consider a generalization of Theorem 1 for the case of an arbitrary complete orthonormal systems of functions in the space $L_2([t,T])$ and $\psi_1(\tau),\ldots,\psi_k(\tau)\in L_2([t,T])$.

Theorem 2 [25] (Sect. 1.11), [35] (Sect. 15). *Suppose that $\psi_1(\tau),\ldots,\psi_k(\tau)\in L_2([t,T])$ and $\{\phi_j(x)\}_{j=0}^{\infty}$ is an arbitrary complete orthonormal system of functions in the space $L_2([t,T])$. Then the following expansion*

$$
J[\psi^{(k)}]_{T,t}=\underset{p_1,\ldots,p_k\to\infty}{\text{l.i.m.}}\sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k}C_{j_k\ldots j_1}\Biggl(\prod_{l=1}^{k}\zeta_{j_l}^{(i_l)}+\sum_{r=1}^{[k/2]}(-1)^r\times
$$

$$
\times\sum_{\substack{(\{\{g_1,g_2\},\ldots,\{g_{2r-1},g_{2r}\}\},\{q_1,\ldots,q_{k-2r}\})\\ \{g_1,g_2,\ldots,g_{2r-1},g_{2r},q_1,\ldots,q_{k-2r}\}=\{1,2,\ldots,k\}}}\prod_{s=1}^{r}\mathbf{1}_{\{i_{g_{2s-1}}=\ i_{g_{2s}}\ne 0\}}\mathbf{1}_{\{j_{g_{2s-1}}=\ j_{g_{2s}}\}}\prod_{l=1}^{k-2r}\zeta_{j_{q_l}}^{(i_{q_l})}\Biggr) \tag{18}
$$

converging in the mean-square sense is valid, where $[x]$ is an integer part of a real number x; another notations are the same as in Theorem 1.

It should be noted that an analogue of Theorem 2 was considered in [54]. Note that we use another notations [25] (Sect. 1.11), [35] (Sect. 15) in comparison with [54]. Moreover, the proof of an analogue of Theorem 2 from [54] is somewhat different from the proof given in [25] (Sect. 1.11), [35] (Sect. 15).

3. Expansions of Iterated Stratonovich Stochastic Integrals of Multiplicities 2 to 4. Some Old Results

As it turned out, Theorems 1, 2 can be adapted for the iterated Stratonovich stochastic integrals (3) at least for multiplicities 1 to 6 (the case $k=1$ obviously corresponds to (9)). Expansions of the mentioned iterated Stratonovich stochastic integrals turned out simpler than the appropriate expansions for the iterated Ito stochastic integrals (2) based on Theorems 1, 2. Let us formulate some theorems on expansions of the iterated Stratonovich stochastic integrals (3) of multiplicities 2 to 4.

Theorem 3 [17]-[19], [22], [24]-[27], [43]. *Suppose that $\{\phi_j(x)\}_{j=0}^{\infty}$ is a complete orthonormal system of Legendre polynomials or trigonometric functions in the space $L_2([t,T])$. At the same time $\psi_2(\tau)$ is a continuously differentiable function on $[t,T]$ and $\psi_1(\tau)$ is twice continuously differentiable function on $[t,T]$. Then, the iterated Stratonovich stochastic integral of second multiplicity*

$$
J^*[\psi^{(2)}]_{T,t}=\int\limits_t^{*T}\psi_2(t_2)\int\limits_t^{*t_2}\psi_1(t_1)d\mathbf{w}_{t_1}^{(i_1)}d\mathbf{w}_{t_2}^{(i_2)}\quad(i_1,i_2=0,1,\ldots,m)
$$

is expanded into the multiple series

$$J^*[\psi^{(2)}]_{T,t} = \underset{p_1,p_2\to\infty}{\text{l.i.m.}} \sum_{j_1=0}^{p_1}\sum_{j_2=0}^{p_2} C_{j_2j_1}\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}$$

converging in the mean-square sense, where

$$\zeta_j^{(i)} = \int\limits_t^T \phi_j(\tau)d\mathbf{w}_\tau^{(i)}$$

are independent standard Gaussian random variables for various i *or* j *(if* $i \neq 0$*),*

$$C_{j_2j_1} = \int\limits_t^T \psi_2(t_2)\phi_{j_2}(t_2)\int\limits_t^{t_2}\psi_1(t_1)\phi_{j_1}(t_1)dt_1dt_2$$

is the Fourier coefficient.

Note that in [24]-[27], [41], [44] Theorem 3 is proved under weaker conditions.

Theorem 4 [24]-[27], [41], [44]. *Suppose that the following conditions are fulfilled*:
1. *The functions* $\psi_1(\tau)$ *and* $\psi_2(\tau)$ *are continuously differentiable at the interval* $[t,T]$.
2. $\{\phi_j(x)\}_{j=0}^{\infty}$ *is a complete orthonormal system of Legendre polynomials or trigonometric functions in the space* $L_2([t,T])$.

Then, the iterated Stratonovich stochastic integral of second multiplicity

$$J^*[\psi^{(2)}]_{T,t} = \int\limits_t^{*T} \psi_2(t_2)\int\limits_t^{*t_2}\psi_1(t_1)d\mathbf{w}_{t_1}^{(i_1)}d\mathbf{w}_{t_2}^{(i_2)} \quad (i_1,i_2=0,1,\ldots,m)$$

is expanded into the multiple series

$$J^*[\psi^{(2)}]_{T,t} = \underset{p_1,p_2\to\infty}{\text{l.i.m.}} \sum_{j_1=0}^{p_1}\sum_{j_2=0}^{p_2} C_{j_2j_1}\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}$$

converging in the mean-square sense, where

$$\zeta_j^{(i)} = \int\limits_t^T \phi_j(\tau)d\mathbf{w}_\tau^{(i)}$$

are independent standard Gaussian random variables for various i *or* j *(if* $i \neq 0$*),*

$$C_{j_2j_1} = \int\limits_t^T \psi_2(t_2)\phi_{j_2}(t_2)\int\limits_t^{t_2}\psi_1(t_1)\phi_{j_1}(t_1)dt_1dt_2$$

is the Fourier coefficient.

Theorem 5 [18], [19], [22], [24]-[27], [43]. *Suppose that* $\{\phi_j(x)\}_{j=0}^{\infty}$ *is a complete orthonormal system of Legendre polynomials or trigonometric functions in the space* $L_2([t,T])$. *At the same time* $\psi_2(\tau)$ *is a continuously differentiable function at the interval* $[t,T]$ *and* $\psi_1(\tau),\psi_3(\tau)$ *are twice continuously differentiable functions at the interval* $[t,T]$. *Then, for the iterated Stratonovich stochastic integral of third multiplicity*

$$J^*[\psi^{(3)}]_{T,t}=\int\limits_t^{*T}\psi_3(t_3)\int\limits_t^{*t_3}\psi_2(t_2)\int\limits_t^{*t_2}\psi_1(t_1)d\mathbf{f}_{t_1}^{(i_1)}d\mathbf{f}_{t_2}^{(i_2)}d\mathbf{f}_{t_3}^{(i_3)}\quad (i_1,i_2,i_3=1,\ldots,m)$$

the following expansion

$$J^*[\psi^{(3)}]_{T,t}=\underset{p\to\infty}{\text{l.i.m.}}\sum_{j_1,j_2,j_3=0}^{p}C_{j_3j_2j_1}\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}\zeta_{j_3}^{(i_3)} \tag{19}$$

converging in the mean-square sense is valid, where

$$C_{j_3j_2j_1}=\int\limits_t^T\psi_3(t_3)\phi_{j_3}(t_3)\int\limits_t^{t_3}\psi_2(t_2)\phi_{j_2}(t_2)\int\limits_t^{t_2}\psi_1(t_1)\phi_{j_1}(t_1)dt_1dt_2dt_3,$$

another notations are the same as in Theorems 1, 2.

Theorem 6 [17]-[19], [22], [24]-[27], [43]. *Suppose that* $\{\phi_j(x)\}_{j=0}^{\infty}$ *is a complete orthonormal system of Legendre polynomials or trigonometric functions in the space* $L_2([t,T])$. *Then, for the iterated Stratonovich stochastic integral of fourth multiplicity*

$$I_{T,t}^{*(i_1i_2i_3i_4)}=\int\limits_t^{*T}\int\limits_t^{*t_4}\int\limits_t^{*t_3}\int\limits_t^{*t_2}d\mathbf{w}_{t_1}^{(i_1)}d\mathbf{w}_{t_2}^{(i_2)}d\mathbf{w}_{t_3}^{(i_3)}d\mathbf{w}_{t_4}^{(i_4)}\quad (i_1,i_2,i_3,i_4=0,1,\ldots,m)$$

the following expansion

$$I_{T,t}^{*(i_1i_2i_3i_4)}=\underset{p\to\infty}{\text{l.i.m.}}\sum_{j_1,j_2,j_3,j_4=0}^{p}C_{j_4j_3j_2j_1}\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}\zeta_{j_3}^{(i_3)}\zeta_{j_4}^{(i_4)}$$

converging in the mean-square sense is valid, where

$$\zeta_j^{(i)}=\int\limits_t^T\phi_j(s)d\mathbf{w}_s^{(i)}$$

are independent standard Gaussian random variables for various i *or* j *(if* $i\neq 0$*)*,

$$C_{j_4j_3j_2j_1}=\int\limits_t^T\phi_{j_4}(t_4)\int\limits_t^{t_4}\phi_{j_3}(t_3)\int\limits_t^{t_3}\phi_{j_2}(t_2)\int\limits_t^{t_2}\phi_{j_1}(t_1)dt_1dt_2dt_3dt_4,$$

$\mathbf{w}_\tau^{(i)}=\mathbf{f}_\tau^{(i)}$ *for* $i=1,\ldots,m$ *and* $\mathbf{w}_\tau^{(0)}=\tau$.

Note that in [17]-[19], [22], [24]-[27], [43] the expansions (9)–(12) have been applied for the proof of Theorems 3–6. In this article, we will prove Theorems 4–6 by an another approach. This approach will be called as the combined approach. More precisely, we will use the scheme of the proof of Theorem 1 from this paper (see [10]–[19], [22], [24]-[27], [35] for details) for the iterated Stratonovich stochastic integrals (3) of multiplicities 2 to 4. As a result, we will obtain two different parts of the expansion of iterated Stratonovich stochastic integrals. The mean-square convergence of the first part will be proved on the base of generalized multiple Fourier series converging in $L_2([t,T]^k)$ $(k=2,3,4)$. At the same time, the mean-square convergence of the second part will be proved on the base of generalized iterated Fourier series converging pointwise. At that, we do not use the iterated Ito stochastic integrals (2) as a tool of the proof and directly consider the iterated Stratonovich stochastic integrals (3).

4. Auxiliary Lemmas

In this section, we collected several lemmas, which will be used for the proof of Theorems 4–6.

Consider the partition $\{\tau_j\}_{j=0}^N$ of the interval $[t,T]$ such that

$$t=\tau_0<\ldots<\tau_N=T,\quad \Delta_N=\max_{0\le j\le N-1}\Delta\tau_j\to 0\ \text{ if }\ N\to\ \infty,\quad \Delta\tau_j=\tau_{j+1}-\tau_j. \tag{20}$$

Lemma 1 [10]–[19], [22], [24]-[27], [35]. *Suppose that every $\psi_l(\tau)$ $(l=1,\ldots,k)$ is a continuous nonrandom function at the interval $[t,T]$. Then*

$$J[\psi^{(k)}]_{T,t}=\underset{N\to\infty}{\text{l.i.m.}}\sum_{j_k=0}^{N-1}\ldots\sum_{j_1=0}^{j_2-1}\prod_{l=1}^k\psi_l(\tau_{j_l})\Delta\mathbf{w}_{\tau_{j_l}}^{(i_l)}\quad w.\ p.\ 1, \tag{21}$$

where $J[\psi^{(k)}]_{T,t}$ has the form (2), $\Delta\mathbf{w}_{\tau_j}^{(i)}=\mathbf{w}_{\tau_{j+1}}^{(i)}-\mathbf{w}_{\tau_j}^{(i)}$ $(i=0,\ 1,\ldots,m)$, $\{\tau_j\}_{j=0}^N$ is a partition of the interval $[t,T]$ satisfying the condition (20); hereinafter w. p. 1 means with probability 1.

Remark 1. *It is easy to see that if $\Delta\mathbf{w}_{\tau_{j_l}}^{(i_l)}$ in (21) for some $l\in\{1,\ldots,k\}$ is replaced with $\left(\Delta\mathbf{w}_{\tau_{j_l}}^{(i_l)}\right)^p$ $(p=2,\ i_l\ne 0)$, then the differential $d\mathbf{w}_{t_l}^{(i_l)}$ in the integral $J[\psi^{(k)}]_{T,t}$ will be replaced with dt_l. If $p=3,4,\ldots,$ then the right-hand side of the formula (21) will become zero w. p. 1. If we replace $\Delta\mathbf{w}_{\tau_{j_l}}^{(i_l)}$ in (21) for some $l\in\{1,\ldots,k\}$ with $(\Delta\tau_{j_l})^p$ $(p=2,3,\ldots)$, then the right-hand side of the formula (21) will also be equal to zero w. p. 1.*

Let us define the following multiple stochastic integral

$$\underset{N\to\infty}{\text{l.i.m.}}\sum_{j_1,\ldots,j_k=0}^{N-1}\Phi\left(\tau_{j_1},\ldots,\tau_{j_k}\right)\prod_{l=1}^k\Delta\mathbf{w}_{\tau_{j_l}}^{(i_l)}\stackrel{\text{def}}{=}J[\Phi]_{T,t}^{(k)}, \tag{22}$$

where $\Phi(t_1,\ldots,t_k):\ [t,T]^k\to\mathbb{R}$ is a nonrandom function (the properties of this function will be specified further), $\Delta\mathbf{w}_{\tau_j}^{(i)}=\mathbf{w}_{\tau_{j+1}}^{(i)}-\mathbf{w}_{\tau_j}^{(i)}$ $(i=0,\ 1,\ldots,m)$, $\{\tau_j\}_{j=0}^N$ is a partition of the interval $[t,T]$ satisfying the condition (20).

Denote

$$D_k=\{(t_1,\ldots,t_k):\ t\le t_1<\ldots<t_k\le T\}. \tag{23}$$

We will use the same symbol D_k to denote the open and closed domains corresponding to the domain D_k defined by (23). However, we always specify what domain we consider (open or closed).

Also we will write $\Phi(t_1,\ldots,t_k)\in C(D_k)$ if $\Phi(t_1,\ldots,t_k)$ is a continuous nonrandom function of k variables in the closed domain D_k.

Let us consider the iterated Ito stochastic integral

$$I[\Phi]_{T,t}^{(k)} \stackrel{\rm def}{=} \int\limits_t^T \ldots \int\limits_t^{t_2} \Phi(t_1,\ldots,t_k) d\mathbf{w}_{t_1}^{(i_1)} \ldots d\mathbf{w}_{t_k}^{(i_k)},$$

where $\Phi(t_1,\ldots,t_k) \in C(D_k)$.

Lemma 2 [10]–[19], [22], [24]-[27], [35]. *Suppose that $\Phi(t_1,\ldots,t_k) \in C(D_k)$ or $\Phi(t_1,\ldots,t_k)$ is a continuous nonrandom function in the open domain D_k and bounded at its boundary. Then*

$$I[\Phi]_{T,t}^{(k)} = \underset{N\to\infty}{\text{l.i.m.}} \sum_{j_k=0}^{N-1} \ldots \sum_{j_1=0}^{j_2-1} \Phi(\tau_{j_1},\ldots,\tau_{j_k}) \prod_{l=1}^{k} \Delta\mathbf{w}_{\tau_{j_l}}^{(i_l)} \quad \text{w. p. 1}, \tag{24}$$

where $\Delta\mathbf{w}_{\tau_j}^{(i)} = \mathbf{w}_{\tau_{j+1}}^{(i)} - \mathbf{w}_{\tau_j}^{(i)}$ $(i=0,1,\ldots,m)$, $\{\tau_j\}_{j=0}^{N}$ is a partition of the interval $[t,T]$ satisfying the condition (20).

Lemma 3 [10]–[19], [22], [24]-[27], [35]. *Suppose that every $\varphi_i(\tau)$ $(i=1,\ldots,k)$ is a continuous nonrandom function at the interval $[t,T]$. Then*

$$\prod_{l=1}^{k} J[\varphi_l]_{T,t} = J[\Phi]_{T,t}^{(k)} \quad \text{w. p. 1}, \tag{25}$$

where

$$J[\varphi_l]_{T,t} = \int\limits_t^T \varphi_l(s) d\mathbf{w}_s^{(i_l)}, \quad \Phi(t_1,\ldots,t_k) = \prod_{l=1}^{k} \varphi_l(t_l)$$

and the integral $J[\Phi]_{T,t}^{(k)}$ is defined by the equality (22).

Let us introduce the following notations

$$J[\psi^{(k)}]_{T,t}^{s_l,\ldots,s_1} \stackrel{\rm def}{=} \prod_{p=1}^{l} \mathbf{1}_{\{i_{s_p}=i_{s_p+1}\neq 0\}} \times$$

$$\times \int\limits_t^T \psi_k(t_k) \ldots \int\limits_t^{t_{s_l+3}} \psi_{s_l+2}(t_{s_l+2}) \int\limits_t^{t_{s_l+2}} \psi_{s_l}(t_{s_l+1})\psi_{s_l+1}(t_{s_l+1}) \times$$

$$\times \int\limits_t^{t_{s_l+1}} \psi_{s_l-1}(t_{s_l-1}) \ldots \int\limits_t^{t_{s_1+3}} \psi_{s_1+2}(t_{s_1+2}) \int\limits_t^{t_{s_1+2}} \psi_{s_1}(t_{s_1+1})\psi_{s_1+1}(t_{s_1+1}) \times$$

$$\times \int\limits_t^{t_{s_1+1}} \psi_{s_1-1}(t_{s_1-1}) \ldots \int\limits_t^{t_2} \psi_1(t_1) d\mathbf{w}_{t_1}^{(i_1)} \ldots d\mathbf{w}_{t_{s_1-1}}^{(i_{s_1-1})} dt_{s_1+1} d\mathbf{w}_{t_{s_1+2}}^{(i_{s_1+2})} \ldots$$

$$\ldots d\mathbf{w}_{t_{s_l-1}}^{(i_{s_l-1})} dt_{s_l+1} d\mathbf{w}_{t_{s_l+2}}^{(i_{s_l+2})} \ldots d\mathbf{w}_{t_k}^{(i_k)}, \tag{26}$$

where

$$\mathrm{A}_{k,l} = \Bigl\{(s_l,\ldots,s_1):\ s_l > s_{l-1}+1,\ldots,s_2 > s_1+1,\ s_l,\ldots,s_1 = 1,\ldots,k-1\Bigr\}, \tag{27}$$

$(s_l,\ldots,s_1)\in \mathrm{A}_{k,l},\ \ l=1,\ldots,[k/2],\ \ i_s=0,1,\ldots,m,\ \ s=1,\ldots,k,\ \ [x]$ is an integer part of a real number x, $\mathbf{1}_A$ is the indicator of the set A.

Lemma 4 [6] (1997), [7], [10]-[19], [22], [24]-[27], [30]. *Suppose that every $\psi_l(\tau)(l=1,\ldots,k)$ is a continuous nonrandom function at the interval $[t,T]$. Then, the following relation between iterated Stratonovich and Ito stochastic integrals is correct*

$$J^*[\psi^{(k)}]_{T,t}=J[\psi^{(k)}]_{T,t}+\sum_{r=1}^{[k/2]}\frac{1}{2^r}\sum_{(s_r,\ldots,s_1)\in \mathrm{A}_{k,r}}J[\psi^{(k)}]_{T,t}^{s_r,\ldots,s_1}\quad w.\ p.\ 1, \tag{28}$$

where $\sum\limits_{\emptyset}$ is supposed to be equal to zero.

Let us define the function $K^*(t_1,\ldots,t_k)$ on the hypercube $[t,T]^k$ $(k\ge 2)$ by the following relation

$$K^*(t_1,\ldots,t_k)=\prod_{l=1}^{k}\psi_l(t_l)\prod_{l=1}^{k-1}\left(\mathbf{1}_{\{t_l<t_{l+1}\}}+\frac{1}{2}\mathbf{1}_{\{t_l=t_{l+1}\}}\right)=$$

$$=\prod_{l=1}^{k}\psi_l(t_l)\left(\prod_{l=1}^{k-1}\mathbf{1}_{\{t_l<t_{l+1}\}}+\sum_{r=1}^{k-1}\frac{1}{2^r}\sum_{\substack{s_r,\ldots,s_1=1\\ s_r>\ldots>s_1}}^{k-1}\prod_{l=1}^{r}\mathbf{1}_{\{t_{s_l}=t_{s_l+1}\}}\prod_{\substack{l=1\\ l\ne s_1,\ldots,s_r}}^{k-1}\mathbf{1}_{\{t_l<t_{l+1}\}}\right), \tag{29}$$

where $\mathbf{1}_A$ is the indicator of the set A.

Lemma 5 [6], [7], [14]-[19], [22], [24]-[27], [30]. *Under the conditions of Lemma 4 the following relation is correct*

$$J[K^*]_{T,t}^{(k)}=J^*[\psi^{(k)}]_{T,t}\quad w.\ p.\ 1, \tag{30}$$

where $J[K^*]_{T,t}^{(k)}$ is defined by the equality (22).

Proof. Substituting (29) into (22) and using Lemmas 1, 2, 4 with Remark 1, it is easy to notice that w. p. 1

$$J[K^*]_{T,t}^{(k)}=J[\psi^{(k)}]_{T,t}+\sum_{r=1}^{[k/2]}\frac{1}{2^r}\sum_{(s_r,\ldots,s_1)\in \mathrm{A}_{k,r}}J[\psi^{(k)}]_{T,t}^{s_r,\ldots,s_1}=J^*[\psi^{(k)}]_{T,t}. \tag{31}$$

Let us consider the following generalized multiple Fourier sum

$$\sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k}C_{j_k\ldots j_1}\prod_{l=1}^{k}\phi_{j_l}(t_l),$$

where $C_{j_k\ldots j_1}$ is the Fourier coefficient of the form

$$C_{j_k\ldots j_1}=\int\limits_{[t,T]^k}K^*(t_1,\ldots,t_k)\prod_{l=1}^{k}\phi_{j_l}(t_l)dt_1\ldots dt_k. \tag{32}$$

Let us subsitute the relation

$$K^*(t_1,\ldots,t_k)=\sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k}C_{j_k\ldots j_1}\prod_{l=1}^{k}\phi_{j_l}(t_l)+K^*(t_1,\ldots,t_k)-\sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k}C_{j_k\ldots j_1}\prod_{l=1}^{k}\phi_{j_l}(t_l)$$

into $J[K^*]_{T,t}^{(k)}$ (here $p_1,\ldots,p_k<\infty$).

Then, using Lemma 3, we obtain

$$J^*[\psi^{(k)}]_{T,t}=\sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k}C_{j_k\ldots j_1}\prod_{l=1}^{k}\zeta_{j_l}^{(i_l)}+J[R_{p_1\ldots p_k}]_{T,t}^{(k)}\quad \text{w. p. 1,} \tag{33}$$

where the stochastic integral $J[R_{p_1\ldots p_k}]_{T,t}^{(k)}$ is defined in accordance with (22) and

$$R_{p_1\ldots p_k}(t_1,\ldots,t_k)=K^*(t_1,\ldots,t_k)-\sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k}C_{j_k\ldots j_1}\prod_{l=1}^{k}\phi_{j_l}(t_l), \tag{34}$$

where

$$\zeta_j^{(i)}=\int\limits_t^T\phi_j(s)d\mathbf{w}_s^{(i)}.$$

5. Proof of Theorem 4 Using the Combined Approach

From (33) we obtain

$$J^*[\psi^{(2)}]_{T,t}=\sum_{j_1=0}^{p_1}\sum_{j_2=0}^{p_2}C_{j_2j_1}\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}+J[R_{p_1p_2}]_{T,t}^{(2)}\quad \text{w. p. 1,} \tag{35}$$

where

$$J[R_{p_1p_2}]_{T,t}^{(2)}=\int\limits_t^T\int\limits_t^{t_2}R_{p_1p_2}(t_1,t_2)d\mathbf{w}_{t_1}^{(i_1)}d\mathbf{w}_{t_2}^{(i_2)}+\int\limits_t^T\int\limits_t^{t_1}R_{p_1p_2}(t_1,t_2)d\mathbf{w}_{t_2}^{(i_2)}d\mathbf{w}_{t_1}^{(i_1)}+$$

$$+\mathbf{1}_{\{i_1=i_2\neq 0\}}\int\limits_t^T R_{p_1p_2}(t_1,t_1)dt_1,$$

$$R_{p_1p_2}(t_1,t_2)=K^*(t_1,t_2)-\sum_{j_1=0}^{p_1}\sum_{j_2=0}^{p_2}C_{j_2j_1}\phi_{j_1}(t_1)\phi_{j_2}(t_2)\quad (p_1,p_2<\infty),$$

$$K^*(t_1,t_2)=K(t_1,t_2)+\frac{1}{2}\mathbf{1}_{\{t_1=t_2\}}\psi_1(t_1)\psi_2(t_1),$$

where

$$K(t_1,t_2)=\begin{cases}\psi_1(t_1)\psi_2(t_2), & t_1<t_2\\ \\ 0, & \text{otherwise}\end{cases},\quad t_1,t_2\in[t,T].$$

Let us consider the case $i_1,i_2\ne 0$ (another cases can be considered absolutely analogously). Using standard estimates for moments of stochastic integrals [1], we get

$$\mathsf{M}\left\{\left(J[R_{p_1p_2}]^{(2)}_{T,t}\right)^2\right\}=$$

$$=\mathsf{M}\left\{\left(\int\limits_t^T\int\limits_t^{t_2}R_{p_1p_2}(t_1,t_2)d\mathbf{w}_{t_1}^{(i_1)}d\mathbf{w}_{t_2}^{(i_2)}+\int\limits_t^T\int\limits_t^{t_1}R_{p_1p_2}(t_1,t_2)d\mathbf{w}_{t_2}^{(i_2)}d\mathbf{w}_{t_1}^{(i_1)}\right)^2\right\}+$$

$$+\mathbf{1}_{\{i_1=i_2\ne 0\}}\left(\int\limits_t^T R_{p_1p_2}(t_1,t_1)dt_1\right)^2\le$$

$$\le 2\left(\int\limits_t^T\int\limits_t^{t_2}\left(R_{p_1p_2}(t_1,t_2)\right)^2dt_1dt_2+\int\limits_t^T\int\limits_t^{t_1}\left(R_{p_1p_2}(t_1,t_2)\right)^2dt_2dt_1\right)+$$

$$+\mathbf{1}_{\{i_1=i_2\ne 0\}}\left(\int\limits_t^T R_{p_1p_2}(t_1,t_1)dt_1\right)^2=$$

$$=2\int\limits_{[t,T]^2}\left(R_{p_1p_2}(t_1,t_2)\right)^2dt_1dt_2+\mathbf{1}_{\{i_1=i_2\ne 0\}}\left(\int\limits_t^T R_{p_1p_2}(t_1,t_1)dt_1\right)^2. \tag{36}$$

Moreover, we have

$$\int\limits_{[t,T]^2}\left(R_{p_1p_2}(t_1,t_2)\right)^2dt_1dt_2=$$

$$=\int\limits_{[t,T]^2}\left(K^*(t_1,t_2)-\sum_{j_1=0}^{p_1}\sum_{j_2=0}^{p_2}C_{j_2j_1}\phi_{j_1}(t_1)\phi_{j_2}(t_2)\right)^2dt_1dt_2=$$

$$=\int\limits_{[t,T]^2}\left(K(t_1,t_2)-\sum_{j_1=0}^{p_1}\sum_{j_2=0}^{p_2}C_{j_2j_1}\phi_{j_1}(t_1)\phi_{j_2}(t_2)\right)^2dt_1dt_2.$$

The function $K(t_1,t_2)$ is piecewise continuous in the square $[t,T]^2$. At this situation it is well known that the generalized multiple Fourier series of the function $K(t_1,t_2)\in L_2([t,T]^2)$ is converging to this function in the square $[t,T]^2$ in the mean-square sense, i.e.

$$\lim_{p_1,p_2\to\infty}\left\|K(t_1,t_2)-\sum_{j_1=0}^{p_1}\sum_{j_2=0}^{p_k}C_{j_2j_1}\prod_{l=1}^{2}\phi_{j_l}(t_l)\right\|_{L_2([t,T]^2)}=0,$$

where

$$\|f\|_{L_2([t,T]^2)}=\left(\int\limits_{[t,T]^2}f^2(t_1,t_2)dt_1dt_2\right)^{1/2}.$$

So, we obtain

$$\lim_{p_1,p_2\to\infty}\int\limits_{[t,T]^2}\left(R_{p_1p_2}(t_1,t_2)\right)^2dt_1dt_2=0. \tag{37}$$

Note that

$$\int\limits_t^T R_{p_1p_2}(t_1,t_1)dt_1=$$

$$=\int\limits_t^T\left(\frac{1}{2}\psi_1(t_1)\psi_2(t_1)-\sum_{j_1=0}^{p_1}\sum_{j_2=0}^{p_2}C_{j_2j_1}\phi_{j_1}(t_1)\phi_{j_2}(t_1)\right)dt_1=$$

$$=\frac{1}{2}\int\limits_t^T\psi_1(t_1)\psi_2(t_1)dt_1-\sum_{j_1=0}^{p_1}\sum_{j_2=0}^{p_2}C_{j_2j_1}\int\limits_t^T\phi_{j_1}(t_1)\phi_{j_2}(t_1)dt_1=$$

$$=\frac{1}{2}\int\limits_t^T\psi_1(t_1)\psi_2(t_1)dt_1-\sum_{j_1=0}^{p_1}\sum_{j_2=0}^{p_2}C_{j_2j_1}\mathbf{1}_{\{j_1=j_2\}}=$$

$$=\frac{1}{2}\int\limits_t^T\psi_1(t_1)\psi_2(t_1)dt_1-\sum_{j_1=0}^{\min\{p_1,p_2\}}C_{j_1j_1}. \tag{38}$$

In [19] (Theorem 3, p. A.59), [24] (Theorem 5.3, p. A.294), [25]-[27] (Theorems 2.1, 2.2), [43] (Theorem 2), [44] (Theorem 6) the following equality

$$\frac{1}{2}\int\limits_t^T\psi_1(t_1)\psi_2(t_1)dt_1=\sum_{j_1=0}^{\infty}C_{j_1j_1} \tag{39}$$

is proved. Note that the existence of the limit on the right-hand side of (39) is proved in [25]-[27], [43] for the polynomial and trigonometric cases.

From (36)–(39) it follows that

$$\lim_{p_1,p_2\to\infty}\mathsf{M}\left\{\left(J[R_{p_1p_2}]_{T,t}^{(2)}\right)^2\right\}=0.$$

Theorem 4 is proved.

6. Proof of Theorem 5 Using the Combined Approach

Let us consider (33) for $k=3$ and $p_1=p_2=p_3=p$

$$J^*[\psi^{(3)}]_{T,t}=\sum_{j_1=0}^{p}\sum_{j_2=0}^{p}\sum_{j_3=0}^{p}C_{j_3j_2j_1}\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}\zeta_{j_3}^{(i_3)}+J[R_{ppp}]_{T,t}^{(3)}\quad \text{w. p. 1}, \tag{40}$$

where

$$J[R_{ppp}]_{T,t}^{(3)}=\underset{N\to\infty}{\text{l.i.m.}}\sum_{l_3=0}^{N-1}\sum_{l_2=0}^{N-1}\sum_{l_1=0}^{N-1}R_{ppp}(\tau_{l_1},\tau_{l_2},\tau_{l_3})\Delta\mathbf{f}_{\tau_{l_1}}^{(i_1)}\Delta\mathbf{f}_{\tau_{l_2}}^{(i_2)}\Delta\mathbf{f}_{\tau_{l_3}}^{(i_3)},$$

$$R_{ppp}(t_1,t_2,t_3)\stackrel{\text{def}}{=}K^*(t_1,t_2,t_3)-\sum_{j_1=0}^{p}\sum_{j_2=0}^{p}\sum_{j_3=0}^{p}C_{j_3j_2j_1}\phi_{j_1}(t_1)\phi_{j_2}(t_2)\phi_{j_3}(t_3),$$

$$K^*(t_1,t_2,t_3)=\prod_{l=1}^{3}\psi_l(t_l)\Biggl(\mathbf{1}_{\{t_1<t_2\}}\mathbf{1}_{\{t_2<t_3\}}+\frac{1}{2}\mathbf{1}_{\{t_1=t_2\}}\mathbf{1}_{\{t_2<t_3\}}+$$

$$+\frac{1}{2}\mathbf{1}_{\{t_1<t_2\}}\mathbf{1}_{\{t_2=t_3\}}+\frac{1}{4}\mathbf{1}_{\{t_1=t_2\}}\mathbf{1}_{\{t_2=t_3\}}\Biggr).$$

Furthermore, we have w. p. 1

$$J[R_{ppp}]_{T,t}^{(3)}=\underset{N\to\infty}{\text{l.i.m.}}\sum_{l_3=0}^{N-1}\sum_{l_2=0}^{N-1}\sum_{l_1=0}^{N-1}R_{ppp}(\tau_{l_1},\tau_{l_2},\tau_{l_3})\Delta\mathbf{f}_{\tau_{l_1}}^{(i_1)}\Delta\mathbf{f}_{\tau_{l_2}}^{(i_2)}\Delta\mathbf{f}_{\tau_{l_3}}^{(i_3)}=$$

$$=\underset{N\to\infty}{\text{l.i.m.}}\sum_{l_3=0}^{N-1}\sum_{l_2=0}^{l_3-1}\sum_{l_1=0}^{l_2-1}\Biggl(R_{ppp}(\tau_{l_1},\tau_{l_2},\tau_{l_3})\Delta\mathbf{f}_{\tau_{l_1}}^{(i_1)}\Delta\mathbf{f}_{\tau_{l_2}}^{(i_2)}\Delta\mathbf{f}_{\tau_{l_3}}^{(i_3)}+$$

$$+R_{ppp}(\tau_{l_1},\tau_{l_3},\tau_{l_2})\Delta\mathbf{f}_{\tau_{l_1}}^{(i_1)}\Delta\mathbf{f}_{\tau_{l_3}}^{(i_2)}\Delta\mathbf{f}_{\tau_{l_2}}^{(i_3)}+$$

$$+R_{ppp}(\tau_{l_2},\tau_{l_1},\tau_{l_3})\Delta\mathbf{f}_{\tau_{l_2}}^{(i_1)}\Delta\mathbf{f}_{\tau_{l_1}}^{(i_2)}\Delta\mathbf{f}_{\tau_{l_3}}^{(i_3)}+$$

$$+R_{ppp}(\tau_{l_2},\tau_{l_3},\tau_{l_1})\Delta\mathbf{f}_{\tau_{l_2}}^{(i_1)}\Delta\mathbf{f}_{\tau_{l_3}}^{(i_2)}\Delta\mathbf{f}_{\tau_{l_1}}^{(i_3)}+$$

$$+R_{ppp}(\tau_{l_3},\tau_{l_2},\tau_{l_1})\Delta\mathbf{f}_{\tau_{l_3}}^{(i_1)}\Delta\mathbf{f}_{\tau_{l_2}}^{(i_2)}\Delta\mathbf{f}_{\tau_{l_1}}^{(i_3)}+$$

$$
+R_{ppp}(\tau_{l_3},\tau_{l_1},\tau_{l_2})\Delta\mathbf{f}_{\tau_{l_3}}^{(i_1)}\Delta\mathbf{f}_{\tau_{l_1}}^{(i_2)}\Delta\mathbf{f}_{\tau_{l_2}}^{(i_3)}\Biggr)+
$$

$$
+\underset{N\to\infty}{\text{l.i.m.}}\sum_{l_3=0}^{N-1}\sum_{l_2=0}^{l_3-1}\Biggl(R_{ppp}(\tau_{l_2},\tau_{l_2},\tau_{l_3})\Delta\mathbf{f}_{\tau_{l_2}}^{(i_1)}\Delta\mathbf{f}_{\tau_{l_2}}^{(i_2)}\Delta\mathbf{f}_{\tau_{l_3}}^{(i_3)}+
$$

$$
+R_{ppp}(\tau_{l_2},\tau_{l_3},\tau_{l_2})\Delta\mathbf{f}_{\tau_{l_2}}^{(i_1)}\Delta\mathbf{f}_{\tau_{l_3}}^{(i_2)}\Delta\mathbf{f}_{\tau_{l_2}}^{(i_3)}+
$$

$$
+R_{ppp}(\tau_{l_3},\tau_{l_2},\tau_{l_2})\Delta\mathbf{f}_{\tau_{l_3}}^{(i_1)}\Delta\mathbf{f}_{\tau_{l_2}}^{(i_2)}\Delta\mathbf{f}_{\tau_{l_2}}^{(i_3)}\Biggr)+
$$

$$
+\underset{N\to\infty}{\text{l.i.m.}}\sum_{l_3=0}^{N-1}\sum_{l_1=0}^{l_3-1}\Biggl(R_{ppp}(\tau_{l_1},\tau_{l_3},\tau_{l_3})\Delta\mathbf{f}_{\tau_{l_1}}^{(i_1)}\Delta\mathbf{f}_{\tau_{l_3}}^{(i_2)}\Delta\mathbf{f}_{\tau_{l_3}}^{(i_3)}+
$$

$$
+R_{ppp}(\tau_{l_3},\tau_{l_1},\tau_{l_3})\Delta\mathbf{f}_{\tau_{l_3}}^{(i_1)}\Delta\mathbf{f}_{\tau_{l_1}}^{(i_2)}\Delta\mathbf{f}_{\tau_{l_3}}^{(i_3)}+
$$

$$
+R_{ppp}(\tau_{l_3},\tau_{l_3},\tau_{l_1})\Delta\mathbf{f}_{\tau_{l_3}}^{(i_1)}\Delta\mathbf{f}_{\tau_{l_3}}^{(i_2)}\Delta\mathbf{f}_{\tau_{l_1}}^{(i_3)}\Biggr)+
$$

$$
+\underset{N\to\infty}{\text{l.i.m.}}\sum_{l_3=0}^{N-1}R_{ppp}(\tau_{l_3},\tau_{l_3},\tau_{l_3})\Delta\mathbf{f}_{\tau_{l_3}}^{(i_1)}\Delta\mathbf{f}_{\tau_{l_3}}^{(i_2)}\Delta\mathbf{f}_{\tau_{l_3}}^{(i_3)}=
$$

$$
=R_{T,t}^{(1)ppp}+R_{T,t}^{(2)ppp},
$$

where

$$
R_{T,t}^{(1)ppp}=
$$

$$
=\int\limits_t^T\int\limits_t^{t_3}\int\limits_t^{t_2}R_{ppp}(t_1,t_2,t_3)d\mathbf{f}_{t_1}^{(i_1)}d\mathbf{f}_{t_2}^{(i_2)}d\mathbf{f}_{t_3}^{(i_3)}+\int\limits_t^T\int\limits_t^{t_3}\int\limits_t^{t_2}R_{ppp}(t_1,t_3,t_2)d\mathbf{f}_{t_1}^{(i_1)}d\mathbf{f}_{t_2}^{(i_3)}d\mathbf{f}_{t_3}^{(i_2)}+
$$

$$
+\int\limits_t^T\int\limits_t^{t_3}\int\limits_t^{t_2}R_{ppp}(t_2,t_1,t_3)d\mathbf{f}_{t_1}^{(i_2)}d\mathbf{f}_{t_2}^{(i_1)}d\mathbf{f}_{t_3}^{(i_3)}+\int\limits_t^T\int\limits_t^{t_3}\int\limits_t^{t_2}R_{ppp}(t_2,t_3,t_1)d\mathbf{f}_{t_1}^{(i_3)}d\mathbf{f}_{t_2}^{(i_1)}d\mathbf{f}_{t_3}^{(i_2)}+
$$

$$
+\int\limits_t^T\int\limits_t^{t_3}\int\limits_t^{t_2}R_{ppp}(t_3,t_2,t_1)d\mathbf{f}_{t_1}^{(i_3)}d\mathbf{f}_{t_2}^{(i_2)}d\mathbf{f}_{t_3}^{(i_1)}+\int\limits_t^T\int\limits_t^{t_3}\int\limits_t^{t_2}R_{ppp}(t_3,t_1,t_2)d\mathbf{f}_{t_1}^{(i_2)}d\mathbf{f}_{t_2}^{(i_3)}d\mathbf{f}_{t_3}^{(i_1)},
$$

$$
R_{T,t}^{(2)ppp}=
$$

$$
=\mathbf{1}_{\{i_1=i_2\ne 0\}}\int\limits_t^T\int\limits_t^{t_3}R_{ppp}(t_2,t_2,t_3)dt_2d\mathbf{f}_{t_3}^{(i_3)}+\mathbf{1}_{\{i_1=i_3\ne 0\}}\int\limits_t^T\int\limits_t^{t_3}R_{ppp}(t_2,t_3,t_2)dt_2d\mathbf{f}_{t_3}^{(i_2)}+
$$

$$
+\mathbf{1}_{\{i_2=i_3\ne 0\}}\int\limits_t^T\int\limits_t^{t_3}R_{ppp}(t_3,t_2,t_2)dt_2d\mathbf{f}_{t_3}^{(i_1)}+\mathbf{1}_{\{i_2=i_3\ne 0\}}\int\limits_t^T\int\limits_t^{t_3}R_{ppp}(t_1,t_3,t_3)d\mathbf{f}_{t_1}^{(i_1)}dt_3+
$$

$$
+\mathbf{1}_{\{i_1=i_3\ne 0\}}\int\limits_t^T\int\limits_t^{t_3}R_{ppp}(t_3,t_1,t_3)d\mathbf{f}_{t_1}^{(i_2)}dt_3+\mathbf{1}_{\{i_1=i_2\ne 0\}}\int\limits_t^T\int\limits_t^{t_3}R_{ppp}(t_3,t_3,t_1)d\mathbf{f}_{t_1}^{(i_3)}dt_3.
$$

Moreover, we obtain

$$
\mathsf{M}\left\{\left(J[R_{ppp}]_{T,t}^{(3)}\right)^2\right\}\le 2\mathsf{M}\left\{\left(R_{T,t}^{(1)ppp}\right)^2\right\}+2\mathsf{M}\left\{\left(R_{T,t}^{(2)ppp}\right)^2\right\}. \tag{41}
$$

Now, using standard estimates for moments of stochastic integrals [1], we obtain the following inequality

$$
\mathsf{M}\left\{\left(R_{T,t}^{(1)ppp}\right)^2\right\}\le
$$

$$
\le 6\int\limits_t^T\int\limits_t^{t_3}\int\limits_t^{t_2}\Biggl(\left(R_{p_1p_2p_3}(t_1,t_2,t_3)\right)^2+\left(R_{p_1p_2p_3}(t_1,t_3,t_2)\right)^2+\left(R_{p_1p_2p_3}(t_2,t_1,t_3)\right)^2+
$$

$$
+\left(R_{p_1p_2p_3}(t_2,t_3,t_1)\right)^2+\left(R_{p_1p_2p_3}(t_3,t_2,t_1)\right)^2+\left(R_{p_1p_2p_3}(t_3,t_1,t_2)\right)^2\Biggr)dt_1dt_2dt_3=
$$

$$
=6\int\limits_{[t,T]^3}\left(R_{ppp}(t_1,t_2,t_3)\right)^2dt_1dt_2dt_3.
$$

We have

$$
\int\limits_{[t,T]^3}\left(R_{ppp}(t_1,t_2,t_3)\right)^2dt_1dt_2dt_3=
$$

$$
=\int\limits_{[t,T]^3}\left(K^*(t_1,t_2,t_3)-\sum_{j_1=0}^{p}\sum_{j_2=0}^{p}\sum_{j_3=0}^{p}C_{j_3j_2j_1}\phi_{j_1}(t_1)\phi_{j_2}(t_2)\phi_{j_3}(t_3)\right)^2dt_1dt_2dt_3=
$$

$$
=\int\limits_{[t,T]^3}\left(K(t_1,t_2,t_3)-\sum_{j_1=0}^{p}\sum_{j_2=0}^{p}\sum_{j_3=0}^{p}C_{j_3j_2j_1}\phi_{j_1}(t_1)\phi_{j_2}(t_2)\phi_{j_3}(t_3)\right)^2dt_1dt_2dt_3,
$$

where

$$K(t_1,t_2,t_3)=\begin{cases}\psi_1(t_1)\psi_2(t_2)\psi_3(t_3), & t_1<t_2<t_3\\ \\ 0, & \text{otherwise}\end{cases},\quad t_1,t_2,t_3\in[t,T].$$

So, we get

$$\lim_{p\to\infty}\ \mathsf{M}\left\{\left(R_{T,t}^{(1)ppp}\right)^2\right\}\le$$

$$\le 6\lim_{p\to\infty}\int\limits_{[t,T]^3}\left(K(t_1,t_2,t_3)-\sum_{j_1=0}^{p}\sum_{j_2=0}^{p}\sum_{j_3=0}^{p}C_{j_3j_2j_1}\phi_{j_1}(t_1)\phi_{j_2}(t_2)\phi_{j_3}(t_3)\right)^2 dt_1dt_2dt_3=0, \tag{42}$$

where $K(t_1,t_2,t_3)\in L_2([t,T]^3)$.

After the integration order replacement in iterated Ito stochastic integrals [46] (also see [19], [24] or Chapter 3 in [25]-[27]) from $R_{T,t}^{(2)ppp}$ we obtain w. p. 1

$$R_{T,t}^{(2)ppp}=$$

$$=\mathbf{1}_{\{i_1=i_2\ne 0\}}\left(\int\limits_t^T\int\limits_t^{t_3}R_{ppp}(t_2,t_2,t_3)dt_2d\mathbf{f}_{t_3}^{(i_3)}+\int\limits_t^T\int\limits_t^{t_3}R_{ppp}(t_3,t_3,t_1)d\mathbf{f}_{t_1}^{(i_3)}dt_3\right)+$$

$$+\mathbf{1}_{\{i_2=i_3\ne 0\}}\left(\int\limits_t^T\int\limits_t^{t_3}R_{ppp}(t_3,t_2,t_2)dt_2d\mathbf{f}_{t_3}^{(i_1)}+\int\limits_t^T\int\limits_t^{t_3}R_{ppp}(t_1,t_3,t_3)d\mathbf{f}_{t_1}^{(i_1)}dt_3\right)+$$

$$+\mathbf{1}_{\{i_1=i_3\ne 0\}}\left(\int\limits_t^T\int\limits_t^{t_3}R_{ppp}(t_2,t_3,t_2)dt_2d\mathbf{f}_{t_3}^{(i_2)}+\int\limits_t^T\int\limits_t^{t_3}R_{ppp}(t_3,t_1,t_3)d\mathbf{f}_{t_1}^{(i_2)}dt_3\right)=$$

$$

From [19] (Theorem 6, pp. A.116–A.117), [24] (Theorem 5.5', p. A.371), [25]-[27] (Chapter 2), [43] (Theorem 3) we obtain

$$
\mathsf{M}\left\{\left(R_{T,t}^{(2)ppp}\right)^2\right\} \le
$$

$$
\le 3\left(\mathbf{1}_{\{i_1=i_2\ne 0\}}\mathsf{M}\left\{\left(\frac{1}{2}\int\limits_t^T \psi_3(t_3)\int\limits_t^{t_3} \psi_1(t_2)\psi_2(t_2)dt_2 d\mathbf{f}_{t_3}^{(i_3)} - \sum_{j_1=0}^{p}\sum_{j_3=0}^{p} C_{j_3 j_1 j_1}\zeta_{j_3}^{(i_3)}\right)^2\right\} +\right.
$$

$$
+\mathbf{1}_{\{i_1=i_3\ne 0\}}\mathsf{M}\left\{\left(\sum_{j_1=0}^{p}\sum_{j_3=0}^{p} C_{j_1 j_3 j_1}\zeta_{j_3}^{(i_2)}\right)^2\right\} +
$$

$$
\left. +\mathbf{1}_{\{i_2=i_3\ne 0\}}\mathsf{M}\left\{\left(\frac{1}{2}\int\limits_t^T \psi_1(t_1)\int\limits_{t_1}^{T} \psi_2(t_2)\psi_3(t_2)dt_2 d\mathbf{f}_{t_1}^{(i_1)} - \sum_{j_1=0}^{p}\sum_{j_3=0}^{p} C_{j_3 j_3 j_1}\zeta_{j_1}^{(i_1)}\right)^2\right\}\right) \to 0 \tag{43}
$$

if $p \to \infty$. Using (40)–(43), we obtain the expansion (19). Theorem 5 is proved.

