$$\mathsf{M}\left\{\left(I_{(10)\tau_{p+1},\tau_p}^{(i_1 i_2)}-I_{(10)\tau_{p+1},\tau_p}^{(i_1 i_2)q}\right)^2\right\}=\mathsf{M}\left\{\left(I_{(01)\tau_{p+1},\tau_p}^{(i_1 i_2)}-I_{(01)\tau_{p+1},\tau_p}^{(i_1 i_2)q}\right)^2\right\}=$$

(54) $$=\frac{\Delta^4}{16}\left(\frac{5}{9}-2\sum_{i=2}^{q}\frac{1}{4i^2-1}-\sum_{i=1}^{q}\frac{1}{(2i-1)^2(2i+3)^2}-\sum_{i=0}^{q}\frac{(i+2)^2+(i+1)^2}{(2i+1)(2i+5)(2i+3)^2}\right)\quad (i_1\ne i_2),$$

$$\mathsf{M}\left\{\left(I_{(10)\tau_{p+1},\tau_p}^{(i_1 i_1)}-I_{(10)\tau_{p+1},\tau_p}^{(i_1 i_1)q}\right)^2\right\}=\mathsf{M}\left\{\left(I_{(01)\tau_{p+1},\tau_p}^{(i_1 i_1)}-I_{(01)\tau_{p+1},\tau_p}^{(i_1 i_1)q}\right)^2\right\}=$$

(55) $$=\frac{\Delta^4}{16}\left(\frac{1}{9}-\sum_{i=0}^{q}\frac{1}{(2i+1)(2i+5)(2i+3)^2}-2\sum_{i=1}^{q}\frac{1}{(2i-1)^2(2i+3)^2}\right).$$

Applying (24) and (25)–(28), we get

$$\mathsf{M}\left\{\left(I_{(000)\tau_{p+1},\tau_p}^{(i_1 i_2 i_3)}-I_{(000)\tau_{p+1},\tau_p}^{(i_1 i_2 i_3)q}\right)^2\right\}=\frac{\Delta^3}{6}-\sum_{j_3,j_2,j_1=0}^{q}C_{j_3j_2j_1}^2\quad (i_1\ne i_2,\ i_1\ne i_3,\ i_2\ne i_3),$$

$$\mathsf{M}\left\{\left(I_{(000)\tau_{p+1},\tau_p}^{(i_1 i_2 i_3)}-I_{(000)\tau_{p+1},\tau_p}^{(i_1 i_2 i_3)q}\right)^2\right\}=\frac{\Delta^3}{6}-\sum_{j_3,j_2,j_1=0}^{q}C_{j_3j_2j_1}^2-\sum_{j_3,j_2,j_1=0}^{q}C_{j_2j_3j_1}C_{j_3j_2j_1}\quad (i_1\ne i_2=i_3),$$

$$\mathsf{M}\left\{\left(I_{(000)\tau_{p+1},\tau_p}^{(i_1 i_2 i_3)}-I_{(000)\tau_{p+1},\tau_p}^{(i_1 i_2 i_3)q}\right)^2\right\}=\frac{\Delta^3}{6}-\sum_{j_3,j_2,j_1=0}^{q}C_{j_3j_2j_1}^2-\sum_{j_3,j_2,j_1=0}^{q}C_{j_3j_2j_1}C_{j_1j_2j_3}\quad (i_1=i_3\ne i_2),$$

$$\mathsf{M}\left\{\left(I_{(000)\tau_{p+1},\tau_p}^{(i_1 i_2 i_3)}-I_{(000)\tau_{p+1},\tau_p}^{(i_1 i_2 i_3)q}\right)^2\right\}=\frac{\Delta^3}{6}-\sum_{j_3,j_2,j_1=0}^{q}C_{j_3j_2j_1}^2-\sum_{j_3,j_2,j_1=0}^{q}C_{j_3j_1j_2}C_{j_3j_2j_1}\quad (i_1=i_2\ne i_3).$$

At the same time using the estimate (22) for $i_1,\ldots,i_5=1,\ldots,m$, we have

$$\mathsf{M}\left\{\left(I_{(01)\tau_{p+1},\tau_p}^{(i_1 i_2)}-I_{(01)\tau_{p+1},\tau_p}^{(i_1 i_2)q}\right)^2\right\}\le 2\left(\frac{\Delta^4}{4}-\sum_{j_1,j_2=0}^{q}\left(C_{j_2j_1}^{01}\right)^2\right),$$

$$\mathsf{M}\left\{\left(I_{(10)\tau_{p+1},\tau_p}^{(i_1i_2)}-I_{(10)\tau_{p+1},\tau_p}^{(i_1i_2)q}\right)^2\right\}\le 2\left(\frac{\Delta^4}{12}-\sum_{j_1,j_2=0}^{q}\left(C_{j_2j_1}^{10}\right)^2\right),$$

(56)
$$\mathsf{M}\left\{\left(I_{(000)\tau_{p+1},\tau_p}^{(i_1i_2i_3)}-I_{(000)\tau_{p+1},\tau_p}^{(i_1i_2i_3)q}\right)^2\right\}\le 6\left(\frac{\Delta^3}{6}-\sum_{j_3,j_2,j_1=0}^{q}C_{j_3j_2j_1}^{2}\right),$$

(57)
$$\mathsf{M}\left\{\left(I_{(0000)\tau_{p+1},\tau_p}^{(i_1i_2i_3i_4)}-I_{(0000)\tau_{p+1},\tau_p}^{(i_1i_2i_3i_4)q}\right)^2\right\}\le 24\left(\frac{\Delta^4}{24}-\sum_{j_1,j_2,j_3,j_4=0}^{q}C_{j_4j_3j_2j_1}^{2}\right),$$

(58)
$$\mathsf{M}\left\{\left(I_{(100)\tau_{p+1},\tau_p}^{(i_1i_2i_3)}-I_{(100)\tau_{p+1},\tau_p}^{(i_1i_2i_3)q}\right)^2\right\}\le 6\left(\frac{\Delta^5}{60}-\sum_{j_1,j_2,j_3=0}^{q}\left(C_{j_3j_2j_1}^{100}\right)^2\right),$$

(59)
$$\mathsf{M}\left\{\left(I_{(010)\tau_{p+1},\tau_p}^{(i_1i_2i_3)}-I_{(010)\tau_{p+1},\tau_p}^{(i_1i_2i_3)q}\right)^2\right\}\le 6\left(\frac{\Delta^5}{20}-\sum_{j_1,j_2,j_3=0}^{q}\left(C_{j_3j_2j_1}^{010}\right)^2\right),$$

(60)
$$\mathsf{M}\left\{\left(I_{(001)\tau_{p+1},\tau_p}^{(i_1i_2i_3)}-I_{(001)\tau_{p+1},\tau_p}^{(i_1i_2i_3)q}\right)^2\right\}\le 6\left(\frac{\Delta^5}{10}-\sum_{j_1,j_2,j_3=0}^{q}\left(C_{j_3j_2j_1}^{001}\right)^2\right),$$

(61)
$$\mathsf{M}\left\{\left(I_{(00000)\tau_{p+1},\tau_p}^{(i_1i_2i_3i_4i_5)}-I_{(00000)\tau_{p+1},\tau_p}^{(i_1i_2i_3i_4i_5)q}\right)^2\right\}\le 120\left(\frac{\Delta^5}{120}-\sum_{j_1,j_2,j_3,j_4,j_5=0}^{q}C_{j_5i_4i_3i_2j_1}^{2}\right).$$

The Fourier–Legendre coefficients

$$\bar{C}_{j_3j_2j_1},\quad \bar{C}_{j_4j_3j_2j_1},\quad \bar{C}_{j_3j_2j_1}^{001},\quad \bar{C}_{j_3j_2j_1}^{010},\quad \bar{C}_{j_3j_2j_1}^{100},\quad \bar{C}_{j_5j_4j_3j_2j_1}$$

can be calculated exactly using computer algebra systems like Derive. The exact values of these Fourier–Legendre coefficients were presented in tabular form in the monographs [11]-[25]. Note that the mendioned Fourier–Legendre coefficients do not depend on the integration step $\tau_{p+1}-\tau_p$ of the numerical method, which can be variable.

Recently, the database with 270,000 exactly calculated Fourier–Legendre coefficients was described [52], [56]. This database was used in the software package, which is written in the Python programming language for the implementation of explicit one-step strong numerical schemes with orders 0.5, 1.0, 1.5, 2.0, 2.5, and 3.0 of convergence for Ito stochastic differential equations [52], [56]. The optimization of the mean-square approximation procedures for iterated Ito stochastic integrals from these numerical schemes can be found in [54].

Note that in [2]-[4] (also see [58]) the iterated stochastic integrals were approximated using the trigonometric Fourier expansion of the multidimensional Brownian bridge process. It is important to pay attention that the number q must be the same for all approximations of iterated stochastic integrals from the considered collection in the approcah from [2]-[4]. At the same time the numbers q can be selected individually for different stochastic integrals from the considred collection in the method based on Theorems 1–3 (see Sect. 5.3, 6.2 from [16] for details).

On the basis of the presented expansions (29)–(40) of iterated Ito stochastic integrals we can see that increasing of multiplicities of these integrals or degree indexes of their weight functions leads to increasing of smallness orders with respect to Δ in the mean-square sense for iterated stochastic integrals. This leads to a sharp decrease of member quantities (the numbers q) in expansions of iterated Ito stochastic integrals, which are required for achieving the acceptable accuracy of approximation. Generally speaking, the minimum values q that guarantee the fulfillment of the condition (6) for each approximation (see (29)–(40)) are different and abruptly decreasing with the growth of smallness order (with respect to Δ) of the approximations of iterated stochastic integrals.

The detailed comparison of the method from [2]-[4] with the method based on Theorems 1–3 can be found in [16]-[18] (Chapters 2, 5, 6), [30], [38].

5. Approximation of Iterated Ito and Stratonovich Stochastic Integrals. Combined Approach

In contrast to the iterated Ito stochastic integrals (2), the iterated Stratonovich stochastic integrals (3) have simpler expansions (see Theorems 4–10 below) than (20). However, the calculation (or estimation) of the mean-square approximation error for the latter is a more difficult problem than for the former. Below in this section, we will study this issue in detail.

As it turned out, Theorems 1, 2 can be adapted for the iterated Stratonovich stochastic integrals (3) at least for multiplicities 1 to 6. Expansions of these iterated Stratonovich stochastic integrals turned out much simpler than the appropriate expansions of the iterated Ito stochastic integrals (2) from Theorems 1, 2. Applying this feature and standard relations between iterated Ito and Stratonovich stochastic integrals, we will get simpler expansions for the iterated Ito stochastic integrals (2) than the expansions from the previous section. However, as was mentioned above, the estimation of the mean-square approximation error for the expansions from this section is a nontrivial problem.

Let us first present some old results on expansion of the iterated Stratonovich stochastic integrals (3) of multiplicities 2 to 4 (Theorems 4–6 below).

Theorem 4 [12]-[18], [23]-[25], [31], [34], [35], [39], [44], [46], [48]. *Assume that the following conditions are fulfilled*:

1. *The function $\psi_2(\tau)$ is continuously differentiable at the interval $[t,T]$ and the function $\psi_1(\tau)$ is twice continuously differentiable at the interval $[t,T]$.*

2. *$\{\phi_j(x)\}_{j=0}^{\infty}$ is a complete orthonormal system of Legendre polynomials or trigonometric functions in the space $L_2([t,T])$.*

Then, the iterated Stratonovich stochastic integral of the second multiplicity

$$\int\limits_t^{*T}\psi_2(t_2)\int\limits_t^{*t_2}\psi_1(t_1)d\mathbf{f}_{t_1}^{(i_1)}d\mathbf{f}_{t_2}^{(i_2)}\quad (i_1,i_2=1,\ldots,m)$$

is expanded into the double series

$$\int\limits_t^{*T}\psi_2(t_2)\int\limits_t^{*t_2}\psi_1(t_1)d\mathbf{f}_{t_1}^{(i_1)}d\mathbf{f}_{t_2}^{(i_2)}=\underset{p_1,p_2\to\infty}{\text{l.i.m.}}\sum_{j_1=0}^{p_1}\sum_{j_2=0}^{p_2}C_{j_2j_1}\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}$$

converging in the mean-square sense, where

$$C_{j_2j_1}=\int\limits_t^T\psi_2(s_2)\phi_{j_2}(s_2)\int\limits_t^{s_2}\psi_1(s_1)\phi_{j_1}(s_1)ds_1ds_2;$$

another notations are the same as in Theorems 1, 2.

Theorem 5 [12]-[18], [23]-[25], [39], [44], [45]. *Assume that* $\{\phi_j(x)\}_{j=0}^{\infty}$ *is a complete orthonormal system of Legendre polynomials or trigonomertic functions in the space* $L_2([t,T])$*. Furthermore, the function* $\psi_2(\tau)$ *is continuously differentiable at the interval* $[t,T]$ *and the functions* $\psi_1(\tau)$, $\psi_3(\tau)$ *are twice continuously differentiable at the interval* $[t,T]$*. Then, for the iterated Stratonovich stochastic integral of third multiplicity*

$$\int\limits_t^{*T}\psi_3(t_3)\int\limits_t^{*t_3}\psi_2(t_2)\int\limits_t^{*t_2}\psi_1(t_1)d\mathbf{f}_{t_1}^{(i_1)}d\mathbf{f}_{t_2}^{(i_2)}d\mathbf{f}_{t_3}^{(i_3)}\quad(i_1,i_2,i_3=1,\ldots,m)$$

the following expansion

$$\int\limits_t^{*T}\psi_3(t_3)\int\limits_t^{*t_3}\psi_2(t_2)\int\limits_t^{*t_2}\psi_1(t_1)d\mathbf{f}_{t_1}^{(i_1)}d\mathbf{f}_{t_2}^{(i_2)}d\mathbf{f}_{t_3}^{(i_3)}=\underset{q\to\infty}{\text{l.i.m.}}\sum_{j_1,j_2,j_3=0}^{q}C_{j_3j_2j_1}\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}\zeta_{j_3}^{(i_3)}\tag{62}$$

converging in the mean-square sense is valid, where

$$C_{j_3j_2j_1}=\int\limits_t^T\psi_3(t_3)\phi_{j_3}(t_3)\int\limits_t^{t_3}\psi_2(t_2)\phi_{j_2}(t_2)\int\limits_t^{t_2}\psi_1(t_1)\phi_{j_1}(t_1)dt_1dt_2dt_3;$$

another notations are the same as in Theorems 1, 2.

Theorem 6 [12]-[18], [23]-[25], [39], [44], [51]. *Suppose that* $\{\phi_j(x)\}_{j=0}^{\infty}$ *is a complete orthonormal system of Legendre polynomials or trigonometric functions in* $L_2([t,T])$*. Then, for the iterated Stratonovich stochastic integral of multiplicity* 4

$$I_{T,t}^{*(i_1i_2i_3i_4)}=\int\limits_t^{*T}\int\limits_t^{*t_4}\int\limits_t^{*t_3}\int\limits_t^{*t_2}d\mathbf{w}_{t_1}^{(i_1)}d\mathbf{w}_{t_2}^{(i_2)}d\mathbf{w}_{t_3}^{(i_3)}d\mathbf{w}_{t_4}^{(i_4)}$$

the following expansion

$$I_{T,t}^{*(i_1i_2i_3i_4)}=\underset{q\to\infty}{\text{l.i.m.}}\sum_{j_1,j_2,j_3,j_4=0}^{q}C_{j_4j_3j_2j_1}\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}\zeta_{j_3}^{(i_3)}\zeta_{j_4}^{(i_4)}$$

converging in the mean-square sense is valid, where $i_1,i_2,i_3,i_4=0,1,\ldots,m,$

$$C_{j_4j_3j_2j_1}=\int\limits_t^T\phi_{j_4}(t_4)\int\limits_t^{t_4}\phi_{j_3}(t_3)\int\limits_t^{t_3}\phi_{j_2}(t_2)\int\limits_t^{t_2}\phi_{j_1}(t_1)dt_1dt_2dt_3dt_4,$$

$\mathbf{w}_\tau^{(i)} = \mathbf{f}_\tau^{(i)}$ $(i = 1, \ldots, m)$ *are independent standard Wiener processes and* $\mathbf{w}_\tau^{(0)} = \tau$.

Recently, a new approach to the expansion and mean-square approximation of iterated Stratonovich stochastic integrals has been obtained [16] (Sect. 2.10–2.16), [43] (Sect. 7–13), [44] (Sect. 13–19), [51] (Sect. 5–11), [55] (Sect. 4–9), [57]. Let us formulate four theorems that were obtained using this approach.

Theorem 7 [16], [43], [44], [51], [55]. *Suppose that* $\{\phi_j(x)\}_{j=0}^{\infty}$ *is a complete orthonormal system of Legendre polynomials or trigonometric functions in the space* $L_2([t, T])$. *Furthermore, let* $\psi_1(\tau), \psi_2(\tau)$, $\psi_3(\tau)$ *are continuously differentiable nonrandom functions on* $[t, T]$. *Then, for the iterated Stratonovich stochastic integral of third multiplicity*

$$J^*[\psi^{(3)}]_{T,t} = \int\limits_t^{*T} \psi_3(t_3) \int\limits_t^{*t_3} \psi_2(t_2) \int\limits_t^{*t_2} \psi_1(t_1) d\mathbf{w}_{t_1}^{(i_1)} d\mathbf{w}_{t_2}^{(i_2)} d\mathbf{w}_{t_3}^{(i_3)} \quad (i_1, i_2, i_3 = 0, 1, \ldots, m)$$

the following relations

$$J^*[\psi^{(3)}]_{T,t} = \underset{p\to\infty}{\text{l.i.m.}} \sum_{j_1,j_2,j_3=0}^{p} C_{j_3 j_2 j_1} \zeta_{j_1}^{(i_1)} \zeta_{j_2}^{(i_2)} \zeta_{j_3}^{(i_3)}, \tag{63}$$

$$\mathsf{M}\left\{\left(J^*[\psi^{(3)}]_{T,t} - \sum_{j_1,j_2,j_3=0}^{p} C_{j_3 j_2 j_1} \zeta_{j_1}^{(i_1)} \zeta_{j_2}^{(i_2)} \zeta_{j_3}^{(i_3)}\right)^2\right\} \le \frac{C}{p} \tag{64}$$

are fulfilled, where $i_1, i_2, i_3 = 0, 1, \ldots, m$ *in* (63) *and* $i_1, i_2, i_3 = 1, \ldots, m$ *in* (64), *constant* C *is independent of* p,

$$C_{j_3 j_2 j_1} = \int\limits_t^T \psi_3(t_3)\phi_{j_3}(t_3) \int\limits_t^{t_3} \psi_2(t_2)\phi_{j_2}(t_2) \int\limits_t^{t_2} \psi_1(t_1)\phi_{j_1}(t_1) dt_1 dt_2 dt_3$$

and

$$\zeta_j^{(i)} = \int\limits_t^T \phi_j(\tau) d\mathbf{f}_\tau^{(i)}$$

are independent standard Gaussian random variables for various i *or* j (*in the case when* $i \neq 0$); *another notations are the same as in Theorems* 1, 2.

Theorem 8 [16], [43], [44], [51], [55]. *Let* $\{\phi_j(x)\}_{j=0}^{\infty}$ *be a complete orthonormal system of Legendre polynomials or trigonometric functions in the space* $L_2([t, T])$. *Furthermore, let* $\psi_1(\tau), \ldots, \psi_4(\tau)$ *be continuously differentiable nonrandom functions on* $[t, T]$. *Then, for the iterated Stratonovich stochastic integral of fourth multiplicity*

$$J^*[\psi^{(4)}]_{T,t} = \int\limits_t^{*T} \psi_4(t_4) \int\limits_t^{*t_4} \psi_3(t_3) \int\limits_t^{*t_3} \psi_2(t_2) \int\limits_t^{*t_2} \psi_1(t_1) d\mathbf{w}_{t_1}^{(i_1)} d\mathbf{w}_{t_2}^{(i_2)} d\mathbf{w}_{t_3}^{(i_3)} d\mathbf{w}_{t_4}^{(i_4)} \tag{65}$$

the following relations

$$J^*[\psi^{(4)}]_{T,t} = \underset{p\to\infty}{\text{l.i.m.}} \sum_{j_1,j_2,j_3,j_4=0}^{p} C_{j_4j_3j_2j_1}\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}\zeta_{j_3}^{(i_3)}\zeta_{j_4}^{(i_4)}, \tag{66}$$

$$\mathsf{M}\left\{\left(J^*[\psi^{(4)}]_{T,t} - \sum_{j_1,j_2,j_3,j_4=0}^{p} C_{j_4j_3j_2j_1}\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}\zeta_{j_3}^{(i_3)}\zeta_{j_4}^{(i_4)}\right)^2\right\} \le \frac{C}{p^{1-\varepsilon}} \tag{67}$$

are fulfilled, where $i_1,\ldots,i_4 = 0,1,\ldots,m$ *in* (65), (66) *and* $i_1,\ldots,i_4 = 1,\ldots,m$ *in* (67), *constant* C *does not depend on* p, ε *is an arbitrary small positive real number for the case of complete orthonormal system of Legendre polynomials in the space* $L_2([t,T])$ *and* $\varepsilon = 0$ *for the case of complete orthonormal system of trigonometric functions in the space* $L_2([t,T])$,

$$C_{j_4j_3j_2j_1} =$$

$$= \int\limits_t^T \psi_4(t_4)\phi_{j_4}(t_4)\int\limits_t^{t_4} \psi_3(t_3)\phi_{j_3}(t_3)\int\limits_t^{t_3} \psi_2(t_2)\phi_{j_2}(t_2)\int\limits_t^{t_2} \psi_1(t_1)\phi_{j_1}(t_1)dt_1dt_2dt_3dt_4;$$

another notations are the same as in Theorem 7.

Theorem 9 [16], [43], [44], [51], [55]. *Assume that* $\{\phi_j(x)\}_{j=0}^{\infty}$ *is a complete orthonormal system of Legendre polynomials or trigonometric functions in the space* $L_2([t,T])$ *and* $\psi_1(\tau),\ldots,\psi_5(\tau)$ *are continuously differentiable nonrandom functions on* $[t,T]$. *Then, for the iterated Stratonovich stochastic integral of fifth multiplicity*

$$J^*[\psi^{(5)}]_{T,t} = \int\limits_t^{*T} \psi_5(t_5)\ldots\int\limits_t^{*t_2} \psi_1(t_1)d\mathbf{w}_{t_1}^{(i_1)}\ldots d\mathbf{w}_{t_5}^{(i_5)} \tag{68}$$

the following relations

$$J^*[\psi^{(5)}]_{T,t} = \underset{p\to\infty}{\text{l.i.m.}} \sum_{j_1,\ldots,j_5=0}^{p} C_{j_5\ldots j_1}\zeta_{j_1}^{(i_1)}\ldots\zeta_{j_5}^{(i_5)}, \tag{69}$$

$$\mathsf{M}\left\{\left(J^*[\psi^{(5)}]_{T,t} - \sum_{j_1,\ldots,j_5=0}^{p} C_{j_5\ldots j_1}\zeta_{j_1}^{(i_1)}\ldots\zeta_{j_5}^{(i_5)}\right)^2\right\} \le \frac{C}{p^{1-\varepsilon}} \tag{70}$$

are fulfilled, where $i_1,\ldots,i_5 = 0,1,\ldots,m$ *in* (68), (69) *and* $i_1,\ldots,i_5 = 1,\ldots,m$ *in* (70), *constant* C *is independent of* p, ε *is an arbitrary small positive real number for the case of complete orthonormal system of Legendre polynomials in the space* $L_2([t,T])$ *and* $\varepsilon = 0$ *for the case of complete orthonormal system of trigonometric functions in the space* $L_2([t,T])$,

$$C_{j_5\ldots j_1}=\int\limits_t^T\psi_5(t_5)\phi_{j_5}(t_5)\ldots\int\limits_t^{t_2}\psi_1(t_1)\phi_{j_1}(t_1)dt_1\ldots dt_5;$$

another notations are the same as in Theorems 7, 8.

Theorem 10 [16], [43], [44], [51], [57]. *Suppose that $\{\phi_j(x)\}_{j=0}^{\infty}$ is a complete orthonormal system of Legendre polynomials or trigonometric functions in the space $L_2([t,T])$. Then, for the iterated Stratonovich stochastic integral of sixth multiplicity*

$$J_{T,t}^{*(i_1\ldots i_6)}=\int\limits_t^{*T}\ldots\int\limits_t^{*t_2}d\mathbf{w}_{t_1}^{(i_1)}\ldots d\mathbf{w}_{t_6}^{(i_6)} \tag{71}$$

the following expansion

$$J_{T,t}^{*(i_1\ldots i_6)}=\underset{p\to\infty}{\text{l.i.m.}}\sum_{j_1,\ldots,j_6=0}^{p}C_{j_6\ldots j_1}\zeta_{j_1}^{(i_1)}\ldots\zeta_{j_6}^{(i_6)}$$

that converges in the mean-square sense is valid, where $i_1,\ldots,i_6=0,1,\ldots,m,$

$$C_{j_6\ldots j_1}=\int\limits_t^T\phi_{j_6}(t_6)\ldots\int\limits_t^{t_2}\phi_{j_1}(t_1)dt_1\ldots dt_6;$$

another notations are the same as in Theorems 7–9.

Let us denote

$$I_{(l_1\ldots l_k)T,t}^{*(i_1\ldots i_k)}=\int\limits_t^{*T}(t-t_k)^{l_k}\ldots\int\limits_t^{*t_2}(t-t_1)^{l_1}d\mathbf{f}_{t_1}^{(i_1)}\ldots d\mathbf{f}_{t_k}^{(i_k)}, \tag{72}$$

where $i_1,\ldots,i_k=1,\ldots,m,\ \ l_1,\ldots,l_k=0,\ 1,\ldots.$

Below we will consider the iterated Stratonovich stochastic integrals (72) as well as the iterated Ito stochastic integrals $I_{(l_1\ldots l_k)T,t}^{(i_1\ldots i_k)}$ defined by (5).

According to the standard relations between iterated Ito and Stratonovich stochastic integrals as well as according to Theorems 5, 7, we obtain

$$I_{(000)\tau_{p+1},\tau_p}^{(i_1i_2i_3)}=I_{(000)\tau_{p+1},\tau_p}^{*(i_1i_2i_3)}+\mathbf{1}_{\{i_1=i_2\}}\frac{1}{2}I_{(1)\tau_{p+1},\tau_p}^{(i_3)}-$$

$$-\mathbf{1}_{\{i_2=i_3\}}\frac{1}{2}\left(\Delta I_{(0)\tau_{p+1},\tau_p}^{(i_1)}+I_{(1)\tau_{p+1},\tau_p}^{(i_1)}\right)\quad \text{w. p. 1}, \tag{73}$$

where

$$I^{*(i_1 i_2 i_3)}_{(000)\tau_{p+1},\tau_p} = \underset{q\to\infty}{\text{l.i.m.}} \sum_{j_1,j_2,j_3=0}^{q} C_{j_3 j_2 j_1}\zeta^{(i_1)}_{j_1}\zeta^{(i_2)}_{j_2}\zeta^{(i_3)}_{j_3} \quad (i_1,i_2,i_3=1,\ldots,m), \tag{74}$$

where $C_{j_3j_2j_1}$ is defined by (41), (47).

From (73), (74) and (29), (31) we obtain the following approximation

$$I^{(i_1 i_2 i_3)q}_{(000)\tau_{p+1},\tau_p} = \sum_{j_1,j_2,j_3=0}^{q} C_{j_3 j_2 j_1}\zeta^{(i_1)}_{j_1}\zeta^{(i_2)}_{j_2}\zeta^{(i_3)}_{j_3} - \frac{1}{4}\mathbf{1}_{\{i_1=i_2\}}\Delta^{3/2}\left(\zeta^{(i_3)}_0 + \frac{1}{\sqrt{3}}\zeta^{(i_3)}_1\right) -$$

$$- \frac{1}{4}\mathbf{1}_{\{i_2=i_3\}}\Delta^{3/2}\left(\zeta^{(i_1)}_0 - \frac{1}{\sqrt{3}}\zeta^{(i_1)}_1\right). \tag{75}$$

For the case $i_1=i_2=i_3$ it is comfortable to use the folowing well known relation

$$I^{(i_1 i_1 i_1)}_{(000)\tau_{p+1},\tau_p} = \frac{1}{6}\Delta^{3/2}\left(\left(\zeta^{(i_1)}_0\right)^3 - 3\zeta^{(i_1)}_0\right) \quad \text{w. p. 1.} \tag{76}$$

Let us consider the iterated Ito stochastic integrals

$$I^{(i_3 i_2 i_1)}_{(100)\tau_{p+1},\tau_p}, \quad I^{(i_3 i_2 i_1)}_{(010)\tau_{p+1},\tau_p}, \quad I^{(i_3 i_2 i_1)}_{(001)\tau_{p+1},\tau_p}.$$

According to the standard relations between iterated Ito and Stratonovich stochastic integrals as well as according to Theorems 5, 7, we obtain

$$I^{(i_1 i_2 i_3)}_{(001)\tau_{p+1},\tau_p} = I^{*(i_1 i_2 i_3)}_{(001)\tau_{p+1},\tau_p} + \frac{1}{2}\mathbf{1}_{\{i_1=i_2\}}I^{(i_3)}_{(2)\tau_{p+1},\tau_p} +$$

$$+ \frac{1}{4}\mathbf{1}_{\{i_2=i_3\}}\left(\Delta^2 I^{(i_1)}_{(0)\tau_{p+1},\tau_p} - I^{(i_1)}_{(2)\tau_{p+1},\tau_p}\right) \quad \text{w. p. 1,} \tag{77}$$

$$I^{(i_1 i_2 i_3)}_{(010)\tau_{p+1},\tau_p} = I^{*(i_1 i_2 i_3)}_{(010)\tau_{p+1},\tau_p} + \frac{1}{4}\mathbf{1}_{\{i_1=i_2\}}I^{(i_3)}_{(2)\tau_{p+1},\tau_p} +$$

$$+ \frac{1}{4}\mathbf{1}_{\{i_2=i_3\}}\left(\Delta^2 I^{(i_1}_{(0)\tau_{p+1},\tau_p} - I^{(i_1)}_{(2)\tau_{p+1},\tau_p}\right) \quad \text{w. p. 1,} \tag{78}$$

$$I^{(i_1 i_2 i_3)}_{(100)\tau_{p+1},\tau_p} = I^{*(i_1 i_2 i_3)}_{(100)\tau_{p+1},\tau_p} + \frac{1}{4}\mathbf{1}_{\{i_1=i_2\}}I^{(i_3)}_{(2)\tau_{p+1},\tau_p} -$$

$$- \frac{1}{2}\mathbf{1}_{\{i_2=i_3\}}\left(I^{(i_1)}_{(2)\tau_{p+1},\tau_p} + \Delta I^{(i_1)}_{(1)\tau_{p+1},\tau_p}\right) \quad \text{w. p. 1,} \tag{79}$$

where

$$I^{*(i_1 i_2 i_3)}_{(001)\tau_{p+1},\tau_p} = \underset{q\to\infty}{\text{l.i.m.}} \sum_{j_1,j_2,j_3=0}^{q} C^{001}_{j_3 j_2 j_1}\zeta^{(i_1)}_{j_1}\zeta^{(i_2)}_{j_2}\zeta^{(i_3)}_{j_3},$$

$$I^{*(i_1 i_2 i_3)}_{(010)\tau_{p+1},\tau_p} = \underset{q\to\infty}{\text{l.i.m.}} \sum_{j_1,j_2,j_3=0}^{q} C^{010}_{j_3 j_2 j_1} \zeta^{(i_1)}_{j_1} \zeta^{(i_2)}_{j_2} \zeta^{(i_3)}_{j_3},$$

$$I^{*(i_1 i_2 i_3)}_{(100)\tau_{p+1},\tau_p} = \underset{q\to\infty}{\text{l.i.m.}} \sum_{j_1,j_2,j_3=0}^{q} C^{100}_{j_3 j_2 j_1} \zeta^{(i_1)}_{j_1} \zeta^{(i_2)}_{j_2} \zeta^{(i_3)}_{j_3},$$

where $C^{001}_{j_3 j_2 j_1}$, $C^{010}_{j_3 j_2 j_1}$, $C^{100}_{j_3 j_2 j_1}$ are defined by (43)-(45) and (49)-(51). From (77)–(79) and (29), (31), (36) we obtain the following approximations

$$I^{(i_1 i_2 i_3)q}_{(001)\tau_{p+1},\tau_p} = \sum_{j_1,j_2,j_3=0}^{q} C^{001}_{j_3 j_2 j_1} \zeta^{(i_1)}_{j_1} \zeta^{(i_2)}_{j_2} \zeta^{(i_3)}_{j_3} + \frac{1}{6}\mathbf{1}_{\{i_1=i_2\}}\Delta^{5/2}\left(\zeta^{(i_3)}_0 + \frac{\sqrt{3}}{2}\zeta^{(i_3)}_1 + \frac{1}{2\sqrt{5}}\zeta^{(i_3)}_2\right) +$$

$$+\frac{1}{12}\mathbf{1}_{\{i_2=i_3\}}\Delta^{5/2}\left(2\zeta^{(i_1)}_0 - \frac{\sqrt{3}}{2}\zeta^{(i_1)}_1 - \frac{1}{2\sqrt{5}}\zeta^{(i_1)}_2\right), \tag{80}$$

$$I^{(i_1 i_2 i_3)q}_{(010)\tau_{p+1},\tau_p} = \sum_{j_1,j_2,j_3=0}^{q} C^{010}_{j_3 j_2 j_1} \zeta^{(i_1)}_{j_1} \zeta^{(i_2)}_{j_2} \zeta^{(i_3)}_{j_3} + \frac{1}{12}\mathbf{1}_{\{i_1=i_2\}}\Delta^{5/2}\left(\zeta^{(i_3)}_0 + \frac{\sqrt{3}}{2}\zeta^{(i_3)}_1 + \frac{1}{2\sqrt{5}}\zeta^{(i_3)}_2\right) +$$

$$+\frac{1}{12}\mathbf{1}_{\{i_2=i_3\}}\Delta^{5/2}\left(2\zeta^{(i_1)}_0 - \frac{\sqrt{3}}{2}\zeta^{(i_1)}_1 - \frac{1}{2\sqrt{5}}\zeta^{(i_1)}_2\right), \tag{81}$$

$$I^{(i_1 i_2 i_3)q}_{(100)\tau_{p+1},\tau_p} = \sum_{j_1,j_2,j_3=0}^{q} C^{100}_{j_3 j_2 j_1} \zeta^{(i_1)}_{j_1} \zeta^{(i_2)}_{j_2} \zeta^{(i_3)}_{j_3} + \frac{1}{12}\mathbf{1}_{\{i_1=i_2\}}\Delta^{5/2}\left(\zeta^{(i_3)}_0 + \frac{\sqrt{3}}{2}\zeta^{(i_3)}_1 + \frac{1}{2\sqrt{5}}\zeta^{(i_3)}_2\right) +$$

$$+\frac{1}{12}\mathbf{1}_{\{i_2=i_3\}}\Delta^{5/2}\left(\zeta^{(i_1)}_0 - \frac{1}{\sqrt{5}}\zeta^{(i_1)}_2\right). \tag{82}$$

Let us consider the iterated Ito stochastic integral of multiplicity 4. According to the standard relations between iterated Ito and Stratonovich stochastic integrals as well as according to Theorems 6, 8, we get

$$I^{(i_1 i_2 i_3 i_4)}_{(0000)\tau_{p+1},\tau_p} = I^{*(i_1 i_2 i_3 i_4)}_{(0000)\tau_{p+1},\tau_p} + \frac{1}{2}\mathbf{1}_{\{i_1=i_2\}} I^{(i_3 i_4)}_{(10)\tau_{p+1},\tau_p} -$$

$$-\frac{1}{2}\mathbf{1}_{\{i_2=i_3\}}\left(I^{(i_1 i_4)}_{(10)\tau_{p+1},\tau_p} - I^{(i_1 i_4)}_{(01)\tau_{p+1},\tau_p}\right) - \frac{1}{2}\mathbf{1}_{\{i_3=i_4\}}\left(\Delta I^{(i_1 i_2)}_{(00)\tau_{p+1},\tau_p} + I^{(i_1 i_2)}_{(01)\tau_{p+1},\tau_p}\right) -$$

$$-\frac{1}{8}\Delta^2 \mathbf{1}_{\{i_1=i_2\}}\mathbf{1}_{\{i_3=i_4\}} \quad \text{w. p. 1}, \tag{83}$$

$$I^{*(i_1i_2i_3i_4)}_{(0000)\tau_{p+1},\tau_p}=\underset{q\to\infty}{\text{l.i.m.}}\sum_{j_1,j_2,j_3,j_4=0}^{q}C_{j_4j_3j_2j_1}\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}\zeta_{j_3}^{(i_3)}\zeta_{j_4}^{(i_4)},$$

$$I^{(i_1i_2i_3i_4)q}_{(0000)\tau_{p+1},\tau_p}=\sum_{j_1,j_2,j_3,j_4=0}^{q}C_{j_4j_3j_2j_1}\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}\zeta_{j_3}^{(i_3)}\zeta_{j_4}^{(i_4)}+\frac{1}{2}\mathbf{1}_{\{i_1=i_2\}}I^{(i_3i_4)q}_{(10)\tau_{p+1},\tau_p}-$$

$$-\frac{1}{2}\mathbf{1}_{\{i_2=i_3\}}\left(I^{(i_1i_4)q}_{(10)\tau_{p+1},\tau_p}-I^{(i_1i_4)q}_{(01)\tau_{p+1},\tau_p}\right)-\frac{1}{2}\mathbf{1}_{\{i_3=i_4\}}\left(\Delta I^{(i_1i_2)q}_{(00)\tau_{p+1},\tau_p}+I^{(i_1i_2)q}_{(01)\tau_{p+1},\tau_p}\right)-$$

$$-\frac{1}{8}\Delta^2\mathbf{1}_{\{i_1=i_2\}}\mathbf{1}_{\{i_3=i_4\}},$$

where

$$I^{(i_1i_2)q}_{(00)\tau_{p+1},\tau_p},\quad I^{(i_1i_2)q}_{(01)\tau_{p+1},\tau_p},\quad I^{(i_1i_2)q}_{(10)\tau_{p+1},\tau_p}$$

are determined by the relations (30), (34), (35) and $C_{j_4j_3j_2j_1}$ is defined by (42), (48).

For the case $i_1=i_2=i_3=i_4$ it is comfortable to use the folowing well known relation

$$I^{(i_1i_1i_1i_1)}_{(0000)\tau_{p+1},\tau_p}=\frac{1}{24}\Delta^2\left(\left(\zeta_0^{(i_1)}\right)^4-6\left(\zeta_0^{(i_1)}\right)^2+3\right)\quad \text{w. p. 1.}$$

Let us consider the iterated Ito stochastic integral of fifth multiplicity using Theorems 6, 9

$$I^{(i_1i_2i_3i_4i_5)}_{(00000)\tau_{p+1},\tau_p}=I^{*(i_1i_2i_3i_4i_5)}_{(00000)\tau_{p+1},\tau_p}+\frac{1}{2}\mathbf{1}_{\{i_1=i_2\}}I^{(i_3i_4i_5)}_{(100)\tau_{p+1},\tau_p}-$$

$$-\frac{1}{2}\mathbf{1}_{\{i_2=i_3\}}\left(I^{(i_1i_4i_5)}_{(100)\tau_{p+1},\tau_p}-I^{(i_1i_4i_5)}_{(010)\tau_{p+1},\tau_p}\right)-\frac{1}{2}\mathbf{1}_{\{i_3=i_4\}}\left(I^{(i_1i_2i_5)}_{(010)\tau_{p+1},\tau_p}-I^{(i_1i_2i_5)}_{(001)\tau_{p+1},\tau_p}\right)-$$

$$-\frac{1}{2}\mathbf{1}_{\{i_4=i_5\}}\left(\Delta I^{(i_1i_2i_3)}_{(000)\tau_{p+1},\tau_p}+I^{(i_1i_2i_3)}_{(001)\tau_{p+1},\tau_p}\right)-\frac{1}{8}\mathbf{1}_{\{i_1=i_2\}}\mathbf{1}_{\{i_3=i_4\}}I^{(i_5)}_{(2)\tau_{p+1},\tau_p}-$$

$$-\frac{1}{8}\mathbf{1}_{\{i_2=i_3\}}\mathbf{1}_{\{i_4=i_5\}}\left(\Delta^2 I^{(i_1)}_{(0)\tau_{p+1},\tau_p}+2\Delta I^{(i_1)}_{(1)\tau_{p+1},\tau_p}+I^{(i_1)}_{(2)\tau_{p+1},\tau_p}\right)+$$

(84)
$$-\frac{1}{8}\mathbf{1}_{\{i_1=i_2\}}\mathbf{1}_{\{i_4=i_5\}}\left(\Delta I^{(i_3)}_{(1)\tau_{p+1},\tau_p}+I^{(i_3)}_{(2)\tau_{p+1},\tau_p}\right)\quad \text{w. p. 1,}$$

$$I^{*(i_1i_2i_3i_4i_5)}_{(00000)\tau_{p+1},\tau_p}=\underset{q\to\infty}{\text{l.i.m.}}\sum_{j_1,j_2,j_3,j_4,j_5=0}^{q}C_{j_5j_4j_3j_2j_1}\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}\zeta_{j_3}^{(i_3)}\zeta_{j_4}^{(i_4)}\zeta_{j_5}^{(i_5)},$$

$$I_{(00000)\tau_{p+1},\tau_p}^{(i_1 i_2 i_3 i_4 i_5)q} = \sum_{j_1,j_2,j_3,j_4,j_5=0}^{q} C_{j_5 j_4 j_3 j_2 j_1} \zeta_{j_1}^{(i_1)} \zeta_{j_2}^{(i_2)} \zeta_{j_3}^{(i_3)} \zeta_{j_4}^{(i_4)} \zeta_{j_5}^{(i_5)} + \frac{1}{2}\mathbf{1}_{\{i_1=i_2\}} I_{(100)\tau_{p+1},\tau_p}^{(i_3 i_4 i_5)q} -$$

$$-\frac{1}{2}\mathbf{1}_{\{i_2=i_3\}}\left(I_{(100)\tau_{p+1},\tau_p}^{(i_1 i_4 i_5)q} - I_{(010)\tau_{p+1},\tau_p}^{(i_1 i_4 i_5)q}\right) - \frac{1}{2}\mathbf{1}_{\{i_3=i_4\}}\left(I_{(010)\tau_{p+1},\tau_p}^{(i_1 i_2 i_5)q} - I_{(001)\tau_{p+1},\tau_p}^{(i_1 i_2 i_5)q}\right) -$$

$$-\frac{1}{2}\mathbf{1}_{\{i_4=i_5\}}\left(\Delta I_{(000)\tau_{p+1},\tau_p}^{(i_1 i_2 i_3)q} + I_{(001)\tau_{p+1},\tau_p}^{(i_1 i_2 i_3)q}\right) - \frac{1}{8}\mathbf{1}_{\{i_1=i_2\}}\mathbf{1}_{\{i_3=i_4\}} I_{(2)\tau_{p+1},\tau_p}^{(i_5)} -$$

$$-\frac{1}{8}\mathbf{1}_{\{i_2=i_3\}}\mathbf{1}_{\{i_4=i_5\}}\left(\Delta^2 I_{(0)\tau_{p+1},\tau_p}^{(i_1)} + 2\Delta I_{(1)\tau_{p+1},\tau_p}^{(i_1)} + I_{(2)\tau_{p+1},\tau_p}^{(i_1)}\right) +$$

$$-\frac{1}{8}\mathbf{1}_{\{i_1=i_2\}}\mathbf{1}_{\{i_4=i_5\}}\left(\Delta I_{(1)\tau_{p+1},\tau_p}^{(i_3)} + I_{(2)\tau_{p+1},\tau_p}^{(i_3)}\right),$$

where

$$I_{(000)\tau_{p+1},\tau_p}^{(i_1 i_2 i_3)q}, \quad I_{(100)\tau_{p+1},\tau_p}^{(i_1 i_2 i_3)q}, \quad I_{(010)\tau_{p+1},\tau_p}^{(i_1 i_2 i_3)q}, \quad I_{(001)\tau_{p+1},\tau_p}^{(i_1 i_2 i_3)q}, \quad I_{(0)\tau_{p+1},\tau_p}^{(i_1)}, \quad I_{(1)\tau_{p+1},\tau_p}^{(i_1)}, \quad I_{(2)\tau_{p+1},\tau_p}^{(i_1)}$$

are determined by (75), (80)–(82), (29), (31), (36) and $C_{j_5 j_4 j_3 j_2 j_1}$ is defined by (46), (52).

For the case $i_1 = \ldots = i_5$ it is comfortable to use the folowing well known relation

$$I_{(00000)\tau_{p+1},\tau_p}^{(i_1 i_1 i_1 i_1 i_1)} = \frac{1}{120}\Delta^{5/2}\left(\left(\zeta_0^{(i_1)}\right)^5 - 10\left(\zeta_0^{(i_1)}\right)^3\Delta + 15\zeta_0^{(i_1)}\Delta^2\right) \quad \text{w. p. 1.}$$

Clearly, the expansions from Theorems 4–10 are simpler than the expansions from Theorems 1, 2. However, the calculation of the mean-square approximation error for the expansions from Theorems 4–10 turns out to be much more difficult than for the expansions from Theorems 1, 2. We will demonstrate this fact below.

The case $k = 1$ is actually not interesting. For $k = 1$, the Ito and Stratonovich stochastic integrals of a smooth non-random function are equal each other w. p. 1. Moreover, for $k = 2$

$$I_{(00)\tau_{p+1},\tau_p}^{(i_1 i_2)} = I_{(00)\tau_{p+1},\tau_p}^{*(i_1 i_2)} \quad (i_1 \neq i_2) \quad \text{w. p. 1.}$$

Consider the triple Stratonovich stochastic integral defined by

$$I_{(000)T,t}^{*(i_1 i_2 i_3)} = \int\limits_t^{*T}\int\limits_t^{*t_3}\int\limits_t^{*t_2} d\mathbf{f}_{t_1}^{(i_1)} d\mathbf{f}_{t_2}^{(i_2)} d\mathbf{f}_{t_3}^{(i_3)} \quad (i_1, i_2, i_3 = 1, \ldots, m).$$

In view of the standard relations between Ito and Stratonovich stochastic integrals and also Theorems 1, 2, 5, 7, we obtain

$$\mathsf{M}\left\{\left(I_{(000)T,t}^{*(i_1 i_2 i_3)} - I_{(000)T,t}^{*(i_1 i_2 i_3)q}\right)^2\right\} =$$

$$= \mathsf{M}\left\{\left(I_{(000)T,t}^{(i_1 i_2 i_3)} + \mathbf{1}_{\{i_1=i_2\}}\frac{1}{2}\int\limits_t^T\int\limits_t^{\tau} ds d\mathbf{f}_{\tau}^{(i_3)} + \mathbf{1}_{\{i_2=i_3\}}\frac{1}{2}\int\limits_t^T\int\limits_t^{\tau} d\mathbf{f}_{s}^{(i_1)} d\tau - I_{(000)T,t}^{*(i_1 i_2 i_3)q}\right)^2\right\} =$$

$$= \mathsf{M}\Biggl\{\Biggl(I_{(000)T,t}^{(i_1 i_2 i_3)} - I_{(000)T,t}^{(i_1 i_2 i_3)q} + I_{(000)T,t}^{(i_1 i_2 i_3)q} +$$

$$+ \mathbf{1}_{\{i_1=i_2\}}\frac{1}{2}\int\limits_t^T\int\limits_t^{\tau} ds d\mathbf{f}_{\tau}^{(i_3)} + \mathbf{1}_{\{i_2=i_3\}}\frac{1}{2}\int\limits_t^T\int\limits_t^{\tau} d\mathbf{f}_{s}^{(i_1)} d\tau - I_{(000)T,t}^{*(i_1 i_2 i_3)q}\Biggr)^2\Biggr\}, \qquad (85)$$

$$I_{(000)T,t}^{(i_1 i_2 i_3)q} = \sum_{j_1,j_2,j_3=0}^{q} C_{j_3 j_2 j_1}\Biggl(\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}\zeta_{j_3}^{(i_3)} - \mathbf{1}_{\{i_1=i_2\}}\mathbf{1}_{\{j_1=j_2\}}\zeta_{j_3}^{(i_3)} -$$

$$-\mathbf{1}_{\{i_2=i_3\}}\mathbf{1}_{\{j_2=j_3\}}\zeta_{j_1}^{(i_1)} - \mathbf{1}_{\{i_1=i_3\}}\mathbf{1}_{\{j_1=j_3\}}\zeta_{j_2}^{(i_2)}\Biggr), \qquad (86)$$

$$I_{(000)T,t}^{*(i_1 i_2 i_3)q} = \sum_{j_1,j_2,j_3=0}^{q} C_{j_3 j_2 j_1}\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}\zeta_{j_3}^{(i_3)}, \qquad (87)$$

where $I_{(000)T,t}^{(i_1 i_2 i_3)q}$ is the approximation defined by the formula (21) (also see (14)) for the case $k = 3$ and $I_{(000)T,t}^{*(i_1 i_2 i_3)q}$ is the approximation based on Theorems 5, 7 (see (98) below).

Substituting (86) and (87) into (85) yields

$$\mathsf{M}\left\{\left(I_{(000)T,t}^{*(i_1 i_2 i_3)} - I_{(000)T,t}^{*(i_1 i_2 i_3)q}\right)^2\right\} =$$

$$= \mathsf{M}\Biggl\{\Biggl(I_{(000)T,t}^{(i_1 i_2 i_3)} - I_{(000)T,t}^{(i_1 i_2 i_3)q} + \mathbf{1}_{\{i_1=i_2\}}\left(\frac{1}{2}\int\limits_t^T\int\limits_t^{\tau} ds d\mathbf{f}_{\tau}^{(i_3)} - \sum_{j_1,j_3=0}^{q} C_{j_3 j_1 j_1}\zeta_{j_3}^{(i_3)}\right) +$$

$$+\mathbf{1}_{\{i_2=i_3\}}\left(\frac{1}{2}\int\limits_t^T\int\limits_t^{\tau} d\mathbf{f}_{s}^{(i_1)} d\tau - \sum_{j_1,j_3=0}^{q} C_{j_3 j_3 j_1}\zeta_{j_1}^{(i_1)}\right) - \mathbf{1}_{\{i_1=i_3\}}\sum_{j_1,j_2=0}^{q} C_{j_1 j_2 j_1}\zeta_{j_2}^{(i_2)}\Biggr)^2\Biggr\} \le$$

$$\le 4\Biggl(\mathsf{M}\left\{\left(I_{(000)T,t}^{(i_1 i_2 i_3)} - I_{(000)T,t}^{(i_1 i_2 i_3)q}\right)^2\right\} + \mathbf{1}_{\{i_1=i_2\}}F_q^{(i_3)} +$$

$$+\mathbf{1}_{\{i_2=i_3\}}G_q^{(i_1)} + \mathbf{1}_{\{i_1=i_3\}}H_q^{(i_2)}\Biggr), \qquad (88)$$

where

$$F_q^{(i_3)}=\mathsf{M}\left\{\left(\frac{1}{2}\int\limits_t^T\int\limits_t^{\tau}dsd\mathbf{f}_{\tau}^{(i_3)}-\sum_{j_1,j_3=0}^{q}C_{j_3j_1j_1}\zeta_{j_3}^{(i_3)}\right)^2\right\},$$

$$G_q^{(i_1)}=\mathsf{M}\left\{\left(\frac{1}{2}\int\limits_t^T\int\limits_t^{\tau}d\mathbf{f}_{s}^{(i_1)}d\tau-\sum_{j_1,j_3=0}^{q}C_{j_3j_3j_1}\zeta_{j_1}^{(i_1)}\right)^2\right\},$$

$$H_q^{(i_2)}=\mathsf{M}\left\{\left(\sum_{j_1,j_2=0}^{q}C_{j_1j_2j_1}\zeta_{j_2}^{(i_2)}\right)^2\right\}.$$

For the cases of Legendre polynomials and trigonometric functions, we have the equalities [12]-[18], [23]-[25], [39], [44], [45]

$$\lim_{q\to\infty}F_q^{(i_3)}=0,\quad \lim_{q\to\infty}G_q^{(i_1)}=0,\quad \lim_{q\to\infty}H_q^{(i_2)}=0.$$

However, in accordance with (88) the value

$$\mathsf{M}\left\{\left(I_{(000)T,t}^{*(i_1i_2i_3)}-I_{(000)T,t}^{*(i_1i_2i_3)q}\right)^2\right\}$$

with a finite q can be estimated by the sum of

$$4\mathsf{M}\left\{\left(I_{(000)T,t}^{(i_1i_2i_3)}-I_{(000)T,t}^{(i_1i_2i_3)q}\right)^2\right\}, \tag{89}$$

and three additional terms of a rather complex structure. The value (89) can be calculated exactly using Theorem 3 or estimated using (22) for the case $k=3$.

As is easily observed, this peculiarity will also apply to the iterated Stratonovich stochastic integrals of multiplicities 4 and 5 with the only difference that the number of additional terms like $F_q^{(i_3)}$, $G_q^{(i_1)}$, and $H_q^{(i_2)}$ will be considerably higher and their structure will be more complicated. Therefore, the payment for relatively simple expansions of the iterated Stratonovich stochastic integrals (Theorems 4–10) in comparison with the iterated Ito stochastic integrals (Theorems 1, 2) is a much more difficult calculation or estimation procedure of their mean-square approximation errors.

6. Explicit One-Step Strong Numerical Schemes of Orders 2.0 and 2.5 Based on the Unified Taylor–Stratonovich expansion

Consider the explicit one-step strong numerical scheme of order 2.5 based on the so-called unified Taylor–Stratonovich expansion [11], [14]-[22]

$$\mathbf{y}_{p+1}=\mathbf{y}_p+\sum_{i_1=1}^{m}B_{i_1}\hat{I}_{(0)\tau_{p+1},\tau_p}^{*(i_1)}+\Delta\bar{\mathbf{a}}+\sum_{i_1,i_2=1}^{m}G_{i_2}B_{i_1}\hat{I}_{(00)\tau_{p+1},\tau_p}^{*(i_2i_1)}+$$

$$
+\sum_{i_1=1}^{m}\Biggl(G_{i_1}\bar{\mathbf{a}}\left(\Delta\hat{I}^{*(i_1)}_{(0)\tau_{p+1},\tau_p}+\hat{I}^{*(i_1)}_{(1)\tau_{p+1},\tau_p}\right)-\bar{L}B_{i_1}\hat{I}^{*(i_1)}_{(1)\tau_{p+1},\tau_p}\Biggr)+
$$

$$

are calculated at the point $(\mathbf{y}_p,p)$.

Under the standard conditions [2], [11] the numerical scheme (90) has strong order 2.5 of convergence. The major emphasis below will be placed on the approximation of the iterated Stratonovich stochastic integrals appearing in (90). Therefore, among the mentioned standard conditions, we note the approximation condition for these stochastic integrals [2], [11], which has the form

$$\mathsf{M}\left\{\left(I^{*(i_1\ldots i_k)}_{(l_1\ldots l_k)\tau_{p+1},\tau_p}-\hat{I}^{*(i_1\ldots i_k)}_{(l_1\ldots l_k)\tau_{p+1},\tau_p}\right)^2\right\}\le C\Delta^6, \tag{91}$$

where constant C is independent of Δ.

Note that if we exclude from (90) the terms starting from the term $\Delta^3 LL\mathbf{a}/6$, then we will have the explicit one-step strong numerical scheme of order 2.0 [2], [11], [14]-[22].

Using the numerical scheme (90) or its modifications based on the Taylor–Stratonovich expansion [7], the implicit or multistep analogues of (90) can be constructed [2], [11], [14]-[22]. The set of the iterated Stratonovich stochastic integrals to be approximated for implementing these modifications is the same as for the numerical scheme (90) itself. Interestingly, the truncated unified Taylor–Stratonovich expansion (the foundation of the numerical scheme (90)) contains 12 different types of the iterated Stratonovich stochastic integrals (72), which cannot be interconnected by linear relations [11], [14]-[22]. The analogous Taylor–Stratonovich expansion [2], [7] contains 17 different types of iterated Stratonovich stochastic integrals, part of which are interconnected by linear relations and part of which have a higher multiplicity than the iterated Stratonovich stochastic integrals (72). This fact well explains the use of the numerical scheme (90).

One of the main problems arising in the implementation of the numerical scheme (90) is the joint numerical modeling of the iterated Stratonovich stochastic integrals figuring in (90). Let us consider an efficient numerical modeling method for the iterated Stratonovich stochastic integrals based on Theorems 4–10.

Using Theorems 4–9 and multiple Fourier–Legendre series, we obtain the following approximations of the iterated Stratonovich stochastic integrals from (90) [11]-[51]

$$I^{*(i_1)}_{(0)\tau_{p+1},\tau_p}=\sqrt{\Delta}\zeta_0^{(i_1)}, \tag{92}$$

$$I_{(1)\tau_{p+1},\tau_p}^{*(i_1)} = -\frac{\Delta^{3/2}}{2}\left(\zeta_0^{(i_1)} + \frac{1}{\sqrt{3}}\zeta_1^{(i_1)}\right), \tag{93}$$

$$I_{(2)\tau_{p+1},\tau_p}^{*(i_1)} = \frac{\Delta^{5/2}}{3}\left(\zeta_0^{(i_1)} + \frac{\sqrt{3}}{2}\zeta_1^{(i_1)} + \frac{1}{2\sqrt{5}}\zeta_2^{(i_1)}\right), \tag{94}$$

$$I_{(00)\tau_{p+1},\tau_p}^{*(i_1 i_2)q} = \frac{\Delta}{2}\left(\zeta_0^{(i_1)}\zeta_0^{(i_2)} + \sum_{i=1}^{q}\frac{1}{\sqrt{4i^2-1}}\left(\zeta_{i-1}^{(i_1)}\zeta_i^{(i_2)} - \zeta_i^{(i_1)}\zeta_{i-1}^{(i_2)}\right)\right), \tag{95}$$

$$I_{(01)\tau_{p+1},\tau_p}^{*(i_1 i_2)q} = -\frac{\Delta}{2}I_{(00)\tau_{p+1},\tau_p}^{*(i_1 i_2)q} - \frac{\Delta^2}{4}\left(\frac{1}{\sqrt{3}}\zeta_0^{(i_1)}\zeta_1^{(i_2)} + \right.$$

$$\left. + \sum_{i=0}^{q}\left(\frac{(i+2)\zeta_i^{(i_1)}\zeta_{i+2}^{(i_2)} - (i+1)\zeta_{i+2}^{(i_1)}\zeta_i^{(i_2)}}{\sqrt{(2i+1)(2i+5)}(2i+3)} - \frac{\zeta_i^{(i_1)}\zeta_i^{(i_2)}}{(2i-1)(2i+3)}\right)\right), \tag{96}$$

$$I_{(10)\tau_{p+1},\tau_p}^{*(i_1 i_2)q} = -\frac{\Delta}{2}I_{(00)\tau_{p+1},\tau_p}^{*(i_1 i_2)q} - \frac{\Delta^2}{4}\left(\frac{1}{\sqrt{3}}\zeta_0^{(i_2)}\zeta_1^{(i_1)} + \right.$$

$$\left. + \sum_{i=0}^{q}\left(\frac{(i+1)\zeta_{i+2}^{(i_2)}\zeta_i^{(i_1)} - (i+2)\zeta_i^{(i_2)}\zeta_{i+2}^{(i_1)}}{\sqrt{(2i+1)(2i+5)}(2i+3)} + \frac{\zeta_i^{(i_1)}\zeta_i^{(i_2)}}{(2i-1)(2i+3)}\right)\right), \tag{97}$$

$$I_{(000)\tau_{p+1},\tau_p}^{*(i_1 i_2 i_3)q} = \sum_{j_1,j_2,j_3=0}^{q} C_{j_3 j_2 j_1}\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}\zeta_{j_3}^{(i_3)}, \tag{98}$$

$$I_{(100)\tau_{p+1},\tau_p}^{*(i_1 i_2 i_3)q} = \sum_{j_1,j_2,j_3=0}^{q} C_{j_3 j_2 j_1}^{100}\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}\zeta_{j_3}^{(i_3)}, \tag{99}$$

$$I_{(010)\tau_{p+1},\tau_p}^{*(i_1 i_2 i_3)q} = \sum_{j_1,j_2,j_3=0}^{q} C_{j_3 j_2 j_1}^{010}\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}\zeta_{j_3}^{(i_3)}, \tag{100}$$

$$I_{(001)\tau_{p+1},\tau_p}^{*(i_1 i_2 i_3)q} = \sum_{j_1,j_2,j_3=0}^{q} C_{j_3 j_2 j_1}^{001}\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}\zeta_{j_3}^{(i_3)}, \tag{101}$$

$$I_{(0000)\tau_{p+1},\tau_p}^{*(i_1 i_2 i_3 i_4)q} = \sum_{j_1,j_2,j_3,j_4=0}^{q} C_{j_4 j_3 j_2 j_1}\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}\zeta_{j_3}^{(i_3)}\zeta_{j_4}^{(i_4)}, \tag{102}$$

$$I_{(00000)\tau_{p+1},\tau_p}^{*(i_1i_2i_3i_4i_5)q} = \sum_{j_1,j_2,j_3,j_4,j_5=0}^{q} C_{j_5j_4j_3j_2j_1}\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}\zeta_{j_3}^{(i_3)}\zeta_{j_4}^{(i_4)}\zeta_{j_5}^{(i_5)}, \qquad (103)$$

where the Fourier–Legendre coefficients

$$C_{j_3j_2j_1},\quad C_{j_3j_2j_1}^{100},\quad C_{j_3j_2j_1}^{010},\quad C_{j_3j_2j_1}^{001},\quad C_{j_4j_3j_2j_1},\quad C_{j_5j_4j_3j_2j_1}$$

are determined by (41)–(46), (47)–(52).

On the basis of the presented expansions (see (92)–(103)) of iterated Stratonovich stochastic integrals we can see that increasing of multiplicities of these integrals or degree indexes of their weight functions leads to increasing of smallness orders with respect to Δ in the mean-square sense for iterated stochastic integrals. This leads to a sharp decrease of member quantities (the numbers q) in expansions of iterated Stratonovich stochastic integrals, which are required for achieving the acceptable accuracy of approximation. Generally speaking, the minimum values q that guarantee the fulfillment of the condition (91) for each approximation (92)–(103) are different and abruptly decreasing with the growth of smallness order (with respect to Δ) of the approximations of iterated stochastic integrals.

From Theorem 3 for the case $i_1 \ne i_2$ we obtain

$$\mathsf{M}\left\{\left(I_{(00)\tau_{p+1},\tau_p}^{*(i_1i_2)} - I_{(00)\tau_{p+1},\tau_p}^{*(i_1i_2)q}\right)^2\right\} = \frac{\Delta^2}{2}\sum_{i=q+1}^{\infty}\frac{1}{4i^2-1} \le$$

$$\le \frac{\Delta^2}{2}\int\limits_q^{\infty}\frac{1}{4x^2-1}dx = -\frac{\Delta^2}{8}\ln\left|1-\frac{2}{2q+1}\right| \le C_1\frac{\Delta^2}{q}, \qquad (104)$$

where constant C_1 does not depend on Δ.

As was mentioned above, the value Δ plays the role of integration step in the numerical procedures for Ito stochastic differential equations. Thus this value is a sufficiently small. Keeping in mind this circumstance, it is easy to notice that there exists such a constant C_2 that

$$\mathsf{M}\left\{\left(I_{(l_1\ldots l_k)\tau_{p+1},\tau_p}^{*(i_1\ldots i_k)} - I_{(l_1\ldots l_k)\tau_{p+1},\tau_p}^{*(i_1\ldots i_k)q}\right)^2\right\} \le C_2\mathsf{M}\left\{\left(I_{(00)\tau_{p+1},\tau_p}^{*(i_1i_2)} - I_{(00)\tau_{p+1},\tau_p}^{*(i_1i_2)q}\right)^2\right\}, \qquad (105)$$

where $I_{(l_1\ldots l_k)\tau_{p+1},\tau_p}^{*(i_1\ldots i_k)q}$ is an approximation of the iterated Stratonovich stochastic integral (72).

From (104) and (105) we finally have

$$\mathsf{M}\left\{\left(I_{(l_1\ldots l_k)\tau_{p+1},\tau_p}^{*(i_1\ldots i_k)} - I_{(l_1\ldots l_k)\tau_{p+1},\tau_p}^{*(i_1\ldots i_k)q}\right)^2\right\} \le K\frac{\Delta^2}{q}, \qquad (106)$$

where constant K does not depend on Δ.

The same idea can be found in [2] for the case of trigonometric functions. Note that, in contrast to the estimate (106), the constant C in Theorems 7–9 does not depend on q.

We can get significantly more information about numbers q using a different approach. Applying the standard relation between iterated Ito and Stratonovich stochastic integrals, we have

$$
I_{(l_1\ldots l_k)\tau_{p+1},\tau_p}^{*(i_1\ldots i_k)}=I_{(l_1\ldots l_k)\tau_{p+1},\tau_p}^{(i_1\ldots i_k)}\quad \text{w. p. 1}
$$

for pairwise different $i_1,\ldots,i_k=1,\ldots,m$.

Then for $i_1\ne i_2$ the following mean-square errors

$$
{\sf M}\left\{\left(I_{(00)\tau_{p+1},\tau_p}^{*(i_1i_2)}-I_{(00)\tau_{p+1},\tau_p}^{*(i_1i_2)q}\right)^2\right\},\quad {\sf M}\left\{\left(I_{(10)\tau_{p+1},\tau_p}^{*(i_1i_2)}-I_{(10)\tau_{p+1},\tau_p}^{*(i_1i_2)q}\right)^2\right\},
$$

$$
{\sf M}\left\{\left(I_{(01)\tau_{p+1},\tau_p}^{*(i_1i_2)}-I_{(01)\tau_{p+1},\tau_p}^{*(i_1i_2)q}\right)^2\right\}
$$

are defined by (53), (54).

Moreover, for pairwise different $i_1,\ldots,i_5=1,\ldots,m$ from (24) we obtain

$$
{\sf M}\left\{\left(I_{(01)\tau_{p+1},\tau_p}^{*(i_1i_2)}-I_{(01)\tau_{p+1},\tau_p}^{*(i_1i_2)q}\right)^2\right\}=\frac{\Delta^4}{4}-\sum_{j_1,j_2=0}^{q}\left(C_{j_2j_1}^{01}\right)^2,
$$

$$
{\sf M}\left\{\left(I_{(10)\tau_{p+1},\tau_p}^{*(i_1i_2)}-I_{(10)\tau_{p+1},\tau_p}^{*(i_1i_2)q}\right)^2\right\}=\frac{\Delta^4}{12}-\sum_{j_1,j_2=0}^{q}\left(C_{j_2j_1}^{10}\right)^2,
$$

$$
{\sf M}\left\{\left(I_{(000)\tau_{p+1},\tau_p}^{*(i_1i_2i_3)}-I_{(000)\tau_{p+1},\tau_p}^{*(i_1i_2i_3)q}\right)^2\right\}=\frac{\Delta^3}{6}-\sum_{j_3,j_2,j_1=0}^{q}C_{j_3j_2j_1}^2,
$$

$$
{\sf M}\left\{\left(I_{(0000)\tau_{p+1},\tau_p}^{*(i_1i_2i_3i_4)}-I_{(0000)\tau_{p+1},\tau_p}^{*(i_1i_2i_3i_4)q}\right)^2\right\}=\frac{\Delta^4}{24}-\sum_{j_1,j_2,j_3,j_4=0}^{q}C_{j_4j_3j_2j_1}^2,
$$

$$
{\sf M}\left\{\left(I_{(100)\tau_{p+1},\tau_p}^{*(i_1i_2i_3)}-I_{(100)\tau_{p+1},\tau_p}^{*(i_1i_2i_3)q}\right)^2\right\}=\frac{\Delta^5}{60}-\sum_{j_1,j_2,j_3=0}^{q}\left(C_{j_3j_2j_1}^{100}\right)^2,
$$

$$
{\sf M}\left\{\left(I_{(010)\tau_{p+1},\tau_p}^{*(i_1i_2i_3)}-I_{(010)\tau_{p+1},\tau_p}^{*(i_1i_2i_3)q}\right)^2\right\}=\frac{\Delta^5}{20}-\sum_{j_1,j_2,j_3=0}^{q}\left(C_{j_3j_2j_1}^{010}\right)^2,
$$

$$
{\sf M}\left\{\left(I_{(001)\tau_{p+1},\tau_p}^{*(i_1i_2i_3)}-I_{(001)\tau_{p+1},\tau_p}^{*(i_1i_2i_3)q}\right)^2\right\}=\frac{\Delta^5}{10}-\sum_{j_1,j_2,j_3=0}^{q}\left(C_{j_3j_2j_1}^{001}\right)^2,
$$

$$
{\sf M}\left\{\left(I_{(00000)\tau_{p+1},\tau_p}^{*(i_1i_2i_3i_4i_5)}-I_{(00000)\tau_{p+1},\tau_p}^{*(i_1i_2i_3i_4i_5)q}\right)^2\right\}=\frac{\Delta^5}{120}-\sum_{j_1,j_2,j_3,j_4,j_5=0}^{q}C_{j_5i_4i_3i_2j_1}^2.
$$

For example [11]-[25],

$$\mathsf{M}\left\{\left(I_{(000)\tau_{p+1},\tau_p}^{*(i_1i_2i_3)}-I_{(000)\tau_{p+1},\tau_p}^{*(i_1i_2i_3)6}\right)^2\right\}=\frac{\Delta^3}{6}-\sum_{j_3,j_2,j_1=0}^{6}C_{j_3j_2j_1}^2\approx 0.01956000\Delta^3,$$

$$\mathsf{M}\left\{\left(I_{(100)\tau_{p+1},\tau_p}^{*(i_1i_2i_3)}-I_{(100)\tau_{p+1},\tau_p}^{*(i_1i_2i_3)2}\right)^2\right\}=\frac{\Delta^5}{60}-\sum_{j_1,j_2,j_3=0}^{2}\left(C_{j_3j_2j_1}^{100}\right)^2\approx 0.00815429\Delta^5,$$

$$\mathsf{M}\left\{\left(I_{(010)\tau_{p+1},\tau_p}^{*(i_1i_2i_3)}-I_{(010)\tau_{p+1},\tau_p}^{*(i_1i_2i_3)2}\right)^2\right\}=\frac{\Delta^5}{20}-\sum_{j_1,j_2,j_3=0}^{2}\left(C_{j_3j_2j_1}^{010}\right)^2\approx 0.01739030\Delta^5,$$

$$\mathsf{M}\left\{\left(I_{(001)\tau_{p+1},\tau_p}^{*(i_1i_2i_3)}-I_{(001)\tau_{p+1},\tau_p}^{*(i_1i_2i_3)2}\right)^2\right\}=\frac{\Delta^5}{10}-\sum_{j_1,j_2,j_3=0}^{2}\left(C_{j_3j_2j_1}^{001}\right)^2\approx 0.02528010\Delta^5,$$

$$\mathsf{M}\left\{\left(I_{(0000)\tau_{p+1},\tau_p}^{*(i_1i_2i_3i_4)}-I_{(0000)\tau_{p+1},\tau_p}^{*(i_1i_2i_3i_4)2}\right)^2\right\}=\frac{\Delta^4}{24}-\sum_{j_1,j_2,j_3,j_4=0}^{2}C_{j_4j_3j_2j_1}^2\approx 0.02360840\Delta^4,$$

$$\mathsf{M}\left\{\left(I_{(00000)\tau_{p+1},\tau_p}^{*(i_1i_2i_3i_4i_5)}-I_{(00000)\tau_{p+1},\tau_p}^{*(i_1i_2i_3i_4i_5)1}\right)^2\right\}=\frac{\Delta^5}{120}-\sum_{j_1,j_2,j_3,j_4,j_5=0}^{1}C_{j_5i_4i_3i_2j_1}^2\approx 0.00759105\Delta^5.$$

STRONG NUMERICAL METHODS OF ORDERS 2.0, 2.5, AND 3.0 FOR ITO STOCHASTIC DIFFERENTIAL EQUATIONS BASED ON THE UNIFIED STOCHASTIC TAYLOR EXPANSIONS AND MULTIPLE FOURIER–LEGENDRE SERIES

DMITRIY F. KUZNETSOV

Abstract. The article is devoted to the construction of explicit one-step strong numerical methods with the orders of convergence 2.0, 2,5, and 3.0 for Ito stochastic differential equations with multidimensional non-commutative noise. We consider the numerical methods based on the unified Taylor–Ito and Taylor–Stratonovich expansions. For numerical modeling of iterated Ito and Stratonovich stochastic integrals of multiplicities 1 to 6 we apply the method of multiple Fourier–Legendre series converging in the sense of norm in Hilbert space $L_2([t,T]^k)$, $k=1,\ldots,6$. The article is addressed to engineers who use numerical modeling in stochastic control and for solving the non-linear filtering problem. The article can be interesting for mathematicians who working in the field of high-order strong numerical methods for Ito stochastic differential equations.

Mathematics Subject Classification: 60H05, 60H10, 42B05, 42C10.
Keywords: Explicit one-step strong numerical method, Unified Taylor–Ito expansion, Unified Taylor–Stratonovich expansion, Iterated Ito stochastic integral, Iterated Stratonovich stochastic integral, Method of generalized multiple Fourier series, Multiple Fourier–Legendre series, Strong convergence, Mean-square convergence, Approximation, Expansion.

1. Introduction

Let $(\Omega, \mathrm{F}, \mathsf{P})$ be a complete probability space, let $\{\mathrm{F}_t, t \in [0,T]\}$ be a nondecreasing right-continous family of σ-algebras of F, and let $\mathbf{f}_t$ be a standard m-dimensional Wiener stochastic process, which is F_t-measurable for any $t \in [0,T]$. We assume that the components $\mathbf{f}_t^{(i)}$ $(i = 1, \ldots, m)$ of this process are independent. Consider an Ito stochastic differential equation (SDE) in the integral form

$$\mathbf{x}_t = \mathbf{x}_0 + \int\limits_0^t \mathbf{a}(\mathbf{x}_\tau, \tau) d\tau + \int\limits_0^t \Sigma(\mathbf{x}_\tau, \tau) d\mathbf{f}_\tau, \ \ \mathbf{x}_0 = \mathbf{x}(0, \omega). \tag{1}$$

Here $\mathbf{x}_t$ is some n-dimensional stochastic process satisfying the equation (1). The nonrandom functions $\mathbf{a} : \mathbb{R}^n \times [0,T] \to \mathbb{R}^n$, $\Sigma : \mathbb{R}^n \times [0,T] \to \mathbb{R}^{n \times m}$ guarantee the existence and uniqueness up to stochastic equivalence of a solution of the equation (1) [1]. The second integral on the right-hand side of (1) is interpreted as the Ito stochastic integral. Let $\mathbf{x}_0$ be an n-dimensional random variable, which is F_0-measurable and $\mathsf{M}\{|\mathbf{x}_0|^2\} < \infty$ (M denotes a mathematical expectation). We assume that $\mathbf{x}_0$ and $\mathbf{f}_t - \mathbf{f}_0$ are independent when $t > 0$.

It is well known [2]-[5] that Ito SDEs are adequate mathematical models of dynamic systems of different physical nature under the influence of random disturbances. One of the effective approaches to the numerical integration of Ito SDEs is an approach based on the Taylor–Ito and Taylor–Stratonovich expansions [2]-[10]. The most important feature of such expansions is a presence in them of the so-called iterated Ito and Stratonovich stochastic integrals, which play the key role for solving the problem of numerical integration of Ito SDEs and have the following form

$$J[\psi^{(k)}]_{T,t} = \int\limits_t^T \psi_k(t_k) \ldots \int\limits_t^{t_2} \psi_1(t_1) d\mathbf{w}_{t_1}^{(i_1)} \ldots d\mathbf{w}_{t_k}^{(i_k)}, \tag{2}$$

$$J^*[\psi^{(k)}]_{T,t} = \int\limits_t^{*T} \psi_k(t_k) \ldots \int\limits_t^{*t_2} \psi_1(t_1) d\mathbf{w}_{t_1}^{(i_1)} \ldots d\mathbf{w}_{t_k}^{(i_k)}, \tag{3}$$

where every $\psi_l(\tau)$ $(l = 1, \ldots, k)$ is a non-random function on $[t,T]$, $\mathbf{w}_\tau^{(i)} = \mathbf{f}_\tau^{(i)}$ for $i = 1, \ldots, m$ and $\mathbf{w}_\tau^{(0)} = \tau$, $i_1, \ldots, i_k = 0, 1, \ldots, m$,

$$\int \ \text{and} \ \int\limits^{*}$$

denote Ito and Stratonovich stochastic integrals, respectively (in this paper, we use the definition of the Stratonovich stochastic integral from [2]).

Note that $\psi_l(\tau) \equiv 1$ $(l = 1, \ldots, k)$ and $i_1, \ldots, i_k = 0, 1, \ldots, m$ in [2]-[4], [6], [7]. At the same time $\psi_l(\tau) \equiv (t - \tau)^{q_l}$ $(l = 1, \ldots, k;\ q_1, \ldots, q_k = 0, 1, 2, \ldots)$ and $i_1, \ldots, i_k = 1, \ldots, m$ in [8]-[10].

Effective solution of the problem of combined mean-square approximation of the iterated Ito and Stratonovich stochastic integrals (2) and (3) of multiplicities 1 to 6 composes one of the subjects of this article.

We want to mention in short that there are two main criteria of numerical methods convergence for Ito SDEs [2]-[4]: a strong or mean-square criterion and a weak criterion where the subject of approximation is not the solution of Ito SDE, simply stated, but the distribution of Ito SDE solution.

Using strong numerical methods, we may build sample pathes of Ito SDEs numerically. These methods require combined mean-square approximation of the iterated Ito and Stratonovich stochastic integrals (2) and (3).

Also numerical integration of Ito SDEs based on the strong convergence criterion of approximation is widely used for the numerical solution of different mathematical problems connected with Ito SDEs. Among these problems, we note the following: signal filtering under influence of random noises in various statements, optimal stochastic control, testing estimation procedures of parameters of stochastic systems, stochastic stability and bifurcations analysis [2]-[4].

The problem of effective jointly numerical modeling (in accordance to the mean-square convergence criterion) of the iterated Ito and Stratonovich stochastic integrals (2) and (3) is difficult from theoretical and computing point of view [2]-[66].

The only exception is connected with a narrow particular case, when $i_1 = \ldots = i_k \neq 0$ and $\psi_1(s), \ldots, \psi_k(s) \equiv \psi(s)$. This case allows the investigation with using of the Ito formula [2]-[4].

Note that even for the mentioned coincidence ($i_1 = \ldots = i_k \neq 0$), but for different functions $\psi_1(s), \ldots, \psi_k(s)$ the mentioned difficulties persist, and relatively simple families of iterated Ito and Stratonovich stochastic integrals, which can be often met in the applications, cannot be represented effectively in a finite form (for the mean-square approximation) using the system of standard Gaussian random variables.

Note that for a number of special types of Ito SDEs the problem of approximation of iterated stochastic integrals can be simplified but cannot be solved. The equations with additive scalar noise, with additive vector noise, with non-additive scalar noise, with a small parameter are related to such types of equations [2]-[4]. For the mentioned types of equations, simplifications are connected with the fact that either some coefficient functions from stochastic analogues of the Taylor formula identically equal to zero, or scalar noise has a strong effect, or due to the presence of a small parameter we may neglect some members from the stochastic analogues of the Taylor formula, which include difficult for approximation iterated stochastic integrals [2]-[4], [13]. In this article, we consider Ito SDEs with multidimensional, non-additive and non-commutative noise.

Seems that iterated stochastic integrals may be approximated by multiple integral sums of different types [3], [4], [14]. However, this approach implies partitioning of the interval of integration $[t, T]$ of iterated stochastic integrals (the length $T - t$ of this interval is a small value, because it is a step of integration of numerical methods for Ito SDEs) and according to numerical experiments this additional partitioning leads to significant calculating costs [5].

In [3] (also see [2], [4], [12], [13]), Milstein proposed to expand (2) or (3) into iterated series in terms of products of standard Gaussian random variables by representing the Wiener process as a trigonometric Fourier series with random coefficients (the version of the so-called Karhunen–Loeve expansion of the Brownian bridge process). To obtain the Milstein expansion of (3), the truncated Fourier expansions of components of the Wiener process $\mathbf{f}_s$ must be iteratively substituted in the single integrals, and the integrals must be calculated, starting from the innermost integral. This is a complicated procedure that does not lead to a general expansion of (3) valid for an arbitrary multiplicity k. For this reason, only expansions of single, double, and triple stochastic integrals of the form (3) were presented in [2], [11]-[13] ($k = 1, 2, 3$) and in [3], [4] ($k = 1, 2$) for the simplest case $\psi_1(s), \psi_2(s), \psi_3(s) \equiv 1$; $i_1, i_2, i_3 = 0, 1, \ldots, m$.

Moreover, in [2] (Sect. 5.8, pp. 202–204), [11] (pp. 82-84), [12] (pp. 438-439), [13] (pp. 263-264) the authors use (without rigorous proof) the Wong–Zakai approximation [67]-[69] within the frames of the Milstein approach [3] based on the Karhunen–Loeve expansion of the Brownian bridge process (see discussions in [54] (Sect. 2.18, 6.2), [55], [56] (Sect. 2.6.2, 6.2), [44]).

Note that in [66] the method of expansion of the iterated Ito stochastic integrals (2) ($k = 2$; $\psi_1(s), \psi_2(s) \equiv 1$; $i_1, i_2 = 1, \ldots, m$) based on expansion of the Wiener process using Haar functions and trigonometric functions has been considered.

It is necessary to note that the Milstein approach [3] excelled in several times or even in several orders the methods of multiple integral sums [3], [4], [14] considering computational costs in the sense of their diminishing.

An alternative strong approximation method was proposed for (3) in [15]-[17] (also see [24]-[30]), where $J^*[\psi^{(k)}]_{T,t}$ was represented as a multiple stochastic integral from the certain discontinuous non-random function of k variables, and the function was then expressed as an iterated generalized Fourier series in a complete systems of continuous functions that are orthonormal in $L_2([t,T])$. In [15]-[17] (also see [24]-[30]) the cases of Legendre polynomials and trigonometric functions are considered in details. As a result, a general iterated series expansion of (3) in terms of products of standard Gaussian random variables was obtained in [15]-[17] (also see [24]-[30]) for an arbitrary multiplicity k. Hereinafter, this method is referred to as the method of generalized iterated Fourier series.

It was shown in [15], [16] (also see [18]-[28]) that the method of generalized iterated Fourier series leads to the Milstein expansion [3] of (3) in the case of trigonometric functions (at least for $k=2$; $\psi_1(s),\psi_2(s)\equiv 1$; $i_1,i_2=1,\ldots,m$) and to a substantially simpler expansion of (3) in the case of Legendre polynomials.

Note that the method of generalized iterated Fourier series as well as the Milstein approach [3] lead to iterated application of the operation of limit transition. This problem appears for triple stochastic integrals ($i_1,i_2,i_3=1,\ldots,m$) or even for some double stochastic integrals in the case, when $\psi_1(\tau)$, $\psi_2(\tau)\not\equiv 1$ ($i_1,i_2=1,\ldots,m$) [15], [16] (also see [18]-[28]).

The mentioned problem (iterated application of the operation of limit transition) not appears in the method, which is considered for (2) in Theorems 1, 2 (see below) [5], [18]-[28], [31]-[56]. The idea of this method is as follows: the iterated Ito stochastic integral (2) of multiplicity k is represented as the multiple stochastic integral from the certain discontinuous non-random function of k variables defined on the hypercube $[t,T]^k$, where $[t,T]$ is the interval of integration of the iterated Ito stochastic integral (2). Then, the indicated non-random function of k variables is expanded in the hypercube into the generalized multiple Fourier series converging in the mean-square sense in the space $L_2([t,T]^k)$. After a number of nontrivial transformations we come (see Theorems 1, 2 below) to the mean-square converging expansion of the iterated Ito stochastic integral (2) into the multiple series in terms of products of standard Gaussian random variables. The coefficients of this series are the coefficients of generalized multiple Fourier series for the mentioned non-random function of k variables, which can be calculated using the explicit formula regardless of the multiplicity k of the iterated Ito stochastic integral (2). Hereinafter, this method is referred to as the method of generalized multiple Fourier series.

Thus, we obtain the following useful possibilities of the method of generalized multiple Fourier series.

1. There is the explicit formula (see (8)) for calculation of expansion coefficients of the iterated Ito stochastic integral (2) with any fixed multiplicity k.

2. We have new possibilities for exact calculation of the mean-square error of approximation of the iterated Ito stochastic integral (2) (see [19], [20], [31]-[34], [36], [37], [39], [54]-[56]).

3. Since the used multiple Fourier series is a generalized in the sense that it is built using various complete orthonormal systems of functions in the space $L_2([t,T])$, then we have new possibilities for approximation — we may use not only the trigonometric functions as in [2]-[4] but the Legendre polynomials.

4. As it turned out (see [5], [15], [16], [18]-[37], [40], [42], [45], [46], [50]-[52], [54]-[56]), it is more convenient to work with Legendre polynomials for constructing of approximations of the iterated Ito stochastic integrals (2). Approximations based on the Legendre polynomials essentially simpler than their analogues based on the trigonometric functions. Another advantages of Legendre polynomials in the framework of the mentioned problem are considered in [34], [52], [54]-[56].

5. The approach based on the Karhunen–Loeve expansion of the Brownian bridge process (also see [66]) leads to iterated application of the operation of limit transition (the operation of limit transition is implemented only once in Theorems 1, 2 (see below)) starting from the second multiplicity (in the general case) and third multiplicity (for the case $\psi_1(s),\psi_2(s),\psi_3(s)\equiv 1$; $i_1,i_2,i_3=1,\ldots,m$) of iterated Ito stochastic integrals. Multiple series (the operation of limit transition is implemented only once) are more convenient for approximation than the iterated ones (iterated application of the operation of limit transition), since partial sums of multiple series converge for any possible case of convergence to infinity of their upper limits of summation (let us denote them as $p_1,\ldots,p_k$). For

example, when $p_1=\ldots=p_k=p\to\infty$. For iterated series, the condition $p_1=\ldots=p_k=p\to\infty$ obviously does not guarantee the convergence of this series.

However, the authors of the works [2] (Sect. 5.8, pp. 202–204), [11] (pp. 82-84), [12] (pp. 438-439), [13] (pp. 263-264) unreasonably use the condition $p_1=p_2=p_3=p\to\infty$ within the frames of the Milstein approach [3] based on the series expansion of the Brownian bridge process together with the Wong–Zakai approximation [67]-[69].

2. Explicit One-Step Strong Numerical Schemes of Orders 2.0, 2.5, and 3.0 Based on the Unified Taylor–Ito expansion

Consider the partition $\{\tau_j\}_{j=0}^N$ of the interval $[0,\bar T]$ such that

$$0=\tau_0<\ldots<\tau_N=\bar T,\quad \Delta_N=\max_{0\le j\le N-1}\Delta\tau_j,\quad \Delta\tau_j=\tau_{j+1}-\tau_j.$$

Let $\mathbf{y}_{\tau_j}\stackrel{\sf def}{=}\mathbf{y}_j;\ j=0,1,\ldots,N$ be a time discrete approximation of the process $\mathbf{x}_s$, $s\in[0,\bar T]$, which is a solution of the Ito SDE (1).

Definition 1 [2]. *We will say that a time discrete approximation* $\mathbf{y}_j;\ j=0,1,\ldots,N$, *corresponding to the maximal step of discretization* Δ_N, *converges strongly with order* $\gamma>0$ *at time moment* $\bar T$ *to the process* $\mathbf{x}_s$, $s\in[0,\bar T]$ *if there exists a constant* $C>0$, *which does not depend on* Δ_N, *and a* $\delta>0$ *such that*

$${\sf M}\{|\mathbf{x}_{\bar T}-\mathbf{y}_{\bar T}|\}\le C(\Delta_N)^{\gamma}$$

for each $\Delta_N\in(0,\delta)$.