7. Proof of Theorem 6 Using the Combined Approach

Let us consider (33) for the case $k = 4$, $p_1 = p_2 = p_3 = p_4 = p$, and $\psi_1(\tau)$, $\psi_2(\tau)$, $\psi_3(\tau)$, $\psi_4(\tau) \equiv 1$

$$
\int\limits_t^{*T}\int\limits_t^{*t_4}\int\limits_t^{*t_3}\int\limits_t^{*t_2} d\mathbf{w}_{t_1}^{(i_1)} d\mathbf{w}_{t_2}^{(i_2)} d\mathbf{w}_{t_3}^{(i_3)} d\mathbf{w}_{t_4}^{(i_4)} =
$$

$$
= \sum_{j_1=0}^{p}\sum_{j_2=0}^{p}\sum_{j_3=0}^{p}\sum_{j_4=0}^{p} C_{j_4 j_3 j_2 j_1}\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}\zeta_{j_3}^{(i_3)}\zeta_{j_4}^{(i_4)} + J[R_{pppp}]_{T,t}^{(4)} \quad \text{w. p. 1,} \tag{44}
$$

where

$$J[R_{pppp}]_{T,t}^{(4)}=\underset{N\to\infty}{\text{l.i.m.}}\sum_{l_4=0}^{N-1}\sum_{l_3=0}^{N-1}\sum_{l_2=0}^{N-1}\sum_{l_1=0}^{N-1}R_{pppp}(\tau_{l_1},\tau_{l_2},\tau_{l_3},\tau_{l_4})\Delta\mathbf{w}_{\tau_{l_1}}^{(i_1)}\Delta\mathbf{w}_{\tau_{l_2}}^{(i_2)}\Delta\mathbf{w}_{\tau_{l_3}}^{(i_3)}\Delta\mathbf{w}_{\tau_{l_4}}^{(i_4)},$$

$$R_{pppp}(t_1,t_2,t_3,t_4)\stackrel{\text{def}}{=}K^*(t_1,t_2,t_3,t_4)-$$

$$-\sum_{j_1=0}^{p}\sum_{j_2=0}^{p}\sum_{j_3=0}^{p}\sum_{j_4=0}^{p}C_{j_4j_3j_2j_1}\phi_{j_1}(t_1)\phi_{j_2}(t_2)\phi_{j_3}(t_3)\phi_{j_4}(t_4),$$

$$K^*(t_1,t_2,t_3,t_4)\stackrel{\text{def}}{=}\prod_{l=1}^{3}\left(\mathbf{1}_{\{t_l<t_{l+1}\}}+\frac{1}{2}\mathbf{1}_{\{t_l=t_{l+1}\}}\right)=$$

$$=\mathbf{1}_{\{t_1<t_2<t_3<t_4\}}+\frac{1}{2}\mathbf{1}_{\{t_1=t_2<t_3<t_4\}}+\frac{1}{2}\mathbf{1}_{\{t_1<t_2=t_3<t_4\}}+$$

$$+\frac{1}{4}\mathbf{1}_{\{t_1=t_2=t_3<t_4\}}+\frac{1}{2}\mathbf{1}_{\{t_1<t_2<t_3=t_4\}}+\frac{1}{4}\mathbf{1}_{\{t_1=t_2<t_3=t_4\}}+$$

$$+\frac{1}{4}\mathbf{1}_{\{t_1<t_2=t_3=t_4\}}+\frac{1}{8}\mathbf{1}_{\{t_1=t_2=t_3=t_4\}}.$$

Moreover, we have

$$J[R_{pppp}]_{T,t}^{(4)}=\sum_{i=0}^{7}R_{T,t}^{(i)pppp}\quad\text{w. p. 1,}\tag{45}$$

where

$$R_{T,t}^{(0)pppp}=\underset{N\to\infty}{\text{l.i.m.}}\sum_{l_4=0}^{N-1}\sum_{l_3=0}^{l_4-1}\sum_{l_2=0}^{l_3-1}\sum_{l_1=0}^{l_2-1}\sum_{(l_1,l_2,l_3,l_4)}\Biggl(R_{pppp}(\tau_{l_1},\tau_{l_2},\tau_{l_3},\tau_{l_4})\times$$

$$\times\Delta\mathbf{w}_{\tau_{l_1}}^{(i_1)}\Delta\mathbf{w}_{\tau_{l_2}}^{(i_2)}\Delta\mathbf{w}_{\tau_{l_3}}^{(i_3)}\Delta\mathbf{w}_{\tau_{l_4}}^{(i_4)}\Biggr),$$

where permutations (l_1,l_2,l_3,l_4) when summing are performed only in the expression, which is enclosed in parentheses,

$$R_{T,t}^{(1)pppp}=\mathbf{1}_{\{i_1=i_2\neq 0\}}\underset{N\to\infty}{\text{l.i.m.}}\sum_{\substack{l_4,l_3,l_1=0\\ l_1\neq l_3,l_1\neq l_4,l_3\neq l_4}}^{N-1}R_{pppp}(\tau_{l_1},\tau_{l_1},\tau_{l_3},\tau_{l_4})\Delta\tau_{l_1}\Delta\mathbf{w}_{\tau_{l_3}}^{(i_3)}\Delta\mathbf{w}_{\tau_{l_4}}^{(i_4)},$$

$$R_{T,t}^{(2)pppp}=\mathbf{1}_{\{i_1=i_3\neq 0\}}\underset{N\to\infty}{\text{l.i.m.}}\sum_{\substack{l_4,l_2,l_1=0\\ l_1\neq l_2,l_1\neq l_4,l_2\neq l_4}}^{N-1}R_{pppp}(\tau_{l_1},\tau_{l_2},\tau_{l_1},\tau_{l_4})\Delta\tau_{l_1}\Delta\mathbf{w}_{\tau_{l_2}}^{(i_2)}\Delta\mathbf{w}_{\tau_{l_4}}^{(i_4)},$$

$$R_{T,t}^{(3)pppp}=\mathbf{1}_{\{i_1=i_4\ne 0\}}\underset{N\to\infty}{\text{l.i.m.}}\sum_{\substack{l_3,l_2,l_1=0\\ l_1\ne l_2,l_1\ne l_3,l_2\ne l_3}}^{N-1}R_{pppp}(\tau_{l_1},\tau_{l_2},\tau_{l_3},\tau_{l_1})\Delta\tau_{l_1}\Delta\mathbf{w}_{\tau_{l_2}}^{(i_2)}\Delta\mathbf{w}_{\tau_{l_3}}^{(i_3)},$$

$$R_{T,t}^{(4)pppp}=\mathbf{1}_{\{i_2=i_3\ne 0\}}\underset{N\to\infty}{\text{l.i.m.}}\sum_{\substack{l_4,l_2,l_1=0\\ l_1\ne l_2,l_1\ne l_4,l_2\ne l_4}}^{N-1}R_{pppp}(\tau_{l_1},\tau_{l_2},\tau_{l_2},\tau_{l_4})\Delta\mathbf{w}_{\tau_{l_1}}^{(i_1)}\Delta\tau_{l_2}\Delta\mathbf{w}_{\tau_{l_4}}^{(i_4)},$$

$$R_{T,t}^{(5)pppp}=\mathbf{1}_{\{i_2=i_4\ne 0\}}\underset{N\to\infty}{\text{l.i.m.}}\sum_{\substack{l_3,l_2,l_1=0\\ l_1\ne l_2,l_1\ne l_3,l_2\ne l_3}}^{N-1}R_{pppp}(\tau_{l_1},\tau_{l_2},\tau_{l_3},\tau_{l_2})\Delta\mathbf{w}_{\tau_{l_1}}^{(i_1)}\Delta\tau_{l_2}\Delta\mathbf{w}_{\tau_{l_3}}^{(i_3)},$$

$$R_{T,t}^{(6)pppp}=\mathbf{1}_{\{i_3=i_4\ne 0\}}\underset{N\to\infty}{\text{l.i.m.}}\sum_{\substack{l_3,l_2,l_1=0\\ l_1\ne l_2,l_1\ne l_3,l_2\ne l_3}}^{N-1}R_{pppp}(\tau_{l_1},\tau_{l_2},\tau_{l_3},\tau_{l_3})\Delta\mathbf{w}_{\tau_{l_1}}^{(i_1)}\Delta\mathbf{w}_{\tau_{l_2}}^{(i_2)}\Delta\tau_{l_3},$$

$$R_{T,t}^{(7)pppp}=\mathbf{1}_{\{i_1=i_2\ne 0\}}\mathbf{1}_{\{i_3=i_4\ne 0\}}\lim_{N\to\infty}\sum_{\substack{l_4,l_2=0\\ l_2\ne l_4}}^{N-1}R_{pppp}(\tau_{l_2},\tau_{l_2},\tau_{l_4},\tau_{l_4})\Delta\tau_{l_2}\Delta\tau_{l_4}+$$

$$+\mathbf{1}_{\{i_1=i_3\ne 0\}}\mathbf{1}_{\{i_2=i_4\ne 0\}}\lim_{N\to\infty}\sum_{\substack{l_4,l_2=0\\ l_2\ne l_4}}^{N-1}R_{pppp}(\tau_{l_2},\tau_{l_4},\tau_{l_2},\tau_{l_4})\Delta\tau_{l_2}\Delta\tau_{l_4}+$$

$$+\mathbf{1}_{\{i_1=i_4\ne 0\}}\mathbf{1}_{\{i_2=i_3\ne 0\}}\lim_{N\to\infty}\sum_{\substack{l_4,l_2=0\\ l_2\ne l_4}}^{N-1}R_{pppp}(\tau_{l_2},\tau_{l_4},\tau_{l_4},\tau_{l_2})\Delta\tau_{l_2}\Delta\tau_{l_4}.$$

The relations (44) and (45) imply that Theorem 6 will be proved if

$$\lim_{p\to\infty}\mathsf{M}\left\{\left(R_{T,t}^{(i)pppp}\right)^2\right\}=0,\quad i=0,1,\ldots,7.$$

We have (see (24))

$$R_{T,t}^{(0)pppp}=\int\limits_t^T\int\limits_t^{t_4}\int\limits_t^{t_3}\int\limits_t^{t_2}\sum_{(t_1,t_2,t_3,t_4)}\left(R_{pppp}(t_1,t_2,t_3,t_4)d\mathbf{w}_{t_1}^{(i_1)}d\mathbf{w}_{t_2}^{(i_2)}d\mathbf{w}_{t_3}^{(i_3)}d\mathbf{w}_{t_4}^{(i_4)}\right),$$

where permutations (t_1,t_2,t_3,t_4) when summing are performed only in the expression, which is enclosed in parentheses.

From the other hand [19], [24]-[27], [35]

$$R_{T,t}^{(0)pppp}=\sum_{(t_1,t_2,t_3,t_4)}\int\limits_t^T\int\limits_t^{t_4}\int\limits_t^{t_3}\int\limits_t^{t_2}R_{pppp}(t_1,t_2,t_3,t_4)d\mathbf{w}_{t_1}^{(i_1)}d\mathbf{w}_{t_2}^{(i_2)}d\mathbf{w}_{t_3}^{(i_3)}d\mathbf{w}_{t_4}^{(i_4)},$$

where permutations $(t_1,\ldots,t_4)$ when summing are performed only in the values $d\mathbf{w}_{t_1}^{(i_1)}\ldots d\mathbf{w}_{t_4}^{(i_4)}$. At the same time, the indexes near upper limits of integration in the iterated stochastic integrals are changed correspondently and if t_r swapped with t_q in the permutation $(t_1,\ldots,t_4)$, then i_r swapped with i_q in the permutations $(i_1,\ldots,i_4)$.

So, we obtain

$$
\mathsf{M}\left\{\left(R_{T,t}^{(0)pppp}\right)^2\right\}\le 24\sum_{(t_1,t_2,t_3,t_4)}\int\limits_t^T\int\limits_t^{t_4}\int\limits_t^{t_3}\int\limits_t^{t_2}\left(R_{pppp}(t_1,t_2,t_3,t_4)\right)^2 dt_1dt_2dt_3dt_4=
$$

$$
=24\int\limits_{[t,T]^4}\left(R_{pppp}(t_1,t_2,t_3,t_4))\right)^2 dt_1dt_2dt_3dt_4\ \to 0
$$

if $p\to\infty$, where $K^*(t_1,t_2,t_3,t_4)\in L_2([t,T]^4)$.

Let us consider $R_{T,t}^{(1)pppp}$

$$
R_{T,t}^{(1)pppp}=\mathbf{1}_{\{i_1=i_2\ne 0\}}\underset{N\to\infty}{\text{l.i.m.}}\sum_{\substack{l_4,l_3,l_1=0\\ l_1\ne l_3,l_1\ne l_4,l_3\ne l_4}}^{N-1}R_{pppp}(\tau_{l_1},\tau_{l_1},\tau_{l_3},\tau_{l_4})\Delta\tau_{l_1}\Delta\mathbf{w}_{\tau_{l_3}}^{(i_3)}\Delta\mathbf{w}_{\tau_{l_4}}^{(i_4)}=
$$

$$
=\mathbf{1}_{\{i_1=i_2\ne 0\}}\underset{N\to\infty}{\text{l.i.m.}}\sum_{\substack{l_4,l_3,l_1=0\\ l_3\ne l_4}}^{N-1}R_{pppp}(\tau_{l_1},\tau_{l_1},\tau_{l_3},\tau_{l_4})\Delta\tau_{l_1}\Delta\mathbf{w}_{\tau_{l_3}}^{(i_3)}\Delta\mathbf{w}_{\tau_{l_4}}^{(i_4)}=
$$

$$

$$

$$
+\mathbf{1}_{\{i_1=i_2\ne 0\}}\mathbf{1}_{\{i_3=i_4\ne 0\}}\left(\sum_{j_4,j_1=0}^{p}C_{j_4j_4j_1j_1}-\frac{1}{4}\int\limits_t^T\int\limits_t^{t_3}dt_1dt_3\right)\quad \text{w. p. 1.}
$$

In [19] (see the proof of Theorem 8, p. A.135), [24] (see the proof of Theorem 5.7, p. A.388), [25]-[27] (see Chapter 2), [43] (see the proof of Theorem 4) we have proved that

$$
\lim_{p\to\infty}\sum_{j_4,j_1=0}^{p}C_{j_4j_4j_1j_1}=\frac{1}{4}\int\limits_t^T\int\limits_t^{t_3}dt_1dt_3,
$$

$$
\underset{p\to\infty}{\text{l.i.m.}}\sum_{j_4,j_2,j_1=0}^{p}C_{j_4j_4j_2j_1}\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}=\frac{1}{2}\int\limits_t^T\int\limits_t^{t_3}\int\limits_t^{t_2}\mathbf{w}_{t_1}^{(i_1)}d\mathbf{w}_{t_2}^{(i_2)}dt_3+
$$

$$
+\mathbf{1}_{\{i_1=i_2\ne 0\}}\frac{1}{4}\int\limits_t^T\int\limits_t^{t_3}dt_1dt_3\quad \text{w. p. 1.}
$$

Then

$$
\lim_{p\to\infty}\mathsf{M}\left\{\left(R_{T,t}^{(6)pppp}\right)^2\right\}=0.
$$

Let us consider $R_{T,t}^{(7)pppp}$

$$
R_{T,t}^{(7)pppp}=\mathbf{1}_{\{i_1=i_2\ne 0\}}\mathbf{1}_{\{i_3=i_4\ne 0\}}\underset{N\to\infty}{\text{l.i.m.}}\sum_{\substack{l_4,l_2=0\\ l_2\ne l_4}}^{N-1}G_{pppp}(\tau_{l_2},\tau_{l_2},\tau_{l_4},\tau_{l_4})\Delta\tau_{l_2}\Delta\tau_{l_4}+
$$

$$
+\mathbf{1}_{\{i_1=i_3\ne 0\}}\mathbf{1}_{\{i_2=i_4\ne 0\}}\underset{N\to\infty}{\text{l.i.m.}}\sum_{\substack{l_4,l_2=0\\ l_2\ne l_4}}^{N-1}G_{pppp}(\tau_{l_2},\tau_{l_4},\tau_{l_2},\tau_{l_4})\Delta\tau_{l_2}\Delta\tau_{l_4}+
$$

$$
+\mathbf{1}_{\{i_1=i_4\ne 0\}}\mathbf{1}_{\{i_2=i_3\ne 0\}}\underset{N\to\infty}{\text{l.i.m.}}\sum_{\substack{l_4,l_2=0\\ l_2\ne l_4}}^{N-1}G_{pppp}(\tau_{l_2},\tau_{l_4},\tau_{l_4},\tau_{l_2})\Delta\tau_{l_2}\Delta\tau_{l_4}=
$$

$$
=\mathbf{1}_{\{i_1=i_2\ne 0\}}\mathbf{1}_{\{i_3=i_4\ne 0\}}\underset{N\to\infty}{\text{l.i.m.}}\sum_{l_4=0}^{N-1}\sum_{l_2=0}^{N-1}G_{pppp}(\tau_{l_2},\tau_{l_2},\tau_{l_4},\tau_{l_4})\Delta\tau_{l_2}\Delta\tau_{l_4}+
$$

$$
+\mathbf{1}_{\{i_1=i_3\ne 0\}}\mathbf{1}_{\{i_2=i_4\ne 0\}}\underset{N\to\infty}{\text{l.i.m.}}\sum_{l_4=0}^{N-1}\sum_{l_2=0}^{N-1}G_{pppp}(\tau_{l_2},\tau_{l_4},\tau_{l_2},\tau_{l_4})\Delta\tau_{l_2}\Delta\tau_{l_4}+
$$

$$
+\mathbf{1}_{\{i_1=i_4\ne 0\}}\mathbf{1}_{\{i_2=i_3\ne 0\}}\underset{N\to\infty}{\text{l.i.m.}}\sum_{l_4=0}^{N-1}\sum_{l_2=0}^{N-1}G_{pppp}(\tau_{l_2},\tau_{l_4},\tau_{l_4},\tau_{l_2})\Delta\tau_{l_2}\Delta\tau_{l_4}=
$$

$$

$$

$$
-\sum_{j_4,j_3,j_2,j_1=0}^{p}C_{j_4j_3j_2j_1}\phi_{j_1}(\tau_{l_2})\phi_{j_2}(\tau_{l_2})\phi_{j_3}(\tau_{l_4})\phi_{j_4}(\tau_{l_4})\Biggr)\Delta\tau_{l_2}\Delta\tau_{l_4}+
$$

$$
+\mathbf{1}_{\{i_1=i_3\ne 0\}}\mathbf{1}_{\{i_2=i_4\ne 0\}}\underset{N\to\infty}{\text{l.i.m.}}\sum_{l_4=0}^{N-1}\sum_{l_2=0}^{N-1}\Biggl(\frac{1}{8}\mathbf{1}_{\{\tau_{l_2}=\tau_{l_4}\}}-\sum_{j_4,j_3,j_2,j_1=0}^{p}C_{j_4j_3j_2j_1}\times
$$

$$
\times\phi_{j_1}(\tau_{l_2})\phi_{j_2}(\tau_{l_4})\phi_{j_3}(\tau_{l_2})\phi_{j_4}(\tau_{l_4})\Biggr)\Delta\tau_{l_2}\Delta\tau_{l_4}+
$$

$$
+\mathbf{1}_{\{i_1=i_4\ne 0\}}\mathbf{1}_{\{i_2=i_3\ne 0\}}\underset{N\to\infty}{\text{l.i.m.}}\sum_{l_4=0}^{N-1}\sum_{l_2=0}^{N-1}\Biggl(\frac{1}{8}\mathbf{1}_{\{\tau_{l_2}=\tau_{l_4}\}}-\sum_{j_4,j_3,j_2,j_1=0}^{p}C_{j_4j_3j_2j_1}\times
$$

$$
\times\phi_{j_1}(\tau_{l_2})\phi_{j_2}(\tau_{l_4})\phi_{j_3}(\tau_{l_4})\phi_{j_4}(\tau_{l_2})\Biggr)\Delta\tau_{l_2}\Delta\tau_{l_4}=
$$

$$
=\mathbf{1}_{\{i_1=i_2\ne 0\}}\mathbf{1}_{\{i_3=i_4\ne 0\}}\left(\frac{1}{4}\int\limits_t^T\int\limits_t^{t_4}dt_2dt_4-\sum_{j_4,j_1=0}^{p}C_{j_4j_4j_1j_1}\right)-
$$

$$
-\mathbf{1}_{\{i_1=i_3\ne 0\}}\mathbf{1}_{\{i_2=i_4\ne 0\}}\sum_{j_4,j_1=0}^{p}C_{j_4j_1j_4j_1}-
$$

$$-\mathbf{1}_{\{i_1=i_4\neq 0\}}\mathbf{1}_{\{i_2=i_3\neq 0\}}\sum_{j_4,j_2=0}^{p} C_{j_4j_2j_2j_4}.$$

In [19] (see the proof of Theorem 8, p. A.135), [24] (see the proof of Theorem 5.7, p. A.388), [25]-[27] (see Chapter 2), [43] (see the proof of Theorem 4) we have proved that

$$\lim_{p\to\infty}\sum_{j_4,j_1=0}^{p} C_{j_4j_4j_1j_1}=\frac{1}{4}\int\limits_t^T\int\limits_t^{t_4} dt_2dt_4,$$

$$\lim_{p\to\infty}\sum_{j_4,j_1=0}^{p} C_{j_4j_1j_4j_1}=0,$$

$$\lim_{p\to\infty}\sum_{j_4,j_2=0}^{p} C_{j_4j_2j_2j_4}=0.$$

Then

$$\lim_{p\to\infty} R_{T,t}^{(7)pppp}=0.$$

Theorem 6 is proved.

8. Theorems 1–6 from Point of View of the Wong–Zakai Approximation

The iterated Ito stochastic integrals and solutions of Ito SDEs are complex and important functionals from the independent components $\mathbf{f}_s^{(i)}$, $i=1,\ldots,m$ of the multidimensional Wiener process $\mathbf{f}_s$, $s\in[0,T]$. Let $\mathbf{f}_s^{(i)p}$, $p\in\mathbb{N}$ be some approximation of $\mathbf{f}_s^{(i)}$, $i=1,\ldots,m$. Suppose that $\mathbf{f}_s^{(i)p}$ converges to $\mathbf{f}_s^{(i)}$, $i=1,\ldots,m$ if $p\to\infty$ in some sense and has differentiable sample trajectories.

A natural question arises: if we replace $\mathbf{f}_s^{(i)}$ by $\mathbf{f}_s^{(i)p}$, $i=1,\ldots,m$ in the functionals mentioned above, will the resulting functionals converge to the original functionals from the components $\mathbf{f}_s^{(i)}$, $i=1,\ldots,m$ of the multidimentional Wiener process $\mathbf{f}_s$? The answere to this question is negative in the general case. However, in the pioneering works of Wong E. and Zakai M. [51], [52], it was shown that under the special conditions and for some types of approximations of the Wiener process the answere is affirmative with one peculiarity: the convergence takes place to the iterated Stratonovich stochastic integrals and solutions of Stratonovich SDEs and not to iterated Ito stochastic integrals and solutions of Ito SDEs. The piecewise linear approximation as well as the regularization by convolution [51]-[53] relate the mentioned types of approximations of the Wiener process. The above approximation of stochastic integrals and solutions of SDEs is often called the Wong–Zakai approximation.

Let $\mathbf{f}_s$, $s\in[0,T]$ be an m-dimensional standard Wiener process with independent components $\mathbf{f}_s^{(i)}$, $i=1,\ldots,m$. It is well known that the following representation takes place [55], [56]

$$\mathbf{f}_\tau^{(i)}-\mathbf{f}_t^{(i)}=\sum_{j=0}^{\infty}\int\limits_t^{\tau}\phi_j(s)ds\ \zeta_j^{(i)},\quad \zeta_j^{(i)}=\int\limits_t^T\phi_j(s)d\mathbf{f}_s^{(i)},\tag{46}$$

where $\tau\in[t,T]$, $t\ge 0$, $\{\phi_j(x)\}_{j=0}^{\infty}$ is an arbitrary complete orthonormal system of functions in the space $L_2([t,T])$, and $\zeta_j^{(i)}$ are independent standard Gaussian random variables for various i or j. Moreover, the series (46) converges for any $\tau\in[t,T]$ in the mean-square sense.

Let $\mathbf{f}_\tau^{(i)p}-\mathbf{f}_t^{(i)p}$ be the mean-square approximation of the process $\mathbf{f}_\tau^{(i)}-\mathbf{f}_t^{(i)}$, which has the following form

$$\mathbf{f}_\tau^{(i)p}-\mathbf{f}_t^{(i)p}=\sum_{j=0}^{p}\int\limits_t^{\tau}\phi_j(s)ds\ \zeta_j^{(i)}. \tag{47}$$

From (47) we obtain

$$d\mathbf{f}_\tau^{(i)p}=\sum_{j=0}^{p}\phi_j(\tau)\zeta_j^{(i)}d\tau. \tag{48}$$

Consider the following iterated Riemann–Stieltjes integral

$$\int\limits_t^{T}\psi_k(t_k)\ldots\int\limits_t^{t_2}\psi_1(t_1)d\mathbf{w}_{t_1}^{(i_1)p_1}\ldots d\mathbf{w}_{t_k}^{(i_k)p_k}, \tag{49}$$

where $i_1,\ldots,i_k=0,1,\ldots,m,\ \ p_1,\ldots,p_k\in\mathbb{N}$,

$$d\mathbf{w}_\tau^{(i)p}=\begin{cases}d\mathbf{f}_\tau^{(i)p} & \text{for}\quad i=1,\ldots,m\\ \\ d\tau & \text{for}\quad i=0\end{cases}, \tag{50}$$

and $d\mathbf{f}_\tau^{(i)p}$ in defined by the relation (48).

Let us substitute (48) into (49)

$$\int\limits_t^{T}\psi_k(t_k)\ldots\int\limits_t^{t_2}\psi_1(t_1)d\mathbf{w}_{t_1}^{(i_1)p_1}\ldots d\mathbf{w}_{t_k}^{(i_k)p_k}=\sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k}C_{j_k\ldots j_1}\prod_{l=1}^{k}\zeta_{j_l}^{(i_l)}, \tag{51}$$

where

$$\zeta_j^{(i)}=\int\limits_t^{T}\phi_j(s)d\mathbf{w}_s^{(i)}$$

are independent standard Gaussian random variables for various i or j (in the case when $i\ne 0$), $\mathbf{w}_s^{(i)}=\mathbf{f}_s^{(i)}$ for $i=1,\ldots,m$ and $\mathbf{w}_s^{(0)}=s$,

$$C_{j_k\ldots j_1}=\int\limits_t^{T}\psi_k(t_k)\phi_{j_k}(t_k)\ldots\int\limits_t^{t_2}\psi_1(t_1)\phi_{j_1}(t_1)dt_1\ldots dt_k$$

is the Fourier coefficient.

To best of our knowledge [51]-[53] the approximations of the Wiener process in the Wong–Zakai approximation must satisfy fairly strong restrictions [53] (see Definition 7.1, pp. 480–481). Moreover, approximations of the Wiener process that are similar to (47) were not considered in [51], [52] (also see [53], Theorems 7.1, 7.2). Therefore, the proof of analogs of Theorems 7.1 and 7.2 [53] for approximations of the Wiener process based on its series expansion (46) should be carried out separately. Thus, the mean-square convergence of the right-hand side of (51) to the iterated Stratonovich stochastic integral (3) does not follow from the results of the papers [51], [52] (also see [53], Theorems 7.1, 7.2).

From the other hand, Theorems 1–6 and Theorems 7–10 (see below) from this paper can be considered as the proof of the Wong–Zakai approximation for the iterated Stratonovich stochastic integrals (3) of multiplicities 1 to 6 based on the Riemann–Stieltjes integrals (49) and approximation (47) of the Wiener process. At that, the mentioned Riemann–Stieltjes integrals converge (according to Theorems 1–6 and Theorems 7–10 (see below)) to the appropriate Stratonovich stochastic integrals (3). Recall that $\{\phi_j(x)\}_{j=0}^{\infty}$ (see (46), (47), and Theorems 3–10) is a complete orthonormal system of Legendre polynomials or trigonometric functions in the space $L_2([t,T])$.

To illustrate the above reasoning, consider two examples for the case $k=2$, $\psi_1(s)$, $\psi_2(s)\equiv 1$; $i_1,i_2=1,\ldots,m$.

The first example relates to the piecewise linear approximation of the multidimensional Wiener process (these approximations were considered in [51]-[53]).

Let $\mathbf{b}_{\Delta}^{(i)}(t)$, $t\in[0,T]$ be the piecewise linear approximation of the ith component $\mathbf{f}_t^{(i)}$ of the multidimensional standard Wiener process $\mathbf{f}_t$, $t\in[0,T]$ with independent components $\mathbf{f}_t^{(i)}$, $i=1,\ldots,m$, i.e.

$$\mathbf{b}_{\Delta}^{(i)}(t)=\mathbf{f}_{k\Delta}^{(i)}+\frac{t-k\Delta}{\Delta}\Delta\mathbf{f}_{k\Delta}^{(i)},$$

where

$$\Delta\mathbf{f}_{k\Delta}^{(i)}=\mathbf{f}_{(k+1)\Delta}^{(i)}-\mathbf{f}_{k\Delta}^{(i)},\quad t\in[k\Delta,(k+1)\Delta),\quad k=0,1,\ldots,N-1.$$

Note that w. p. 1

$$\frac{d\mathbf{b}_{\Delta}^{(i)}}{dt}(t)=\frac{\Delta\mathbf{f}_{k\Delta}^{(i)}}{\Delta},\quad t\in[k\Delta,(k+1)\Delta),\quad k=0,1,\ldots,N-1. \tag{52}$$

Consider the following iterated Riemann–Stieltjes integral

$$\int\limits_0^T\int\limits_0^s d\mathbf{b}_{\Delta}^{(i_1)}(\tau)d\mathbf{b}_{\Delta}^{(i_2)}(s),\quad i_1,i_2=1,\ldots,m.$$

Using (52) and additive property of the Riemann–Stieltjes integral, we can write w. p. 1

$$\int\limits_0^T\int\limits_0^s d\mathbf{b}_{\Delta}^{(i_1)}(\tau)d\mathbf{b}_{\Delta}^{(i_2)}(s)=\int\limits_0^T\int\limits_0^s \frac{d\mathbf{b}_{\Delta}^{(i_1)}}{d\tau}(\tau)d\tau\frac{d\mathbf{b}_{\Delta}^{(i_2)}}{ds}(s)ds=$$

$$=\sum_{l=0}^{N-1}\int\limits_{l\Delta}^{(l+1)\Delta}\left(\sum_{q=0}^{l-1}\int\limits_{q\Delta}^{(q+1)\Delta}\frac{\Delta\mathbf{f}_{q\Delta}^{(i_1)}}{\Delta}d\tau+\int\limits_{l\Delta}^{s}\frac{\Delta\mathbf{f}_{l\Delta}^{(i_1)}}{\Delta}d\tau\right)\frac{\Delta\mathbf{f}_{l\Delta}^{(i_2)}}{\Delta}ds=$$

$$
=\sum_{l=0}^{N-1}\sum_{q=0}^{l-1}\Delta\mathbf{f}_{q\Delta}^{(i_1)}\Delta\mathbf{f}_{l\Delta}^{(i_2)}+\frac{1}{\Delta^2}\sum_{l=0}^{N-1}\Delta\mathbf{f}_{l\Delta}^{(i_1)}\Delta\mathbf{f}_{l\Delta}^{(i_2)}\int\limits_{l\Delta}^{(l+1)\Delta}\int\limits_{l\Delta}^{s}d\tau ds=
$$

$$
=\sum_{l=0}^{N-1}\sum_{q=0}^{l-1}\Delta\mathbf{f}_{q\Delta}^{(i_1)}\Delta\mathbf{f}_{l\Delta}^{(i_2)}+\frac{1}{2}\sum_{l=0}^{N-1}\Delta\mathbf{f}_{l\Delta}^{(i_1)}\Delta\mathbf{f}_{l\Delta}^{(i_2)}. \tag{53}
$$

Using (53), it is not difficult to show that

$$
\underset{N\to\infty}{\text{l.i.m.}}\int\limits_0^T\int\limits_0^s d\mathbf{b}_{\Delta}^{(i_1)}(\tau)d\mathbf{b}_{\Delta}^{(i_2)}(s)=\int\limits_0^T\int\limits_0^s d\mathbf{f}_{\tau}^{(i_1)}d\mathbf{f}_{s}^{(i_2)}+\frac{1}{2}\mathbf{1}_{\{i_1=i_2\}}\int\limits_0^T ds=
$$

$$
=\int\limits_0^{*T}\int\limits_0^{*s} d\mathbf{f}_{\tau}^{(i_1)}d\mathbf{f}_{s}^{(i_2)}, \tag{54}
$$

where $\Delta\to 0$ if $N\to\infty$ $(N\Delta=T)$.

Obviously, (54) agrees with Theorem 7.1 (see [53], p. 486).

The next example relates to the approximation of the Wiener process based on its series expansion (46) for $t=0$, where $\{\phi_j(x)\}_{j=0}^{\infty}$ is a complete orthonormal system of Legendre polynomials or trigonometric functions in the space $L_2([0,T])$.

Consider the following iterated Riemann–Stieltjes integral

$$
\int\limits_0^T\int\limits_0^s d\mathbf{f}_{\tau}^{(i_1)p}d\mathbf{f}_{s}^{(i_2)p},\quad i_1,i_2=1,\ldots,m, \tag{55}
$$

where $d\mathbf{f}_{\tau}^{(i)p}$ is defined by the relation (48).

Let us substitute (48) into (55)

$$
\int\limits_0^T\int\limits_0^s d\mathbf{f}_{\tau}^{(i_1)p}d\mathbf{f}_{s}^{(i_2)p}=\sum_{j_1,j_2=0}^{p}C_{j_2j_1}\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}, \tag{56}
$$

where

$$
C_{j_2j_1}=\int\limits_0^T\phi_{j_2}(s)\int\limits_0^s\phi_{j_1}(\tau)d\tau ds
$$

is the Fourier coefficient; another notations are the same as in (51).

As we noted above, approximations of the Wiener process that are similar to (47) were not considered in [51], [52] (also see Theorems 7.1, 7.2 in [53]). Furthermore, the extension of the results of Theorems 7.1 and 7.2 [53] to the case under consideration is not obvious.

On the other hand, we can apply the theory built in Chapters 1 and 2 of the monographs [25]-[27]. More precisely, using Theorems 3, 4 from this paper, we obtain from (56) the desired result

$$\underset{p\to\infty}{\text{l.i.m.}}\int\limits_0^T\int\limits_0^s d\mathbf{f}_\tau^{(i_1)p}d\mathbf{f}_s^{(i_2)p}=\underset{p\to\infty}{\text{l.i.m.}}\sum_{j_1,j_2=0}^{p}C_{j_2j_1}\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}=$$

$$=\int\limits_0^{*T}\int\limits_0^{*s}d\mathbf{f}_\tau^{(i_1)}d\mathbf{f}_s^{(i_2)}. \qquad (57)$$

From the other hand, by Theorems 1, 2 (see (10)) for the case $k=2$ we obtain from (56) the following relation

$$\underset{p\to\infty}{\text{l.i.m.}}\int\limits_0^T\int\limits_0^s d\mathbf{f}_\tau^{(i_1)p}d\mathbf{f}_s^{(i_2)p}=\underset{p\to\infty}{\text{l.i.m.}}\sum_{j_1,j_2=0}^{p}C_{j_2j_1}\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}=$$

$$=\underset{p\to\infty}{\text{l.i.m.}}\sum_{j_1,j_2=0}^{p}C_{j_2j_1}\left(\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}-\mathbf{1}_{\{i_1=i_2\}}\mathbf{1}_{\{j_1=j_2\}}\right)+\mathbf{1}_{\{i_1=i_2\}}\sum_{j_1=0}^{\infty}C_{j_1j_1}=$$

$$=\int\limits_0^T\int\limits_0^s d\mathbf{f}_\tau^{(i_1)}d\mathbf{f}_s^{(i_2)}+\mathbf{1}_{\{i_1=i_2\}}\sum_{j_1=0}^{\infty}C_{j_1j_1}. \qquad (58)$$

Since

$$\sum_{j_1=0}^{\infty}C_{j_1j_1}=\frac{1}{2}\sum_{j_1=0}^{\infty}\left(\int\limits_0^T\phi_j(\tau)d\tau\right)^2=\frac{1}{2}\left(\int\limits_0^T\phi_0(\tau)d\tau\right)^2=\frac{1}{2}\int\limits_0^T ds,$$

then from standard relation between Ito and Stratonovich stochastic integrals and (58) we obtain (57).

9. Recent Results on Expansions of Iterated Stratonovich Stochastic Integrals of Multiplicities 3 to 6

Recently, a new approach to the expansion and mean-square approximation of iterated Stratonovich stochastic integrals has been obtained [25] (Sect. 2.10–2.16), [32] (Sect. 5–11), [33] (Sect. 7–13), [43] (Sect. 13–19), [63] (Sect. 4–9), [64]. Let us formulate four theorems that were obtained using this approach.

Theorem 7 [25], [32], [33], [43], [63]. *Suppose that* $\{\phi_j(x)\}_{j=0}^{\infty}$ *is a complete orthonormal system of Legendre polynomials or trigonometric functions in the space* $L_2([t,T])$. *Furthermore, let* $\psi_1(\tau),\psi_2(\tau)$, $\psi_3(\tau)$ *are continuously differentiable nonrandom functions on* $[t,T]$. *Then, for the iterated Stratonovich stochastic integral of third multiplicity*

$$J^*[\psi^{(3)}]_{T,t}=\int\limits_t^{*T}\psi_3(t_3)\int\limits_t^{*t_3}\psi_2(t_2)\int\limits_t^{*t_2}\psi_1(t_1)d\mathbf{w}_{t_1}^{(i_1)}d\mathbf{w}_{t_2}^{(i_2)}d\mathbf{w}_{t_3}^{(i_3)}\quad (i_1,i_2,i_3=0,1,\ldots,m)$$

the following relations

$$J^*[\psi^{(3)}]_{T,t} = \underset{p\to\infty}{\text{l.i.m.}} \sum_{j_1,j_2,j_3=0}^{p} C_{j_3j_2j_1}\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}\zeta_{j_3}^{(i_3)}, \tag{59}$$

$$\mathsf{M}\left\{\left(J^*[\psi^{(3)}]_{T,t} - \sum_{j_1,j_2,j_3=0}^{p} C_{j_3j_2j_1}\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}\zeta_{j_3}^{(i_3)}\right)^2\right\} \le \frac{C}{p} \tag{60}$$

are fulfilled, where $i_1, i_2, i_3 = 0, 1, \ldots, m$ *in* (59) *and* $i_1, i_2, i_3 = 1, \ldots, m$ *in* (60), *constant* C *is independent of* p,

$$C_{j_3j_2j_1} = \int\limits_t^T \psi_3(t_3)\phi_{j_3}(t_3)\int\limits_t^{t_3} \psi_2(t_2)\phi_{j_2}(t_2)\int\limits_t^{t_2} \psi_1(t_1)\phi_{j_1}(t_1)dt_1dt_2dt_3$$

and

$$\zeta_j^{(i)} = \int\limits_t^T \phi_j(\tau)d\mathbf{f}_\tau^{(i)}$$

are independent standard Gaussian random variables for various i *or* j *(in the case when* $i \ne 0$*); another notations are the same as in Theorems* 1, 2.

Theorem 8 [25], [32], [33], [43], [63]. *Let* $\{\phi_j(x)\}_{j=0}^{\infty}$ *be a complete orthonormal system of Legendre polynomials or trigonometric functions in the space* $L_2([t,T])$. *Furthermore, let* $\psi_1(\tau), \ldots, \psi_4(\tau)$ *be continuously differentiable nonrandom functions on* $[t,T]$. *Then, for the iterated Stratonovich stochastic integral of fourth multiplicity*

$$J^*[\psi^{(4)}]_{T,t} = \int\limits_t^{*T} \psi_4(t_4)\int\limits_t^{*t_4} \psi_3(t_3)\int\limits_t^{*t_3} \psi_2(t_2)\int\limits_t^{*t_2} \psi_1(t_1)d\mathbf{w}_{t_1}^{(i_1)}d\mathbf{w}_{t_2}^{(i_2)}d\mathbf{w}_{t_3}^{(i_3)}d\mathbf{w}_{t_4}^{(i_4)} \tag{61}$$

the following relations

$$J^*[\psi^{(4)}]_{T,t} = \underset{p\to\infty}{\text{l.i.m.}} \sum_{j_1,j_2,j_3,j_4=0}^{p} C_{j_4j_3j_2j_1}\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}\zeta_{j_3}^{(i_3)}\zeta_{j_4}^{(i_4)}, \tag{62}$$

$$\mathsf{M}\left\{\left(J^*[\psi^{(4)}]_{T,t} - \sum_{j_1,j_2,j_3,j_4=0}^{p} C_{j_4j_3j_2j_1}\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}\zeta_{j_3}^{(i_3)}\zeta_{j_4}^{(i_4)}\right)^2\right\} \le \frac{C}{p^{1-\varepsilon}} \tag{63}$$

are fulfilled, where $i_1, \ldots, i_4 = 0, 1, \ldots, m$ *in* (61), (62) *and* $i_1, \ldots, i_4 = 1, \ldots, m$ *in* (63), *constant* C *does not depend on* p, ε *is an arbitrary small positive real number for the case of complete orthonormal system of Legendre polynomials in the space* $L_2([t,T])$ *and* $\varepsilon = 0$ *for the case of complete orthonormal system of trigonometric functions in the space* $L_2([t,T])$,

$$C_{j_4 j_3 j_2 j_1} =$$

$$= \int\limits_t^T \psi_4(t_4)\phi_{j_4}(t_4) \int\limits_t^{t_4} \psi_3(t_3)\phi_{j_3}(t_3) \int\limits_t^{t_3} \psi_2(t_2)\phi_{j_2}(t_2) \int\limits_t^{t_2} \psi_1(t_1)\phi_{j_1}(t_1) dt_1 dt_2 dt_3 dt_4;$$

another notations are the same as in Theorem 7.

Theorem 9 [25], [32], [33], [43], [63]. *Assume that* $\{\phi_j(x)\}_{j=0}^{\infty}$ *is a complete orthonormal system of Legendre polynomials or trigonometric functions in the space* $L_2([t,T])$ *and* $\psi_1(\tau), \ldots, \psi_5(\tau)$ *are continuously differentiable nonrandom functions on* $[t,T]$. *Then, for the iterated Stratonovich stochastic integral of fifth multiplicity*

$$J^*[\psi^{(5)}]_{T,t} = \int\limits_t^{*T} \psi_5(t_5) \ldots \int\limits_t^{*t_2} \psi_1(t_1) d\mathbf{w}_{t_1}^{(i_1)} \ldots d\mathbf{w}_{t_5}^{(i_5)} \tag{64}$$

the following relations

$$J^*[\psi^{(5)}]_{T,t} = \underset{p\to\infty}{\text{l.i.m.}} \sum_{j_1,\ldots,j_5=0}^{p} C_{j_5\ldots j_1} \zeta_{j_1}^{(i_1)} \ldots \zeta_{j_5}^{(i_5)}, \tag{65}$$

$$\mathsf{M}\left\{\left(J^*[\psi^{(5)}]_{T,t} - \sum_{j_1,\ldots,j_5=0}^{p} C_{j_5\ldots j_1} \zeta_{j_1}^{(i_1)} \ldots \zeta_{j_5}^{(i_5)}\right)^2\right\} \le \frac{C}{p^{1-\varepsilon}} \tag{66}$$

are fulfilled, where $i_1, \ldots, i_5 = 0, 1, \ldots, m$ *in* (64), (65) *and* $i_1, \ldots, i_5 = 1, \ldots, m$ *in* (66), *constant* C *is independent of* p, ε *is an arbitrary small positive real number for the case of complete orthonormal system of Legendre polynomials in the space* $L_2([t,T])$ *and* $\varepsilon = 0$ *for the case of complete orthonormal system of trigonometric functions in the space* $L_2([t,T])$,

$$C_{j_5\ldots j_1} = \int\limits_t^T \psi_5(t_5)\phi_{j_5}(t_5) \ldots \int\limits_t^{t_2} \psi_1(t_1)\phi_{j_1}(t_1) dt_1 \ldots dt_5;$$

another notations are the same as in Theorems 7, 8.

Theorem 10 [25], [32], [33], [43], [64]. *Suppose that* $\{\phi_j(x)\}_{j=0}^{\infty}$ *is a complete orthonormal system of Legendre polynomials or trigonometric functions in the space* $L_2([t,T])$. *Then, for the iterated Stratonovich stochastic integral of sixth multiplicity*

$$J_{T,t}^{*(i_1\ldots i_6)} = \int\limits_t^{*T} \ldots \int\limits_t^{*t_2} d\mathbf{w}_{t_1}^{(i_1)} \ldots d\mathbf{w}_{t_6}^{(i_6)} \tag{67}$$

the following expansion

$$J_{T,t}^{*(i_1\ldots i_6)}=\underset{p\to\infty}{\text{l.i.m.}}\sum_{j_1,\ldots,j_6=0}^{p}C_{j_6\ldots j_1}\zeta_{j_1}^{(i_1)}\ldots\zeta_{j_6}^{(i_6)}$$

that converges in the mean-square sense is valid, where $i_1,\ldots,i_6=0,1,\ldots,m,$

$$C_{j_6\ldots j_1}=\int\limits_t^T\phi_{j_6}(t_6)\ldots\int\limits_t^{t_2}\phi_{j_1}(t_1)dt_1\ldots dt_6;$$

another notations are the same as in Theorems 7–9.

EXPANSION OF ITERATED STRATONOVICH STOCHASTIC INTEGRALS OF MULTIPLICITY 2. COMBINED APPROACH BASED ON GENERALIZED MULTIPLE AND ITERATED FOURIER SERIES

DMITRIY F. KUZNETSOV

Abstract. The article is devoted to the expansion of iterated Stratonovich stochastic integrals of multiplicity 2 on the base of the combined approach of generalized multiple and iterated Fourier series. We consider two different parts of the expansion of iterated Stratonovich stochastic integrals. The mean-square convergence of the first part is proved on the base of generalized multiple Fourier series converging in the sense of norm in Hilbert space $L_2([t,T]^2)$. The mean-square convergence of the second part is proved on the base of generalized iterated (double) Fourier series converging pointwise. At that, we prove the iterated limit transition for the second part of the expansion on the base of Lebesgue's Dominated Convergence Theorem. The results of the article can be applied to the numerical integration of Ito stochastic differential equations.

Contents

1. Introduction

Let $(\Omega, \mathrm{F}, \mathsf{P})$ be a complete probability space, let $\{\mathrm{F}_t, t\in[0,T]\}$ be a nondecreasing right-continous family of σ-algebras of F, and let $\mathbf{f}_t$ be a standard m-dimensional Wiener stochastic process, which is F_t-measurable for any $t\in[0,T]$. We assume that the components $\mathbf{f}_t^{(i)}$ $(i=1,\ldots,m)$ of this process are independent.

Let us consider the following collections of iterated Stratonovich and Ito stochastic integrals

Mathematics Subject Classification: 60H05, 60H10, 42B05, 42C10.

Keywords: Iterated Stratonovich stochastic integral, Iterated Ito stochastic integral, Generalized multiple Fourier series, Generalized iterated Fourier series, Legendre polynomial, Trigonometric functions, Mean-square approximation, Expansion.

$$J^*[\psi^{(2)}]_{T,t} = \int\limits_t^{*T} \psi_2(t_2) \int\limits_t^{*t_2} \psi_1(t_1) d\mathbf{w}_{t_1}^{(i_1)} d\mathbf{w}_{t_2}^{(i_2)}, \tag{1}$$

$$J[\psi^{(2)}]_{T,t} = \int\limits_t^{T} \psi_2(t_2) \int\limits_t^{t_2} \psi_1(t_1) d\mathbf{w}_{t_1}^{(i_1)} d\mathbf{w}_{t_2}^{(i_2)}, \tag{2}$$

where every $\psi_l(\tau)$ $(l = 1,\ 2)$ is a nonrandom function at the interval $[t, T]$, $\mathbf{w}_\tau^{(i)} = \mathbf{f}_\tau^{(i)}$ for $i = 1, \ldots, m$ and $\mathbf{w}_\tau^{(0)} = \tau,\ \ i_1, \ldots, i_k = 0,\ 1, \ldots, m,$

$$\int\limits^{*} \text{ and } \int$$

denote Stratonovich and Ito stochastic integrals, respectively (in this paper, we use the definition of the Stratonovich stochastic integral from [1]).