Consider the following explicit one-step strong numerical scheme of order 3.0 based on the so-called unified Taylor–Ito expansion [5], [10], [19]-[24], [54]-[56]

$$\mathbf{y}_{p+1}=\mathbf{y}_p+\sum_{i_1=1}^m\Sigma_{i_1}\hat I_{0_{\tau_{p+1},\tau_p}}^{(i_1)}+\Delta\mathbf{a}+\sum_{i_1,i_2=1}^m G_0^{(i_2)}\Sigma_{i_1}\hat I_{00_{\tau_{p+1},\tau_p}}^{(i_2i_1)}+$$

$$+\sum_{i_1=1}^m\left[G_0^{(i_1)}\mathbf{a}\left(\Delta\hat I_{0_{\tau_{p+1},\tau_p}}^{(i_1)}+\hat I_{1_{\tau_{p+1},\tau_p}}^{(i_1)}\right)-L\Sigma_{i_1}\hat I_{1_{\tau_{p+1},\tau_p}}^{(i_1)}\right]+$$

$$+\sum_{i_1,i_2,i_3=1}^m G_0^{(i_3)}G_0^{(i_2)}\Sigma_{i_1}\hat I_{000_{\tau_{p+1},\tau_p}}^{(i_3i_2i_1)}+\frac{\Delta^2}{2}L\mathbf{a}+$$

$$+\sum_{i_1,i_2=1}^m\left[G_0^{(i_2)}L\Sigma_{i_1}\left(\hat I_{10_{\tau_{p+1},\tau_p}}^{(i_2i_1)}-\hat I_{01_{\tau_{p+1},\tau_p}}^{(i_2i_1)}\right)-LG_0^{(i_2)}\Sigma_{i_1}\hat I_{10_{\tau_{p+1},\tau_p}}^{(i_2i_1)}+\right.$$

$$\left.+G_0^{(i_2)}G_0^{(i_1)}\mathbf{a}\left(\hat I_{01_{\tau_{p+1},\tau_p}}^{(i_2i_1)}+\Delta\hat I_{00_{\tau_{p+1},\tau_p}}^{(i_2i_1)}\right)\right]+$$

$$+\sum_{i_1,i_2,i_3,i_4=1}^m G_0^{(i_4)}G_0^{(i_3)}G_0^{(i_2)}\Sigma_{i_1}\hat I_{0000_{\tau_{p+1},\tau_p}}^{(i_4i_3i_2i_1)}+\mathbf{u}_{p+1,p}+\mathbf{v}_{p+1,p},\tag{4}$$

$$\mathbf{u}_{p+1,p}=\sum_{i_1=1}^{m}\Biggl[G_0^{(i_1)}L\mathbf{a}\left(\frac{1}{2}\hat I_{2_{\tau_{p+1},\tau_p}}^{(i_1)}+\Delta\hat I_{1_{\tau_{p+1},\tau_p}}^{(i_1)}+\frac{\Delta^2}{2}\hat I_{0_{\tau_{p+1},\tau_p}}^{(i_1)}\right)+$$

$$+\frac{1}{2}LL\Sigma_{i_1}\hat I_{2_{\tau_{p+1},\tau_p}}^{(i_1)}-LG_0^{(i_1)}\mathbf{a}\left(\hat I_{2_{\tau_{p+1},\tau_p}}^{(i_1)}+\Delta\hat I_{1_{\tau_{p+1},\tau_p}}^{(i_1)}\right)\Biggr]+$$

$$+\sum_{i_1,i_2,i_3=1}^{m}\Biggl[G_0^{(i_3)}LG_0^{(i_2)}\Sigma_{i_1}\left(\hat I_{100_{\tau_{p+1},\tau_p}}^{(i_3i_2i_1)}-\hat I_{010_{\tau_{p+1},\tau_p}}^{(i_3i_2i_1)}\right)+$$

$$+G_0^{(i_3)}G_0^{(i_2)}L\Sigma_{i_1}\left(\hat I_{010_{\tau_{p+1},\tau_p}}^{(i_3i_2i_1)}-\hat I_{001_{\tau_{p+1},\tau_p}}^{(i_3i_2i_1)}\right)+$$

$$+G_0^{(i_3)}G_0^{(i_2)}G_0^{(i_1)}\mathbf{a}\left(\Delta\hat I_{000_{\tau_{p+1},\tau_p}}^{(i_3i_2i_1)}+\hat I_{001_{\tau_{p+1},\tau_p}}^{(i_3i_2i_1)}\right)-$$

$$-LG_0^{(i_3)}G_0^{(i_2)}\Sigma_{i_1}\hat I_{100_{\tau_{p+1},\tau_p}}^{(i_3i_2i_1)}\Biggr]+$$

are calculated at the point $(\mathbf{y}_p,p)$.

It is well known [2] that under the standard conditions the numerical scheme (4) has strong order of convergence 3.0. Among these conditions we consider only the condition for approximations of iterated Ito stochastic integrals from the numerical scheme (4) [2], [5]

$$\mathsf{M}\left\{\left(I_{l_1\ldots l_k\,\tau_{p+1},\tau_p}^{(i_1\ldots i_k)}-\hat{I}_{l_1\ldots l_k\,\tau_{p+1},\tau_p}^{(i_1\ldots i_k)}\right)^2\right\}\le C\Delta^7, \tag{6}$$

where $\hat{I}^{(i_1\ldots i_k)}_{l_1\ldots l_k\,\tau_{p+1},\tau_p}$ is an approximation of $I^{(i_1\ldots i_k)}_{l_1\ldots l_k\,\tau_{p+1},\tau_p}$, constant C does not depend on Δ.

Note that if we exclude $\mathbf{u}_{p+1,p}+\mathbf{v}_{p+1,p}$ from the right-hand side of (4), then we will have the explicit one-step strong numerical scheme of order 2.0. The right-hand side of (4) but without the value $\mathbf{v}_{p+1,p}$ define the explicit one-step strong numerical scheme of order 2.5.

Note that the truncated unified Taylor–Ito expansion [5], [8], [10], [16], [18]-[28], [54]-[56] contains the less number of various types of iterated Ito stochastic integrals (moreover, their major part will have less multiplicities) in comparison with the classical Taylor–Ito expansion [2], [7].

Furthermore, some iterated Ito stochastic integrals from the Taylor–Ito expansion [2], [7] are connected by linear relations. However, the iterated stochastic integrals from the unified Taylor–Ito expansion [5], [8], [10], [16], [18]-[28], [54]-[56] cannot be connected by linear relations. Therefore, we call these families of stochastic integrals from the unified Taylor–Ito expansion as the stochastic bases [5], [10], [54]-[56]. Note that (4) contains 20 different types of iterated Ito stochastic integrals. At the same time, the analogue of (4) based on the classical Taylor–Ito expansion [2], [7] contains 29 different types of iterated Ito stochastic integrals.

3. Approximation of iterated Ito Stochastic Integrals Based on Multiple Fourier–Legendre Series

Suppose that every $\psi_l(\tau)$ $(l=1,\ldots,k)$ is a non-random function from the space $L_2([t,T])$. Define the following function on the hypercube $[t,T]^k$

$$K(t_1,\ldots,t_k)=\begin{cases}\psi_1(t_1)\ldots\psi_k(t_k) & \text{for}\ \ t_1<\ldots<t_k\\ \\ 0 & \text{otherwise}\end{cases},\qquad t_1,\ldots,t_k\in[t,T],\qquad k\ge 2, \tag{7}$$

and $K(t_1)\equiv\psi_1(t_1)$ for $t_1\in[t,T]$.

Suppose that $\{\phi_j(x)\}_{j=0}^{\infty}$ is a complete orthonormal system of functions in the space $L_2([t,T])$. The function $K(t_1,\ldots,t_k)$ belongs to the space $L_2([t,T]^k)$. At this situation it is well known that the generalized multiple Fourier series of $K(t_1,\ldots,t_k)\in L_2([t,T]^k)$ is converging to $K(t_1,\ldots,t_k)$ in the hypercube $[t,T]^k$ in the mean-square sense, i.e.

$$\lim_{p_1,\ldots,p_k\to\infty}\left\|K(t_1,\ldots,t_k)-\sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k}C_{j_k\ldots j_1}\prod_{l=1}^{k}\phi_{j_l}(t_l)\right\|_{L_2([t,T]^k)}=0,$$

where

$$C_{j_k\ldots j_1}=\int\limits_{[t,T]^k}K(t_1,\ldots,t_k)\prod_{l=1}^{k}\phi_{j_l}(t_l)dt_1\ldots dt_k, \tag{8}$$

$$\|f\|=\left(\int\limits_{[t,T]^k}f^2(t_1,\ldots,t_k)dt_1\ldots dt_k\right)^{1/2}.$$

Consider the partition $\{\tau_j\}_{j=0}^{N}$ of $[t,T]$ such that

$$t=\tau_0<\ldots<\tau_N=T,\quad \Delta_N=\max_{0\le j\le N-1}\Delta\tau_j\to 0\ \ \text{if}\ \ N\to\infty,\quad \Delta\tau_j=\tau_{j+1}-\tau_j. \tag{9}$$

Theorem 1 [5] (2006), [18]-[28], [31]-[56]. *Suppose that every $\psi_l(\tau)$ $(l=1,\ldots,k)$ is a continuous non-random function on $[t,T]$ and $\{\phi_j(x)\}_{j=0}^{\infty}$ is a complete orthonormal system of continuous functions in the space $L_2([t,T])$. Then*

$$J[\psi^{(k)}]_{T,t} = \underset{p_1,\ldots,p_k\to\infty}{\text{l.i.m.}} \sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k} C_{j_k\ldots j_1}\Biggl(\prod_{l=1}^{k}\zeta_{j_l}^{(i_l)} -$$

$$- \underset{N\to\infty}{\text{l.i.m.}} \sum_{(l_1,\ldots,l_k)\in \mathrm{G}_k} \phi_{j_1}(\tau_{l_1})\Delta\mathbf{w}_{\tau_{l_1}}^{(i_1)}\ldots\phi_{j_k}(\tau_{l_k})\Delta\mathbf{w}_{\tau_{l_k}}^{(i_k)}\Biggr), \qquad (10)$$

where $J[\psi^{(k)}]_{T,t}$ is defined by (2),

$$\mathrm{G}_k = \mathrm{H}_k\backslash\mathrm{L}_k,\quad \mathrm{H}_k = \{(l_1,\ldots,l_k):\ l_1,\ldots,l_k = 0,\ 1,\ldots,N-1\},$$

$$\mathrm{L}_k = \{(l_1,\ldots,l_k):\ l_1,\ldots,l_k = 0,\ 1,\ldots,N-1;\ l_g\ne l_r\ (g\ne r);\ g,r=1,\ldots,k\},$$

l.i.m. *is a limit in the mean-square sense, $i_1,\ldots,i_k = 0,1,\ldots,m,$*

$$\zeta_j^{(i)} = \int\limits_t^T \phi_j(s)d\mathbf{w}_s^{(i)} \qquad (11)$$

are independent standard Gaussian random variables for various i or j (if $i\ne 0$), $C_{j_k\ldots j_1}$ is the Fourier coefficient (8), $\Delta\mathbf{w}_{\tau_j}^{(i)} = \mathbf{w}_{\tau_{j+1}}^{(i)} - \mathbf{w}_{\tau_j}^{(i)}$ $(i=0,1,\ldots,m)$, $\{\tau_j\}_{j=0}^{N}$ is a partition of the interval $[t,T]$, which satisfies the condition (9).

The convergence in the mean of degree $2n$ $(n\in\mathbb{N})$ [18]-[20], [22]-[28], [54]-[56] as well as the convergence with probability 1 [38], [40], [54]-[56] of approximations from Theorem 1 are proved. Moreover, the complete orthonormal systems of Haar and Rademacher–Walsh functions in $L_2([t,T])$ can also be applied in Theorem 1 [5], [18]-[28], [54]-[56]. The modification of Theorem 1 for complete orthonormal with weigth $r(x)\ge 0$ systems of functions in the space $L_2([t,T])$ can be found in [20], [53]-[56]. Application of Theorem 1 and Theorem 2 (see below) for the mean-square approximation of iterated stochastic integrals with respect to the infinite-dimensional Q-Wiener process can be found in the monographs [54]-[56] (Chapter 7) and in [36], [37], [58], [62]-[64].

In order to evaluate the significance of Theorem 1 for practice we will demonstrate its transformed particular cases for $k=1,\ldots,6$ [5], [18]-[28], [31]-[56]

$$J[\psi^{(1)}]_{T,t} = \underset{p_1\to\infty}{\text{l.i.m.}} \sum_{j_1=0}^{p_1} C_{j_1}\zeta_{j_1}^{(i_1)}, \qquad (12)$$

$$J[\psi^{(2)}]_{T,t} = \underset{p_1,p_2\to\infty}{\text{l.i.m.}} \sum_{j_1=0}^{p_1}\sum_{j_2=0}^{p_2} C_{j_2j_1}\Biggl(\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)} - \mathbf{1}_{\{i_1=i_2\ne 0\}}\mathbf{1}_{\{j_1=j_2\}}\Biggr), \qquad (13)$$

$$J[\psi^{(3)}]_{T,t} = \underset{p_1,\ldots,p_3\to\infty}{\text{l.i.m.}} \sum_{j_1=0}^{p_1}\sum_{j_2=0}^{p_2}\sum_{j_3=0}^{p_3} C_{j_3j_2j_1}\Biggl(\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}\zeta_{j_3}^{(i_3)} -$$

$$
-\mathbf{1}_{\{i_1=i_2\ne 0\}}\mathbf{1}_{\{j_1=j_2\}}\zeta_{j_3}^{(i_3)}-\mathbf{1}_{\{i_2=i_3\ne 0\}}\mathbf{1}_{\{j_2=j_3\}}\zeta_{j_1}^{(i_1)}-\mathbf{1}_{\{i_1=i_3\ne 0\}}\mathbf{1}_{\{j_1=j_3\}}\zeta_{j_2}^{(i_2)}\Biggr), \qquad (14)
$$

$$
\begin{aligned}

$$-\mathbf{1}_{\{i_6=i_5\ne 0\}}\mathbf{1}_{\{j_6=j_5\}}\mathbf{1}_{\{i_1=i_3\ne 0\}}\mathbf{1}_{\{j_1=j_3\}}\mathbf{1}_{\{i_2=i_4\ne 0\}}\mathbf{1}_{\{j_2=j_4\}}\Biggr), \tag{17}$$

where $\mathbf{1}_A$ is the indicator of the set A.

Note that we will consider the case $i_1,\ldots,i_6=1,\ldots,m$. This case corresponds to the numerical method (4).

For further consideration, let us consider the generalization of formulas (12)–(17) for the case of an arbitrary multiplicity k ($k\in\mathbb{N}$) of the iterated Ito stochastic integral $J[\psi^{(k)}]_{T,t}$ defined by (2). In order to do this, let us introduce some notations. Consider the unordered set $\{1,2,\ldots,k\}$ and separate it into two parts: the first part consists of r unordered pairs (sequence order of these pairs is also unimportant) and the second one consists of the remaining $k-2r$ numbers. So, we have

$$(\{\underbrace{\{g_1,g_2\},\ldots,\{g_{2r-1},g_{2r}\}}_{\text{part 1}}\},\{\underbrace{q_1,\ldots,q_{k-2r}}_{\text{part 2}}\}), \tag{18}$$

where $\{g_1,g_2,\ldots,g_{2r-1},g_{2r},q_1,\ldots,q_{k-2r}\}=\{1,2,\ldots,k\}$, braces mean an unordered set, and parentheses mean an ordered set.

We will say that (18) is a partition and consider the sum with respect to all possible partitions

$$\sum_{\substack{(\{\{g_1,g_2\},\ldots,\{g_{2r-1},g_{2r}\}\},\{q_1,\ldots,q_{k-2r}\})\\ \{g_1,g_2,\ldots,g_{2r-1},g_{2r},q_1,\ldots,q_{k-2r}\}=\{1,2,\ldots,k\}}} a_{g_1g_2,\ldots,g_{2r-1}g_{2r},q_1\ldots q_{k-2r}}. \tag{19}$$

Below there are several examples of sums in the form (19)

$$\sum_{\substack{(\{g_1,g_2\})\\ \{g_1,g_2\}=\{1,2\}}} a_{g_1g_2}=a_{12},$$

$$\sum_{\substack{(\{\{g_1,g_2\},\{g_3,g_4\}\})\\ \{g_1,g_2,g_3,g_4\}=\{1,2,3,4\}}} a_{g_1g_2g_3g_4}=a_{1234}+a_{1324}+a_{2314},$$

$$\sum_{\substack{(\{g_1,g_2\},\{q_1,q_2\})\\ \{g_1,g_2,q_1,q_2\}=\{1,2,3,4\}}} a_{g_1g_2,q_1q_2}=$$

$$=a_{12,34}+a_{13,24}+a_{14,23}+a_{23,14}+a_{24,13}+a_{34,12},$$

$$\sum_{\substack{(\{g_1,g_2\},\{q_1,q_2,q_3\})\\ \{g_1,g_2,q_1,q_2,q_3\}=\{1,2,3,4,5\}}} a_{g_1g_2,q_1q_2q_3} =$$

$$= a_{12,345} + a_{13,245} + a_{14,235} + a_{15,234} + a_{23,145} + a_{24,135} +$$
$$+ a_{25,134} + a_{34,125} + a_{35,124} + a_{45,123},$$

$$\sum_{\substack{(\{\{g_1,g_2\},\{g_3,g_4\}\},\{q_1\})\\ \{g_1,g_2,g_3,g_4,q_1\}=\{1,2,3,4,5\}}} a_{g_1g_2,g_3g_4,q_1} =$$

$$= a_{12,34,5} + a_{13,24,5} + a_{14,23,5} + a_{12,35,4} + a_{13,25,4} + a_{15,23,4} + a_{12,54,3} + a_{15,24,3} + a_{14,25,3} +$$
$$+ a_{15,34,2} + a_{13,54,2} + a_{14,53,2} + a_{52,34,1} + a_{53,24,1} + a_{54,23,1}.$$

Now we can write (10) as

$$J[\psi^{(k)}]_{T,t} = \underset{p_1,\ldots,p_k\to\infty}{\text{l.i.m.}} \sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k} C_{j_k\ldots j_1}\Biggl(\prod_{l=1}^{k}\zeta_{j_l}^{(i_l)} + \sum_{r=1}^{[k/2]}(-1)^r \times$$

$$\times \sum_{\substack{(\{\{g_1,g_2\},\ldots,\{g_{2r-1},g_{2r}\}\},\{q_1,\ldots,q_{k-2r}\})\\ \{g_1,g_2,\ldots,g_{2r-1},g_{2r},q_1,\ldots,q_{k-2r}\}=\{1,2,\ldots,k\}}} \prod_{s=1}^{r} \mathbf{1}_{\{i_{g_{2s-1}}=\ i_{g_{2s}}\neq 0\}}\mathbf{1}_{\{j_{g_{2s-1}}=\ j_{g_{2s}}\}} \prod_{l=1}^{k-2r}\zeta_{j_{q_l}}^{(i_{q_l})}\Biggr), \tag{20}$$

where $[x]$ is an integer part of a real number x; another notations are the same as in Theorem **1**.

In particular, from (20) for $k=5$ we obtain

$$J[\psi^{(5)}]_{T,t} = \underset{p_1,\ldots,p_5\to\infty}{\text{l.i.m.}} \sum_{j_1=0}^{p_1}\ldots\sum_{j_5=0}^{p_5} C_{j_5\ldots j_1}\Biggl(\prod_{l=1}^{5}\zeta_{j_l}^{(i_l)} -$$

$$- \sum_{\substack{(\{g_1,g_2\},\{q_1,q_2,q_3\})\\ \{g_1,g_2,q_1,q_2,q_3\}=\{1,2,3,4,5\}}} \mathbf{1}_{\{i_{g_1}=\ i_{g_2}\neq 0\}}\mathbf{1}_{\{j_{g_1}=\ j_{g_2}\}} \prod_{l=1}^{3}\zeta_{j_{q_l}}^{(i_{q_l})} +$$

$$+ \sum_{\substack{(\{\{g_1,g_2\},\{g_3,g_4\}\},\{q_1\})\\ \{g_1,g_2,g_3,g_4,q_1\}=\{1,2,3,4,5\}}} \mathbf{1}_{\{i_{g_1}=\ i_{g_2}\neq 0\}}\mathbf{1}_{\{j_{g_1}=\ j_{g_2}\}}\mathbf{1}_{\{i_{g_3}=\ i_{g_4}\neq 0\}}\mathbf{1}_{\{j_{g_3}=\ j_{g_4}\}}\zeta_{j_{q_1}}^{(i_{q_1})}\Biggr).$$

The last equality obviously agrees with (16).

Let us consider the generalization of Theorem 1 for the case of an arbitrary complete orthonormal systems of functions in the space $L_2([t,T])$ and $\psi_1(\tau),\ldots,\psi_k(\tau)\in L_2([t,T])$.

Theorem 2 [54] (Sect. 1.11), [38] (Sect. 15). *Suppose that* $\psi_1(\tau),\ldots,\psi_k(\tau)\in L_2([t,T])$ *and* $\{\phi_j(x)\}_{j=0}^{\infty}$ *is an arbitrary complete orthonormal system of functions in the space* $L_2([t,T])$. *Then the following expansion*

$$J[\psi^{(k)}]_{T,t}=\underset{p_1,\ldots,p_k\to\infty}{\text{l.i.m.}}\sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k}C_{j_k\ldots j_1}\Biggl(\prod_{l=1}^{k}\zeta_{j_l}^{(i_l)}+\sum_{r=1}^{[k/2]}(-1)^r\times$$

$$\times\sum_{\substack{(\{\{g_1,g_2\},\ldots,\{g_{2r-1},g_{2r}\}\},\{q_1,\ldots,q_{k-2r}\})\\ \{g_1,g_2,\ldots,g_{2r-1},g_{2r},q_1,\ldots,q_{k-2r}\}=\{1,2,\ldots,k\}}}\prod_{s=1}^{r}\mathbf{1}_{\{i_{g_{2s-1}}=\ i_{g_{2s}}\ne 0\}}\mathbf{1}_{\{j_{g_{2s-1}}=\ j_{g_{2s}}\}}\prod_{l=1}^{k-2r}\zeta_{j_{q_l}}^{(i_{q_l})}\Biggr)\qquad(21)$$

converging in the mean-square sense is valid, where $[x]$ *is an integer part of a real number* x; *another notations are the same as in Theorem* 1.

It should be noted that an analogue of Theorem 2 was considered in [70]. Note that we use another notations [54] (Sect. 1.11), [38] (Sect. 15) in comparison with [70]. Moreover, the proof of an analogue of Theorem 2 from [70] is somewhat different from the proof given in [54] (Sect. 1.11), [38] (Sect. 15).

Let us consider the exact calculation and effective estimation of the mean-square error of approximation $J[\psi^{(k)}]_{T,t}^q$. Here $J[\psi^{(k)}]_{T,t}^q$ is the expression on the right-hand side of (21) before passing to the limit $\underset{p_1,\ldots,p_k\to\infty}{\text{l.i.m.}}$ for the case $p_1=\ldots=p_k=q$

$$J[\psi^{(k)}]_{T,t}^q=\sum_{j_1,\ldots,j_k=0}^{q}C_{j_k\ldots j_1}\Biggl(\prod_{l=1}^{k}\zeta_{j_l}^{(i_l)}+\sum_{r=1}^{[k/2]}(-1)^r\times$$

$$\times\sum_{\substack{(\{\{g_1,g_2\},\ldots,\{g_{2r-1},g_{2r}\}\},\{q_1,\ldots,q_{k-2r}\})\\ \{g_1,g_2,\ldots,g_{2r-1},g_{2r},q_1,\ldots,q_{k-2r}\}=\{1,2,\ldots,k\}}}\prod_{s=1}^{r}\mathbf{1}_{\{i_{g_{2s-1}}=\ i_{g_{2s}}\ne 0\}}\mathbf{1}_{\{j_{g_{2s-1}}=\ j_{g_{2s}}\}}\prod_{l=1}^{k-2r}\zeta_{j_{q_l}}^{(i_{q_l})}\Biggr),$$

where $[x]$ is an integer part of a real number x; another notations are the same as in Theorems 1, 2.

Let us denote

$$\mathsf{M}\left\{\left(J[\psi^{(k)}]_{T,t}-J[\psi^{(k)}]_{T,t}^q\right)^2\right\}\stackrel{\rm def}{=}E_k^q,\qquad\int\limits_{[t,T]^k}K^2(t_1,\ldots,t_k)dt_1\ldots dt_k\stackrel{\rm def}{=}I_k.$$

In [19], [20], [31], [39], [54]-[56] it was shown that

$$E_k^q\le k!\left(I_k-\sum_{j_1,\ldots,j_k=0}^{q}C_{j_k\ldots j_1}^2\right),\qquad(22)$$

where $i_1,\ldots,i_k=1,\ldots,m$ $(T-t\in(0,+\infty))$ or $i_1,\ldots,i_k=0,1,\ldots,m$ $(T-t\in(0,1))$.

The value E_k^q can be calculated exactly.

Theorem 3 [54] (Sect. 1.12), [39] (Sect. 6). *Suppose that* $\{\phi_j(x)\}_{j=0}^{\infty}$ *is an arbitrary complete orthonormal system of functions in the space* $L_2([t,T])$ *and* $\psi_1(\tau),\ldots,\psi_k(\tau)\in L_2([t,T])$, $i_1,\ldots,i_k=1,\ldots,m$. *Then*

(23) $$E_k^q = I_k - \sum_{j_1,\ldots,j_k=0}^{q} C_{j_k\ldots j_1} \mathsf{M}\left\{ J[\psi^{(k)}]_{T,t} \sum_{(j_1,\ldots,j_k)} \int\limits_t^T \phi_{j_k}(t_k)\ldots \int\limits_t^{t_2} \phi_{j_1}(t_1) d\mathbf{f}_{t_1}^{(i_1)} \ldots d\mathbf{f}_{t_k}^{(i_k)} \right\},$$

where $i_1,\ldots,i_k = 1,\ldots,m$; *the expression*

$$\sum_{(j_1,\ldots,j_k)}$$

means the sum with respect to all possible permutations $(j_1,\ldots,j_k)$. *At the same time if* j_r *swapped with* j_q *in the permutation* $(j_1,\ldots,j_k)$, *then* i_r *swapped with* i_q *in the permutation* $(i_1,\ldots,i_k)$; *another notations are the same as in Theorems* 1, 2.

Note that

$$\mathsf{M}\left\{ J[\psi^{(k)}]_{T,t} \int\limits_t^T \phi_{j_k}(t_k)\ldots \int\limits_t^{t_2} \phi_{j_1}(t_1) d\mathbf{f}_{t_1}^{(i_1)} \ldots d\mathbf{f}_{t_k}^{(i_k)} \right\} = C_{j_k\ldots j_1}.$$

Then from Theorem 3 for pairwise different $i_1,\ldots,i_k$ and for $i_1 = \ldots = i_k$ we obtain [20], [31], [39], [54]-[56]

(24) $$E_k^q = I_k - \sum_{j_1,\ldots,j_k=0}^{q} C^2_{j_k\ldots j_1},$$

$$E_k^q = I_k - \sum_{j_1,\ldots,j_k=0}^{q} C_{j_k\ldots j_1}\left(\sum_{(j_1,\ldots,j_k)} C_{j_k\ldots j_1}\right),$$

where

$$\sum_{(j_1,\ldots,j_k)}$$

is a sum with respect to all possible permutations $(j_1,\ldots,j_k)$.

Consider some examples [20], [31], [39], [54]-[56] of application of Theorem 3 ($i_1,\ldots,i_5 = 1,\ldots,m$)

(25) $$E_2^q = I_2 - \sum_{j_1,j_2=0}^{q} C^2_{j_2j_1} - \sum_{j_1,j_2=0}^{q} C_{j_2j_1}C_{j_1j_2} \quad (i_1 = i_2),$$

(26) $$E_3^q = I_3 - \sum_{j_3,j_2,j_1=0}^{q} C^2_{j_3j_2j_1} - \sum_{j_3,j_2,j_1=0}^{q} C_{j_3j_1j_2}C_{j_3j_2j_1} \quad (i_1 = i_2 \neq i_3),$$

(27) $$E_3^q = I_3 - \sum_{j_3,j_2,j_1=0}^{q} C^2_{j_3j_2j_1} - \sum_{j_3,j_2,j_1=0}^{q} C_{j_2j_3j_1}C_{j_3j_2j_1} \quad (i_1 \neq i_2 = i_3),$$

(28) $$E_3^q = I_3 - \sum_{j_3,j_2,j_1=0}^{q} C^2_{j_3j_2j_1} - \sum_{j_3,j_2,j_1=0}^{q} C_{j_3j_2j_1}C_{j_1j_2j_3} \quad (i_1 = i_3 \neq i_2),$$

$$E_4^q = I_4 - \sum_{j_1,\ldots,j_4=0}^{q} C_{j_4\ldots j_1}\left(\sum_{(j_1,j_2)} C_{j_4\ldots j_1}\right) \quad (i_1=i_2\ne i_3,i_4;\ i_3\ne i_4),$$

$$E_4^q = I_4 - \sum_{j_1,\ldots,j_4=0}^{q} C_{j_4\ldots j_1}\left(\sum_{(j_1,j_3)} C_{j_4\ldots j_1}\right) \quad (i_1=i_3\ne i_2,i_4;\ i_2\ne i_4),$$

$$E_4^q = I_4 - \sum_{j_1,\ldots,j_4=0}^{q} C_{j_4\ldots j_1}\left(\sum_{(j_1,j_2,j_3)} C_{j_4\ldots j_1}\right) \quad (i_1=i_2=i_3\ne i_4),$$

$$E_4^q = I_4 - \sum_{j_1,\ldots,j_4=0}^{q} C_{j_4\ldots j_1}\left(\sum_{(j_2,j_3,j_4)} C_{j_4\ldots j_1}\right) \quad (i_2=i_3=i_4\ne i_1),$$

$$E_4^q = I_4 - \sum_{j_1,\ldots,j_4=0}^{q} C_{j_4\ldots j_1}\left(\sum_{(j_1,j_2)}\left(\sum_{(j_3,j_4)} C_{j_4\ldots j_1}\right)\right) \quad (i_1=i_2\ne i_3=i_4),$$

$$E_4^q = I_4 - \sum_{j_1,\ldots,j_4=0}^{q} C_{j_4\ldots j_1}\left(\sum_{(j_1,j_3)}\left(\sum_{(j_2,j_4)} C_{j_4\ldots j_1}\right)\right) \quad (i_1=i_3\ne i_2=i_4),$$

$$E_5^q = I_5 - \sum_{j_1,\ldots,j_5=0}^{q} C_{j_5\ldots j_1}\left(\sum_{(j_2,j_4)}\left(\sum_{(j_3,j_5)} C_{j_5\ldots j_1}\right)\right) \quad (i_1\ne i_2=i_4\ne i_3=i_5\ne i_1),$$

$$E_5^q = I_5 - \sum_{j_1,\ldots,j_5=0}^{q} C_{j_5\ldots j_1}\left(\sum_{(j_4,j_5)}\left(\sum_{(j_1,j_2,j_3)} C_{j_5\ldots j_1}\right)\right) \quad (i_1=i_2=i_3\ne i_4=i_5),$$

$$E_5^q = I_5 - \sum_{j_1,\ldots,j_5=0}^{q} C_{j_5\ldots j_1}\left(\sum_{(j_1,j_3,j_4,j_5)} C_{j_5\ldots j_1}\right) \quad (i_1=i_3=i_4=i_5\ne i_2).$$

The values E_4^q and E_5^q were calculated exaclty for all possible combinations of $i_1,\ldots,i_5=1,\ldots,m$ in [19], [20], [39], [54]-[56].

Let us consider the approximations of iterated Ito stochastic integrals from (4) using (12)–(17) and complete orthonormal system of Legendre polynomials in the space $L_2([\tau_p,\tau_{p+1}])$ ($\tau_p=p\Delta$, $N\Delta=\bar{T}$, $p=0,1,\ldots,N$) [20] (also see [15]-[19], [21]-[56])

$$I_{0_{\tau_{p+1},\tau_p}}^{(i_1)} = \sqrt{\Delta}\zeta_0^{(i_1)},$$

$$I_{00_{\tau_{p+1},\tau_p}}^{(i_1i_2)q} = \frac{\Delta}{2}\left(\zeta_0^{(i_1)}\zeta_0^{(i_2)} + \sum_{i=1}^{q}\frac{1}{\sqrt{4i^2-1}}\left(\zeta_{i-1}^{(i_1)}\zeta_i^{(i_2)} - \zeta_i^{(i_1)}\zeta_{i-1}^{(i_2)}\right) - \mathbf{1}_{\{i_1=i_2\}}\right), \tag{29}$$

$$I_{1_{\tau_{p+1},\tau_p}}^{(i_1)}=-\frac{\Delta^{3/2}}{2}\left(\zeta_0^{(i_1)}+\frac{1}{\sqrt{3}}\zeta_1^{(i_1)}\right),$$

$$I_{000_{\tau_{p+1},\tau_p}}^{(i_1i_2i_3)q}=\sum_{j_1,j_2,j_3=0}^{q}C_{j_3j_2j_1}\Biggl(\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}\zeta_{j_3}^{(i_3)}-\mathbf{1}_{\{i_1=i_2\}}\mathbf{1}_{\{j_1=j_2\}}\zeta_{j_3}^{(i_3)}-$$
$$-\mathbf{1}_{\{i_2=i_3\}}\mathbf{1}_{\{j_2=j_3\}}\zeta_{j_1}^{(i_1)}-\mathbf{1}_{\{i_1=i_3\}}\mathbf{1}_{\{j_1=j_3\}}\zeta_{j_2}^{(i_2)}\Biggr),$$

$$I_{0000_{\tau_{p+1},\tau_p}}^{(i_1i_2i_3i_4)q}=\sum_{j_1,j_2,j_3,j_4=0}^{q}C_{j_4j_3j_2j_1}\Biggl(\prod_{l=1}^{4}\zeta_{j_l}^{(i_l)}-$$
$$-\mathbf{1}_{\{i_1=i_2\}}\mathbf{1}_{\{j_1=j_2\}}\zeta_{j_3}^{(i_3)}\zeta_{j_4}^{(i_4)}-\mathbf{1}_{\{i_1=i_3\}}\mathbf{1}_{\{j_1=j_3\}}\zeta_{j_2}^{(i_2)}\zeta_{j_4}^{(i_4)}-$$
$$-\mathbf{1}_{\{i_1=i_4\}}\mathbf{1}_{\{j_1=j_4\}}\zeta_{j_2}^{(i_2)}\zeta_{j_3}^{(i_3)}-\mathbf{1}_{\{i_2=i_3\}}\mathbf{1}_{\{j_2=j_3\}}\zeta_{j_1}^{(i_1)}\zeta_{j_4}^{(i_4)}-$$
$$-\mathbf{1}_{\{i_2=i_4\}}\mathbf{1}_{\{j_2=j_4\}}\zeta_{j_1}^{(i_1)}\zeta_{j_3}^{(i_3)}-\mathbf{1}_{\{i_3=i_4\}}\mathbf{1}_{\{j_3=j_4\}}\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}+$$
$$+\mathbf{1}_{\{i_1=i_2\}}\mathbf{1}_{\{j_1=j_2\}}\mathbf{1}_{\{i_3=i_4\}}\mathbf{1}_{\{j_3=j_4\}}+\mathbf{1}_{\{i_1=i_3\}}\mathbf{1}_{\{j_1=j_3\}}\mathbf{1}_{\{i_2=i_4\}}\mathbf{1}_{\{j_2=j_4\}}+$$
$$+\mathbf{1}_{\{i_1=i_4\}}\mathbf{1}_{\{j_1=j_4\}}\mathbf{1}_{\{i_2=i_3\}}\mathbf{1}_{\{j_2=j_3\}}\Biggr),$$

$$I_{01_{\tau_{p+1},\tau_p}}^{(i_1i_2)q}=-\frac{\Delta}{2}I_{00_{\tau_{p+1},\tau_p}}^{(i_1i_2)q}-\frac{\Delta^2}{4}\Biggl(\frac{1}{\sqrt{3}}\zeta_0^{(i_1)}\zeta_1^{(i_2)}+$$

The Fourier–Legendre coefficients

$$\bar{C}_{j_3j_2j_1},\ \bar{C}_{j_4j_3j_2j_1},\ \bar{C}_{j_3j_2j_1}^{001},\ \bar{C}_{j_3j_2j_1}^{010},\ \bar{C}_{j_3j_2j_1}^{100},\ \bar{C}_{j_5j_4j_3j_2j_1},\ \bar{C}_{j_4j_3j_2j_1}^{0001},$$

$$\bar{C}_{j_4j_3j_2j_1}^{0010},\ \bar{C}_{j_4j_3j_2j_1}^{0100},\ \bar{C}_{j_4j_3j_2j_1}^{1000},\ \bar{C}_{j_6j_5j_4j_3j_2j_1}$$

can be calculated exactly before start of the numerical method (4) using DERIVE or MAPLE (computer algebra systems). In [5], [18]-[28], [40], [54]-[56] several tables with these coefficients can be found. Note that the mentioned Fourier–Legendre coefficients are independent of the integration step $\tau_{p+1}-\tau_p$ of the numerical scheme, which can be not a constant in a general case.

Note that in [57], [60] the database with 270,000 exactly calculated Fourier–Legendre coefficients was described. This database was used in the software package [57], [60], which is written in the Python programming language for the implementation of explicit one-step numerical schemes with strong orders 0.5, 1.0, 1.5, 2.0, 2.5, and 3.0 of convergence for Ito SDEs. The optimization of the mean-square approximation procedures for iterated Ito stochastic integrals from these numerical schemes can be found in [59].

On the basis of the presented approximations of iterated Ito stochastic integrals we can see that increasing of multiplicities of these integrals leads to increasing of orders of smallness with respect to $\tau_{p+1}-\tau_p$ ($\tau_{p+1}-\tau_p \ll 1$) in the mean-square sense for iterated Ito stochastic integrals. This leads to a sharp decrease of member quantities in the approximations of iterated Ito stochastic integrals (see the number q in Theorem 3), which are required for achieving the acceptable accuracy of approximation.

4. Explicit One-Step Strong Numerical Schemes of Orders 2.0, 2.5, and 3.0 Based on the Unified Taylor–Stratonovich expansion

Consider the following explicit one-step strong numerical scheme of order 3.0 based on the so-called unified Taylor–Stratonovich expansion [9] (also see [5], [18]-[28], [54]-[56])

$$
\begin{aligned}
\mathbf{y}_{p+1} = \mathbf{y}_p &+ \sum_{i_1=1}^{m} \Sigma_{i_1} \hat{I}_{0_{\tau_{p+1},\tau_p}}^{*(i_1)} + \Delta\bar{\mathbf{a}} + \sum_{i_1,i_2=1}^{m} G_0^{(i_2)} \Sigma_{i_1} \hat{I}_{00_{\tau_{p+1},\tau_p}}^{*(i_2 i_1)} + \\
&+ \sum_{i_1=1}^{m} \left[G_0^{(i_1)} \bar{\mathbf{a}} \left(\Delta \hat{I}_{0_{\tau_{p+1},\tau_p}}^{*(i_1)} + \hat{I}_{1_{\tau_{p+1},\tau_p}}^{*(i_1)} \right) - \bar{L} \Sigma_{i_1} \hat{I}_{1_{\tau_{p+1},\tau_p}}^{*(i_1)} \right] + \\

$$

are calculated at the point $(\mathbf{y}_p,p)$.

It is well known [2] that under the standard conditions the numerical scheme (33) has strong order of convergence 3.0. Among these conditions we consider only the condition for approximations of iterated Stratonovich stochastic integrals from the numerical scheme (33) [2], [5]

$$
\mathsf{M}\left\{\left(I_{l_1\ldots l_k\,\tau_{p+1},\tau_p}^{*(i_1\ldots i_k)}-\hat{I}_{l_1\ldots l_k\,\tau_{p+1},\tau_p}^{*(i_1\ldots i_k)}\right)^2\right\}\le C\Delta^7,
$$

where $\hat{I}_{l_1\ldots l_k\,\tau_{p+1},\tau_p}^{*(i_1\ldots i_k)}$ is an approximation of $I_{l_1\ldots l_k\,\tau_{p+1},\tau_p}^{*(i_1\ldots i_k)}$, constant C does not depend on Δ.

Note that if we exclude $\mathbf{q}_{p+1,p}+\mathbf{r}_{p+1,p}$ from the right-hand side of (33), then we will have the explicit one-step strong numerical scheme of order 2.0. The right-hand side of (33) but without the value $\mathbf{r}_{p+1,p}$ and with replacing the value $\Delta^3\bar{L}\bar{L}\bar{\mathbf{a}}/6$ by the value $\Delta^3 LL\mathbf{a}/6$ define the explicit one-step strong numerical scheme of order 2.5.

Note that the truncated unified Taylor–Stratonovich expansion [9] (also see [5], [18]-[28], [54]-[56]) contains the less number of various types of iterated Stratonovich stochastic integrals (moreover, their major part will have less multiplicities) in comparison with the classical Taylor–Stratonovich expansion [2], [7].

Furthermore, some iterated stochastic integrals from the Taylor–Stratonovich expansion [2], [7] are connected by linear relations. However, the iterated stochastic integrals from the unified Taylor–Stratonovich expansion [9] (also see [5], [18]-[28], [54]-[56]) cannot be connected by linear relations. Therefore, we call these families of stochastic integrals as the stochastic bases [5], [18]-[28], [54]-[56]. Note that (33) contains 20 different types of iterated Stratonovich stochastic integrals. At the same time, the analogue of (33) based on the classical Taylor–Stratonovich expansion [2], [7] contains 29 different types of iterated stochastic integrals.

5. Fourier–Legendre Expansions of Iterated Stratonovich Stochastic Integrals of Multiplicities 1 to 6

As noted above, in a number of works of the author Theorems 1, 2 have been adapted for the iterated Stratonovich stochastic integrals (3) of multiplicities 1 to 6 (the case of multiplicity 1 is given by (12)). Let us first present some old results.

Theorem 4 [18]-[20], [25]-[28], [41], [47], [54]-[56]. *Assume that the following conditions are fulfilled*:

1. *The function $\psi_2(\tau)$ is continuously differentiable at the interval $[t,T]$ and the function $\psi_1(\tau)$ is two times continuously differentiable at the interval $[t,T]$.*

2. *$\{\phi_j(x)\}_{j=0}^{\infty}$ is a complete orthonormal system of Legendre polynomials or system of trigonometric functions in the space $L_2([t,T])$.*

Then, the iterated Stratonovich stochastic integral of multiplicity 2

$$J^*[\psi^{(2)}]_{T,t}=\int\limits_t^{*T}\psi_2(t_2)\int\limits_t^{*t_2}\psi_1(t_1)d\mathbf{f}_{t_1}^{(i_1)}d\mathbf{f}_{t_2}^{(i_2)}\quad (i_1,i_2=1,\ldots,m)$$

is expanded into the converging in the mean-square sense multiple series

$$J^*[\psi^{(2)}]_{T,t}=\underset{p_1,p_2\to\infty}{\text{l.i.m.}}\sum_{j_1=0}^{p_1}\sum_{j_2=0}^{p_2}C_{j_2j_1}\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)},$$

where the meaning of notations introduced in the formulation of Theorem 1 *is remained.*

Proving the theorem 4 [18]-[20], [25]-[28], [41], [47], [54]-[56] we used Theorem 1 and double integration by parts. This procedure leads to the condition of double continuous differentiability of the function $\psi_1(\tau)$ at the interval $[t,T]$. The mentioned condition can be weakened [17], [35], [42], [49], [54]-[56] and Theorem 4 will be valid for continuously differentiable functions $\psi_l(\tau)$ $(l=1,2)$ at the interval $[t,T]$.

Theorem 5 [18]-[20], [25]-[28], [41], [47], [54]-[56]. *Assume, that $\{\phi_j(x)\}_{j=0}^{\infty}$ is a complete orthonormal system of Legendre polynomials or trigonomertic functions in the space $L_2([t,T])$. Furthermore, the function $\psi_2(\tau)$ is continuously differentiable at the interval $[t,T]$ and the functions $\psi_1(\tau)$, $\psi_3(\tau)$ are twice continuously differentiable at the interval $[t,T]$. Then, for the iterated Stratonovich stochastic integral of multiplicity* 3

$$J^*[\psi^{(3)}]_{T,t}=\int\limits_t^{*T}\psi_3(t_3)\int\limits_t^{*t_3}\psi_2(t_2)\int\limits_t^{*t_2}\psi_1(t_1)d\mathbf{f}_{t_1}^{(i_1)}d\mathbf{f}_{t_2}^{(i_2)}d\mathbf{f}_{t_3}^{(i_3)}\quad (i_1,i_2,i_3=1,\ldots,m)$$

the following expansion

$$J^*[\psi^{(3)}]_{T,t} = \underset{p\to\infty}{\text{l.i.m.}} \sum_{j_1,j_2,j_3=0}^{p} C_{j_3j_2j_1}\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}\zeta_{j_3}^{(i_3)} \tag{35}$$

converging in the mean-square sense is valid, where

$$C_{j_3j_2j_1} = \int\limits_t^T \psi_3(t_3)\phi_{j_3}(t_3)\int\limits_t^{t_3} \psi_2(t_2)\phi_{j_2}(t_2)\int\limits_t^{t_2} \psi_1(t_1)\phi_{j_1}(t_1)dt_1dt_2dt_3;$$

another notations are the same as in Theorems 1, 2.

Theorem 6 [18]–[20], [25]-[28], [41], [43], [54]-[56]. *Assume that* $\{\phi_j(x)\}_{j=0}^{\infty}$ *is a complete orthonormal system of Legendre polynomials or trigonometric functions in the space* $L_2([t,T])$. *Then, for the iterated Stratonovich stochastic integral of multiplicity* 4

$$I_{T,t}^{*(i_1i_2i_3i_4)} = \int\limits_t^{*T}\int\limits_t^{*t_4}\int\limits_t^{*t_3}\int\limits_t^{*t_2} d\mathbf{w}_{t_1}^{(i_1)}d\mathbf{w}_{t_2}^{(i_2)}d\mathbf{w}_{t_3}^{(i_3)}d\mathbf{w}_{t_4}^{(i_4)},$$

where $i_1, i_2, i_3, i_4 = 0, 1, \ldots, m$, *the following expansion*

$$I_{T,t}^{*(i_1i_2i_3i_4)} = \underset{p\to\infty}{\text{l.i.m.}} \sum_{j_1,j_2,j_3,j_4=0}^{p} C_{j_4j_3j_2j_1}\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}\zeta_{j_3}^{(i_3)}\zeta_{j_4}^{(i_4)}$$

converging in the mean-square sense is valid, where

$$C_{j_4j_3j_2j_1} = \int\limits_t^T \phi_{j_4}(t_4)\int\limits_t^{t_4} \phi_{j_3}(t_3)\int\limits_t^{t_3} \phi_{j_2}(t_2)\int\limits_t^{t_2} \phi_{j_1}(t_1)dt_1dt_2dt_3dt_4;$$

$\mathbf{w}_\tau^{(i)} = \mathbf{f}_\tau^{(i)}$ $(i = 1, \ldots, m)$ *are independent standard Wiener processes and* $\mathbf{w}_\tau^{(0)} = \tau$; *another notations are the same as in Theorems* 1, 2.

Recently, a new approach to the expansion and mean-square approximation of iterated Stratonovich stochastic integrals has been obtained [54] (Sect. 2.10–2.16), [41] (Sect. 13–19), [43] (Sect. 5–11), [44] (Sect. 7–13), [71] (Sections 4–9). Let us formulate four theorems that were obtained using this approach.

Theorem 7 [41], [43], [44], [54], [71]. *Suppose that* $\{\phi_j(x)\}_{j=0}^{\infty}$ *is a complete orthonormal system of Legendre polynomials or trigonometric functions in the space* $L_2([t,T])$. *Furthermore, let* $\psi_1(\tau), \psi_2(\tau)$, $\psi_3(\tau)$ *are continuously differentiable nonrandom functions on* $[t,T]$. *Then, for the iterated Stratonovich stochastic integral of third multiplicity*

$$J^*[\psi^{(3)}]_{T,t} = \int\limits_t^{*T} \psi_3(t_3)\int\limits_t^{*t_3} \psi_2(t_2)\int\limits_t^{*t_2} \psi_1(t_1)d\mathbf{w}_{t_1}^{(i_1)}d\mathbf{w}_{t_2}^{(i_2)}d\mathbf{w}_{t_3}^{(i_3)} \quad (i_1, i_2, i_3 = 0, 1, \ldots, m)$$

the following relations

$$J^*[\psi^{(3)}]_{T,t} = \underset{p\to\infty}{\text{l.i.m.}} \sum_{j_1,j_2,j_3=0}^{p} C_{j_3j_2j_1}\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}\zeta_{j_3}^{(i_3)}, \tag{36}$$

$$\mathsf{M}\left\{\left(J^*[\psi^{(3)}]_{T,t} - \sum_{j_1,j_2,j_3=0}^{p} C_{j_3j_2j_1}\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}\zeta_{j_3}^{(i_3)}\right)^2\right\} \le \frac{C}{p} \tag{37}$$

are fulfilled, where $i_1, i_2, i_3 = 0, 1, \ldots, m$ *in* (36) *and* $i_1, i_2, i_3 = 1, \ldots, m$ *in* (37)*, constant* C *is independent of* p*,*

$$C_{j_3j_2j_1} = \int_t^T \psi_3(t_3)\phi_{j_3}(t_3)\int_t^{t_3}\psi_2(t_2)\phi_{j_2}(t_2)\int_t^{t_2}\psi_1(t_1)\phi_{j_1}(t_1)dt_1dt_2dt_3$$

and

$$\zeta_j^{(i)} = \int_t^T \phi_j(\tau)d\mathbf{f}_\tau^{(i)}$$

are independent standard Gaussian random variables for various i *or* j *(in the case when* $i \neq 0$*); another notations are the same as in Theorems* 1, 2.

Theorem 8 [41], [43], [44], [54], [71]. *Let* $\{\phi_j(x)\}_{j=0}^{\infty}$ *be a complete orthonormal system of Legendre polynomials or trigonometric functions in the space* $L_2([t,T])$*. Furthermore, let* $\psi_1(\tau), \ldots, \psi_4(\tau)$ *be continuously differentiable nonrandom functions on* $[t,T]$*. Then, for the iterated Stratonovich stochastic integral of fourth multiplicity*

$$J^*[\psi^{(4)}]_{T,t} = {\int_t^{*}}^{T} \psi_4(t_4){\int_t^{*}}^{t_4}\psi_3(t_3){\int_t^{*}}^{t_3}\psi_2(t_2){\int_t^{*}}^{t_2}\psi_1(t_1)d\mathbf{w}_{t_1}^{(i_1)}d\mathbf{w}_{t_2}^{(i_2)}d\mathbf{w}_{t_3}^{(i_3)}d\mathbf{w}_{t_4}^{(i_4)} \tag{38}$$

the following relations

$$J^*[\psi^{(4)}]_{T,t} = \underset{p\to\infty}{\text{l.i.m.}} \sum_{j_1,j_2,j_3,j_4=0}^{p} C_{j_4j_3j_2j_1}\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}\zeta_{j_3}^{(i_3)}\zeta_{j_4}^{(i_4)}, \tag{39}$$

$$\mathsf{M}\left\{\left(J^*[\psi^{(4)}]_{T,t} - \sum_{j_1,j_2,j_3,j_4=0}^{p} C_{j_4j_3j_2j_1}\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}\zeta_{j_3}^{(i_3)}\zeta_{j_4}^{(i_4)}\right)^2\right\} \le \frac{C}{p^{1-\varepsilon}} \tag{40}$$

are fulfilled, where $i_1, \ldots, i_4 = 0, 1, \ldots, m$ *in* (38), (39) *and* $i_1, \ldots, i_4 = 1, \ldots, m$ *in* (40)*, constant* C *does not depend on* p*,* ε *is an arbitrary small positive real number for the case of complete orthonormal system of Legendre polynomials in the space* $L_2([t,T])$ *and* $\varepsilon = 0$ *for the case of complete orthonormal system of trigonometric functions in the space* $L_2([t,T])$*,*

$$C_{j_4 j_3 j_2 j_1} =$$

$$= \int\limits_t^T \psi_4(t_4)\phi_{j_4}(t_4) \int\limits_t^{t_4} \psi_3(t_3)\phi_{j_3}(t_3) \int\limits_t^{t_3} \psi_2(t_2)\phi_{j_2}(t_2) \int\limits_t^{t_2} \psi_1(t_1)\phi_{j_1}(t_1)dt_1dt_2dt_3dt_4;$$

another notations are the same as in Theorem 7*.*

Theorem 9 [41], [43], [44], [54], [71]. *Assume that* $\{\phi_j(x)\}_{j=0}^{\infty}$ *is a complete orthonormal system of Legendre polynomials or trigonometric functions in the space* $L_2([t,T])$ *and* $\psi_1(\tau), \ldots, \psi_5(\tau)$ *are continuously differentiable nonrandom functions on* $[t,T]$*. Then, for the iterated Stratonovich stochastic integral of fifth multiplicity*

$$J^*[\psi^{(5)}]_{T,t} = \int\limits_t^{*T} \psi_5(t_5) \ldots \int\limits_t^{*t_2} \psi_1(t_1) d\mathbf{w}_{t_1}^{(i_1)} \ldots d\mathbf{w}_{t_5}^{(i_5)} \tag{41}$$

the following relations

$$J^*[\psi^{(5)}]_{T,t} = \underset{p\to\infty}{\text{l.i.m.}} \sum_{j_1,\ldots,j_5=0}^{p} C_{j_5\ldots j_1} \zeta_{j_1}^{(i_1)} \ldots \zeta_{j_5}^{(i_5)}, \tag{42}$$

$$\mathsf{M}\left\{\left(J^*[\psi^{(5)}]_{T,t} - \sum_{j_1,\ldots,j_5=0}^{p} C_{j_5\ldots j_1} \zeta_{j_1}^{(i_1)} \ldots \zeta_{j_5}^{(i_5)}\right)^2\right\} \le \frac{C}{p^{1-\varepsilon}} \tag{43}$$

are fulfilled, where $i_1, \ldots, i_5 = 0, 1, \ldots, m$ *in* (41), (42) *and* $i_1, \ldots, i_5 = 1, \ldots, m$ *in* (43)*, constant* C *is independent of* p*,* ε *is an arbitrary small positive real number for the case of complete orthonormal system of Legendre polynomials in the space* $L_2([t,T])$ *and* $\varepsilon = 0$ *for the case of complete orthonormal system of trigonometric functions in the space* $L_2([t,T])$*,*

$$C_{j_5\ldots j_1} = \int\limits_t^T \psi_5(t_5)\phi_{j_5}(t_5) \ldots \int\limits_t^{t_2} \psi_1(t_1)\phi_{j_1}(t_1) dt_1 \ldots dt_5;$$

another notations are the same as in Theorems 7, 8*.*

Theorem 10 [41], [43], [44], [54]. *Suppose that* $\{\phi_j(x)\}_{j=0}^{\infty}$ *is a complete orthonormal system of Legendre polynomials or trigonometric functions in the space* $L_2([t,T])$*. Then, for the iterated Stratonovich stochastic integral of sixth multiplicity*

$$I_{T,t}^{*(i_1\ldots i_6)} = \int\limits_t^{*T} \ldots \int\limits_t^{*t_2} d\mathbf{w}_{t_1}^{(i_1)} \ldots d\mathbf{w}_{t_6}^{(i_6)} \tag{44}$$

the following expansion

$$I_{T,t}^{*(i_1\ldots i_6)}=\underset{p\to\infty}{\text{l.i.m.}}\sum_{j_1,\ldots,j_6=0}^{p}C_{j_6\ldots j_1}\zeta_{j_1}^{(i_1)}\ldots\zeta_{j_6}^{(i_6)}$$

that converges in the mean-square sense is valid, where $i_1,\ldots,i_6=0,1,\ldots,m,$

$$C_{j_6\ldots j_1}=\int\limits_t^T\phi_{j_6}(t_6)\ldots\int\limits_t^{t_2}\phi_{j_1}(t_1)dt_1\ldots dt_6;$$

another notations are the same as in Theorems 7–9*.*

On the base of Theorems 4–10 the folloing hypothesis was formulated in [18]-[20], [25]-[28], [44], [54]-[56].

Hypothesis 1 [18]-[20], [25]-[28], [44], [54]-[56]. *Assume that* $\{\phi_j(x)\}_{j=0}^{\infty}$ *is a complete orthonormal system of Legendre polynomials or trigonometric functions in the space* $L_2([t,T])$*. Moreover, every* $\psi_l(\tau)$ $(l=1,\ldots,k)$ *is an enough smooth nonrandom function on* $[t,T]$*. Then, for the iterated Stratonovich stochastic integral* $J^*[\psi^{(k)}]_{T,t}$ *defined by* (3) *the following expansion*

$$J^*[\psi^{(k)}]_{T,t}=\underset{p\to\infty}{\text{l.i.m.}}\sum_{j_1,\ldots j_k=0}^{p}C_{j_k\ldots j_1}\zeta_{j_1}^{(i_1)}\ldots\zeta_{j_k}^{(i_k)} \tag{45}$$

converging in the mean-square sense is valid, where the notations are the same as in Theorems 1, 2*.*

Hypothesis 1 allows to approximate the iterated Stratonovich stochastic integral $J^*[\psi^{(k)}]_{T,t}$ by the sum

$$J^*[\psi^{(k)}]_{T,t}^p=\sum_{j_1,\ldots j_k=0}^{p}C_{j_k\ldots j_1}\prod_{l=1}^{k}\zeta_{j_l}^{(i_l)},$$

where

$$\lim_{p\to\infty}\mathsf{M}\left\{\left(J^*[\psi^{(k)}]_{T,t}-J^*[\psi^{(k)}]_{T,t}^p\right)^2\right\}=0.$$

Note that Hypothesis 1 is proved in [54] (Sect. 2.10) under the condition of convergence of trace series (also see [41], [43], [44]). In [44], [54]-[56] a more general hypothesis is formulated.

Applying Theorems 4–10, we obtain the following approximations of iterated Stratonovich stochastic integrals from (33)

$$I_{0_{\tau_{p+1},\tau_p}}^{*(i_1)}=\sqrt{\Delta}\zeta_0^{(i_1)},$$

$$I_{00_{\tau_{p+1},\tau_p}}^{*(i_1i_2)q}=\frac{\Delta}{2}\left(\zeta_0^{(i_1)}\zeta_0^{(i_2)}+\sum_{i=1}^{q}\frac{1}{\sqrt{4i^2-1}}\left(\zeta_{i-1}^{(i_1)}\zeta_i^{(i_2)}-\zeta_i^{(i_1)}\zeta_{i-1}^{(i_2)}\right)\right),$$

$$I_{1_{\tau_{p+1},\tau_p}}^{*(i_1)}=-\frac{\Delta^{3/2}}{2}\left(\zeta_0^{(i_1)}+\frac{1}{\sqrt{3}}\zeta_1^{(i_1)}\right),$$

$$I_{000_{\tau_{p+1},\tau_p}}^{*(i_1i_2i_3)q} = \sum_{j_1,j_2,j_3=0}^{q} C_{j_3j_2j_1}\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}\zeta_{j_3}^{(i_3)},$$

$$I_{01_{\tau_{p+1},\tau_p}}^{*(i_1i_2)q} = -\frac{\Delta}{2}I_{00_{\tau_{p+1},\tau_p}}^{*(i_1i_2)q} - \frac{\Delta^2}{4}\Biggl[\frac{1}{\sqrt{3}}\zeta_0^{(i_1)}\zeta_1^{(i_2)}+$$

$$+\sum_{i=0}^{q}\Biggl(\frac{(i+2)\zeta_i^{(i_1)}\zeta_{i+2}^{(i_2)}-(i+1)\zeta_{i+2}^{(i_1)}\zeta_i^{(i_2)}}{\sqrt{(2i+1)(2i+5)}(2i+3)} - \frac{\zeta_i^{(i_1)}\zeta_i^{(i_2)}}{(2i-1)(2i+3)}\Biggr)\Biggr],$$

$$I_{10_{\tau_{p+1},\tau_p}}^{*(i_1i_2)q} = -\frac{\Delta}{2}I_{00_{\tau_{p+1},\tau_p}}^{*(i_1i_2)q} - \frac{\Delta^2}{4}\Biggl[\frac{1}{\sqrt{3}}\zeta_0^{(i_2)}\zeta_1^{(i_1)}+$$

$$+\sum_{i=0}^{q}\Biggl(\frac{(i+1)\zeta_{i+2}^{(i_2)}\zeta_i^{(i_1)}-(i+2)\zeta_i^{(i_2)}\zeta_{i+2}^{(i_1)}}{\sqrt{(2i+1)(2i+5)}(2i+3)} + \frac{\zeta_i^{(i_1)}\zeta_i^{(i_2)}}{(2i-1)(2i+3)}\Biggr)\Biggr],$$

where formulas for the Fourier–Legendre coefficients

$$C_{j_3j_2j_1},\ C_{j_4j_3j_2j_1},\ C_{j_3j_2j_1}^{001},\ C_{j_3j_2j_1}^{010},\ C_{j_3j_2j_1}^{100},\ C_{j_5j_4j_3j_2j_1}, C_{j_4j_3j_2j_1}^{0001},\ C_{j_4j_3j_2j_1}^{0010},$$

$$C_{j_4j_3j_2j_1}^{0100},\ C_{j_4j_3j_2j_1}^{1000},\ C_{j_6j_5j_4j_3j_2j_1}$$

can be found in Sect. 3.

On the basis of the presented approximations of iterated Stratonovich stochastic integrals we can see that increasing of multiplicities of these integrals leads to increasing of orders of smallness with respect to $\tau_{p+1}-\tau_p$ $(\tau_{p+1}-\tau_p \ll 1)$ in the mean-square sense for iterated Stratonovich stochastic integrals. This leads to a sharp decrease of member quantities in the approximations of iterated Stratonovich stochastic integrals (see the numbers q in the approximations of iterated Stratonovich stochastic integrals from this section), which are required for achieving the acceptable accuracy of approximation.

From (29) $(i_1\ne i_2)$ we have

$$\mathsf{M}\left\{\left(I_{00_{\tau_{p+1},\tau_p}}^{*(i_1i_2)}-I_{00_{\tau_{p+1},\tau_p}}^{*(i_1i_2)q}\right)^2\right\}=\frac{\Delta^2}{2}\sum_{i=q+1}^{\infty}\frac{1}{4i^2-1}\le$$

$$\le\frac{\Delta^2}{2}\int\limits_q^{\infty}\frac{1}{4x^2-1}dx=-\frac{\Delta^2}{8}\ln\left|1-\frac{2}{2q+1}\right|\le C_1\frac{\Delta^2}{q}, \tag{46}$$

where C_1 is a constant.

Since the value $\Delta=\tau_{p+1}-\tau_p$ plays the role of integration step in the numerical scheme (33), then this value is a sufficiently small.

Keeping in mind this circumstance, it is easy to notice that there exists such a constant C_2 that

$$\mathsf{M}\left\{\left(I_{l_1\ldots l_k\,\tau_{p+1},\tau_p}^{*(i_1\ldots i_k)}-I_{l_1\ldots l_k\,\tau_{p+1},\tau_p}^{*(i_1\ldots i_k)q}\right)^2\right\}\le C_2\mathsf{M}\left\{\left(I_{00_{\tau_{p+1},\tau_p}}^{*(i_1i_2)}-I_{00_{\tau_{p+1},\tau_p}}^{*(i_1i_2)q}\right)^2\right\}, \tag{47}$$

where $I_{l_1\ldots l_k\,\tau_{p+1},\tau_p}^{*(i_1\ldots i_k)q}$ is an approximation of the iterated Stratonovich stochastic integral $I_{l_1\ldots l_k\,\tau_{p+1},\tau_p}^{*(i_1\ldots i_k)}$.

From (46) and (47) we finally obtain

$$\mathsf{M}\left\{\left(I_{l_1\ldots l_k\,\tau_{p+1},\tau_p}^{*(i_1\ldots i_k)}-I_{l_1\ldots l_k\,\tau_{p+1},\tau_p}^{*(i_1\ldots i_k)q}\right)^2\right\}\le C\frac{\Delta^2}{q}, \tag{48}$$

where constant C does not depend on Δ.

The same idea can be found in [2] for the case of trigonometric functions. Note that, in contrast to the estimate (48), the constant C in Theorems 7–9 does not depend on q.

Since

$$J^*[\psi^{(k)}]_{T,t}=J[\psi^{(k)}]_{T,t}\quad \text{w. p. 1}$$

for pairwise different $i_1,\ldots,i_k=1,\ldots,m$, then we can write for pairwise different $i_1,\ldots,i_6=1,\ldots,m$ (see (24))

$$\mathsf{M}\left\{\left(I_{01_{\tau_{p+1},\tau_p}}^{*(i_1i_2)}-I_{01_{\tau_{p+1},\tau_p}}^{*(i_1i_2)q}\right)^2\right\}=\frac{\Delta^4}{4}-\sum_{j_1,j_2=0}^{q}\left(C_{j_2j_1}^{01}\right)^2,$$

For example [5] (also see [18]-[28], [54]-[56])

$$\mathsf{M}\left\{\left(I^{*(i_1i_2i_3)}_{000_{\tau_{p+1},\tau_p}}-I^{*(i_1i_2i_3)6}_{000_{\tau_{p+1},\tau_p}}\right)^2\right\}=\frac{\Delta^3}{6}-\sum_{j_3,j_2,j_1=0}^{6}C^2_{j_3j_2j_1}\approx 0.01956000\Delta^3,$$

$$\mathsf{M}\left\{\left(I^{*(i_1i_2i_3)}_{100_{\tau_{p+1},\tau_p}}-I^{*(i_1i_2i_3)2}_{100_{\tau_{p+1},\tau_p}}\right)^2\right\}=\frac{\Delta^5}{60}-\sum_{j_1,j_2,j_3=0}^{2}\left(C^{100}_{j_3j_2j_1}\right)^2\approx 0.00815429\Delta^5,$$

$$\mathsf{M}\left\{\left(I^{*(i_1i_2i_3)}_{010_{\tau_{p+1},\tau_p}}-I^{*(i_1i_2i_3)2}_{010_{\tau_{p+1},\tau_p}}\right)^2\right\}=\frac{\Delta^5}{20}-\sum_{j_1,j_2,j_3=0}^{2}\left(C^{010}_{j_3j_2j_1}\right)^2\approx 0.01739030\Delta^5,$$

$$\mathsf{M}\left\{\left(I^{*(i_1i_2i_3)}_{001_{\tau_{p+1},\tau_p}}-I^{*(i_1i_2i_3)2}_{001_{\tau_{p+1},\tau_p}}\right)^2\right\}=\frac{\Delta^5}{10}-\sum_{j_1,j_2,j_3=0}^{2}\left(C^{001}_{j_3j_2j_1}\right)^2\approx 0.02528010\Delta^5,$$

$$\mathsf{M}\left\{\left(I^{*(i_1i_2i_3i_4)}_{0000_{\tau_{p+1},\tau_p}}-I^{*(i_1i_2i_3i_4)2}_{0000_{\tau_{p+1},\tau_p}}\right)^2\right\}=\frac{\Delta^4}{24}-\sum_{j_1,j_2,j_3,j_4=0}^{2}C^2_{j_4j_3j_2j_1}\approx 0.02360840\Delta^4,$$

$$\mathsf{M}\left\{\left(I^{*(i_1i_2i_3i_4i_5)}_{00000_{\tau_{p+1},\tau_p}}-I^{*(i_1i_2i_3i_4i_5)1}_{00000_{\tau_{p+1},\tau_p}}\right)^2\right\}=\frac{\Delta^5}{120}-\sum_{j_1,j_2,j_3,j_4,j_5=0}^{1}C^2_{j_5i_4i_3i_2j_1}\approx 0.00759105\Delta^5.$$

The theory presented in this article was realized [57], [60] in the form of a software package in the Python programming language. The mentioned software package implements the strong numerical methods with convergence orders 0.5, 1.0, 1.5, 2.0, 2.5, and 3.0 for Ito SDEs with multidimensional non-commutative noise based on the unified Taylor–Ito and Taylor–Stratonovich expansions. At that for the numerical simulation of iterated Ito and Stratonovich stochastic integrals of multiplicities 1 to 6 we applied the formulas based on multiple Fourier–Legendre series [57], [60]. Moreover, we used [57], [60] the database with 270,000 exactly calculated Fourier–Legendre coefficients.

Chapter 5.

Application to the High-Order Strong Numerical Methods for Non-Commutative Semilinear SPDEs

APPLICATION OF THE METHOD OF APPROXIMATION OF ITERATED ITÔ STOCHASTIC INTEGRALS BASED ON GENERALIZED MULTIPLE FOURIER SERIES TO THE HIGH-ORDER STRONG NUMERICAL METHODS FOR NON-COMMUTATIVE SEMILINEAR STOCHASTIC PARTIAL DIFFERENTIAL EQUATIONS

DMITRIY F. KUZNETSOV

ABSTRACT. We consider a method for the approximation of iterated stochastic integrals of arbitrary multiplicity k ($k \in \mathbb{N}$) with respect to the infinite-dimensional Q-Wiener process using the mean-square approximation method of iterated Itô stochastic integrals with respect to the scalar standard Wiener processes based on generalized multiple Fourier series. The case of multiple Fourier–Legendre series is considered in details. The results of the article can be applied to construction of high-order strong numerical methods (with respect to the temporal discretization) for the approximation of mild solution for non-commutative semilinear stochastic partial differential equations with multiplicative trace class noise.

1. INTRODUCTION

There exists a lot of publications on the subject of numerical integration of stochastic partial differential equations (SPDEs) (see, for example, [1]-[25]). One of the perspective approaches to the construction of high-order strong numerical methods (with respect to the temporal discretization) for SPDEs is based on the Taylor formula in Banach spaces and exponential formula for the mild solution of SPDEs [12] (2015), [13] (2016). As shown in [12] (2015) and [17] (2007) the exponential Milstein type approximation method has the strong order of convergence $1.0 - \varepsilon$ (where ε is an arbitrary small posilive real number) [12] or 1.0 [17]. In [13] the exponential Wagner–Platen type numerical method for SPDEs with strong order $1.5 - \varepsilon$ (where ε is an arbitrary small posilive real number) has been considered. An important feature of these numerical methods is a presence in them of the so-called iterated stochastic integrals with respect to the infinite-dimensional Q-Wiener process [19]. Approximation of these stochastic integrals is a complex problem. This problem can be significantly simplified if special commutativity conditions be fulfilled [12], [13]. In [25] (2019) two methods of the mean-square approximation of simplest iterated (double) stochastic integrals with respect to the infinite-dimensional Q-Wiener process are considered and theorems on the convergence of these methods are given (the basic idea about Karhunen–Loeve expansion of the Brownian bridge process was taken from monograph [26] (1988, In Russian)). It is important to note that the approximation of iterated stochastic integrals with respect to the infinite-dimensional Q-Wiener process can be reduced to the approximation of iterated Itô stochastic integrals with respect to the scalar standard Wiener processes. In a lot of author's publications [27]-[65] the effective methods for the mean-square approximation of iterated Itô and Stratonovich stochastic integrals with respect to the scalar standard Wiener processes were proposed and developed. One of these methods [30] (also see [31]-[65]) is based on generalized multiple Fourier series, in particular, on multiple Fourier–Legendre series. The purpose of this article is an adaptation of the method [30]-[65] for the mean-square approximation of iterated

MATHEMATICS SUBJECT CLASSIFICATION: 60H05, 60H10, 42B05, 42C10.

KEYWORDS: NON-COMMUTATIVE SEMILINEAR STOCHASTIC PARTIAL DIFFERENTIAL EQUATION, INFINITE-DIMENSIONAL Q-WIENER PROCESS, ITERATED ITÔ STOCHASTIC INTEGRAL, GENERALIZED MULTIPLE FOURIER SERIES, MULTIPLE FOURIER–LEGENDRE SERIES, LEGENDRE POLYNOMIAL, MEAN-SQUARE APPROXIMATION, EXPANSION, TRACE CLASS NOISE.

stochastic integrals of multiplicity k ($k \in \mathbb{N}$) with respect to the finite-dimensional approximation of the infinite-dimensional Q-Wiener process.

Let U, H be separable $\mathbb{R}$-Hilbert spaces and $L_{HS}(U,H)$ be a space of Hilbert–Schmidt operators mapping from U to H. Let $(\Omega, \mathbf{F}, \mathsf{P})$ be a probability space with a normal filtration $\{\mathbf{F}_t, t \in [0,\bar{T}]\}$ [19], let $\mathbf{W}_t$ be an U-valued Q-Wiener process with respect to $\{\mathbf{F}_t, t \in [0,\bar{T}]\}$, which has a covariance trace class operator $Q \in L(U)$. Here $L(U)$ denotes all bounded linear operators mapping from U to U. Consider the semilinear parabolic SPDE

$$dX_t = (AX_t + F(X_t))\,dt + B(X_t)d\mathbf{W}_t, \quad X_0 = \xi, \quad t \in [0,\bar{T}], \tag{1}$$

where nonlinear operators F, B ($F : H \to H$, $B : H \to L_{HS}(U_0, H)$), linear operator $A : D(A) \subset H \to H$ as well as the initial value ξ are assumed to satisfy the conditions of existence and uniqueness of the SPDE (1) mild solution [22] (see also [12], [13]). Here U_0 is an $\mathbb{R}$-Hilbert space defined by $U_0 = Q^{1/2}(U)$. The scalar product in U_0 is defined as follows $\langle u, w\rangle_{U_0} = \left\langle Q^{-1/2}u, Q^{-1/2}w\right\rangle_U$ for all $u, w \in U_0$.

As it is known, strong numerical methods with high-orders of accuracy (with respect to the temporal discretization) for approximating the mild solution of the SPDE (1), which are based on the Taylor formula in Banach spaces and an exponential formula for the mild solution of SPDEs, contain iterated stochastic integrals with respect to the Q-Wiener process [8], [10]-[13], [17].

Note that the exponential Milstein type numerical scheme [12], [17], [24] and exponential Wagner–Platen type numerical scheme [13] contain, for example, the following iterated stochastic integrals

$$\int\limits_t^T B(Z)d\mathbf{W}_{t_1}, \quad \int\limits_t^T B'(Z)\left(\int\limits_t^{t_2} B(Z)d\mathbf{W}_{t_1}\right)d\mathbf{W}_{t_2}, \tag{2}$$

$$\int\limits_t^T F'(Z)\left(\int\limits_t^{t_2} B(Z)d\mathbf{W}_{t_1}\right)dt_2, \quad \int\limits_t^T B'(Z)\left(\int\limits_t^{t_3} B'(Z)\left(\int\limits_t^{t_2} B(Z)d\mathbf{W}_{t_1}\right)d\mathbf{W}_{t_2}\right)d\mathbf{W}_{t_3}, \tag{3}$$

$$\int\limits_t^T B'(Z)\left(\int\limits_t^{t_2} F(Z)dt_1\right)d\mathbf{W}_{t_2}, \quad \int\limits_t^T B''(Z)\left(\int\limits_t^{t_2} B(Z)d\mathbf{W}_{t_1}, \int\limits_t^{t_2} B(Z)d\mathbf{W}_{t_1}\right)d\mathbf{W}_{t_2}, \tag{4}$$

where $0 \le t < T \le \bar{T}$, $Z : \Omega \to H$ is an $\mathbf{F}_t/\mathcal{B}(H)$-measurable mapping and F', B', B'' denote Frêchet derivatives. At that, the exponential Milstein type scheme [12] contains integrals (2) while the exponential Wagner–Platen type scheme [13] contains integrals (2)–(4). It is easy to notice that the numerical schemes for SPDEs with higher orders of convergence (with respect to the temporal discretization) in contrast with numerical schemes from [12], [13] will include iterated stochastic integrals (with respect to the Q-Wiener process) with multiplicities $k > 3$ [21] (2012). So, this work is partially devoted to the approximation of iterated stochastic integrals of the form

$$I[\Phi^{(k)}(Z)]_{T,t} = \int\limits_t^T \Phi_k(Z)\left(\ldots\left(\int\limits_t^{t_3} \Phi_2(Z)\left(\int\limits_t^{t_2} \Phi_1(Z)d\mathbf{W}_{t_1}\right)d\mathbf{W}_{t_2}\right)\ldots\right)d\mathbf{W}_{t_k}, \tag{5}$$

where $Z : \Omega \to H$ is an $\mathbf{F}_t/\mathcal{B}(H)$-measurable mapping, $\Phi_k(v)(\ \ldots(\Phi_2(v)(\Phi_1(v))\ldots\ ))$ is a k-linear Hilbert–Schmidt operator mapping from $\underbrace{U_0 \times \ldots \times U_0}_{k\ \text{times}}$ to H for all $v \in H$, and $0 \le t < T \le \bar{T}$.

In Sect. 5 we consider the approximation of more general iterated stochastic integrals than (5). In Sect. 6, 7 some other types of iterated stochastic integrals of multiplicities 2–4 with respect to the Q-Wiener process will be considered. In this paper, in all the integrals mentioned above, the infinite-dimensional Q-Wiener process will be replaced by its finite-dimensional approximation. In [59]-[61], (also see [44], Chapter 7) one can find a continuation of the studies begun in this work. In [44], [59]-[61] we consider the approximation of iterated stochastic integrals (2)–(4) with respect to the infinite-dimensional Q-Wiener process.

Note that the second stochastic integral in (4) is not a special case of the stochastic integral (5) for $k = 3$. Nevertheless, the expanded representation of the approximation of stochastic integral (4) has a close structure to (9) for $k = 3$ (see below). Moreover, the mentioned representation of stochastic integral (4) contains the same iterated Itô stochastic integrals of third multiplicity as in (9) for $k = 3$ (see Sect. 6). These conclusions mean that the main result of this article (Theorem 4, Sect. 5) for $k = 3$ can be reformulated naturally for the stochastic integral (4) (see Sect. 6).

It should be noted that by developing an approach from the work [13], which uses the Taylor formula in Banach spaces and a formula for the mild solution of the SPDE (1), we obviously obtain a number of other iterated stochastic integrals with respect to the Q-Wiener process. For example, the following stochastic integrals

$$\int\limits_t^T B'''(Z)\left(\int\limits_t^{t_2} B(Z)d\mathbf{W}_{t_1}, \int\limits_t^{t_2} B(Z)d\mathbf{W}_{t_1}, \int\limits_t^{t_2} B(Z)d\mathbf{W}_{t_1}\right) d\mathbf{W}_{t_2},$$

$$\int\limits_t^T B'(Z)\left(\int\limits_t^{t_3} B''(Z)\left(\int\limits_t^{t_2} B(Z)d\mathbf{W}_{t_1}, \int\limits_t^{t_2} B(Z)d\mathbf{W}_{t_1}\right) d\mathbf{W}_{t_2}\right) d\mathbf{W}_{t_3},$$

$$\int\limits_t^T B''(Z)\left(\int\limits_t^{t_3} B(Z)d\mathbf{W}_{t_1}, \int\limits_t^{t_3} B'(Z)\left(\int\limits_t^{t_2} B(Z)d\mathbf{W}_{t_1}\right) d\mathbf{W}_{t_2}\right) d\mathbf{W}_{t_3},$$

$$\int\limits_t^T F'(Z)\left(\int\limits_t^{t_3} B'(Z)\left(\int\limits_t^{t_2} B(Z)d\mathbf{W}_{t_1}\right) d\mathbf{W}_{t_2}\right) dt_3,$$

$$\int\limits_t^T F''(Z)\left(\int\limits_t^{t_2} B(Z)d\mathbf{W}_{t_1}, \int\limits_t^{t_2} B(Z)d\mathbf{W}_{t_1}\right) dt_2,$$

$$\int\limits_t^T B''(Z)\left(\int\limits_t^{t_2} F(Z)dt_1, \int\limits_t^{t_2} B(Z)d\mathbf{W}_{t_1}\right) d\mathbf{W}_{t_2}$$

will be considered in Sect. 7. Here $Z:\Omega\to H$ is an $\mathbf{F}_t/\mathcal{B}(H)$-measurable mapping and B', B'', B''', F', F'' are Frêchet derivatives.

Consider eigenvalues λ_i and eigenfunctions $e_i(x)$ of the covariance operator Q, where $i = (i_1,\ldots,i_d)$ $\in J$, $x = (x_1,\ldots,x_d)$, and $J = \{i:\ i\in\mathbb{N}^d,\ \text{and}\ \lambda_i > 0\}$.

The series representation of the Q-Wiener process has the following form [19]

$$\mathbf{W}(t,x) = \sum_{i\in J} e_i(x)\sqrt{\lambda_i}\mathbf{w}_t^{(i)},\quad t\in[0,\bar{T}],$$

or in the shorter notations

$$\mathbf{W}_t=\sum_{i\in J} e_i\sqrt{\lambda_i}\mathbf{w}_t^{(i)},\quad t\in[0,\bar T],$$

where $\mathbf{w}_t^{(i)}$, $i\in J$ are independent standard Wiener processes. Note that eigenfunctions e_i, $i\in J$ form an orthonormal basis of U [19].

Consider the finite-dimensional approximation of $\mathbf{W}_t$ [19]

$$\mathbf{W}_t^M=\sum_{i\in J_M} e_i\sqrt{\lambda_i}\mathbf{w}_t^{(i)},\quad t\in[0,\bar T], \tag{6}$$

where $J_M=\{i:\ 1\le i_1,\ldots,i_d\le M,\ \text{and}\ \lambda_i>0\}$.

Using (6) and the relation [19]

$$\mathbf{w}_t^{(i)}=\frac{1}{\sqrt{\lambda_i}}\langle e_i,\mathbf{W}_t\rangle_U,\quad i\in J, \tag{7}$$

we obtain

$$\mathbf{W}_t^M=\sum_{i\in J_M} e_i\ \langle e_i,\mathbf{W}_t\rangle_U,\quad t\in[0,\bar T], \tag{8}$$

where $\langle\cdot,\cdot\rangle_U$ is a scalar product in U.

Taking into account (7), (8), we note that the approximation $I[\Phi^{(k)}(Z)]_{T,t}^M$ of iterated stochastic integral $I[\Phi^{(k)}(Z)]_{T,t}$ (see (5)) can be rewritten with probability 1 (further w. p. 1) in the following form

$$I[\Phi^{(k)}(Z)]_{T,t}^M=\int\limits_t^T\Phi_k(Z)\left(\ldots\left(\int\limits_t^{t_3}\Phi_2(Z)\left(\int\limits_t^{t_2}\Phi_1(Z)d\mathbf{W}_{t_1}^M\right)d\mathbf{W}_{t_2}^M\right)\ldots\right)d\mathbf{W}_{t_k}^M=$$

$$=\sum_{r_1,\ldots,r_k\in J_M}\Phi_k(Z)\left(\ldots\left(\Phi_2(Z)\left(\Phi_1(Z)e_{r_1}\right)e_{r_2}\right)\ldots\right)e_{r_k}\times$$

$$\times\int\limits_t^T\ldots\int\limits_t^{t_3}\int\limits_t^{t_2}d\langle e_{r_1},\mathbf{W}_{t_1}\rangle_U\ d\langle e_{r_2},\mathbf{W}_{t_2}\rangle_U\ \ldots\ d\langle e_{r_k},\mathbf{W}_{t_k}\rangle_U=$$

$$=\sum_{r_1,\ldots,r_k\in J_M}\Phi_k(Z)\left(\ldots\left(\Phi_2(Z)\left(\Phi_1(Z)e_{r_1}\right)e_{r_2}\right)\ldots\right)e_{r_k}\sqrt{\lambda_{r_1}\lambda_{r_2}\ldots\lambda_{r_k}}\times$$

$$\times\int\limits_t^T\ldots\int\limits_t^{t_3}\int\limits_t^{t_2}d\mathbf{w}_{t_1}^{(r_1)}d\mathbf{w}_{t_2}^{(r_2)}\ldots d\mathbf{w}_{t_k}^{(r_k)}, \tag{9}$$

where $0\le t<T\le\bar T$.

Remark 1. *Obviously, without the loss of generality we can write* $J_M=\{1,2,\ldots,M\}$.

When special conditions of commutativity for SPDEs in the form (1) be fulfilled it is proposed to simulate numerically the stochastic integrals (2)–(4) using the simple formulas [12], [13]. In this case, the numerical simulation of mentioned stochastic integrals requires the use of increments of the Q-Wiener process only. However, if these commutativity conditions are not fulfilled (which often corresponds to SPDEs in numerous applications), the numerical simulation of stochastic integrals (2)–(4) becomes much more difficult. In [25] two methods for the mean-square approximation of simplest iterated (double) stochastic integrals with respect to the Q-Wiener process are proposed. In this article, we consider a substantially more general and effective method for the mean-square approximation of iterated stochastic integrals of multiplicity k ($k \in \mathbb{N}$) with respect to the Q-Wiener process. The convergence analysis in the transition from J_M to J, i.e. from $\mathbf{W}_t^M$ to $\mathbf{W}t$ is carried out in [44] (Sect.7.4.2), [45] (Sect.7.4.2), [46], [59], [60] for stochastic integrals of multiplicity k ($k = 1, 2, 3$) with respect to the Q-Wiener process (the cases $k = 1, 2$ is considered in Theorem 1 from [25]).

The monographs [43] (Chapters 5 and 6) and [44] or [45], [46] (Chapters 1, 2, and 5) (also see [30]-[42], [47]-[58]) are devoted to constructing of efficient methods of the mean-square approximation of iterated Itô stochastic integrals with respect to the scalar standard Wiener processes. These results are adapted for iterated Stratonovich stochastic integrals [27]-[58]. Below (Sect. 2–4) we consider a very short review of results from monographs [43] (Chapters 5 and 6) and [44] or [45], [46] (Chapters 1, 2, and 5) and some new results (Sect. 5–7).

2. Method of Approximation of Iterated Itô Stochastic integrals Based on Generalized Multiple Fourier Series

Consider more general iterated Itô stochastic integrals than in (9)

$$J[\psi^{(k)}]_{T,t}^{(i_1\ldots i_k)} = \int\limits_t^T \psi_k(t_k)\ldots \int\limits_t^{t_2} \psi_1(t_1) d\mathbf{w}_{t_1}^{(i_1)} \ldots d\mathbf{w}_{t_k}^{(i_k)}, \tag{10}$$

where $0 \le t < T \le \bar{T}$ and every $\psi_l(\tau)$ ($l = 1, \ldots, k$) is a continuous non-random function on $[t, T]$; $\mathbf{w}_\tau^{(i)}$ ($i = 1, \ldots, m$) are independent standard Wiener processes (see Sect. 1) and $\mathbf{w}_\tau^{(0)} = \tau$; $i_1, \ldots, i_k = 0,\ 1, \ldots, m$. The case $\psi_1(\tau), \ldots, \psi_k(\tau) \in L_2([t, T])$ will be considered in Theorem 2 (see below).

Suppose that $\{\phi_j(x)\}_{j=0}^\infty$ is a complete orthonormal system of functions in $L_2([t, T])$. Define the following function on the hypercube $[t, T]^k$

$$K(t_1, \ldots, t_k) = \begin{cases} \psi_1(t_1)\ldots\psi_k(t_k),\ t_1 < \ldots < t_k \\ \\ 0,\ \text{otherwise} \end{cases} = \prod_{l=1}^k \psi_l(t_l) \prod_{l=1}^{k-1} \mathbf{1}_{\{t_l < t_{l+1}\}}, \tag{11}$$

where $t_1, \ldots, t_k \in [t, T]$ for $k \ge 2$ and $K(t_1) \equiv \psi_1(t_1)$ for $t_1 \in [t, T]$. Here $\mathbf{1}_A$ is the indicator of the set A.