Further, we will denote as $\{\phi_j(x)\}_{j=0}^{\infty}$ the complete orthonormal systems of Legendre polynomials and trigonometric functions in the space $L_2([t, T])$. Also we will pay a special attention on the following well-known facts connecting to these two systems of functions [2].

Suppose that the function $f(x)$ is bounded at the interval $[t, T]$. Moreover, its derivative $f'(x)$ is a continuous function at the interval $[t, T]$ except may be the finite number of points of the finite discontinuity. Then the Fourier series

$$\sum_{j=0}^{\infty} C_j \phi_j(x), \quad C_j = \int\limits_t^T f(x)\phi_j(x)dx$$

converges at any internal point x of the interval $[t, T]$ to the value $\left(f(x + 0) + f(x - 0)\right)/2$ and converges uniformly to $f(x)$ on any closed interval of continuity of the function $f(x)$ laying inside $[t, T]$. At the same time, the Fourier–Legendre series converges if $x = t$ and $x = T$ to $f(t + 0)$ and $f(T - 0)$ correspondently, and the trigonometric Fourier series converges if $x = t$ and $x = T$ to $\left(f(t + 0) + f(T - 0)\right)/2$ in the case of periodic continuation of the function $f(x)$.

2. Expansion of Iterated Stratonovich Stochastic Integrals of Multiplicity 2

The use of generalized multiple and iterated Fourier series by various complete orthonormal systems of functions in the space $L_2([t, T])$ for the expansion of iterated Ito and Stratonovich stochastic integrals is reflected in a number of works of the author [3]-[44]. In these papers, several new approaches to the mean-square approximation of iterated stochastic integrals were proposed and developed. One of the mentioned approaches (the so-called combined approach) for the expansion of iterated Stratonovich stochastic integrals of multiplicities 1 to 4 based on generalized multiple and iterated Fourier series has been considered in [4]. In this article, we consider the case of second multiplicity of iterated Stratonovich stochastic integrals. At that, we prove the mean-square convergence of the expansion of iterated Stratonovich stochastic integrals using the another method in comparison with the method from [4].

Theorem 1 [3] (2013) (also see [8] (Sect. 2.1.1) and references therein). *Suppose that $\{\phi_j(x)\}_{j=0}^{\infty}$ is a complete orthonormal system of Legendre polynomials or trigonometric functions in the space $L_2([t, T])$. At the same time $\psi_2(\tau)$ is a continuously differentiable nonrandom function on $[t, T]$ and*

$\psi_1(\tau)$ is twice continuously differentiable nonrandom function on $[t,T]$. Then the iterated Stratonovich stochastic integral of the second multiplicity

$$J^*[\psi^{(2)}]_{T,t}={\int\limits_t^{*}}^{T}\psi_2(t_2){\int\limits_t^{*}}^{t_2}\psi_1(t_1)d\mathbf{w}_{t_1}^{(i_1)}d\mathbf{w}_{t_2}^{(i_2)}\quad (i_1,i_2=0,1,\ldots,m)$$

is expanded into the multiple series

$$J^*[\psi^{(2)}]_{T,t}=\underset{p_1,p_2\to\infty}{\text{l.i.m.}}\sum_{j_1=0}^{p_1}\sum_{j_2=0}^{p_2}C_{j_2j_1}\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}$$

that converges in the mean-square sense, where l.i.m. *is a limit in the mean-square sense,*

$$\zeta_j^{(i)}=\int\limits_t^T\phi_j(\tau)d\mathbf{w}_\tau^{(i)}$$

are independent standard Gaussian random variables for various i or j (if $i\neq 0$),

$$C_{j_2j_1}=\int\limits_t^T\psi_2(t_2)\phi_{j_2}(t_2)\int\limits_t^{t_2}\psi_1(t_1)\phi_{j_1}(t_1)dt_1dt_2$$

is the Fourier coefficient.

Remark 1. *It should be noted that Theorem* 1 *is proved in* [3] (2013) (*also see* [8] (*Sect.* 2.1.1) *and references therein*). *The proof from* [3], [8] (*Sect.* 2.1.1) *is based on double integration by parts. Below we consider another proof of Theorem* 1.

Proof. Let us consider some auxiliary lemmas from [3] (also see [8] and references therein). At that, we will consider the particular case of these lemmas for $k=2$.

Consider the partition $\{\tau_j\}_{j=0}^N$ of the interval $[t,T]$ such that

$$t=\tau_0<\ldots<\tau_N=T,\quad \Delta_N=\max_{0\le j\le N-1}\Delta\tau_j\to 0\ \text{ if }\ N\to\infty,\quad \Delta\tau_j=\tau_{j+1}-\tau_j. \tag{3}$$

Lemma 1 [3] (also see [8] and references therein). *Suppose that every $\psi_l(\tau)$ $(l=1,\ 2)$ is a continuous nonrandom function at the interval $[t,T]$. Then*

$$J[\psi^{(2)}]_{T,t}=\underset{N\to\infty}{\text{l.i.m.}}\sum_{j_2=0}^{N-1}\sum_{j_1=0}^{j_2-1}\psi_1(\tau_{j_1})\psi_2(\tau_{j_2})\Delta\mathbf{w}_{\tau_{j_1}}^{(i_1)}\Delta\mathbf{w}_{\tau_{j_2}}^{(i_2)}\quad \text{w. p. 1}, \tag{4}$$

where $J[\psi^{(2)}]_{T,t}$ is the iterated Ito stochastic integral (2), $\Delta\mathbf{w}_{\tau_j}^{(i)}=\mathbf{w}_{\tau_{j+1}}^{(i)}-\mathbf{w}_{\tau_j}^{(i)}$ $(i=0,1,\ldots,m)$, *$\{\tau_j\}_{j=0}^N$ is the partition of the interval $[t,T]$ satisfying the condition* (3); *hereinafter w. p.* 1 *means with probability* 1.

Let us define the following multiple stochastic integral

$$\underset{N\to\infty}{\text{l.i.m.}}\sum_{j_1,j_2=0}^{N-1}\Phi\left(\tau_{j_1},\tau_{j_2}\right)\Delta\mathbf{w}_{\tau_{j_1}}^{(i_1)}\Delta\mathbf{w}_{\tau_{j_2}}^{(i_2)}\stackrel{\text{def}}{=}J[\Phi]_{T,t}^{(2)}, \tag{5}$$

where $\Phi(t_1, t_2): [t, T]^2 \to \mathbb{R}$ is a nonrandom function (the properties of this function will be specified further), $\Delta \mathbf{w}_{\tau_j}^{(i)} = \mathbf{w}_{\tau_{j+1}}^{(i)} - \mathbf{w}_{\tau_j}^{(i)}$ $(i = 0, 1, \ldots, m)$, $\{\tau_j\}_{j=0}^{N}$ is the partition of the interval $[t, T]$ satisfying the condition (3).

Denote

$$D_2 = \{(t_1, t_2): \ t \le t_1 < t_2 \le T\}. \tag{6}$$

We will use the same symbol D_2 to denote the open and closed domains corresponding to the domain D_2 defined by (6). However, we always specify what domain we consider (open or closed).

Also we will write $\Phi(t_1, t_2) \in C(D_2)$ if $\Phi(t_1, t_2)$ is a continuous nonrandom function of two variables in the closed domain D_2.

Let us consider the iterated Ito stochastic integral

$$I[\Phi]_{T,t}^{(2)} \stackrel{\rm def}{=} \int\limits_t^T \int\limits_t^{t_2} \Phi(t_1, t_2) d\mathbf{w}_{t_1}^{(i_1)} d\mathbf{w}_{t_2}^{(i_2)},$$

where $\Phi(t_1, t_2) \in C(D_2)$.

Lemma 2 [3] (also see [8] and references therein). *Suppose that $\Phi(t_1, t_2) \in C(D_2)$ or $\Phi(t_1, t_2)$ is a continuous nonrandom function in the open domain D_2 and bounded at its boundary. Then*

$$I[\Phi]_{T,t}^{(2)} = \underset{N \to \infty}{\rm l.i.m.} \sum_{j_k=0}^{N-1} \sum_{j_1=0}^{j_2-1} \Phi(\tau_{j_1}, \tau_{j_2}) \Delta \mathbf{w}_{\tau_{j_1}}^{(i_1)} \Delta \mathbf{w}_{\tau_{j_2}}^{(i_2)} \quad \text{w. p. 1}, \tag{7}$$

where $\Delta \mathbf{w}_{\tau_j}^{(i)} = \mathbf{w}_{\tau_{j+1}}^{(i)} - \mathbf{w}_{\tau_j}^{(i)}$ $(i = 0, 1, \ldots, m)$, $\{\tau_j\}_{j=0}^{N}$ is the partition of the interval $[t, T]$ satisfying the condition (3).

Lemma 3 [3] (also see [8] and references therein). *Suppose that every $\varphi_l(\tau)$ $(l = 1, \ 2)$ is a continuous nonrandom function at the interval $[t, T]$. Then*

$$J[\varphi_1]_{T,t} J[\varphi_2]_{T,t} = J[\Phi]_{T,t}^{(2)} \quad w. \ p. \ 1, \tag{8}$$

where

$$\Phi(t_1, t_2) = \varphi_1(t_1)\varphi_2(t_2), \qquad J[\varphi_l]_{T,t} = \int\limits_t^T \varphi_l(\tau) d\mathbf{w}_{\tau}^{(i_l)} \quad (l = 1, \ 2)$$

and the stochastic integral $J[\Phi]_{T,t}^{(2)}$ is defined by the equality (5), $i_1, i_2 = 0, 1, \ldots, m$.

In accordance to the standard relations between Stratonovich and Ito stochastic integrals we have w. p. 1 [1]

$$J^*[\psi^{(2)}]_{T,t} = J[\psi^{(2)}]_{T,t} + \frac{1}{2} \mathbf{1}_{\{i_1 = i_2 \ne 0\}} \int\limits_t^T \psi_1(t_1)\psi_2(t_1) dt_1, \tag{9}$$

where $\mathbf{1}_A$ is the indicator of the set A.

Let us define the function $K^*(t_1, t_2)$ at the square $[t, T]^2$ as follows

$$K^*(t_1, t_2) = \psi_1(t_1)\psi_2(t_2) \left(\mathbf{1}_{\{t_1 < t_2\}} + \frac{1}{2} \mathbf{1}_{\{t_1 = t_2\}} \right) = K(t_1, t_2) + \frac{1}{2} \mathbf{1}_{\{t_1 = t_2\}} \psi_1(t_1)\psi_2(t_2), \tag{10}$$

where

$$K(t_1,t_2)=\begin{cases}\psi_1(t_1)\psi_2(t_2), & t_1<t_2\\ & \\ 0, & \text{otherwise}\end{cases},\quad t_1,t_2\in[t,T]$$

and $\mathbf{1}_A$ is the indicator of the set A.

Lemma 4 [3] (also see [8] and references therein). *Under the conditions of Theorem* 1 *the following relation*

$$J[K^*]_{T,t}^{(2)}=J^*[\psi^{(2)}]_{T,t} \tag{11}$$

is valid w. p. 1*, where* $J[K^*]_{T,t}^{(2)}$ *is defined by the equality* (5).

Proof. Substituting (10) into (5) and using Lemmas 1 and 2, it is easy to see that

$$J[K^*]_{T,t}^{(2)}=J[\psi^{(2)}]_{T,t}+\frac{1}{2}\mathbf{1}_{\{i_1=i_2\ne 0\}}\int\limits_t^T\psi_1(t_1)\psi_2(t_1)dt_1=J^*[\psi^{(2)}]_{T,t}\quad \text{w. p. 1.} \tag{12}$$

Let us consider the following generalized double Fourier sum

$$\sum_{j_1=0}^{p_1}\sum_{j_2=0}^{p_2}C_{j_2j_1}\phi_{j_1}(t_1)\phi_{j_2}(t_2),$$

where $C_{j_2j_1}$ is the Fourier coefficient of the form

$$C_{j_2j_1}=\int\limits_{[t,T]^2}K^*(t_1,t_2)\phi_{j_1}(t_1)\phi_{j_2}(t_2)dt_1dt_2. \tag{13}$$

Substitute the relation

$$K^*(t_1,t_2)=\sum_{j_1=0}^{p_1}\sum_{j_2=0}^{p_2}C_{j_2j_1}\phi_{j_1}(t_1)\phi_{j_2}(t_2)+K^*(t_1,t_2)-\sum_{j_1=0}^{p_1}\sum_{j_2=0}^{p_2}C_{j_2j_1}\phi_{j_1}(t_1)\phi_{j_2}(t_2)$$

with finite p_1 and p_2 into $J[K^*]_{T,t}^{(2)}$. Then, using Lemma 3, we obtain

$$J^*[\psi^{(2)}]_{T,t}=\sum_{j_1=0}^{p_1}\sum_{j_2=0}^{p_2}C_{j_2j_1}\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}+J[R_{p_1p_2}]_{T,t}^{(2)}\quad \text{w. p. 1,} \tag{14}$$

where the stochastic integral $J[R_{p_1p_2}]_{T,t}^{(2)}$ is defined in accordance with (5) and

$$R_{p_1p_2}(t_1,t_2)=K^*(t_1,t_2)-\sum_{j_1=0}^{p_1}\sum_{j_2=0}^{p_2}C_{j_2j_1}\phi_{j_1}(t_1)\phi_{j_2}(t_2), \tag{15}$$

$$\zeta_j^{(i)}=\int\limits_t^T \phi_j(\tau)d\mathbf{w}_{\tau}^{(i)},$$

$$J[R_{p_1p_2}]_{T,t}^{(2)}=\int\limits_t^T\int\limits_t^{t_2} R_{p_1p_2}(t_1,t_2)d\mathbf{w}_{t_1}^{(i_1)}d\mathbf{w}_{t_2}^{(i_2)}+\int\limits_t^T\int\limits_t^{t_1} R_{p_1p_2}(t_1,t_2)d\mathbf{w}_{t_2}^{(i_2)}d\mathbf{w}_{t_1}^{(i_1)}+$$

$$+\mathbf{1}_{\{i_1=i_2\ne 0\}}\int\limits_t^T R_{p_1p_2}(t_1,t_1)dt_1.$$

Let us consider the case $i_1,i_2\ne 0$ (another cases can be considered absolutely analogously). Using standard estimates for moments of stochastic integrals [23], we obtain

$$\mathsf{M}\left\{\left(J[R_{p_1p_2}]_{T,t}^{(2)}\right)^2\right\}=$$

$$=\mathsf{M}\left\{\left(\int\limits_t^T\int\limits_t^{t_2} R_{p_1p_2}(t_1,t_2)d\mathbf{w}_{t_1}^{(i_1)}d\mathbf{w}_{t_2}^{(i_2)}+\int\limits_t^T\int\limits_t^{t_1} R_{p_1p_2}(t_1,t_2)d\mathbf{w}_{t_2}^{(i_2)}d\mathbf{w}_{t_1}^{(i_1)}\right)^2\right\}+$$

$$+\mathbf{1}_{\{i_1=i_2\ne 0\}}\left(\int\limits_t^T R_{p_1p_2}(t_1,t_1)dt_1\right)^2\le$$

$$\le 2\left(\int\limits_t^T\int\limits_t^{t_2}\left(R_{p_1p_2}(t_1,t_2)\right)^2dt_1dt_2+\int\limits_t^T\int\limits_t^{t_1}\left(R_{p_1p_2}(t_1,t_2)\right)^2dt_2dt_1\right)+$$

$$+\mathbf{1}_{\{i_1=i_2\ne 0\}}\left(\int\limits_t^T R_{p_1p_2}(t_1,t_1)dt_1\right)^2=$$

$$=2\int\limits_{[t,T]^2}\left(R_{p_1p_2}(t_1,t_2)\right)^2dt_1dt_2+\mathbf{1}_{\{i_1=i_2\ne 0\}}\left(\int\limits_t^T R_{p_1p_2}(t_1,t_1)dt_1\right)^2. \tag{16}$$

We have

$$\int\limits_{[t,T]^2}\left(R_{p_1p_2}(t_1,t_2)\right)^2dt_1dt_2=$$

$$=\int\limits_{[t,T]^2}\left(K^*(t_1,t_2)-\sum_{j_1=0}^{p_1}\sum_{j_2=0}^{p_2}C_{j_2j_1}\phi_{j_1}(t_1)\phi_{j_2}(t_2)\right)^2dt_1dt_2=$$

$$=\int\limits_{[t,T]^2}\left(K(t_1,t_2)-\sum_{j_1=0}^{p_1}\sum_{j_2=0}^{p_2}C_{j_2j_1}\phi_{j_1}(t_1)\phi_{j_2}(t_2)\right)^2dt_1dt_2.$$

The function $K(t_1,t_2)$ is piecewise continuous in the square $[t,T]^2$. At this situation it is well-known that the generalized multiple Fourier series of the function $K(t_1,t_2)\in L_2([t,T]^2)$ is converging to this function in the square $[t,T]^2$ in the mean-square sense, i.e.

$$\lim_{p_1,p_2\to\infty}\left\|K(t_1,t_2)-\sum_{j_1=0}^{p_1}\sum_{j_2=0}^{p_2}C_{j_2j_1}\prod_{l=1}^{2}\phi_{j_l}(t_l)\right\|_{L_2([t,T]^2)}=0,$$

where

$$\|f\|_{L_2([t,T]^2)}=\left(\int\limits_{[t,T]^2}f^2(t_1,t_2)dt_1dt_2\right)^{1/2}.$$

So, we obtain

$$\lim_{p_1,p_2\to\infty}\int\limits_{[t,T]^2}\left(R_{p_1p_2}(t_1,t_2)\right)^2dt_1dt_2=0. \tag{17}$$

Note that

$$\int\limits_t^T R_{p_1p_2}(t_1,t_1)dt_1=$$

$$=\int\limits_t^T\left(\frac{1}{2}\psi_1(t_1)\psi_2(t_1)-\sum_{j_1=0}^{p_1}\sum_{j_2=0}^{p_2}C_{j_2j_1}\phi_{j_1}(t_1)\phi_{j_2}(t_1)\right)dt_1=$$

$$=\frac{1}{2}\int\limits_t^T\psi_1(t_1)\psi_2(t_1)dt_1-\sum_{j_1=0}^{p_1}\sum_{j_2=0}^{p_2}C_{j_2j_1}\int\limits_t^T\phi_{j_1}(t_1)\phi_{j_2}(t_1)dt_1=$$

$$=\frac{1}{2}\int\limits_t^T\psi_1(t_1)\psi_2(t_1)dt_1-\sum_{j_1=0}^{p_1}\sum_{j_2=0}^{p_2}C_{j_2j_1}\mathbf{1}_{\{j_1=j_2\}}=$$

$$=\frac{1}{2}\int\limits_t^T\psi_1(t_1)\psi_2(t_1)dt_1-\sum_{j_1=0}^{\min\{p_1,p_2\}}C_{j_1j_1}. \tag{18}$$

From (18) we obtain

$$\lim_{p_1\to\infty}\lim_{p_2\to\infty}\int\limits_t^T R_{p_1p_2}(t_1,t_1)dt_1= \tag{19}$$

$$=\frac{1}{2}\int\limits_t^T\psi_1(t_1)\psi_2(t_1)dt_1-\lim_{p_1\to\infty}\sum_{j_1=0}^{p_1}C_{j_1j_1}=$$

$$= \frac{1}{2}\int\limits_t^T \psi_1(t_1)\psi_2(t_1)dt_1 - \sum_{j_1=0}^{\infty} C_{j_1 j_1} =$$

$$= \lim_{p_1,p_2\to\infty}\int\limits_t^T R_{p_1p_2}(t_1,t_1)dt_1. \tag{20}$$

Note that the existence of the limit

$$\lim_{p_1\to\infty}\sum_{j_1=0}^{p_1} C_{j_1j_1}$$

is proved in [8] (Sect. 2.1.1, 2.1.2) for the polynomial and trigonometric cases.

If we prove the following relation

$$\lim_{p_1\to\infty}\lim_{p_2\to\infty}\int\limits_t^T R_{p_1p_2}(t_1,t_1)dt_1 = 0, \tag{21}$$

then from (20) we get

$$\frac{1}{2}\int\limits_t^T \psi_1(t_1)\psi_2(t_1)dt_1 = \sum_{j_1=0}^{\infty} C_{j_1j_1}, \tag{22}$$

$$\lim_{p_1,p_2\to\infty}\int\limits_t^T R_{p_1p_2}(t_1,t_1)dt_1 = 0. \tag{23}$$

From (16), (17), and (23) we obtain

$$\lim_{p_1,p_2\to\infty} \mathsf{M}\left\{\left(J[R_{p_1p_2}]_{T,t}^{(2)}\right)^2\right\} = 0$$

and Theorem 1 will be proved.

Let us expand the function $K^*(t_1,t_2)$ (see (10)) using the variable t_1, when t_2 is fixed, into the generalized Fourier series at the interval (t,T)

$$K^*(t_1,t_2) = \sum_{j_1=0}^{\infty} C_{j_1}(t_2)\phi_{j_1}(t_1) \quad (t_1\neq t,T), \tag{24}$$

where

$$C_{j_1}(t_2) = \int\limits_t^T K^*(t_1,t_2)\phi_{j_1}(t_1)dt_1 = \psi_2(t_2)\int\limits_t^{t_2} \psi_1(t_1)\phi_{j_1}(t_1)dt_1.$$

The equality (24) is satisfied pointwise in each point of the interval (t, T) with respect to the variable t_1, when $t_2 \in [t, T]$ is fixed, due to a piecewise smoothness of the function $K^*(t_1, t_2)$ with respect to the variable $t_1 \in [t, T]$ (t_2 is fixed).

Note also that due to well-known properties of the Fourier–Legendre series and trigonometric Fourier series, the series (24) converges when $t_1 = t$ and $t_1 = T$.

Obtaining (24), we also used the fact that the right-hand side of (24) converges when $t_1 = t_2$ (point of a finite discontinuity of the function $K(t_1, t_2)$) to the value

$$\frac{1}{2}\left(K(t_2 - 0, t_2) + K(t_2 + 0, t_2)\right) = \frac{1}{2}\psi_1(t_2)\psi_2(t_2) = K^*(t_2, t_2).$$

The function $C_{j_1}(t_2)$ is a continuously differentiable one at the interval $[t, T]$. Let us expand it into the generalized Fourier series at the interval (t, T)

$$C_{j_1}(t_2) = \sum_{j_2=0}^{\infty} C_{j_2 j_1}\phi_{j_2}(t_2) \quad (t_2 \neq t, T), \tag{25}$$

where

$$C_{j_2 j_1} = \int\limits_t^T C_{j_1}(t_2)\phi_{j_2}(t_2)dt_2 = \int\limits_t^T \psi_2(t_2)\phi_{j_2}(t_2)\int\limits_t^{t_2}\psi_1(t_1)\phi_{j_1}(t_1)dt_1 dt_2$$

and the equality (25) is satisfied pointwise at any point of the interval (t, T) (the right-hand side of (25) converges when $t_2 = t$ and $t_1 = T$).

Let us substitute (25) into (24)

$$K^*(t_1, t_2) = \sum_{j_1=0}^{\infty}\sum_{j_2=0}^{\infty} C_{j_2 j_1}\phi_{j_1}(t_1)\phi_{j_2}(t_2), \quad (t_1, t_2) \in (t, T)^2. \tag{26}$$

Futhermore, the series on the right-hand side of (26) converges at the boundary of the square $[t, T]^2$.

From (15) and (26) we obtain

$$\lim_{p_1\to\infty}\lim_{p_2\to\infty} R_{p_1 p_2}(t_1, t_1) = 0 \quad \text{when} \quad t_1 \in (t, T). \tag{27}$$

Since the integral

$$\int\limits_t^T R_{p_1 p_2}(t_1, t_1)dt_1 \tag{28}$$

exists as Riemann integral, then this integral equals to the corresponding Lebesgue integral. Moreover,

$$\lim_{p_1\to\infty}\lim_{p_2\to\infty} R_{p_1 p_2}(t_1, t_1) = 0 \quad \text{when} \quad t_1 \in (t, T), \tag{29}$$

where the left-hand side of (29) is bounded on $[t, T]$.

According to (15), (24)–(26), we have

$$
R_{p_1p_2}(t_1,t_2)=\left(K^*(t_1,t_2)-\sum_{j_1=0}^{p_1}C_{j_1}(t_2)\phi_{j_1}(t_1)\right)+
$$

$$
+\left(\sum_{j_1=0}^{p_1}\left(C_{j_1}(t_2)-\sum_{j_2=0}^{p_2}C_{j_2j_1}\phi_{j_2}(t_2)\right)\phi_{j_1}(t_1)\right).
$$

Then, appling two times (we mean here an iterated passage to the limit $\lim\limits_{p_1\to\infty}\lim\limits_{p_2\to\infty}$) the Lebesgue's Dominated Convergence Theorem to the integral (28), we obtain

$$
\lim_{p_1\to\infty}\lim_{p_2\to\infty}\int\limits_t^T R_{p_1p_2}(t_1,t_1)dt_1=0.
$$

For a discussion of the choice of integrable majorants when applying Lebesgue's Dominated Convergence Theorem to the integral (28) for the polynomial and trigonometric cases, see [8] (Sect. 2.4.1), [43] (Sect. 2).

Note that the developement of the approach from this article can be found in [8] (Sect. 2.4), [43].

3. Some Recent Results on Expansion of Iterated Stratonovich Stochastic Integrals of Multiplicities 2 to 6

Recently, a new approach to the expansion and mean-square approximation of iterated Stratonovich stochastic integrals has been obtained [8] (Sect. 2.10–2.16), [13] (Sect. 13–19), [34] (Sect. 5–11), [35] (Sect. 7–13), [64] (Sect. 4–9). Let us formulate four theorems that were obtained using this approach.

Theorem 2 [8], [13], [34], [35], [64]. *Suppose that $\{\phi_j(x)\}_{j=0}^{\infty}$ is a complete orthonormal system of Legendre polynomials or trigonometric functions in the space $L_2([t,T])$. Furthermore, let $\psi_1(\tau),\psi_2(\tau)$, $\psi_3(\tau)$ are continuously differentiable nonrandom functions on $[t,T]$. Then, for the iterated Stratonovich stochastic integral of third multiplicity*

$$
J^*[\psi^{(3)}]_{T,t}=\int\limits_t^{*T}\psi_3(t_3)\int\limits_t^{*t_3}\psi_2(t_2)\int\limits_t^{*t_2}\psi_1(t_1)d\mathbf{w}_{t_1}^{(i_1)}d\mathbf{w}_{t_2}^{(i_2)}d\mathbf{w}_{t_3}^{(i_3)}\quad (i_1,i_2,i_3=0,1,\ldots,m)
$$

the following relations

$$
J^*[\psi^{(3)}]_{T,t}=\underset{p\to\infty}{\text{l.i.m.}}\sum_{j_1,j_2,j_3=0}^{p}C_{j_3j_2j_1}\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}\zeta_{j_3}^{(i_3)}, \tag{30}
$$

$$
\mathsf{M}\left\{\left(J^*[\psi^{(3)}]_{T,t}-\sum_{j_1,j_2,j_3=0}^{p}C_{j_3j_2j_1}\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}\zeta_{j_3}^{(i_3)}\right)^2\right\}\le\frac{C}{p} \tag{31}
$$

are fulfilled, where $i_1, i_2, i_3 = 0, 1, \ldots, m$ *in* (30) *and* $i_1, i_2, i_3 = 1, \ldots, m$ *in* (31)*, constant* C *is independent of* p*,*

$$C_{j_3j_2j_1} = \int\limits_t^T \psi_3(t_3)\phi_{j_3}(t_3) \int\limits_t^{t_3} \psi_2(t_2)\phi_{j_2}(t_2) \int\limits_t^{t_2} \psi_1(t_1)\phi_{j_1}(t_1) dt_1 dt_2 dt_3$$

and

$$\zeta_j^{(i)} = \int\limits_t^T \phi_j(\tau) d\mathbf{f}_\tau^{(i)}$$

are independent standard Gaussian random variables for various i *or* j *(in the case when* $i \neq 0$*); another notations are the same as in Theorem* 1*.*

Theorem 3 [8], [13], [34], [35], [64]. *Let* $\{\phi_j(x)\}_{j=0}^{\infty}$ *be a complete orthonormal system of Legendre polynomials or trigonometric functions in the space* $L_2([t, T])$*. Furthermore, let* $\psi_1(\tau), \ldots, \psi_4(\tau)$ *be continuously differentiable nonrandom functions on* $[t, T]$*. Then, for the iterated Stratonovich stochastic integral of fourth multiplicity*

$$J^*[\psi^{(4)}]_{T,t} = \int\limits_t^{*T} \psi_4(t_4) \int\limits_t^{*t_4} \psi_3(t_3) \int\limits_t^{*t_3} \psi_2(t_2) \int\limits_t^{*t_2} \psi_1(t_1) d\mathbf{w}_{t_1}^{(i_1)} d\mathbf{w}_{t_2}^{(i_2)} d\mathbf{w}_{t_3}^{(i_3)} d\mathbf{w}_{t_4}^{(i_4)} \qquad (32)$$

the following relations

$$J^*[\psi^{(4)}]_{T,t} = \underset{p\to\infty}{\text{l.i.m.}} \sum_{j_1,j_2,j_3,j_4=0}^{p} C_{j_4j_3j_2j_1} \zeta_{j_1}^{(i_1)} \zeta_{j_2}^{(i_2)} \zeta_{j_3}^{(i_3)} \zeta_{j_4}^{(i_4)}, \qquad (33)$$

$$\mathsf{M}\left\{\left(J^*[\psi^{(4)}]_{T,t} - \sum_{j_1,j_2,j_3,j_4=0}^{p} C_{j_4j_3j_2j_1} \zeta_{j_1}^{(i_1)} \zeta_{j_2}^{(i_2)} \zeta_{j_3}^{(i_3)} \zeta_{j_4}^{(i_4)}\right)^2\right\} \le \frac{C}{p^{1-\varepsilon}} \qquad (34)$$

are fulfilled, where $i_1, \ldots, i_4 = 0, 1, \ldots, m$ *in* (32), (33) *and* $i_1, \ldots, i_4 = 1, \ldots, m$ *in* (34)*, constant* C *does not depend on* p*,* ε *is an arbitrary small positive real number for the case of complete orthonormal system of Legendre polynomials in the space* $L_2([t, T])$ *and* $\varepsilon = 0$ *for the case of complete orthonormal system of trigonometric functions in the space* $L_2([t, T])$*,*

$$C_{j_4j_3j_2j_1} =$$

$$= \int\limits_t^T \psi_4(t_4)\phi_{j_4}(t_4) \int\limits_t^{t_4} \psi_3(t_3)\phi_{j_3}(t_3) \int\limits_t^{t_3} \psi_2(t_2)\phi_{j_2}(t_2) \int\limits_t^{t_2} \psi_1(t_1)\phi_{j_1}(t_1) dt_1 dt_2 dt_3 dt_4;$$

another notations are the same as in Theorem 2*.*

Theorem 4 [8], [13], [34], [35], [64]. *Assume that* $\{\phi_j(x)\}_{j=0}^{\infty}$ *is a complete orthonormal system of Legendre polynomials or trigonometric functions in the space* $L_2([t,T])$ *and* $\psi_1(\tau),\ldots,\psi_5(\tau)$ *are continuously differentiable nonrandom functions on* $[t,T]$. *Then, for the iterated Stratonovich stochastic integral of fifth multiplicity*

$$J^*[\psi^{(5)}]_{T,t}=\int\limits_t^{*T}\psi_5(t_5)\ldots\int\limits_t^{*t_2}\psi_1(t_1)d\mathbf{w}_{t_1}^{(i_1)}\ldots d\mathbf{w}_{t_5}^{(i_5)} \tag{35}$$

the following relations

$$J^*[\psi^{(5)}]_{T,t}=\underset{p\to\infty}{\text{l.i.m.}}\sum_{j_1,\ldots,j_5=0}^{p}C_{j_5\ldots j_1}\zeta_{j_1}^{(i_1)}\ldots\zeta_{j_5}^{(i_5)}, \tag{36}$$

$$\mathsf{M}\left\{\left(J^*[\psi^{(5)}]_{T,t}-\sum_{j_1,\ldots,j_5=0}^{p}C_{j_5\ldots j_1}\zeta_{j_1}^{(i_1)}\ldots\zeta_{j_5}^{(i_5)}\right)^2\right\}\le\frac{C}{p^{1-\varepsilon}} \tag{37}$$

are fulfilled, where $i_1,\ldots,i_5=0,1,\ldots,m$ *in* (35), (36) *and* $i_1,\ldots,i_5=1,\ldots,m$ *in* (37), *constant* C *is independent of* p, ε *is an arbitrary small positive real number for the case of complete orthonormal system of Legendre polynomials in the space* $L_2([t,T])$ *and* $\varepsilon=0$ *for the case of complete orthonormal system of trigonometric functions in the space* $L_2([t,T])$,

$$C_{j_5\ldots j_1}=\int\limits_t^{T}\psi_5(t_5)\phi_{j_5}(t_5)\ldots\int\limits_t^{t_2}\psi_1(t_1)\phi_{j_1}(t_1)dt_1\ldots dt_5;$$

another notations are the same as in Theorems 2, 3.

Theorem 5 [8], [13], [34], [35]. *Suppose that* $\{\phi_j(x)\}_{j=0}^{\infty}$ *is a complete orthonormal system of Legendre polynomials or trigonometric functions in the space* $L_2([t,T])$. *Then, for the iterated Stratonovich stochastic integral of sixth multiplicity*

$$J_{T,t}^{*(i_1\ldots i_6)}=\int\limits_t^{*T}\ldots\int\limits_t^{*t_2}d\mathbf{w}_{t_1}^{(i_1)}\ldots d\mathbf{w}_{t_6}^{(i_6)} \tag{38}$$

the following expansion

$$J_{T,t}^{*(i_1\ldots i_6)}=\underset{p\to\infty}{\text{l.i.m.}}\sum_{j_1,\ldots,j_6=0}^{p}C_{j_6\ldots j_1}\zeta_{j_1}^{(i_1)}\ldots\zeta_{j_6}^{(i_6)}$$

that converges in the mean-square sense is valid, where $i_1,\ldots,i_6=0,1,\ldots,m$,

$$C_{j_6\ldots j_1}=\int\limits_t^{T}\phi_{j_6}(t_6)\ldots\int\limits_t^{t_2}\phi_{j_1}(t_1)dt_1\ldots dt_6;$$

another notations are the same as in Theorems 2–4.

Recently the equality (22) was proved in [66] (also see [8] (Sect. 2.1.4)) for the case of an arbitrary complete orthonormal system of functions in $L_2([t,T])$ and $\psi_1(\tau), \psi_2(\tau) \in L_2([t,T])$. This means that we have the following generalizaion of Theorem 1.

Theorem 6 [8] (Sect. 2.1.4). *Suppose that* $\{\phi_j(x)\}_{j=0}^{\infty}$ *is an arbitrary complete orthonormal system of functions in the space* $L_2([t,T])$ *and* $\psi_1(\tau), \psi_2(\tau)$ *are continuous functions on* $[t,T]$. *Then the iterated Stratonovich stochastic integral of the second multiplicity*

$$J^*[\psi^{(2)}]_{T,t} = \int\limits_t^{*T} \psi_2(t_2) \int\limits_t^{*t_2} \psi_1(t_1) d\mathbf{w}_{t_1}^{(i_1)} d\mathbf{w}_{t_2}^{(i_2)} \quad (i_1, i_2 = 0, 1, \ldots, m)$$

is expanded into the multiple series

$$J^*[\psi^{(2)}]_{T,t} = \underset{p_1,p_2\to\infty}{\text{l.i.m.}} \sum_{j_1=0}^{p_1} \sum_{j_2=0}^{p_2} C_{j_2 j_1} \zeta_{j_1}^{(i_1)} \zeta_{j_2}^{(i_2)}$$

that converges in the mean-square sense; *where notations are the same as in Theorem* 1.

The condition of continuity of the functions $\psi_1(\tau), \psi_2(\tau)$ is related to the definition of the Stratonovich stochastic integral that we use (see [1]).

4. Theorems 1–6 from Point of View of the Wong–Zakai Approximation

The iterated Ito stochastic integrals and solutions of Ito SDEs are complex and important functionals from the independent components $\mathbf{f}_s^{(i)}$, $i = 1, \ldots, m$ of the multidimensional Wiener process $\mathbf{f}_s$, $s \in [0, T]$. Let $\mathbf{f}_s^{(i)p}$, $p \in \mathbb{N}$ be some approximation of $\mathbf{f}_s^{(i)}$, $i = 1, \ldots, m$. Suppose that $\mathbf{f}_s^{(i)p}$ converges to $\mathbf{f}_s^{(i)}$, $i = 1, \ldots, m$ if $p \to \infty$ in some sense and has differentiable sample trajectories.

A natural question arises: if we replace $\mathbf{f}_s^{(i)}$ by $\mathbf{f}_s^{(i)p}$, $i = 1, \ldots, m$ in the functionals mentioned above, will the resulting functionals converge to the original functionals from the components $\mathbf{f}_s^{(i)}$, $i = 1, \ldots, m$ of the multidimentional Wiener process $\mathbf{f}_s$? The answere to this question is negative in the general case. However, in the pioneering works of Wong E. and Zakai M. [50], [51], it was shown that under the special conditions and for some types of approximations of the Wiener process the answere is affirmative with one peculiarity: the convergence takes place to the iterated Stratonovich stochastic integrals and solutions of Stratonovich SDEs and not to iterated Ito stochastic integrals and solutions of Ito SDEs. The piecewise linear approximation as well as the regularization by convolution [50]-[52] relate the mentioned types of approximations of the Wiener process. The above approximation of stochastic integrals and solutions of SDEs is often called the Wong–Zakai approximation.

Let $\mathbf{f}_s$, $s \in [0, T]$ be an m-dimensional standard Wiener process with independent components $\mathbf{f}_s^{(i)}$, $i = 1, \ldots, m$. It is well known that the following representation takes place [53], [54]

$$\mathbf{f}_\tau^{(i)} - \mathbf{f}_t^{(i)} = \sum_{j=0}^{\infty} \int\limits_t^{\tau} \phi_j(s) ds \ \zeta_j^{(i)}, \quad \zeta_j^{(i)} = \int\limits_t^T \phi_j(\tau) d\mathbf{f}_\tau^{(i)}, \tag{39}$$

where $\tau \in [t, T]$, $t \geq 0$, $\{\phi_j(x)\}_{j=0}^{\infty}$ is an arbitrary complete orthonormal system of functions in the space $L_2([t, T])$, and $\zeta_j^{(i)}$ are independent standard Gaussian random variables for various i or j. Moreover, the series (39) converges for any $\tau \in [t, T]$ in the mean-square sense.

Let $\mathbf{f}_\tau^{(i)p}-\mathbf{f}_t^{(i)p}$ be the mean-square approximation of the process $\mathbf{f}_\tau^{(i)}-\mathbf{f}_t^{(i)}$, which has the following form

$$\mathbf{f}_\tau^{(i)p}-\mathbf{f}_t^{(i)p}=\sum_{j=0}^{p}\int\limits_t^{\tau}\phi_j(s)ds\ \zeta_j^{(i)}. \tag{40}$$

From (40) we obtain

$$d\mathbf{f}_\tau^{(i)p}=\sum_{j=0}^{p}\phi_j(\tau)\zeta_j^{(i)}d\tau. \tag{41}$$

Consider the following iterated Riemann–Stieltjes integral

$$\int\limits_t^T\psi_k(t_k)\ldots\int\limits_t^{t_2}\psi_1(t_1)d\mathbf{w}_{t_1}^{(i_1)p_1}\ldots d\mathbf{w}_{t_k}^{(i_k)p_k}, \tag{42}$$

where $i_1,\ldots,i_k=0,1,\ldots,m,\ \ p_1,\ldots,p_k\in\mathbb{N}$,

$$d\mathbf{w}_\tau^{(i)p}=\begin{cases}d\mathbf{f}_\tau^{(i)p} & \text{for}\quad i=1,\ldots,m\\ \\ d\tau & \text{for}\quad i=0\end{cases}, \tag{43}$$

and $d\mathbf{f}_\tau^{(i)p}$ in defined by the relation (41).

Let us substitute (41) into (42)

$$\int\limits_t^T\psi_k(t_k)\ldots\int\limits_t^{t_2}\psi_1(t_1)d\mathbf{w}_{t_1}^{(i_1)p_1}\ldots d\mathbf{w}_{t_k}^{(i_k)p_k}=\sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k}C_{j_k\ldots j_1}\prod_{l=1}^{k}\zeta_{j_l}^{(i_l)}, \tag{44}$$

where

$$\zeta_j^{(i)}=\int\limits_t^T\phi_j(\tau)d\mathbf{w}_\tau^{(i)}$$

are independent standard Gaussian random variables for various i or j (in the case when $i\neq 0$), $\mathbf{w}_s^{(i)}=\mathbf{f}_s^{(i)}$ for $i=1,\ldots,m$ and $\mathbf{w}_s^{(0)}=s$,

$$C_{j_k\ldots j_1}=\int\limits_t^T\psi_k(t_k)\phi_{j_k}(t_k)\ldots\int\limits_t^{t_2}\psi_1(t_1)\phi_{j_1}(t_1)dt_1\ldots dt_k$$

is the Fourier coefficient.

Consider the following iterated Stratonovich stochastic integrals

$$J^*[\psi^{(k)}]_{T,t}=\int\limits_t^{*T}\psi_k(t_k)\ldots\int\limits_t^{*t_2}\psi_1(t_1)d\mathbf{w}_{t_1}^{(i_1)}\ldots d\mathbf{w}_{t_k}^{(i_k)}, \tag{45}$$

where every $\psi_l(\tau)$ $(l=1,\ldots,k)$ is a continuously differentiable nonrandom function at the interval $[t,T]$; another notations are the same as in (1).

To best of our knowledge [50]-[52] the approximations of the Wiener process in the Wong–Zakai approximation must satisfy fairly strong restrictions [52] (see Definition 7.1, pp. 480–481). Moreover, approximations of the Wiener process that are similar to (40) were not considered in [50], [51] (also see [52], Theorems 7.1, 7.2). Therefore, the proof of analogs of Theorems 7.1 and 7.2 [52] for approximations of the Wiener process based on its series expansion (39) should be carried out separately. Thus, the mean-square convergence of the right-hand side of (44) to the appropriate iterated Stratonovich stochastic integral (45) does not follow from the results of the papers [50], [51] (also see [52], Theorems 7.1, 7.2).

However, in [1] (Sect. 5.8, pp. 202–204), [55] (pp. 82-84), [56] (pp. 438-439), [57] (pp. 263-264) the authors use (without rigorous proof) the Wong–Zakai approximation [50]-[52] within the frames of the method of approximation of iterated Stratonovich stochastic integrals based on the Karhunen–Loeve expansion of the Brownian bridge process [58].

From the other hand, Theorems 1–6 from this paper can be considered as the proof of the Wong–Zakai approximation for the iterated Stratonovich stochastic integrals (45) of multiplicities 2 to 6 based on the approximation (40) of the Wiener process. At that, the Riemann–Stieltjes integrals (42) of multiplicities 2 to 6 converge in the mean-square sense to the appropriate Stratonovich stochastic integrals (45). Recall that $\{\phi_j(x)\}_{j=0}^{\infty}$ (see (39), (40), and Theorems 1–5) is a complete orthonormal system of Legendre polynomials or trigonometric functions in the space $L_2([t,T])$.

To illustrate the above reasoning, consider two examples for the case $k=2$, $\psi_1(\tau)$, $\psi_2(\tau)\equiv 1$; $i_1,i_2=1,\ldots,m$.

The first example relates to the piecewise linear approximation of the multidimensional Wiener process (these approximations were considered in [50]-[52]).

Let $\mathbf{b}_{\Delta}^{(i)}(t)$, $t\in[0,T]$ be the piecewise linear approximation of the ith component $\mathbf{f}_t^{(i)}$ of the multidimensional standard Wiener process $\mathbf{f}_t$, $t\in[0,T]$ with independent components $\mathbf{f}_t^{(i)}$, $i=1,\ldots,m$, i.e.

$$\mathbf{b}_{\Delta}^{(i)}(t)=\mathbf{f}_{k\Delta}^{(i)}+\frac{t-k\Delta}{\Delta}\Delta\mathbf{f}_{k\Delta}^{(i)},$$

where

$$\Delta\mathbf{f}_{k\Delta}^{(i)}=\mathbf{f}_{(k+1)\Delta}^{(i)}-\mathbf{f}_{k\Delta}^{(i)},\quad t\in[k\Delta,(k+1)\Delta),\quad k=0,1,\ldots,N-1.$$

Note that w. p. 1

$$\frac{d\mathbf{b}_{\Delta}^{(i)}}{dt}(t)=\frac{\Delta\mathbf{f}_{k\Delta}^{(i)}}{\Delta},\quad t\in[k\Delta,(k+1)\Delta),\quad k=0,1,\ldots,N-1. \tag{46}$$

Consider the following iterated Riemann–Stieltjes integral

$$\int\limits_0^T\int\limits_0^s d\mathbf{b}_{\Delta}^{(i_1)}(\tau)d\mathbf{b}_{\Delta}^{(i_2)}(s),\quad i_1,i_2=1,\ldots,m.$$

Using (46) and additive property of the Riemann–Stieltjes integral, we can write w. p. 1

$$\int\limits_0^T\int\limits_0^s d\mathbf{b}_{\Delta}^{(i_1)}(\tau)d\mathbf{b}_{\Delta}^{(i_2)}(s)=\int\limits_0^T\int\limits_0^s \frac{d\mathbf{b}_{\Delta}^{(i_1)}}{d\tau}(\tau)d\tau\frac{d\mathbf{b}_{\Delta}^{(i_2)}}{ds}(s)ds=$$

$$= \sum_{l=0}^{N-1} \int\limits_{l\Delta}^{(l+1)\Delta} \left(\sum_{q=0}^{l-1} \int\limits_{q\Delta}^{(q+1)\Delta} \frac{\Delta \mathbf{f}_{q\Delta}^{(i_1)}}{\Delta} d\tau + \int\limits_{l\Delta}^{s} \frac{\Delta \mathbf{f}_{l\Delta}^{(i_1)}}{\Delta} d\tau \right) \frac{\Delta \mathbf{f}_{l\Delta}^{(i_2)}}{\Delta} ds =$$

$$= \sum_{l=0}^{N-1} \sum_{q=0}^{l-1} \Delta \mathbf{f}_{q\Delta}^{(i_1)} \Delta \mathbf{f}_{l\Delta}^{(i_2)} + \frac{1}{\Delta^2} \sum_{l=0}^{N-1} \Delta \mathbf{f}_{l\Delta}^{(i_1)} \Delta \mathbf{f}_{l\Delta}^{(i_2)} \int\limits_{l\Delta}^{(l+1)\Delta} \int\limits_{l\Delta}^{s} d\tau ds =$$

$$= \sum_{l=0}^{N-1} \sum_{q=0}^{l-1} \Delta \mathbf{f}_{q\Delta}^{(i_1)} \Delta \mathbf{f}_{l\Delta}^{(i_2)} + \frac{1}{2} \sum_{l=0}^{N-1} \Delta \mathbf{f}_{l\Delta}^{(i_1)} \Delta \mathbf{f}_{l\Delta}^{(i_2)}. \tag{47}$$

Using (47), it is not difficult to show that

$$\underset{N\to\infty}{\text{l.i.m.}} \int\limits_0^T \int\limits_0^s d\mathbf{b}_{\Delta}^{(i_1)}(\tau) d\mathbf{b}_{\Delta}^{(i_2)}(s) = \int\limits_0^T \int\limits_0^s d\mathbf{f}_{\tau}^{(i_1)} d\mathbf{f}_{s}^{(i_2)} + \frac{1}{2} \mathbf{1}_{\{i_1=i_2\}} \int\limits_0^T ds = \int\limits_0^{*T} \int\limits_0^{*s} d\mathbf{f}_{\tau}^{(i_1)} d\mathbf{f}_{s}^{(i_2)}, \tag{48}$$

where $\Delta \to 0$ if $N \to \infty$ $(N\Delta = T)$.

Obviously, (48) agrees with Theorem 7.1 (see [52], p. 486).

The next example relates to the approximation of the Wiener process based on its series expansion (39) for $t = 0$, where $\{\phi_j(x)\}_{j=0}^{\infty}$ is a complete orthonormal system of Legendre polynomials or trigonometric functions in the space $L_2([0,T])$.

Consider the following iterated Riemann–Stieltjes integral

$$\int\limits_0^T \int\limits_0^s d\mathbf{f}_{\tau}^{(i_1)p} d\mathbf{f}_{s}^{(i_2)p}, \quad i_1, i_2 = 1, \ldots, m, \tag{49}$$

where $d\mathbf{f}_{\tau}^{(i)p}$ is defined by the relation (41).

Let us substitute (41) into (49)

$$\int\limits_0^T \int\limits_0^s d\mathbf{f}_{\tau}^{(i_1)p} d\mathbf{f}_{s}^{(i_2)p} = \sum_{j_1,j_2=0}^{p} C_{j_2 j_1} \zeta_{j_1}^{(i_1)} \zeta_{j_2}^{(i_2)}, \tag{50}$$

where

$$C_{j_2 j_1} = \int\limits_0^T \phi_{j_2}(s) \int\limits_0^s \phi_{j_1}(\tau) d\tau ds$$

is the Fourier coefficient; another notations are the same as in (44).

As we noted above, approximations of the Wiener process that are similar to (40) were not considered in [50], [51] (also see Theorems 7.1, 7.2 in [52]). Furthermore, the extension of the results of Theorems 7.1 and 7.2 [52] to the case under consideration is not obvious.

On the other hand, we can apply Theorem 1 from this paper and obtain from (50) the desired result

$$\underset{p\to\infty}{\text{l.i.m.}} \int\limits_0^T \int\limits_0^s d\mathbf{f}_\tau^{(i_1)p} d\mathbf{f}_s^{(i_2)p} = \underset{p\to\infty}{\text{l.i.m.}} \sum_{j_1,j_2=0}^{p} C_{j_2 j_1} \zeta_{j_1}^{(i_1)} \zeta_{j_2}^{(i_2)} = \int\limits_0^{*T} \int\limits_0^{*s} d\mathbf{f}_\tau^{(i_1)} d\mathbf{f}_s^{(i_2)}. \tag{51}$$

EXPANSION OF ITERATED STRATONOVICH STOCHASTIC INTEGRALS OF FIFTH AND SIXTH MULTIPLICITY BASED ON GENERALIZED MULTIPLE FOURIER SERIES

DMITRIY F. KUZNETSOV

Abstract. The article is devoted to the construction of expansions of iterated Stratonovich stochastic integrals of fifth and sixth multiplicities based on the method of generalized multiple Fourier series converging in the sense of norm in Hilbert space $L_2([t,T]^k)$, $k \in \mathbb{N}$. Specifically, we use multiple Fourier–Legendre series and multiple trigonometric Fourier series. Expansions of iterated Sratonovich stochastic integrals of multiplicities 1–4 were obtained in previous works of the author. The considered expansions converges in the mean-square sense and contain only one operation of the limit transition in contrast to its existing analogues. Expansions of iterated Stratonovich stochastic integrals turned out much simpler than appropriate expansions of iterated Ito stochastic integrals. We use expansions of the latter as a tool of the proof of expansions for iterated Stratonovich stochastic integrals. Iterated Stratonovich stochastic integrals are the part of the Taylor–Stratonovich expansion of solutions of Ito stochastic differential equations. That is why the results of the article can be applied to the numerical integrations of Ito stochastic differential equations.

Contents

Mathematics Subject Classification: 60H05, 60H10, 42B05, 42C10.
Keywords: Iterated Ito stochastic integral, Iterated Stratonovich stochastic integral, Generalized Multiple Fourier series, Multiple Fourier–Legendre series, Multiple trigonometric Fourier series, Legendre polynomial, Mean-square approximation, Expansion.

1. Introduction

Let $(\Omega, \mathrm{F}, \mathsf{P})$ be a complete probability space, let $\{\mathrm{F}_t, t \in [0,T]\}$ be a nondecreasing right-continous family of σ-algebras of F, and let $\mathbf{f}_t$ be a standard m-dimensional Wiener stochastic process, which is F_t-measurable for any $t \in [0,T]$. We assume that the components $\mathbf{f}_t^{(i)}$ $(i = 1, \ldots, m)$ of this process are independent.

Let us consider the following iterated Ito and Stratonovich stochastic integrals

$$J[\psi^{(k)}]_{T,t} = \int\limits_t^T \psi_k(t_k) \ldots \int\limits_t^{t_2} \psi_1(t_1) d\mathbf{w}_{t_1}^{(i_1)} \ldots d\mathbf{w}_{t_k}^{(i_k)}, \tag{1}$$

$$J^*[\psi^{(k)}]_{T,t} = \int\limits_t^{*T} \psi_k(t_k) \ldots \int\limits_t^{*t_2} \psi_1(t_1) d\mathbf{w}_{t_1}^{(i_1)} \ldots d\mathbf{w}_{t_k}^{(i_k)}, \tag{2}$$

where $\psi_1(\tau), \ldots, \psi_k(\tau)$ are nonrandom functions on $[t,T]$, $\mathbf{w}_\tau^{(i)} = \mathbf{f}_\tau^{(i)}$ for $i = 1, \ldots, m$ and $\mathbf{w}_\tau^{(0)} = \tau$,

$$\int \ \text{and} \ \int^{*}$$

denote Ito and Stratonovich stochastic integrals, respectively; $i_1, \ldots, i_k = 0, 1, \ldots, m$. Note that in this paper we use the definition of the Stratonovich stochastic integral from [1].

The problem of effective jointly numerical modeling (in accordance to the mean-square convergence criterion) of iterated Ito and Stratonovich stochastic integrals (1) and (2) arises when solving the problem of numerical integration of Ito stochastic differential equations (SDEs) [1]-[4]. It is well known that this problem is difficult from theoretical and computing point of view [1]-[54]. The only exception is connected with a narrow particular case, when $i_1 = \ldots = i_k \neq 0$ and $\psi_1(\tau), \ldots, \psi_k(\tau) \equiv \psi(\tau)$. This case allows the investigation with using the Ito formula [1]-[4]. Note that even for the mentioned coincidence $(i_1 = \ldots = i_k \neq 0)$, but for different functions $\psi_1(\tau), \ldots, \psi_k(\tau)$ the mentioned difficulties persist, and relatively simple families of iterated Ito and Stratonovich stochastic integrals, which can be often met in the applications, cannot be represented effectively in a finite form (for the mean-square approximation) using the system of standard Gaussian random variables.

Note that for a number of special types of Ito SDEs the problem of approximation of iterated stochastic integrals can be simplified but cannot be solved. The equations with additive vector noise, with additive scalar noise, with non-additive scalar noise, with a small parameter are related to such types of equations [1]-[4]. For the mentioned types of equations, simplifications are connected with the fact that some coefficient functions from stochastic analogues of the Taylor formula identically equal to zero or due to the presence of a small parameter we may neglect some members from stochastic analogues of the Taylor formula, which include difficult for approximation iterated stochastic integrals [1]-[3].

There are several approaches to solution of the problem of jointly numerical modeling (in accordance to the mean-square convergence criterion) of iterated Ito and Stratonovich stochastic integrals (1) and (2) [1]-[55].

One of the most effective methods of this problem solving is the method based on generalized multiple Fourier series, which is proposed and developed by the author in a lot of publications [7]-[45] (see Theorems 1, 2 below). It is important to note that the operation of limit transition is implemented only once in the method [7]-[45]. At the same time the existing analogues of the method [7]-[45] lead to iterated application of the operation of limit transition [1]-[6], [54].

For example, the authors of the works [1] (Sect. 5.8, pp. 202–204), [4] (pp. 82-84), [5] (pp. 438-439), [6] (pp. 263-264) use the Wong–Zakai approximation [58]-[60] (without rigorous proof) within the frames of the method of expansion of iterated stochastic integrals [2] (1988) based on the series expansion of the Brownian bridge process (version of the so-called Karhunen-Loeve expansion). See discussion in Sect. 13 of this paper for details.

The idea of the method [7]-[45] (see Theorems 1, 2 below) is as follows: the iterated Ito stochastic integral (1) of multiplicity k ($k \in \mathbb{N}$) is represented as the multiple stochastic integral from the certain discontinuous nonrandom function of k variables defined on the hypercube $[t,T]^k = [t,T] \times \ldots \times [t,T]$ (k times), where $[t,T]$ is the interval of integration of the iterated Ito stochastic integral (1). Then, the mentioned nonrandom function is expanded in the hypercube $[t,T]^k$ into the generalized multiple Fourier series converging in the mean-square sense in the space $L_2([t,T]^k)$. After a number of nontrivial transformations we come (see Theorems 1, 2 below) to the mean-square convergening expansion of the iterated Ito stochastic integral (1) into the multiple series of products of standard Gaussian random variables. The coefficients of this series are the coefficients of the generalized multiple Fourier series for the mentioned nonrandom function of k variables, which can be calculated using the explicit formula regardless of the multiplicity k of the iterated Ito stochastic integral (1). Hereinafter, this method is referred to as the method of generalized multiple Fourier series.

As it turned out [8]-[15], [20]-[22], [28], [32], [35]-[42] the adaptation of Theorem 1 for the iterated Stratonovich stochastic integrals (2) of multiplicities 1 to 4 leads to relatively simple expansions compared to expansions for the appropriate iterated Ito stochastic integrals (1) (see (8)–(13) below). The developement of the mentioned adaptation for the iterated Stratonovich stochastic integrals (2) of multiplicities 5 and 6 composes the subject of this article.

In Sect. 2, we formulate Theorem 1 on expansion of iterated Ito stochastic integrals of arbitrary multiplicity k ($k \in \mathbb{N}$) based on generalized multiple Fourier series [7] (2006) (see also [8]-[45]). The particular cases $k = 5, 6$ of Theorem 1 will be used for the proof of main results (Theorems 17, 22 (Sect. 8, 11)). Sect. 3 is devoted to the hypothesis (Hypothesis 1) on expansion of the iterated Stratonovich stochastic integrals (2) of arbitrary multiplicity k [12]-[15], [36]. As mentioned above, the proof of Hypothesis 1 for the cases $k = 5, 6$ composes the subject of the article. In Sect. 4, we consider several theorems (some old results), which were formulated and proved by the author. These theorems are particular cases of Hypothesis 1 for $k = 2, 3, 4$ [8]-[15], [20]-[22], [28], [32], [35]-[42]. In Sect 5, we give the proof of Hypothesis 1 under the condition of convergence of trace series. Expansions of iterated Stratonovich stochastic integrals of multiplicities 3 and 4 are considered in Sect. 6, 7. Rate of the mean-square convergence of expansions of iterated Stratonovich stochastic integrals is considered in Sect. 9, 10. Sect. 13 is devoted to a discussion of the connection between Theorems 1, 2, 5-12, 15-17, 22 and the Wong–Zakai approximation of the iterated Stratonovich stochastic integrals (2) based on the series expansion of the Wiener process with using the complete orthonormal systems of Legendre polynomials and trigonometric functions in the space $L_2([t,T])$. In Sect. 12, 14 we consider generalizations of the results from Sect. 5, 6.

2. Expansion of Iterated Ito Stochastic Integrals of Arbitrary Multiplicity k Based on Generalized Multiple Fourier Series Converging in the Mean

Suppose that every $\psi_l(\tau)$ $(l=1,\ldots,k)$ is a continuous nonrandom function on $[t,T]$ (the case $\psi_1(\tau),\ldots,\psi_k(\tau)\in L_2([t,T])$ will be considered in Theorem 2 (see below)). Define the following function on the hypercube $[t,T]^k$

$$K(t_1,\ldots,t_k)=\begin{cases}\psi_1(t_1)\ldots\psi_k(t_k) & \text{for}\ \ t_1<\ldots<t_k\\ \\ 0 & \text{otherwise}\end{cases},\qquad t_1,\ldots,t_k\in[t,T],\qquad k\ge 2, \tag{3}$$

and $K(t_1)\equiv\psi_1(t_1)$ for $t_1\in[t,T]$.

Suppose that $\{\phi_j(x)\}_{j=0}^{\infty}$ is a complete orthonormal system of functions in the space $L_2([t,T])$.

The function $K(t_1,\ldots,t_k)$ is piecewise continuous in the hypercube $[t,T]^k$. At this situation it is well known that the generalized multiple Fourier series of $K(t_1,\ldots,t_k)\in L_2([t,T]^k)$ is converging to $K(t_1,\ldots,t_k)$ in the hypercube $[t,T]^k$ in the mean-square sense, i.e.

$$\lim_{p_1,\ldots,p_k\to\infty}\left\|K(t_1,\ldots,t_k)-\sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k}C_{j_k\ldots j_1}\prod_{l=1}^{k}\phi_{j_l}(t_l)\right\|_{L_2([t,T]^k)}=0,$$

where

$$C_{j_k\ldots j_1}=\int\limits_{[t,T]^k}K(t_1,\ldots,t_k)\prod_{l=1}^{k}\phi_{j_l}(t_l)dt_1\ldots dt_k \tag{4}$$

is the Fourier coefficient,

$$\|f\|_{L_2([t,T]^k)}=\left(\int\limits_{[t,T]^k}f^2(t_1,\ldots,t_k)dt_1\ldots dt_k\right)^{1/2}.$$

Consider the partition $\{\tau_j\}_{j=0}^{N}$ of $[t,T]$ such that

$$t=\tau_0<\ldots<\tau_N=T,\quad \Delta_N=\max_{0\le j\le N-1}\Delta\tau_j\to 0\ \ \text{if}\ \ N\to\infty,\quad \Delta\tau_j=\tau_{j+1}-\tau_j. \tag{5}$$

Theorem 1 [7] (2006) [8]-[45]. *Suppose that every $\psi_l(\tau)$ $(l=1,\ldots,k)$ is a continuous nonrandom function on $[t,T]$ and $\{\phi_j(x)\}_{j=0}^{\infty}$ is a complete orthonormal system of continuous functions in the space $L_2([t,T])$. Then*

$$J[\psi^{(k)}]_{T,t} = \underset{p_1,\ldots,p_k\to\infty}{\text{l.i.m.}} \sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k} C_{j_k\ldots j_1}\Biggl(\prod_{l=1}^{k}\zeta_{j_l}^{(i_l)} -$$

$$- \underset{N\to\infty}{\text{l.i.m.}} \sum_{(l_1,\ldots,l_k)\in \mathrm{G}_k} \phi_{j_1}(\tau_{l_1})\Delta\mathbf{w}_{\tau_{l_1}}^{(i_1)}\ldots\phi_{j_k}(\tau_{l_k})\Delta\mathbf{w}_{\tau_{l_k}}^{(i_k)}\Biggr), \qquad (6)$$

where $J[\psi^{(k)}]_{T,t}$ *is defined by* (1),

$$\mathrm{G}_k = \mathrm{H}_k \backslash \mathrm{L}_k, \quad \mathrm{H}_k = \{(l_1,\ldots,l_k):\ l_1,\ldots,l_k = 0,\ 1,\ldots,N-1\},$$

$$\mathrm{L}_k = \{(l_1,\ldots,l_k):\ l_1,\ldots,l_k = 0,\ 1,\ldots,N-1;\ l_g \ne l_r\ (g\ne r);\ g,r = 1,\ldots,k\},$$

l.i.m. *is a limit in the mean-square sense*, $i_1,\ldots,i_k = 0,1,\ldots,m$,

$$\zeta_j^{(i)} = \int\limits_t^T \phi_j(\tau)d\mathbf{w}_\tau^{(i)} \qquad (7)$$

are independent standard Gaussian random variables for various i *or* j (*if* $i\ne 0$), $C_{j_k\ldots j_1}$ *is the Fourier coefficient* (4), $\Delta\mathbf{w}_{\tau_j}^{(i)} = \mathbf{w}_{\tau_{j+1}}^{(i)} - \mathbf{w}_{\tau_j}^{(i)}$ $(i=0,1,\ldots,m)$, $\{\tau_j\}_{j=0}^{N}$ *is a partition of the interval* $[t,T]$, *which satisfies the condition* (5).

It was shown in [17]-[22] that Theorem 1 is valid for convergence in the mean of degree $2n$ ($n\in\mathbb{N}$) and for convergence with probability 1 [12]-[15], [45]. Moreover, the complete orthonormal systems of Haar and Rademacher–Walsh functions in $L_2([t,T])$ can also be applied in Theorem 1 [7]-[22]. The modification of Theorem 1 for complete orthonormal with weigth $r(x)\ge 0$ systems of functions in the space $L_2([t,T])$ can be found in [11]-[15], [43]. The generalization of Theorem 1 for the case of an arbitrary complete orthonormal systems of functions in the space $L_2([t,T])$ and $\psi_1(\tau),\ldots,\psi_k(\tau)\in L_2([t,T])$ is given in [12] (Sect. 1.11), [33] (Sect. 15).

Thus, we obtain the following useful possibilities of the method of generalized multiple Fourier series.

1. There is the explicit formula (see (4)) for calculation of expansion coefficients of the iterated Ito stochastic integral (1) with any fixed multiplicity k.

2. We have possibilities for explicit calculation of the mean-square approximation error of the iterated Ito stochastic integral (1) (see [10]-[15], [23], [34]).

3. Since the used multiple Fourier series is a generalized in the sense that it is built using various complete orthonormal systems of functions in the space $L_2([t,T])$, then we have new possibilities for approximation — we can use not only trigonometric functions as in [1]-[3] but Legendre polynomials.

4. As it turned out (see [7]-[51]), it is more convenient to work with Legendre polynomials for constructing the approximations of iterated Ito and Stratonovich stochastic integrals. Approximations based on the Legendre polynomials essentially simpler than their analogues based on the trigonometric functions. Another advantages of the application of Legendre polynomials in the framework of the mentioned problem are considered in [12]-[15], [27], [31].

5. The approach based on the Karhunen–Loeve expansion of the Brownian bridge process [1], [2] (also see [54]) leads to iterated application of the operation of limit transition (the operation of limit transition is implemented only once in Theorem 1) starting from the second multiplicity (in the general case) and third multiplicity (for the case $\psi_1(\tau),\psi_2(\tau),\psi_3(\tau)\equiv 1$; $i_1,i_2,i_3=1,\ldots,m$) of

the iterated Ito and Stratonovich stochastic integrals (1), (2). Multiple series (the operation of limit transition is implemented only once) are more convenient for approximation than the iterated ones (iterated application of the operation of limit transition) since partial sums of multiple series converge for any possible case of convergence to infinity of their upper limits of summation (let us denote them as $p_1, \ldots, p_k$). For example, when $p_1 = \ldots = p_k = p \to \infty$. For iterated series, the condition $p_1 = \ldots = p_k = p \to \infty$ obviously does not guarantee the convergence of this series. However, in [1] (Sect. 5.8, pp. 202–204), [4] (pp. 82-84), [5] (pp. 438-439), [6] (pp. 263-264) the authors use (without rigorous proof) the condition $p_1 = p_2 = p_3 = p \to \infty$ within the frames of the mentioned approach based on the Karhunen–Loeve expansion of the Brownian bridge process [2] together with the Wong–Zakai approximation [58]-[60].

In order to evaluate the significance of Theorem 1 for practice we will demonstrate its transformed particular cases for $k = 1, \ldots, 6$ [7]-[43]

$$J[\psi^{(1)}]_{T,t} = \underset{p_1\to\infty}{\text{l.i.m.}} \sum_{j_1=0}^{p_1} C_{j_1}\zeta_{j_1}^{(i_1)}, \tag{8}$$

\end{gathered}
$$

where $\mathbf{1}_A$ is the indicator of the set A.

For further consideration, let us consider the generalization of formulas (8)–(13) for the case of an arbitrary multiplicity k ($k\in\mathbb{N}$) of the iterated Ito stochastic integral $J[\psi^{(k)}]_{T,t}$ defined by (1). In order to do this, let us introduce some notations. Consider the unordered set $\{1,2,\ldots,k\}$ and separate it into two parts: the first part consists of r unordered pairs (sequence order of these pairs is also unimportant) and the second one consists of the remaining $k-2r$ numbers. So, we have

$$
(\{\underbrace{\{g_1,g_2\},\ldots,\{g_{2r-1},g_{2r}\}}_{\text{part 1}}\},\{\underbrace{q_1,\ldots,q_{k-2r}}_{\text{part 2}}\}), \tag{14}
$$

where

$$
\{g_1,g_2,\ldots,g_{2r-1},g_{2r},q_1,\ldots,q_{k-2r}\}=\{1,2,\ldots,k\},
$$

braces mean an unordered set, and parentheses mean an ordered set.

We will say that (14) is a partition and consider the sum with respect to all possible partitions

$$\sum_{\substack{(\{\{g_1,g_2\},\ldots,\{g_{2r-1},g_{2r}\}\},\{q_1,\ldots,q_{k-2r}\})\\ \{g_1,g_2,\ldots,g_{2r-1},g_{2r},q_1,\ldots,q_{k-2r}\}=\{1,2,\ldots,k\}}} a_{g_1g_2,\ldots,g_{2r-1}g_{2r},q_1\ldots q_{k-2r}}, \tag{15}$$

where $a_{g_1g_2,\ldots,g_{2r-1}g_{2r},q_1\ldots q_{k-2r}}\in\mathbb{R}$.

Below there are several examples of sums in the form (15)

$$\sum_{\substack{(\{g_1,g_2\})\\ \{g_1,g_2\}=\{1,2\}}} a_{g_1g_2}=a_{12},$$

$$\sum_{\substack{(\{\{g_1,g_2\},\{g_3,g_4\}\})\\ \{g_1,g_2,g_3,g_4\}=\{1,2,3,4\}}} a_{g_1g_2,g_3g_4}=a_{12,34}+a_{13,24}+a_{23,14},$$

$$\sum_{\substack{(\{g_1,g_2\},\{q_1,q_2\})\\ \{g_1,g_2,q_1,q_2\}=\{1,2,3,4\}}} a_{g_1g_2,q_1q_2}=$$

$$=a_{12,34}+a_{13,24}+a_{14,23}+a_{23,14}+a_{24,13}+a_{34,12},$$

$$\sum_{\substack{(\{g_1,g_2\},\{q_1,q_2,q_3\})\\ \{g_1,g_2,q_1,q_2,q_3\}=\{1,2,3,4,5\}}} a_{g_1g_2,q_1q_2q_3}=$$

$$=a_{12,345}+a_{13,245}+a_{14,235}+a_{15,234}+a_{23,145}+a_{24,135}+$$
$$+a_{25,134}+a_{34,125}+a_{35,124}+a_{45,123},$$

$$\sum_{\substack{(\{\{g_1,g_2\},\{g_3,g_4\}\},\{q_1\})\\ \{g_1,g_2,g_3,g_4,q_1\}=\{1,2,3,4,5\}}} a_{g_1g_2,g_3g_4,q_1}=$$

$$=a_{12,34,5}+a_{13,24,5}+a_{14,23,5}+a_{12,35,4}+a_{13,25,4}+a_{15,23,4}+$$
$$+a_{12,54,3}+a_{15,24,3}+a_{14,25,3}+a_{15,34,2}+a_{13,54,2}+a_{14,53,2}+$$
$$+a_{52,34,1}+a_{53,24,1}+a_{54,23,1}.$$

Now we can write (6) as

$$J[\psi^{(k)}]_{T,t}=\underset{p_1,\ldots,p_k\to\infty}{\text{l.i.m.}}\sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k}C_{j_k\ldots j_1}\Biggl(\prod_{l=1}^{k}\zeta_{j_l}^{(i_l)}+\sum_{r=1}^{[k/2]}(-1)^r\times$$

$$\times\sum_{\substack{(\{\{g_1,g_2\},\ldots,\{g_{2r-1},g_{2r}\}\},\{q_1,\ldots,q_{k-2r}\})\\ \{g_1,g_2,\ldots,g_{2r-1},g_{2r},q_1,\ldots,q_{k-2r}\}=\{1,2,\ldots,k\}}}\prod_{s=1}^{r}\mathbf{1}_{\{i_{g_{2s-1}}=\ i_{g_{2s}}\neq 0\}}\mathbf{1}_{\{j_{g_{2s-1}}=\ j_{g_{2s}}\}}\prod_{l=1}^{k-2r}\zeta_{j_{q_l}}^{(i_{q_l})}\Biggr), \tag{16}$$

where $[x]$ is an integer part of a real number x and $\prod_{\emptyset} \stackrel{\sf def}{=} 1$, $\sum_{\emptyset} \stackrel{\sf def}{=} 0$; another notations are the same as in Theorem 1.

In particular, from (16) for $k=5$ we obtain

$$
J[\psi^{(5)}]_{T,t} = \underset{p_1,\ldots,p_5\to\infty}{\text{l.i.m.}} \sum_{j_1=0}^{p_1}\ldots\sum_{j_5=0}^{p_5} C_{j_5\ldots j_1}\Biggl(\prod_{l=1}^{5}\zeta_{j_l}^{(i_l)} -
$$

$$
- \sum_{\substack{(\{g_1,g_2\},\{q_1,q_2,q_3\})\\ \{g_1,g_2,q_1,q_2,q_3\}=\{1,2,3,4,5\}}} \mathbf{1}_{\{i_{g_1}=\,i_{g_2}\ne 0\}}\mathbf{1}_{\{j_{g_1}=\,j_{g_2}\}}\prod_{l=1}^{3}\zeta_{j_{q_l}}^{(i_{q_l})} +
$$

$$
+ \sum_{\substack{(\{\{g_1,g_2\},\{g_3,g_4\}\},\{q_1\})\\ \{g_1,g_2,g_3,g_4,q_1\}=\{1,2,3,4,5\}}} \mathbf{1}_{\{i_{g_1}=\,i_{g_2}\ne 0\}}\mathbf{1}_{\{j_{g_1}=\,j_{g_2}\}}\mathbf{1}_{\{i_{g_3}=\,i_{g_4}\ne 0\}}\mathbf{1}_{\{j_{g_3}=\,j_{g_4}\}}\zeta_{j_{q_1}}^{(i_{q_1})}\Biggr).
$$

The last equality obviously agrees with (12).

Let us consider the generalization of Theorem 1 for the case of an arbitrary complete orthonormal systems of functions in the space $L_2([t,T])$ and $\psi_1(\tau),\ldots,\psi_k(\tau)\in L_2([t,T])$.

Theorem 2 [12] (Sect. 1.11), [33] (Sect. 15), [55]. *Suppose that* $\psi_1(\tau),\ldots,\psi_k(\tau)\in L_2([t,T])$ *and* $\{\phi_j(x)\}_{j=0}^{\infty}$ *is an arbitrary complete orthonormal system of functions in the space* $L_2([t,T])$*. Then the following expansion*

$$
J[\psi^{(k)}]_{T,t} = \underset{p_1,\ldots,p_k\to\infty}{\text{l.i.m.}} \sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k} C_{j_k\ldots j_1}\Biggl(\prod_{l=1}^{k}\zeta_{j_l}^{(i_l)} + \sum_{r=1}^{[k/2]}(-1)^r\times
$$

$$
\times \sum_{\substack{(\{\{g_1,g_2\},\ldots,\{g_{2r-1},g_{2r}\}\},\{q_1,\ldots,q_{k-2r}\})\\ \{g_1,g_2,\ldots,g_{2r-1},g_{2r},q_1,\ldots,q_{k-2r}\}=\{1,2,\ldots,k\}}} \prod_{s=1}^{r}\mathbf{1}_{\{i_{g_{2s-1}}=\,i_{g_{2s}}\ne 0\}}\mathbf{1}_{\{j_{g_{2s-1}}=\,j_{g_{2s}}\}}\prod_{l=1}^{k-2r}\zeta_{j_{q_l}}^{(i_{q_l})}\Biggr) \tag{17}
$$

converging in the mean-square sense is valid, where $[x]$ *is an integer part of a real number* x *and* $\prod_{\emptyset} \stackrel{\sf def}{=} 1$, $\sum_{\emptyset} \stackrel{\sf def}{=} 0$; *another notations are the same as in Theorem* 1*.*

It should be noted that an analogue of Theorem 2 was considered in [56]. Note that we use another notations [12] (Sect. 1.11), [33] (Sect. 15) in comparison with [56]. Moreover, the proof of an analogue of Theorem 2 from [56] is somewhat different from the proof given in [12] (Sect. 1.11), [33] (Sect. 15).

Note that for the integrals $J[\psi^{(k)}]_{T,t}$ defined by (1) the mean-square approximation error can be calculated exactly and estimated efficiently.

Assume that $J[\psi^{(k)}]_{T,t}^{p_1\ldots p_k}$ is the approximation of (1), which is the expression on the right-hand side of (17) before passing to the limit

$$
J[\psi^{(k)}]_{T,t}^{p_1\ldots p_k} = \sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k} C_{j_k\ldots j_1}\Biggl(\prod_{l=1}^{k}\zeta_{j_l}^{(i_l)} + \sum_{r=1}^{[k/2]}(-1)^r\times
$$

$$
\times \sum_{\substack{(\{\{g_1,g_2\},\ldots,\{g_{2r-1},g_{2r}\}\},\{q_1,\ldots,q_{k-2r}\})\\ \{g_1,g_2,\ldots,g_{2r-1},g_{2r},q_1,\ldots,q_{k-2r}\}=\{1,2,\ldots,k\}}} \prod_{s=1}^{r}\mathbf{1}_{\{i_{g_{2s-1}}=\,i_{g_{2s}}\ne 0\}}\mathbf{1}_{\{j_{g_{2s-1}}=\,j_{g_{2s}}\}}\prod_{l=1}^{k-2r}\zeta_{j_{q_l}}^{(i_{q_l})}\Biggr),
$$

where $[x]$ is an integer part of a real number x; another notations are the same as in Theorems 1, 2.

Let us denote

$$E_k^{p_1,\ldots,p_k} \stackrel{\rm def}{=} {\sf M}\left\{\left(J[\psi^{(k)}]_{T,t}-J[\psi^{(k)}]_{T,t}^{p_1,\ldots,p_k}\right)^2\right\},$$

$$E_k^{p_1,\ldots,p_k} \stackrel{\rm def}{=} E_k^p \ \ \text{if} \ \ p_1=\ldots=p_k=p,$$

$$I_k \stackrel{\rm def}{=} \|K\|^2_{L_2([t,T]^k)}=\int\limits_{[t,T]^k} K^2(t_1,\ldots,t_k)dt_1\ldots dt_k.$$

In [10]-[15], [33], [34] it was shown that

$$E_k^q \le k!\left(I_k-\sum_{j_1,\ldots,j_k=0}^{q} C^2_{j_k\ldots j_1}\right) \tag{18}$$

for the following two cases:

1. $i_1,\ldots,i_k=1,\ldots,m$ and $T-t\in(0,+\infty)$,
2. $i_1,\ldots,i_k=0,1,\ldots,m$ and $T-t\in(0,1)$.

The value E_k^p can be calculated exactly.

Theorem 3 [12] (Sect. 1.12), [34] (Sect. 6). *Suppose that* $\{\phi_j(x)\}_{j=0}^{\infty}$ *is an arbitrary complete orthonormal system of functions in the space* $L_2([t,T])$ *and* $\psi_1(\tau),\ldots,\psi_k(\tau)\in L_2([t,T])$, $i_1,\ldots,i_k=1,\ldots,m$. *Then*

$$E_k^p = I_k-\sum_{j_1,\ldots,j_k=0}^{p} C_{j_k\ldots j_1}{\sf M}\left\{J[\psi^{(k)}]_{T,t}\sum_{(j_1,\ldots,j_k)}\int\limits_t^T\phi_{j_k}(t_k)\ldots\int\limits_t^{t_2}\phi_{j_1}(t_1)d{\bf f}_{t_1}^{(i_1)}\ldots d{\bf f}_{t_k}^{(i_k)}\right\}, \tag{19}$$

where $i_1,\ldots,i_k=1,\ldots,m$; *the expression*

$$\sum_{(j_1,\ldots,j_k)}$$

means the sum with respect to all possible permutations $(j_1,\ldots,j_k)$. *At the same time if* j_r *swapped with* j_q *in the permutation* $(j_1,\ldots,j_k)$, *then* i_r *swapped with* i_q *in the permutation* $(i_1,\ldots,i_k)$; *another notations are the same as in Theorems* 1, 2.

Note that

$${\sf M}\left\{J[\psi^{(k)}]_{T,t}\int\limits_t^T\phi_{j_k}(t_k)\ldots\int\limits_t^{t_2}\phi_{j_1}(t_1)d{\bf f}_{t_1}^{(i_1)}\ldots d{\bf f}_{t_k}^{(i_k)}\right\}=C_{j_k\ldots j_1}.$$

Then from Theorem 3 for pairwise different $i_1,\ldots,i_k$ and for $i_1=\ldots=i_k$ we obtain

$$E_k^p = I_k-\sum_{j_1,\ldots,j_k=0}^{p} C^2_{j_k\ldots j_1},$$

$$E_k^p = I_k - \sum_{j_1,\ldots,j_k=0}^{p} C_{j_k\ldots j_1}\Biggl(\sum_{(j_1,\ldots,j_k)} C_{j_k\ldots j_1}\Biggr).$$

Another examples of the calculation of E_k^p can be found in [12], [34].

3. The Hypothesis on Expansion of Iterated Stratonovich Stochastic Integrals of Arbitrary Multiplicity k

Note that three hypotheses on expansion of the iterated Stratonovich stochastic integrals (2) of arbitrary multiplicity k has been formulated by the author in [8]-[15], [36]. Let us consider one of the mentioned hypotheses.

Hypothesis 1 [8]-[15], [36]. *Assume that $\{\phi_j(x)\}_{j=0}^{\infty}$ is a complete orthonormal system of Legendre polynomials or trigonometric functions in the space $L_2([t,T])$. Moreover, every $\psi_l(\tau)$ $(l=1,2,\ldots,k)$ is an enough smooth nonrandom function on $[t,T]$. Then, for the iterated Stratonovich stochastic integral* (2) *of kth multiplicity*

$$J^*[\psi^{(k)}]_{T,t} = {\int\limits_t^{*T}} \psi_k(t_k)\ldots {\int\limits_t^{*t_2}} \psi_1(t_1)d\mathbf{w}_{t_1}^{(i_1)}\ldots d\mathbf{w}_{t_k}^{(i_k)} \quad (i_1,\ldots,i_k=0,1,\ldots,m) \tag{20}$$

the following expansion

$$J^*[\psi^{(k)}]_{T,t} = \underset{p\to\infty}{\text{l.i.m.}} \sum_{j_1,\ldots j_k=0}^{p} C_{j_k\ldots j_1}\zeta_{j_1}^{(i_1)}\ldots\zeta_{j_k}^{(i_k)} \tag{21}$$

converging in the mean-square sense is valid, where the Fourier coefficient $C_{j_k\ldots j_1}$ has the form

$$C_{j_k\ldots j_1} = \int\limits_t^T \psi_k(t_k)\phi_{j_k}(t_k)\ldots\int\limits_t^{t_2}\psi_1(t_1)\phi_{j_1}(t_1)dt_1\ldots dt_k,$$

l.i.m. *is a limit in the mean-square sense,*

$$\zeta_j^{(i)} = \int\limits_t^T \phi_j(\tau)d\mathbf{w}_\tau^{(i)}$$

are independent standard Gaussian random variables for various i or j (if $i\neq 0$), $\mathbf{w}_\tau^{(i)} = \mathbf{f}_\tau^{(i)}$ are independent standard Wiener processes $(i=1,\ldots,m)$ and $\mathbf{w}_\tau^{(0)}=\tau$.

Hypothesis 1 allows us to approximate the iterated Stratonovich stochastic integral $J^*[\psi^{(k)}]_{T,t}$ by the sum

$$J^*[\psi^{(k)}]_{T,t}^p = \sum_{j_1,\ldots j_k=0}^{p} C_{j_k\ldots j_1}\zeta_{j_1}^{(i_1)}\ldots\zeta_{j_k}^{(i_k)}, \tag{22}$$

where

$$\lim_{p\to\infty}\mathsf{M}\left\{\left(J^*[\psi^{(k)}]_{T,t}-J^*[\psi^{(k)}]_{T,t}^p\right)^2\right\}=0.$$

The iterated Stratonovich stochastic integrals (20) are part of the Taylor–Stratonovich expansion [1]-[3] (also see [7]-[15], [57]). It means that the approximations (22) can be useful for the numerical integration of Ito SDEs.

The expansion (21) has only one operation of the limit transition and by this reason is suitable for approximation of iterated Stratonovich stochastic integrals.

Let us consider the idea of the proof of Hypothesis 1. Introduce the following notations

$$J[\psi^{(k)}]_{T,t}^{s_l,\ldots,s_1}\stackrel{\rm def}{=}\prod_{p=1}^{l}\mathbf{1}_{\{i_{s_p}=i_{s_p+1}\ne 0\}}\times$$

$$\times\int\limits_t^T\psi_k(t_k)\ldots\int\limits_t^{t_{s_l+3}}\psi_{s_l+2}(t_{s_l+2})\int\limits_t^{t_{s_l+2}}\psi_{s_l}(t_{s_l+1})\psi_{s_l+1}(t_{s_l+1})\times$$

$$\times\int\limits_t^{t_{s_l+1}}\psi_{s_l-1}(t_{s_l-1})\ldots\int\limits_t^{t_{s_1+3}}\psi_{s_1+2}(t_{s_1+2})\int\limits_t^{t_{s_1+2}}\psi_{s_1}(t_{s_1+1})\psi_{s_1+1}(t_{s_1+1})\times$$

$$\times\int\limits_t^{t_{s_1+1}}\psi_{s_1-1}(t_{s_1-1})\ldots\int\limits_t^{t_2}\psi_1(t_1)d\mathbf{w}_{t_1}^{(i_1)}\ldots d\mathbf{w}_{t_{s_1-1}}^{(i_{s_1-1})}dt_{s_1+1}d\mathbf{w}_{t_{s_1+2}}^{(i_{s_1+2})}\ldots$$

$$\ldots d\mathbf{w}_{t_{s_l-1}}^{(i_{s_l-1})}dt_{s_l+1}d\mathbf{w}_{t_{s_l+2}}^{(i_{s_l+2})}\ldots d\mathbf{w}_{t_k}^{(i_k)},\qquad (23)$$

where $(s_l,\ldots,s_1)\in\mathrm{A}_{k,l}$,

$$\mathrm{A}_{k,l}=\left\{(s_l,\ldots,s_1):\ s_l>s_{l-1}+1,\ldots,s_2>s_1+1;\ s_l,\ldots,s_1=1,\ldots,k-1\right\},\qquad (24)$$

where $l=1,\ldots,[k/2]$, $i_s=0,1,\ldots,m$, $s=1,\ldots,k$, $[x]$ is an integer part of a real number x, $\mathbf{1}_A$ is the indicator of the set A.

Let us formulate the statement on connection between iterated Ito and Stratonovich stochastic integrals (1) and (2) of arbitrary multiplicity k.

Theorem 4 [46] (1997) (also see [7]-[15]). *Suppose that every $\psi_l(\tau)$ $(l=1,\ldots,k)$ is a continuous nonrandom function at the interval $[t,T]$. Then, the following relation between iterated Ito and Stratonovich stochastic integrals (1) and (2) is correct*

$$J^*[\psi^{(k)}]_{T,t}=J[\psi^{(k)}]_{T,t}+\sum_{r=1}^{[k/2]}\frac{1}{2^r}\sum_{(s_r,\ldots,s_1)\in\mathrm{A}_{k,r}}J[\psi^{(k)}]_{T,t}^{s_r,\ldots,s_1}\quad \text{w. p. 1},\qquad (25)$$

where $\sum\limits_{\emptyset}$ is supposed to be equal to zero, here and further w. p. 1 *means with probability* 1.

Note that the condition of continuity of the functions $\psi_1(\tau),\ldots,\psi_k(\tau)$ is related to the definition [1] of the Stratonovich stochastic integral that we use.

According to (6), we have

$$\underset{p_1,\ldots,p_k\to\infty}{\text{l.i.m.}}\sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k}C_{j_k\ldots j_1}\prod_{g=1}^{k}\zeta_{j_g}^{(i_g)}=J[\psi^{(k)}]_{T,t}+$$

$$+\underset{p_1,\ldots,p_k\to\infty}{\text{l.i.m.}}\sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k}C_{j_k\ldots j_1}\underset{N\to\infty}{\text{l.i.m.}}\sum_{(l_1,\ldots,l_k)\in G_k}\prod_{g=1}^{k}\phi_{j_g}(\tau_{l_g})\Delta\mathbf{w}_{\tau_{l_g}}^{(i_g)}. \tag{26}$$

From (3) and (25) it follows that

$$J^*[\psi^{(k)}]_{T,t}=\underset{p_1,\ldots,p_k\to\infty}{\text{l.i.m.}}\sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k}C_{j_k\ldots j_1}\prod_{g=1}^{k}\zeta_{j_g}^{(i_g)} \tag{27}$$

if

$$\sum_{r=1}^{[k/2]}\frac{1}{2^r}\sum_{(s_r,\ldots,s_1)\in\mathrm{A}_{k,r}}J[\psi^{(k)}]_{T,t}^{s_r,\ldots,s_1}=$$

$$=\underset{p_1,\ldots,p_k\to\infty}{\text{l.i.m.}}\sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k}C_{j_k\ldots j_1}\underset{N\to\infty}{\text{l.i.m.}}\sum_{(l_1,\ldots,l_k)\in G_k}\prod_{g=1}^{k}\phi_{j_g}(\tau_{l_g})\Delta\mathbf{w}_{\tau_{l_g}}^{(i_g)}\quad \text{w. p. 1.}$$

In the following section we consider some theorems prooving Hypothesis 1 for the cases $k=2,3,4$. The case $k=1$ obviously follows from Theorem 1 (see (8)). The cases $k=5,6$ (see Theorems 17, 22) will be proved in Sect. 8, 11.

4. Expansions of Iterated Stratonovich Stochastc Integrals of Multiplicities 2 to 4. Some Old Results

As it turned out, approximations of the iterated Stratonovich stochastic integrals (2) (see Theorems 5–11 below) are essentially simpler than their analogues for the iterated Ito stochastic integrals (1) based on Theorems 1, 2. For the first time this fact was mentioned in [7] (2006).

We begin the consideration from the multiplicity $k=2$ since according to (8) the expansions for iterated Ito and Stratonovich stochastic integrals (1), (2) of first multiplicity are equal to each other w. p. 1.

The following theorems adapt Theorems 1, 2 for the integrals (2) of multiplicity 2 (Hypothesis 1 for the case $k=2$).

Theorem 5 [8]-[15], [20]-[22], [37]. *Suppose that the following conditions are fulfulled:*

1. *The function $\psi_2(\tau)$ is continuously differentiable at the interval $[t,T]$ and the function $\psi_1(\tau)$ is twice continuously differentiable at the interval $[t,T]$.*

2. *$\{\phi_j(x)\}_{j=0}^{\infty}$ is a complete orthonormal system of Legendre polynomials or trigonometric functions in the space $L_2([t,T])$.*

Then, the iterated Stratonovich stochastic integral of second multiplicity

$$J^*[\psi^{(2)}]_{T,t}=\int\limits_t^{*T}\psi_2(t_2)\int\limits_t^{*t_2}\psi_1(t_1)d\mathbf{f}_{t_1}^{(i_1)}d\mathbf{f}_{t_2}^{(i_2)}\quad (i_1,i_2=0,1,\ldots,m)$$

is expanded into the converging in the mean-square sense double series

$$J^*[\psi^{(2)}]_{T,t}=\underset{p_1,p_2\to\infty}{\text{l.i.m.}}\sum_{j_1=0}^{p_1}\sum_{j_2=0}^{p_2}C_{j_2j_1}\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)},$$

where the meaning of the notations introduced in the formulation of Theorem 1 *is saved.*

Prooving Theorem 5 [8]-[15], [20]-[22], [37] we used Theorem 1 and double integration by parts. This procedure leads to the condition of double continuously differentiability of the function $\psi_1(\tau)$ at the interval $[t,T]$. The mentioned condition can be weakened. As a result, we have the following theorem.

Theorem 6 [11]-[15], [28], [40]. *Suppose that the following conditions are fulfilled*:
1. *Every* $\psi_l(\tau)$ $(l=1,2)$ *is a continuously differentiable function at the interval* $[t,T]$.
2. $\{\phi_j(x)\}_{j=0}^{\infty}$ *is a complete orthonormal system of Legendre polynomials or trigonometric functions in the space* $L_2([t,T])$.

Then, the iterated Stratonovich stochastic integral of second multiplicity

$$J^*[\psi^{(2)}]_{T,t}=\int\limits_t^{*T}\psi_2(t_2)\int\limits_t^{*t_2}\psi_1(t_1)d\mathbf{f}_{t_1}^{(i_1)}d\mathbf{f}_{t_2}^{(i_2)}\quad (i_1,i_2=0,1,\ldots,m)$$

is expanded into the converging in the mean-square sense double series

$$J^*[\psi^{(2)}]_{T,t}=\underset{p_1,p_2\to\infty}{\text{l.i.m.}}\sum_{j_1=0}^{p_1}\sum_{j_2=0}^{p_2}C_{j_2j_1}\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)},$$

where the meaning of the notations introduced in the formulation of Theorem 1 *is saved.*

Note that the another approaches to the proof of Theorem 6 can be found in the monographs [12]-[15] (see Chapter 2).

The following four theorems (Theorems 7–10) adapt Theorems 1, 2 for the iterated Stratonovich stochastic integrals (2) of multiplicity 3 (Hypothesis 1 for the case $k=3$). The notations used in Theorems 7–10 are the same as in Theorems 1, 2.