The function $K(t_1, \ldots, t_k)$ is piecewise continuous on the hypercube $[t, T]^k$. At this situation it is well known that the generalized multiple Fourier series of $K(t_1, \ldots, t_k) \in L_2([t, T]^k)$ converges to $K(t_1, \ldots, t_k)$ in the hypercube $[t, T]^k$ in the mean-square sense, i.e.

$$\lim_{p_1,\ldots,p_k\to\infty} \left\| K(t_1, \ldots, t_k) - \sum_{j_1=0}^{p_1} \ldots \sum_{j_k=0}^{p_k} C_{j_k\ldots j_1} \prod_{l=1}^k \phi_{j_l}(t_l) \right\|_{L_2([t,T]^k)} = 0, \tag{12}$$

where

$$C_{j_k\ldots j_1}=\int\limits_{[t,T]^k}K(t_1,\ldots,t_k)\prod_{l=1}^{k}\phi_{j_l}(t_l)dt_1\ldots dt_k \tag{13}$$

is the Fourier coefficient and

$$\|f\|_{L_2([t,T]^k)}=\left(\int\limits_{[t,T]^k}f^2(t_1,\ldots,t_k)dt_1\ldots dt_k\right)^{1/2}.$$

Consider the discretization $\{\tau_j\}_{j=0}^{N}$ of $[t,T]$ such that

$$t=\tau_0<\ldots<\tau_N=T,\quad \Delta_N=\max_{0\le j\le N-1}\Delta\tau_j\to 0\ \text{ if }\ N\to\infty,\quad \Delta\tau_j=\tau_{j+1}-\tau_j. \tag{14}$$

Theorem 1 [30] (2006) (also see [31]-[60]). *Suppose that every $\psi_l(\tau)$ $(l=1,\ldots,k)$ is a continuous non-random function on $[t,T]$ and $\{\phi_j(x)\}_{j=0}^{\infty}$ is a complete orthonormal system of continuous functions in $L_2([t,T])$. Then*

$$J[\psi^{(k)}]_{T,t}^{(i_1\ldots i_k)}=\underset{p_1,\ldots,p_k\to\infty}{\text{l.i.m.}}\sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k}C_{j_k\ldots j_1}\left(\prod_{l=1}^{k}\zeta_{j_l}^{(i_l)}-\right.$$

$$\left.-\ \underset{N\to\infty}{\text{l.i.m.}}\sum_{(l_1,\ldots,l_k)\in \text{G}_k}\phi_{j_1}(\tau_{l_1})\Delta\mathbf{w}_{\tau_{l_1}}^{(i_1)}\ldots\phi_{j_k}(\tau_{l_k})\Delta\mathbf{w}_{\tau_{l_k}}^{(i_k)}\right), \tag{15}$$

where

$$\text{G}_k=\text{H}_k\backslash\text{L}_k;\ \text{H}_k=\{(l_1,\ldots,l_k):\ l_1,\ldots,l_k=0,\ 1,\ldots,N-1\},$$

$$\text{L}_k=\{(l_1,\ldots,l_k):\ l_1,\ldots,l_k=0,\ 1,\ldots,N-1;\ l_g\ne l_r\ (g\ne r);\ g,r=1,\ldots,k\},$$

l.i.m. *is a limit in the mean-square sense*, $i_1,\ldots,i_k=0,1,\ldots,m$,

$$\zeta_j^{(i)}=\int\limits_t^T\phi_j(s)d\mathbf{w}_s^{(i)} \tag{16}$$

are independent standard Gaussian random variables for various i or j (if $i\ne 0$), $C_{j_k\ldots j_1}$ is the Fourier coefficient (13), $\Delta\mathbf{w}_{\tau_j}^{(i)}=\mathbf{w}_{\tau_{j+1}}^{(i)}-\mathbf{w}_{\tau_j}^{(i)}$ $(i=0,\ 1,\ldots,m)$, $\{\tau_j\}_{j=0}^{N}$ *is the discretization of* $[t,T]$, *which satisfies the condition* (14).

Note that in [30]-[57] the version of Theorem 1 for systems of Haar and Rademacher–Walsh functions has been considered. Another modifications and generalizations of Theorem 1 can be found in the monographs [44]-[46] (also see Theorem 2 below).

It is not difficult to see that for the case of pairwise different numbers $i_1,\ldots,i_k=1,\ldots,m$ from Theorem 1 we obtain

$$J[\psi^{(k)}]_{T,t}^{(i_1\ldots i_k)}=\underset{p_1,\ldots,p_k\to\infty}{\text{l.i.m.}}\sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k}C_{j_k\ldots j_1}\zeta_{j_1}^{(i_1)}\ldots\zeta_{j_k}^{(i_k)}.$$

In order to evaluate the significance of Theorem 1 for practice we will demonstrate its transformed particular cases for $k = 1, \ldots, 6$ [30]-[58] (the cases $k = 7$ and $k > 7$ can be found in [34], [39], [43]-[46])

$$J[\psi^{(1)}]_{T,t}^{(i_1)} = \underset{p_1\to\infty}{\text{l.i.m.}} \sum_{j_1=0}^{p_1} C_{j_1}\zeta_{j_1}^{(i_1)}, \tag{17}$$

$$J[\psi^{(2)}]_{T,t}^{(i_1 i_2)} = \underset{p_1,p_2\to\infty}{\text{l.i.m.}} \sum_{j_1=0}^{p_1}\sum_{j_2=0}^{p_2} C_{j_2 j_1}\Biggl(\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)} - \mathbf{1}_{\{i_1=i_2\ne 0\}}\mathbf{1}_{\{j_1=j_2\}}\Biggr), \tag{18}$$

$$J[\psi^{(3)}]_{T,t}^{(i_1 i_2 i_3)} = \underset{p_1,p_2,p_3\to\infty}{\text{l.i.m.}} \sum_{j_1=0}^{p_1}\sum_{j_2=0}^{p_2}\sum_{j_3=0}^{p_3} C_{j_3 j_2 j_1}\Biggl(\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}\zeta_{j_3}^{(i_3)} -$$
$$-\mathbf{1}_{\{i_1=i_2\ne 0\}}\mathbf{1}_{\{j_1=j_2\}}\zeta_{j_3}^{(i_3)} - \mathbf{1}_{\{i_2=i_3\ne 0\}}\mathbf{1}_{\{j_2=j_3\}}\zeta_{j_1}^{(i_1)} - \mathbf{1}_{\{i_1=i_3\ne 0\}}\mathbf{1}_{\{j_1=j_3\}}\zeta_{j_2}^{(i_2)}\Biggr), \tag{19}$$

$$J[\psi^{(4)}]_{T,t}^{(i_1\ldots i_4)} = \underset{p_1,\ldots,p_4\to\infty}{\text{l.i.m.}} \sum_{j_1=0}^{p_1}\ldots\sum_{j_4=0}^{p_4} C_{j_4\ldots j_1}\Biggl(\prod_{l=1}^{4}\zeta_{j_l}^{(i_l)} -$$
$$-\mathbf{1}_{\{i_1=i_2\ne 0\}}\mathbf{1}_{\{j_1=j_2\}}\zeta_{j_3}^{(i_3)}\zeta_{j_4}^{(i_4)} - \mathbf{1}_{\{i_1=i_3\ne 0\}}\mathbf{1}_{\{j_1=j_3\}}\zeta_{j_2}^{(i_2)}\zeta_{j_4}^{(i_4)} -$$
$$-\mathbf{1}_{\{i_1=i_4\ne 0\}}\mathbf{1}_{\{j_1=j_4\}}\zeta_{j_2}^{(i_2)}\zeta_{j_3}^{(i_3)} - \mathbf{1}_{\{i_2=i_3\ne 0\}}\mathbf{1}_{\{j_2=j_3\}}\zeta_{j_1}^{(i_1)}\zeta_{j_4}^{(i_4)} -$$
$$-\mathbf{1}_{\{i_2=i_4\ne 0\}}\mathbf{1}_{\{j_2=j_4\}}\zeta_{j_1}^{(i_1)}\zeta_{j_3}^{(i_3)} - \mathbf{1}_{\{i_3=i_4\ne 0\}}\mathbf{1}_{\{j_3=j_4\}}\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)} +$$
$$+\mathbf{1}_{\{i_1=i_2\ne 0\}}\mathbf{1}_{\{j_1=j_2\}}\mathbf{1}_{\{i_3=i_4\ne 0\}}\mathbf{1}_{\{j_3=j_4\}} + \mathbf{1}_{\{i_1=i_3\ne 0\}}\mathbf{1}_{\{j_1=j_3\}}\mathbf{1}_{\{i_2=i_4\ne 0\}}\mathbf{1}_{\{j_2=j_4\}} +$$
$$+\mathbf{1}_{\{i_1=i_4\ne 0\}}\mathbf{1}_{\{j_1=j_4\}}\mathbf{1}_{\{i_2=i_3\ne 0\}}\mathbf{1}_{\{j_2=j_3\}}\Biggr), \tag{20}$$

$$J[\psi^{(5)}]_{T,t}^{(i_1\ldots i_5)} = \underset{p_1,\ldots,p_5\to\infty}{\text{l.i.m.}} \sum_{j_1=0}^{p_1}\ldots\sum_{j_5=0}^{p_5} C_{j_5\ldots j_1}\Biggl(\prod_{l=1}^{5}\zeta_{j_l}^{(i_l)} -$$
$$-\mathbf{1}_{\{i_1=i_2\ne 0\}}\mathbf{1}_{\{j_1=j_2\}}\zeta_{j_3}^{(i_3)}\zeta_{j_4}^{(i_4)}\zeta_{j_5}^{(i_5)} - \mathbf{1}_{\{i_1=i_3\ne 0\}}\mathbf{1}_{\{j_1=j_3\}}\zeta_{j_2}^{(i_2)}\zeta_{j_4}^{(i_4)}\zeta_{j_5}^{(i_5)} -$$
$$-\mathbf{1}_{\{i_1=i_4\ne 0\}}\mathbf{1}_{\{j_1=j_4\}}\zeta_{j_2}^{(i_2)}\zeta_{j_3}^{(i_3)}\zeta_{j_5}^{(i_5)} - \mathbf{1}_{\{i_1=i_5\ne 0\}}\mathbf{1}_{\{j_1=j_5\}}\zeta_{j_2}^{(i_2)}\zeta_{j_3}^{(i_3)}\zeta_{j_4}^{(i_4)} -$$
$$-\mathbf{1}_{\{i_2=i_3\ne 0\}}\mathbf{1}_{\{j_2=j_3\}}\zeta_{j_1}^{(i_1)}\zeta_{j_4}^{(i_4)}\zeta_{j_5}^{(i_5)} - \mathbf{1}_{\{i_2=i_4\ne 0\}}\mathbf{1}_{\{j_2=j_4\}}\zeta_{j_1}^{(i_1)}\zeta_{j_3}^{(i_3)}\zeta_{j_5}^{(i_5)} -$$

where $\mathbf{1}_A$ is the indicator of the set A.

Consider the generalization of (17)–(22) for the case of an arbitrary k ($k\in\mathbb{N}$) as well as for the case of an arbitrary complete orthonormal system of functions $\{\phi_j(x)\}_{j=0}^{\infty}$ in the space $L_2([t,T])$ and $\psi_1(\tau),\ldots,\psi_k(\tau)\in L_2([t,T])$.

In order to do this, let us consider the unordered set $\{1,2,\ldots,k\}$ and separate it into two parts: the first part consists of r unordered pairs (sequence order of these pairs is also unimportant) and the second one consists of the remaining $k-2r$ numbers. So, we have

$$(\{\underbrace{\{g_1,g_2\},\ldots,\{g_{2r-1},g_{2r}\}}_{\text{part 1}}\},\{\underbrace{q_1,\ldots,q_{k-2r}}_{\text{part 2}}\}), \tag{23}$$

where $\{g_1,g_2,\ldots,g_{2r-1},g_{2r},q_1,\ldots,q_{k-2r}\}=\{1,2,\ldots,k\}$, braces mean an unordered set, and parentheses mean an ordered set.

We will say that (23) is a partition and consider the sum with respect to all possible partitions

$$\sum_{\substack{(\{\{g_1,g_2\},\ldots,\{g_{2r-1},g_{2r}\}\},\{q_1,\ldots,q_{k-2r}\})\\ \{g_1,g_2,\ldots,g_{2r-1},g_{2r},q_1,\ldots,q_{k-2r}\}=\{1,2,\ldots,k\}}} a_{g_1g_2,\ldots,g_{2r-1}g_{2r},q_1\ldots q_{k-2r}}. \tag{24}$$

Below there are several examples of sums in the form (24)

$$\sum_{\substack{(\{g_1,g_2\})\\ \{g_1,g_2\}=\{1,2\}}} a_{g_1g_2}=a_{12},$$

$$\sum_{\substack{(\{\{g_1,g_2\},\{g_3,g_4\}\})\\ \{g_1,g_2,g_3,g_4\}=\{1,2,3,4\}}} a_{g_1g_2g_3g_4}=a_{1234}+a_{1324}+a_{2314},$$

$$\sum_{\substack{(\{g_1,g_2\},\{q_1,q_2\})\\ \{g_1,g_2,q_1,q_2\}=\{1,2,3,4\}}} a_{g_1g_2,q_1q_2}=a_{12,34}+a_{13,24}+a_{14,23}+a_{23,14}+a_{24,13}+a_{34,12},$$

$$\sum_{\substack{(\{g_1,g_2\},\{q_1,q_2,q_3\})\\ \{g_1,g_2,q_1,q_2,q_3\}=\{1,2,3,4,5\}}} a_{g_1g_2,q_1q_2q_3}=a_{12,345}+a_{13,245}+a_{14,235}+a_{15,234}+a_{23,145}+a_{24,135}+$$

$$+a_{25,134}+a_{34,125}+a_{35,124}+a_{45,123},$$

$$\sum_{\substack{(\{\{g_1,g_2\},\{g_3,g_4\}\},\{q_1\})\\ \{g_1,g_2,g_3,g_4,q_1\}=\{1,2,3,4,5\}}} a_{g_1g_2,g_3g_4,q_1}=a_{12,34,5}+a_{13,24,5}+a_{14,23,5}+a_{12,35,4}+a_{13,25,4}+a_{15,23,4}+$$

$$+a_{12,54,3}+a_{15,24,3}+a_{14,25,3}+a_{15,34,2}+a_{13,54,2}+a_{14,53,2}+a_{52,34,1}+a_{53,24,1}+a_{54,23,1}.$$

Now we can formulate the following generalization of Theorem 1.

Theorem 2 [44] (Sect. 1.11), [47] (Sect. 15). *Suppose that $\{\phi_j(x)\}_{j=0}^{\infty}$ is an arbitrary complete orthonormal system of functions in the space $L_2([t,T])$ and $\psi_1(\tau),\ldots,\psi_k(\tau)\in L_2([t,T])$. Then the following expansion*

$$J[\psi^{(k)}]_{T,t}^{(i_1\ldots i_k)}=\underset{p_1,\ldots,p_k\to\infty}{\text{l.i.m.}}\sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k}C_{j_k\ldots j_1}\Biggl(\prod_{l=1}^{k}\zeta_{j_l}^{(i_l)}+\sum_{r=1}^{[k/2]}(-1)^r\times$$

$$\times\sum_{\substack{(\{\{g_1,g_2\},\ldots,\{g_{2r-1},g_{2r}\}\},\{q_1,\ldots,q_{k-2r}\})\\ \{g_1,g_2,\ldots,g_{2r-1},g_{2r},q_1,\ldots,q_{k-2r}\}=\{1,2,\ldots,k\}}}\prod_{s=1}^{r}\mathbf{1}_{\{i_{g_{2s-1}}=\,i_{g_{2s}}\neq 0\}}\mathbf{1}_{\{j_{g_{2s-1}}=\,j_{g_{2s}}\}}\prod_{l=1}^{k-2r}\zeta_{j_{q_l}}^{(i_{q_l})}\Biggr)\qquad(25)$$

converging in the mean-square sense is valid, where $[x]$ is an integer part of a real number x; another notations are the same as in Theorem 1.

In particular, from (25) for $k=5$ we obtain

$$J[\psi^{(5)}]_{T,t}^{(i_1\ldots i_5)}=\sum_{j_1,\ldots,j_5=0}^{\infty}C_{j_5\ldots j_1}\Biggl(\prod_{l=1}^{5}\zeta_{j_l}^{(i_l)}-\sum_{\substack{(\{g_1,g_2\},\{q_1,q_2,q_3\})\\ \{g_1,g_2,q_1,q_2,q_3\}=\{1,2,3,4,5\}}}\mathbf{1}_{\{i_{g_1}=\,i_{g_2}\neq 0\}}\mathbf{1}_{\{j_{g_1}=\,j_{g_2}\}}\prod_{l=1}^{3}\zeta_{j_{q_l}}^{(i_{q_l})}+$$

$$+\sum_{\substack{(\{\{g_1,g_2\},\{g_3,g_4\}\},\{q_1\})\\ \{g_1,g_2,g_3,g_4,q_1\}=\{1,2,3,4,5\}}}\mathbf{1}_{\{i_{g_1}=\,i_{g_2}\neq 0\}}\mathbf{1}_{\{j_{g_1}=\,j_{g_2}\}}\mathbf{1}_{\{i_{g_3}=\,i_{g_4}\neq 0\}}\mathbf{1}_{\{j_{g_3}=\,j_{g_4}\}}\zeta_{j_{q_1}}^{(i_{q_1})}\Biggr).$$

The last equality obviously agrees with (21). Note that the correctness of formulas (17)–(22) can be verified by the fact that if $i_1 = \ldots = i_6 = i = 1, \ldots, m$ and $\psi_1(s), \ldots, \psi_6(s) \equiv \psi(s)$, then we can derive from (17)–(22) the well known equalities

$$J[\psi^{(1)}]_{T,t}^{(i)} = \frac{1}{1!}\delta_{T,t}^{(i)},$$

$$J[\psi^{(2)}]_{T,t}^{(ii)} = \frac{1}{2!}\left(\left(\delta_{T,t}^{(i)}\right)^2 - \Delta_{T,t}\right),$$

$$J[\psi^{(3)}]_{T,t}^{(iii)} = \frac{1}{3!}\left(\left(\delta_{T,t}^{(i)}\right)^3 - 3\delta_{T,t}^{(i)}\Delta_{T,t}\right),$$

$$J[\psi^{(4)}]_{T,t}^{(iiii)} = \frac{1}{4!}\left(\left(\delta_{T,t}^{(i)}\right)^4 - 6\left(\delta_{T,t}^{(i)}\right)^2\Delta_{T,t} + 3\Delta_{T,t}^2\right),$$

$$J[\psi^{(5)}]_{T,t}^{(iiiii)} = \frac{1}{5!}\left(\left(\delta_{T,t}^{(i)}\right)^5 - 10\left(\delta_{T,t}^{(i)}\right)^3\Delta_{T,t} + 15\delta_{T,t}^{(i)}\Delta_{T,t}^2\right),$$

$$J[\psi^{(6)}]_{T,t}^{(iiiiii)} = \frac{1}{6!}\left(\left(\delta_{T,t}^{(i)}\right)^6 - 15\left(\delta_{T,t}^{(i)}\right)^4\Delta_{T,t} + 45\left(\delta_{T,t}^{(i)}\right)^2\Delta_{T,t}^2 - 15\Delta_{T,t}^3\right)$$

w. p. 1 [31]-[43], where

$$\delta_{T,t}^{(i)} = \int\limits_t^T \psi(s)d\mathbf{w}_s^{(i)}, \quad \Delta_{T,t} = \int\limits_t^T \psi^2(s)ds.$$

The above equalities can be independently obtained using the Itô formula and Hermite polynomials [66].

3. Calculation of the Mean-Square Approximation Error of Iterated Itô Stochastic Integrals in Theorems 1, 2

Assume that $J[\psi^{(k)}]_{T,t}^{(i_1\ldots i_k)p_1\ldots p_k}$ is an approximation of (10), which is the expression on the right-hand side of (25) before passing to the limit $\underset{p_1,\ldots,p_k\to\infty}{\text{l.i.m.}}$. Let us denote

$$E^{(i_1\ldots i_k)p_1,\ldots,p_k} = \mathsf{M}\left\{\left(J[\psi^{(k)}]_{T,t}^{(i_1\ldots i_k)} - J[\psi^{(k)}]_{T,t}^{(i_1\ldots i_k)p_1,\ldots,p_k}\right)^2\right\},$$

$$E^{(i_1\ldots i_k)p} = E_k^{(i_1\ldots i_k)p_1,\ldots,p_k}\Big|_{p_1=\ldots=p_k=p},$$

$$I_k = \|K\|_{L_2([t,T]^k)}^2 = \int\limits_{[t,T]^k} K^2(t_1,\ldots,t_k)dt_1\ldots dt_k. \tag{26}$$

In [39]-[46], [55]-[57] it was shown that

$$E_k^{(i_1\ldots i_k)p_1,\ldots,p_k} \le k!\left(I_k - \sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k} C_{j_k\ldots j_1}^2\right), \tag{27}$$

where $i_1,\ldots,i_k=1,\ldots,m$ for $0<T-t<\infty$ and $i_1,\ldots,i_k=0,1,\ldots,m$ for $0<T-t<1$. Note that the estimate (27) is valid under the conditions of Theorem 2.

The exact calcutation of $E^{(i_1\ldots i_k)p}$ is presented in the following theorem.

Theorem 3 [44] (Sect. 1.12). *Suppose that $\{\phi_j(x)\}_{j=0}^{\infty}$ is an arbitrary complete orthonormal system of functions in the space $L_2([t,T])$ and $\psi_1(\tau),\ldots,\psi_k(\tau)\in L_2([t,T])$, $i_1,\ldots,i_k=1,\ldots,m$. Then*

$$E^{(i_1\ldots i_k)p}=I_k-$$

$$-\sum_{j_1,\ldots,j_k=0}^{p}C_{j_k\ldots j_1}\mathsf{M}\left\{J[\psi^{(k)}]_{T,t}^{(i_1\ldots i_k)}\sum_{(j_1,\ldots,j_k)}\int\limits_t^T\phi_{j_k}(t_k)\ldots\int\limits_t^{t_2}\phi_{j_1}(t_1)d\mathbf{w}_{t_1}^{(i_1)}\ldots d\mathbf{w}_{t_k}^{(i_k)}\right\}, \tag{28}$$

where $J[\psi^{(k)}]_{T,t}^{(i_1\ldots i_k)p}$ is the expression on the right-hand side of (25) before passing to the limit $\underset{p_1,\ldots,p_k\to\infty}{\text{l.i.m.}}$ for $p_1=\ldots=p_k=p$; the expression

$$\sum_{(j_1,\ldots,j_k)}$$

means the sum with respect to all possible permutations $(j_1,\ldots,j_k)$. At the same time if j_r swapped with j_q in the permutation $(j_1,\ldots,j_k)$, then i_r swapped with i_q in the permutation $(i_1,\ldots,i_k)$; another notations are the same as in Theorems 1, 2.

Note that

$$\mathsf{M}\left\{J[\psi^{(k)}]_{T,t}^{(i_1\ldots i_k)}\int\limits_t^T\phi_{j_k}(t_k)\ldots\int\limits_t^{t_2}\phi_{j_1}(t_1)d\mathbf{w}_{t_1}^{(i_1)}\ldots d\mathbf{w}_{t_k}^{(i_k)}\right\}=C_{j_k\ldots j_1}$$

for $i_1\ldots i_k=1,\ldots,m$.

Then from Theorem 3 for $i_1,\ldots,i_k=1,\ldots,m$ we obtain [40], [42]-[46]

$$E^{(i_1\ldots i_k)p}=I_k-\sum_{j_1,\ldots,j_k=0}^{p}C_{j_k\ldots j_1}^2\quad(\text{pairwise different } i_1,\ldots,i_k), \tag{29}$$

$$E^{(i_1i_2)p}=I_2-\sum_{j_1,j_2=0}^{p}C_{j_2j_1}^2-\sum_{j_1,j_2=0}^{p}C_{j_2j_1}C_{j_1j_2}\quad(i_1=i_2),$$

$$E^{(i_1i_2i_3)p}=I_3-\sum_{j_3,j_2,j_1=0}^{p}C_{j_3j_2j_1}^2-\sum_{j_3,j_2,j_1=0}^{p}C_{j_3j_1j_2}C_{j_3j_2j_1}\quad(i_1=i_2\neq i_3),$$

$$E^{(i_1i_2i_3i_4)p}=I_4-\sum_{j_1,j_2,j_3,j_4=0}^{p}C_{j_4j_3j_2j_1}\left(\sum_{(j_3,j_4)}\left(\sum_{(j_1,j_2)}C_{j_4j_3j_2j_1}\right)\right)\quad(i_1=i_2\neq i_3=i_4),$$

$$E^{(i_1 i_2 i_3 i_4 i_5)p} = I_5 - \sum_{j_1,j_2,j_3,j_4,j_5=0}^{p} C_{j_5 j_4 j_3 j_2 j_1} \left(\sum_{(j_3,j_4)} \left(\sum_{(j_1,j_2,j_5)} C_{j_5 j_4 j_3 j_2 j_1} \right)\right)$$

$$(i_1 = i_2 = i_5 \neq i_3 = i_4).$$

4. Some Examples of the Mean-Square Approximations of Iterated Itô Stochastic Integrals Using Legendre Polynomials

Denote

$$I_{(1)T,t}^{(i_1)} = \int\limits_t^T d\mathbf{w}_{t_1}^{(i_1)},$$

$$I_{(10)T,t}^{(i_1 0)} = \int\limits_t^T \int\limits_t^{t_2} d\mathbf{w}_{t_1}^{(i_1)} dt_2, \quad I_{(01)T,t}^{(0 i_2)} = \int\limits_t^T \int\limits_t^{t_2} dt_1 d\mathbf{w}_{t_2}^{(i_2)},$$

$$I_{(11)T,t}^{(i_1 i_2)} = \int\limits_t^T \int\limits_t^{t_2} d\mathbf{w}_{t_1}^{(i_1)} d\mathbf{w}_{t_2}^{(i_2)}, \quad I_{(111)T,t}^{(i_1 i_2 i_3)} = \int\limits_t^T \int\limits_t^{t_3} \int\limits_t^{t_2} d\mathbf{w}_{t_1}^{(i_1)} d\mathbf{w}_{t_2}^{(i_2)} d\mathbf{w}_{t_3}^{(i_3)},$$

$$I_{(1111)T,t}^{(i_1 i_2 i_3 i_4)} = \int\limits_t^T \int\limits_t^{t_4} \int\limits_t^{t_3} \int\limits_t^{t_2} d\mathbf{w}_{t_1}^{(i_1)} d\mathbf{w}_{t_2}^{(i_2)} d\mathbf{w}_{t_3}^{(i_3)} d\mathbf{w}_{t_4}^{(i_4)},$$

$$I_{(11111)T,t}^{(i_1 i_2 i_3 i_4 i_5)} = \int\limits_t^T \int\limits_t^{t_5} \int\limits_t^{t_4} \int\limits_t^{t_3} \int\limits_t^{t_2} d\mathbf{w}_{t_1}^{(i_1)} d\mathbf{w}_{t_2}^{(i_2)} d\mathbf{w}_{t_3}^{(i_3)} d\mathbf{w}_{t_4}^{(i_4)} d\mathbf{w}_{t_5}^{(i_5)},$$

where $i_1, i_2, i_3, i_4, i_5 = 1, \ldots, m$.

The complete orthonormal system of Legendre polynomials in the space $L_2([t,T])$ looks as follows

$$\phi_j(x) = \sqrt{\frac{2j+1}{T-t}} P_j\left(\left(x - \frac{T+t}{2} \right) \frac{2}{T-t} \right); \ j = 0, 1, 2, \ldots, \tag{30}$$

where $P_j(x)$ is the Legendre polynomial.

Using the system of functions (30) and Theorems 1, 2 we obtain the following approximations of iterated Itô stochastic integrals [27]-[65]

$$I_{(1)T,t}^{(i_1)} = \sqrt{T-t}\,\zeta_0^{(i_1)},$$

$$I_{(01)T,t}^{(0 i_1)} = \frac{(T-t)^{3/2}}{2} \left(\zeta_0^{(i_1)} + \frac{1}{\sqrt{3}} \zeta_1^{(i_1)} \right), \tag{31}$$

$$I_{(10)T,t}^{(i_1 0)} = \frac{(T-t)^{3/2}}{2} \left(\zeta_0^{(i_1)} - \frac{1}{\sqrt{3}} \zeta_1^{(i_1)} \right), \tag{32}$$

$$I_{(11)T,t}^{(i_1 i_2)q}=\frac{T-t}{2}\left(\zeta_0^{(i_1)}\zeta_0^{(i_2)}+\sum_{i=1}^{q}\frac{1}{\sqrt{4i^2-1}}\left(\zeta_{i-1}^{(i_1)}\zeta_i^{(i_2)}-\zeta_i^{(i_1)}\zeta_{i-1}^{(i_2)}\right)-\mathbf{1}_{\{i_1=i_2\}}\right),$$

$$I_{(111)T,t}^{(i_1 i_2 i_3)q_1}=\sum_{j_1,j_2,j_3=0}^{q_1}C_{j_3 j_2 j_1}\Biggl(\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}\zeta_{j_3}^{(i_3)}-\mathbf{1}_{\{i_1=i_2\}}\mathbf{1}_{\{j_1=j_2\}}\zeta_{j_3}^{(i_3)}-$$

$$-\mathbf{1}_{\{i_2=i_3\}}\mathbf{1}_{\{j_2=j_3\}}\zeta_{j_1}^{(i_1)}-\mathbf{1}_{\{i_1=i_3\}}\mathbf{1}_{\{j_1=j_3\}}\zeta_{j_2}^{(i_2)}\Biggr), \tag{33}$$

$$I_{(111)T,t}^{(i_1 i_1 i_1)}=\frac{1}{6}(T-t)^{3/2}\left(\left(\zeta_0^{(i_1)}\right)^3-3\zeta_0^{(i_1)}\right),$$

$$I_{(1111)T,t}^{(i_1 i_2 i_3 i_4)q_2}=\sum_{j_1,j_2,j_3,j_4=0}^{q_2}C_{j_4 j_3 j_2 j_1}\Biggl(\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}\zeta_{j_3}^{(i_3)}\zeta_{j_4}^{(i_4)}-$$
$$-\mathbf{1}_{\{i_1=i_2\}}\mathbf{1}_{\{j_1=j_2\}}\zeta_{j_3}^{(i_3)}\zeta_{j_4}^{(i_4)}-\mathbf{1}_{\{i_1=i_3\}}\mathbf{1}_{\{j_1=j_3\}}\zeta_{j_2}^{(i_2)}\zeta_{j_4}^{(i_4)}-\mathbf{1}_{\{i_1=i_4\}}\mathbf{1}_{\{j_1=j_4\}}\zeta_{j_2}^{(i_2)}\zeta_{j_3}^{(i_3)}-$$
$$-\mathbf{1}_{\{i_2=i_3\}}\mathbf{1}_{\{j_2=j_3\}}\zeta_{j_1}^{(i_1)}\zeta_{j_4}^{(i_4)}-\mathbf{1}_{\{i_2=i_4\}}\mathbf{1}_{\{j_2=j_4\}}\zeta_{j_1}^{(i_1)}\zeta_{j_3}^{(i_3)}-\mathbf{1}_{\{i_3=i_4\}}\mathbf{1}_{\{j_3=j_4\}}\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}+$$
$$+\mathbf{1}_{\{i_1=i_2\}}\mathbf{1}_{\{j_1=j_2\}}\mathbf{1}_{\{i_3=i_4\}}\mathbf{1}_{\{j_3=j_4\}}+\mathbf{1}_{\{i_1=i_3\}}\mathbf{1}_{\{j_1=j_3\}}\mathbf{1}_{\{i_2=i_4\}}\mathbf{1}_{\{j_2=j_4\}}+$$
$$+\mathbf{1}_{\{i_1=i_4\}}\mathbf{1}_{\{j_1=j_4\}}\mathbf{1}_{\{i_2=i_3\}}\mathbf{1}_{\{j_2=j_3\}}\Biggr), \tag{34}$$

$$I_{(1111)T,t}^{(i_1 i_1 i_1 i_1)}=\frac{1}{24}(T-t)^2\left(\left(\zeta_0^{(i_1)}\right)^4-6\left(\zeta_0^{(i_1)}\right)^2+3\right),$$

$$I_{(11111)T,t}^{(i_1 i_2 i_3 i_4 i_5)q_3}=\sum_{j_1,j_2,j_3,j_4,j_5=0}^{q_3}C_{j_5 j_4 j_3 j_2 j_1}\Biggl(\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}\zeta_{j_3}^{(i_3)}\zeta_{j_4}^{(i_4)}\zeta_{j_5}^{(i_5)}-\mathbf{1}_{\{i_1=i_2\}}\mathbf{1}_{\{j_1=j_2\}}\zeta_{j_3}^{(i_3)}\zeta_{j_4}^{(i_4)}\zeta_{j_5}^{(i_5)}-$$
$$-\mathbf{1}_{\{i_1=i_3\}}\mathbf{1}_{\{j_1=j_3\}}\zeta_{j_2}^{(i_2)}\zeta_{j_4}^{(i_4)}\zeta_{j_5}^{(i_5)}-\mathbf{1}_{\{i_1=i_4\}}\mathbf{1}_{\{j_1=j_4\}}\zeta_{j_2}^{(i_2)}\zeta_{j_3}^{(i_3)}\zeta_{j_5}^{(i_5)}-\mathbf{1}_{\{i_1=i_5\}}\mathbf{1}_{\{j_1=j_5\}}\zeta_{j_2}^{(i_2)}\zeta_{j_3}^{(i_3)}\zeta_{j_4}^{(i_4)}-$$
$$-\mathbf{1}_{\{i_2=i_3\}}\mathbf{1}_{\{j_2=j_3\}}\zeta_{j_1}^{(i_1)}\zeta_{j_4}^{(i_4)}\zeta_{j_5}^{(i_5)}-\mathbf{1}_{\{i_2=i_4\}}\mathbf{1}_{\{j_2=j_4\}}\zeta_{j_1}^{(i_1)}\zeta_{j_3}^{(i_3)}\zeta_{j_5}^{(i_5)}-\mathbf{1}_{\{i_2=i_5\}}\mathbf{1}_{\{j_2=j_5\}}\zeta_{j_1}^{(i_1)}\zeta_{j_3}^{(i_3)}\zeta_{j_4}^{(i_4)}-$$
$$-\mathbf{1}_{\{i_3=i_4\}}\mathbf{1}_{\{j_3=j_4\}}\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}\zeta_{j_5}^{(i_5)}-\mathbf{1}_{\{i_3=i_5\}}\mathbf{1}_{\{j_3=j_5\}}\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}\zeta_{j_4}^{(i_4)}-\mathbf{1}_{\{i_4=i_5\}}\mathbf{1}_{\{j_4=j_5\}}\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}\zeta_{j_3}^{(i_3)}+$$
$$+\mathbf{1}_{\{i_1=i_2\}}\mathbf{1}_{\{j_1=j_2\}}\mathbf{1}_{\{i_3=i_4\}}\mathbf{1}_{\{j_3=j_4\}}\zeta_{j_5}^{(i_5)}+\mathbf{1}_{\{i_1=i_2\}}\mathbf{1}_{\{j_1=j_2\}}\mathbf{1}_{\{i_3=i_5\}}\mathbf{1}_{\{j_3=j_5\}}\zeta_{j_4}^{(i_4)}+$$
$$+\mathbf{1}_{\{i_1=i_2\}}\mathbf{1}_{\{j_1=j_2\}}\mathbf{1}_{\{i_4=i_5\}}\mathbf{1}_{\{j_4=j_5\}}\zeta_{j_3}^{(i_3)}+\mathbf{1}_{\{i_1=i_3\}}\mathbf{1}_{\{j_1=j_3\}}\mathbf{1}_{\{i_2=i_4\}}\mathbf{1}_{\{j_2=j_4\}}\zeta_{j_5}^{(i_5)}+$$
$$+\mathbf{1}_{\{i_1=i_3\}}\mathbf{1}_{\{j_1=j_3\}}\mathbf{1}_{\{i_2=i_5\}}\mathbf{1}_{\{j_2=j_5\}}\zeta_{j_4}^{(i_4)}+\mathbf{1}_{\{i_1=i_3\}}\mathbf{1}_{\{j_1=j_3\}}\mathbf{1}_{\{i_4=i_5\}}\mathbf{1}_{\{j_4=j_5\}}\zeta_{j_2}^{(i_2)}+$$
$$+\mathbf{1}_{\{i_1=i_4\}}\mathbf{1}_{\{j_1=j_4\}}\mathbf{1}_{\{i_2=i_3\}}\mathbf{1}_{\{j_2=j_3\}}\zeta_{j_5}^{(i_5)}+\mathbf{1}_{\{i_1=i_4\}}\mathbf{1}_{\{j_1=j_4\}}\mathbf{1}_{\{i_2=i_5\}}\mathbf{1}_{\{j_2=j_5\}}\zeta_{j_3}^{(i_3)}+$$
$$+\mathbf{1}_{\{i_1=i_4\}}\mathbf{1}_{\{j_1=j_4\}}\mathbf{1}_{\{i_3=i_5\}}\mathbf{1}_{\{j_3=j_5\}}\zeta_{j_2}^{(i_2)}+\mathbf{1}_{\{i_1=i_5\}}\mathbf{1}_{\{j_1=j_5\}}\mathbf{1}_{\{i_2=i_3\}}\mathbf{1}_{\{j_2=j_3\}}\zeta_{j_4}^{(i_4)}+$$
$$+\mathbf{1}_{\{i_1=i_5\}}\mathbf{1}_{\{j_1=j_5\}}\mathbf{1}_{\{i_2=i_4\}}\mathbf{1}_{\{j_2=j_4\}}\zeta_{j_3}^{(i_3)}+\mathbf{1}_{\{i_1=i_5\}}\mathbf{1}_{\{j_1=j_5\}}\mathbf{1}_{\{i_3=i_4\}}\mathbf{1}_{\{j_3=j_4\}}\zeta_{j_2}^{(i_2)}+$$

$$
+\mathbf{1}_{\{i_2=i_3\}}\mathbf{1}_{\{j_2=j_3\}}\mathbf{1}_{\{i_4=i_5\}}\mathbf{1}_{\{j_4=j_5\}}\zeta_{j_1}^{(i_1)}+\mathbf{1}_{\{i_2=i_4\}}\mathbf{1}_{\{j_2=j_4\}}\mathbf{1}_{\{i_3=i_5\}}\mathbf{1}_{\{j_3=j_5\}}\zeta_{j_1}^{(i_1)}+
$$

$$
\left.+\mathbf{1}_{\{i_2=i_5\}}\mathbf{1}_{\{j_2=j_5\}}\mathbf{1}_{\{i_3=i_4\}}\mathbf{1}_{\{j_3=j_4\}}\zeta_{j_1}^{(i_1)}\right), \tag{35}
$$

$$
I_{(11111)T,t}^{(i_1i_1i_1i_1i_1)}=\frac{1}{120}(T-t)^{5/2}\left(\left(\zeta_0^{(i_1)}\right)^5-10\left(\zeta_0^{(i_1)}\right)^3+15\zeta_0^{(i_1)}\right),
$$

$$
C_{j_3j_2j_1}=\frac{\sqrt{(2j_1+1)(2j_2+1)(2j_3+1)}(T-t)^{3/2}}{8}\bar{C}_{j_3j_2j_1},
$$

$$
C_{j_4j_3j_2j_1}=\frac{\sqrt{(2j_1+1)(2j_2+1)(2j_3+1)(2j_4+1)}(T-t)^{2}}{16}\bar{C}_{j_4j_3j_2j_1},
$$

$$
C_{j_5j_4j_3j_2j_1}=\frac{\sqrt{(2j_1+1)(2j_2+1)(2j_3+1)(2j_4+1)(2j_5+1)}(T-t)^{5/2}}{32}\bar{C}_{j_5j_4j_3j_2j_1},
$$

$$
\bar{C}_{j_3j_2j_1}=\int\limits_{-1}^{1}P_{j_3}(z)\int\limits_{-1}^{z}P_{j_2}(y)\int\limits_{-1}^{y}P_{j_1}(x)dxdydz,
$$

$$
\bar{C}_{j_4j_3j_2j_1}=\int\limits_{-1}^{1}P_{j_4}(u)\int\limits_{-1}^{u}P_{j_3}(z)\int\limits_{-1}^{z}P_{j_2}(y)\int\limits_{-1}^{y}P_{j_1}(x)dxdydzdu,
$$

$$
\bar{C}_{j_5j_4j_3j_2j_1}=\int\limits_{-1}^{1}P_{j_5}(v)\int\limits_{-1}^{v}P_{j_4}(u)\int\limits_{-1}^{u}P_{j_3}(z)\int\limits_{-1}^{z}P_{j_2}(y)\int\limits_{-1}^{y}P_{j_1}(x)dxdydzdudv,
$$

random variables $\zeta_j^{(i)}$ are defined by (16), and

$$
I_{(11)T,t}^{(i_1i_2)}=\underset{q\to\infty}{\text{l.i.m.}}\ I_{(11)T,t}^{(i_1i_2)q},\quad I_{(111)T,t}^{(i_1i_2i_3)}=\underset{q_1\to\infty}{\text{l.i.m.}}\ I_{(111)T,t}^{(i_1i_2i_3)q_1},
$$

$$
I_{(1111)T,t}^{(i_1i_2i_3i_4)}=\underset{q_2\to\infty}{\text{l.i.m.}}\ I_{(1111)T,t}^{(i_1i_2i_3i_4)q_2},\quad I_{(11111)T,t}^{(i_1i_2i_3i_4i_5)}=\underset{q_3\to\infty}{\text{l.i.m.}}\ I_{(11111)T,t}^{(i_1i_2i_3i_4i_5)q_3}.
$$

Note that $T-t\ll 1$ ($T-t$ is an integration step with respect to the temporal variable). Thus $q_1\ll q$ (see Table 1 [30]-[39], [42]-[46]). Moreover, the values $\bar{C}_{j_3j_2j_1}$, $\bar{C}_{j_4j_3j_2j_1}$, $\bar{C}_{j_5j_4j_3j_2j_1}$ do not depend on $T-t$. This feature is important because we can use a variable integration step $T-t$. Coefficients $\bar{C}_{j_3j_2j_1}$, $\bar{C}_{j_4j_3j_2j_1}$, $\bar{C}_{j_5j_4j_3j_2j_1}$ are calculated once and before the start of the numerical scheme. Some examples of the exact calculation of coefficients $\bar{C}_{j_3j_2j_1}$, $\bar{C}_{j_4j_3j_2j_1}$, $\bar{C}_{j_5j_4j_3j_2j_1}$ via Python programming language can be found in Tables 2–4 (the database with 270,000 exactly calculated Fourier–Legendre coefficients was described in [62], [63]).

1	$\frac{4}{315}$	$-\frac{8}{945}$

$$E^{(i_1 i_2)q} = \mathsf{M}\left\{\left(I_{(11)T,t}^{(i_1 i_2)} - I_{(11)T,t}^{(i_1 i_2)q}\right)^2\right\},$$

$$E^{(i_1 i_2 i_3)q_1} = \mathsf{M}\left\{\left(I_{(111)T,t}^{(i_1 i_2 i_3)} - I_{(111)T,t}^{(i_1 i_2 i_3)q_1}\right)^2\right\},$$

$$E^{(i_1 i_2 i_3 i_4)q_2} = \mathsf{M}\left\{\left(I_{(1111)T,t}^{(i_1 i_2 i_3 i_4)} - I_{(1111)T,t}^{(i_1 i_2 i_3 i_4)q_2}\right)^2\right\},$$

$$E^{(i_1 i_2 i_3 i_4 i_5)q_3} = \mathsf{M}\left\{\left(I_{(11111)T,t}^{(i_1 i_2 i_3 i_4 i_5)} - I_{(11111)T,t}^{(i_1 i_2 i_3 i_4 i_5)q_3}\right)^2\right\}.$$

Then for pairwise different $i_1, i_2, i_3, i_4, i_5 = 1, \ldots, m$ from Theorem 3 we obtain [27]-[65]

$$E^{(i_1 i_2)q} = \frac{(T-t)^2}{2}\left(\frac{1}{2} - \sum_{i=1}^{q} \frac{1}{4i^2-1}\right), \tag{36}$$

$$E^{(i_1 i_2 i_3)q_1} = \frac{(T-t)^3}{6} - \sum_{j_1,j_2,j_3=0}^{q_1} C_{j_3 j_2 j_1}^2, \tag{37}$$

$$E^{(i_1 i_2 i_3 i_4)q_2} = \frac{(T-t)^4}{24} - \sum_{j_1,j_2,j_3,j_4=0}^{q_2} C_{j_4 j_3 j_2 j_1}^2, \tag{38}$$

$$E^{(i_1 i_2 i_3 i_4 i_5)q_3} = \frac{(T-t)^5}{120} - \sum_{j_1,j_2,j_3,j_4,j_5=0}^{q_3} C_{j_5 j_4 j_3 j_2 j_1}^2. \tag{39}$$

On the basis of the presented approximations of iterated Itô stochastic integrals we can see that increasing of multiplicities of these integrals leads to increasing of orders of smallness with respect to $T-t$ $(T-t \ll 1)$ in the mean-square sense for iterated Itô stochastic integrals. This leads to a sharp decrease of member quantities in the approximations of iterated Itô stochastic integrals, which are required for achieving the acceptable accuracy of approximation $(q_1 \ll q)$.