Theorem 7 [8]-[15], [20]-[22], [39]. *Suppose that* $\{\phi_j(x)\}_{j=0}^{\infty}$ *is a complete orthonormal system of Legendre polynomials or trigonometric functions in the space* $L_2([t,T])$. *Then, for the iterated Stratonovich stochastic integral of third multiplicity*

$$\int\limits_t^{*T}\int\limits_t^{*t_3}\int\limits_t^{*t_2}d\mathbf{f}_{t_1}^{(i_1)}d\mathbf{f}_{t_2}^{(i_2)}d\mathbf{f}_{t_3}^{(i_3)}\quad (i_1,i_2,i_3=1,\ldots,m)$$

the following expansion

$$
\int\limits_t^{*T}\int\limits_t^{*t_3}\int\limits_t^{*t_2} d\mathbf{f}_{t_1}^{(i_1)}d\mathbf{f}_{t_2}^{(i_2)}d\mathbf{f}_{t_3}^{(i_3)} = \underset{p_1,p_2,p_3\to\infty}{\text{l.i.m.}} \sum_{j_1=0}^{p_1}\sum_{j_2=0}^{p_2}\sum_{j_3=0}^{p_3} C_{j_3j_2j_1}\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}\zeta_{j_3}^{(i_3)}
$$

that is converges in the mean-square sense is valid, where

$$
C_{j_3j_2j_1} = \int\limits_t^T \phi_{j_3}(t_3)\int\limits_t^{t_3}\phi_{j_2}(t_2)\int\limits_t^{t_2}\phi_{j_1}(t_1)dt_1dt_2dt_3.
$$

Theorem 8 [8]-[15], [20]-[22], [39]. *Suppose that $\{\phi_j(x)\}_{j=0}^{\infty}$ is a complete orthonormal system of Legendre polynomials in the space $L_2([t,T])$. Then, for the iterated Stratonovich stochastic integral of third multiplicity*

$$
I_{l_1l_2l_3T,t}^{*(i_1i_2i_3)} = \int\limits_t^{*T}(t-t_3)^{l_3}\int\limits_t^{*t_3}(t-t_2)^{l_2}\int\limits_t^{*t_2}(t-t_1)^{l_1}d\mathbf{f}_{t_1}^{(i_1)}d\mathbf{f}_{t_2}^{(i_2)}d\mathbf{f}_{t_3}^{(i_3)} \quad (i_1,i_2,i_3=1,\ldots,m)
$$

the following expansion

$$
I_{l_1l_2l_3T,t}^{*(i_1i_2i_3)} = \underset{p_1,p_2,p_3\to\infty}{\text{l.i.m.}} \sum_{j_1=0}^{p_1}\sum_{j_2=0}^{p_2}\sum_{j_3=0}^{p_3} C_{j_3j_2j_1}\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}\zeta_{j_3}^{(i_3)}
$$

that is converges in the mean-square sense is valid for each of the following cases

1. $i_1\ne i_2,\ i_2\ne i_3,\ i_1\ne i_3$ *and* $l_1,l_2,l_3=0,1,2,\ldots$
2. $i_1=i_2\ne i_3$ *and* $l_1=l_2\ne l_3$ *and* $l_1,l_2,l_3=0,1,2,\ldots$
3. $i_1\ne i_2=i_3$ *and* $l_1\ne l_2=l_3$ *and* $l_1,l_2,l_3=0,1,2,\ldots$
4. $i_1,i_2,i_3=1,\ldots,m;\ l_1=l_2=l_3=l$ *and* $l=0,1,2,\ldots,$

where

$$
C_{j_3j_2j_1} = \int\limits_t^T (t-t_3)^{l_3}\phi_{j_3}(t_3)\int\limits_t^{t_3}(t-t_2)^{l_2}\phi_{j_2}(t_2)\int\limits_t^{t_2}(t-t_1)^{l_1}\phi_{j_1}(t_1)dt_1dt_2dt_3.
$$

Theorem 9 [8]-[15], [20]-[22]. *Suppose that $\{\phi_j(x)\}_{j=0}^{\infty}$ is a complete orthonormal system of Legendre polynomials or trigonometric functions in the space $L_2([t,T])$ and $\psi_l(\tau)$ $(l=1,2,3)$ are continuously differentiable functions at the interval $[t,T]$. Then, for the iterated Stratonovich stochastic integral of third multiplicity*

$$
J^*[\psi^{(3)}]_{T,t} = \int\limits_t^{*T}\psi_3(t_3)\int\limits_t^{*t_3}\psi_2(t_2)\int\limits_t^{*t_2}\psi_1(t_1)d\mathbf{f}_{t_1}^{(i_1)}d\mathbf{f}_{t_2}^{(i_2)}d\mathbf{f}_{t_3}^{(i_3)} \quad (i_1,i_2,i_3=1,\ldots,m)
$$

the following expansion

$$J^*[\psi^{(3)}]_{T,t} = \underset{p\to\infty}{\text{l.i.m.}} \sum_{j_1,j_2,j_3=0}^{p} C_{j_3j_2j_1}\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}\zeta_{j_3}^{(i_3)} \tag{28}$$

that is converges in the mean-square sense is valid for each of the following cases

1. $i_1 \neq i_2,\ i_2 \neq i_3,\ i_1 \neq i_3$,
2. $i_1 = i_2 \neq i_3$ *and* $\psi_1(\tau) \equiv \psi_2(\tau)$,
3. $i_1 \neq i_2 = i_3$ *and* $\psi_2(\tau) \equiv \psi_3(\tau)$,
4. $i_1, i_2, i_3 = 1, \ldots, m$ *and* $\psi_1(\tau) \equiv \psi_2(\tau) \equiv \psi_3(\tau)$,

where

$$C_{j_3j_2j_1} = \int\limits_t^T \psi_3(t_3)\phi_{j_3}(t_3)\int\limits_t^{t_3}\psi_2(t_2)\phi_{j_2}(t_2)\int\limits_t^{t_2}\psi_1(t_1)\phi_{j_1}(t_1)dt_1dt_2dt_3.$$

Theorem 10 [9]-[15], [22], [37]. *Suppose that $\{\phi_j(x)\}_{j=0}^{\infty}$ is a complete orthonormal system of Legendre polynomials or trigonomertic functions in the space $L_2([t,T])$. Furthermore, let the function $\psi_2(\tau)$ is continuously differentiable at the interval $[t,T]$ and the functions $\psi_1(\tau)$, $\psi_3(\tau)$ are twice continuously differentiable at the interval $[t,T]$. Then, for the iterated Stratonovich stochastic integral of third multiplicity*

$$J^*[\psi^{(3)}]_{T,t} = \int\limits_t^{*T}\psi_3(t_3)\int\limits_t^{*t_3}\psi_2(t_2)\int\limits_t^{*t_2}\psi_1(t_1)d\mathbf{f}_{t_1}^{(i_1)}d\mathbf{f}_{t_2}^{(i_2)}d\mathbf{f}_{t_3}^{(i_3)} \quad (i_1,i_2,i_3=1,\ldots,m)$$

the following expansion

$$J^*[\psi^{(3)}]_{T,t} = \underset{p\to\infty}{\text{l.i.m.}} \sum_{j_1,j_2,j_3=0}^{p} C_{j_3j_2j_1}\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}\zeta_{j_3}^{(i_3)} \tag{29}$$

that is converges in the mean-square sense is valid, where

$$C_{j_3j_2j_1} = \int\limits_t^T \psi_3(t_3)\phi_{j_3}(t_3)\int\limits_t^{t_3}\psi_2(t_2)\phi_{j_2}(t_2)\int\limits_t^{t_2}\psi_1(t_1)\phi_{j_1}(t_1)dt_1dt_2dt_3.$$

The following theorem adapts Theorems 1, 2 for the iterated Stratonovich stochastic integrals (2) of multiplicity 4 (Hypothesis 1 for the case $k=4$).

Theorem 11 [9]-[15], [22], [37]. *Suppose that $\{\phi_j(x)\}_{j=0}^{\infty}$ is a complete orthonormal system of Legendre polynomials or trigonometric functions in the space $L_2([t,T])$. Then, for the iterated Stratonovich stochastic integral of fourth multiplicity*

$$I_{T,t}^{*(i_1i_2i_3i_4)} = \int\limits_t^{*T}\int\limits_t^{*t_4}\int\limits_t^{*t_3}\int\limits_t^{*t_2} d\mathbf{w}_{t_1}^{(i_1)}d\mathbf{w}_{t_2}^{(i_2)}d\mathbf{w}_{t_3}^{(i_3)}d\mathbf{w}_{t_4}^{(i_4)} \quad (i_1,i_2,i_3,i_4=0,1,\ldots,m)$$

the following expansion

$$I_{T,t}^{*(i_1 i_2 i_3 i_4)} = \underset{p\to\infty}{\text{l.i.m.}} \sum_{j_1,j_2,j_3,j_4=0}^{p} C_{j_4 j_3 j_2 j_1} \zeta_{j_1}^{(i_1)} \zeta_{j_2}^{(i_2)} \zeta_{j_3}^{(i_3)} \zeta_{j_4}^{(i_4)}$$

that is converges in the mean-square sense is valid, where

$$C_{j_4 j_3 j_2 j_1} = \int\limits_t^T \phi_{j_4}(t_4) \int\limits_t^{t_4} \phi_{j_3}(t_3) \int\limits_t^{t_3} \phi_{j_2}(t_2) \int\limits_t^{t_2} \phi_{j_1}(t_1) dt_1 dt_2 dt_3 dt_4,$$

$\mathbf{w}_\tau^{(i)} = \mathbf{f}_\tau^{(i)}$ $(i = 1, \ldots, m)$ *are independent standard Wiener processes and* $\mathbf{w}_\tau^{(0)} = \tau$; *another notations are the same as in Theorems* 1, 2.

5. Proof of Hypothesis 1 Under the Condition of Convergence of Trace Series

In this section, we prove the expansion of iterated Stratonovich stochastic integrals of arbitrary multiplicity k $(k \in \mathbb{N})$ under the condition of convergence of trace series. Let us recall some notations.

Consider the unordered set $\{1, 2, \ldots, k\}$ and separate it into two parts: the first part consists of r unordered pairs (sequence order of these pairs is also unimportant) and the second one consists of the remaining $k - 2r$ numbers. So, we have

$$(\{\underbrace{\{g_1, g_2\}, \ldots, \{g_{2r-1}, g_{2r}\}}_{\text{part 1}}\}, \{\underbrace{q_1, \ldots, q_{k-2r}}_{\text{part 2}}\}), \tag{30}$$

where

$$\{g_1, g_2, \ldots, g_{2r-1}, g_{2r}, q_1, \ldots, q_{k-2r}\} = \{1, 2, \ldots, k\},$$

braces mean an unordered set, and parentheses mean an ordered set.

Consider the sum with respect to all possible partitions (30)

$$\sum_{\substack{(\{\{g_1,g_2\},\ldots,\{g_{2r-1},g_{2r}\}\},\{q_1,\ldots,q_{k-2r}\}) \\ \{g_1,g_2,\ldots,g_{2r-1},g_{2r},q_1,\ldots,q_{k-2r}\}=\{1,2,\ldots,k\}}} a_{g_1 g_2,\ldots,g_{2r-1} g_{2r}, q_1 \ldots q_{k-2r}}$$

and the Fourier coefficient

$$C_{j_k \ldots j_1} = \int\limits_t^T \psi_k(t_k) \phi_{j_k}(t_k) \ldots \int\limits_t^{t_2} \psi_1(t_1) \phi_{j_1}(t_1) dt_1 \ldots dt_k \tag{31}$$

corresponding to the function (3), where $\{\phi_j(x)\}_{j=0}^{\infty}$ is a complete orthonormal system of functions in the space $L_2([t, T])$. At that we suppose $\phi_0(x) = 1/\sqrt{T-t}$.

Denote

$$C_{j_k \ldots j_{l+1} j_l j_l j_{l-2} \ldots j_1} \Bigg|_{(j_l j_l) \frown (\cdot)} \stackrel{\mathsf{def}}{=} \tag{32}$$

$$\stackrel{\sf def}{=}\int\limits_t^T\psi_k(t_k)\phi_{j_k}(t_k)\ldots\int\limits_t^{t_{l+2}}\psi_{l+1}(t_{l+1})\phi_{j_{l+1}}(t_{l+1})\int\limits_t^{t_{l+1}}\psi_l(t_l)\psi_{l-1}(t_l)\times$$

$$\times\int\limits_t^{t_l}\psi_{l-2}(t_{l-2})\phi_{j_{l-2}}(t_{l-2})\ldots\int\limits_t^{t_2}\psi_1(t_1)\phi_{j_1}(t_1)dt_1\ldots dt_{l-2}dt_lt_{l+1}\ldots dt_k=$$

$$=\sqrt{T-t}\int\limits_t^T\psi_k(t_k)\phi_{j_k}(t_k)\ldots\int\limits_t^{t_{l+2}}\psi_{l+1}(t_{l+1})\phi_{j_{l+1}}(t_{l+1})\int\limits_t^{t_{l+1}}\psi_l(t_l)\psi_{l-1}(t_l)\phi_0(t_l)\times$$

$$\times\int\limits_t^{t_l}\psi_{l-2}(t_{l-2})\phi_{j_{l-2}}(t_{l-2})\ldots\int\limits_t^{t_2}\psi_1(t_1)\phi_{j_1}(t_1)dt_1\ldots dt_{l-2}dt_lt_{l+1}\ldots dt_k=$$

$$=\sqrt{T-t}\hat C_{j_k\ldots j_{l+1}0j_{l-2}\ldots j_1},$$

i.e. $\sqrt{T-t}\hat C_{j_k\ldots j_{l+1}0j_{l-2}\ldots j_1}$ is again the Fourier coefficient of type $C_{j_k\ldots j_1}$ but with a new shorter multi-index $j_k\ldots j_{l+1}0j_{l-2}\ldots j_1$ and new weight functions $\psi_1(\tau),\ \ldots,\ \psi_{l-2}(\tau),\ \sqrt{T-t}\psi_{l-1}(\tau)\psi_l(\tau)$, $\psi_{l+1}(\tau),\ \ldots,\ \psi_k(\tau)$ (also we suppose that $\{l,l-1\}$ is one of the pairs $\{g_1,g_2\},\ldots,\{g_{2r-1},g_{2r}\}$).

Let

$$C_{j_k\ldots j_{l+1}j_lj_lj_{l-2}\ldots j_1}\Biggr|_{(j_lj_l)\curvearrowright j_m}\stackrel{\sf def}{=}$$

$$\stackrel{\sf def}{=}\int\limits_t^T\psi_k(t_k)\phi_{j_k}(t_k)\ldots\int\limits_t^{t_{l+2}}\psi_{l+1}(t_{l+1})\phi_{j_{l+1}}(t_{l+1})\int\limits_t^{t_{l+1}}\psi_l(t_l)\psi_{l-1}(t_l)\phi_{j_m}(t_l)\times$$

$$\times\int\limits_t^{t_l}\psi_{l-2}(t_{l-2})\phi_{j_{l-2}}(t_{l-2})\ldots\int\limits_t^{t_2}\psi_1(t_1)\phi_{j_1}(t_1)dt_1\ldots dt_{l-2}dt_lt_{l+1}\ldots dt_k= \qquad (33)$$

$$=\bar C_{j_k\ldots j_{l+1}j_mj_{l-2}\ldots j_1},$$

i.e. $\bar C_{j_k\ldots j_{l+1}j_mj_{l-2}\ldots j_1}$ is again the Fourier coefficient of type $C_{j_k\ldots j_1}$ but with a new shorter multi-index $j_k\ldots j_{l+1}j_mj_{l-2}\ldots j_1$ and new weight functions $\psi_1(\tau),\ldots,\psi_{l-2}(\tau),\psi_{l-1}(\tau)\psi_l(\tau),\psi_{l+1}(\tau),\ldots,$ $\psi_k(\tau)$ (also we suppose that $\{l-1,l\}$ is one of the pairs $\{g_1,g_2\},\ldots,\{g_{2r-1},g_{2r}\}$).

Denote

$$\bar C^{(p)}_{j_k\ldots j_q\ldots j_1}\Biggr|_{q\ne g_1,g_2,\ldots,g_{2r-1},g_{2r}}\stackrel{\sf def}{=}$$

$$\stackrel{\sf def}{=}\sum_{j_{g_{2r-1}}=p+1}^{\infty}\sum_{j_{g_{2r-3}}=p+1}^{\infty}\ldots\sum_{j_{g_3}=p+1}^{\infty}\sum_{j_{g_1}=p+1}^{\infty}C_{j_k\ldots j_1}\Biggr|_{j_{g_1}=j_{g_2},\ldots,j_{g_{2r-1}}=j_{g_{2r}}}. \qquad (34)$$

Introduce the following notation

$$S_l\left\{\bar C^{(p)}_{j_k\ldots j_q\ldots j_1}\biggr|_{q\ne g_1,g_2,\ldots,g_{2r-1},g_{2r}}\right\}\stackrel{\sf def}{=}\frac{1}{2}{\bf 1}_{\{g_{2l}=g_{2l-1}+1\}}\sum\limits_{j_{g_{2r-1}}=p+1}^{\infty}\ \sum\limits_{j_{g_{2r-3}}=p+1}^{\infty}\ldots$$

$$\ldots\sum\limits_{j_{g_{2l+1}}=p+1}^{\infty}\ \sum\limits_{j_{g_{2l-3}}=p+1}^{\infty}\ldots\sum\limits_{j_{g_{3}}=p+1}^{\infty}\ \sum\limits_{j_{g_{1}}=p+1}^{\infty}C_{j_k\ldots j_1}\biggr|_{(j_{g_{2l}}j_{g_{2l-1}})\frown(\cdot),j_{g_1}=j_{g_2},\ldots,j_{g_{2r-1}}=j_{g_{2r}}}. \tag{35}$$

Note that the operation S_l $(l=1,2,\ldots,r)$ acts on the value

$$\bar C^{(p)}_{j_k\ldots j_q\ldots j_1}\biggr|_{q\ne g_1,g_2,\ldots,g_{2r-1},g_{2r}} \tag{36}$$

as follows: S_l multiplies (36) by ${\bf 1}_{\{g_{2l}=g_{2l-1}+1\}}/2$, removes the summation

$$\sum\limits_{j_{g_{2l-1}}=p+1}^{\infty},$$

and replaces

$$C_{j_k\ldots j_1}\biggr|_{j_{g_1}=j_{g_2},\ldots,j_{g_{2r-1}}=j_{g_{2r}}}$$

with

$$C_{j_k\ldots j_1}\biggr|_{(j_{g_{2l}}j_{g_{2l-1}})\frown(\cdot),j_{g_1}=j_{g_2},\ldots,j_{g_{2r-1}}=j_{g_{2r}}}. \tag{37}$$

Note that we write

$$C_{j_k\ldots j_1}\biggr|_{(j_{g_1}j_{g_2})\frown(\cdot),j_{g_1}=j_{g_2}}=C_{j_k\ldots j_1}\biggr|_{(j_{g_1}j_{g_1})\frown(\cdot),j_{g_1}=j_{g_2}},$$

$$C_{j_k\ldots j_1}\biggr|_{(j_{g_1}j_{g_2})\frown j_m,j_{g_1}=j_{g_2}}=C_{j_k\ldots j_1}\biggr|_{(j_{g_1}j_{g_1})\frown j_m,j_{g_1}=j_{g_2}},$$

$$C_{j_k\ldots j_1}\biggr|_{(j_{g_1}j_{g_2})\frown(\cdot),(j_{g_3}j_{g_4})\frown(\cdot),j_{g_1}=j_{g_2},j_{g_3}=j_{g_4}}=C_{j_k\ldots j_1}\biggr|_{(j_{g_1}j_{g_1})\frown(\cdot)(j_{g_3}j_{g_3})\frown(\cdot),j_{g_1}=j_{g_2},j_{g_3}=j_{g_4}},\quad\ldots$$

Since (37) is again the Fourier coefficient, then the action of superposition S_lS_m on (37) is obvious. For example, for $r=3$

$$S_3S_2S_1\left\{\bar C^{(p)}_{j_k\ldots j_q\ldots j_1}\biggr|_{q\ne g_1,g_2,\ldots,g_5,g_6}\right\}=$$

$$=\frac{1}{2^3}\prod_{s=1}^{3}{\bf 1}_{\{g_{2s}=g_{2s-1}+1\}}C_{j_k\ldots j_1}\biggr|_{(j_{g_2}j_{g_1})\frown(\cdot)(j_{g_4}j_{g_3})\frown(\cdot)(j_{g_6}j_{g_5})\frown(\cdot),j_{g_1}=j_{g_2},j_{g_3}=j_{g_4},j_{g_5}=j_{g_6}},$$

$$S_3 S_1\left\{\bar{C}_{j_k\ldots j_q\ldots j_1}^{(p)}\Biggl|_{q\ne g_1,g_2,\ldots,g_5,g_6}\right\}=$$

$$=\frac{1}{2^2}\mathbf{1}_{\{g_6=g_5+1\}}\mathbf{1}_{\{g_2=g_1+1\}}\sum_{j_{g_3}=p+1}^{\infty}C_{j_k\ldots j_1}\Biggl|_{(j_{g_2}j_{g_1})\frown(\cdot)(j_{g_6}j_{g_5})\frown(\cdot),j_{g_1}=j_{g_2},j_{g_3}=j_{g_4},j_{g_5}=j_{g_6}},$$

$$S_2\left\{\bar{C}_{j_k\ldots j_q\ldots j_1}^{(p)}\Biggl|_{q\ne g_1,g_2,\ldots,g_5,g_6}\right\}=$$

$$=\frac{1}{2}\mathbf{1}_{\{g_4=g_3+1\}}\sum_{j_{g_1}=p+1}^{\infty}\sum_{j_{g_5}=p+1}^{\infty}C_{j_k\ldots j_1}\Biggl|_{(j_{g_4}j_{g_3})\frown(\cdot),j_{g_1}=j_{g_2},j_{g_3}=j_{g_4},j_{g_5}=j_{g_6}}.$$

Theorem 12 [12], [36], [37], [51]. *Assume that the continuously differentiable functions* $\psi_l(\tau)$ $(l=1,\ldots,k)$ *and the complete orthonormal system* $\{\phi_j(x)\}_{j=0}^{\infty}$ *of continuous functions* $(\phi_0(x)=1/\sqrt{T-t})$ *in the space* $L_2([t,T])$ *are such that the following conditions are satisfied*:

1. *The equality*

$$\frac{1}{2}\int\limits_t^s\Phi_1(t_1)\Phi_2(t_1)dt_1=\sum_{j_1=0}^{\infty}\int\limits_t^s\Phi_2(t_2)\phi_{j_1}(t_2)\int\limits_t^{t_2}\Phi_1(t_1)\phi_{j_1}(t_1)dt_1dt_2 \qquad (38)$$

holds for all $s\in(t,T]$, *where the nonrandom functions* $\Phi_1(\tau)$, $\Phi_2(\tau)$ *are continuously differentiable on* $[t,T]$ *and the series on the right-hand side of* (38) *converges absolutely.*

2. *The estimates*

$$\left|\int\limits_t^s\phi_j(\tau)\Phi_1(\tau)d\tau\right|\le\frac{\Psi_1(s)}{j^{1/2+\alpha}},\quad \left|\int\limits_s^T\phi_j(\tau)\Phi_2(\tau)d\tau\right|\le\frac{\Psi_1(s)}{j^{1/2+\alpha}},$$

$$\left|\sum_{j=p+1}^{\infty}\int\limits_t^s\Phi_2(\tau)\phi_j(\tau)\int\limits_t^{\tau}\Phi_1(\theta)\phi_j(\theta)d\theta d\tau\right|\le\frac{\Psi_2(s)}{p^{\beta}}$$

hold for all $s\in(t,T)$ *and for some* $\alpha,\beta>0$, *where* $\Phi_1(\tau)$, $\Phi_2(\tau)$ *are continuously differentiable nonrandom functions on* $[t,T]$, $j,p\in\mathbb{N}$, *and*

$$\int\limits_t^T\Psi_1^2(\tau)d\tau<\infty,\quad \int\limits_t^T\left|\Psi_2(\tau)\right|d\tau<\infty.$$

3. *The condition*

$$\lim_{p\to\infty}\sum_{\substack{j_1,\ldots,j_q,\ldots,j_k=0\\ q\ne g_1,g_2,\ldots,g_{2r-1},g_{2r}}}^{p}\left(S_{l_1}S_{l_2}\ldots S_{l_d}\left\{\bar{C}_{j_k\ldots j_q\ldots j_1}^{(p)}\Biggl|_{q\ne g_1,g_2,\ldots,g_{2r-1},g_{2r}}\right\}\right)^2=0$$

holds for all possible $g_1, g_2, \ldots, g_{2r-1}, g_{2r}$ *(see* (30)*) and* $l_1, l_2, \ldots, l_d$ *such that* $l_1, l_2, \ldots, l_d \in \{1, 2, \ldots, r\}$, $l_1 > l_2 > \ldots > l_d$, $d = 0, 1, 2, \ldots, r-1$, *where* $r = 1, 2, \ldots, [k/2]$ *and*

$$S_{l_1} S_{l_2} \ldots S_{l_d} \left\{ \bar{C}^{(p)}_{j_k \ldots j_q \ldots j_1} \Bigg|_{q \ne g_1, g_2, \ldots, g_{2r-1}, g_{2r}} \right\} \stackrel{\text{def}}{=} \bar{C}^{(p)}_{j_k \ldots j_q \ldots j_1} \Bigg|_{q \ne g_1, g_2, \ldots, g_{2r-1}, g_{2r}}$$

for $d = 0$.

Then, for the iterated Stratonovich stochastic integral of arbitrary multiplicity k

$$J^*[\psi^{(k)}]^{(i_1 \ldots i_k)}_{T,t} = \int\limits_t^{*T} \psi_k(t_k) \ldots \int\limits_t^{*t_2} \psi_1(t_1) d\mathbf{w}^{(i_1)}_{t_1} \ldots d\mathbf{w}^{(i_k)}_{t_k} \tag{39}$$

the following expansion

$$J^*[\psi^{(k)}]^{(i_1 \ldots i_k)}_{T,t} = \underset{p \to \infty}{\text{l.i.m.}} \sum_{j_1, \ldots, j_k = 0}^{p} C_{j_k \ldots j_1} \prod_{l=1}^{k} \zeta^{(i_l)}_{j_l} \tag{40}$$

that converges in the mean-square sense is valid, where

$$C_{j_k \ldots j_1} = \int\limits_t^T \psi_k(t_k) \phi_{j_k}(t_k) \ldots \int\limits_t^{t_2} \psi_1(t_1) \phi_{j_1}(t_1) dt_1 \ldots dt_k \tag{41}$$

is the Fourier coefficient, l.i.m. *is a limit in the mean-square sense,* $i_1, \ldots, i_k = 0, 1, \ldots, m$,

$$\zeta^{(i)}_j = \int\limits_t^T \phi_j(\tau) d\mathbf{w}^{(i)}_\tau$$

are independent standard Gaussian random variables for various i *or* j *(in the case when* $i \ne 0$*),* $\mathbf{w}^{(i)}_\tau = \mathbf{f}^{(i)}_\tau$ *for* $i = 1, \ldots, m$ *and* $\mathbf{w}^{(0)}_\tau = \tau$.

Proof. First note that (38) is fulfilled (see [12], Sect. 2.1.4 or [75]). The proof of Theorem 12 will consist of several steps.

Step 1. Let us find a representation of the quantity

$$\sum_{j_1, \ldots, j_k = 0}^{p} C_{j_k \ldots j_1} \prod_{l=1}^{k} \zeta^{(i_l)}_{j_l}$$

that will be convenient for further consideration.

Let us consider the following multiple stochastic integral

$$\underset{N \to \infty}{\text{l.i.m.}} \sum_{\substack{j_1, \ldots, j_k = 0 \\ j_q \ne j_r;\ q \ne r;\ q, r = 1, \ldots, k}}^{N-1} \Phi\left(\tau_{j_1}, \ldots, \tau_{j_k}\right) \prod_{l=1}^{k} \Delta \mathbf{w}^{(i_l)}_{\tau_{j_l}} \stackrel{\text{def}}{=} J'[\Phi]^{(i_1 \ldots i_k)}_{T,t}, \tag{42}$$

where for simplicity we assume that $\Phi(t_1, \ldots, t_k) : [t, T]^k \to \mathbb{R}$ is a continuous nonrandom function on $[t, T]^k$. Moreover, $\Delta \mathbf{w}^{(i)}_{\tau_j} = \mathbf{w}^{(i)}_{\tau_{j+1}} - \mathbf{w}^{(i)}_{\tau_j}$ $(i = 0, 1, \ldots, m)$, $\{\tau_j\}_{j=0}^{N}$ is a partition of $[t, T]$, which satisfies the condition (5), $i_1, \ldots, i_k = 0, 1, \ldots, m$.

The stochastic integral with respect to the scalar standard Wiener process ($i_1 = \ldots = i_k \neq 0$) and similar to (42) was considered in [67] (1951) and is called the multiple Wiener stochastic integral [67].

Note that the following well known estimate

$$\mathsf{M}\left\{\left(J'[\Phi]_{T,t}^{(i_1\ldots i_k)}\right)^2\right\} \le C_k \int\limits_{[t,T]^k} \Phi^2(t_1,\ldots,t_k)dt_1\ldots dt_k \tag{43}$$

is true for the multiple Wiener stochastic integral, where $J'[\Phi]_{T,t}^{(i_1\ldots i_k)}$ is defined by (42) and C_k is a constant.

From the proof of Theorem 1 (see the proof of Theorem 5.1 in the original paper [7] (2006) in Russian or proof of Theorems 1.1, 1.16 in the monograph [12] in English) it follows that (6), (17) can be written as

$$J[\psi^{(k)}]_{T,t}^{(i_1\ldots i_k)} = \underset{p_1,\ldots,p_k\to\infty}{\text{l.i.m.}} \sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k} C_{j_k\ldots j_1} J'[\phi_{j_1}\ldots\phi_{j_k}]_{T,t}^{(i_1\ldots i_k)}, \tag{44}$$

where $J'[\phi_{j_1}\ldots\phi_{j_k}]_{T,t}^{(i_1\ldots i_k)}$ is the multiple Wiener stochatic integral defined by (42) and $J[\psi^{(k)}]_{T,t}^{(i_1\ldots i_k)}$ is the iterated Ito stochastic integral (1), i.e.

$$J[\psi^{(k)}]_{T,t}^{(i_1\ldots i_k)} = \int\limits_t^T \psi_k(t_k)\ldots\int\limits_t^{t_2}\psi_1(t_1)d\mathbf{w}_{t_1}^{(i_1)}\ldots d\mathbf{w}_{t_k}^{(i_k)}.$$

Consider the following multiple stochastic integral

$$\underset{N\to\infty}{\text{l.i.m.}} \sum_{j_1,\ldots,j_k=0}^{N-1} \Phi\left(\tau_{j_1},\ldots,\tau_{j_k}\right)\prod_{l=1}^k \Delta\mathbf{w}_{\tau_{j_l}}^{(i_l)} \stackrel{\text{def}}{=} J[\Phi]_{T,t}^{(i_1\ldots i_k)}, \tag{45}$$

where we assume that $\Phi(t_1,\ldots,t_k):\ [t,T]^k\to\mathbb{R}$ is a continuous nonrandom function on $[t,T]^k$. Another notations are the same as in (42).

The stochastic integral with respect to the scalar standard Wiener process ($i_1 = \ldots = i_k \neq 0$) and similar to (45) (the function $\Phi(t_1,\ldots,t_k)$ is assumed to be symmetric on the hypercube $[t,T]^k$) has been considered in the literature (see, for example, Remark 1.5.7 [68]). The integral (45) is sometimes called the multiple Stratonovich stochastic integral. This is due to the fact that the following rule of the classical integral calculus holds for this integral

$$J[\Phi]_{T,t}^{(i_1\ldots i_k)} = J[\varphi_1]_{T,t}^{(i_1)}\ldots J[\varphi_k]_{T,t}^{(i_k)} \quad \text{w. p. 1},$$

where $\Phi(t_1,\ldots,t_k)=\varphi_1(t_1)\ldots\varphi_k(t_k)$ and

$$J[\varphi_l]_{T,t}^{(i_l)} = \int\limits_t^T \varphi_l(\tau)d\mathbf{w}_\tau^{(i_l)} \quad (l=1,\ldots,k).$$

Theorem 13 [12], [14]. *Suppose that $\Phi(t_1,\ldots,t_k):\ [t,T]^k\to\mathbb{R}$ is a continuous nonrandom function on $[t,T]^k$. Furthermore, let $\{\phi_j(x)\}_{j=0}^\infty$ is a complete orthonormal system of functions in the space $L_2([t,T])$, each function $\phi_j(x)$ of which for finite j is continuous at the interval $[t,T]$ except* *may be for the finite number of points of the finite discontinuity as well as $\phi_j(x)$ is right-continuous at the interval $[t,T]$. Then the following expansion*

$$J'[\Phi]_{T,t}^{(i_1\ldots i_k)}=\underset{p_1,\ldots,p_k\to\infty}{\text{l.i.m.}}\sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k}C_{j_k\ldots j_1}J'[\phi_{j_1}\ldots\phi_{j_k}]_{T,t}^{(i_1\ldots i_k)}=$$

$$=\underset{p_1,\ldots,p_k\to\infty}{\text{l.i.m.}}\sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k}C_{j_k\ldots j_1}\Biggl(\prod_{l=1}^{k}\zeta_{j_l}^{(i_l)}+\sum_{r=1}^{[k/2]}(-1)^r\times$$

$$\times\sum_{\substack{(\{\{g_1,g_2\},\ldots,\{g_{2r-1},g_{2r}\}\},\{q_1,\ldots,q_{k-2r}\})\\ \{g_1,g_2,\ldots,g_{2r-1},g_{2r},q_1,\ldots,q_{k-2r}\}=\{1,2,\ldots,k\}}}\prod_{s=1}^{r}\mathbf{1}_{\{i_{g_{2s-1}}=\ i_{g_{2s}}\ne 0\}}\mathbf{1}_{\{j_{g_{2s-1}}=\ j_{g_{2s}}\}}\prod_{l=1}^{k-2r}\zeta_{j_{q_l}}^{(i_{q_l})}\Biggr) \tag{46}$$

converging in the mean-square sense is valid, where $J'[\Phi]_{T,t}^{(i_1\ldots i_k)}$ is the multiple Wiener stochatic integral defined by (42),

$$C_{j_k\ldots j_1}=\int\limits_{[t,T]^k}\Phi(t_1,\ldots,t_k)\prod_{l=1}^{k}\phi_{j_l}(t_l)dt_1\ldots dt_k \tag{47}$$

is the Fourier coefficient. Another notations are the same as in Theorems 1, 2.

From (17) and (44) we conclude that

$$J'[\phi_{j_1}\ldots\phi_{j_k}]_{T,t}^{(i_1\ldots i_k)}=\prod_{l=1}^{k}\zeta_{j_l}^{(i_l)}+$$

$$+\sum_{r=1}^{[k/2]}(-1)^r\sum_{\substack{(\{\{g_1,g_2\},\ldots,\{g_{2r-1},g_{2r}\}\},\{q_1,\ldots,q_{k-2r}\})\\ \{g_1,g_2,\ldots,g_{2r-1},g_{2r},q_1,\ldots,q_{k-2r}\}=\{1,2,\ldots,k\}}}\prod_{s=1}^{r}\mathbf{1}_{\{i_{g_{2s-1}}=\ i_{g_{2s}}\ne 0\}}\mathbf{1}_{\{j_{g_{2s-1}}=\ j_{g_{2s}}\}}\prod_{l=1}^{k-2r}\zeta_{j_{q_l}}^{(i_{q_l})} \tag{48}$$

w. p. 1, where notations are the same as in Theorem 2 and $J'[\phi_{j_1}\ldots\phi_{j_k}]_{T,t}^{(i_1\ldots i_k)}$ is the multiple Wiener stochastic integral (42).

Using (48), we obtain

$$\prod_{l=1}^{k}\zeta_{j_l}^{(i_l)}=J'[\phi_{j_1}\ldots\phi_{j_k}]_{T,t}^{(i_1\ldots i_k)}-$$

$$-\sum_{r=1}^{[k/2]}(-1)^r\sum_{\substack{(\{\{g_1,g_2\},\ldots,\{g_{2r-1},g_{2r}\}\},\{q_1,\ldots,q_{k-2r}\})\\ \{g_1,g_2,\ldots,g_{2r-1},g_{2r},q_1,\ldots,q_{k-2r}\}=\{1,2,\ldots,k\}}}\prod_{s=1}^{r}\mathbf{1}_{\{i_{g_{2s-1}}=\ i_{g_{2s}}\ne 0\}}\mathbf{1}_{\{j_{g_{2s-1}}=\ j_{g_{2s}}\}}\prod_{l=1}^{k-2r}\zeta_{j_{q_l}}^{(i_{q_l})} \tag{49}$$

w. p. 1.

By iteratively applying the formula (49) (also see (9)–(13)), we obtain the following representation of the product

$$\prod_{l=1}^{k}\zeta_{j_l}^{(i_l)}$$

as the sum of some constant value and multiple Wiener stochastic integrals of multiplicities not exceeding k

$$\prod_{l=1}^{k}\zeta_{j_l}^{(i_l)}=J'[\phi_{j_1}\ldots\phi_{j_k}]_{T,t}^{(i_1\ldots i_k)}+$$

$$+\sum_{r=1}^{[k/2]}\sum_{\substack{(\{\{g_1,g_2\},\ldots,\{g_{2r-1},g_{2r}\}\},\{q_1,\ldots,q_{k-2r}\})\\ \{g_1,g_2,\ldots,g_{2r-1},g_{2r},q_1,\ldots,q_{k-2r}\}=\{1,2,\ldots,k\}}}\prod_{s=1}^{r}\mathbf{1}_{\{i_{g_{2s-1}}=\ i_{g_{2s}}\neq 0\}}\times$$

$$\times\mathbf{1}_{\{j_{g_{2s-1}}=\ j_{g_{2s}}\}}J'[\phi_{j_{q_1}}\ldots\phi_{j_{q_{k-2r}}}]_{T,t}^{(i_{q_1}\ldots i_{q_{k-2r}})}\quad \text{w. p. 1,}\tag{50}$$

where $J'[\phi_{j_{q_1}}\ldots\phi_{j_{q_{k-2r}}}]_{T,t}^{(i_{q_1}\ldots i_{q_{k-2r}})}\stackrel{\sf def}{=}1$ for $k=2r$.

Multiplying both sides of the equality (50) by $C_{j_k\ldots j_1}$ and summing over $j_1,\ldots,j_k$, we get w. p. 1

$$\sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k}C_{j_k\ldots j_1}\prod_{l=1}^{k}\zeta_{j_l}^{(i_l)}=\sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k}C_{j_k\ldots j_1}J'[\phi_{j_1}\ldots\phi_{j_k}]_{T,t}^{(i_1\ldots i_k)}+$$

$$+\sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k}C_{j_k\ldots j_1}\sum_{r=1}^{[k/2]}\sum_{\substack{(\{\{g_1,g_2\},\ldots,\{g_{2r-1},g_{2r}\}\},\{q_1,\ldots,q_{k-2r}\})\\ \{g_1,g_2,\ldots,g_{2r-1},g_{2r},q_1,\ldots,q_{k-2r}\}=\{1,2,\ldots,k\}}}\prod_{s=1}^{r}\mathbf{1}_{\{i_{g_{2s-1}}=\ i_{g_{2s}}\neq 0\}}\times$$

$$\times\mathbf{1}_{\{j_{g_{2s-1}}=\ j_{g_{2s}}\}}J'[\phi_{j_{q_1}}\ldots\phi_{j_{q_{k-2r}}}]_{T,t}^{(i_{q_1}\ldots i_{q_{k-2r}})}\quad \text{w. p. 1.}\tag{51}$$

Denote

$$K_{p_1\ldots p_k}(t_1,\ldots,t_k)=\sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k}C_{j_k\ldots j_1}\prod_{l=1}^{k}\phi_{j_l}(t_l),\tag{52}$$

$$K_{p_1\ldots p_k}^{g_1\ldots g_{2r},q_1\ldots q_{k-2r}}(t_{q_1},\ldots,t_{q_{k-2r}})=$$

$$=\sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k}C_{j_k\ldots j_1}\prod_{s=1}^{r}\mathbf{1}_{\{j_{g_{2s-1}}=\ j_{g_{2s}}\}}\prod_{l=1}^{k-2r}\phi_{j_{q_l}}(t_{q_l}),\tag{53}$$

where $C_{j_k\ldots j_1}$ is defined by (41) and $\prod_{\emptyset}\stackrel{\sf def}{=}1$.

The equality (51) can be written as

$$J[K_{p_1\ldots p_k}]_{T,t}^{(i_1\ldots i_k)} = J'[K_{p_1\ldots p_k}]_{T,t}^{(i_1\ldots i_k)} +$$

$$+\sum_{r=1}^{[k/2]} \sum_{\substack{(\{\{g_1,g_2\},\ldots,\{g_{2r-1},g_{2r}\}\},\{q_1,\ldots,q_{k-2r}\}) \\ \{g_1,g_2,\ldots,g_{2r-1},g_{2r},q_1,\ldots,q_{k-2r}\}=\{1,2,\ldots,k\}}} \prod_{s=1}^{r} \mathbf{1}_{\{i_{g_{2s-1}}=\ i_{g_{2s}}\neq 0\}}\ J'[K_{p_1\ldots p_k}^{g_1\ldots g_{2r},q_1\ldots q_{k-2r}}]_{T,t}^{(i_{q_1}\ldots i_{q_{k-2r}})} \tag{54}$$

w. p. 1, where $K_{p_1\ldots p_k}(t_1,\ldots,t_k)$ and $K_{p_1\ldots p_k}^{g_1\ldots g_{2r},q_1\ldots q_{k-2r}}(t_{q_1},\ldots,t_{q_{k-2r}})$ have the form (52), (53), $J[K_{p_1\ldots p_k}]_{T,t}^{(i_1\ldots i_k)}$ is the multiple Stratonovich stochastic integral defined by (45), $J'[K_{p_1\ldots p_k}]_{T,t}^{(i_1\ldots i_k)}$ and $J'[K_{p_1\ldots p_k}^{g_1\ldots g_{2r},q_1\ldots q_{k-2r}}]_{T,t}^{(i_{q_1}\ldots i_{q_{k-2r}})}$ are multiple Wiener stochastic integrals defined by (42).

Passing to the limit $\underset{p_1,\ldots,p_k\to\infty}{\text{l.i.m.}}$ $(p_1=\ldots=p_k=p)$ in (51) or (54), we get w. p. 1 (see (44))

$$\underset{p\to\infty}{\text{l.i.m.}} \sum_{j_1,\ldots,j_k=0}^{p} C_{j_k\ldots j_1} \prod_{l=1}^{k} \zeta_{j_l}^{(i_l)} = J[\psi^{(k)}]_{T,t}^{(i_1\ldots i_k)} +$$

$$+\underset{p\to\infty}{\text{l.i.m.}} \sum_{j_1,\ldots,j_k=0}^{p} C_{j_k\ldots j_1} \sum_{r=1}^{[k/2]} \sum_{\substack{(\{\{g_1,g_2\},\ldots,\{g_{2r-1},g_{2r}\}\},\{q_1,\ldots,q_{k-2r}\}) \\ \{g_1,g_2,\ldots,g_{2r-1},g_{2r},q_1,\ldots,q_{k-2r}\}=\{1,2,\ldots,k\}}} \prod_{s=1}^{r} \mathbf{1}_{\{i_{g_{2s-1}}=\ i_{g_{2s}}\neq 0\}}\times$$

$$\times\mathbf{1}_{\{j_{g_{2s-1}}=\ j_{g_{2s}}\}} J'[\phi_{j_{q_1}}\ldots\phi_{j_{q_{k-2r}}}]_{T,t}^{(i_{q_1}\ldots i_{q_{k-2r}})} = \tag{55}$$

$$= J[\psi^{(k)}]_{T,t}^{(i_1\ldots i_k)} + \underset{p\to\infty}{\text{l.i.m.}} \sum_{r=1}^{[k/2]} \sum_{\substack{(\{\{g_1,g_2\},\ldots,\{g_{2r-1},g_{2r}\}\},\{q_1,\ldots,q_{k-2r}\}) \\ \{g_1,g_2,\ldots,g_{2r-1},g_{2r},q_1,\ldots,q_{k-2r}\}=\{1,2,\ldots,k\}}} \prod_{s=1}^{r} \mathbf{1}_{\{i_{g_{2s-1}}=\ i_{g_{2s}}\neq 0\}}\times$$

$$\times J'[K_{p_1\ldots p_k}^{g_1\ldots g_{2r},q_1\ldots q_{k-2r}}]_{T,t}^{(i_{q_1}\ldots i_{q_{k-2r}})} \tag{56}$$

w. p. 1, where $J[\psi^{(k)}]_{T,t}^{(i_1\ldots i_k)}$ is the iterated Ito stochastic integral (1).

If we prove that w. p. 1

$$\sum_{r=1}^{[k/2]} \frac{1}{2^r} \sum_{(s_r,\ldots,s_1)\in \mathrm{A}_{k,r}} J[\psi^{(k)}]_{T,t}^{s_r,\ldots,s_1} =$$

$$= \underset{p\to\infty}{\text{l.i.m.}} \sum_{j_1,\ldots,j_k=0}^{p} C_{j_k\ldots j_1} \sum_{r=1}^{[k/2]} \sum_{\substack{(\{\{g_1,g_2\},\ldots,\{g_{2r-1},g_{2r}\}\},\{q_1,\ldots,q_{k-2r}\}) \\ \{g_1,g_2,\ldots,g_{2r-1},g_{2r},q_1,\ldots,q_{k-2r}\}=\{1,2,\ldots,k\}}} \prod_{s=1}^{r} \mathbf{1}_{\{i_{g_{2s-1}}=\ i_{g_{2s}}\neq 0\}}\times$$

$$\times\mathbf{1}_{\{j_{g_{2s-1}}=\ j_{g_{2s}}\}} J'[\phi_{j_{q_1}}\ldots\phi_{j_{q_{k-2r}}}]_{T,t}^{(i_{q_1}\ldots i_{q_{k-2r}})}, \tag{57}$$

then (see (55), (57), and Theorem 4)

(58)

$$\underset{p\to\infty}{\text{l.i.m.}}\sum_{j_1,\ldots,j_k=0}^{p} C_{j_k\ldots j_1}\prod_{l=1}^{k}\zeta_{j_l}^{(i_l)} = J[\psi^{(k)}]_{T,t}^{(i_1\ldots i_k)} + \sum_{r=1}^{[k/2]}\frac{1}{2^r}\sum_{(s_r,\ldots,s_1)\in \mathrm{A}_{k,r}} J[\psi^{(k)}]_{T,t}^{s_r,\ldots,s_1} = J^*[\psi^{(k)}]_{T,t}^{(i_1\ldots i_k)}$$

w. p. 1, where notations in (58) are the same as in Theorem 4. Thus Theorem 12 will be proved.

From (54) we have that the multiple Stratonovich stochastic integral $J[K_{p_1\ldots p_k}]_{T,t}^{(i_1\ldots i_k)}$ of multiplicity k is expressed as a sum of some constant value and multiple Wiener stochastic integrals $J'[K_{p_1\ldots p_k}]_{T,t}^{(i_1\ldots i_k)}$ and $J[K_{p_1\ldots p_k}^{g_1\ldots g_{2r},q_1\ldots q_{k-2r}}]_{T,t}^{(i_{q_1}\ldots i_{q_{k-2r}})}$ of multiplicities $k,\ k-2,\ k-4,\ \ldots,\ k-2[k/2]$ $(r=1,2,\ldots,[k/2])$.

The formulas (51), (54) can be considered as new representations of the Hu-Meyer formula for the case of a multidimensional Wiener process [69] (also see [68], [70]) and kernel $K_{p_1\ldots p_k}(t_1,\ldots,t_k)$ (see (52)).

Note that the equality (54) can be obtained from (46) if we consider (46) for $\Phi(t_1,\ldots,t_k) = K_{p_1\ldots p_k}(t_1,\ldots,t_k)$ and without passing to the limit $\underset{p_1,\ldots,p_k\to\infty}{\text{l.i.m.}}$

For $k=2,3,4,5,6$ from (51) we have w. p. 1

$$\sum_{j_1=0}^{p_1}\sum_{j_2=0}^{p_2} C_{j_2j_1}\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)} = J'[K_{p_1p_2}]_{T,t}^{(i_1i_2)} + \sum_{j_1=0}^{p_1}\sum_{j_2=0}^{p_2} C_{j_2j_1}\mathbf{1}_{\{i_1=i_2\ne 0\}}\mathbf{1}_{\{j_1=j_2\}}, \tag{59}$$

$$\sum_{j_1=0}^{p_1}\sum_{j_2=0}^{p_2}\sum_{j_3=0}^{p_3} C_{j_3j_2j_1}\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}\zeta_{j_3}^{(i_3)} = J'[K_{p_1p_2p_3}]_{T,t}^{(i_1i_2i_3)} +$$

$$

$$
+\mathbf{1}_{\{i_1=i_4\ne 0\}}\sum_{j_2=0}^{p_2}\sum_{j_3=0}^{p_3}\left(\sum_{j_4=0}^{\min\{p_1,p_4\}}C_{j_4j_3j_2j_4}\right)J'[\phi_{j_2}\phi_{j_3}]_{T,t}^{(i_2i_3)}+
$$

$$
+\mathbf{1}_{\{i_2=i_3\ne 0\}}\sum_{j_1=0}^{p_1}\sum_{j_4=0}^{p_4}\left(\sum_{j_3=0}^{\min\{p_2,p_3\}}C_{j_4j_3j_3j_1}\right)J'[\phi_{j_1}\phi_{j_4}]_{T,t}^{(i_1i_4)}+
$$

$$
+\mathbf{1}_{\{i_2=i_4\ne 0\}}\sum_{j_1=0}^{p_1}\sum_{j_3=0}^{p_3}\left(\sum_{j_4=0}^{\min\{p_2,p_4\}}C_{j_4j_3j_4j_1}\right)J'[\phi_{j_1}\phi_{j_3}]_{T,t}^{(i_1i_3)}+
$$

$$
+\mathbf{1}_{\{i_3=i_4\ne 0\}}\sum_{j_1=0}^{p_1}\sum_{j_2=0}^{p_2}\left(\sum_{j_4=0}^{\min\{p_3,p_4\}}C_{j_4j_4j_2j_1}\right)J'[\phi_{j_1}\phi_{j_2}]_{T,t}^{(i_1i_2)}+
$$

$$
+\mathbf{1}_{\{i_2=i_3\ne 0\}}\mathbf{1}_{\{i_1=i_4\ne 0\}}\sum_{j_2=0}^{\min\{p_2,p_3\}}\sum_{j_4=0}^{\min\{p_1,p_4\}}C_{j_4j_2j_2j_4}+
$$

$$
+\mathbf{1}_{\{i_2=i_4\ne 0\}}\mathbf{1}_{\{i_1=i_3\ne 0\}}\sum_{j_3=0}^{\min\{p_1,p_3\}}\sum_{j_4=0}^{\min\{p_2,p_4\}}C_{j_4j_3j_4j_3}+
$$

$$
+\mathbf{1}_{\{i_3=i_4\ne 0\}}\mathbf{1}_{\{i_1=i_2\ne 0\}}\sum_{j_2=0}^{\min\{p_1,p_2\}}\sum_{j_4=0}^{\min\{p_3,p_4\}}C_{j_4j_4j_2j_2}\quad \text{w. p. 1.}
$$

Step 2. Let us prove that

$$
\sum_{j_l=0}^{\infty}C_{j_k\ldots j_{l+1}j_lj_{l-1}\ldots j_{s+1}j_lj_{s-1}\ldots j_1}=0 \tag{64}
$$

or

$$
\sum_{j_l=0}^{p}C_{j_k\ldots j_{l+1}j_lj_{l-1}\ldots j_{s+1}j_lj_{s-1}\ldots j_1}=-\sum_{j_l=p+1}^{\infty}C_{j_k\ldots j_{l+1}j_lj_{l-1}\ldots j_{s+1}j_lj_{s-1}\ldots j_1}, \tag{65}
$$

where $l-1\ge s+1$.

Our further proof will not fundamentally depend on the weight functions $\psi_1(\tau),\ldots,\psi_k(\tau)$. Therefore, sometimes in subsequent consideration we assume that $\psi_1(\tau),\ldots,\psi_k(\tau)\equiv 1$.

We have

$$C_{j_k\ldots j_{l+1}j_lj_{l-1}\ldots j_{s+1}j_lj_{s-1}\ldots j_1}=$$

$$=\int\limits_t^T\phi_{j_k}(t_k)\ldots\int\limits_t^{t_{l+2}}\phi_{j_{l+1}}(t_{l+1})\int\limits_t^{t_{l+1}}\phi_{j_l}(t_l)\int\limits_t^{t_l}\phi_{j_{l-1}}(t_{l-1})\ldots$$

$$\ldots\int\limits_t^{t_{s+2}}\phi_{j_{s+1}}(t_{s+1})\int\limits_t^{t_{s+1}}\phi_{j_l}(t_s)\int\limits_t^{t_s}\phi_{j_{s-1}}(t_{s-1})\ldots$$

$$\ldots\int\limits_t^{t_2}\phi_{j_1}(t_1)dt_1\ldots dt_{s-1}dt_sdt_{s+1}\ldots dt_{l-1}dt_ldt_{l+1}\ldots dt_k=$$

$$=\int\limits_t^T\phi_{j_{s+1}}(t_{s+1})\int\limits_t^{t_{s+1}}\phi_{j_l}(t_s)\int\limits_t^{t_s}\phi_{j_{s-1}}(t_{s-1})\ldots\int\limits_t^{t_2}\phi_{j_1}(t_1)dt_1\ldots dt_{s-1}dt_s\times$$

$$\times\Biggl(\int\limits_{t_{s+1}}^T\phi_{j_{s+2}}(t_{s+2})\ldots\int\limits_{t_{l-2}}^T\phi_{j_{l-1}}(t_{l-1})\int\limits_{t_{l-1}}^T\phi_{j_l}(t_l)\int\limits_{t_l}^T\phi_{j_{l+1}}(t_{l+1})\ldots$$

$$\ldots\int\limits_{t_{k-1}}^T\phi_{j_k}(t_k)dt_k\ldots dt_{l+1}dt_ldt_{l-1}\ldots dt_{s+2}\Biggr)dt_{s+1}=$$

$$=\int\limits_t^T\phi_{j_{s+1}}(t_{s+1})\int\limits_t^{t_{s+1}}\phi_{j_l}(t_s)\underbrace{\int\limits_t^{t_s}\phi_{j_{s-1}}(t_{s-1})\ldots\int\limits_t^{t_2}\phi_{j_1}(t_1)dt_1\ldots dt_{s-1}}_{G_{j_{s-1}\ldots j_1}(t_s)}dt_s\times$$

$$\times\int\limits_{t_{s+1}}^T\phi_{j_l}(t_l)\underbrace{\int\limits_{t_l}^T\phi_{j_{l+1}}(t_{l+1})\ldots\int\limits_{t_{k-1}}^T\phi_{j_k}(t_k)dt_k\ldots dt_{l+1}}_{H_{j_k\ldots j_{l+1}}(t_l)}\times$$

$$\times\left(\underbrace{\int\limits_{t_{s+1}}^{t_l}\phi_{j_{l-1}}(t_{l-1})\ldots\int\limits_{t_{s+1}}^{t_{s+3}}\phi_{j_{s+2}}(t_{s+2})dt_{s+2}\ldots dt_{l-1}}_{Q_{j_{l-1}\ldots j_{s+2}}(t_l,t_{s+1})}dt_l\right)dt_{s+1}=$$

$$=\int\limits_t^T\phi_{j_{s+1}}(t_{s+1})\int\limits_t^{t_{s+1}}\phi_{j_l}(t_s)G_{j_{s-1}\ldots j_1}(t_s)dt_s\times$$

$$\times \int\limits_{t_{s+1}}^{T} \phi_{j_l}(t_l) H_{j_k \ldots j_{l+1}}(t_l) Q_{j_{l-1} \ldots j_{s+2}}(t_l, t_{s+1}) dt_l dt_{s+1}. \tag{66}$$

Using the additive property of the integral, we obtain

$$Q_{j_{l-1} \ldots j_{s+2}}(t_l, t_{s+1}) =$$

$$= \int\limits_{t_{s+1}}^{t_l} \phi_{j_{l-1}}(t_{l-1}) \ldots \int\limits_{t_{s+1}}^{t_{s+3}} \phi_{j_{s+2}}(t_{s+2}) dt_{s+2} \ldots dt_{l-1} =$$

$$= \int\limits_{t_{s+1}}^{t_l} \phi_{j_{l-1}}(t_{l-1}) \ldots \int\limits_{t_{s+1}}^{t_{s+4}} \phi_{j_{s+3}}(t_{s+3}) \int\limits_{t}^{t_{s+3}} \phi_{j_{s+2}}(t_{s+2}) dt_{s+2} dt_{s+3} \ldots dt_{l-1} -$$

$$- \int\limits_{t_{s+1}}^{t_l} \phi_{j_{l-1}}(t_{l-1}) \ldots \int\limits_{t_{s+1}}^{t_{s+4}} \phi_{j_{s+3}}(t_{s+3}) dt_{s+3} \ldots dt_{l-1} \int\limits_{t}^{t_{s+1}} \phi_{j_{s+2}}(t_{s+2}) dt_{s+2} =$$

$$\ldots$$

$$= \sum_{m=1}^{d} h^{(m)}_{j_{l-1} \ldots j_{s+2}}(t_l) q^{(m)}_{j_{l-1} \ldots j_{s+2}}(t_{s+1}), \quad d < \infty. \tag{67}$$

Combining (66) and (67), we have

$$\sum_{j_l=0}^{p} C_{j_k \ldots j_{l+1} j_l j_{l-1} \ldots j_{s+1} j_l j_{s-1} \ldots j_1} =$$

$$= \sum_{m=1}^{d} \left(\int\limits_{t}^{T} \phi_{j_{s+1}}(t_{s+1}) q^{(m)}_{j_{l-1} \ldots j_{s+2}}(t_{s+1}) \sum_{j_l=0}^{p} \int\limits_{t}^{t_{s+1}} \phi_{j_l}(t_s) G_{j_{s-1} \ldots j_1}(t_s) dt_s \times \right.$$

$$\left. \times \int\limits_{t_{s+1}}^{T} \phi_{j_l}(t_l) H_{j_k \ldots j_{l+1}}(t_l) h^{(m)}_{j_{l-1} \ldots j_{s+2}}(t_l) dt_l dt_{s+1} \right). \tag{68}$$

Using the generalized Parseval equality, we obtain

$$\sum_{j_l=0}^{\infty} \int\limits_{t}^{t_{s+1}} \phi_{j_l}(t_s) G_{j_{s-1} \ldots j_1}(t_s) dt_s \int\limits_{t_{s+1}}^{T} \phi_{j_l}(t_l) H_{j_k \ldots j_{l+1}}(t_l) h^{(m)}_{j_{l-1} \ldots j_{s+2}}(t_l) dt_l =$$

$$= \int\limits_{t}^{T} \mathbf{1}_{\{\tau < t_{s+1}\}} G_{j_{s-1} \ldots j_1}(\tau) \cdot \mathbf{1}_{\{\tau > t_{s+1}\}} H_{j_k \ldots j_{l+1}}(\tau) h^{(m)}_{j_{l-1} \ldots j_{s+2}}(\tau) d\tau = 0. \tag{69}$$

From (68) and (69) we get

$$\sum_{j_l=0}^{p} C_{j_k\ldots j_{l+1}j_lj_{l-1}\ldots j_{s+1}j_lj_{s-1}\ldots j_1} =$$

$$= -\sum_{m=1}^{d}\left(\int\limits_t^T \phi_{j_{s+1}}(t_{s+1})q^{(m)}_{j_{l-1}\ldots j_{s+2}}(t_{s+1})\sum_{j_l=p+1}^{\infty}\int\limits_t^{t_{s+1}}\phi_{j_l}(t_s)G_{j_{s-1}\ldots j_1}(t_s)dt_s\times\right.$$

$$\left.\times\int\limits_{t_{s+1}}^{T}\phi_{j_l}(t_l)H_{j_k\ldots j_{l+1}}(t_l)h^{(m)}_{j_{l-1}\ldots j_{s+2}}(t_l)dt_ldt_{s+1}\right). \tag{70}$$

Combining Condition 2 of Theorem 12 and (66)–(68), (70), we have

$$\sum_{j_l=0}^{p} C_{j_k\ldots j_{l+1}j_lj_{l-1}\ldots j_{s+1}j_lj_{s-1}\ldots j_1} =$$

$$= -\sum_{j_l=p+1}^{\infty}\sum_{m=1}^{d}\left(\int\limits_t^T \phi_{j_{s+1}}(t_{s+1})q^{(m)}_{j_{l-1}\ldots j_{s+2}}(t_{s+1})\int\limits_t^{t_{s+1}}\phi_{j_l}(t_s)G_{j_{s-1}\ldots j_1}(t_s)dt_s\times\right.$$

$$\left.\times\int\limits_{t_{s+1}}^{T}\phi_{j_l}(t_l)H_{j_k\ldots j_{l+1}}(t_l)h^{(m)}_{j_{l-1}\ldots j_{s+2}}(t_l)dt_ldt_{s+1}\right) =$$

$$= -\sum_{j_l=p+1}^{\infty}\int\limits_t^T\phi_{j_k}(t_k)\ldots\int\limits_t^{t_{l+2}}\phi_{j_{l+1}}(t_{l+1})\int\limits_t^{t_{l+1}}\phi_{j_l}(t_l)\int\limits_t^{t_l}\phi_{j_{l-1}}(t_{l-1})\ldots$$

$$\ldots\int\limits_t^{t_{s+2}}\phi_{j_{s+1}}(t_{s+1})\int\limits_t^{t_{s+1}}\phi_{j_l}(t_s)\int\limits_t^{t_s}\phi_{j_{s-1}}(t_{s-1})\ldots$$

$$\ldots\int\limits_t^{t_2}\phi_{j_1}(t_1)dt_1\ldots dt_{s-1}dt_sdt_{s+1}\ldots dt_{l-1}dt_ldt_{l+1}\ldots dt_k =$$

$$= -\sum_{j_l=p+1}^{\infty} C_{j_k\ldots j_{l+1}j_lj_{l-1}\ldots j_{s+1}j_lj_{s-1}\ldots j_1}. \tag{71}$$

The equality (71) implies (64), (65).

Step 3. Using Conditions 1 and 2 of Theorem 12, we obtain

$$\sum_{j_l=0}^{p} C_{j_k\ldots j_{l+1}j_lj_lj_{l-2}\ldots j_1} =$$

$$
=\int\limits_t^T \psi_k(t_k)\phi_{j_k}(t_k)\ldots\int\limits_t^{t_{l+2}}\psi_{l+1}(t_{l+1})\phi_{j_{l+1}}(t_{l+1})\times
$$

$$
\times\sum_{j_l=0}^{p}\int\limits_t^{t_{l+1}}\psi_l(t_l)\phi_{j_l}(t_l)\int\limits_t^{t_l}\psi_{l-1}(t_{l-1})\phi_{j_l}(t_{l-1})\times
$$

$$
\times\int\limits_t^{t_{l-1}}\psi_{l-2}(t_{l-2})\phi_{j_{l-2}}(t_{l-2})\ldots\int\limits_t^{t_2}\psi_1(t_1)\phi_{j_1}(t_1)dt_1\ldots dt_{l-2}dt_{l-1}dt_l dt_{l+1}\ldots dt_k=
$$

$$
=\int\limits_t^T \psi_k(t_k)\phi_{j_k}(t_k)\ldots\int\limits_t^{t_{l+2}}\psi_{l+1}(t_{l+1})\phi_{j_{l+1}}(t_{l+1})\times
$$

$$
\times\sum_{j_l=0}^{\infty}\int\limits_t^{t_{l+1}}\psi_l(t_l)\phi_{j_l}(t_l)\int\limits_t^{t_l}\psi_{l-1}(t_{l-1})\phi_{j_l}(t_{l-1})\times
$$

$$
\times\int\limits_t^{t_{l-1}}\psi_{l-2}(t_{l-2})\phi_{j_{l-2}}(t_{l-2})\ldots\int\limits_t^{t_2}\psi_1(t_1)\phi_{j_1}(t_1)dt_1\ldots dt_{l-2}dt_{l-1}dt_l dt_{l+1}\ldots dt_k-
$$

$$
-\sum_{j_l=p+1}^{\infty}C_{j_k\ldots j_{l+1}j_lj_lj_{l-2}\ldots j_1}=
$$

$$
=\frac{1}{2}C_{j_k\ldots j_1}\Biggr|_{(j_lj_l)\curvearrowright(\cdot)}-\sum_{j_l=p+1}^{\infty}C_{j_k\ldots j_{l+1}j_lj_lj_{l-2}\ldots j_1}. \tag{72}
$$

Step 4. Passing to the limit $\underset{p\to\infty}{\text{l.i.m.}}$ $(p_1=\ldots=p_k=p)$ in (51), we have (see (44))

$$
\underset{p\to\infty}{\text{l.i.m.}}\sum_{j_1,\ldots,j_k=0}^{p}C_{j_k\ldots j_1}\zeta_{j_1}^{(i_1)}\ldots\zeta_{j_k}^{(i_k)}=J[\psi^{(k)}]_{T,t}^{(i_1\ldots i_k)}+
$$

$$
+\sum_{r=1}^{[k/2]}\sum_{\substack{(\{\{g_1,g_2\},\ldots,\{g_{2r-1},g_{2r}\}\},\{q_1,\ldots,q_{k-2r}\})\\ \{g_1,g_2,\ldots,g_{2r-1},g_{2r},q_1,\ldots,q_{k-2r}\}=\{1,2,\ldots,k\}}}\prod_{s=1}^{r}\mathbf{1}_{\{i_{g_{2s-1}}=\ i_{g_{2s}}\neq 0\}}\times
$$

$$
\times\underset{p\to\infty}{\text{l.i.m.}}\sum_{j_1,\ldots,j_k=0}^{p}C_{j_k\ldots j_1}\prod_{s=1}^{r}\mathbf{1}_{\{j_{g_{2s-1}}=\ j_{g_{2s}}\}}J'[\phi_{j_{q_1}}\ldots\phi_{j_{q_{k-2r}}}]_{T,t}^{(i_{q_1}\ldots i_{q_{k-2r}})}\quad \text{w. p. 1.} \tag{73}
$$

Taking into account (65) and (72), we obtain for $r=1$

$$\mathbf{1}_{\{i_{g_1}=\ i_{g_2}\ne 0\}}\underset{p\to\infty}{\text{l.i.m.}}\sum_{j_1,\ldots,j_k=0}^{p}C_{j_k\ldots j_1}\mathbf{1}_{\{j_{g_1}=\ j_{g_2}\}}J'[\phi_{j_{q_1}}\ldots\phi_{j_{q_{k-2}}}]_{T,t}^{(i_{q_1}\ldots i_{q_{k-2}})}=$$

$$=-\mathbf{1}_{\{i_{g_1}=\ i_{g_2}\ne 0\}}\underset{p\to\infty}{\text{l.i.m.}}\sum_{j_{g_1}=p+1}^{\infty}\sum_{\substack{j_1,\ldots,j_q,\ldots,j_k=0\\ q\ne g_1,g_2}}^{p}C_{j_k\ldots j_1}\Biggl.\Biggr|_{j_{g_1}=\ j_{g_2}}\mathbf{1}_{\{g_2>g_1+1\}}\times$$

$$\times J'[\phi_{j_{q_1}}\ldots\phi_{j_{q_{k-2}}}]_{T,t}^{(i_{q_1}\ldots i_{q_{k-2}})}+$$

$$+\mathbf{1}_{\{i_{g_1}=\ i_{g_2}\ne 0\}}\underset{p\to\infty}{\text{l.i.m.}}\sum_{\substack{j_1,\ldots,j_q,\ldots,j_k=0\\ q\ne g_1,g_2}}^{p}\frac{1}{2}C_{j_k\ldots j_1}\Biggl.\Biggr|_{(j_{g_2}j_{g_1})\frown(\cdot),j_{g_1}=\ j_{g_2}}\mathbf{1}_{\{g_2=g_1+1\}}\times$$

$$\times J'[\phi_{j_{q_1}}\ldots\phi_{j_{q_{k-2}}}]_{T,t}^{(i_{q_1}\ldots i_{q_{k-2}})}-$$

$$-\mathbf{1}_{\{i_{g_1}=\ i_{g_2}\ne 0\}}\underset{p\to\infty}{\text{l.i.m.}}\sum_{j_{g_1}=p+1}^{\infty}\sum_{\substack{j_1,\ldots,j_q,\ldots,j_k=0\\ q\ne g_1,g_2}}^{p}C_{j_k\ldots j_1}\Biggl.\Biggr|_{j_{g_1}=\ j_{g_2}}\mathbf{1}_{\{g_2=g_1+1\}}\times$$

$$\times J'[\phi_{j_{q_1}}\ldots\phi_{j_{q_{k-2}}}]_{T,t}^{(i_{q_1}\ldots i_{q_{k-2}})}=$$

$$=-\mathbf{1}_{\{i_{g_1}=\ i_{g_2}\ne 0\}}\underset{p\to\infty}{\text{l.i.m.}}\sum_{j_{g_1}=p+1}^{\infty}\sum_{\substack{j_1,\ldots,j_q,\ldots,j_k=0\\ q\ne g_1,g_2}}^{p}C_{j_k\ldots j_1}\Biggl.\Biggr|_{j_{g_1}=\ j_{g_2}}\times$$

$$\times J'[\phi_{j_{q_1}}\ldots\phi_{j_{q_{k-2}}}]_{T,t}^{(i_{q_1}\ldots i_{q_{k-2}})}+$$

$$+\mathbf{1}_{\{i_{g_1}=\ i_{g_2}\ne 0\}}\underset{p\to\infty}{\text{l.i.m.}}\sum_{\substack{j_1,\ldots,j_q,\ldots,j_k=0\\ q\ne g_1,g_2}}^{p}\frac{1}{2}C_{j_k\ldots j_1}\Biggl.\Biggr|_{(j_{g_2}j_{g_1})\frown(\cdot),j_{g_1}=\ j_{g_2}}\mathbf{1}_{\{g_2=g_1+1\}}\times$$

$$\times J'[\phi_{j_{q_1}}\ldots\phi_{j_{q_{k-2}}}]_{T,t}^{(i_{q_1}\ldots i_{q_{k-2}})}= \tag{74}$$

$$=\frac{1}{2}\mathbf{1}_{\{g_2=g_1+1\}}J[\psi^{(k)}]_{T,t}^{g_1}+\mathbf{1}_{\{i_{g_1}=\ i_{g_2}\ne 0\}}\underset{p\to\infty}{\text{l.i.m.}}\ R_{T,t}^{(p)1,g_1,g_2}\quad \text{w. p. 1}, \tag{75}$$

where $J[\psi^{(k)}]_{T,t}^{g_1}$ $(g_1=1,2,\ldots,k-1)$ is defined by (23),

$$R_{T,t}^{(p)1,g_1,g_2}=-\sum_{\substack{j_1,\ldots,j_q,\ldots,j_k=0\\ q\ne g_1,g_2}}^{p}\bar{C}_{j_k\ldots j_q\ldots j_1}^{(p)}\Biggl.\Biggr|_{q\ne g_1,g_2}J'[\phi_{j_{q_1}}\ldots\phi_{j_{q_{k-2}}}]_{T,t}^{(i_{q_1}\ldots i_{q_{k-2}})}.$$

Let us explain the transition from (74) to (75). We have for $g_2=g_1+1$

$$
\mathbf{1}_{\{i_{g_1}=\ i_{g_2}\ne 0\}}\underset{p\to\infty}{\hbox{l.i.m.}}\sum_{\substack{j_1,\ldots,j_q,\ldots,j_k=0\\ q\ne g_1,g_2}}^{p}\frac{1}{2}C_{j_k\ldots j_1}\Biggl.\Biggr|_{(j_{g_2}j_{g_1})\curvearrowright(\cdot),j_{g_1}=\ j_{g_2}}\times
$$

$$
\times J'[\phi_{j_{q_1}}\ldots\phi_{j_{q_{k-2}}}]_{T,t}^{(i_{q_1}\ldots i_{q_{k-2}})}=
$$

$$
=\frac{1}{2}\mathbf{1}_{\{i_{g_1}=\ i_{g_2}\ne 0\}}\underset{p\to\infty}{\hbox{l.i.m.}}\sum_{\substack{j_1,\ldots,j_q,\ldots,j_k=0\\ q\ne g_1,g_2}}^{p}C_{j_k\ldots j_1}\Biggl.\Biggr|_{(j_{g_2}j_{g_1})\curvearrowright 0,j_{g_1}=\ j_{g_2}}\times
$$

$$
\times\zeta_0^{(0)}J'[\phi_{j_{q_1}}\ldots\phi_{j_{q_{k-2}}}]_{T,t}^{(i_{q_1}\ldots i_{q_{k-2}})}=
$$

$$
=\frac{1}{2}\mathbf{1}_{\{i_{g_1}=\ i_{g_2}\ne 0\}}\underset{p\to\infty}{\hbox{l.i.m.}}\sum_{\substack{j_1,\ldots,j_q,\ldots,j_k=0\\ q\ne g_1,g_2}}^{p}\sum_{j_{m_1}=0}^{p}C_{j_k\ldots j_1}\Biggl.\Biggr|_{(j_{g_2}j_{g_1})\curvearrowright j_{m_1},j_{g_1}=\ j_{g_2}}\times
$$

$$
\times\zeta_{j_{m_1}}^{(0)}J'[\phi_{j_{q_1}}\ldots\phi_{j_{q_{k-2}}}]_{T,t}^{(i_{q_1}\ldots i_{q_{k-2}})}=
$$

$$
=\frac{1}{2}\mathbf{1}_{\{i_{g_1}=\ i_{g_2}\ne 0\}}\underset{p\to\infty}{\hbox{l.i.m.}}\sum_{\substack{j_1,\ldots,j_q,\ldots,j_k=0\\ q\ne g_1,g_2}}^{p}\sum_{j_{m_1}=0}^{p}C_{j_k\ldots j_1}\Biggl.\Biggr|_{(j_{g_2}j_{g_1})\curvearrowright j_{m_1},j_{g_1}=\ j_{g_2}}\times
$$

$$
\times J'[\phi_{j_{m_1}}\phi_{j_{q_1}}\ldots\phi_{j_{q_{k-2}}}]_{T,t}^{(0 i_{q_1}\ldots i_{q_{k-2}})}= \tag{76}
$$

$$
=\frac{1}{2}J[\psi^{(k)}]_{T,t}^{g_1}\quad \hbox{w. p. 1}, \tag{77}
$$

where

$$
C_{j_k\ldots j_1}\Biggl.\Biggr|_{(j_{g_2}j_{g_1})\curvearrowright j_{m_1},j_{g_1}=\ j_{g_2},g_2=g_1+1}=
$$

$$
=\int\limits_t^T\psi_k(t_k)\phi_{j_k}(t_k)\ldots\int\limits_t^{t_{g_1+3}}\psi_l(t_{g_1+2})\phi_{j_{g_1+2}}(t_{g_1+2})\int\limits_t^{t_{g_1+2}}\psi_{g_1+1}(t_{g_1})\psi_{g_1}(t_{g_1})\phi_{j_{m_1}}(t_{g_1})\times
$$

$$
\times\int\limits_t^{t_{g_1}}\psi_l(t_{g_1-1})\phi_{j_{g_1-1}}(t_{g_1-1})\ldots\int\limits_t^{t_2}\psi_1(t_1)\phi_{j_1}(t_1)dt_1\ldots dt_{g_1-1}dt_{g_1}dt_{g_1+2}\ldots dt_k,
$$

$$
\zeta_{j_{m_1}}^{(0)}=\int\limits_t^T\phi_{j_{m_1}}(\tau)d\mathbf{w}_{\tau}^{(0)}=\int\limits_t^T\phi_{j_{m_1}}(\tau)d\tau=\begin{cases}\sqrt{T-t} & \hbox{if } j_{m_1}=0\\ 0 & \hbox{if } j_{m_1}\ne 0\end{cases},
$$

$$\phi_0(\tau)=\frac{1}{\sqrt{T-t}}.$$

The transition from (76) to (77) is based on (44).

By Condition 3 of Theorem 12 we have (also see the property (43) of multiple Wiener stochastic integral)

$$\lim_{p\to\infty}\mathsf{M}\left\{\left(R_{T,t}^{(p)1,g_1,g_2}\right)^2\right\}\le K\lim_{p\to\infty}\sum_{\substack{j_1,\ldots,j_q,\ldots,j_k=0\\ q\ne g_1,g_2}}^{p}\left(\bar{C}^{(p)}_{j_k\ldots j_q\ldots j_1}\Biggr|_{q\ne g_1,g_2}\right)^2=0,$$

where constant K does not depend on p.

Thus

$$\mathbf{1}_{\{i_{g_1}=\ i_{g_2}\ne 0\}}\underset{p\to\infty}{\text{l.i.m.}}\sum_{j_1,\ldots,j_k=0}^{p}C_{j_k\ldots j_1}\mathbf{1}_{\{j_{g_1}=\ j_{g_2}\}}J'[\phi_{j_{q_1}}\ldots\phi_{j_{q_{k-2}}}]_{T,t}^{(i_{q_1}\ldots i_{q_{k-2}})}=$$

$$=\frac{1}{2}\mathbf{1}_{\{g_2=g_1+1\}}J[\psi^{(k)}]_{T,t}^{g_1}\quad \text{w. p. 1.}$$

Involving into consideration the second pair $\{g_3,g_4\}$ (the first pair is $\{g_1,g_2\}$), we obtain from (74) for $r=2$

$$\prod_{s=1}^{2}\mathbf{1}_{\{i_{g_{2s-1}}=\ i_{g_{2s}}\ne 0\}}\underset{p\to\infty}{\text{l.i.m.}}\sum_{j_1,\ldots,j_k=0}^{p}C_{j_k\ldots j_1}\prod_{s=1}^{2}\mathbf{1}_{\{j_{g_{2s-1}}=\ j_{g_{2s}}\}}\times$$

$$\times J'[\phi_{j_{q_1}}\ldots\phi_{j_{q_{k-4}}}]_{T,t}^{(i_{q_1}\ldots i_{q_{k-4}})}=$$

$$=\prod_{s=1}^{2}\mathbf{1}_{\{i_{g_{2s-1}}=\ i_{g_{2s}}\ne 0\}}\times$$

$$\times\underset{p\to\infty}{\text{l.i.m.}}\sum_{\substack{j_1,\ldots,j_q,\ldots,j_k=0\\ q\ne g_1,g_2,g_3,g_4}}^{p}\left(\frac{1}{4}C_{j_k\ldots j_1}\Biggr|_{(j_{g_2}j_{g_1})\curvearrowright(\cdot)(j_{g_4}j_{g_3})\curvearrowright(\cdot),j_{g_1}=\ j_{g_2},j_{g_3}=\ j_{g_4}}\prod_{s=1}^{2}\mathbf{1}_{\{g_{2s}=g_{2s-1}+1\}}-\right.$$

$$-\frac{1}{2}\sum_{j_{g_1}=p+1}^{\infty}C_{j_k\ldots j_1}\Biggr|_{(j_{g_4}j_{g_3})\curvearrowright(\cdot),j_{g_1}=\ j_{g_2},j_{g_3}=\ j_{g_4}}\mathbf{1}_{\{g_4=g_3+1\}}-$$

$$-\frac{1}{2}\sum_{j_{g_3}=p+1}^{\infty}C_{j_k\ldots j_1}\Biggr|_{(j_{g_2}j_{g_1})\curvearrowright(\cdot),j_{g_1}=\ j_{g_2},j_{g_3}=\ j_{g_4}}\mathbf{1}_{\{g_2=g_1+1\}}+$$

$$\left.+\sum_{j_{g_3}=p+1}^{\infty}\sum_{j_{g_1}=p+1}^{\infty}C_{j_k\ldots j_1}\Biggr|_{j_{g_1}=\ j_{g_2},j_{g_3}=\ j_{g_4}}\right)J'[\phi_{j_{q_1}}\ldots\phi_{j_{q_{k-4}}}]_{T,t}^{(i_{q_1}\ldots i_{q_{k-4}})}= \tag{78}$$

$$
= \frac{1}{4}\prod_{s=1}^{2}\mathbf{1}_{\{g_{2s}=g_{2s-1}+1\}}J[\psi^{(k)}]_{T,t}^{s_2,s_1} + \prod_{s=1}^{2}\mathbf{1}_{\{i_{g_{2s-1}}=\ i_{g_{2s}}\ne 0\}}\underset{p\to\infty}{\text{l.i.m.}}\ R_{T,t}^{(p)2,g_1,g_2,g_3,g_4} \tag{79}
$$

w. p. 1, where $g_3 \stackrel{\textsf{def}}{=} s_2$, $g_1 \stackrel{\textsf{def}}{=} s_1$, $(s_2,s_1)\in \mathrm{A}_{k,2}$, $J[\psi^{(k)}]_{T,t}^{s_2,s_1}$ is defined by (23) and $\mathrm{A}_{k,2}$ is defined by (24),

$$
R_{T,t}^{(p)2,g_1,g_2,g_3,g_4} = \sum_{\substack{j_1,\ldots,j_q,\ldots,j_k=0\\ q\ne g_1,g_2,g_3,g_4}}^{p}\left(\bar{C}_{j_k\ldots j_q\ldots j_1}^{(p)}\Bigg|_{q\ne g_1,g_2,g_3,g_4} -\right.
$$

$$
\left. -S_1\left\{\bar{C}_{j_k\ldots j_q\ldots j_1}^{(p)}\Bigg|_{q\ne g_1,g_2,g_3,g_4}\right\} - S_2\left\{\bar{C}_{j_k\ldots j_q\ldots j_1}^{(p)}\Bigg|_{q\ne g_1,g_2,g_3,g_4}\right\}\right)\times
$$

$$
\times J'[\phi_{j_{q_1}}\ldots\phi_{j_{q_{k-4}}}]_{T,t}^{(i_{q_1}\ldots i_{q_{k-4}})}.
$$

Let us explain the transition from (78) to (79). We have for $g_2=g_1+1$, $g_4=g_3+1$

$$
\underset{p\to\infty}{\text{l.i.m.}}\sum_{\substack{j_1,\ldots,j_q,\ldots,j_k=0\\ q\ne g_1,g_2,g_3,g_4}}^{p}\frac{1}{4}C_{j_k\ldots j_1}\Bigg|_{(j_{g_2}j_{g_1})\curvearrowright(\cdot)(j_{g_4}j_{g_3})\curvearrowright(\cdot),j_{g_1}=\ j_{g_2},j_{g_3}=\ j_{g_4}}\times
$$

$$
\times\prod_{s=1}^{2}\mathbf{1}_{\{i_{g_{2s-1}}=\ i_{g_{2s}}\ne 0\}}J'[\phi_{j_{q_1}}\ldots\phi_{j_{q_{k-4}}}]_{T,t}^{(i_{q_1}\ldots i_{q_{k-4}})} =

$$

$$
=\frac{1}{4}J[\psi^{(k)}]_{T,t}^{s_2,s_1}\quad \text{w. p. 1.} \tag{81}
$$

The transition from (80) to (81) is based on (44).

Note that

$$
C_{j_k\ldots j_1}\Biggl|_{(j_{g_2}j_{g_1})\curvearrowright j_{m_1},j_{g_1}=\ j_{g_2}}=C_{j_k\ldots j_1}\Biggl|_{(j_{g_1}j_{g_1})\curvearrowright j_{m_1},j_{g_1}=\ j_{g_2}}
$$

is the Fourier coefficient, where $g_2=g_1+1$. Therefore, the value

$$
C_{j_k\ldots j_1}\Biggl|_{(j_{g_2}j_{g_1})\curvearrowright j_{m_1}(j_{g_4}j_{g_3})\curvearrowright j_{m_3},j_{g_1}=\ j_{g_2},j_{g_3}=\ j_{g_4}}=
$$

$$
=C_{j_k\ldots j_1}\Biggl|_{(j_{g_1}j_{g_1})\curvearrowright j_{m_1}(j_{g_3}j_{g_3})\curvearrowright j_{m_3},j_{g_1}=\ j_{g_2},j_{g_3}=\ j_{g_4}}
$$

is determined recursively using (33) in an obvious way for $g_2=g_1+1$ and $g_4=g_3+1$.

By Condition 3 of Theorem 12 we have (also see the property (43) of multiple Wiener stochastic integral)

$$
\lim_{p\to\infty}\mathsf{M}\left\{\left(R_{T,t}^{(p)2,g_1,g_2,g_3,g_4}\right)^2\right\}\le K\lim_{p\to\infty}\sum_{\substack{j_1,\ldots,j_q,\ldots,j_k=0\\ q\ne g_1,g_2,g_3,g_4}}^{p}\left(\left(\bar{C}_{j_k\ldots j_q\ldots j_1}^{(p)}\Biggl|_{q\ne g_1,g_2,g_3,g_4}\right)^2+\right.
$$

$$
\left.+\left(S_1\left\{\bar{C}_{j_k\ldots j_q\ldots j_1}^{(p)}\Biggl|_{q\ne g_1,g_2,g_3,g_4}\right\}\right)^2+\left(S_2\left\{\bar{C}_{j_k\ldots j_q\ldots j_1}^{(p)}\Biggl|_{q\ne g_1,g_2,g_3,g_4}\right\}\right)^2\right)=0,
$$

where constant K is independent of p.

Thus

$$
\prod_{s=1}^{2}\mathbf{1}_{\{i_{g_{2s-1}}=\ i_{g_{2s}}\ne 0\}}\underset{p\to\infty}{\text{l.i.m.}}\sum_{j_1,\ldots,j_k=0}^{p}C_{j_k\ldots j_1}\prod_{s=1}^{2}\mathbf{1}_{\{j_{g_{2s-1}}=\ j_{g_{2s}}\}}\times
$$

$$
\times J'[\phi_{j_{q_1}}\ldots\phi_{j_{q_{k-4}}}]_{T,t}^{(i_{q_1}\ldots i_{q_{k-4}})}=\frac{1}{4}\prod_{s=1}^{2}\mathbf{1}_{\{g_{2s}=g_{2s-1}+1\}}J[\psi^{(k)}]_{T,t}^{s_2,s_1}\quad \text{w. p. 1,}
$$

where $g_3 \stackrel{\sf def}{=} s_2,\ g_1 \stackrel{\sf def}{=} s_1,\ (s_2,s_1)\in {\rm A}_{k,2},\ J[\psi^{(k)}]_{T,t}^{s_2,s_1}$ is defined by (23) and ${\rm A}_{k,2}$ is defined by (24).

Involving into consideration the third pair $\{g_6,g_5\}$ ($\{g_1,g_2\}$ is the first pair and $\{g_4,g_3\}$ is the second pair), we obtain from (78) for $r=3$

$$\prod_{s=1}^{3}{\bf 1}_{\{i_{g_{2s-1}}=~i_{g_{2s}}\ne 0\}}\hbox{\vtop{\offinterlineskip\halign{\hfil#\hfil\cr{\rm l.i.m.}\cr$\scriptstyle p\to\infty$\cr}}}\sum_{j_1,\ldots,j_k=0}^{p}C_{j_k\ldots j_1}\prod_{s=1}^{3}{\bf 1}_{\{j_{g_{2s-1}}=~j_{g_{2s}}\}}\times$$

$$\times J'[\phi_{j_{q_1}}\ldots\phi_{j_{q_{k-2r}}}]_{T,t}^{(i_{q_1}\ldots i_{q_{k-2r}})}. \tag{84}$$

Let us explain the transition from (82) to (83). We have for $g_2=g_1+1,\ldots,g_{2r}=g_{2r-1}+1$

$$\underset{p\to\infty}{\text{l.i.m.}}\sum_{\substack{j_1,\ldots,j_q,\ldots,j_k=0\\ q\ne g_1,g_2,\ldots,g_{2r-1},g_{2r}}}^{p}\frac{1}{2^r}C_{j_k\ldots j_1}\Bigr|_{(j_{g_2}j_{g_1})\curvearrowright(\cdot)\ldots(j_{g_{2r}}j_{g_{2r-1}})\curvearrowright(\cdot),j_{g_1}=j_{g_2},\ldots,j_{g_{2r-1}}=j_{g_{2r}}}\times$$

$$\times\prod_{s=1}^{r}\mathbf{1}_{\{i_{g_{2s-1}}=i_{g_{2s}}\ne 0\}}J'[\phi_{j_{q_1}}\ldots\phi_{j_{q_{k-2r}}}]_{T,t}^{(i_{q_1}\ldots i_{q_{k-2r}})}=$$

$$=\frac{1}{2^r}\underset{p\to\infty}{\text{l.i.m.}}\sum_{\substack{j_1,\ldots,j_q,\ldots,j_k=0\\ q\ne g_1,g_2,\ldots,g_{2r-1},g_{2r}}}^{p}C_{j_k\ldots j_1}\Bigr|_{(j_{g_2}j_{g_1})\curvearrowright 0\ldots(j_{g_{2r}}j_{g_{2r-1}})\curvearrowright 0,j_{g_1}=j_{g_2},\ldots,j_{g_{2r-1}}=j_{g_{2r}}}\times$$

$$\times\prod_{s=1}^{r}\mathbf{1}_{\{i_{g_{2s-1}}=i_{g_{2s}}\ne 0\}}\left(\zeta_0^{(0)}\right)^r J'[\phi_{j_{q_1}}\ldots\phi_{j_{q_{k-2r}}}]_{T,t}^{(i_{q_1}\ldots i_{q_{k-2r}})}=$$

$$=\frac{1}{2^r}\underset{p\to\infty}{\text{l.i.m.}}\sum_{\substack{j_1,\ldots,j_q,\ldots,j_k=0\\ q\ne g_1,g_2,\ldots,g_{2r-1},g_{2r}}}^{p}\ \sum_{j_{m_1},j_{m_3}\ldots,j_{m_{2r-1}}=0}^{p}\prod_{s=1}^{r}\mathbf{1}_{\{i_{g_{2s-1}}=i_{g_{2s}}\ne 0\}}\times$$

$$\times C_{j_k\ldots j_1}\Bigr|_{(j_{g_2}j_{g_1})\curvearrowright j_{m_1}\ldots(j_{g_{2r}}j_{g_{2r-1}})\curvearrowright j_{m_{2r-1}},j_{g_1}=j_{g_2},\ldots,j_{g_{2r-1}}=j_{g_{2r}}}\times$$

$$\times\zeta_{j_{m_1}}^{(0)}\zeta_{j_{m_3}}^{(0)}\ldots\zeta_{j_{m_{2r-1}}}^{(0)}J'[\phi_{j_{q_1}}\ldots\phi_{j_{q_{k-2r}}}]_{T,t}^{(i_{q_1}\ldots i_{q_{k-2r}})}=$$

$$=\frac{1}{2^r}\underset{p\to\infty}{\text{l.i.m.}}\sum_{\substack{j_1,\ldots,j_q,\ldots,j_k=0\\ q\ne g_1,g_2,\ldots,g_{2r-1},g_{2r}}}^{p}\ \sum_{j_{m_1},j_{m_3}\ldots,j_{m_{2r-1}}=0}^{p}\prod_{s=1}^{r}\mathbf{1}_{\{i_{g_{2s-1}}=\ i_{g_{2s}}\ne 0\}}\times$$

$$\times C_{j_k\ldots j_1}\Bigg|_{(j_{g_2}j_{g_1})\frown j_{m_1}\ldots(j_{g_{2r}}j_{g_{2r-1}})\frown j_{m_{2r-1}},j_{g_1}=\ j_{g_2},\ldots,j_{g_{2r-1}}=\ j_{g_{2r}}}\times$$

$$\times J'[\phi_{j_{m_1}}\phi_{j_{m_3}}\ldots\phi_{j_{m_{2r-1}}}\phi_{j_{q_1}}\ldots\phi_{j_{q_{k-2r}}}]_{T,t}^{(00\ldots 0i_{q_1}\ldots i_{q_{k-2r}})}= \tag{85}$$

$$=\frac{1}{2^r}J[\psi^{(k)}]_{T,t}^{s_r,\ldots,s_1}\quad \text{w. p. 1.} \tag{86}$$

The transition from (85) to (86) is based on (44).

Note that

$$C_{j_k\ldots j_1}\Bigg|_{(j_{g_2}j_{g_1})\frown j_{m_1},j_{g_1}=\ j_{g_2}}=C_{j_k\ldots j_1}\Bigg|_{(j_{g_1}j_{g_1})\frown j_{m_1},j_{g_1}=\ j_{g_2}}$$

is the Fourier coefficient, where $g_2=g_1+1$. Therefore, the value

$$C_{j_k\ldots j_1}\Bigg|_{(j_{g_2}j_{g_1})\frown j_{m_1}\ldots(j_{g_{2d}}j_{g_{2d-1}})\frown j_{m_{2d-1}},j_{g_1}=\ j_{g_2},\ldots,j_{g_{2d-1}}=\ j_{g_{2d}}}=$$

$$=C_{j_k\ldots j_1}\Bigg|_{(j_{g_1}j_{g_1})\frown j_{m_1}\ldots(j_{g_{2d-1}}j_{g_{2d-1}})\frown j_{m_{2d-1}},j_{g_1}=\ j_{g_2},\ldots,j_{g_{2d-1}}=\ j_{g_{2d}}}$$

is determined recursively using (33) in an obvious way for $g_2=g_1+1,\ \ldots,\ g_{2d}=g_{2d-1}+1$ and $d=2,\ldots,r$.

By Condition 3 of Theorem 12 we have (also see the property (43) of multiple Wiener stochastic integral)

$$\lim_{p\to\infty}\mathsf{M}\left\{\left(R_{T,t}^{(p)r,g_1,g_2,\ldots,g_{2r-1},g_{2r}}\right)^2\right\}\le$$

$$\le K\lim_{p\to\infty}\sum_{\substack{j_1,\ldots,j_q,\ldots,j_k=0\\ q\ne g_1,g_2,\ldots,g_{2r-1},g_{2r}}}^{p}\left(\left(\bar{C}_{j_k\ldots j_q\ldots j_1}^{(p)}\Bigg|_{q\ne g_1,g_2,\ldots,g_{2r-1},g_{2r}}\right)^2+\right.$$

$$+\sum_{l_1=1}^{r}\left(S_{l_1}\left\{\bar{C}_{j_k\ldots j_q\ldots j_1}^{(p)}\Bigg|_{q\ne g_1,g_2,\ldots,g_{2r-1},g_{2r}}\right\}\right)^2+$$

$$+\sum_{\substack{l_1,l_2=1\\ l_1>l_2}}^{r}\left(S_{l_1}S_{l_2}\left\{\bar C_{j_k\ldots j_q\ldots j_1}^{(p)}\Big|_{q\ne g_1,g_2,\ldots,g_{2r-1},g_{2r}}\right\}\right)^2+$$

$$\ldots$$

$$\left.+\sum_{\substack{l_1,l_2,\ldots,l_{r-1}=1\\ l_1>l_2>\ldots>l_{r-1}}}^{r}\left(S_{l_1}S_{l_2}\ldots S_{l_{r-1}}\left\{\bar C_{j_k\ldots j_q\ldots j_1}^{(p)}\Big|_{q\ne g_1,g_2,\ldots,g_{2r-1},g_{2r}}\right\}\right)^2\right)=0,$$

where constant K does not depend on p.

So we have

$$\prod_{s=1}^{r}\mathbf{1}_{\{i_{g_{2s-1}}=\ i_{g_{2s}}\ne 0\}}\underset{p\to\infty}{\text{l.i.m.}}\sum_{j_1,\ldots,j_k=0}^{p}C_{j_k\ldots j_1}\prod_{s=1}^{r}\mathbf{1}_{\{j_{g_{2s-1}}=\ j_{g_{2s}}\}}\times$$

$$\times J'[\phi_{j_{q_1}}\ldots\phi_{j_{q_{k-2r}}}]_{T,t}^{(i_{q_1}\ldots i_{q_{k-2r}})}=$$

$$=\frac{1}{2^r}\prod_{s=1}^{r}\mathbf{1}_{\{g_{2s}=g_{2s-1}+1\}}J[\psi^{(k)}]_{T,t}^{s_r,\ldots,s_1}\quad\text{w. p. 1,}\tag{87}$$

where $g_{2i-1}\stackrel{\text{def}}{=}s_i;\ i=1,2,\ldots,r;\ r=1,2,\ldots,[k/2]\,,\ (s_r,\ldots,s_1)\in \mathrm{A}_{k,r},\ J[\psi^{(k)}]_{T,t}^{s_r,\ldots,s_1}$ is defined by (23) and $\mathrm{A}_{k,r}$ is defined by (24).

Note that

$$\sum_{\substack{(\{\{g_1,g_2\},\ldots,\{g_{2r-1},g_{2r}\}\},\{q_1,\ldots,q_{k-2r}\})\\ \{g_1,g_2,\ldots,g_{2r-1},g_{2r},q_1,\ldots,q_{k-2r}\}=\{1,2,\ldots,k\}}}\Bigg|_{g_2=g_1+1,g_3=g_2+1,\ldots,g_{2r}=g_{2r-1}+1}A_{g_1,g_3,\ldots,g_{2r-1}}=$$

$$=\sum_{(s_r,\ldots,s_1)\in\mathrm{A}_{k,r}}A_{s_1,s_2,\ldots,s_r},\tag{88}$$

where $A_{g_1,g_3,\ldots,g_{2r-1}}$, $A_{s_1,s_2,\ldots,s_r}$ are scalar values, $g_{2i-1}=s_i;\ i=1,2,\ldots,r;\ r=1,2,\ldots,[k/2]\,,\ \mathrm{A}_{k,r}$ is defined by (24):

$$\mathrm{A}_{k,r}=\big\{(s_r,\ldots,s_1):\ s_r>s_{r-1}+1,\ldots,s_2>s_1+1,\ s_r,\ldots,s_1=1,\ldots,k-1\big\}.$$

Using (73), (87), (88), and Theorem 4, we finally get

$$\underset{p\to\infty}{\text{l.i.m.}}\sum_{j_1,\ldots,j_k=0}^{p}C_{j_k\ldots j_1}\prod_{l=1}^{k}\zeta_{j_l}^{(i_l)}=\underset{p\to\infty}{\text{l.i.m.}}\sum_{j_1,\ldots,j_k=0}^{p}C_{j_k\ldots j_1}\zeta_{j_1}^{(i_1)}\ldots\zeta_{j_k}^{(i_k)}=$$

$$= J[\psi^{(k)}]_{T,t}^{(i_1\ldots i_k)} + \sum_{r=1}^{[k/2]} \frac{1}{2^r} \sum_{(s_r,\ldots,s_1)\in \mathrm{A}_{k,r}} J[\psi^{(k)}]_{T,t}^{s_r,\ldots,s_1} = J^*[\psi^{(k)}]_{T,t}^{(i_1\ldots i_k)} \tag{89}$$

w. p. 1, where (see (23))

$$J[\psi^{(k)}]_{T,t}^{s_r,\ldots,s_1} \stackrel{\rm def}{=} \prod_{p=1}^{r} \mathbf{1}_{\{i_{s_p}=i_{s_p+1}\ne 0\}} \times$$

$$\times \int\limits_t^T \psi_k(t_k)\ldots \int\limits_t^{t_{s_r+3}} \psi_{s_r+2}(t_{s_r+2}) \int\limits_t^{t_{s_r+2}} \psi_{s_r}(t_{s_r+1})\psi_{s_r+1}(t_{s_r+1})\times$$

$$\times \int\limits_t^{t_{s_r+1}} \psi_{s_r-1}(t_{s_r-1})\ldots \int\limits_t^{t_{s_1+3}} \psi_{s_1+2}(t_{s_1+2}) \int\limits_t^{t_{s_1+2}} \psi_{s_1}(t_{s_1+1})\psi_{s_1+1}(t_{s_1+1})\times$$

$$\times \int\limits_t^{t_{s_1+1}} \psi_{s_1-1}(t_{s_1-1})\ldots \int\limits_t^{t_2} \psi_1(t_1)d\mathbf{w}_{t_1}^{(i_1)}\ldots d\mathbf{w}_{t_{s_1-1}}^{(i_{s_1-1})}dt_{s_1+1}d\mathbf{w}_{t_{s_1+2}}^{(i_{s_1+2})}\ldots$$

$$\ldots\ d\mathbf{w}_{t_{s_r-1}}^{(i_{s_r-1})}dt_{s_r+1}d\mathbf{w}_{t_{s_r+2}}^{(i_{s_r+2})}\ldots d\mathbf{w}_{t_k}^{(i_k)}. \tag{90}$$

Theorem 12 is proved.