From (37)–(39) we obtain [30]-[39], [42]-[46]

$$E^{(i_1 i_2 i_3)q_1}\Big|_{q_1=6} \approx 0.01956000(T-t)^3, \tag{40}$$

$$E^{(i_1 i_2 i_3 i_4)q_2}\Big|_{q_2=2} \approx 0.02360840(T-t)^4, \tag{41}$$

$$E^{(i_1 i_2 i_3 i_4 i_5)q_3}\Big|_{q_3=1} \approx 0.00759105(T-t)^5. \tag{42}$$

It is not difficult to see that the accuracy in (41) and (42) is significantly better than in (40) $(T-t \ll 1)$ even for $q_2 = 2$ and $q_3 = 1$. This means that in such situation in formulas (34), (35) the number of terms can be chosen significantly less than 3^4 $(q_2 = 2)$ and 2^5 $(q_3 = 1)$. So, in practice, we can leave only few terms in these formulas. For more details see [62]-[65].

5. Approximation of Iterated Stochastic Integrals of Multiplicity k with Respect to the Q-Wiener Process

Consider the iterated stochastic integral with respect to the Q-Wiener process in the form

$$I[\Phi^{(k)}(Z), \psi^{(k)}]_{T,t} =$$

$$= \int_t^T \Phi_k(Z)\left(\ldots\left(\int_t^{t_3} \Phi_2(Z)\left(\int_t^{t_2} \Phi_1(Z)\psi_1(t_1)d\mathbf{W}_{t_1}\right)\psi_2(t_2)d\mathbf{W}_{t_2}\right)\ldots\right)\psi_k(t_k)d\mathbf{W}_{t_k}, \tag{43}$$

where $Z:\Omega\to H$ is an $\mathbf{F}_t/\mathcal{B}(H)$-measurable mapping, $\Phi_k(v)(\ \ldots(\Phi_2(v)(\Phi_1(v)))\ldots\ )$ is a k-linear Hilbert–Schmidt operator mapping from $\underbrace{U_0\times\ldots\times U_0}_{k\ \text{times}}$ to H for all $v\in H$, and $\psi_1(\tau),\ldots,\psi_k(\tau)\in L_2([t,T])$.

Let $I[\Phi^{(k)}(Z),\psi^{(k)}]_{T,t}^{M}$ be an approximation of the stochastic integral (43)

$$I[\Phi^{(k)}(Z),\psi^{(k)}]_{T,t}^{M}=$$

$$=\int\limits_t^T\Phi_k(Z)\left(\ldots\left(\int\limits_t^{t_3}\Phi_2(Z)\left(\int\limits_t^{t_2}\Phi_1(Z)\psi_1(t_1)d\mathbf{W}_{t_1}^M\right)\psi_2(t_2)d\mathbf{W}_{t_2}^M\right)\ldots\right)\psi_k(t_k)d\mathbf{W}_{t_k}^M=$$

$$=\sum_{r_1,r_2,\ldots,r_k\in J_M}\Phi_k(Z)\left(\ldots\left(\Phi_2(Z)\left(\Phi_1(Z)e_{r_1}\right)e_{r_2}\right)\ldots\right)e_{r_k}\times$$

$$\times\sqrt{\lambda_{r_1}\lambda_{r_2}\ldots\lambda_{r_k}}\ J[\psi^{(k)}]_{T,t}^{(r_1r_2\ldots r_k)},\tag{44}$$

where $0\le t<T\le\bar{T}$, and

$$J[\psi^{(k)}]_{T,t}^{(r_1\ldots r_k)}=\int\limits_t^T\psi_k(t_k)\ldots\int\limits_t^{t_3}\psi_2(t_2)\int\limits_t^{t_2}\psi_1(t_1)d\mathbf{w}_{t_1}^{(r_1)}d\mathbf{w}_{t_2}^{(r_2)}\ldots d\mathbf{w}_{t_k}^{(r_k)}$$

is the iterated Itô stochastic integral (10), $r_1,r_2,\ldots,r_k\in J_M$.

Let $I[\Phi^{(k)}(Z),\psi^{(k)}]_{T,t}^{M,p_1\ldots,p_k}$ be an approximation of the stochastic integral (44)

$$I[\Phi^{(k)}(Z),\psi^{(k)}]_{T,t}^{M,p_1\ldots,p_k}=$$

$$=\sum_{r_1,r_2,\ldots,r_k\in J_M}\Phi_k(Z)\left(\ldots\left(\Phi_2(Z)\left(\Phi_1(Z)e_{r_1}\right)e_{r_2}\right)\ldots\right)e_{r_k}\times$$

$$\times\sqrt{\lambda_{r_1}\lambda_{r_2}\ldots\lambda_{r_k}}\ J[\psi^{(k)}]_{T,t}^{(r_1r_2\ldots r_k)p_1,\ldots,p_k},\tag{45}$$

where $J[\psi^{(k)}]_{T,t}^{(r_1r_2\ldots r_k)p_1,\ldots,p_k}$ is defined as a prelimit expression on the right-hand side of (25)

$$J[\psi^{(k)}]_{T,t}^{(r_1\ldots r_k)p_1\ldots p_k}=\sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k}C_{j_k\ldots j_1}\left(\prod_{l=1}^k\zeta_{j_l}^{(r_l)}+\sum_{m=1}^{[k/2]}(-1)^m\times\right.$$

$$\left.\times\sum_{\substack{(\{\{g_1,g_2\},\ldots,\{g_{2m-1},g_{2m}\}\},\{q_1,\ldots,q_{k-2m}\})\\ \{g_1,g_2,\ldots,g_{2m-1},g_{2m},q_1,\ldots,q_{k-2m}\}=\{1,2,\ldots,k\}}}\prod_{s=1}^m\mathbf{1}_{\{r_{g_{2s-1}}=\ r_{g_{2s}}\ne 0\}}\mathbf{1}_{\{j_{g_{2s-1}}=\ j_{g_{2s}}\}}\prod_{l=1}^{k-2m}\zeta_{j_{q_l}}^{(r_{q_l})}\right).\tag{46}$$

Let U, H be separable $\mathbb{R}$-Hilbert spaces, $U_0 = Q^{1/2}(U)$, and $L(U,H)$ be the space of linear and bounded operators mapping from U to H. Let $L(U,H)_0 = \{T|_{U_0}:\ T\in L(U,H)\}$ (here $T|_{U_0}$ is the restriction of operator T to the space U_0). It is known [7] that $L(U,H)_0$ is a dense subset of the space of Hilbert–Schmidt operators $L_{HS}(U_0,H)$.

Theorem 4 [44]-[46], [59], [60], [68]. *Suppose that $\{\phi_j(x)\}_{j=0}^{\infty}$ is an arbitrary complete orthonormal system of functions in the space $L_2([t,T])$ and $\psi_1(\tau),\ldots,\psi_k(\tau)\in L_2([t,T])$. Furthermore, let the following conditions be satisfied*:

1. *$Q\in L(U)$ is a nonnegative and symmetric trace class operator (λ_i and e_i ($i\in J$) are its eigenvalues and eigenfunctions (which form an orthonormal basis of U) correspondingly), and $\mathbf{W}_\tau$, $\tau\in[0,\bar{T}]$ is an U-valued Q-Wiener process.*
2. *$Z:\Omega\to H$ is an $\mathbf{F}_t/\mathcal{B}(H)$-measurable mapping.*
3. *$\Phi_1\in L(U,H)_0$, $\Phi_2\in L(H,L(U,H)_0)$, and $\Phi_k(v)(\ \ldots(\Phi_2(v)(\Phi_1(v)))\ldots\ )$ is a k-linear Hilbert–Schmidt operator mapping from $\underbrace{U_0\times\ldots\times U_0}_{k\ times}$ to H for all $v\in H$ such that*

$$
\left\|\Phi_k(Z)\left(\ldots\left(\Phi_2(Z)\left(\Phi_1(Z)e_{r_1}\right)e_{r_2}\right)\ldots\right)e_{r_k}\right\|_H^2\le L_k<\infty
$$

w. p. 1 for all $r_1,r_2,\ldots,r_k\in J_M$, $M\in\mathbb{N}$.

Then

$$
\mathsf{M}\left\{\left\|I[\Phi^{(k)}(Z),\psi^{(k)}]_{T,t}^{M}-I[\Phi^{(k)}(Z),\psi^{(k)}]_{T,t}^{M,p_1\ldots p_k}\right\|_H^2\right\}\le
$$

$$
\le L_k(k!)^2\left(\mathrm{tr}\ Q\right)^k\left(I_k-\sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k}C_{j_k\ldots j_1}^2\right), \tag{47}
$$

where I_k is defined by (26)*,* $\mathrm{tr}\ Q=\sum\limits_{i\in J}\lambda_i$*, and*

$$
C_{j_k\ldots j_1}=\int\limits_{[t,T]^k}K(t_1,\ldots,t_k)\prod_{l=1}^{k}\phi_{j_l}(t_l)dt_1\ldots dt_k,
$$

$$
K(t_1,\ldots,t_k)=\begin{cases}\psi_1(t_1)\ldots\psi_k(t_k),\ t_1<\ldots<t_k\\ \\ 0,\ \text{otherwise}\end{cases}.
$$

Remark 2. *It should be noted that the right-hand side of the inequality* (47) *is independent of M and tends to zero if $p_1,\ldots,p_k\to\infty$ due to the Parseval equality.*

Proof. Using (27), we obtain

$$
\mathsf{M}\left\{\left\|I[\Phi^{(k)}(Z),\psi^{(k)}]_{T,t}^{M}-I[\Phi^{(k)}(Z),\psi^{(k)}]_{T,t}^{M,p_1\ldots p_k}\right\|_H^2\right\}=
$$

$$= \mathsf{M}\left\{\left\|\sum_{r_1,r_2,\ldots,r_k\in J_M}\Phi_k(Z)\left(\ldots\left(\Phi_2(Z)\left(\Phi_1(Z)e_{r_1}\right)e_{r_2}\right)\ldots\right)e_{r_k}\sqrt{\lambda_{r_1}\lambda_{r_2}\ldots\lambda_{r_k}}\times\right.\right.$$

$$\left.\left.\times\left(J[\psi^{(k)}]_{T,t}^{(r_1r_2\ldots r_k)}-J[\psi^{(k)}]_{T,t}^{(r_1r_2\ldots r_k)p_1,\ldots,p_k}\right)\right\|_H^2\right\}= \tag{48}$$

$$=\left|\mathsf{M}\left\{\sum_{r_1,r_2,\ldots,r_k\in J_M}\ \sum_{(r_1^{'},r_2^{'},\ldots,r_k^{'}):\ \{r_1^{'},r_2^{'},\ldots,r_k^{'}\}=\{r_1,r_2,\ldots,r_k\}}\left\langle\ \Phi_k(Z)\left(\ldots\left(\Phi_2(Z)\left(\Phi_1(Z)e_{r_1}\right)e_{r_2}\right)\ldots\right)e_{r_k}\ ,\right.\right.\right.$$

$$\left.\Phi_k(Z)\left(\ldots\left(\Phi_2(Z)\left(\Phi_1(Z)e_{r_1^{'}}\right)e_{r_2^{'}}\right)\ldots\right)e_{r_k^{'}}\ \right\rangle_H\sqrt{\lambda_{r_1}\lambda_{r_2}\ldots\lambda_{r_k}}\sqrt{\lambda_{r_1^{'}}\lambda_{r_2^{'}}\ldots\lambda_{r_k^{'}}}\times$$

$$\times\ \mathsf{M}\left\{\left(J[\psi^{(k)}]_{T,t}^{(r_1r_2\ldots r_k)}-J[\psi^{(k)}]_{T,t}^{(r_1r_2\ldots r_k)p_1,\ldots,p_k}\right)\times\right.$$

$$\left.\left.\left.\times\left(J[\psi^{(k)}]_{T,t}^{(r_1^{'}r_2^{'}\ldots r_k^{'})}-J[\psi^{(k)}]_{T,t}^{(r_1^{'}r_2^{'}\ldots r_k^{'})p_1,\ldots,p_k}\right)\right|\mathbf{F}_t\right\}\right\}\right|\le \tag{49}$$

$$\le\sum_{r_1,r_2,\ldots,r_k\in J_M}\ \sum_{(r_1^{'},r_2^{'},\ldots,r_k^{'}):\ \{r_1^{'},r_2^{'},\ldots,r_k^{'}\}=\{r_1,r_2,\ldots,r_k\}}\mathsf{M}\left\{\left\|\ \Phi_k(Z)\left(\ldots\left(\Phi_2(Z)\left(\Phi_1(Z)e_{r_1}\right)e_{r_2}\right)\ldots\right)e_{r_k}\right\|_H\times\right.$$

$$\times\left\|\ \Phi_k(Z)\left(\ldots\left(\Phi_2(Z)\left(\Phi_1(Z)e_{r_1^{'}}\right)e_{r_2^{'}}\right)\ldots\right)e_{r_k^{'}}\ \right\|_H\sqrt{\lambda_{r_1}\lambda_{r_2}\ldots\lambda_{r_k}}\sqrt{\lambda_{r_1^{'}}\lambda_{r_2^{'}}\ldots\lambda_{r_k^{'}}}\times$$

$$\times\left|\mathsf{M}\left\{\left(J[\psi^{(k)}]_{T,t}^{(r_1r_2\ldots r_k)}-J[\psi^{(k)}]_{T,t}^{(r_1r_2\ldots r_k)p_1,\ldots,p_k}\right)\times\right.\right.$$

$$\left.\left.\left.\times\left(J[\psi^{(k)}]_{T,t}^{(r_1^{'}r_2^{'}\ldots r_k^{'})}-J[\psi^{(k)}]_{T,t}^{(r_1^{'}r_2^{'}\ldots r_k^{'})p_1,\ldots,p_k}\right)\right|\mathbf{F}_t\right\}\right|\right\}\le$$

$$
\le L_k \sum_{r_1,r_2,\ldots,r_k\in J_M}\ \sum_{(r_1^{\prime},r_2^{\prime},\ldots,r_k^{\prime}):\ \{r_1^{\prime},r_2^{\prime},\ldots,r_k^{\prime}\}=\{r_1,r_2,\ldots,r_k\}} \sqrt{\lambda_{r_1}\lambda_{r_2}\ldots\lambda_{r_k}}\sqrt{\lambda_{r_1^{\prime}}\lambda_{r_2^{\prime}}\ldots\lambda_{r_k^{\prime}}}\times
$$

$$
\times\mathsf{M}\Biggl\{\Biggl|\Biggl(J[\psi^{(k)}]_{T,t}^{(r_1r_2\ldots r_k)}-J[\psi^{(k)}]_{T,t}^{(r_1r_2\ldots r_k)p_1,\ldots,p_k}\Biggr)\times
$$

$$
\times\Biggl(J[\psi^{(k)}]_{T,t}^{(r_1^{\prime}r_2^{\prime}\ldots r_k^{\prime})}-J[\psi^{(k)}]_{T,t}^{(r_1^{\prime}r_2^{\prime}\ldots r_k^{\prime})p_1,\ldots,p_k}\Biggr)\Biggr|\Biggr\}\le
$$

$$
\le L_k \sum_{r_1,r_2,\ldots,r_k\in J_M}\ \sum_{(r_1^{\prime},r_2^{\prime},\ldots,r_k^{\prime}):\ \{r_1^{\prime},r_2^{\prime},\ldots,r_k^{\prime}\}=\{r_1,r_2,\ldots,r_k\}} \sqrt{\lambda_{r_1}\lambda_{r_2}\ldots\lambda_{r_k}}\sqrt{\lambda_{r_1^{\prime}}\lambda_{r_2^{\prime}}\ldots\lambda_{r_k^{\prime}}}\times
$$

$$
\times\left(\mathsf{M}\left\{\left(J[\psi^{(k)}]_{T,t}^{(r_1r_2\ldots r_k)}-J[\psi^{(k)}]_{T,t}^{(r_1r_2\ldots r_k)p_1,\ldots,p_k}\right)^2\right\}\right)^{1/2}\times
$$

$$
\times\left(\mathsf{M}\left\{\left(J[\psi^{(k)}]_{T,t}^{(r_1^{\prime}r_2^{\prime}\ldots r_k^{\prime})}-J[\psi^{(k)}]_{T,t}^{(r_1^{\prime}r_2^{\prime}\ldots r_k^{\prime})p_1,\ldots,p_k}\right)^2\right\}\right)^{1/2}\le
$$

$$
\le L_k \sum_{r_1,r_2,\ldots,r_k\in J_M}\ \sum_{(r_1^{\prime},r_2^{\prime},\ldots,r_k^{\prime}):\ \{r_1^{\prime},r_2^{\prime},\ldots,r_k^{\prime}\}=\{r_1,r_2,\ldots,r_k\}} \sqrt{\lambda_{r_1}\lambda_{r_2}\ldots\lambda_{r_k}}\sqrt{\lambda_{r_1^{\prime}}\lambda_{r_2^{\prime}}\ldots\lambda_{r_k^{\prime}}}\times
$$

$$
\times\left(k!\left(I_k-\sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k}C_{j_k\ldots j_1}^2\right)\right)^{1/2}\left(k!\left(I_k-\sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k}C_{j_k\ldots j_1}^2\right)\right)^{1/2}\le
$$

$$
\le L_k \sum_{r_1,r_2,\ldots,r_k\in J_M} k!\ \lambda_{r_1}\lambda_{r_2}\ldots\lambda_{r_k}\left(k!\left(I_k-\sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k}C_{j_k\ldots j_1}^2\right)\right)=
$$

$$
=L_k\,(k!)^2\sum_{r_1,r_2,\ldots,r_k\in J_M}\lambda_{r_1}\lambda_{r_2}\ldots\lambda_{r_k}\left(I_k-\sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k}C_{j_k\ldots j_1}^2\right)\le
$$

$$\leq L_k\,(k!)^2\,(\text{tr}\ Q)^k\left(I_k-\sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k}C^2_{j_k\ldots j_1}\right),$$

where $\langle\cdot,\cdot\rangle_H$ is a scalar product in H, and

$$\sum_{(r_1^{\backprime},r_2^{\backprime},\ldots,r_k^{\backprime}):\ \{r_1^{\backprime},r_2^{\backprime},\ldots,r_k^{\backprime}\}=\{r_1,r_2,\ldots,r_k\}}$$

means the sum with respect to all possible permutations $(r_1^{\backprime},r_2^{\backprime},\ldots,r_k^{\backprime})$ such that

$$\{r_1^{\backprime},r_2^{\backprime},\ldots,r_k^{\backprime}\}=\{r_1,r_2,\ldots,r_k\}.$$

The transition from (48) to (49) is based on the following theorem.

Theorem 5 [44]-[46], [68]. *The following equality is true*

$$\mathsf{M}\Biggl\{\left(J[\psi^{(k)}]_{T,t}^{(r_1\ldots r_k)}-J[\psi^{(k)}]_{T,t}^{(r_1\ldots r_k)p_1\ldots p_k}\right)\times$$

$$\times\left(J[\psi^{(k)}]_{T,t}^{(m_1\ldots m_k)}-J[\psi^{(k)}]_{T,t}^{(m_1\ldots m_k)p_1\ldots p_k}\right)\Biggl|\mathbf{F}_t\Biggr\}=0 \tag{50}$$

w. p. 1 for all $r_1,\ldots,r_k,m_1,\ldots,m_k\in J_M$ $(M\in\mathbb{N})$ *such that* $\{r_1,\ldots,r_k\}\neq\{m_1,\ldots,m_k\}$.

Proof. Using the standard moment properties of the Itô stochastic integral, we obtain

$$\mathsf{M}\left\{J[\psi^{(k)}]_{T,t}^{(r_1\ldots r_k)}J[\psi^{(k)}]_{T,t}^{(m_1\ldots m_k)}\Biggl|\mathbf{F}_t\right\}=0 \tag{51}$$

w. p. 1 for all $r_1,\ldots,r_k,m_1,\ldots,m_k\in J_M$ such that $(r_1,\ldots,r_k)\neq(m_1,\ldots,m_k)$, $M\in\mathbb{N}$.

From the proof of Theorem 1.18 in [44] (Sect. 1.12) it follows that

$$\prod_{l=1}^{k}\zeta_{j_l}^{(r_l)}+\sum_{m=1}^{[k/2]}(-1)^m\times$$

$$\times\sum_{\substack{(\{\{g_1,g_2\},\ldots,\{g_{2m-1},g_{2m}\}\},\{q_1,\ldots,q_{k-2m}\})\\ \{g_1,g_2,\ldots,g_{2m-1},g_{2m},q_1,\ldots,q_{k-2m}\}=\{1,2,\ldots,k\}}}\prod_{s=1}^{m}\mathbf{1}_{\{r_{g_{2s-1}}=\ r_{g_{2s}}\neq 0\}}\mathbf{1}_{\{j_{g_{2s-1}}=\ j_{g_{2s}}\}}\prod_{l=1}^{k-2m}\zeta_{j_{q_l}}^{(r_{q_l})}=$$

$$=\sum_{(j_1,\ldots,j_k)}\int\limits_t^T\phi_{j_k}(t_k)\ldots\int\limits_t^{t_2}\phi_{j_1}(t_1)d\mathbf{w}_{t_1}^{(r_1)}\ldots d\mathbf{w}_{t_k}^{(r_k)}\quad \text{w. p. 1,} \tag{52}$$

where

$$\sum_{(j_1,\ldots,j_k)}$$

means the sum with respect to all possible permutations $(j_1,\ldots,j_k)$. At the same time if j_l swapped with j_q in the permutation $(j_1,\ldots,j_k)$, then r_l swapped with r_q in the permutation $(r_1,\ldots,r_k)$; another notations are the same as in Theorem 2.

Using (25) and (52), we get

$$J[\psi^{(k)}]_{T,t}^{(r_1\ldots r_k)p_1\ldots p_k}=\sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k}C_{j_k\ldots j_1}\sum_{(j_1,\ldots,j_k)}\int\limits_t^T\phi_{j_k}(t_k)\ldots\int\limits_t^{t_2}\phi_{j_1}(t_1)d\mathbf{w}_{t_1}^{(r_1)}\ldots d\mathbf{w}_{t_k}^{(r_k)}, \tag{53}$$

where notations are the same as in (52).

Then w. p. 1

$$\mathsf{M}\left\{J[\psi^{(k)}]_{T,t}^{(m_1\ldots m_k)}J[\psi^{(k)}]_{T,t}^{(r_1\ldots r_k)p_1\ldots p_k}\Bigg|\mathbf{F}_t\right\}=$$

$$=\sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k}C_{j_k\ldots j_1}\times$$

$$\times\mathsf{M}\left\{J[\psi^{(k)}]_{T,t}^{(m_1\ldots m_k)}\sum_{(j_1,\ldots,j_k)}\int\limits_t^T\phi_{j_k}(t_k)\ldots\int\limits_t^{t_2}\phi_{j_1}(t_1)d\mathbf{w}_{t_1}^{(r_1)}\ldots d\mathbf{w}_{t_k}^{(r_k)}\Bigg|\mathbf{F}_t\right\}.$$

From the standard moment properties of the Itô stochastic integral it follows that

$$\mathsf{M}\left\{J[\psi^{(k)}]_{T,t}^{(m_1\ldots m_k)}\sum_{(j_1,\ldots,j_k)}\int\limits_t^T\phi_{j_k}(t_k)\ldots\int\limits_t^{t_2}\phi_{j_1}(t_1)d\mathbf{w}_{t_1}^{(r_1)}\ldots d\mathbf{w}_{t_k}^{(r_k)}\Bigg|\mathbf{F}_t\right\}=0$$

w. p. 1 for all $r_1,\ldots,r_k,m_1,\ldots,m_k\in J_M$ such that $\{r_1,\ldots,r_k\}\ne\{m_1,\ldots,m_k\}$, $M\in\mathbb{N}$.

Then

$$\mathsf{M}\left\{J[\psi^{(k)}]_{T,t}^{(m_1\ldots m_k)}J[\psi^{(k)}]_{T,t}^{(r_1\ldots r_k)p_1\ldots p_k}\Bigg|\mathbf{F}_t\right\}=0 \tag{54}$$

w. p. 1 for all $r_1,\ldots,r_k,m_1,\ldots,m_k\in J_M$ $(M\in\mathbb{N})$ such that $\{r_1,\ldots,r_k\}\ne\{m_1,\ldots,m_k\}$.

From (53) it follows that

$$\mathsf{M}\left\{J[\psi^{(k)}]_{T,t}^{(r_1\ldots r_k)p_1,\ldots,p_k}J[\psi^{(k)}]_{T,t}^{(m_1\ldots m_k)p_1,\ldots,p_k}\Big|\mathbf{F}_t\right\}=$$

$$=\sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k}C_{j_k\ldots j_1}\sum_{q_1=0}^{p_1}\ldots\sum_{q_k=0}^{p_k}C_{q_k\ldots q_1}\times$$

$$\times\mathsf{M}\left\{\left(\sum_{(j_1,\ldots,j_k)}\int\limits_t^T\phi_{j_k}(t_k)\ldots\int\limits_t^{t_2}\phi_{j_1}(t_1)d\mathbf{w}_{t_1}^{(r_1)}\ldots d\mathbf{w}_{t_k}^{(r_k)}\right)\times\right.$$

$$\left.\times\left(\sum_{(q_1,\ldots,q_k)}\int\limits_t^T\phi_{q_k}(t_k)\ldots\int\limits_t^{t_2}\phi_{q_1}(t_1)d\mathbf{w}_{t_1}^{(m_1)}\ldots d\mathbf{w}_{t_k}^{(m_k)}\right)\Big|\mathbf{F}_t\right\}=0 \qquad (55)$$

w. p. 1 for all $r_1,\ldots,r_k,m_1,\ldots,m_k\in J_M$ $(M\in\mathbb{N})$ such that $\{r_1,\ldots,r_k\}\neq\{m_1,\ldots,m_k\}$.

From (51), (54), and (55) we obtain (50). Theorem 5 is proved.

Corollary 1 [44]-[46], [68]. *The following equality is true*

$$\mathsf{M}\left\{\left(J[\psi^{(k)}]_{T,t}^{(r_1\ldots r_k)}-J[\psi^{(k)}]_{T,t}^{(r_1\ldots r_k)p_1\ldots p_k}\right)\left(J[\psi^{(l)}]_{T,t}^{(m_1\ldots m_l)}-J[\psi^{(l)}]_{T,t}^{(m_1\ldots m_l)q_1\ldots q_l}\right)\Big|\mathbf{F}_t\right\}=0$$

w. p. 1 for all $l=1,2,\ldots,k-1,$ *and* $r_1,\ldots,r_k,m_1,\ldots,m_l\in J_M,$ $p_1,\ldots,p_k,q_1,\ldots,q_l=0,1,2,\ldots$

6. Approximation of Some Iterated Stochastic Integrals of Second and Third Miltiplicity with Respect to the Q-Wiener Process

This section is devoted to the approximation of iterated stochastic integrals of the following form (see Sect. 1)

$$I_0[B(Z),F(Z)]_{T,t}^M=\int\limits_t^T B'(Z)\left(\int\limits_t^{t_2}F(Z)dt_1\right)d\mathbf{W}_{t_2}^M, \qquad (56)$$

$$I_1[B(Z),F(Z)]_{T,t}^M=\int\limits_t^T F'(Z)\left(\int\limits_t^{t_2}B(Z)d\mathbf{W}_{t_1}^M\right)dt_2, \qquad (57)$$

$$I_2[B(Z)]_{T,t}^M=\int\limits_t^T B''(Z)\left(\int\limits_t^{t_2}B(Z)d\mathbf{W}_{t_1}^M,\int\limits_t^{t_2}B(Z)d\mathbf{W}_{t_1}^M\right)d\mathbf{W}_{t_2}^M. \qquad (58)$$

Let conditions 1 and 2 of Theorem 4 be fulfilled. Let $B''(v)(B(v),B(v))$ be a 3-linear Hilbert–Schmidt operator mapping from $U_0\times U_0\times U_0$ to H for all $v\in H$.

Then we have w. p. 1 (see (44))

$$I_0[B(Z),F(Z)]_{T,t}^M=\sum_{r_1\in J_M}B'(Z)F(Z)e_{r_1}\sqrt{\lambda_{r_1}}I_{(01)T,t}^{(0r_1)},\tag{59}$$

$$I_1[B(Z),F(Z)]_{T,t}^M=\sum_{r_1\in J_M}F'(Z)(B(Z)e_{r_1})\sqrt{\lambda_{r_1}}I_{(10)T,t}^{(r_10)},\tag{60}$$

$$I_2[B(Z)]_{T,t}^M=\sum_{r_1,r_2,r_3\in J_M}B''(Z)\left(B(Z)e_{r_1},B(Z)e_{r_2}\right)e_{r_3}\sqrt{\lambda_{r_1}\lambda_{r_2}\lambda_{r_3}}\times$$
$$\times\int\limits_t^T\left(\int\limits_t^s d\mathbf{w}_\tau^{(r_1)}\int\limits_t^s d\mathbf{w}_\tau^{(r_2)}\right)d\mathbf{w}_s^{(r_3)}.\tag{61}$$

Using the Itô formula, we obtain

$$\int\limits_t^s d\mathbf{w}_\tau^{(r_1)}\int\limits_t^s d\mathbf{w}_\tau^{(r_2)}=I_{(11)s,t}^{(r_1r_2)}+I_{(11)s,t}^{(r_2r_1)}+\mathbf{1}_{\{r_1=r_2\}}(s-t)\quad\text{w. p. 1.}\tag{62}$$

From (62) we have

$$\int\limits_t^T\left(\int\limits_t^s d\mathbf{w}_\tau^{(r_1)}\int\limits_t^s d\mathbf{w}_\tau^{(r_2)}\right)d\mathbf{w}_s^{(r_3)}=I_{(111)T,t}^{(r_1r_2r_3)}+I_{(111)T,t}^{(r_2r_1r_3)}+\mathbf{1}_{\{r_1=r_2\}}I_{(01)T,t}^{(0r_3)}\quad\text{w. p. 1.}\tag{63}$$

Note that in (59), (60), (62), and (63) we use the notations from Sect. 4.

After substituting (63) into (61), we have

$$I_2[B(Z)]_{T,t}^M=\sum_{r_1,r_2,r_3\in J_M}B''(Z)\left(B(Z)e_{r_1},B(Z)e_{r_2}\right)e_{r_3}\sqrt{\lambda_{r_1}\lambda_{r_2}\lambda_{r_3}}\times$$
$$\times\left(I_{(111)T,t}^{(r_1r_2r_3)}+I_{(111)T,t}^{(r_2r_1r_3)}+\mathbf{1}_{\{r_1=r_2\}}I_{(01)T,t}^{(0r_3)}\right)\quad\text{w. p. 1.}\tag{64}$$

Taking into account (31) and (32), we put for $q=1$

$$I_{(01)T,t}^{(0r_3)q}=I_{(01)T,t}^{(0r_3)}=\frac{(T-t)^{3/2}}{2}\left(\zeta_0^{(r_3)}+\frac{1}{\sqrt{3}}\zeta_1^{(r_3)}\right)\quad(q=1)\quad\text{w. p. 1,}\tag{65}$$

$$I_{(10)T,t}^{(r_10)q}=I_{(10)T,t}^{(r_10)}=\frac{(T-t)^{3/2}}{2}\left(\zeta_0^{(r_1)}-\frac{1}{\sqrt{3}}\zeta_1^{(r_1)}\right)\quad(q=1)\quad\text{w. p. 1,}\tag{66}$$

where $I_{(01)T,t}^{(0r_3)q}$, $I_{(10)T,t}^{(r_10)q}$ denote the approximations of corresponding iterated Itô stochastic integrals.

Denote by $I_0[B(Z),F(Z)]_{T,t}^{M,q}$, $I_1[B(Z),F(Z)]_{T,t}^{M,q}$, $I_2[B(Z)]_{T,t}^{M,q}$ the approximations of iterated stochastic integrals (59), (60), (64)

$$I_0[B(Z),F(Z)]_{T,t}^{M,q}=\sum_{r_1\in J_M}B'(Z)F(Z)e_{r_1}\sqrt{\lambda_{r_1}}I_{(01)T,t}^{(0r_1)q}, \tag{67}$$

$$I_1[B(Z),F(Z)]_{T,t}^{M,q}=\sum_{r_1\in J_M}F'(Z)(B(Z)e_{r_1})\sqrt{\lambda_{r_1}}I_{(10)T,t}^{(r_10)q}, \tag{68}$$

$$I_2[B(Z)]_{T,t}^{M,q}=\sum_{r_1,r_2,r_3\in J_M}B''(Z)\left(B(Z)e_{r_1},B(Z)e_{r_2}\right)e_{r_3}\sqrt{\lambda_{r_1}\lambda_{r_2}\lambda_{r_3}}\times$$

$$\times\left(I_{(111)T,t}^{(r_1r_2r_3)q}+I_{(111)T,t}^{(r_2r_1r_3)q}+\mathbf{1}_{\{r_1=r_2\}}I_{(01)T,t}^{(0r_3)q}\right), \tag{69}$$

where $q\ge 1$, and the approximations $I_{(111)T,t}^{(r_1r_2r_3)q}$, $I_{(111)T,t}^{(r_2r_1r_3)q}$ are defined by (33).

From (59), (60), (64), (67)–(69) it follows that

$$I_0[B(Z),F(Z)]_{T,t}^{M}-I_0[B(Z),F(Z)]_{T,t}^{M,q}=0\quad \text{w. p. 1},$$

$$I_1[B(Z),F(Z)]_{T,t}^{M}-I_1[B(Z),F(Z)]_{T,t}^{M,q}=0\quad \text{w. p. 1},$$

$$I_2[B(Z)]_{T,t}^{M}-I_2[B(Z)]_{T,t}^{M,q}=\sum_{r_1,r_2,r_3\in J_M}B''(Z)\left(B(Z)e_{r_1},B(Z)e_{r_2}\right)e_{r_3}\sqrt{\lambda_{r_1}\lambda_{r_2}\lambda_{r_3}}\times$$

$$\times\left(\left(I_{(111)T,t}^{(r_1r_2r_3)}-I_{(111)T,t}^{(r_1r_2r_3)q}\right)+\left(I_{(111)T,t}^{(r_2r_1r_3)}-I_{(111)T,t}^{(r_2r_1r_3)q}\right)\right)\quad \text{w. p. 1}.$$

Repeating with an insignificant modification the proof of Theorem 4 for the case $k=3$, we obtain

$$\mathsf{M}\left\{\left\|I_2[B(Z)]_{T,t}^{M}-I_2[B(Z)]_{T,t}^{M,q}\right\|_H^2\right\}\le$$

$$\le 4C(3!)^2\left(\text{tr }Q\right)^3\left(\frac{(T-t)^3}{6}-\sum_{j_1,j_2,j_3=0}^{q}C_{j_3j_2j_1}^2\right),$$

where here and further constant C has the same meaning as constant L_k in Theorem 4 (k is the multiplicity of the iterated stochastic integral), and

$$C_{j_3j_2j_1}=\frac{\sqrt{(2j_1+1)(2j_2+1)(2j_3+1)}(T-t)^{3/2}}{8}\bar C_{j_3j_2j_1},$$

$$\bar C_{j_3j_2j_1}=\int\limits_{-1}^{1}P_{j_3}(z)\int\limits_{-1}^{z}P_{j_2}(y)\int\limits_{-1}^{y}P_{j_1}(x)dxdydz,$$

where $P_j(x)$ is the Legendre polynomial.

7. Approximation of Some Iterated Stochastic Integrals of Third and Fourth Miltiplicity with Respect to the Q-Wiener Process

In this section, we consider the approximation of iterated stochastic integrals of the following form (see Sect. 1)

$$I_3[B(Z)]_{T,t}^M=\int\limits_t^T B'''(Z)\left(\int\limits_t^{t_2}B(Z)d\mathbf{W}_{t_1}^M,\int\limits_t^{t_2}B(Z)d\mathbf{W}_{t_1}^M,\int\limits_t^{t_2}B(Z)d\mathbf{W}_{t_1}^M\right)d\mathbf{W}_{t_2}^M,$$

$$I_4[B(Z)]_{T,t}^M=\int\limits_t^T B'(Z)\left(\int\limits_t^{t_3}B''(Z)\left(\int\limits_t^{t_2}B(Z)d\mathbf{W}_{t_1}^M,\int\limits_t^{t_2}B(Z)d\mathbf{W}_{t_1}^M\right)d\mathbf{W}_{t_2}^M\right)d\mathbf{W}_{t_3}^M,$$

$$I_5[B(Z)]_{T,t}^M=\int\limits_t^T B''(Z)\left(\int\limits_t^{t_3}B(Z)d\mathbf{W}_{t_1}^M,\int\limits_t^{t_3}B'(Z)\left(\int\limits_t^{t_2}B(Z)d\mathbf{W}_{t_1}^M\right)d\mathbf{W}_{t_2}^M\right)d\mathbf{W}_{t_3}^M,$$

$$I_6[B(Z),F(Z)]_{T,t}^M=\int\limits_t^T F'(Z)\left(\int\limits_t^{t_3}B'(Z)\left(\int\limits_t^{t_2}B(Z)d\mathbf{W}_{t_1}^M\right)d\mathbf{W}_{t_2}^M\right)dt_3,$$

$$I_7[B(Z),F(Z)]_{T,t}^M=\int\limits_t^T F''(Z)\left(\int\limits_t^{t_2}B(Z)d\mathbf{W}_{t_1}^M,\int\limits_t^{t_2}B(Z)d\mathbf{W}_{t_1}^M\right)dt_2,$$

$$I_8[B(Z),F(Z)]_{T,t}^M=\int\limits_t^T B''(Z)\left(\int\limits_t^{t_2}F(Z)dt_1,\int\limits_t^{t_2}B(Z)d\mathbf{W}_{t_1}^M\right)d\mathbf{W}_{t_2}^M.$$

Consider the stochastic integral $I_3[B(Z)]_{T,t}^M$. Let conditions 1 and 2 of Theorem 4 be fulfilled. Let $B'''(v)(B(v),B(v),B(v))$ be a 4-linear Hilbert–Schmidt operator mapping from $U_0\times U_0\times U_0\times U_0$ to H for all $v\in H$.

We have (see (44))

$$I_3[B(Z)]_{T,t}^M = \sum_{r_1,r_2,r_3,r_4\in J_M} B'''(Z)\left(B(Z)e_{r_1}, B(Z)e_{r_2}, B(Z)e_{r_3}\right) e_{r_4}\sqrt{\lambda_{r_1}\lambda_{r_2}\lambda_{r_3}\lambda_{r_4}}\times$$

$$\times \int\limits_t^T \left(\int\limits_t^s d\mathbf{w}_\tau^{(r_1)} \int\limits_t^s d\mathbf{w}_\tau^{(r_2)} \int\limits_t^s d\mathbf{w}_\tau^{(r_3)}\right) d\mathbf{w}_s^{(r_4)} \quad \text{w. p. 1.} \tag{70}$$

From [43] (pp. A.438–A.439) (also see [44]-[46]) or using the Itô formula we obtain

$$I_{(1)s,t}^{(r_1)} I_{(1)s,t}^{(r_2)} I_{(1)s,t}^{(r_3)} =$$

$$= I_{(111)s,t}^{(r_1 r_2 r_3)} + I_{(111)s,t}^{(r_1 r_3 r_2)} + I_{(111)s,t}^{(r_2 r_1 r_3)} + I_{(111)s,t}^{(r_2 r_3 r_1)} + I_{(111)s,t}^{(r_3 r_1 r_2)} + I_{(111)s,t}^{(r_3 r_2 r_1)} +$$

$$+ \mathbf{1}_{\{r_1=r_2\}}\left(I_{(10)s,t}^{(r_3 0)} + I_{(01)s,t}^{(0 r_3)}\right) + \mathbf{1}_{\{r_1=r_3\}}\left(I_{(10)s,t}^{(r_2 0)} + I_{(01)s,t}^{(0 r_2)}\right) +$$

$$+ \mathbf{1}_{\{r_2=r_3\}}\left(I_{(10)s,t}^{(r_1 0)} + I_{(01)s,t}^{(0 r_1)}\right) =$$

$$= \sum_{(r_1,r_2,r_3)} I_{(111)s,t}^{(r_1 r_2 r_3)} + (s-t)\left(\mathbf{1}_{\{r_2=r_3\}} I_{(1)s,t}^{(r_1)} + \mathbf{1}_{\{r_1=r_3\}} I_{(1)s,t}^{(r_2)} + \mathbf{1}_{\{r_1=r_2\}} I_{(1)s,t}^{(r_3)}\right) \quad \text{w. p. 1,} \tag{71}$$

where

$$\sum_{(r_1,r_2,r_3)}$$

means the sum with respect to all possible permutations (r_1, r_2, r_3) and we use the notations from Sect. 4.

After substituting (71) into (70), we obtain

$$I_3[B(Z)]_{T,t}^M = \sum_{r_1,r_2,r_3,r_4\in J_M} B'''(Z)\left(B(Z)e_{r_1}, B(Z)e_{r_2}, B(Z)e_{r_3}\right) e_{r_4}\sqrt{\lambda_{r_1}\lambda_{r_2}\lambda_{r_3}\lambda_{r_4}}\times$$

$$\times\left(\sum_{(r_1,r_2,r_3)} I_{(1111)T,t}^{(r_1 r_2 r_3 r_4)} - \mathbf{1}_{\{r_1=r_2\}} J_{(01)T,t}^{(r_3 r_4)} - \mathbf{1}_{\{r_1=r_3\}} J_{(01)T,t}^{(r_2 r_4)} - \mathbf{1}_{\{r_2=r_3\}} J_{(01)T,t}^{(r_1 r_4)}\right) \quad \text{w. p. 1,} \tag{72}$$

where

$$J_{(01)T,t}^{(r_1 r_2)} = \int\limits_t^T (t-s) \int\limits_t^s d\mathbf{w}_\tau^{(r_1)} d\mathbf{w}_s^{(r_2)}. \tag{73}$$

Denote by $I_3[B(Z)]_{T,t}^{M,q}$ the approximation of the iterated stochastic integral (72), which has the following form

$$I_3[B(Z)]_{T,t}^{M,q}=\sum_{r_1,r_2,r_3,r_4\in J_M}B'''(Z)\left(B(Z)e_{r_1},B(Z)e_{r_2},B(Z)e_{r_3}\right)e_{r_4}\sqrt{\lambda_{r_1}\lambda_{r_2}\lambda_{r_3}\lambda_{r_4}}\times$$

$$\times\left(\sum_{(r_1,r_2,r_3)}I_{(1111)T,t}^{(r_1r_2r_3r_4)q}-\mathbf{1}_{\{r_1=r_2\}}J_{(01)T,t}^{(r_3r_4)q}-\mathbf{1}_{\{r_1=r_3\}}J_{(01)T,t}^{(r_2r_4)q}-\mathbf{1}_{\{r_2=r_3\}}J_{(01)T,t}^{(r_1r_4)q}\right), \tag{74}$$

where the approximations $I_{(1111)T,t}^{(r_1r_2r_3r_4)q}$, $J_{(01)T,t}^{(r_1r_2)q}$ are based on Theorems 1, 2 and Legendre polynomials.

The approximation $J_{(01)T,t}^{(r_1r_2)q}$ of the stochastic integral $J_{(01)T,t}^{(r_1r_2)}$ $(r_1,r_2=1,\ldots,M)$, which is based on Theorems 1, 2 and Legendre polynomials has the following form (see [43] (formula (6.91), p. A.544) or [39] (formula (5.7), p. A.249))

$$J_{(01)T,t}^{(r_1r_2)q}=-\frac{T-t}{2}I_{(11)T,t}^{(r_1r_2)q}-\frac{(T-t)^2}{4}\left(\frac{1}{\sqrt{3}}\zeta_0^{(r_1)}\zeta_1^{(r_2)}+\right.$$

$$\left.+\sum_{i=0}^{q}\left(\frac{(i+2)\zeta_i^{(r_1)}\zeta_{i+2}^{(r_2)}-(i+1)\zeta_{i+2}^{(r_1)}\zeta_i^{(r_2)}}{\sqrt{(2i+1)(2i+5)}(2i+3)}-\frac{\zeta_i^{(r_1)}\zeta_i^{(r_2)}}{(2i-1)(2i+3)}\right)\right), \tag{75}$$

$$I_{(11)T,t}^{(r_1r_2)q}=\frac{T-t}{2}\left(\zeta_0^{(r_1)}\zeta_0^{(r_2)}+\sum_{i=1}^{q}\frac{1}{\sqrt{4i^2-1}}\left(\zeta_{i-1}^{(r_1)}\zeta_i^{(r_2)}-\zeta_i^{(r_1)}\zeta_{i-1}^{(r_2)}\right)-\mathbf{1}_{\{r_1=r_2\}}\right), \tag{76}$$

where notations are the same as in Theorems 1, 2.

Moreover (see [43] (formula (6.106), p. A.551) or [39] (formula (5.19), p. A.252–A.253)),

$$\mathsf{M}\left\{\left(J_{(01)T,t}^{(r_1r_2)}-J_{(01)T,t}^{(r_1r_2)q}\right)^2\right\}=\frac{(T-t)^4}{16}\times$$

$$\times\left(\frac{5}{9}-2\sum_{i=2}^{q}\frac{1}{4i^2-1}-\sum_{i=1}^{q}\frac{1}{(2i-1)^2(2i+3)^2}-\sum_{i=0}^{q}\frac{(i+2)^2+(i+1)^2}{(2i+1)(2i+5)(2i+3)^2}\right)\quad(r_1\neq r_2). \tag{77}$$

From (27), (29) we obtain

$$\mathsf{M}\left\{\left(J_{(01)T,t}^{(r_1r_2)}-J_{(01)T,t}^{(r_1r_2)q}\right)^2\right\}\le$$

$$\le\frac{(T-t)^4}{8}\left(\frac{5}{9}-2\sum_{i=2}^{q}\frac{1}{4i^2-1}-\sum_{i=1}^{q}\frac{1}{(2i-1)^2(2i+3)^2}-\sum_{i=0}^{q}\frac{(i+2)^2+(i+1)^2}{(2i+1)(2i+5)(2i+3)^2}\right),$$

where $r_1,r_2=1,\ldots,M$.

From (72), (74) it follows that

$$I_3[B(Z)]_{T,t}^M - I_3[B(Z)]_{T,t}^{M,q} =$$

$$= \sum_{r_1,r_2,r_3,r_4\in J_M} B'''(Z)\left(B(Z)e_{r_1}, B(Z)e_{r_2}, B(Z)e_{r_3}\right)e_{r_4}\sqrt{\lambda_{r_1}\lambda_{r_2}\lambda_{r_3}\lambda_{r_4}}\times$$

$$\times\Biggl(\sum_{(r_1,r_2,r_3)}\left(I_{(1111)T,t}^{(r_1r_2r_3r_4)} - I_{(1111)T,t}^{(r_1r_2r_3r_4)q}\right) - \mathbf{1}_{\{r_1=r_2\}}\left(J_{(01)T,t}^{(r_3r_4)} - J_{(01)T,t}^{(r_3r_4)q}\right) -$$

$$-\mathbf{1}_{\{r_1=r_3\}}\left(J_{(01)T,t}^{(r_2r_4)} - J_{(01)T,t}^{(r_2r_4)q}\right) - \mathbf{1}_{\{r_2=r_3\}}\left(J_{(01)T,t}^{(r_1r_4)} - J_{(01)T,t}^{(r_1r_4)q}\right)\Biggr)\quad \text{w. p. 1.} \tag{78}$$

Repeating with an insignificant modification the proof of Theorem 4 for the cases $k = 2, 4$, we obtain

$$\mathsf{M}\left\{\left\|I_3[B(Z)]_{T,t}^M - I_3[B(Z)]_{T,t}^{M,q}\right\|_H^2\right\} \le$$

$$\le C\,(\text{tr } Q)^4\left(6^2(4!)^2\left(\frac{(T-t)^4}{24} - \sum_{j_1,j_2,j_3,j_4=0}^{q} C_{j_4j_3j_2j_1}^2\right) + 3^2(2!)^2E_q\right),$$

where E_q is the right-hand side of (77), and

$$C_{j_4j_3j_2j_1} = \frac{\sqrt{(2j_1+1)(2j_2+1)(2j_3+1)(2j_4+1)}(T-t)^2}{16}\bar{C}_{j_4j_3j_2j_1}, \tag{79}$$

$$\bar{C}_{j_4j_3j_2j_1} = \int\limits_{-1}^{1} P_{j_4}(u)\int\limits_{-1}^{u} P_{j_3}(z)\int\limits_{-1}^{z} P_{j_2}(y)\int\limits_{-1}^{y} P_{j_1}(x)dxdydzdu,$$

where $P_j(x)$ is the Legendre polynomial.

Consider the stochastic integral $I_4[B(Z)]_{T,t}^M$. Let conditions 1 and 2 of Theorem 4 be fulfilled. Let $B'(v)(B''(v)(B(v), B(v)))$ be a 4-linear Hilbert–Schmidt operator mapping from $U_0 \times U_0 \times U_0 \times U_0$ to H for all $v \in H$.

We have (see (44))

$$I_4[B(Z)]_{T,t}^M = \sum_{r_1,r_2,r_3,r_4\in J_M} B'(Z)\left(B''(Z)\left(B(Z)e_{r_1}, B(Z)e_{r_2}\right)e_{r_3}\right)e_{r_4}\sqrt{\lambda_{r_1}\lambda_{r_2}\lambda_{r_3}\lambda_{r_4}}\times$$

$$\times\int\limits_t^T\int\limits_t^s\left(\int\limits_t^{\tau} d\mathbf{w}_u^{(r_1)}\int\limits_t^{\tau} d\mathbf{w}_u^{(r_2)}\right)d\mathbf{w}_{\tau}^{(r_3)}d\mathbf{w}_s^{(r_4)}\quad \text{w. p. 1.} \tag{80}$$

From (63) and (80) we obtain

$$I_4[B(Z)]_{T,t}^{M}=\sum_{r_1,r_2,r_3,r_4\in J_M} B'(Z)\left(B''(Z)\left(B(Z)e_{r_1},B(Z)e_{r_2}\right)e_{r_3}\right)e_{r_4}\sqrt{\lambda_{r_1}\lambda_{r_2}\lambda_{r_3}\lambda_{r_4}}\times$$

$$\times\left(I_{(1111)T,t}^{(r_1r_2r_3r_4)}+I_{(1111)T,t}^{(r_2r_1r_3r_4)}-\mathbf{1}_{\{r_1=r_2\}}J_{(10)T,t}^{(r_3r_4)}\right)\quad \text{w. p. 1,} \tag{81}$$

where

$$J_{(10)T,t}^{(r_3r_4)}=\int\limits_t^T\int\limits_t^s (t-\tau)d\mathbf{w}_\tau^{(r_3)}d\mathbf{w}_s^{(r_4)}. \tag{82}$$

Denote by $I_4[B(Z)]_{T,t}^{M,q}$ the approximation of the iterated stochastic integral (81), which has the following form

$$I_4[B(Z)]_{T,t}^{M,q}=\sum_{r_1,r_2,r_3,r_4\in J_M} B'(Z)\left(B''(Z)\left(B(Z)e_{r_1},B(Z)e_{r_2}\right)e_{r_3}\right)e_{r_4}\sqrt{\lambda_{r_1}\lambda_{r_2}\lambda_{r_3}\lambda_{r_4}}\times$$

$$\times\left(I_{(1111)T,t}^{(r_1r_2r_3r_4)q}+I_{(1111)T,t}^{(r_2r_1r_3r_4)q}-\mathbf{1}_{\{r_1=r_2\}}J_{(10)T,t}^{(r_3r_4)q}\right)\quad \text{w. p. 1,} \tag{83}$$

where the approximations $I_{(1111)T,t}^{(r_1r_2r_3r_4)q}$, $J_{(10)T,t}^{(r_1r_2)q}$ are based on Theorems 1, 2 and Legendre polynomials.

The approximation $J_{(10)T,t}^{(r_1r_2)q}$ of the stochastic integral $J_{(10)T,t}^{(r_1r_2)}$ $(r_1,r_2=1,\ldots,M)$, which is based on Theorems 1, 2 and Legendre polynomials has the following form (see [43] (formula (6.92), p. A.544) or [39] (formula (5.8), p. A.249))

$$J_{(10)T,t}^{(r_1r_2)q}=-\frac{T-t}{2}I_{(11)T,t}^{(r_1r_2)q}-\frac{(T-t)^2}{4}\left(\frac{1}{\sqrt{3}}\zeta_0^{(r_2)}\zeta_1^{(r_1)}+\right.$$

$$\left.+\sum_{i=0}^{q}\left(\frac{(i+1)\zeta_{i+2}^{(r_2)}\zeta_i^{(r_1)}-(i+2)\zeta_i^{(r_2)}\zeta_{i+2}^{(r_1)}}{\sqrt{(2i+1)(2i+5)}(2i+3)}+\frac{\zeta_i^{(r_1)}\zeta_i^{(r_2)}}{(2i-1)(2i+3)}\right)\right), \tag{84}$$

where the approximation $I_{(11)T,t}^{(r_1r_2)q}$ is defined by (76).

Moreover,

$$\mathsf{M}\left\{\left(J_{(10)T,t}^{(r_1r_2)}-J_{(10)T,t}^{(r_1r_2)q}\right)^2\right\}=E_q\quad (r_1\ne r_2), \tag{85}$$

where E_q is the right-hand side of (77) (see [43] (formula (6.106), p. A.551) or [39] (formula (5.19), p. A.252–A.253)).

From (81), (83) it follows that

$$I_4[B(Z)]_{T,t}^{M} - I_4[B(Z)]_{T,t}^{M,q} =$$

$$= \sum_{r_1,r_2,r_3,r_4\in J_M} B'(Z)\left(B''(Z)\left(B(Z)e_{r_1}, B(Z)e_{r_2}\right)e_{r_3}\right)e_{r_4}\sqrt{\lambda_{r_1}\lambda_{r_2}\lambda_{r_3}\lambda_{r_4}}\times$$

$$\times\Biggl(\left(I_{(1111)T,t}^{(r_1r_2r_3r_4)} - I_{(1111)T,t}^{(r_1r_2r_3r_4)q}\right) + \left(I_{(1111)T,t}^{(r_2r_1r_3r_4)} - I_{(1111)T,t}^{(r_2r_1r_3r_4)q}\right) -$$

$$-\mathbf{1}_{\{r_1=r_2\}}\left(J_{(10)T,t}^{(r_3r_4)} - J_{(10)T,t}^{(r_3r_4)q}\right)\Biggr) \quad \text{w. p. 1.}$$

Repeating with an insignificant modification the proof of Theorem 4 for the cases $k = 2, 4$, we obtain

$$\mathsf{M}\left\{\left\|I_4[B(Z)]_{T,t}^{M} - I_4[B(Z)]_{T,t}^{M,q}\right\|_H^2\right\} \le$$

$$\le C\,(\mathrm{tr}\ Q)^4\left(2^2(4!)^2\left(\frac{(T-t)^4}{24} - \sum_{j_1,j_2,j_3,j_4=0}^{q} C_{j_4j_3j_2j_1}^2\right) + (2!)^2E_q\right),$$

where E_q is the right-hand side of (77), and $C_{j_4j_3j_2j_1}$ is defined by (79).

Consider the stochastic integral $I_5[B(Z)]_{T,t}^{M}$. Let conditions 1 and 2 of Theorem 4 be fulfilled. Let $B''(v)(B(v), B'(v)(B(v)))$ be a 4-linear Hilbert–Schmidt operator mapping from $U_0\times U_0\times U_0\times U_0$ to H for all $v\in H$.

We have (see (44))

$$I_5[B(Z)]_{T,t}^{M} = \sum_{r_1,r_2,r_3,r_4\in J_M} B''(Z)(B(Z)e_{r_3}, B'(Z)(B(Z)e_{r_2})e_{r_1})e_{r_4}\sqrt{\lambda_{r_1}\lambda_{r_2}\lambda_{r_3}\lambda_{r_4}}\times$$

(86)
$$\times\int\limits_t^T\left(\int\limits_t^s d\mathbf{w}_\tau^{(r_3)}\int\limits_t^s\int\limits_t^\tau d\mathbf{w}_u^{(r_2)}d\mathbf{w}_\tau^{(r_1)}\right)d\mathbf{w}_s^{(r_4)} \quad \text{w. p. 1.}$$

Using the theorem on the integration order replacement in iterated Itô stochastic integrals (see [43] (p. A.150, p. A.163), [44]-[46], [67]) or the Itô formula, we obtain

$$\int\limits_t^T\left(\int\limits_t^s d\mathbf{w}_\tau^{(r_3)}\int\limits_t^s\int\limits_t^\tau d\mathbf{w}_u^{(r_2)}d\mathbf{w}_\tau^{(r_1)}\right)d\mathbf{w}_s^{(r_4)} =$$

$$= I_{(1111)T,t}^{(r_2r_1r_3r_4)} + I_{(1111)T,t}^{(r_2r_3r_1r_4)} + I_{(1111)T,t}^{(r_3r_2r_1r_4)} +$$

$$+ \mathbf{1}_{\{r_1=r_3\}} \left(J_{(10)T,t}^{(r_2r_4)} - J_{(01)T,t}^{(r_2r_4)} \right) - \mathbf{1}_{\{r_2=r_3\}} J_{(10)T,t}^{(r_1r_4)} \quad \text{w. p. 1,} \tag{87}$$

where we use the notations from Sect. 4, and $J_{(01)T,t}^{(r_1r_2)}$, $J_{(10)T,t}^{(r_1r_2)}$ are defined by (73), (82).

After substituting (87) into (86), we obtain

$$I_5[B(Z)]_{T,t}^M = \sum_{r_1,r_2,r_3,r_4 \in J_M} B''(Z)(B(Z)e_{r_3}, B'(Z)(B(Z)e_{r_2})e_{r_1})e_{r_4} \sqrt{\lambda_{r_1}\lambda_{r_2}\lambda_{r_3}\lambda_{r_4}} \times$$

$$\times \Biggl(I_{(1111)T,t}^{(r_2r_1r_3r_4)} + I_{(1111)T,t}^{(r_2r_3r_1r_4)} + I_{(1111)T,t}^{(r_3r_2r_1r_4)} +$$

$$+\mathbf{1}_{\{r_1=r_3\}} \left(J_{(10)T,t}^{(r_2r_4)} - J_{(01)T,t}^{(r_2r_4)} \right) - \mathbf{1}_{\{r_2=r_3\}} J_{(10)T,t}^{(r_1r_4)} \Biggr) \quad \text{w. p. 1.} \tag{88}$$

Denote by $I_5[B(Z)]_{T,t}^{M,q}$ the approximation of the iterated stochastic integral (88), which has the following form

$$I_5[B(Z)]_{T,t}^{M,q} = \sum_{r_1,r_2,r_3,r_4 \in J_M} B''(Z)(B(Z)e_{r_3}, B'(Z)(B(Z)e_{r_2})e_{r_1})e_{r_4} \sqrt{\lambda_{r_1}\lambda_{r_2}\lambda_{r_3}\lambda_{r_4}} \times$$

$$\times \Biggl(I_{(1111)T,t}^{(r_2r_1r_3r_4)q} + I_{(1111)T,t}^{(r_2r_3r_1r_4)q} + I_{(1111)T,t}^{(r_3r_2r_1r_4)q} +$$

$$+\mathbf{1}_{\{r_1=r_3\}} \left(J_{(10)T,t}^{(r_2r_4)q} - J_{(01)T,t}^{(r_2r_4)q} \right) - \mathbf{1}_{\{r_2=r_3\}} J_{(10)T,t}^{(r_1r_4)q} \Biggr) \quad \text{w. p. 1,} \tag{89}$$

where the approximations $I_{(1111)T,t}^{(r_1r_2r_3r_4)q}$, $J_{(01)T,t}^{(r_1r_2)q}$, and $J_{(10)T,t}^{(r_1r_2)q}$ are based on Theorems 1, 2 and Legendre polynomials.

From (88), (89) it follows that

$$I_5[B(Z)]_{T,t}^M - I_5[B(Z)]_{T,t}^{M,q} = \sum_{r_1,r_2,r_3,r_4 \in J_M} B''(Z)(B(Z)e_{r_3}, B'(Z)(B(Z)e_{r_2})e_{r_1})e_{r_4} \sqrt{\lambda_{r_1}\lambda_{r_2}\lambda_{r_3}\lambda_{r_4}} \times$$

$$\times \Biggl(\left(I_{(1111)T,t}^{(r_2r_1r_3r_4)} - I_{(1111)T,t}^{(r_2r_1r_3r_4)q} \right) + \left(I_{(1111)T,t}^{(r_2r_3r_1r_4)} - I_{(1111)T,t}^{(r_2r_3r_1r_4)q} \right) + \left(I_{(1111)T,t}^{(r_3r_2r_1r_4)} - I_{(1111)T,t}^{(r_3r_2r_1r_4)q} \right) +$$

$$+\mathbf{1}_{\{r_1=r_3\}} \left(\left(J_{(10)T,t}^{(r_2r_4)} - J_{(10)T,t}^{(r_2r_4)q} \right) - \left(J_{(01)T,t}^{(r_2r_4)} - J_{(01)T,t}^{(r_2r_4)q} \right) \right) - \mathbf{1}_{\{r_2=r_3\}} \left(J_{(10)T,t}^{(r_1r_4)} - J_{(10)T,t}^{(r_1r_4)q} \right) \Biggr) \quad \text{w. p. 1.}$$

Repeating with an insignificant modification the proof of Theorem 4 for the cases $k = 2, 4$ and taking into account (85), we obtain

$$\mathsf{M}\left\{\left\|I_5[B(Z)]_{T,t}^{M} - I_5[B(Z)]_{T,t}^{M,q}\right\|_H^2\right\} \le$$

$$\le C\,(\mathrm{tr}\ Q)^4\left(3^2(4!)^2\left(\frac{(T-t)^4}{24} - \sum_{j_1,j_2,j_3,j_4=0}^{q} C_{j_4j_3j_2j_1}^2\right) + 3^2(2!)^2E_q\right),$$

where E_q is the right-hand side of (77), and $C_{j_4j_3j_2j_1}$ is defined by (79).

Consider the stochastic integral $I_6[B(Z), F(Z)]_{T,t}^{M}$. Let conditions 1 and 2 of Theorem 4 be fulfilled. We have (see (44))

$$I_6[B(Z), F(Z)]_{T,t}^{M} = \sum_{r_1,r_2\in J_M} F'(Z)(B'(Z)(B(Z)e_{r_1})e_{r_2})\sqrt{\lambda_{r_1}\lambda_{r_2}}\times$$

(90) $$\times\int\limits_t^T\int\limits_t^s\int\limits_t^\tau d\mathbf{w}_u^{(r_1)}d\mathbf{w}_\tau^{(r_2)}ds \quad \text{w. p. 1.}$$

Using the theorem on the integration order replacement in iterated Itô stochastic integrals (see [43] (p. A.150, p. A.163), [44]-[46], [67]) or the Itô formula, we obtain

(91) $$\int\limits_t^T\int\limits_t^s\int\limits_t^\tau d\mathbf{w}_u^{(r_1)}d\mathbf{w}_\tau^{(r_2)}ds = (T-t)I_{(11)T,t}^{(r_1r_2)} + J_{(01)T,t}^{(r_1r_2)} \quad \text{w. p. 1.}$$

After substituting (91) into (90) we have

$$I_6[B(Z), F(Z)]_{T,t}^{M} = \sum_{r_1,r_2\in J_M} F'(Z)(B'(Z)(B(Z)e_{r_1})e_{r_2})\sqrt{\lambda_{r_1}\lambda_{r_2}}\times$$

(92) $$\times\left((T-t)I_{(11)T,t}^{(r_1r_2)} + J_{(01)T,t}^{(r_1r_2)}\right) \quad \text{w. p. 1.}$$

Denote by $I_6[B(Z), F(Z)]_{T,t}^{M,q}$ the approximation of the iterated stochastic integral (92), which has the following form

$$I_6[B(Z), F(Z)]_{T,t}^{M,q} = \sum_{r_1,r_2\in J_M} F'(Z)(B'(Z)(B(Z)e_{r_1})e_{r_2})\sqrt{\lambda_{r_1}\lambda_{r_2}}\times$$

(93) $$\times\left((T-t)I_{(11)T,t}^{(r_1r_2)q} + J_{(01)T,t}^{(r_1r_2)q}\right),$$

where the approximations $J^{(r_1r_2)q}_{(01)T,t}$, $I^{(r_1r_2)q}_{(11)T,t}$ are defined by (75), (76).

From (92), (93) it follows that

$$I_6[B(Z),F(Z)]^M_{T,t}-I_6[B(Z),F(Z)]^{M,q}_{T,t}=\sum_{r_1,r_2\in J_M}F'(Z)(B'(Z)(B(Z)e_{r_1})e_{r_2})\sqrt{\lambda_{r_1}\lambda_{r_2}}\times$$

$$\times\Biggl((T-t)\left(I^{(r_1r_2)}_{(11)T,t}-I^{(r_1r_2)q}_{(11)T,t}\right)+\left(J^{(r_1r_2)}_{(01)T,t}-J^{(r_1r_2)q}_{(01)T,t}\right)\Biggr)\quad \text{w. p. 1.}$$

Repeating with an insignificant modification the proof of Theorem 4 for the case $k=2$, we obtain

$$\mathsf{M}\left\{\left\|I_6[B(Z),F(Z)]^M_{T,t}-I_6[B(Z),F(Z)]^{M,q}_{T,t}\right\|^2_H\right\}\le$$

$$\le 2C(2!)^2\left(\text{tr } Q\right)^2\Bigl((T-t)^2G_q+E_q\Bigr),$$

where G_q and E_q are the right-hand sides of (36) and (77) correspondingly.

Consider the stochastic integral $I_7[B(Z),F(Z)]^M_{T,t}$. Let conditions 1 and 2 of Theorem 4 be fulfilled. Then we have (see (44)) w. p. 1

$$I_7[B(Z),F(Z)]^M_{T,t}=\sum_{r_1,r_2\in J_M}F''(Z)\left(B(Z)e_{r_1},B(Z)e_{r_2}\right)\sqrt{\lambda_{r_1}\lambda_{r_2}}\times$$

$$\times\int\limits_t^T\left(\int\limits_t^s d\mathbf{w}^{(r_1)}_\tau\int\limits_t^s d\mathbf{w}^{(r_2)}_\tau\right)ds. \tag{94}$$

Using the Itô formula, we obtain

$$\int\limits_t^s d\mathbf{w}^{(r_1)}_\tau\int\limits_t^s d\mathbf{w}^{(r_2)}_\tau=I^{(r_1r_2)}_{(11)s,t}+I^{(r_2r_1)}_{(11)s,t}+\mathbf{1}_{\{r_1=r_2\}}(s-t)\quad \text{w. p. 1,} \tag{95}$$

where we use the notations from Sect. 4.

From (95) and (91) we have

$$\int\limits_t^T\left(\int\limits_t^s d\mathbf{w}^{(r_1)}_\tau\int\limits_t^s d\mathbf{w}^{(r_2)}_\tau\right)ds=$$

$$=\int\limits_t^T I^{(r_1r_2)}_{(11)s,t}ds+\int\limits_t^T I^{(r_2r_1)}_{(11)s,t}ds+\mathbf{1}_{\{r_1=r_2\}}\frac{(T-t)^2}{2}=$$

$$
= (T-t)\left(I_{(11)T,t}^{(r_1r_2)}+I_{(11)T,t}^{(r_2r_1)}\right)+J_{(01)T,t}^{(r_1r_2)}+J_{(01)T,t}^{(r_2r_1)}+\mathbf{1}_{\{r_1=r_2\}}\frac{(T-t)^2}{2}=
$$

$$
= (T-t)\left(I_{(1)T,t}^{(r_1)}I_{(1)T,t}^{(r_2)}-\mathbf{1}_{\{r_1=r_2\}}(T-t)\right)+J_{(01)T,t}^{(r_1r_2)}+J_{(01)T,t}^{(r_2r_1)}+\mathbf{1}_{\{r_1=r_2\}}\frac{(T-t)^2}{2}=
$$

$$
= (T-t)I_{(1)T,t}^{(r_1)}I_{(1)T,t}^{(r_2)}+J_{(01)T,t}^{(r_1r_2)}+J_{(01)T,t}^{(r_2r_1)}-
$$

$$
-\mathbf{1}_{\{r_1=r_2\}}\frac{(T-t)^2}{2}\quad \text{w. p. 1.} \tag{96}
$$

After substituting (96) into (94) we obtain

$$
I_7[B(Z),F(Z)]_{T,t}^{M}=\sum_{r_1,r_2\in J_M}F''(Z)\left(B(Z)e_{r_1},B(Z)e_{r_2}\right)\sqrt{\lambda_{r_1}\lambda_{r_2}}\times
$$

$$
\times\left((T-t)I_{(1)T,t}^{(r_1)}I_{(1)T,t}^{(r_2)}+J_{(01)T,t}^{(r_1r_2)}+J_{(01)T,t}^{(r_2r_1)}-\mathbf{1}_{\{r_1=r_2\}}\frac{(T-t)^2}{2}\right)\quad \text{w. p. 1.} \tag{97}
$$

Denote by $I_7[B(Z),F(Z)]_{T,t}^{M,q}$ the approximation of the iterated stochastic integral (97), which has the following form

$$
I_7[B(Z),F(Z)]_{T,t}^{M,q}=\sum_{r_1,r_2\in J_M}F''(Z)\left(B(Z)e_{r_1},B(Z)e_{r_2}\right)\sqrt{\lambda_{r_1}\lambda_{r_2}}\times
$$

$$
\times\left((T-t)I_{(1)T,t}^{(r_1)}I_{(1)T,t}^{(r_2)}+J_{(01)T,t}^{(r_1r_2)q}+J_{(01)T,t}^{(r_2r_1)q}-\mathbf{1}_{\{r_1=r_2\}}\frac{(T-t)^2}{2}\right), \tag{98}
$$

where the approximation $J_{(01)T,t}^{(r_1r_2)q}$ is defined by (75).

From (97), (98) it follows that

$$
I_7[B(Z),F(Z)]_{T,t}^{M}-I_7[B(Z),F(Z)]_{T,t}^{M,q}=\sum_{r_1,r_2\in J_M}F''(Z)\left(B(Z)e_{r_1},B(Z)e_{r_2}\right)\sqrt{\lambda_{r_1}\lambda_{r_2}}\times
$$

$$
\times\left(\left(J_{(01)T,t}^{(r_1r_2)}-J_{(01)T,t}^{(r_1r_2)q}\right)+\left(J_{(01)T,t}^{(r_2r_1)}-J_{(01)T,t}^{(r_2r_1)q}\right)\right)\quad \text{w. p. 1.}
$$

Repeating with an insignificant modification the proof of Theorem 4 for the case $k=2$, we obtain

$$\mathsf{M}\left\{\left\|I_7[B(Z),F(Z)]_{T,t}^{M}-I_7[B(Z),F(Z)]_{T,t}^{M,q}\right\|_H^2\right\}\le$$

$$\le 2^2 C(2!)^2\,(\mathrm{tr}\ Q)^2\,E_q,$$

where E_q is the right-hand side of (77).

Consider the stochastic integral $I_8[B(Z),F(Z)]_{T,t}^{M}$. Let conditions 1 and 2 of Theorem 4 be fulfilled. Then we have (see (44)) w. p. 1

$$I_8[B(Z),F(Z)]_{T,t}^{M}=-\sum_{r_1,r_2\in J_M}B''(Z)\,(F(Z),B(Z)e_{r_1})\,e_{r_2}\sqrt{\lambda_{r_1}\lambda_{r_2}}J_{(01)T,t}^{(r_1r_2)}. \tag{99}$$

Denote by $I_8[B(Z),F(Z)]_{T,t}^{M,q}$ the approximation of the iterated stochastic integral (99), which has the following form

$$I_8[B(Z),F(Z)]_{T,t}^{M,q}=-\sum_{r_1,r_2\in J_M}B''(Z)\,(F(Z),B(Z)e_{r_1})\,e_{r_2}\sqrt{\lambda_{r_1}\lambda_{r_2}}J_{(01)T,t}^{(r_1r_2)q}, \tag{100}$$

where the approximation $J_{(01)T,t}^{(r_1r_2)q}$ is defined by (75).

From (99), (100) it follows that

$$I_8[B(Z),F(Z)]_{T,t}^{M}-I_8[B(Z),F(Z)]_{T,t}^{M,q}=$$

$$=-\sum_{r_1,r_2\in J_M}B''(Z)\,(F(Z),B(Z)e_{r_1})\,e_{r_2}\sqrt{\lambda_{r_1}\lambda_{r_2}}\times$$

$$\times\left(J_{(01)T,t}^{(r_1r_2)}-J_{(01)T,t}^{(r_1r_2)q}\right)\quad \text{w. p. 1.}$$

Repeating with an insignificant modification the proof of Theorem 4 for the case $k=2$, we obtain

$$\mathsf{M}\left\{\left\|I_8[B(Z),F(Z)]_{T,t}^{M}-I_8[B(Z),F(Z)]_{T,t}^{M,q}\right\|_H^2\right\}\le C(2!)^2\,(\mathrm{tr}\ Q)^2\,E_q,$$

where E_q is the right-hand side of (77).

Using computational experiments it was shown in [64], [65] (also see [44], Sect. 5.4) that we can neglect the multiplier factor $k!$ in the estimate (27). As a result, the computational costs for the approximation of iterated Itô stochastic integrals are significantly reduced. For the same reason, we can replace the multiplier factor $(k!)^2$ by $k!$ in the formula (47) in practical calculations.

Acknowledgement. I would like to thank Leonid Makarovsky for his help in translation this article into English and Konstantin Rybakov for useful discussion of some presented results.

APPLICATION OF MULTIPLE FOURIER–LEGENDRE SERIES TO IMPLEMENTATION OF STRONG EXPONENTIAL MILSTEIN AND WAGNER–PLATEN METHODS FOR NON-COMMUTATIVE SEMILINEAR STOCHASTIC PARTIAL DIFFERENTIAL EQUATIONS

DMITRIY F. KUZNETSOV

Abstract. The article is devoted to the application of multiple Fourier–Legendre series to implementation of strong exponential Milstein and Wagner–Platen methods for non-commutative semilinear stochastic partial differential equations with multiplicative trace class noise. These methods have strong orders of convergence $1.0-\varepsilon$ and $1.5-\varepsilon$ correspondingly (here ε is an arbitrary small positive real number) with respect to the temporal discretization. The theorem on mean-square convergence of approximations of iterated stochastic integrals of multiplicities 1 to 3 with respect to the infinite-dimensional Q-Wiener process is formulated and proved. The results of the article can be applied to implementation of exponential Milstein and Wagner–Platen methods for non-commutative semilinear stochastic partial differential equations with multiplicative trace class noise.

1. Introduction

It is well-known that one of the effective approaches to the construction of high-order strong numerical methods (with respect to the temporal discretization) for stochastic partial differential equations (SPDEs) is based on the Taylor formula in Banach spaces and exponential formula for the mild solution of SPDEs [1]-[6]. A significant step in this direction was made in [2], [3], where the exponential Milstein and Wagner–Platen methods for semilinear SPDEs were constructed. Under the appropriate conditions [2], [3] these methods have strong orders of convergence $1.0-\varepsilon$ and $1.5-\varepsilon$ correspondingly (where ε is an arbitrary small posilive real number) with respect to the temporal discretization.

An important feature of the mentioned numerical methods is the presence in them of the so-called iterated stochastic integrals with respect to the infinite-dimensional Q-Wiener process [7]. The problem of numerical modeling of these stochastic integrals was solved in [2], [3] for the case when special commutativity conditions are fulfilled.

If the mentioned commutativity conditions are not fulfilled, which often corresponds to SPDEs in numerous applications, the numerical simulation of iterated stochastic integrals with respect to the infinite-dimensional Q-Wiener process becomes much more difficult. Note that the exponential Milstein scheme [2] contains the iterated stochastic integrals of multiplicities 1 and 2 with respect to the infinite-dimensional Q-Wiener process and the exponential Wagner–Platen scheme [3] contains the mentioned stochastic integrals of multiplicities 1 to 3. In [8] two methods of the mean-square approximation of iterated stochastic integrals from the Milstein scheme [2] have been considered. Note that the mean-square error of approximation of these stochastic integrals consists of two components [8].

Mathematics Subject Classification: 60H05, 60H10, 42B05, 42C10.

Keywords: Non-commutative semilinear Stochastic partial differential equation, Multiplicative trace class noise, Infinite-dimensional Q-Wiener process, Iterated Itô stochastic integral, Generalized multiple Fourier series, Multiple Fourier–Legendre series, Exponential Milstein scheme, Exponential Wagner–Platen scheme, Legendre polynomials, Mean-square approximation, Expansion.

The first component is related with the finite-dimentional approximation of the infinite-dimentional Q-Wiener process while the second one is connected with the approximation of iterated Itô stochastic integrals with respect to the scalar standard Brownian motions. In the author's publications [9], [10], [23], [24] the problem of the mean-square approximation of iterated stochastic integrals with respect to the infinite-dimensional Q-Wiener process in the sense of second component of approximation error (see above) has been solved for an arbitrary multiplicity k ($k \in \mathbb{N}$) of stochastic integrals. More precisely, in [9], [10] (also see [23], [24]) the method of generalized multiple Fourier series [11]-[54] for the approximation of iterated Itô stochastic integrals with respect to the scalar standard Brownian motions was adapted for iterated stochastic integrals with respect to the infinite-dimensional Q-Wiener process (in the sense of second component of the approximation error).

In this article, we extend the method for estimating the first component of approximation error from [8] for iterated stochastic integrals of multiplicities 1 to 3 with respect to the infinite-dimensional Q-Wiener process. In addition, we combine the obtained results with the results from [9], [10]. Thus, the results of the article can be applied to the implementation of exponential Milstein and Wagner–Platen schemes for semilinear SPDEs with multiplicative trace class noise and without the conditions of commutativity for SPDEs.

2. Exponential Milstein and Wagner–Platen Numerical Schemes for Non-Commutative Semilinear SPDEs

Let U, H be separable $\mathbb{R}$-Hilbert spaces and $L_{HS}(U,H)$ be a space of Hilbert–Schmidt operators mapping from U to H. Let $(\Omega, \mathbf{F}, \mathsf{P})$ be a probability space with a normal filtration $\{\mathbf{F}_t, t \in [0, \bar{T}]\}$ [7], let $\mathbf{W}_t$ be an U-valued Q-Wiener process with respect to $\{\mathbf{F}_t, t \in [0, \bar{T}]\}$, which has a covariance trace class operator $Q \in L(U)$. Here $L(U)$ denotes all bounded linear operators mapping from U to U. Consider an $\mathbb{R}$-Hilbert space $U_0 = Q^{1/2}(U)$ with a scalar product

$$\langle u, w \rangle_{U_0} = \left\langle Q^{-1/2}u, Q^{-1/2}w \right\rangle_U$$

for all $u, w \in U_0$.

Consider the semilinear parabolic SPDE

$$dX_t = (AX_t + F(X_t))\,dt + B(X_t)d\mathbf{W}_t, \quad X_0 = \xi, \quad t \in [0, \bar{T}], \tag{1}$$

where nonlinear operators F, B ($F: H \to H$, $B: H \to L_{HS}(U_0, H)$), linear operator $A: D(A) \subset H \to H$ as well as the initial value ξ are assumed to satisfy the conditions of existence and uniqueness of the SPDE (1) mild solution (see [3], Assumptions A1–A4).

It is well-known [6] that Assumptions A1–A4 [3] guarantee the existence and uniqueness (up to modifications) of the mild solution $X_t : [0, \bar{T}] \times \Omega \to H$ of the SPDE (1)

$$X_t = \exp(At)\xi + \int\limits_0^t \exp(A(t-\tau))F(X_\tau)d\tau + \int\limits_0^t \exp(A(t-\tau))B(X_\tau)d\mathbf{W}_\tau \tag{2}$$

with probability 1 (further w. p. 1) for all $t \in [0, \bar{T}]$, where $\exp(At)$, $t \geq 0$ is the semigroup generated by the operator A.

Consider eigenvalues λ_i and eigenfunctions $e_i(x)$ of the covariance operator Q, where $i = (i_1, \ldots, i_d) \in J$, $x = (x_1, \ldots, x_d)$, and $J = \{i : \ i \in \mathbb{N}^d, \ \text{and} \ \lambda_i > 0\}$.

The series representation of the Q-Wiener process has the following form [7]

$$\mathbf{W}_t = \sum_{i\in J} e_i \sqrt{\lambda_i}\mathbf{w}_t^{(i)} \quad \text{or} \quad \mathbf{W}_t = \sum_{i\in J_M} e_i \ \langle e_i, \mathbf{W}_t\rangle_U,$$

where $t \in [0, \bar{T}]$, $\mathbf{w}_t^{(i)}$ $(i \in J)$ are independent standard Wiener processes and $\langle\cdot,\cdot\rangle_U$ is a scalar product in U.

Note that eigenfunctions e_i, $i \in J$ form an orthonormal basis of U [7]. Consider the finite-dimensional approximation of $\mathbf{W}_t$ [7]

$$\mathbf{W}_t^M = \sum_{i\in J_M} e_i \sqrt{\lambda_i}\mathbf{w}_t^{(i)}, \quad t \in [0, \bar{T}], \tag{3}$$

where

$$J_M = \{i: \ 1 \le i_1, \ldots, i_d \le M, \ \text{and} \ \lambda_i > 0\}. \tag{4}$$

Remark 1. *Obviously, without the loss of generality we can write* $J_M = \{1, 2, \ldots, M\}$.

Let $\Delta > 0$, $\tau_p = p\Delta$ $(p = 0, 1, \ldots, N)$, and $N\Delta = \bar{T}$. Consider the following exponential Milstein and Wagner–Platen numerical schemes for the SPDE (1) [2], [3]

$$Y_{p+1} = \exp\left(A\Delta\right)\left(Y_p + \Delta F(Y_p) + \int\limits_{\tau_p}^{\tau_{p+1}} B(Y_p)d\mathbf{W}_s + \right.$$

$$\left. + \int\limits_{\tau_p}^{\tau_{p+1}} B'(Y_p)\left(\int\limits_{\tau_p}^{s} B(Y_p)d\mathbf{W}_\tau\right)d\mathbf{W}_s\right), \tag{5}$$

(an exponential Milstein scheme)

$$Y_{p+1} = \exp\left(\frac{A\Delta}{2}\right)\times$$

$$\times\left(\exp\left(\frac{A\Delta}{2}\right)Y_p + \Delta F(Y_p) + \frac{\Delta^2}{2}F'(Y_p)\Bigl(AY_p + F(Y_p)\Bigr) + \int\limits_{\tau_p}^{\tau_{p+1}} B(Y_p)d\mathbf{W}_s + \right.$$

$$+\frac{\Delta^2}{4}\sum_{i\in J}\lambda_i F''(Y_p)\Bigl(B(Y_p)e_i, B(Y_p)e_i\Bigr) + \int\limits_{\tau_p}^{\tau_{p+1}} B'(Y_p)\left(\int\limits_{\tau_p}^{s} B(Y_p)d\mathbf{W}_\tau\right)d\mathbf{W}_s +$$

$$+A\left(\int\limits_{\tau_p}^{\tau_{p+1}}\int\limits_{\tau_p}^{s} B(Y_p)d\mathbf{W}_\tau ds - \frac{\Delta}{2}\int\limits_{\tau_p}^{\tau_{p+1}} B(Y_p)d\mathbf{W}_s\right) +$$

$$
+\Delta\int\limits_{\tau_p}^{\tau_{p+1}} B'(Y_p)\Bigl(AY_p+F(Y_p)\Bigr)d\mathbf{W}_s-\int\limits_{\tau_p}^{\tau_{p+1}}\int\limits_{\tau_p}^{s} B'(Y_p)\Bigl(AY_p+F(Y_p)\Bigr)d\mathbf{W}_\tau ds+
$$

$$
+\frac{1}{2}\int\limits_{\tau_p}^{\tau_{p+1}} B''(Y_p)\left(\int\limits_{\tau_p}^{s} B(Y_p)d\mathbf{W}_\tau, \int\limits_{\tau_p}^{s} B(Y_p)d\mathbf{W}_\tau\right)d\mathbf{W}_s+
$$

$$
+\int\limits_{\tau_p}^{\tau_{p+1}} F'(Y_p)\left(\int\limits_{\tau_p}^{s} B(Y_p)d\mathbf{W}_\tau\right)ds+
$$

$$
+\int\limits_{\tau_p}^{\tau_{p+1}} B'(Y_p)\left(\int\limits_{\tau_p}^{s} B'(Y_p)\left(\int\limits_{\tau_p}^{\tau} B(Y_p)d\mathbf{W}_\theta\right)d\mathbf{W}_\tau\right)d\mathbf{W}_s\Biggr), \tag{6}
$$

(an exponential Wagner–Platen scheme)

where Y_p is an approximation of X_{τ_p} (mild solution (2) at the time moment τ_p), $p=0,1,\ldots,N$, and B', B'', F', F'' are Frêchet derivatives. In addition to the temporal discretization, the implementation of numerical schemes (5) and (6) also requires a finite-dimensional approximation of the spaces H, U. Further, we will consider this approximation only for the space U.

Let us consider the following iterated Itô stochastic integrals

$$
I_{(1)T,t}^{(r_1)}=\int\limits_t^T d\mathbf{w}_{t_1}^{(r_1)},
$$

$$
I_{(10)T,t}^{(r_10)}=\int\limits_t^T\int\limits_t^{t_2} d\mathbf{w}_{t_1}^{(r_1)}dt_2,\quad I_{(01)T,t}^{(0r_2)}=\int\limits_t^T\int\limits_t^{t_2} dt_1 d\mathbf{w}_{t_2}^{(r_2)},
$$

$$
I_{(11)T,t}^{(r_1r_2)}=\int\limits_t^T\int\limits_t^{t_2} d\mathbf{w}_{t_1}^{(r_1)}d\mathbf{w}_{t_2}^{(r_2)},
$$

$$
I_{(111)T,t}^{(r_1r_2r_3)}=\int\limits_t^T\int\limits_t^{t_3}\int\limits_t^{t_2} d\mathbf{w}_{t_1}^{(r_1)}d\mathbf{w}_{t_2}^{(r_2)}d\mathbf{w}_{t_3}^{(r_3)},
$$

where $r_1,r_2,r_3\in J_M,\ \ 0\le t<T\le\bar{T}$, and J_M is defined by (4).