Let us make a number of remarks about Theorem 12. An expansion similar to (40) was obtained in [69], where the author used the definition (387) of the Stratonovich stochastic integral, which differs from the definition we use in this article [1]. The proof from [69] is somewhat simpler than the proof proposed in this work. However, the results from [69] were obtained under the condition of convergence of trace series. The verification of this condition for the kernel (3) is a separate problem. In our proof, we essentially use the structure of the Fourier coefficients (31) corresponding to the kernel $K(t_1,\ldots,t_k)$ of the form (3). This circumstance actually made it possible to prove Theorem 12 using not the condition of finiteness of trace series, but using the condition of convergence to zero of explicit expressions for the remainders of the mentioned series. This leaves hope that it is possible to prove analog of Theorems 2.35–2.37 [12], [14] on the rate of the mean-square convergence of approximations of iterated Stratonovich stochastic integrals for the case of arbitrary k ($k\in\mathbb{N}$).

Note that under the conditions of Theorem 12 (also see (65), (72)) the sequential order of the series

$$\sum_{j_{g_{2r-1}}=p+1}^{\infty}\ \sum_{j_{g_{2r-3}}=p+1}^{\infty}\ldots \sum_{j_{g_3}=p+1}^{\infty}\ \sum_{j_{g_1}=p+1}^{\infty}$$

is not important.

We also note that the first and second conditions of Theorem 12 are satisfied for complete orthonormal systems of Legendre polynomials and trigonometric functions in the space $L_2([t,T])$ (see the proofs of Theorems 5–11 (Theorems 2.1–2.8 in [12]-[15])). It is easy to see that in the proofs of Theorems 5–11 (Theorems 2.1–2.8 in [12]-[15]) the conditions of Theorem 12 are verified for various special cases of iterated Stratonovich stochastic integrals of multiplicities 2–4 with respect to components of the multidimensional Wiener process.

It should be noted that (see (84))

$$(-1)^r \bar{C}^{(p)}_{j_k\ldots j_q\ldots j_1}\Biggl|_{q\ne g_1,g_2,\ldots,g_{2r-1},g_{2r}}+$$

$$+(-1)^{r-1}\sum_{l_1=1}^{r} S_{l_1}\left\{\bar{C}^{(p)}_{j_k\ldots j_q\ldots j_1}\Biggl|_{q\ne g_1,g_2,\ldots,g_{2r-1},g_{2r}}\right\}+$$

$$+(-1)^{r-2}\sum_{\substack{l_1,l_2=1\\ l_1>l_2}}^{r} S_{l_1}S_{l_2}\left\{\bar{C}^{(p)}_{j_k\ldots j_q\ldots j_1}\Biggl|_{q\ne g_1,g_2,\ldots,g_{2r-1},g_{2r}}\right\}+$$

$$\ldots$$

$$+(-1)^{1}\sum_{\substack{l_1,l_2,\ldots,l_{r-1}=1\\ l_1>l_2>\ldots>l_{r-1}}}^{r} S_{l_1}S_{l_2}\ldots S_{l_{r-1}}\left\{\bar{C}^{(p)}_{j_k\ldots j_q\ldots j_1}\Biggl|_{q\ne g_1,g_2,\ldots,g_{2r-1},g_{2r}}\right\}=$$

$$=\sum_{j_{g_1}=0}^{p}\ldots\sum_{j_{g_{2r-1}}=0}^{p} C_{j_k\ldots j_1}\Biggl|_{j_{g_1}=j_{g_2},\ldots,j_{g_{2r-1}}=j_{g_{2r}}}-$$

$$-\frac{1}{2^r}\prod_{l=1}^{r}\mathbf{1}_{\{g_{2l}=g_{2l-1}+1\}}C_{j_k\ldots j_1}\Biggl|_{(j_{g_2}j_{g_1})\curvearrowright(\cdot)\ldots(j_{g_{2r}}j_{g_{2r-1}})\curvearrowright(\cdot),\,j_{g_1}=j_{g_2},\ldots,j_{g_{2r-1}}=j_{g_{2r}}},\qquad (91)$$

where the meaning of the notations used in (84) is preserved.

For example, from (91) for the case $r=2$ we get

$$\sum_{j_{g_3}=p+1}^{\infty}\sum_{j_{g_1}=p+1}^{\infty} C_{j_k\ldots j_1}\Biggl|_{j_{g_1}=j_{g_2},\,j_{g_3}=j_{g_4}}-$$

$$-\frac{1}{2}\mathbf{1}_{\{g_4=g_3+1\}}\sum_{j_{g_1}=p+1}^{\infty} C_{j_k\ldots j_1}\Biggl|_{(j_{g_4}j_{g_3})\curvearrowright(\cdot),\,j_{g_1}=j_{g_2},\,j_{g_3}=j_{g_4}}-$$

$$-\frac{1}{2}\mathbf{1}_{\{g_2=g_1+1\}}\sum_{j_{g_3}=p+1}^{\infty} C_{j_k\ldots j_1}\Biggl|_{(j_{g_2}j_{g_1})\curvearrowright(\cdot),\,j_{g_1}=j_{g_2},\,j_{g_3}=j_{g_4}}=$$

$$=\sum_{j_{g_1}=0}^{p}\sum_{j_{g_3}=0}^{p} C_{j_k\ldots j_1}\Biggl|_{j_{g_1}=j_{g_2},\,j_{g_3}=j_{g_4}}-$$

$$-\frac{1}{4}\mathbf{1}_{\{g_2=g_1+1\}}\mathbf{1}_{\{g_4=g_3+1\}}C_{j_k\ldots j_1}\Biggl|_{(j_{g_2}j_{g_1})\curvearrowright(\cdot)(j_{g_4}j_{g_3})\curvearrowright(\cdot),\,j_{g_1}=j_{g_2},\,j_{g_3}=j_{g_4}}.$$

As a result, Condition 3 of Theorem 12 can be replaced by a weaker condition

$$\lim_{p\to\infty}\sum_{\substack{j_1,\ldots,j_q,\ldots,j_k=0\\ q\ne g_1,g_2,\ldots,g_{2r-1},g_{2r}}}^{p}\Biggl(\sum_{j_{g_1}=0}^{p}\ldots\sum_{j_{g_{2r-1}}=0}^{p}C_{j_k\ldots j_1}\Bigg|_{j_{g_1}=j_{g_2},\ldots,j_{g_{2r-1}}=j_{g_{2r}}}-$$

$$-\frac{1}{2^r}\prod_{l=1}^{r}\mathbf{1}_{\{g_{2l}=g_{2l-1}+1\}}C_{j_k\ldots j_1}\Bigg|_{(j_{g_2}j_{g_1})\curvearrowright(\cdot)\ldots(j_{g_{2r}}j_{g_{2r-1}})\curvearrowright(\cdot),j_{g_1}=\,j_{g_2},\ldots,j_{g_{2r-1}}=\,j_{g_{2r}}}\Biggr)^2=0, \tag{92}$$

where $r=1,2,\ldots,[k/2]$.

However, Condition 3 of Theorem 12 itself contains a way of proving of the condition (92), which is partially realized in the proof of Theorems 15–17, 22 (see below).

In fact, when proving Theorem 17 (the case $r=3$ is proved in Theorem 22 for $\psi_1(\tau),\ldots,\psi_6(\tau)\equiv 1$), we proved the following equality

$$\lim_{p\to\infty}\sum_{j_{g_1}=0}^{p}\sum_{j_{g_3}=0}^{p}C_{j_k\ldots j_1}\Bigg|_{j_{g_1}=j_{g_2},j_{g_3}=j_{g_4}}=$$

$$=\frac{1}{4}\mathbf{1}_{\{g_2=g_1+1\}}\mathbf{1}_{\{g_4=g_3+1\}}C_{j_k\ldots j_1}\Bigg|_{(j_{g_2}j_{g_1})\curvearrowright(\cdot)(j_{g_4}j_{g_3})\curvearrowright(\cdot),j_{g_1}=\,j_{g_2},j_{g_3}=\,j_{g_4}}.$$

On the other hand, iterative application of (72) gives

$$\sum_{j_{g_1}=0}^{\infty}\ldots\sum_{j_{g_{2r-1}}=0}^{\infty}C_{j_k\ldots j_1}\Bigg|_{j_{g_1}=j_{g_2},\ldots,j_{g_{2r-1}}=j_{g_{2r}}}=$$

$$=\frac{1}{2^r}\prod_{l=1}^{r}\mathbf{1}_{\{g_{2l}=g_{2l-1}+1\}}C_{j_k\ldots j_1}\Bigg|_{(j_{g_2}j_{g_1})\curvearrowright(\cdot)\ldots(j_{g_{2r}}j_{g_{2r-1}})\curvearrowright(\cdot),j_{g_1}=\,j_{g_2},\ldots,j_{g_{2r-1}}=\,j_{g_{2r}}},$$

where $r=1,2,\ldots,[k/2]$.

Taking into account the generalization of Theorem 1 for the case of integration interval $[t,s]$ ($s\in(t,T]$) of iterated Ito stochastic integrals (see Theorems 1.11, 1.24 in [12]), we can formulate an analogue of Theorem 12 for the case of integration interval $[t,s]$ ($s\in(t,T]$) of iterated Stratonovich stochastic integrals of multiplicity k ($k\in\mathbb{N}$).

Denote

$$\bar{C}^{(p)}_{j_k\ldots j_q\ldots j_1}(s)\Bigg|_{q\ne g_1,g_2,\ldots,g_{2r-1},g_{2r}}\stackrel{\text{def}}{=}$$

$$\stackrel{\text{def}}{=}\sum_{j_{g_{2r-1}}=p+1}^{\infty}\sum_{j_{g_{2r-3}}=p+1}^{\infty}\ldots\sum_{j_{g_3}=p+1}^{\infty}\sum_{j_{g_1}=p+1}^{\infty}C_{j_k\ldots j_1}(s)\Bigg|_{j_{g_1}=j_{g_2},\ldots,j_{g_{2r-1}}=j_{g_{2r}}}$$

and introduce the following notation

$$S_l\left\{\bar{C}^{(p)}_{j_k\ldots j_q\ldots j_1}(s)\Biggr|_{q\ne g_1,g_2,\ldots,g_{2r-1},g_{2r}}\right\}\stackrel{\sf def}{=}\frac{1}{2}{\bf 1}_{\{g_{2l}=g_{2l-1}+1\}}\sum_{j_{g_{2r-1}}=p+1}^{\infty}\sum_{j_{g_{2r-3}}=p+1}^{\infty}\ldots$$

$$\ldots\sum_{j_{g_{2l+1}}=p+1}^{\infty}\sum_{j_{g_{2l-3}}=p+1}^{\infty}\ldots\sum_{j_{g_3}=p+1}^{\infty}\sum_{j_{g_1}=p+1}^{\infty}C_{j_k\ldots j_1}(s)\Biggr|_{(j_{g_{2l}}j_{g_{2l-1}})\curvearrowright(\cdot),j_{g_1}=j_{g_2},\ldots,j_{g_{2r-1}}=j_{g_{2r}}},$$

where $l=1,2,\ldots,r$,

$$C_{j_k\ldots j_1}(s)\Biggr|_{(j_{g_{2l}}j_{g_{2l-1}})\curvearrowright(\cdot)}$$

is defined by analogy with (32),

$$C_{j_k\ldots j_1}(s)=\int\limits_t^s\psi_k(t_k)\phi_{j_k}(t_k)\ldots\int\limits_t^{t_2}\psi_1(t_1)\phi_{j_1}(t_1)dt_1\ldots dt_k. \tag{93}$$

Theorem 14 [12], [36], [37], [51]. *Assume that the continuously differentiable functions $\psi_l(\tau)$ $(l=1,\ldots,k)$ and the complete orthonormal system $\{\phi_j(x)\}_{j=0}^{\infty}$ of continuous functions ($\phi_0(x)=1/\sqrt{T-t}$) in the space $L_2([t,T])$ are such that the following conditions are satisfied:*

1. *The equality*

$$\frac{1}{2}\int\limits_t^s\Phi_1(t_1)\Phi_2(t_1)dt_1=\sum_{j_1=0}^{\infty}\int\limits_t^s\Phi_2(t_2)\phi_{j_1}(t_2)\int\limits_t^{t_2}\Phi_1(t_1)\phi_{j_1}(t_1)dt_1dt_2 \tag{94}$$

holds for all $s\in(t,T]$, where the nonrandom functions $\Phi_1(\tau)$, $\Phi_2(\tau)$ are continuously differentiable on $[t,T]$ and the series on the right-hand side of (94) converges absolutely.

2. *The estimates*

$$\left|\int\limits_t^s\phi_j(\tau)\Phi_1(\tau)d\tau\right|\le\frac{\Psi_1(s)}{j^{1/2+\alpha}},\quad \left|\int\limits_\tau^s\phi_j(\theta)\Phi_2(\theta)d\theta\right|\le\frac{\Psi_2(s,\tau)}{j^{1/2+\alpha}},$$

$$\left|\sum_{j=p+1}^{\infty}\int\limits_t^s\Phi_2(\tau)\phi_j(\tau)\int\limits_t^{\tau}\Phi_1(\theta)\phi_j(\theta)d\theta d\tau\right|\le\frac{\Psi_3(s)}{p^{\beta}}$$

hold for all s,τ such that $t<\tau<s<T$ and for some $\alpha,\beta>0$, where $\Phi_1(\tau)$, $\Phi_2(\tau)$ are continuously differentiable nonrandom functions on $[t,T]$, $j,p\in\mathbb{N}$, and

$$\int\limits_t^s|\Psi_1(\tau)\Psi_2(s,\tau)|\,d\tau<\infty,\quad \int\limits_t^s|\Psi_3(\tau)|\,d\tau<\infty$$

for all $s\in(t,T)$.

3. *The condition*

$$\lim_{p\to\infty}\sum_{\substack{j_1,\ldots,j_q,\ldots,j_k=0\\ q\ne g_1,g_2,\ldots,g_{2r-1},g_{2r}}}^{p}\left(S_{l_1}S_{l_2}\ldots S_{l_d}\left\{\bar{C}^{(p)}_{j_k\ldots j_q\ldots j_1}(s)\Bigr|_{q\ne g_1,g_2,\ldots,g_{2r-1},g_{2r}}\right\}\right)^2=0$$

holds for all possible $g_1,g_2,\ldots,g_{2r-1},g_{2r}$ *(see* (30)*) and* $l_1,l_2,\ldots,l_d$ *such that* $l_1,l_2,\ldots,l_d\in\{1,2,\ldots,r\}$, $l_1>l_2>\ldots>l_d$, $d=0,1,2,\ldots,r-1$, *where* $r=1,2,\ldots,[k/2]$ *and*

$$S_{l_1}S_{l_2}\ldots S_{l_d}\left\{\bar{C}^{(p)}_{j_k\ldots j_q\ldots j_1}(s)\Bigr|_{q\ne g_1,g_2,\ldots,g_{2r-1},g_{2r}}\right\}\stackrel{\sf def}{=}\bar{C}^{(p)}_{j_k\ldots j_q\ldots j_1}(s)\Bigr|_{q\ne g_1,g_2,\ldots,g_{2r-1},g_{2r}}$$

for $d=0$.

Then, for the iterated Stratonovich stochastic integral of arbitrary multiplicity k

$$J^*[\psi^{(k)}]_{s,t}^{(i_1\ldots i_k)}=\int\limits_t^{*s}\psi_k(t_k)\ldots\int\limits_t^{*t_2}\psi_1(t_1)d\mathbf{w}_{t_1}^{(i_1)}\ldots d\mathbf{w}_{t_k}^{(i_k)}\tag{95}$$

the following expansion

$$J^*[\psi^{(k)}]_{s,t}^{(i_1\ldots i_k)}=\underset{p\to\infty}{\text{l.i.m.}}\sum_{j_1,\ldots,j_k=0}^{p}C_{j_k\ldots j_1}(s)\prod_{l=1}^{k}\zeta_{j_l}^{(i_l)}$$

that converges in the mean-square sense is valid, where $C_{j_k\ldots j_1}(s)$ *is the Fourier coefficient* (93), l.i.m. *is a limit in the mean-square sense,* $i_1,\ldots,i_k=0,1,\ldots,m$, $s\in(t,T)$,

$$\zeta_j^{(i)}=\int\limits_t^T\phi_j(\tau)d\mathbf{w}_\tau^{(i)}$$

are independent standard Gaussian random variables for various i *or* j *(in the case when* $i\ne 0$*),* $\mathbf{w}_\tau^{(i)}=\mathbf{f}_\tau^{(i)}$ *for* $i=1,\ldots,m$ *and* $\mathbf{w}_\tau^{(0)}=\tau$.

In Sect. 2.1.2 of the monograpths [12]–[15], the following formula is proved

$$\frac{1}{2}\int\limits_t^T\psi_1(t_1)\psi_2(t_1)dt_1=\sum_{j_1=0}^{\infty}C_{j_1j_1},\tag{96}$$

where

$$C_{j_1j_1}=\int\limits_t^T\psi_2(t_2)\phi_{j_1}(t_2)\int\limits_t^{t_2}\psi_1(t_1)\phi_{j_1}(t_1)dt_1dt_2,$$

$\{\phi_j(x)\}_{j=0}^{\infty}$ is a complete orthonormal system of Legendre polynomials or trigonometric functions in the space $L_2([t,T])$, the functions $\psi_1(\tau)$, $\psi_2(\tau)$ are continuously differentiable at the interval $[t,T]$.

Moreover (see Sect. 2.1.2 of the monograpths [12]–[15]), the following estimate

$$\left|\sum_{j_1=p+1}^{\infty} C_{j_1 j_1}\right| \le \frac{C}{p}, \tag{97}$$

holds under the above assumptions, where constant C does not depend on p.

The relations (96) and (97) have been modified for the Legendre polynomial system as follows (see Sect. 2.8, 2.13 of the monograpth [14])

$$\frac{1}{2}\int_t^s \psi_1(t_1)\psi_2(t_1)dt_1 = \sum_{j_1=0}^{\infty} C_{j_1 j_1}(s), \tag{98}$$

$$\left|\sum_{j_1=p+1}^{\infty} C_{j_1 j_1}(s)\right| \le \frac{C}{p}\left(\frac{1}{\left(1-z^2(s)\right)^{1/4}}+1\right), \tag{99}$$

where $s \in (t,T)$ (s is fixed, the case $s=T$ corresponds to (96) and (97)), constant C does not depend on p, the functions $\psi_1(\tau)$, $\psi_2(\tau)$ are continuously differentiable at the interval $[t,T]$,

$$C_{j_1 j_1}(s) = \int_t^s \psi_2(t_2)\phi_{j_1}(t_2)\int_t^{t_2} \psi_1(t_1)\phi_{j_1}(t_1)dt_1 dt_2,$$

$$z(s) = \left(s - \frac{T+t}{2}\right)\frac{2}{T-t}. \tag{100}$$

For the trigonometric case, the estimate (99) is replaced by

$$\left|\sum_{j_1=p+1}^{\infty} C_{j_1 j_1}(s)\right| \le \frac{C}{p}, \tag{101}$$

where $s \in [t,T]$, constant C does not depend p.

Note the well known estimate for the Legendre polynomials

$$|P_j(y)| < \frac{K}{\sqrt{j+1}(1-y^2)^{1/4}}, \quad y \in (-1,1), \quad j \in \mathbb{N}, \tag{102}$$

where $P_j(y)$ is the Legendre polynomial, constant K does not depend on y and j.

We also note the following useful estimates for the case of Legendre polynomials ([12]-[15], Chapters 1, 2)

$$\left|\int_t^x \psi(\tau)\phi_j(\tau)d\tau\right| < \frac{C}{j}\left(\frac{1}{(1-(z(x))^2)^{1/4}}+1\right), \tag{103}$$

$$\left|\int_x^T \psi(\tau)\phi_j(\tau)d\tau\right| < \frac{C}{j}\left(\frac{1}{(1-(z(x))^2)^{1/4}}+1\right), \tag{104}$$

$$\left|\int\limits_{v}^{x}\psi(\tau)\phi_j(\tau)d\tau\right|<\frac{C}{j}\left(\frac{1}{(1-(z(x))^2)^{1/4}}+\frac{1}{(1-(z(v))^2)^{1/4}}+1\right), \tag{105}$$

where $j\in\mathbb{N}$, $z(x),z(v)\in(-1,1)$, $x,v\in(t,T)$, the function $\psi(\tau)$ is continuously differentiable at the interval $[t,T]$, constant C does not depend on j.

For the case of trigonometric functions we note the following obvious estimates

$$\left|\int\limits_{t}^{x}\psi(\tau)\phi_j(\tau)d\tau\right|<\frac{C}{j}, \tag{106}$$

$$\left|\int\limits_{x}^{T}\psi(\tau)\phi_j(\tau)d\tau\right|<\frac{C}{j}, \tag{107}$$

$$\left|\int\limits_{v}^{x}\psi(\tau)\phi_j(\tau)d\tau\right|<\frac{C}{j}, \tag{108}$$

where $j\in\mathbb{N}$, $x,v\in[t,T]$, the function $\psi(\tau)$ is continuously differentiable at the interval $[t,T]$, constant C is independent of j.

It is easy to see that the estimates (99), (101), (103), (105), (106), (108) imply the fulfillment of Condition 2 of Theorem 14 for complete orthonormal systems of Legendre polynomials and trigonometric functions in the space $L_2([t,T])$. Also the equality (98) and its analogue for the trigonometric case as well as the equatily (96) guarantee the fulfillment of Condition 1 of Theorems 12, 14 for complete orthonormal systems of Legendre polynomials and trigonometric functions in the space $L_2([t,T])$ (see the proof of Theorems 2.27, 2.38 [14]). Furthermore, Condition 2 of Theorem 12 follow from (97), (103), (104), (106), (107).

Recently, the equality (96) is proved for the case of an arbitrary complete orthonormal system of functions in $L_2([t,T])$ and $\psi_1(\tau),\psi_2(\tau)\in L_2([t,T])$ in [75] or [12] (Sect. 2.1.4).

6. Weakening of the Conditions of Theorem 10. Simple Proof Based on Theorem 12

In this section, we present a simple proof of Theorem 10 based on Theorem 12. In this case, the conditions of Theorem 10 will be weakened.

First, consider the following equalities

$$\frac{1}{2}\int\limits_{t_1}^{t_2}\Phi_1(\tau)\Phi_2(\tau)d\tau=\sum_{j=0}^{\infty}\int\limits_{t_1}^{t_2}\Phi_2(\tau)\phi_j(\tau)\int\limits_{t_1}^{\tau}\Phi_1(\theta)\phi_j(\theta)d\theta d\tau, \tag{109}$$

$$\frac{1}{2}\int\limits_{t_1}^{t_2}\Phi_1(\tau)\Phi_2(\tau)d\tau=\sum_{j=0}^{\infty}\int\limits_{t_1}^{t_2}\Phi_1(\theta)\phi_j(\theta)\int\limits_{\theta}^{t_2}\Phi_2(\tau)\phi_j(\tau)d\tau d\theta \tag{110}$$

that will be used further, where $t \le t_1 < t_2 \le T$, $\Phi_1(\tau), \Phi_2(\tau) \in L_2([t,T])$, $\{\phi_j(x)\}_{j=0}^{\infty}$ is an arbitrary complete orthonormal system of funtions in $L_2([t,T])$.

The equality (110) is proved in Sect. 2.7.2 [12]. Using (110) and Fubini's Theorem, we get (109).

Theorem 15 [12], [36], [37], [51]. *Suppose that $\{\phi_j(x)\}_{j=0}^{\infty}$ is a complete orthonormal system of Legendre polynomials or trigonometric functions in the space $L_2([t,T])$. Furthermore, let $\psi_1(\tau), \psi_2(\tau)$, $\psi_3(\tau)$ are continuously differentiable nonrandom functions on $[t,T]$. Then, for the iterated Stratonovich stochastic integral of third multiplicity*

$$J^*[\psi^{(3)}]_{T,t} = \int\limits_t^{*T} \psi_3(t_3) \int\limits_t^{*t_3} \psi_2(t_2) \int\limits_t^{*t_2} \psi_1(t_1) d\mathbf{w}_{t_1}^{(i_1)} d\mathbf{w}_{t_2}^{(i_2)} d\mathbf{w}_{t_3}^{(i_3)} \tag{111}$$

the following expansion

$$J^*[\psi^{(3)}]_{T,t} = \underset{p\to\infty}{\text{l.i.m.}} \sum_{j_1,j_2,j_3=0}^{p} C_{j_3 j_2 j_1} \zeta_{j_1}^{(i_1)} \zeta_{j_2}^{(i_2)} \zeta_{j_3}^{(i_3)}$$

that converges in the mean-square sense is valid, where $i_1, i_3, i_3 = 0, 1, \ldots, m$,

$$C_{j_3 j_2 j_1} = \int\limits_t^{T} \psi_3(t_3)\phi_{j_3}(t_3) \int\limits_t^{t_3} \psi_2(t_2)\phi_{j_2}(t_2) \int\limits_t^{t_2} \psi_1(t_1)\phi_{j_1}(t_1) dt_1 dt_2 dt_3$$

and

$$\zeta_j^{(i)} = \int\limits_t^{T} \phi_j(\tau) d\mathbf{w}_\tau^{(i)}$$

are independent standard Gaussian random variables for various i or j (in the case when $i \neq 0$), $\mathbf{w}_\tau^{(i)} = \mathbf{f}_\tau^{(i)}$ for $i = 1, \ldots, m$ and $\mathbf{w}_\tau^{(0)} = \tau$.

Proof. As noted above (see Sect. 5), Conditions 1 and 2 of Theorem 12 are satisfied for complete orthonormal systems of Legendre polynomials and trigonometric functions in the space $L_2([t,T])$. Let us verify Condition 3 of Theorem 12 for the iterated Stratonovich stochastic integral (111). Thus, we have to check the following conditions

$$\lim_{p\to\infty} \sum_{j_3=0}^{p} \left(\sum_{j_1=p+1}^{\infty} C_{j_3 j_1 j_1} \right)^2 = 0, \tag{112}$$

$$\lim_{p\to\infty} \sum_{j_1=0}^{p} \left(\sum_{j_3=p+1}^{\infty} C_{j_3 j_3 j_1} \right)^2 = 0, \tag{113}$$

$$\lim_{p\to\infty} \sum_{j_2=0}^{p} \left(\sum_{j_1=p+1}^{\infty} C_{j_1 j_2 j_1} \right)^2 = 0. \tag{114}$$

We have

$$\sum_{j_3=0}^{p}\left(\sum_{j_1=p+1}^{\infty} C_{j_3 j_1 j_1}\right)^2 =$$

$$= \sum_{j_3=0}^{p}\left(\sum_{j_1=p+1}^{\infty} \int\limits_t^T \psi_3(t_3)\phi_{j_3}(t_3)\int\limits_t^{t_3}\psi_2(t_2)\phi_{j_1}(t_2)\int\limits_t^{t_2}\psi_1(t_1)\phi_{j_1}(t_1)dt_1dt_2dt_3\right)^2 = \tag{115}$$

$$= \sum_{j_3=0}^{p}\left(\int\limits_t^T \psi_3(t_3)\phi_{j_3}(t_3)\sum_{j_1=p+1}^{\infty}\int\limits_t^{t_3}\psi_2(t_2)\phi_{j_1}(t_2)\int\limits_t^{t_2}\psi_1(t_1)\phi_{j_1}(t_1)dt_1dt_2dt_3\right)^2 \le \tag{116}$$

$$\le \sum_{j_3=0}^{\infty}\left(\int\limits_t^T \psi_3(t_3)\phi_{j_3}(t_3)\sum_{j_1=p+1}^{\infty}\int\limits_t^{t_3}\psi_2(t_2)\phi_{j_1}(t_2)\int\limits_t^{t_2}\psi_1(t_1)\phi_{j_1}(t_1)dt_1dt_2dt_3\right)^2 = \tag{117}$$

$$= \int\limits_t^T \psi_3^2(t_3)\left(\sum_{j_1=p+1}^{\infty}\int\limits_t^{t_3}\psi_2(t_2)\phi_{j_1}(t_2)\int\limits_t^{t_2}\psi_1(t_1)\phi_{j_1}(t_1)dt_1dt_2\right)^2 dt_3 \le \tag{118}$$

$$\le \frac{K}{p^2} \ \to\ 0 \tag{119}$$

if $p\to\infty$, where constant K does not depend on p.

Note that the transition from (115) to (116) is based on the estimate (99) for the polynomial case and its analogue (101) for the trigonometric case, the transition from (117) to (118) is based on the Parseval equality, and the transition from (118) to (119) is also based on the estimate (99) and its analogue (101) for the trigonometric case.

By analogy with the previous case we have

$$\sum_{j_1=0}^{p}\left(\sum_{j_3=p+1}^{\infty} C_{j_3 j_3 j_1}\right)^2 =$$

$$= \sum_{j_1=0}^{p}\left(\sum_{j_3=p+1}^{\infty} \int\limits_t^T \psi_3(t_3)\phi_{j_3}(t_3)\int\limits_t^{t_3}\psi_2(t_2)\phi_{j_3}(t_2)\int\limits_t^{t_2}\psi_1(t_1)\phi_{j_1}(t_1)dt_1dt_2dt_3\right)^2 =$$

$$= \sum_{j_1=0}^{p}\left(\sum_{j_3=p+1}^{\infty} \int\limits_t^T \psi_1(t_1)\phi_{j_1}(t_1)\int\limits_{t_1}^{T}\psi_2(t_2)\phi_{j_3}(t_2)\int\limits_{t_2}^{T}\psi_3(t_3)\phi_{j_3}(t_3)dt_3dt_2dt_1\right)^2 = \tag{120}$$

$$= \sum_{j_1=0}^{p}\left(\int\limits_t^T \psi_1(t_1)\phi_{j_1}(t_1)\sum_{j_3=p+1}^{\infty}\int\limits_{t_1}^{T}\psi_2(t_2)\phi_{j_3}(t_2)\int\limits_{t_2}^{T}\psi_3(t_3)\phi_{j_3}(t_3)dt_3dt_2dt_1\right)^2 \le \tag{121}$$

$$\le \sum_{j_1=0}^{\infty}\left(\int\limits_t^T \psi_1(t_1)\phi_{j_1}(t_1)\sum_{j_3=p+1}^{\infty}\int\limits_{t_1}^T \psi_2(t_2)\phi_{j_3}(t_2)\int\limits_{t_2}^T \psi_3(t_3)\phi_{j_3}(t_3)dt_3dt_2dt_1\right)^2 =$$

$$=\int\limits_t^T \psi_1^2(t_1)\left(\sum_{j_3=p+1}^{\infty}\int\limits_{t_1}^T \psi_2(t_2)\phi_{j_3}(t_2)\int\limits_{t_2}^T \psi_1(t_3)\phi_{j_3}(t_3)dt_3dt_2\right)^2 dt_1 \le \tag{122}$$

$$\le \frac{K}{p^2} \ \to \ 0 \tag{123}$$

if $p\to\infty$, where constant K is independent of p.

The transition from (120) to (121) is based on analogues of the estimates (99), (101) for the value

$$\left|\sum_{j_3=p+1}^{\infty}\int\limits_{t_1}^T \psi_2(t_2)\phi_{j_3}(t_2)\int\limits_{t_2}^T \psi_3(t_3)\phi_{j_3}(t_3)dt_3dt_2\right|$$

for the polynomial and trigonometric cases, the transition from (122) to (123) is also based on the mentioned analogues of the estimates (99), (101).

Further, we have

$$\sum_{j_2=0}^{p}\left(\sum_{j_1=p+1}^{\infty} C_{j_1j_2j_1}\right)^2 =$$

$$=\sum_{j_2=0}^{p}\left(\sum_{j_1=p+1}^{\infty}\int\limits_t^T \psi_3(t_3)\phi_{j_1}(t_3)\int\limits_t^{t_3} \psi_2(t_2)\phi_{j_2}(t_2)\int\limits_t^{t_2} \psi_1(t_1)\phi_{j_1}(t_1)dt_1dt_2dt_3\right)^2 =$$

$$=\sum_{j_2=0}^{p}\left(\sum_{j_1=p+1}^{\infty}\int\limits_t^T \psi_2(t_2)\phi_{j_2}(t_2)\int\limits_t^{t_2} \psi_1(t_1)\phi_{j_1}(t_1)dt_1\int\limits_{t_2}^T \psi_3(t_3)\phi_{j_1}(t_3)dt_3dt_2\right)^2 = \tag{124}$$

$$=\sum_{j_2=0}^{p}\left(\int\limits_t^T \psi_2(t_2)\phi_{j_2}(t_2)\sum_{j_1=p+1}^{\infty}\int\limits_t^{t_2} \psi_1(t_1)\phi_{j_1}(t_1)dt_1\int\limits_{t_2}^T \psi_3(t_3)\phi_{j_1}(t_3)dt_3dt_2\right)^2 \le \tag{125}$$

$$\le\sum_{j_2=0}^{\infty}\left(\int\limits_t^T \psi_2(t_2)\phi_{j_2}(t_2)\sum_{j_1=p+1}^{\infty}\int\limits_t^{t_2} \psi_1(t_1)\phi_{j_1}(t_1)dt_1\int\limits_{t_2}^T \psi_3(t_3)\phi_{j_1}(t_3)dt_3dt_2\right)^2 =$$

$$=\int\limits_t^T \psi_2^2(t_2)\left(\sum_{j_1=p+1}^{\infty}\int\limits_t^{t_2} \psi_1(t_1)\phi_{j_1}(t_1)dt_1\int\limits_{t_2}^T \psi_3(t_3)\phi_{j_1}(t_3)dt_3\right)^2 dt_2. \tag{126}$$

The transition from (124) to (125) is based on the estimates (103), (104) and its obvious analogues (106), (107) for the trigonometric case. However, the estimates (103), (104) cannot be used to estimate the right-hand side of (126), since we get the divergent integral. For this reason, we will obtain new estimate based on the relation [12]-[15]

$$\int\limits_t^x \psi(s)\phi_{j_1}(s)ds = \frac{\sqrt{T-t}\sqrt{2j_1+1}}{2}\int\limits_{-1}^{z(x)} P_{j_1}(y)\psi(u(y))dy =$$

$$= \frac{\sqrt{T-t}}{2\sqrt{2j_1+1}}\Biggl((P_{j_1+1}(z(x)) - P_{j_1-1}(z(x)))\psi(x) -$$

$$-\frac{T-t}{2}\int\limits_{-1}^{z(x)}((P_{j_1+1}(y) - P_{j_1-1}(y))\psi'(u(y))dy\Biggr), \tag{127}$$

where $x \in (t,T)$, $j_1 \geq p+1$, $z(x)$ is defined by (100), $P_j(x)$ is the Legendre polynomial, ψ' is a derivative of the continuously differentiable function $\psi(\tau)$ with respect to the variable $u(y)$,

$$u(y) = \frac{T-t}{2}y + \frac{T+t}{2}.$$

From (102) and the estimate $|P_j(y)| \leq 1$, $y \in [-1,1]$ we obtain

$$|P_j(y)| = |P_j(y)|^{\varepsilon}\cdot|P_j(y)|^{1-\varepsilon} \leq |P_j(y)|^{1-\varepsilon} < \frac{C}{j^{1/2-\varepsilon/2}(1-y^2)^{1/4-\varepsilon/4}}, \tag{128}$$

where $y \in (-1,1)$, $j \in \mathbb{N}$, and ε is an arbitrary small positive real number.

Combining (127) and (128), we have the following estimate

$$\left|\int\limits_t^s \psi_1(\tau)\phi_{j_1}(\tau)d\tau\right| < \frac{C}{(j_1)^{1-\varepsilon/2}}\left(\frac{1}{(1-z^2(s))^{1/4-\varepsilon/4}} + 1\right), \tag{129}$$

where $s \in (t,T)$, $z(s)$ is defined by (100), constant C does not depend on j_1.

Similarly to (129) we obtain

$$\left|\int\limits_s^T \psi_3(\tau)\phi_{j_1}(\tau)d\tau\right| < \frac{C}{(j_1)^{1-\varepsilon/2}}\left(\frac{1}{(1-z^2(s))^{1/4-\varepsilon/4}} + 1\right), \tag{130}$$

where $s \in (t,T)$, constant C is independent of j_1.

Combining (103) and (130), we have

$$\left|\int\limits_t^s \psi_1(\tau)\phi_{j_1}(\tau)d\tau\int\limits_s^T \psi_3(\tau)\phi_{j_1}(\tau)d\tau\right| <$$

$$
(131)\qquad < \frac{L}{(j_1)^{2-\varepsilon/2}}\left(\frac{1}{(1-z^2(s))^{1/4-\varepsilon/4}}+1\right)\left(\frac{1}{(1-z^2(s))^{1/4}}+1\right),
$$

where $s\in(t,T)$, $z(s)$ is defined by (100), constant L does not depend on j_1.

Observe that

$$
(132)\qquad \sum_{j_1=p+1}^{\infty}\frac{1}{(j_1)^{2-\varepsilon/2}}\le\int\limits_p^{\infty}\frac{dx}{x^{2-\varepsilon/2}}=\frac{1}{(1-\varepsilon/2)p^{1-\varepsilon/2}}.
$$

Applying (131) and (132) to estimate the right-hand side of (126) gives

$$
(133)\qquad \sum_{j_2=0}^{p}\left(\sum_{j_1=p+1}^{\infty}C_{j_1j_2j_1}\right)^2\le\frac{K}{p^{2-\varepsilon}}\ \to\ 0
$$

if $p\to\infty$, where ε is an arbitrary small positive real number, constant K is independent of p.

The estimation of the right-hand side of (126) for the trigonometric case is carried out using the estimates (106), (107). At that we obtain the estimate (133) with $\varepsilon=0$. Theorem 15 is proved.

7. Expansion of Iterated Stratonovich Stochastic Integrals of Multiplicity 4 for the Case of Smooth Weight Functions $\psi_1(\tau),\ \ldots,\ \psi_4(\tau)$. Simple Proof Based on Theorem 12

Theorem 16 [12], [36], [37], [51]. *Suppose that $\{\phi_j(x)\}_{j=0}^{\infty}$ is a complete orthonormal system of Legendre polynomials or trigonometric functions in the space $L_2([t,T])$. Furthermore, let $\psi_1(\tau),\ldots,$ $\psi_4(\tau)$ are continuously differentiable nonrandom functions on $[t,T]$. Then, for the iterated Stratonovich stochastic integral of fourth multiplicity*

$$
(134)\qquad J^*[\psi^{(4)}]_{T,t}=\int\limits_t^{*T}\psi_4(t_4)\int\limits_t^{*t_4}\psi_3(t_3)\int\limits_t^{*t_3}\psi_2(t_2)\int\limits_t^{*t_2}\psi_1(t_1)d\mathbf{w}_{t_1}^{(i_1)}d\mathbf{w}_{t_2}^{(i_2)}d\mathbf{w}_{t_3}^{(i_3)}d\mathbf{w}_{t_4}^{(i_4)}
$$

the following expansion

$$
J^*[\psi^{(4)}]_{T,t}=\underset{p\to\infty}{\text{l.i.m.}}\sum_{j_1,j_2,j_3,j_4=0}^{p}C_{j_4j_3j_2j_1}\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}\zeta_{j_3}^{(i_3)}\zeta_{j_4}^{(i_4)}
$$

that converges in the mean-square sense is valid, where $i_1,i_3,i_3,i_4=0,1,\ldots,m,$

$$
C_{j_4j_3j_2j_1}=\int\limits_t^{T}\psi_4(t_4)\phi_{j_4}(t_4)\int\limits_t^{t_4}\psi_3(t_3)\phi_{j_3}(t_3)\int\limits_t^{t_3}\psi_2(t_2)\phi_{j_2}(t_2)\int\limits_t^{t_2}\psi_1(t_1)\phi_{j_1}(t_1)dt_1dt_2dt_3dt_4
$$

and

$$\zeta_j^{(i)} = \int\limits_t^T \phi_j(\tau) d\mathbf{w}_\tau^{(i)}$$

are independent standard Gaussian random variables for various i *or* j *(in the case when* $i \neq 0$*),* $\mathbf{w}_\tau^{(i)} = \mathbf{f}_\tau^{(i)}$ *for* $i = 1, \ldots, m$ *and* $\mathbf{w}_\tau^{(0)} = \tau$*.*

Proof. As noted above (see Sect. 5), Conditions 1 and 2 of Theorem 12 are satisfied for complete orthonormal systems of Legendre polynomials and trigonometric functions in the space $L_2([t,T])$. Let us verify Condition 3 of Theorem 12 for the iterated Stratonovich stochastic integral (134). Thus, we have to check the following conditions

$$\lim_{p\to\infty} \sum_{j_3,j_4=0}^{p} \left(\sum_{j_1=p+1}^{\infty} C_{j_4 j_3 j_1 j_1} \right)^2 = 0, \tag{135}$$

$$\lim_{p\to\infty} \sum_{j_2,j_4=0}^{p} \left(\sum_{j_1=p+1}^{\infty} C_{j_4 j_1 j_2 j_1} \right)^2 = 0, \tag{136}$$

$$\lim_{p\to\infty} \sum_{j_2,j_3=0}^{p} \left(\sum_{j_1=p+1}^{\infty} C_{j_1 j_3 j_2 j_1} \right)^2 = 0, \tag{137}$$

$$\lim_{p\to\infty} \sum_{j_1,j_4=0}^{p} \left(\sum_{j_2=p+1}^{\infty} C_{j_4 j_2 j_2 j_1} \right)^2 = 0, \tag{138}$$

$$\lim_{p\to\infty} \sum_{j_1,j_3=0}^{p} \left(\sum_{j_2=p+1}^{\infty} C_{j_2 j_3 j_2 j_1} \right)^2 = 0, \tag{139}$$

$$\lim_{p\to\infty} \sum_{j_1,j_2=0}^{p} \left(\sum_{j_3=p+1}^{\infty} C_{j_3 j_3 j_2 j_1} \right)^2 = 0, \tag{140}$$

$$\lim_{p\to\infty} \left(\sum_{j_2=p+1}^{\infty} \sum_{j_1=p+1}^{\infty} C_{j_2 j_1 j_2 j_1} \right)^2 = 0, \tag{141}$$

$$\lim_{p\to\infty} \left(\sum_{j_2=p+1}^{\infty} \sum_{j_1=p+1}^{\infty} C_{j_1 j_2 j_2 j_1} \right)^2 = 0, \tag{142}$$

$$\lim_{p\to\infty} \left(\sum_{j_3=p+1}^{\infty} \sum_{j_1=p+1}^{\infty} C_{j_3 j_3 j_1 j_1} \right)^2 = 0, \tag{143}$$

$$\lim_{p\to\infty}\left(\sum_{j_3=p+1}^{\infty} C_{j_3j_3j_1j_1}\Big|_{(j_1j_1)\curvearrowright(\cdot)}\right)^2=0, \tag{144}$$

$$\lim_{p\to\infty}\left(\sum_{j_1=p+1}^{\infty} C_{j_3j_3j_1j_1}\Big|_{(j_3j_3)\curvearrowright(\cdot)}\right)^2=0, \tag{145}$$

$$\lim_{p\to\infty}\left(\sum_{j_1=p+1}^{\infty} C_{j_1j_2j_2j_1}\Big|_{(j_2j_2)\curvearrowright(\cdot)}\right)^2=0, \tag{146}$$

where in (144)–(146) we use the notation (32).

Applying arguments similar to those we used in the proof of Theorem 15, we obtain for (135)

$$\sum_{j_3,j_4=0}^{p}\left(\sum_{j_1=p+1}^{\infty} C_{j_4j_3j_1j_1}\right)^2=$$

$$=\sum_{j_3,j_4=0}^{p}\left(\sum_{j_1=p+1}^{\infty}\int\limits_t^T\psi_4(t_4)\phi_{j_4}(t_4)\int\limits_t^{t_4}\psi_3(t_3)\phi_{j_3}(t_3)\times\right.$$

$$\left.\times\int\limits_t^{t_3}\psi_2(t_2)\phi_{j_1}(t_2)\int\limits_t^{t_2}\psi_1(t_1)\phi_{j_1}(t_1)dt_1dt_2dt_3dt_4\right)^2= \tag{147}$$

$$=\sum_{j_3,j_4=0}^{p}\left(\int\limits_t^T\psi_4(t_4)\phi_{j_4}(t_4)\int\limits_t^{t_4}\psi_3(t_3)\phi_{j_3}(t_3)\times\right.$$

$$\left.\times\sum_{j_1=p+1}^{\infty}\int\limits_t^{t_3}\psi_2(t_2)\phi_{j_1}(t_2)\int\limits_t^{t_2}\psi_1(t_1)\phi_{j_1}(t_1)dt_1dt_2dt_3dt_4\right)^2\le \tag{148}$$

$$\le\sum_{j_3,j_4=0}^{\infty}\left(\int\limits_t^T\psi_4(t_4)\phi_{j_4}(t_4)\int\limits_t^{t_4}\psi_3(t_3)\phi_{j_3}(t_3)\times\right.$$

$$\left.\times\sum_{j_1=p+1}^{\infty}\int\limits_t^{t_3}\psi_2(t_2)\phi_{j_1}(t_2)\int\limits_t^{t_2}\psi_1(t_1)\phi_{j_1}(t_1)dt_1dt_2dt_3dt_4\right)^2= \tag{149}$$

$$=\int\limits_{[t,T]^2}\mathbf{1}_{\{t_3<t_4\}}\psi_4^2(t_4)\psi_3^2(t_3)\left(\sum_{j_1=p+1}^{\infty}\int\limits_t^{t_3}\psi_2(t_2)\phi_{j_1}(t_2)\int\limits_t^{t_2}\psi_1(t_1)\phi_{j_1}(t_1)dt_1dt_2\right)^2dt_3dt_4\le \tag{150}$$

$$\le\frac{K}{p^2}\ \to\ 0 \tag{151}$$

if $p\to\infty$, where constant K is independent of p.

Note that the transition from (147) to (148) is based on the estimate (99) for the polynomial case and its analogue for the trigonometric case, the transition from (149) to (150) is based on the Parseval equality, and the transition from (150) to (151) is also based on the estimate (99) and its analogue for the trigonometric case.

Further, we have for (136)

$$\sum_{j_2,j_4=0}^{p}\left(\sum_{j_1=p+1}^{\infty}C_{j_4j_1j_2j_1}\right)^2=$$

$$=\sum_{j_2,j_4=0}^{p}\left(\sum_{j_1=p+1}^{\infty}\int\limits_t^T\psi_4(t_4)\phi_{j_4}(t_4)\int\limits_t^{t_4}\psi_3(t_3)\phi_{j_1}(t_3)\times\right.$$

$$\left.\times\int\limits_t^{t_3}\psi_2(t_2)\phi_{j_2}(t_2)\int\limits_t^{t_2}\psi_1(t_1)\phi_{j_1}(t_1)dt_1dt_2dt_3dt_4\right)^2= \tag{152}$$

$$=\sum_{j_2,j_4=0}^{p}\left(\sum_{j_1=p+1}^{\infty}\int\limits_t^T\psi_4(t_4)\phi_{j_4}(t_4)\int\limits_t^{t_4}\psi_2(t_2)\phi_{j_2}(t_2)\times\right.$$

$$\left.\times\int\limits_t^{t_2}\psi_1(t_1)\phi_{j_1}(t_1)dt_1\int\limits_{t_2}^{t_4}\psi_3(t_3)\phi_{j_1}(t_3)dt_3dt_2dt_4\right)^2= \tag{153}$$

$$=\sum_{j_2,j_4=0}^{p}\left(\int\limits_t^T\psi_4(t_4)\phi_{j_4}(t_4)\int\limits_t^{t_4}\psi_2(t_2)\phi_{j_2}(t_2)\times\right.$$

$$\left.\times\sum_{j_1=p+1}^{\infty}\int\limits_t^{t_2}\psi_1(t_1)\phi_{j_1}(t_1)dt_1\int\limits_{t_2}^{t_4}\psi_3(t_3)\phi_{j_1}(t_3)dt_3dt_2dt_4\right)^2\le$$

$$\le\sum_{j_2,j_4=0}^{\infty}\left(\int\limits_t^T\psi_4(t_4)\phi_{j_4}(t_4)\int\limits_t^{t_4}\psi_2(t_2)\phi_{j_2}(t_2)\times\right.$$

$$\left.\times\sum_{j_1=p+1}^{\infty}\int\limits_t^{t_2}\psi_1(t_1)\phi_{j_1}(t_1)dt_1\int\limits_{t_2}^{t_4}\psi_3(t_3)\phi_{j_1}(t_3)dt_3dt_2dt_4\right)^2=$$

$$=\int\limits_{[t,T]^2}\mathbf{1}_{\{t_2<t_4\}}\psi_4^2(t_4)\psi_2^2(t_2)\left(\sum_{j_1=p+1}^{\infty}\int\limits_t^{t_2}\psi_1(t_1)\phi_{j_1}(t_1)dt_1\int\limits_{t_2}^{t_4}\psi_3(t_3)\phi_{j_1}(t_3)dt_3\right)^2dt_2dt_4\le$$

$$\le\frac{K}{p^{2-\varepsilon}}\ \to\ 0 \tag{154}$$

if $p\to\infty$, where ε is an arbitrary small positive real number for the polynomial case and $\varepsilon=0$ for the trigonometric case, constant K does not depend on p.

The relation (154) was obtained by the same method as (151). Note that in obtaining (154) we used the estimates (105), (129) for the polynomial case and (106), (108) for the trigonometric case. We also used the integration order replacement in the iterated Riemann integrals (see (152), (153)).

Repeating the previous steps for (137) and (138), we get

$$\sum_{j_2,j_3=0}^{p}\left(\sum_{j_1=p+1}^{\infty} C_{j_1 j_3 j_2 j_1}\right)^2 =$$

$$= \sum_{j_2,j_3=0}^{p}\left(\sum_{j_1=p+1}^{\infty}\int\limits_t^T \psi_4(t_4)\phi_{j_1}(t_4)\int\limits_t^{t_4}\psi_3(t_3)\phi_{j_3}(t_3)\times\right.$$

$$\left.\times\int\limits_t^{t_3}\psi_2(t_2)\phi_{j_2}(t_2)\int\limits_t^{t_2}\psi_1(t_1)\phi_{j_1}(t_1)dt_1dt_2dt_3dt_4\right)^2 =$$

$$= \sum_{j_2,j_3=0}^{p}\left(\sum_{j_1=p+1}^{\infty}\int\limits_t^T \psi_3(t_3)\phi_{j_3}(t_3)\int\limits_t^{t_3}\psi_2(t_2)\phi_{j_2}(t_2)\times\right.$$

$$\left.\times\int\limits_t^{t_2}\psi_1(t_1)\phi_{j_1}(t_1)dt_1\int\limits_{t_3}^{T}\psi_4(t_4)\phi_{j_1}(t_4)dt_4dt_2dt_3\right)^2 =$$

$$= \sum_{j_2,j_3=0}^{p}\left(\int\limits_t^T \psi_3(t_3)\phi_{j_3}(t_3)\int\limits_t^{t_3}\psi_2(t_2)\phi_{j_2}(t_2)\times\right.$$

$$\left.\times\sum_{j_1=p+1}^{\infty}\int\limits_t^{t_2}\psi_1(t_1)\phi_{j_1}(t_1)dt_1\int\limits_{t_3}^{T}\psi_4(t_4)\phi_{j_1}(t_4)dt_4dt_2dt_3\right)^2 \le$$

$$\le \sum_{j_2,j_3=0}^{\infty}\left(\int\limits_t^T \psi_3(t_3)\phi_{j_3}(t_3)\int\limits_t^{t_3}\psi_2(t_2)\phi_{j_2}(t_2)\times\right.$$

$$\left.\times\sum_{j_1=p+1}^{\infty}\int\limits_t^{t_2}\psi_1(t_1)\phi_{j_1}(t_1)dt_1\int\limits_{t_3}^{T}\psi_4(t_4)\phi_{j_1}(t_4)dt_4dt_2dt_3\right)^2 =$$

$$= \int\limits_{[t,T]^2}\mathbf{1}_{\{t_2<t_3\}}\psi_3^2(t_3)\psi_2^2(t_2)\left(\sum_{j_1=p+1}^{\infty}\int\limits_t^{t_2}\psi_1(t_1)\phi_{j_1}(t_1)dt_1\int\limits_{t_3}^{T}\psi_4(t_4)\phi_{j_1}(t_4)dt_4\right)^2 dt_2dt_3 \le$$

$$\le \frac{K}{p^2} \ \rightarrow\ 0 \tag{155}$$

if $p\to\infty$, where constant K does not depend on p;

$$\sum_{j_1,j_4=0}^{p}\left(\sum_{j_2=p+1}^{\infty} C_{j_4 j_2 j_2 j_1}\right)^2 =$$

$$
= \sum_{j_1,j_4=0}^{p} \left(\sum_{j_2=p+1}^{\infty} \int\limits_t^T \psi_4(t_4)\phi_{j_4}(t_4) \int\limits_t^{t_4} \psi_3(t_3)\phi_{j_2}(t_3) \times \right.
$$

$$
\left. \times \int\limits_t^{t_3} \psi_2(t_2)\phi_{j_2}(t_2) \int\limits_t^{t_2} \psi_1(t_1)\phi_{j_1}(t_1) dt_1 dt_2 dt_3 dt_4 \right)^2 =
$$

$$
= \sum_{j_1,j_4=0}^{p} \left(\sum_{j_2=p+1}^{\infty} \int\limits_t^T \psi_4(t_4)\phi_{j_4}(t_4) \int\limits_t^{t_4} \psi_1(t_1)\phi_{j_1}(t_1) \times \right.
$$

$$
\left. \times \int\limits_{t_1}^{t_4} \psi_2(t_2)\phi_{j_2}(t_2) \int\limits_{t_2}^{t_4} \psi_3(t_3)\phi_{j_2}(t_3) dt_3 dt_2 dt_1 dt_4 \right)^2 =
$$

$$
= \sum_{j_1,j_4=0}^{p} \left(\int\limits_t^T \psi_4(t_4)\phi_{j_4}(t_4) \int\limits_t^{t_4} \psi_1(t_1)\phi_{j_1}(t_1) \times \right.
$$

$$
\left. \times \sum_{j_2=p+1}^{\infty} \int\limits_{t_1}^{t_4} \psi_2(t_2)\phi_{j_2}(t_2) \int\limits_{t_2}^{t_4} \psi_3(t_3)\phi_{j_2}(t_3) dt_3 dt_2 dt_1 dt_4 \right)^2 \le
$$

$$
\le \sum_{j_1,j_4=0}^{\infty} \left(\int\limits_t^T \psi_4(t_4)\phi_{j_4}(t_4) \int\limits_t^{t_4} \psi_1(t_1)\phi_{j_1}(t_1) \times \right.
$$

$$
\left. \times \sum_{j_2=p+1}^{\infty} \int\limits_{t_1}^{t_4} \psi_2(t_2)\phi_{j_2}(t_2) \int\limits_{t_2}^{t_4} \psi_3(t_3)\phi_{j_2}(t_3) dt_3 dt_2 dt_1 dt_4 \right)^2 =
$$

$$
= \int\limits_{[t,T]^2} \mathbf{1}_{\{t_1<t_4\}} \psi_4^2(t_4)\psi_1^2(t_1) \left(\sum_{j_2=p+1}^{\infty} \int\limits_{t_1}^{t_4} \psi_2(t_2)\phi_{j_2}(t_2) \int\limits_{t_2}^{t_4} \psi_3(t_3)\phi_{j_2}(t_3) dt_3 dt_2 \right)^2 dt_1 dt_4. \tag{156}
$$

Note that, by virtue of the additivity property of the integral, we have

$$
\sum_{j_2=p+1}^{\infty} \int\limits_{t_1}^{t_4} \psi_2(t_2)\phi_{j_2}(t_2) \int\limits_{t_2}^{t_4} \psi_3(t_3)\phi_{j_2}(t_3) dt_3 dt_2 = \tag{157}
$$

$$
= \sum_{j_2=p+1}^{\infty} \int\limits_t^{t_4} \psi_3(t_3)\phi_{j_2}(t_3) \int\limits_t^{t_3} \psi_2(t_2)\phi_{j_2}(t_2) dt_2 dt_3 -
$$

$$
- \sum_{j_2=p+1}^{\infty} \int\limits_t^{t_1} \psi_3(t_3)\phi_{j_2}(t_3) \int\limits_t^{t_3} \psi_2(t_2)\phi_{j_2}(t_2) dt_2 dt_3 -
$$

$$
- \sum_{j_2=p+1}^{\infty} \int\limits_{t_1}^{t_4} \psi_3(t_3)\phi_{j_2}(t_3) dt_3 \int\limits_t^{t_1} \psi_2(t_2)\phi_{j_2}(t_2) dt_2. \tag{158}
$$

However, all three series on the right-hand side of (158) have already been evaluated in (151) and (154). From (156) and (158) we finally obtain

$$\sum_{j_1,j_4=0}^{p}\left(\sum_{j_2=p+1}^{\infty}C_{j_4j_2j_2j_1}\right)^2\le\frac{K}{p^{2-\varepsilon}}\ \to\ 0 \tag{159}$$

if $p\to\infty$, where ε is an arbitrary small positive real number for the polynomial case and $\varepsilon=0$ for the trigonometric case, constant K does not depend on p.

In complete analogy with (154), we have for (139)

$$\sum_{j_1,j_3=0}^{p}\left(\sum_{j_2=p+1}^{\infty}C_{j_2j_3j_2j_1}\right)^2=$$

$$=\sum_{j_1,j_3=0}^{p}\left(\sum_{j_2=p+1}^{\infty}\int\limits_t^T\psi_4(t_4)\phi_{j_2}(t_4)\int\limits_t^{t_4}\psi_3(t_3)\phi_{j_3}(t_3)\times\right.$$

$$\left.\times\int\limits_t^{t_3}\psi_2(t_2)\phi_{j_2}(t_2)\int\limits_t^{t_2}\psi_1(t_1)\phi_{j_1}(t_1)dt_1dt_2dt_3dt_4\right)^2=$$

$$=\sum_{j_1,j_3=0}^{p}\left(\sum_{j_2=p+1}^{\infty}\int\limits_t^T\psi_3(t_3)\phi_{j_3}(t_3)\int\limits_t^{t_3}\psi_2(t_2)\phi_{j_2}(t_2)\times\right.$$

$$\left.\times\int\limits_t^{t_2}\psi_1(t_1)\phi_{j_1}(t_1)dt_1dt_2\int\limits_{t_3}^{T}\psi_4(t_4)\phi_{j_2}(t_4)dt_4dt_3\right)^2=$$

$$=\sum_{j_1,j_3=0}^{p}\left(\sum_{j_2=p+1}^{\infty}\int\limits_t^T\psi_3(t_3)\phi_{j_3}(t_3)\int\limits_t^{t_3}\psi_1(t_1)\phi_{j_1}(t_1)\times\right.$$

$$\left.\times\int\limits_{t_1}^{t_3}\psi_2(t_2)\phi_{j_2}(t_2)dt_2dt_1\int\limits_{t_3}^{T}\psi_4(t_4)\phi_{j_2}(t_4)dt_4dt_3\right)^2=$$

$$=\sum_{j_1,j_3=0}^{p}\left(\int\limits_t^T\psi_3(t_3)\phi_{j_3}(t_3)\int\limits_t^{t_3}\psi_1(t_1)\phi_{j_1}(t_1)\times\right.$$

$$\left.\times\sum_{j_2=p+1}^{\infty}\int\limits_{t_1}^{t_3}\psi_2(t_2)\phi_{j_2}(t_2)dt_2dt_1\int\limits_{t_3}^{T}\psi_4(t_4)\phi_{j_2}(t_4)dt_4dt_3\right)^2\le$$

$$\le\sum_{j_1,j_3=0}^{\infty}\left(\int\limits_t^T\psi_3(t_3)\phi_{j_3}(t_3)\int\limits_t^{t_3}\psi_1(t_1)\phi_{j_1}(t_1)\times\right.$$

$$\left.\times\sum_{j_2=p+1}^{\infty}\int\limits_{t_1}^{t_3}\psi_2(t_2)\phi_{j_2}(t_2)dt_2\int\limits_{t_3}^{T}\psi_4(t_4)\phi_{j_2}(t_4)dt_4dt_1dt_3\right)^2=$$

$$= \int\limits_{[t,T]^2} \mathbf{1}_{\{t_1<t_3\}} \psi_3^2(t_3)\psi_1^2(t_1) \left(\sum_{j_2=p+1}^{\infty} \int\limits_{t_1}^{t_3} \psi_2(t_2)\phi_{j_2}(t_2)dt_2 \int\limits_{t_3}^{T} \psi_4(t_4)\phi_{j_2}(t_4)dt_4 \right)^2 dt_1 dt_3 \le$$

$$\le \frac{K}{p^{2-\varepsilon}} \ \to \ 0 \qquad (160)$$

if $p\to\infty$, where ε is an arbitrary small positive real number for the polynomial case and $\varepsilon=0$ for the trigonometric case, constant K does not depend on p.

We have for (140)

$$\sum_{j_1,j_2=0}^{p} \left(\sum_{j_3=p+1}^{\infty} C_{j_3 j_3 j_2 j_1} \right)^2 =$$

$$= \sum_{j_1,j_2=0}^{p} \left(\sum_{j_3=p+1}^{\infty} \int\limits_{t}^{T} \psi_4(t_4)\phi_{j_3}(t_4) \int\limits_{t}^{t_4} \psi_3(t_3)\phi_{j_3}(t_3) \times \right.$$

$$\left. \times \int\limits_{t}^{t_3} \psi_2(t_2)\phi_{j_2}(t_2) \int\limits_{t}^{t_2} \psi_1(t_1)\phi_{j_1}(t_1) dt_1 dt_2 dt_3 dt_4 \right)^2 =$$

$$= \sum_{j_1,j_2=0}^{p} \left(\sum_{j_3=p+1}^{\infty} \int\limits_{t}^{T} \psi_1(t_1)\phi_{j_1}(t_1) \int\limits_{t_1}^{T} \psi_2(t_2)\phi_{j_2}(t_2) \times \right.$$

$$\left. \times \int\limits_{t_2}^{T} \psi_3(t_3)\phi_{j_3}(t_3) \int\limits_{t_3}^{T} \psi_4(t_4)\phi_{j_3}(t_4) dt_4 dt_3 dt_2 dt_1 \right)^2 =$$

$$= \sum_{j_1,j_2=0}^{p} \left(\int\limits_{t}^{T} \psi_1(t_1)\phi_{j_1}(t_1) \int\limits_{t_1}^{T} \psi_2(t_2)\phi_{j_2}(t_2) \times \right.$$

$$\left. \times \sum_{j_3=p+1}^{\infty} \int\limits_{t_2}^{T} \psi_3(t_3)\phi_{j_3}(t_3) \int\limits_{t_3}^{T} \psi_4(t_4)\phi_{j_3}(t_4) dt_4 dt_3 dt_2 dt_1 \right)^2 \le$$

$$\le \sum_{j_1,j_2=0}^{\infty} \left(\int\limits_{t}^{T} \psi_1(t_1)\phi_{j_1}(t_1) \int\limits_{t_1}^{T} \psi_2(t_2)\phi_{j_2}(t_2) \times \right.$$

$$\left. \times \sum_{j_3=p+1}^{\infty} \int\limits_{t_2}^{T} \psi_3(t_3)\phi_{j_3}(t_3) \int\limits_{t_3}^{T} \psi_4(t_4)\phi_{j_3}(t_4) dt_4 dt_3 dt_2 dt_1 \right)^2 =$$

$$= \int\limits_{[t,T]^2} \mathbf{1}_{\{t_1<t_2\}} \psi_1^2(t_1)\psi_2^2(t_2) \left(\sum_{j_3=p+1}^{\infty} \int\limits_{t_2}^{T} \psi_3(t_3)\phi_{j_3}(t_3) \int\limits_{t_3}^{T} \psi_4(t_4)\phi_{j_3}(t_4) dt_4 dt_3 \right)^2 dt_2 dt_1. \qquad (161)$$

It is easy to see that the integral (see (161))

$$\int\limits_{t_2}^{T} \psi_3(t_3)\phi_{j_3}(t_3) \int\limits_{t_3}^{T} \psi_4(t_4)\phi_{j_3}(t_4)dt_4dt_3$$

is similar to the integral from the formula (157) if in the last integral we substitute $t_4 = T$. Therefore, by analogy with (159), we obtain

$$\sum_{j_1,j_2=0}^{p} \left(\sum_{j_3=p+1}^{\infty} C_{j_3j_3j_2j_1} \right)^2 \le \frac{K}{p^{2-\varepsilon}} \ \to \ 0 \tag{162}$$

if $p \to \infty$, where ε is an arbitrary small positive real number for the polynomial case and $\varepsilon = 0$ for the trigonometric case, constant K does not depend on p.

Now consider (141)–(143). We have for (141) (see **Step 2** in the proof of Theorem 12)

$$\left(\sum_{j_2=p+1}^{\infty} \sum_{j_1=p+1}^{\infty} C_{j_2j_1j_2j_1} \right)^2 = \left(\sum_{j_1=0}^{p} \sum_{j_2=p+1}^{\infty} C_{j_2j_1j_2j_1} \right)^2 \le$$

$$\le (p+1) \sum_{j_1=0}^{p} \left(\sum_{j_2=p+1}^{\infty} C_{j_2j_1j_2j_1} \right)^2. \tag{163}$$

Consider (139) and (160). We have

$$\sum_{j_1=0}^{p} \left(\sum_{j_2=p+1}^{\infty} C_{j_2j_1j_2j_1} \right)^2 = \sum_{j_1,j_3=0}^{p} \left(\sum_{j_2=p+1}^{\infty} C_{j_2j_3j_2j_1} \right)^2 \Biggr|_{j_1=j_3} \le$$

$$\le \sum_{j_1,j_3=0}^{p} \left(\sum_{j_2=p+1}^{\infty} C_{j_2j_3j_2j_1} \right)^2 \le \frac{K}{p^{2-\varepsilon}}, \tag{164}$$

where ε is an arbitrary small positive real number for the polynomial case and $\varepsilon = 0$ for the trigonometric case, constant K does not depend on p. Combining (163) and (164), we obtain

$$\left(\sum_{j_2=p+1}^{\infty} \sum_{j_1=p+1}^{\infty} C_{j_2j_1j_2j_1} \right)^2 \le \frac{(p+1)K}{p^{2-\varepsilon}} \le \frac{K_1}{p^{1-\varepsilon}} \ \to \ 0$$

if $p \to \infty$, where constant K_1 does not depend on p.

Similarly for (142) we have (see (138), (159))

$$\left(\sum_{j_2=p+1}^{\infty} \sum_{j_1=p+1}^{\infty} C_{j_1j_2j_2j_1} \right)^2 = \left(\sum_{j_1=0}^{p} \sum_{j_2=p+1}^{\infty} C_{j_1j_2j_2j_1} \right)^2 \le$$

$$\le (p+1) \sum_{j_1=0}^{p} \left(\sum_{j_2=p+1}^{\infty} C_{j_1j_2j_2j_1} \right)^2, \tag{165}$$

$$\sum_{j_1=0}^{p}\left(\sum_{j_2=p+1}^{\infty} C_{j_1j_2j_2j_1}\right)^2 = \sum_{j_1,j_4=0}^{p}\left(\sum_{j_2=p+1}^{\infty} C_{j_4j_2j_2j_1}\right)^2\Biggl|_{j_1=j_4} \le$$

$$\le \sum_{j_1,j_4=0}^{p}\left(\sum_{j_2=p+1}^{\infty} C_{j_4j_2j_2j_1}\right)^2 \le \frac{K}{p^{2-\varepsilon}}, \tag{166}$$

where ε is an arbitrary small positive real number for the polynomial case and $\varepsilon = 0$ for the trigonometric case, constant K does not depend on p. Combining (165) and (166), we obtain

$$\left(\sum_{j_2=p+1}^{\infty}\sum_{j_1=p+1}^{\infty} C_{j_1j_2j_2j_1}\right)^2 \le \frac{(p+1)K}{p^{2-\varepsilon}} \le \frac{K_1}{p^{1-\varepsilon}} \ \to\ 0$$

if $p\to\infty$, where constant K_1 does not depend on p.

Consider (143). Using (72), we obtain

$$\sum_{j_3=p+1}^{\infty}\sum_{j_1=p+1}^{\infty} C_{j_3j_3j_1j_1} = \sum_{j_3=p+1}^{\infty}\sum_{j_1=0}^{\infty} C_{j_3j_3j_1j_1} - \sum_{j_3=p+1}^{\infty}\sum_{j_1=0}^{p} C_{j_3j_3j_1j_1} =$$

$$= \frac{1}{2}\sum_{j_3=p+1}^{\infty} C_{j_3j_3j_1j_1}\Biggl|_{(j_1j_1)\frown(\cdot)} - \sum_{j_3=p+1}^{\infty}\sum_{j_1=0}^{p} C_{j_3j_3j_1j_1}, \tag{167}$$

where (see (32))

$$C_{j_3j_3j_1j_1}\Biggl|_{(j_1j_1)\frown(\cdot)} =$$

$$= \int\limits_t^T \psi_4(t_4)\phi_{j_3}(t_4)\int\limits_t^{t_4}\psi_3(t_3)\phi_{j_3}(t_3)\int\limits_t^{t_3}\psi_2(t_2)\psi_1(t_2)dt_2dt_3dt_4.$$

From the estimate (97) for the polynomial and trigonometric cases we get

$$\left|\sum_{j_3=p+1}^{\infty} C_{j_3j_3j_1j_1}\Biggl|_{(j_1j_1)\frown(\cdot)}\right| \le \frac{C}{p}, \tag{168}$$

where constant C is independent of p.

Further, we have (see (162))

$$\left(\sum_{j_1=0}^{p}\sum_{j_3=p+1}^{\infty} C_{j_3j_3j_1j_1}\right)^2 \le (p+1)\sum_{j_1=0}^{p}\left(\sum_{j_3=p+1}^{\infty} C_{j_3j_3j_1j_1}\right)^2 =$$

$$= (p+1)\sum_{j_1,j_2=0}^{p}\left(\sum_{j_3=p+1}^{\infty} C_{j_3j_3j_2j_1}\right)^2\Biggl|_{j_1=j_2} \le$$

(169)
$$\le (p+1)\sum_{j_1,j_2=0}^{p}\left(\sum_{j_3=p+1}^{\infty} C_{j_3j_3j_2j_1}\right)^2 \le \frac{(p+1)K}{p^{2-\varepsilon}} \le \frac{K_1}{p^{1-\varepsilon}},$$

where constant K_1 does not depend on p.

Combining (167)–(169), we obtain

$$\left(\sum_{j_3=p+1}^{\infty}\sum_{j_1=p+1}^{\infty} C_{j_3j_3j_1j_1}\right)^2 \le \frac{K_2}{p^{1-\varepsilon}} \ \to\ 0$$

if $p\to\infty$, where constant K_2 does not depend on p.

Let us prove (144)–(146). It is not difficult to see that the estimate (168) proves (144).

Using the integration order replacement, we obtain

$$\sum_{j_1=p+1}^{\infty} C_{j_3j_3j_1j_1}\Biggr|_{(j_3j_3)\curvearrowright(\cdot)} =$$

$$= \sum_{j_1=p+1}^{\infty}\int\limits_t^T \psi_4(t_4)\psi_3(t_4)\int\limits_t^{t_4}\psi_2(t_2)\phi_{j_1}(t_2)\int\limits_t^{t_2}\psi_1(t_1)\phi_{j_1}(t_1)dt_1dt_2dt_4 =$$

(170)
$$= \sum_{j_1=p+1}^{\infty}\int\limits_t^T \left(\psi_2(t_2)\int\limits_{t_2}^{T}\psi_4(t_4)\psi_3(t_4)dt_4\right)\phi_{j_1}(t_2)\int\limits_t^{t_2}\psi_1(t_1)\phi_{j_1}(t_1)dt_1dt_2,$$

$$\sum_{j_1=p+1}^{\infty} C_{j_1j_2j_2j_1}\Biggr|_{(j_2j_2)\curvearrowright(\cdot)} =$$

$$= \sum_{j_1=p+1}^{\infty}\int\limits_t^T \psi_4(t_4)\phi_{j_1}(t_4)\int\limits_t^{t_4}\psi_3(t_3)\psi_2(t_3)\int\limits_t^{t_3}\psi_1(t_1)\phi_{j_1}(t_1)dt_1dt_3dt_4 =$$

$$= \sum_{j_1=p+1}^{\infty}\int\limits_t^T \psi_4(t_4)\phi_{j_1}(t_4)\int\limits_t^{t_4}\psi_1(t_1)\phi_{j_1}(t_1)\int\limits_{t_1}^{t_4}\psi_3(t_3)\psi_2(t_3)dt_3dt_1dt_4 =$$

$$= \sum_{j_1=p+1}^{\infty}\int\limits_t^T \psi_4(t_4)\phi_{j_1}(t_4)\int\limits_t^{t_4}\psi_1(t_1)\phi_{j_1}(t_1)\left(\int\limits_t^{t_4}-\int\limits_t^{t_1}\right)\psi_3(t_3)\psi_2(t_3)dt_3dt_1dt_4 =$$

(171)
$$= \sum_{j_1=p+1}^{\infty}\int\limits_t^T \left(\psi_4(t_4)\int\limits_t^{t_4}\psi_3(t_3)\psi_2(t_3)dt_3\right)\phi_{j_1}(t_4)\int\limits_t^{t_4}\psi_1(t_1)\phi_{j_1}(t_1)dt_1dt_4-$$

$$
-\sum_{j_1=p+1}^{\infty}\int\limits_t^T \psi_4(t_4)\phi_{j_1}(t_4)\int\limits_t^{t_4}\left(\psi_1(t_1)\int\limits_t^{t_1}\psi_3(t_3)\psi_2(t_3)dt_3\right)\phi_{j_1}(t_1)dt_1dt_4. \tag{172}
$$

Applying the estimate (97) (polynomial and trigonometric cases) to the right-hand sides of (170)–(172), we get

$$
\left|\sum_{j_3=p+1}^{\infty} C_{j_3j_3j_1j_1}\Bigg|_{(j_3j_3)\curvearrowright(\cdot)}\right| \le \frac{C}{p}, \tag{173}
$$

$$
\left|\sum_{j_1=p+1}^{\infty} C_{j_1j_2j_2j_1}\Bigg|_{(j_2j_2)\curvearrowright(\cdot)}\right| \le \frac{C}{p}, \tag{174}
$$

where constant C is independent of p. The estimates (173), (174) prove (145), (146).

The relations (135)–(146) are proved. Theorem 16 is proved.

8. Expansion of Iterated Stratonovich Stochastic Integrals of Multiplicity 5. The Case $p_1 = \ldots = p_5 \to \infty$ and Continuously Differentiable Weight Functions $\psi_1(\tau)$, $\ldots$, $\psi_5(\tau)$ (The Cases of Legendre Polynomials and Trigonometric Functions)

Theorem 17 [12], [36], [37], [51]. *Suppose that $\{\phi_j(x)\}_{j=0}^{\infty}$ is a complete orthonormal system of Legendre polynomials or trigonometric functions in the space $L_2([t,T])$. Furthermore, let $\psi_1(\tau),\ldots,$ $\psi_5(\tau)$ are continuously differentiable nonrandom functions on $[t,T]$. Then, for the iterated Stratonovich stochastic integral of fifth multiplicity*

$$
J^*[\psi^{(5)}]_{T,t} = \int\limits_t^{*T}\psi_5(t_5)\ldots\int\limits_t^{*t_2}\psi_1(t_1)d\mathbf{w}_{t_1}^{(i_1)}\ldots d\mathbf{w}_{t_5}^{(i_5)} \tag{175}
$$

the following expansion

$$
J^*[\psi^{(5)}]_{T,t} = \underset{p\to\infty}{\text{l.i.m.}}\sum_{j_1,\ldots,j_5=0}^{p} C_{j_5\ldots j_1}\zeta_{j_1}^{(i_1)}\ldots\zeta_{j_5}^{(i_5)}
$$

that converges in the mean-square sense is valid, where $i_1,\ldots,i_5 = 0,1,\ldots,m,$

$$
C_{j_5\ldots j_1} = \int\limits_t^T \psi_5(t_5)\phi_{j_5}(t_5)\ldots\int\limits_t^{t_2}\psi_1(t_1)\phi_{j_1}(t_1)dt_1\ldots dt_5
$$

and

$$
\zeta_j^{(i)} = \int\limits_t^T \phi_j(\tau)d\mathbf{w}_{\tau}^{(i)}
$$

are independent standard Gaussian random variables for various i or j (in the case when $i \neq 0$), $\mathbf{w}_{\tau}^{(i)} = \mathbf{f}_{\tau}^{(i)}$ for $i = 1, \ldots, m$ and $\mathbf{w}_{\tau}^{(0)} = \tau$.

Proof. Note that in this proof we write k instead of 5 when this is true for an arbitrary k ($k \in \mathbb{N}$). As noted before (see Sect. 5), Conditions 1 and 2 of Theorem 12 are satisfied for complete orthonormal systems of Legendre polynomials and trigonometric functions in the space $L_2([t, T])$. Let us verify Condition 3 of Theorem 12 for the iterated Stratonovich stochastic integral (175). Thus, we have to check the following conditions

$$\lim_{p\to\infty} \sum_{j_{q_1}, j_{q_2}, j_{q_3}=0}^{p} \left(\sum_{j_{g_1}=p+1}^{\infty} C_{j_5\ldots j_1}\Bigg|_{j_{g_1}=j_{g_2}} \right)^2 = 0, \tag{176}$$

$$\lim_{p\to\infty} \sum_{j_{q_1}=0}^{p} \left(\sum_{j_{g_1}=p+1}^{\infty} \sum_{j_{g_3}=p+1}^{\infty} C_{j_5\ldots j_1}\Bigg|_{j_{g_1}=j_{g_2}, j_{g_3}=j_{g_4}} \right)^2 = 0, \tag{177}$$

$$\lim_{p\to\infty} \sum_{j_{q_1}=0}^{p} \left(\sum_{j_{g_3}=p+1}^{\infty} C_{j_5\ldots j_1}\Bigg|_{(j_{g_2} j_{g_1})\curvearrowright(\cdot), j_{g_1}=j_{g_2}, j_{g_3}=j_{g_4}, g_2=g_1+1} \right)^2 = 0, \tag{178}$$

where $(\{g_1, g_2\}, \{g_3, g_4\}, \{q_1\})$ and $(\{g_1, g_2\}, \{q_1, q_2, q_3\})$ are partitions of the set $\{1, 2, \ldots, 5\}$ that is $\{g_1, g_2, g_3, g_4, q_1\} = \{g_1, g_2, q_1, q_2, q_3\} = \{1, 2, \ldots, 5\}$; braces mean an unordered set, and parentheses mean an ordered set.

Let us find a representation for $C_{j_k\ldots j_1}\Big|_{j_{g_1}=j_{g_2},\ g_2>g_1+1}$ that will be convenient for further consideration.

Using the integration order replacement in the Riemann integrals, we obtain

$$\int_t^T h_k(t_k)\ldots \int_t^{t_{l+2}} h_{l+1}(t_{l+1}) \int_t^{t_{l+1}} h_l(t_l) \int_t^{t_l} h_{l-1}(t_{l-1})\ldots \int_t^{t_2} h_1(t_1)dt_1\ldots$$

$$\ldots dt_{l-1}dt_l dt_{l+1}\ldots dt_k =$$

$$= \int_t^T h_k(t_k)\ldots \int_t^{t_{l+2}} h_{l+1}(t_{l+1}) \int_t^{t_{l+1}} h_1(t_1) \int_{t_1}^{t_{l+1}} h_2(t_2)\ldots \int_{t_{l-2}}^{t_{l+1}} h_{l-1}(t_{l-1}) \int_{t_{l-1}}^{t_{l+1}} h_l(t_l)dt_l \times$$

$$\times dt_{l-1}\ldots dt_2 dt_1 dt_{l+1}\ldots dt_k =$$

$$= \int_t^T h_k(t_k)\ldots \int_t^{t_{l+2}} h_{l+1}(t_{l+1}) \left(\int_t^{t_{l+1}} h_l(t_l)dt_l \right) \int_t^{t_{l+1}} h_1(t_1) \int_{t_1}^{t_{l+1}} h_2(t_2)\ldots \int_{t_{l-2}}^{t_{l+1}} h_{l-1}(t_{l-1}) \times$$

$$\times dt_{l-1}\ldots dt_2 dt_1 dt_{l+1}\ldots dt_k -$$

$$- \int_t^T h_k(t_k)\ldots \int_t^{t_{l+2}} h_{l+1}(t_{l+1}) \int_t^{t_{l+1}} h_1(t_1) \int_{t_1}^{t_{l+1}} h_2(t_2)\ldots \int_{t_{l-2}}^{t_{l+1}} h_{l-1}(t_{l-1}) \left(\int_t^{t_{l-1}} h_l(t_l)dt_l \right) \times$$

$$\times dt_{l-1}\ldots dt_2dt_1dt_{l+1}\ldots dt_k =$$

$$= \int\limits_t^T h_k(t_k)\ldots\int\limits_t^{t_{l+2}} h_{l+1}(t_{l+1})\left(\int\limits_t^{t_{l+1}} h_l(t_l)dt_l\right)\int\limits_t^{t_{l+1}} h_{l-1}(t_{l-1})\ldots$$

$$\ldots\int\limits_t^{t_2} h_1(t_1)dt_1\ldots dt_{l-1}dt_{l+1}\ldots dt_k -$$

$$-\int\limits_t^T h_k(t_k)\ldots\int\limits_t^{t_{l+2}} h_{l+1}(t_{l+1})\int\limits_t^{t_{l+1}} h_{l-1}(t_{l-1})\left(\int\limits_t^{t_{l-1}} h_l(t_l)dt_l\right)\int\limits_t^{t_{l-1}} h_{l-2}(t_{l-2})\ldots$$

$$\ldots\int\limits_t^{t_2} h_1(t_1)dt_1\ldots dt_{l-2}dt_{l-1}dt_{l+1}\ldots dt_k, \qquad (179)$$

where $1 < l < k$ and $h_1(\tau),\ldots,h_k(\tau)$ are continuous functions on the interval $[t,T]$. By analogy with (179) we have for $l = k$

$$\int\limits_t^T h_l(t_l)\int\limits_t^{t_l} h_{l-1}(t_{l-1})\ldots\int\limits_t^{t_2} h_1(t_1)dt_1\ldots dt_{l-1}dt_l =$$

$$= \int\limits_t^T h_1(t_1)\int\limits_{t_1}^T h_2(t_2)\ldots\int\limits_{t_{l-2}}^T h_{l-1}(t_{l-1})\int\limits_{t_{l-1}}^T h_l(t_l)dt_ldt_{l-1}\ldots dt_2dt_1 =$$

$$= \left(\int\limits_t^T h_l(t_l)dt_l\right)\int\limits_t^T h_1(t_1)\int\limits_{t_1}^T h_2(t_2)\ldots\int\limits_{t_{l-2}}^T h_{l-1}(t_{l-1})dt_{l-1}\ldots dt_2dt_1 -$$

$$-\int\limits_t^T h_1(t_1)\int\limits_{t_1}^T h_2(t_2)\ldots\int\limits_{t_{l-2}}^T h_{l-1}(t_{l-1})\left(\int\limits_t^{t_{l-1}} h_l(t_l)dt_l\right)dt_{l-1}\ldots dt_2dt_1 =$$

$$= \left(\int\limits_t^T h_l(t_l)dt_l\right)\int\limits_t^T h_{l-1}(t_{l-1})\ldots\int\limits_t^{t_2} h_1(t_1)dt_1\ldots dt_{l-1} -$$

$$-\int\limits_t^T h_{l-1}(t_{l-1})\left(\int\limits_t^{t_{l-1}} h_l(t_l)dt_l\right)\int\limits_t^{t_{l-1}} h_{l-2}(t_{l-2})\ldots\int\limits_t^{t_2} h_1(t_1)dt_1\ldots dt_{l-1}. \qquad (180)$$

The formulas (179), (180) will be used further.

Our further proof will not fundamentally depend on the weight functions $\psi_1(\tau),\ldots,\psi_k(\tau)$. Therefore, sometimes in subsequent consideration we assume for simplicity that $\psi_1(\tau),\ldots,\psi_k(\tau)\equiv 1$.

Let us continue the proof. Applying (179) to $C_{j_k\ldots j_{l+1}j_lj_{l-1}\ldots j_{s+1}j_lj_{s-1}\ldots j_1}$ (more precisely to $h_s(t_s) = \psi_s(t_s)\phi_{j_l}(t_s)$), we obtain for $l+1\le k$, $s-1\ge 1$, $l-1\ge s+1$

$$\sum_{j_l=p+1}^{\infty} C_{j_k\ldots j_{l+1}j_lj_{l-1}\ldots j_{s+1}j_lj_{s-1}\ldots j_1} = \tag{181}$$

$$= \sum_{j_l=p+1}^{\infty} \int\limits_t^T \phi_{j_k}(t_k)\ldots \int\limits_t^{t_{l+2}} \phi_{j_{l+1}}(t_{l+1}) \int\limits_t^{t_{l+1}} \phi_{j_l}(t_l) \int\limits_t^{t_l} \phi_{j_{l-1}}(t_{l-1})\ldots$$

$$\ldots \int\limits_t^{t_{s+2}} \phi_{j_{s+1}}(t_{s+1}) \int\limits_t^{t_{s+1}} \phi_{j_l}(t_s) \int\limits_t^{t_s} \phi_{j_{s-1}}(t_{s-1})\ldots$$

$$\ldots \int\limits_t^{t_2} \phi_{j_1}(t_1)dt_1\ldots dt_{s-1}dt_sdt_{s+1}\ldots dt_{l-1}dt_ldt_{l+1}\ldots dt_k =$$

$$= \sum_{j_l=p+1}^{\infty} \int\limits_t^T \phi_{j_k}(t_k)\ldots \int\limits_t^{t_{l+2}} \phi_{j_{l+1}}(t_{l+1}) \int\limits_t^{t_{l+1}} \phi_{j_l}(t_l) \int\limits_t^{t_l} \phi_{j_{l-1}}(t_{l-1})\ldots$$

$$\ldots \int\limits_t^{t_{s+2}} \phi_{j_{s+1}}(t_{s+1}) \left(\int\limits_t^{t_{s+1}} \phi_{j_l}(t_s)dt_s\right) \int\limits_t^{t_{s+1}} \phi_{j_{s-1}}(t_{s-1})\ldots$$

$$\ldots \int\limits_t^{t_2} \phi_{j_1}(t_1)dt_1\ldots dt_{s-1}dt_{s+1}\ldots dt_{l-1}dt_ldt_{l+1}\ldots dt_k -$$

$$- \sum_{j_l=p+1}^{\infty} \int\limits_t^T \phi_{j_k}(t_k)\ldots \int\limits_t^{t_{l+2}} \phi_{j_{l+1}}(t_{l+1}) \int\limits_t^{t_{l+1}} \phi_{j_l}(t_l) \int\limits_t^{t_l} \phi_{j_{l-1}}(t_{l-1})\ldots$$

$$\ldots \int\limits_t^{t_{s+2}} \phi_{j_{s+1}}(t_{s+1}) \int\limits_t^{t_{s+1}} \phi_{j_{s-1}}(t_{s-1}) \left(\int\limits_t^{t_{s-1}} \phi_{j_l}(t_s)dt_s\right) \int\limits_t^{t_{s-1}} \phi_{j_{s-2}}(t_{s-2})\ldots$$

$$\ldots \int\limits_t^{t_2} \phi_{j_1}(t_1)dt_1\ldots dt_{s-2}dt_{s-1}dt_{s+1}\ldots dt_{l-1}dt_ldt_{l+1}\ldots dt_k =$$

$$= \sum_{j_l=p+1}^{\infty} A_{j_k\ldots j_{l+1}j_lj_{l-1}\ldots j_{s+1}j_lj_{s-1}\ldots j_1} - \sum_{j_l=p+1}^{\infty} B_{j_k\ldots j_{l+1}j_lj_{l-1}\ldots j_{s+1}j_lj_{s-1}\ldots j_1}.$$

Now we apply the formula (179) to $A_{j_k\ldots j_{l+1}j_lj_{l-1}\ldots j_{s+1}j_lj_{s-1}\ldots j_1}$, $B_{j_k\ldots j_{l+1}j_lj_{l-1}\ldots j_{s+1}j_lj_{s-1}\ldots j_1}$ (more precisely to $h_l(t_l)=\psi_l(t_l)\phi_{j_l}(t_l)$). Then we have for $l+1\le k$, $s-1\ge 1$, $l-1\ge s+1$

$$\sum_{j_l=p+1}^{\infty} C_{j_k\ldots j_{l+1}j_lj_{l-1}\ldots j_{s+1}j_lj_{s-1}\ldots j_1} =$$

$$= \int\limits_{[t,T]^{k-2}} \sum_{d=1}^{4} F_p^{(d)}(t_1,\ldots,t_{s-1},t_{s+1},\ldots,t_{l-1},t_{l+1},\ldots,t_k)\times$$

$$\times \prod_{\substack{g=1\\ g\neq l,s}}^{k} \psi_g(t_g)\phi_{j_g}(t_g)dt_1\ldots dt_{s-1}dt_{s+1}\ldots dt_{l-1}dt_{l+1}\ldots dt_k =$$

$$= \sum_{d=1}^{4} C^{*(d)}_{j_k\ldots j_{l+1}j_{l-1}\ldots j_{s+1}j_{s-1}\ldots j_1} = \sum_{d=1}^{4} C^{*(d)}_{j_k\ldots j_q\ldots j_1}\Bigg|_{q\neq l,s}, \tag{182}$$

where

$$F_p^{(1)}(t_1,\ldots,t_{s-1},t_{s+1},\ldots,t_{l-1},t_{l+1},\ldots,t_k) =$$

$$= \mathbf{1}_{\{t_1<\ldots<t_{s-1}<t_{s+1}<\ldots<t_{l-1}<t_{l+1}<\ldots<t_k\}} \sum_{j_l=p+1}^{\infty} \int\limits_t^{t_{s+1}} \psi_s(\tau)\phi_{j_l}(\tau)d\tau \int\limits_t^{t_{l+1}} \psi_l(\tau)\phi_{j_l}(\tau)d\tau, \tag{183}$$

$$F_p^{(2)}(t_1,\ldots,t_{s-1},t_{s+1},\ldots,t_{l-1},t_{l+1},\ldots,t_k) =$$

$$= \mathbf{1}_{\{t_1<\ldots<t_{s-1}<t_{s+1}<\ldots<t_{l-1}<t_{l+1}<\ldots<t_k\}} \sum_{j_l=p+1}^{\infty} \int\limits_t^{t_{s-1}} \psi_s(\tau)\phi_{j_l}(\tau)d\tau \int\limits_t^{t_{l-1}} \psi_l(\tau)\phi_{j_l}(\tau)d\tau, \tag{184}$$

$$F_p^{(3)}(t_1,\ldots,t_{s-1},t_{s+1},\ldots,t_{l-1},t_{l+1},\ldots,t_k) =$$

$$= -\mathbf{1}_{\{t_1<\ldots<t_{s-1}<t_{s+1}<\ldots<t_{l-1}<t_{l+1}<\ldots<t_k\}} \sum_{j_l=p+1}^{\infty} \int\limits_t^{t_{s-1}} \psi_s(\tau)\phi_{j_l}(\tau)d\tau \int\limits_t^{t_{l+1}} \psi_l(\tau)\phi_{j_l}(\tau)d\tau, \tag{185}$$

$$F_p^{(4)}(t_1,\ldots,t_{s-1},t_{s+1},\ldots,t_{l-1},t_{l+1},\ldots,t_k) =$$

$$= -\mathbf{1}_{\{t_1<\ldots<t_{s-1}<t_{s+1}<\ldots<t_{l-1}<t_{l+1}<\ldots<t_k\}} \sum_{j_l=p+1}^{\infty} \int\limits_t^{t_{s+1}} \psi_s(\tau)\phi_{j_l}(\tau)d\tau \int\limits_t^{t_{l-1}} \psi_l(\tau)\phi_{j_l}(\tau)d\tau. \tag{186}$$

By analogy with (182) we can consider the expressions

$$\sum_{j_l=p+1}^{\infty} C_{j_l j_{k-1}\ldots j_2 j_l}, \tag{187}$$

$$\sum_{j_l=p+1}^{\infty} C_{j_k\ldots j_{l+1}j_l j_{l-1}\ldots j_2 j_l} \quad (l+1\le k), \tag{188}$$

$$\sum_{j_l=p+1}^{\infty} C_{j_l j_{k-1}\ldots j_{s+1}j_l j_{s-1}\ldots j_1} \quad (s-1\ge 1). \tag{189}$$

Then we have for (187)–(189) (see (179), (180))

$$\sum_{j_l=p+1}^{\infty} C_{j_l j_{k-1}\ldots j_2 j_l} = \int\limits_{[t,T]^{k-2}} \sum_{d=1}^{2} G_p^{(d)}(t_2,\ldots,t_{k-1}) \prod_{g=2}^{k-1} \psi_g(t_g)\phi_{j_g}(t_g)dt_2\ldots dt_{k-1}, \tag{190}$$

$$\sum_{j_l=p+1}^{\infty} C_{j_k\ldots j_{l+1}j_l j_{l-1}\ldots j_2 j_l} = \int\limits_{[t,T]^{k-2}} \sum_{d=1}^{2} E_p^{(d)}(t_2,\ldots,t_{l-1},t_{l+1},\ldots,t_k)\times$$

$$\times \prod_{\substack{g=2\\ g\neq l}}^{k} \psi_g(t_g)\phi_{j_g}(t_g)dt_2\ldots dt_{l-1}dt_{l+1}\ldots dt_k, \tag{191}$$

$$\sum_{j_l=p+1}^{\infty} C_{j_l j_{k-1}\ldots j_{s+1}j_l j_{s-1}\ldots j_1} = \int\limits_{[t,T]^{k-2}} \sum_{d=1}^{4} D_p^{(d)}(t_1,\ldots,t_{s-1},t_{s+1},\ldots,t_{k-1})\times$$

$$\times \prod_{\substack{g=1\\ g\neq s}}^{k-1} \psi_g(t_g)\phi_{j_g}(t_g)dt_1\ldots dt_{s-1}dt_{s+1}\ldots dt_{k-1}, \tag{192}$$

where

$$G_p^{(1)}(t_2,\ldots,t_{k-1}) = \mathbf{1}_{\{t_2<\ldots<t_{k-1}\}} \sum_{j_l=p+1}^{\infty} \int\limits_t^T \psi_k(\tau)\phi_{j_l}(\tau)d\tau \int\limits_t^{t_2} \psi_1(\tau)\phi_{j_l}(\tau)d\tau,$$

$$G_p^{(2)}(t_2,\ldots,t_{k-1}) = -\mathbf{1}_{\{t_2<\ldots<t_{k-1}\}} \sum_{j_l=p+1}^{\infty} \int\limits_t^{t_{k-1}} \psi_k(\tau)\phi_{j_l}(\tau)d\tau \int\limits_t^{t_2} \psi_1(\tau)\phi_{j_l}(\tau)d\tau,$$

$$E_p^{(1)}(t_2,\ldots,t_{l-1},t_{l+1},\ldots,t_k) =$$