Let us replace the infinite-dimensional Q-Wiener process in the iterated stochastic integrals from (5), (6) by its finite-dimensional approximation (3). Then we have w. p. 1

$$
\int\limits_{\tau_p}^{\tau_{p+1}} B(Y_p)d\mathbf{W}_s^M=\sum_{r_1\in J_M} B(Y_p)e_{r_1}\sqrt{\lambda_{r_1}}I_{(1)\tau_{p+1},\tau_p}^{(r_1)}, \tag{7}
$$

$$A\left(\int\limits_{\tau_p}^{\tau_{p+1}}\int\limits_{\tau_p}^{s}B(Y_p)d\mathbf{W}_{\tau}^{M}ds-\frac{\Delta}{2}\int\limits_{\tau_p}^{\tau_{p+1}}B(Y_p)d\mathbf{W}_{s}^{M}\right)=A\int\limits_{\tau_p}^{\tau_{p+1}}B(Y_p)\left(\frac{\tau_{p+1}}{2}-s+\frac{\tau_p}{2}\right)d\mathbf{W}_{s}^{M}=$$

$$=\sum_{r_1\in J_M}AB(Y_p)e_{r_1}\sqrt{\lambda_{r_1}}\left(\frac{\Delta}{2}I_{(1)\tau_{p+1},\tau_p}^{(r_1)}-I_{(01)\tau_{p+1},\tau_p}^{(0r_1)}\right), \tag{8}$$

$$\Delta\int\limits_{\tau_p}^{\tau_{p+1}}B'(Y_p)\Bigl(AY_p+F(Y_p)\Bigr)d\mathbf{W}_{s}^{M}-\int\limits_{\tau_p}^{\tau_{p+1}}\int\limits_{\tau_p}^{s}B'(Y_p)\Bigl(AY_p+F(Y_p)\Bigr)d\mathbf{W}_{\tau}^{M}ds=$$

$$=\int\limits_{\tau_p}^{\tau_{p+1}}B'(Y_p)\int\limits_{\tau_p}^{s}\Bigl(AY_p+F(Y_p)\Bigr)d\tau d\mathbf{W}_{s}^{M}=$$

$$=\sum_{r_1\in J_M}B'(Y_p)\Bigl(AY_p+F(Y_p)\Bigr)e_{r_1}\sqrt{\lambda_{r_1}}I_{(01)\tau_{p+1},\tau_p}^{(0r_1)}, \tag{9}$$

$$\int\limits_{\tau_p}^{\tau_{p+1}}F'(Y_p)\left(\int\limits_{\tau_p}^{s}B(Y_p)d\mathbf{W}_{\tau}^{M}\right)ds=$$

$$=\sum_{r_1\in J_M}F'(Y_p)B(Y_p)e_{r_1}\sqrt{\lambda_{r_1}}\left(\Delta I_{(1)\tau_{p+1},\tau_p}^{(r_1)}-I_{(01)\tau_{p+1},\tau_p}^{(0r_1)}\right), \tag{10}$$

$$\int\limits_{\tau_p}^{\tau_{p+1}}B'(Y_p)\left(\int\limits_{\tau_p}^{s}B(Y_p)d\mathbf{W}_{\tau}^{M}\right)d\mathbf{W}_{s}^{M}=$$

$$=\sum_{r_1,r_2\in J_M}B'(Y_p)\left(B(Y_p)e_{r_1}\right)e_{r_2}\sqrt{\lambda_{r_1}\lambda_{r_2}}I_{(11)\tau_{p+1},\tau_p}^{(r_1r_2)}, \tag{11}$$

$$\int\limits_{\tau_p}^{\tau_{p+1}}B'(Y_p)\left(\int\limits_{\tau_p}^{s}B'(Y_p)\left(\int\limits_{\tau_p}^{\tau}B(Y_p)d\mathbf{W}_{\theta}^{M}\right)d\mathbf{W}_{\tau}^{M}\right)d\mathbf{W}_{s}^{M}=$$

$$=\sum_{r_1,r_2,r_3\in J_M}B'(Y_p)\left(B'(Y_p)\left(B(Y_p)e_{r_1}\right)e_{r_2}\right)e_{r_3}\sqrt{\lambda_{r_1}\lambda_{r_2}\lambda_{r_3}}I_{(111)\tau_{p+1},\tau_p}^{(r_1r_2r_3)}, \tag{12}$$

$$\int\limits_{\tau_p}^{\tau_{p+1}} B''(Y_p)\left(\int\limits_{\tau_p}^{s} B(Y_p)d\mathbf{W}_\tau^M, \int\limits_{\tau_p}^{s} B(Y_p)d\mathbf{W}_\tau^M\right)d\mathbf{W}_s^M =$$

$$= \sum_{r_1,r_2,r_3\in J_M} B''(Y_p)\left(B(Y_p)e_{r_1}, B(Y_p)e_{r_2}\right)e_{r_3}\sqrt{\lambda_{r_1}\lambda_{r_2}\lambda_{r_3}}\times$$

$$\times \int\limits_{\tau_p}^{\tau_{p+1}}\left(\int\limits_{\tau_p}^{s} d\mathbf{w}_\tau^{(r_1)}\int\limits_{\tau_p}^{s} d\mathbf{w}_\tau^{(r_2)}\right)d\mathbf{w}_s^{(r_3)}. \tag{13}$$

Note that in (8)–(10) we used the Itô formula. Moreover, using the Itô formula we obtain

$$\int\limits_{\tau_p}^{s} d\mathbf{w}_\tau^{(r_1)}\int\limits_{\tau_p}^{s} d\mathbf{w}_\tau^{(r_2)} = I_{(11)s,\tau_p}^{(r_1r_2)} + I_{(11)s,\tau_p}^{(r_2r_1)} + \mathbf{1}_{\{r_1=r_2\}}(s-\tau_p) \quad \text{w. p. 1.} \tag{14}$$

From (14) we have

$$\int\limits_{\tau_p}^{\tau_{p+1}}\left(\int\limits_{\tau_p}^{s} d\mathbf{w}_\tau^{(r_1)}\int\limits_{\tau_p}^{s} d\mathbf{w}_\tau^{(r_2)}\right)d\mathbf{w}_s^{(r_3)} = I_{(111)\tau_{p+1},\tau_p}^{(r_1r_2r_3)} + I_{(111)\tau_{p+1},\tau_p}^{(r_2r_1r_3)} + \mathbf{1}_{\{r_1=r_2\}}I_{(01)\tau_{p+1},\tau_p}^{(0r_3)} \quad \text{w. p. 1.} \tag{15}$$

After substituting (15) into (13), we obtain

$$\int\limits_{\tau_p}^{\tau_{p+1}} B''(Y_p)\left(\int\limits_{\tau_p}^{s} B(Y_p)d\mathbf{W}_\tau^M, \int\limits_{\tau_p}^{s} B(Y_p)d\mathbf{W}_\tau^M\right)d\mathbf{W}_s^M =$$

$$= \sum_{r_1,r_2,r_3\in J_M} B''(Z)\left(B(Z)e_{r_1}, B(Z)e_{r_2}\right)e_{r_3}\sqrt{\lambda_{r_1}\lambda_{r_2}\lambda_{r_3}}\times$$

$$\times\left(I_{(111)\tau_{p+1},\tau_p}^{(r_1r_2r_3)} + I_{(111)\tau_{p+1},\tau_p}^{(r_2r_1r_3)} + \mathbf{1}_{\{r_1=r_2\}}I_{(01)\tau_{p+1},\tau_p}^{(0r_3)}\right) \quad \text{w. p. 1.} \tag{16}$$

Thus, for the implementation of numerical schemes (5) and (6) we need to approximate the following collection of iterated Itô stochastic integrals

$$I_{(1)T,t}^{(r_1)}, \quad I_{(01)T,t}^{(0r_1)}, \quad I_{(11)T,t}^{(r_1r_2)}, \quad I_{(111)T,t}^{(r_1r_2r_3)},$$

where $r_1, r_2, r_3 \in J_M$, $0 \le t < T \le \bar{T}$.

The monographs [22] (Chapters 5, 6) and [23] or [24] (Chapters 1, 2, and 5) (also see [11]-[21], [26]-[54]) are devoted to the constructing of efficient methods (based on generalized multiple Fourier series) of the mean-square approximation of iterated Itô stochastic integrals with respect to components of the finite-dimensional Wiener process. These results are also adapted for iterated Stratonovich stochastic integrals [16]-[24], [28], [33], [35]-[42], [46], [49], [50], [52], [54]. In Sect. 3, we consider a very short review of the results from monographs [22] (Chapters 5, 6) and [23] or [24] (Chapters 1, 2, and 5).

3. Method of Approximation of Iterated Itô Stohastic integrals Based on Generalized Multiple Fourier Series. The Case of Multiple Fourier–Legendre Series

Consider the following iterated Itô stochastic integrals

$$J[\psi^{(k)}]_{T,t}^{(i_1\ldots i_k)}=\int\limits_t^T\psi_k(t_k)\ldots\int\limits_t^{t_2}\psi_1(t_1)d\mathbf{w}_{t_1}^{(i_1)}\ldots d\mathbf{w}_{t_k}^{(i_k)}, \tag{17}$$

where $0\le t<T\le\bar{T}$, every $\psi_l(\tau)$ $(l=1,\ldots,k)$ is a continuous non-random function on $[t,T]$, $\mathbf{w}_\tau^{(i)}$ $(i=1,\ldots,m)$ are independent standard Wiener processes, $\mathbf{w}_\tau^{(0)}=\tau$, $i_1,\ldots,i_k=0,1,\ldots,m$. The case $\psi_1(\tau),\ldots,\psi_k(\tau)\in L_2([t,T])$ will be considered in Theorem 2 (see below).

Suppose that $\{\phi_j(x)\}_{j=0}^\infty$ is a complete orthonormal system of functions in the space $L_2([t,T])$. Define the following function on the hypercube $[t,T]^k$

$$K(t_1,\ldots,t_k)=\begin{cases}\psi_1(t_1)\ldots\psi_k(t_k),\ t_1<\ldots<t_k\\ \\ 0,\ \text{otherwise}\end{cases}=\prod_{l=1}^k\psi_l(t_l)\ \prod_{l=1}^{k-1}\mathbf{1}_{\{t_l<t_{l+1}\}}, \tag{18}$$

where $t_1,\ldots,t_k\in[t,T]$ for $k\ge 2$ and $K(t_1)\equiv\psi_1(t_1)$ for $t_1\in[t,T]$. Here $\mathbf{1}_A$ is the indicator of the set A.

The function $K(t_1,\ldots,t_k)$ is piecewise continuous on the hypercube $[t,T]^k$. At this situation it is well known that the generalized multiple Fourier series of $K(t_1,\ldots,t_k)\in L_2([t,T]^k)$ converges to $K(t_1,\ldots,t_k)$ on the hypercube $[t,T]^k$ in the mean-square sense, i.e.

$$\lim_{p_1,\ldots,p_k\to\infty}\left\|K(t_1,\ldots,t_k)-\sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k}C_{j_k\ldots j_1}\prod_{l=1}^k\phi_{j_l}(t_l)\right\|_{L_2([t,T]^k)}=0, \tag{19}$$

where

$$C_{j_k\ldots j_1}=\int\limits_{[t,T]^k}K(t_1,\ldots,t_k)\prod_{l=1}^k\phi_{j_l}(t_l)dt_1\ldots dt_k \tag{20}$$

is the Fourier coefficient and

$$\|f\|_{L_2([t,T]^k)}=\left(\int\limits_{[t,T]^k}f^2(t_1,\ldots,t_k)dt_1\ldots dt_k\right)^{1/2}.$$

Consider the discretization $\{\tau_j\}_{j=0}^{N}$ of $[t,T]$ such that

$$t=\tau_0<\ldots<\tau_N=T,\quad \Delta_N=\max_{0\le j\le N-1}\Delta\tau_j\to 0\ \text{ if }\ N\to\infty,\quad \Delta\tau_j=\tau_{j+1}-\tau_j. \tag{21}$$

Theorem 1 [11] (2006) (also see [9], [10], [12]-[54]). *Suppose that every $\psi_l(\tau)$ $(l=1,\ldots,k)$ is a continuous non-random function on $[t,T]$ and $\{\phi_j(x)\}_{j=0}^{\infty}$ is a complete orthonormal system of continuous functions in $L_2([t,T])$. Then*

$$J[\psi^{(k)}]_{T,t}^{(i_1\ldots i_k)}=\underset{p_1,\ldots,p_k\to\infty}{\text{l.i.m.}}\sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k}C_{j_k\ldots j_1}\Biggl(\prod_{l=1}^{k}\zeta_{j_l}^{(i_l)}-$$

$$-\ \underset{N\to\infty}{\text{l.i.m.}}\sum_{(l_1,\ldots,l_k)\in\mathrm{G}_k}\phi_{j_1}(\tau_{l_1})\Delta\mathbf{w}_{\tau_{l_1}}^{(i_1)}\ldots\phi_{j_k}(\tau_{l_k})\Delta\mathbf{w}_{\tau_{l_k}}^{(i_k)}\Biggr), \tag{22}$$

where

$$\mathrm{G}_k=\mathrm{H}_k\backslash\mathrm{L}_k,\quad \mathrm{H}_k=\Bigl\{(l_1,\ldots,l_k):\ l_1,\ldots,l_k=0,\ 1,\ldots,N-1\Bigr\},$$

$$\mathrm{L}_k=\Bigl\{(l_1,\ldots,l_k):\ l_1,\ldots,l_k=0,\ 1,\ldots,N-1;\ l_g\ne l_r\ (g\ne r);\ g,r=1,\ldots,k\Bigr\},$$

l.i.m. *is a limit in the mean-square sense*, $i_1,\ldots,i_k=0,1,\ldots,m,$

$$\zeta_j^{(i)}=\int\limits_t^T\phi_j(s)d\mathbf{w}_s^{(i)} \tag{23}$$

are independent standard Gaussian random variables for various i or j (if $i\ne 0$), $C_{j_k\ldots j_1}$ is the Fourier coefficient (20), $\Delta\mathbf{w}_{\tau_j}^{(i)}=\mathbf{w}_{\tau_{j+1}}^{(i)}-\mathbf{w}_{\tau_j}^{(i)}$ $(i=0,\ 1,\ldots,m)$, $\{\tau_j\}_{j=0}^{N}$ *is the discretization of* $[t,T]$, *which satisfies the condition* (21).

Note that in [11]-[24], [32] the version of Theorem 1 for systems of Haar and Rademacher–Walsh functions has been considered. Another version of Theorem 1 related to the application of complete orthonormal with weight $r(t_1)\ldots r(t_k)\ge 0$ systems of functions in $L_2([t,T]^k)$ has been considered in [22]-[24], [44]. A generalization of Theorem 1 to the case of an arbitrary complete orthonormal system of functions $\{\phi_j(x)\}_{j=0}^{\infty}$ in the space $L_2([t,T])$ as well as $\psi_1(\tau),\ldots,\psi_k(\tau)\in L_2([t,T])$ will be considered below (see Theorem 2).

In order to evaluate the significance of Theorem 1 for practice we will demonstrate its transformed particular cases for $k=1,\ldots,5$ [11]-[54] (cases $k=6,\ 7$ and $k>7$ can be found in [12]-[54])

$$J[\psi^{(1)}]_{T,t}^{(i_1)}=\underset{p_1\to\infty}{\text{l.i.m.}}\sum_{j_1=0}^{p_1}C_{j_1}\zeta_{j_1}^{(i_1)}, \tag{24}$$

$$J[\psi^{(2)}]_{T,t}^{(i_1i_2)}=\underset{p_1,p_2\to\infty}{\text{l.i.m.}}\sum_{j_1=0}^{p_1}\sum_{j_2=0}^{p_2}C_{j_2j_1}\Biggl(\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}-\mathbf{1}_{\{i_1=i_2\ne 0\}}\mathbf{1}_{\{j_1=j_2\}}\Biggr), \tag{25}$$

$$J[\psi^{(3)}]_{T,t}^{(i_1 i_2 i_3)} = \underset{p_1,p_2,p_3\to\infty}{\text{l.i.m.}} \sum_{j_1=0}^{p_1}\sum_{j_2=0}^{p_2}\sum_{j_3=0}^{p_3} C_{j_3 j_2 j_1}\Biggl(\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}\zeta_{j_3}^{(i_3)} -$$

$$-\mathbf{1}_{\{i_1=i_2\ne 0\}}\mathbf{1}_{\{j_1=j_2\}}\zeta_{j_3}^{(i_3)} - \mathbf{1}_{\{i_2=i_3\ne 0\}}\mathbf{1}_{\{j_2=j_3\}}\zeta_{j_1}^{(i_1)} - \mathbf{1}_{\{i_1=i_3\ne 0\}}\mathbf{1}_{\{j_1=j_3\}}\zeta_{j_2}^{(i_2)}\Biggr), \tag{26}$$

$$J[\psi^{(4)}]_{T,t}^{(i_1\ldots i_4)} = \underset{p_1,\ldots,p_4\to\infty}{\text{l.i.m.}} \sum_{j_1=0}^{p_1}\ldots\sum_{j_4=0}^{p_4} C_{j_4\ldots j_1}\Biggl(\prod_{l=1}^{4}\zeta_{j_l}^{(i_l)} -$$
$$-\mathbf{1}_{\{i_1=i_2\ne 0\}}\mathbf{1}_{\{j_1=j_2\}}\zeta_{j_3}^{(i_3)}\zeta_{j_4}^{(i_4)} - \mathbf{1}_{\{i_1=i_3\ne 0\}}\mathbf{1}_{\{j_1=j_3\}}\zeta_{j_2}^{(i_2)}\zeta_{j_4}^{(i_4)} -$$
$$-\mathbf{1}_{\{i_1=i_4\ne 0\}}\mathbf{1}_{\{j_1=j_4\}}\zeta_{j_2}^{(i_2)}\zeta_{j_3}^{(i_3)} - \mathbf{1}_{\{i_2=i_3\ne 0\}}\mathbf{1}_{\{j_2=j_3\}}\zeta_{j_1}^{(i_1)}\zeta_{j_4}^{(i_4)} -$$
$$-\mathbf{1}_{\{i_2=i_4\ne 0\}}\mathbf{1}_{\{j_2=j_4\}}\zeta_{j_1}^{(i_1)}\zeta_{j_3}^{(i_3)} - \mathbf{1}_{\{i_3=i_4\ne 0\}}\mathbf{1}_{\{j_3=j_4\}}\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)} +$$
$$+\mathbf{1}_{\{i_1=i_2\ne 0\}}\mathbf{1}_{\{j_1=j_2\}}\mathbf{1}_{\{i_3=i_4\ne 0\}}\mathbf{1}_{\{j_3=j_4\}} +$$
$$+\mathbf{1}_{\{i_1=i_3\ne 0\}}\mathbf{1}_{\{j_1=j_3\}}\mathbf{1}_{\{i_2=i_4\ne 0\}}\mathbf{1}_{\{j_2=j_4\}} +$$
$$+\mathbf{1}_{\{i_1=i_4\ne 0\}}\mathbf{1}_{\{j_1=j_4\}}\mathbf{1}_{\{i_2=i_3\ne 0\}}\mathbf{1}_{\{j_2=j_3\}}\Biggr), \tag{27}$$

$$J[\psi^{(5)}]_{T,t}^{(i_1\ldots i_5)} = \underset{p_1,\ldots,p_5\to\infty}{\text{l.i.m.}} \sum_{j_1=0}^{p_1}\ldots\sum_{j_5=0}^{p_5} C_{j_5\ldots j_1}\Biggl(\prod_{l=1}^{5}\zeta_{j_l}^{(i_l)} -$$
$$-\mathbf{1}_{\{i_1=i_2\ne 0\}}\mathbf{1}_{\{j_1=j_2\}}\zeta_{j_3}^{(i_3)}\zeta_{j_4}^{(i_4)}\zeta_{j_5}^{(i_5)} - \mathbf{1}_{\{i_1=i_3\ne 0\}}\mathbf{1}_{\{j_1=j_3\}}\zeta_{j_2}^{(i_2)}\zeta_{j_4}^{(i_4)}\zeta_{j_5}^{(i_5)} -$$
$$-\mathbf{1}_{\{i_1=i_4\ne 0\}}\mathbf{1}_{\{j_1=j_4\}}\zeta_{j_2}^{(i_2)}\zeta_{j_3}^{(i_3)}\zeta_{j_5}^{(i_5)} - \mathbf{1}_{\{i_1=i_5\ne 0\}}\mathbf{1}_{\{j_1=j_5\}}\zeta_{j_2}^{(i_2)}\zeta_{j_3}^{(i_3)}\zeta_{j_4}^{(i_4)} -$$
$$-\mathbf{1}_{\{i_2=i_3\ne 0\}}\mathbf{1}_{\{j_2=j_3\}}\zeta_{j_1}^{(i_1)}\zeta_{j_4}^{(i_4)}\zeta_{j_5}^{(i_5)} - \mathbf{1}_{\{i_2=i_4\ne 0\}}\mathbf{1}_{\{j_2=j_4\}}\zeta_{j_1}^{(i_1)}\zeta_{j_3}^{(i_3)}\zeta_{j_5}^{(i_5)} -$$
$$-\mathbf{1}_{\{i_2=i_5\ne 0\}}\mathbf{1}_{\{j_2=j_5\}}\zeta_{j_1}^{(i_1)}\zeta_{j_3}^{(i_3)}\zeta_{j_4}^{(i_4)} - \mathbf{1}_{\{i_3=i_4\ne 0\}}\mathbf{1}_{\{j_3=j_4\}}\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}\zeta_{j_5}^{(i_5)} -$$
$$-\mathbf{1}_{\{i_3=i_5\ne 0\}}\mathbf{1}_{\{j_3=j_5\}}\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}\zeta_{j_4}^{(i_4)} - \mathbf{1}_{\{i_4=i_5\ne 0\}}\mathbf{1}_{\{j_4=j_5\}}\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}\zeta_{j_3}^{(i_3)} +$$
$$+\mathbf{1}_{\{i_1=i_2\ne 0\}}\mathbf{1}_{\{j_1=j_2\}}\mathbf{1}_{\{i_3=i_4\ne 0\}}\mathbf{1}_{\{j_3=j_4\}}\zeta_{j_5}^{(i_5)} + \mathbf{1}_{\{i_1=i_2\ne 0\}}\mathbf{1}_{\{j_1=j_2\}}\mathbf{1}_{\{i_3=i_5\ne 0\}}\mathbf{1}_{\{j_3=j_5\}}\zeta_{j_4}^{(i_4)} +$$
$$+\mathbf{1}_{\{i_1=i_2\ne 0\}}\mathbf{1}_{\{j_1=j_2\}}\mathbf{1}_{\{i_4=i_5\ne 0\}}\mathbf{1}_{\{j_4=j_5\}}\zeta_{j_3}^{(i_3)} + \mathbf{1}_{\{i_1=i_3\ne 0\}}\mathbf{1}_{\{j_1=j_3\}}\mathbf{1}_{\{i_2=i_4\ne 0\}}\mathbf{1}_{\{j_2=j_4\}}\zeta_{j_5}^{(i_5)} +$$
$$+\mathbf{1}_{\{i_1=i_3\ne 0\}}\mathbf{1}_{\{j_1=j_3\}}\mathbf{1}_{\{i_2=i_5\ne 0\}}\mathbf{1}_{\{j_2=j_5\}}\zeta_{j_4}^{(i_4)} + \mathbf{1}_{\{i_1=i_3\ne 0\}}\mathbf{1}_{\{j_1=j_3\}}\mathbf{1}_{\{i_4=i_5\ne 0\}}\mathbf{1}_{\{j_4=j_5\}}\zeta_{j_2}^{(i_2)} +$$
$$+\mathbf{1}_{\{i_1=i_4\ne 0\}}\mathbf{1}_{\{j_1=j_4\}}\mathbf{1}_{\{i_2=i_3\ne 0\}}\mathbf{1}_{\{j_2=j_3\}}\zeta_{j_5}^{(i_5)} + \mathbf{1}_{\{i_1=i_4\ne 0\}}\mathbf{1}_{\{j_1=j_4\}}\mathbf{1}_{\{i_2=i_5\ne 0\}}\mathbf{1}_{\{j_2=j_5\}}\zeta_{j_3}^{(i_3)} +$$
$$+\mathbf{1}_{\{i_1=i_4\ne 0\}}\mathbf{1}_{\{j_1=j_4\}}\mathbf{1}_{\{i_3=i_5\ne 0\}}\mathbf{1}_{\{j_3=j_5\}}\zeta_{j_2}^{(i_2)} + \mathbf{1}_{\{i_1=i_5\ne 0\}}\mathbf{1}_{\{j_1=j_5\}}\mathbf{1}_{\{i_2=i_3\ne 0\}}\mathbf{1}_{\{j_2=j_3\}}\zeta_{j_4}^{(i_4)} +$$
$$+\mathbf{1}_{\{i_1=i_5\ne 0\}}\mathbf{1}_{\{j_1=j_5\}}\mathbf{1}_{\{i_2=i_4\ne 0\}}\mathbf{1}_{\{j_2=j_4\}}\zeta_{j_3}^{(i_3)} + \mathbf{1}_{\{i_1=i_5\ne 0\}}\mathbf{1}_{\{j_1=j_5\}}\mathbf{1}_{\{i_3=i_4\ne 0\}}\mathbf{1}_{\{j_3=j_4\}}\zeta_{j_2}^{(i_2)} +$$
$$+\mathbf{1}_{\{i_2=i_3\ne 0\}}\mathbf{1}_{\{j_2=j_3\}}\mathbf{1}_{\{i_4=i_5\ne 0\}}\mathbf{1}_{\{j_4=j_5\}}\zeta_{j_1}^{(i_1)} + \mathbf{1}_{\{i_2=i_4\ne 0\}}\mathbf{1}_{\{j_2=j_4\}}\mathbf{1}_{\{i_3=i_5\ne 0\}}\mathbf{1}_{\{j_3=j_5\}}\zeta_{j_1}^{(i_1)} +$$
$$+\mathbf{1}_{\{i_2=i_5\ne 0\}}\mathbf{1}_{\{j_2=j_5\}}\mathbf{1}_{\{i_3=i_4\ne 0\}}\mathbf{1}_{\{j_3=j_4\}}\zeta_{j_1}^{(i_1)}\Biggr), \tag{28}$$

where $\mathbf{1}_A$ is the indicator of the set A.

Consider the generalization of (24)–(28) for the case of an arbitrary k ($k \in \mathbb{N}$) as well as for the case of an arbitrary complete orthonormal system of functions $\{\phi_j(x)\}_{j=0}^{\infty}$ in the space $L_2([t,T])$ and $\psi_1(\tau),\ldots,\psi_k(\tau) \in L_2([t,T])$.

In order to do this, let us consider the unordered set $\{1,2,\ldots,k\}$ and separate it into two parts: the first part consists of r unordered pairs (sequence order of these pairs is also unimportant) and the second one consists of the remaining $k-2r$ numbers. So, we have

$$(\{\underbrace{\{g_1,g_2\},\ldots,\{g_{2r-1},g_{2r}\}}_{\text{part 1}}\},\underbrace{\{q_1,\ldots,q_{k-2r}\}}_{\text{part 2}}), \tag{29}$$

where $\{g_1,g_2,\ldots,g_{2r-1},g_{2r},q_1,\ldots,q_{k-2r}\}=\{1,2,\ldots,k\}$, braces mean an unordered set and parentheses mean an ordered set.

We will say that (29) is a partition and consider the sum with respect to all possible partitions

$$\sum_{\substack{(\{\{g_1,g_2\},\ldots,\{g_{2r-1},g_{2r}\}\},\{q_1,\ldots,q_{k-2r}\})\\ \{g_1,g_2,\ldots,g_{2r-1},g_{2r},q_1,\ldots,q_{k-2r}\}=\{1,2,\ldots,k\}}} a_{g_1g_2,\ldots,g_{2r-1}g_{2r},q_1\ldots q_{k-2r}}. \tag{30}$$

Theorem 2 [23] (Sect. 1.11), [32] (Sect. 15). *Suppose that $\{\phi_j(x)\}_{j=0}^{\infty}$ is an arbitrary complete orthonormal system of functions in the space $L_2([t,T])$ and $\psi_1(\tau),\ldots,\psi_k(\tau) \in L_2([t,T])$. Then the following expansion*

$$J[\psi^{(k)}]_{T,t}^{(i_1\ldots i_k)} = \underset{p_1,\ldots,p_k\to\infty}{\text{l.i.m.}} \sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k} C_{j_k\ldots j_1}\Biggl(\prod_{l=1}^{k}\zeta_{j_l}^{(i_l)} + \sum_{r=1}^{[k/2]}(-1)^r \times$$

$$\times \sum_{\substack{(\{\{g_1,g_2\},\ldots,\{g_{2r-1},g_{2r}\}\},\{q_1,\ldots,q_{k-2r}\})\\ \{g_1,g_2,\ldots,g_{2r-1},g_{2r},q_1,\ldots,q_{k-2r}\}=\{1,2,\ldots,k\}}} \prod_{s=1}^{r}\mathbf{1}_{\{i_{g_{2s-1}}=\,i_{g_{2s}}\neq 0\}}\mathbf{1}_{\{j_{g_{2s-1}}=\,j_{g_{2s}}\}}\prod_{l=1}^{k-2r}\zeta_{j_{q_l}}^{(i_{q_l})}\Biggr) \tag{31}$$

converging in the mean-square sense is valid, where $[x]$ is an integer part of a real number x; another notations are the same as in Theorem 1.

In particular, from (31) for $k=5$ we obtain

$$J[\psi^{(5)}]_{T,t}^{(i_1\ldots i_5)} = \underset{p_1,\ldots,p_5\to\infty}{\text{l.i.m.}} \sum_{j_1=0}^{p_1}\ldots\sum_{j_5=0}^{p_5} C_{j_5\ldots j_1}\Biggl(\prod_{l=1}^{5}\zeta_{j_l}^{(i_l)} -$$

$$- \sum_{\substack{(\{g_1,g_2\},\{q_1,q_2,q_3\})\\ \{g_1,g_2,q_1,q_2,q_3\}=\{1,2,3,4,5\}}} \mathbf{1}_{\{i_{g_1}=\,i_{g_2}\neq 0\}}\mathbf{1}_{\{j_{g_1}=\,j_{g_2}\}}\prod_{l=1}^{3}\zeta_{j_{q_l}}^{(i_{q_l})} +$$

$$+ \sum_{\substack{(\{\{g_1,g_2\},\{g_3,g_4\}\},\{q_1\})\\ \{g_1,g_2,g_3,g_4,q_1\}=\{1,2,3,4,5\}}} \mathbf{1}_{\{i_{g_1}=\,i_{g_2}\neq 0\}}\mathbf{1}_{\{j_{g_1}=\,j_{g_2}\}}\mathbf{1}_{\{i_{g_3}=\,i_{g_4}\neq 0\}}\mathbf{1}_{\{j_{g_3}=\,j_{g_4}\}}\zeta_{j_{q_1}}^{(i_{q_1})}\Biggr).$$

The last equality obviously agrees with (28). Note that the correctness of formulas (24)–(28) can be verified by the fact that if $i_1 = \ldots = i_5 = i = 1, \ldots, m$ and $\psi_1(s), \ldots, \psi_6(s) \equiv \psi(s)$, then we can derive from (24)–(28) the well known equalities (the cases $k = 2, 3$ were discussed in details in [12]-[24], [32])

$$J[\psi^{(1)}]_{T,t}^{(i)} = \frac{1}{1!}\delta_{T,t}^{(i)},$$

$$J[\psi^{(2)}]_{T,t}^{(ii)} = \frac{1}{2!}\left(\left(\delta_{T,t}^{(i)}\right)^2 - \Delta_{T,t}\right),$$

$$J[\psi^{(3)}]_{T,t}^{(iii)} = \frac{1}{3!}\left(\left(\delta_{T,t}^{(i)}\right)^3 - 3\delta_{T,t}^{(i)}\Delta_{T,t}\right),$$

$$J[\psi^{(4)}]_{T,t}^{(iiii)} = \frac{1}{4!}\left(\left(\delta_{T,t}^{(i)}\right)^4 - 6\left(\delta_{T,t}^{(i)}\right)^2\Delta_{T,t} + 3\Delta_{T,t}^2\right),$$

$$J[\psi^{(5)}]_{T,t}^{(iiiii)} = \frac{1}{5!}\left(\left(\delta_{T,t}^{(i)}\right)^5 - 10\left(\delta_{T,t}^{(i)}\right)^3\Delta_{T,t} + 15\delta_{T,t}^{(i)}\Delta_{T,t}^2\right)$$

w. p. 1, where

$$\delta_{T,t}^{(i)} = \int\limits_t^T \psi(s)d\mathbf{w}_s^{(i)}, \quad \Delta_{T,t} = \int\limits_t^T \psi^2(s)ds.$$

The above equalities can be independently obtained using the Itô formula and Hermite polynomials [61].

Assume that $J[\psi^{(k)}]_{T,t}^{(i_1\ldots i_k)p_1\ldots p_k}$ is an approximation of the stochastic integral (17), which is the expression on the right-hand side of (31) before passing to the limit $\underset{p_1,\ldots,p_k\to\infty}{\text{l.i.m.}}$. Let us denote

$$E^{(i_1\ldots i_k)p_1,\ldots,p_k} = \mathsf{M}\left\{\left(J[\psi^{(k)}]_{T,t}^{(i_1\ldots i_k)} - J[\psi^{(k)}]_{T,t}^{(i_1\ldots i_k)p_1,\ldots,p_k}\right)^2\right\},$$

$$I_k = \|K\|_{L_2([t,T]^k)}^2 = \int\limits_{[t,T]^k} K^2(t_1,\ldots,t_k)dt_1\ldots dt_k, \qquad E^{(i_1\ldots i_k)p_1,\ldots,p_k}\Big|_{p_1=\ldots=p_k=p} \stackrel{\mathsf{def}}{=} E^{(i_1\ldots i_k)p}. \tag{32}$$

In [21], [22]-[24], [32], [34] it was shown that

$$E_k^{(i_1\ldots i_k)p_1,\ldots,p_k} \le k!\left(I_k - \sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k} C_{j_k\ldots j_1}^2\right), \tag{33}$$

where $i_1, \ldots, i_k = 1, \ldots, m$ for $0 < T - t < \infty$ and $i_1, \ldots, i_k = 0, 1, \ldots, m$ for $0 < T - t < 1$. Note that the estimate (33) is valid under the conditions of Theorem 2.

Let us consider some approximations of iterated Itô stochastic integrals using Theorems 1, 2 and multiple Fourier–Legendre series.

The complete orthonormal system of Legendre polynomials in the space $L_2([t,T])$ looks as follows

$$\phi_j(x)=\sqrt{\frac{2j+1}{T-t}}P_j\left(\left(x-\frac{T+t}{2}\right)\frac{2}{T-t}\right),\quad j=0,1,2,\ldots, \tag{34}$$

where $P_j(x)$ is the Legendre polynomial.

Using the system of functions (34) and Theorems 1, 2 we obtain the following approximations of iterated Itô stochastic integrals [9]-[58] (also see early publications [62] (1997), [63] (1998), [64] (2000))

$$I_{(1)T,t}^{(i_1)}=\sqrt{T-t}\zeta_0^{(i_1)}, \tag{35}$$

$$I_{(01)T,t}^{(0i_1)}=\frac{(T-t)^{3/2}}{2}\left(\zeta_0^{(i_1)}+\frac{1}{\sqrt{3}}\zeta_1^{(i_1)}\right), \tag{36}$$

$$I_{(10)T,t}^{(i_10)}=\frac{(T-t)^{3/2}}{2}\left(\zeta_0^{(i_1)}-\frac{1}{\sqrt{3}}\zeta_1^{(i_1)}\right), \tag{37}$$

$$I_{(11)T,t}^{(i_1i_2)q}=\frac{T-t}{2}\left(\zeta_0^{(i_1)}\zeta_0^{(i_2)}+\sum_{i=1}^{q}\frac{1}{\sqrt{4i^2-1}}\left(\zeta_{i-1}^{(i_1)}\zeta_i^{(i_2)}-\zeta_i^{(i_1)}\zeta_{i-1}^{(i_2)}\right)-\mathbf{1}_{\{i_1=i_2\}}\right), \tag{38}$$

$$I_{(111)T,t}^{(i_1i_2i_3)q_1}=\sum_{j_1,j_2,j_3=0}^{q_1}C_{j_3j_2j_1}\Biggl(\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}\zeta_{j_3}^{(i_3)}-\mathbf{1}_{\{i_1=i_2\}}\mathbf{1}_{\{j_1=j_2\}}\zeta_{j_3}^{(i_3)}-$$

$$-\mathbf{1}_{\{i_2=i_3\}}\mathbf{1}_{\{j_2=j_3\}}\zeta_{j_1}^{(i_1)}-\mathbf{1}_{\{i_1=i_3\}}\mathbf{1}_{\{j_1=j_3\}}\zeta_{j_2}^{(i_2)}\Biggr), \tag{39}$$

$$I_{(111)T,t}^{(i_1i_1i_1)}=\frac{1}{6}(T-t)^{3/2}\left(\left(\zeta_0^{(i_1)}\right)^3-3\zeta_0^{(i_1)}\right),$$

$$C_{j_3j_2j_1}=\frac{\sqrt{(2j_1+1)(2j_2+1)(2j_3+1)}(T-t)^{3/2}}{8}\bar{C}_{j_3j_2j_1},$$

$$\bar{C}_{j_3j_2j_1}=\int\limits_{-1}^{1}P_{j_3}(z)\int\limits_{-1}^{z}P_{j_2}(y)\int\limits_{-1}^{y}P_{j_1}(x)dxdydz,$$

Table 1. Minimal numbers q, q_1 such that $E^{(i_1 i_2)q}$, $E^{(i_1 i_2 i_3)q_1} \le (T-t)^4$, $\quad q_1 \ll q$.

$T-t$	0.08222	0.05020	0.02310	0.01956
q	19	51	235	328
q_1	1	2	5	6

Table 2. Coefficients $\bar{C}_{3jk}$.

$j \backslash k$	0	1	2	3	4	5	6
0	0	$\frac{2}{105}$	0	$-\frac{4}{315}$	0	$\frac{2}{693}$	0
1	$\frac{4}{105}$	0	$-\frac{2}{315}$	0	$-\frac{8}{3465}$	0	$\frac{10}{9009}$
2	$\frac{2}{35}$	$-\frac{2}{105}$	0	$\frac{4}{3465}$	0	$-\frac{74}{45045}$	0
3	$\frac{2}{315}$	0	$-\frac{2}{3465}$	0	$\frac{16}{45045}$	0	$-\frac{10}{9009}$
4	$-\frac{2}{63}$	$\frac{46}{3465}$	0	$-\frac{32}{45045}$	0	$\frac{2}{9009}$	0
5	$-\frac{10}{693}$	0	$\frac{38}{9009}$	0	$-\frac{4}{9009}$	0	$\frac{122}{765765}$
6	0	$-\frac{10}{3003}$	0	$\frac{20}{9009}$	0	$-\frac{226}{765765}$	0

standard Gaussian random variables $\zeta_j^{(i)}$ $(i \ne 0)$ are defined by (23), and

$$I_{(11)T,t}^{(i_1 i_2)} = \underset{q\to\infty}{\text{l.i.m.}}\ I_{(11)T,t}^{(i_1 i_2)q},$$

$$I_{(111)T,t}^{(i_1 i_2 i_3)} = \underset{q_1\to\infty}{\text{l.i.m.}}\ I_{(111)T,t}^{(i_1 i_2 i_3)q_1}.$$

Note that $T-t \ll 1$ ($T-t$ is an integration step with respect to the temporal variable). Thus $q_1 \ll q$ (see Table 1 [9]-[24], [35]). Moreover, the values $\bar{C}_{j_3 j_2 j_1}$ do not depend on $T-t$. This feature is important because we can use a variable integration step $T-t$. Coefficients $\bar{C}_{j_3 j_2 j_1}$ are calculated once and before the start of the numerical scheme. Some examples of exact calculation of coefficients $\bar{C}_{j_3 j_2 j_1}$ via Python programming language can be found in Table 2 (the database with 270,000 exactly calculated Fourier–Legendre coefficients was described in [55], [56]).

According to the notations introduced above, we have

$$E^{(i_1 i_2)q} = \mathsf{M}\left\{\left(I_{(11)T,t}^{(i_1 i_2)} - I_{(11)T,t}^{(i_1 i_2)q}\right)^2\right\},$$

$$E^{(i_1 i_2 i_3)q_1} = \mathsf{M}\left\{\left(I_{(111)T,t}^{(i_1 i_2 i_3)} - I_{(111)T,t}^{(i_1 i_2 i_3)q_1}\right)^2\right\}.$$

Then for pairwise different $i_1, i_2, i_3 = 1, \ldots, m$ we obtain [9]-[24], [34]

$$E^{(i_1 i_2)q} = \frac{(T-t)^2}{2}\left(\frac{1}{2} - \sum_{i=1}^{q} \frac{1}{4i^2-1}\right), \tag{40}$$

$$E^{(i_1 i_2 i_3)q_1} = \frac{(T-t)^3}{6} - \sum_{j_1,j_2,j_3=0}^{q_1} C^2_{j_3 j_2 j_1}. \qquad (41)$$

On the basis of the presented approximations of iterated Itô stochastic integrals we can see that increasing of multiplicities of these integrals leads to increasing of orders of smallness with respect to $T-t$ $(T-t \ll 1)$ in the mean-square sense for iterated Itô stochastic integrals. This leads to sharp decrease of member quantities in the approximations of iterated Itô stochastic integrals, which are required for achieving the acceptable accuracy of approximation $(q_1 \ll q)$.

From (41) we obtain [9]-[24], [35], [54] (for more details see [55]-[58])

$$E^{(i_1 i_2 i_3)q_1}\Big|_{q_1=6} \approx 0.01956000(T-t)^3. \qquad (42)$$

4. Approximation of Iterated Stochastic Integrals of Multiplicity k with Respect to the Q-Wiener Process

Consider the iterated Itô stochastic integral with respect to the Q-Wiener process in the following form

$$I[\Phi^{(k)}(Z), \psi^{(k)}]_{T,t} =$$

$$= \int_t^T \Phi_k(Z)\left(\ldots\left(\int_t^{t_3} \Phi_2(Z)\left(\int_t^{t_2} \Phi_1(Z)\psi_1(t_1)d\mathbf{W}_{t_1}\right)\psi_2(t_2)d\mathbf{W}_{t_2}\right)\ldots\right)\psi_k(t_k)d\mathbf{W}_{t_k}, \qquad (43)$$

where $Z: \Omega \to H$ is an $\mathbf{F}_t/\mathcal{B}(H)$-measurable mapping, $\Phi_k(v)(\ \ldots(\Phi_2(v)(\Phi_1(v)))\ldots\ )$ is a k-linear Hilbert–Schmidt operator mapping from $\underbrace{U_0 \times \ldots \times U_0}_{k \text{ times}}$ to H for all $v \in H$, and $\psi_1(\tau), \ldots, \psi_k(\tau) \in L_2([t,T])$.

Let $I[\Phi^{(k)}(Z), \psi^{(k)}]^M_{T,t}$ be an approximation of the stochastic integral (43)

$$I[\Phi^{(k)}(Z), \psi^{(k)}]^M_{T,t} =$$

$$= \int_t^T \Phi_k(Z)\left(\ldots\left(\int_t^{t_3} \Phi_2(Z)\left(\int_t^{t_2} \Phi_1(Z)\psi_1(t_1)d\mathbf{W}^M_{t_1}\right)\psi_2(t_2)d\mathbf{W}^M_{t_2}\right)\ldots\right)\psi_k(t_k)d\mathbf{W}^M_{t_k} =$$

$$= \sum_{r_1,r_2,\ldots,r_k \in J_M} \Phi_k(Z)\left(\ldots\left(\Phi_2(Z)\left(\Phi_1(Z)e_{r_1}\right)e_{r_2}\right)\ldots\right)e_{r_k} \times$$

$$\times \sqrt{\lambda_{r_1}\lambda_{r_2}\ldots\lambda_{r_k}}\ J[\psi^{(k)}]^{(r_1 r_2 \ldots r_k)}_{T,t}, \qquad (44)$$

where $0 \le t < T \le \bar{T}$ and

$$J[\psi^{(k)}]_{T,t}^{(r_1\ldots r_k)} = \int\limits_t^T \psi_k(t_k)\ldots \int\limits_t^{t_3} \psi_2(t_2)\int\limits_t^{t_2} \psi_1(t_1)d\mathbf{w}_{t_1}^{(r_1)}d\mathbf{w}_{t_2}^{(r_2)}\ldots d\mathbf{w}_{t_k}^{(r_k)}$$

is the iterated Itô stochastic integral (17), $r_1, r_2, \ldots, r_k \in J_M$.

Let $I[\Phi^{(k)}(Z), \psi^{(k)}]_{T,t}^{M,p_1\ldots,p_k}$ be an approximation of the stochastic integral (44)

$$I[\Phi^{(k)}(Z), \psi^{(k)}]_{T,t}^{M,p_1\ldots,p_k} = \sum_{r_1,r_2,\ldots,r_k\in J_M} \Phi_k(Z)\left(\ldots\left(\Phi_2(Z)\left(\Phi_1(Z)e_{r_1}\right)e_{r_2}\right)\ldots\right)e_{r_k}\times$$

$$\times\sqrt{\lambda_{r_1}\lambda_{r_2}\ldots\lambda_{r_k}}\ J[\psi^{(k)}]_{T,t}^{(r_1r_2\ldots r_k)p_1,\ldots,p_k}, \tag{45}$$

where $J[\psi^{(k)}]_{T,t}^{(r_1r_2\ldots r_k)p_1,\ldots,p_k}$ is defined as a prelimit expression on the right-hand side of (31)

$$J[\psi^{(k)}]_{T,t}^{(r_1\ldots r_k)p_1\ldots p_k} = \sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k} C_{j_k\ldots j_1}\left(\prod_{l=1}^{k}\zeta_{j_l}^{(r_l)} + \sum_{m=1}^{[k/2]}(-1)^m\times\right.$$

$$\left.\times \sum_{\substack{(\{\{g_1,g_2\},\ldots,\{g_{2m-1},g_{2m}\}\},\{q_1,\ldots,q_{k-2m}\})\\ \{g_1,g_2,\ldots,g_{2m-1},g_{2m},q_1,\ldots,q_{k-2m}\}=\{1,2,\ldots,k\}}} \prod_{s=1}^{m}\mathbf{1}_{\{r_{g_{2s-1}}=\ r_{g_{2s}}\neq 0\}}\mathbf{1}_{\{j_{g_{2s-1}}=\ j_{g_{2s}}\}}\prod_{l=1}^{k-2m}\zeta_{j_{q_l}}^{(r_{q_l})}\right). \tag{46}$$

Let U, H be separable $\mathbb{R}$-Hilbert spaces, $U_0 = Q^{1/2}(U)$, and $L(U,H)$ be the space of linear and bounded operators mapping from U to H. Let $L(U,H)_0 = \{T|_{U_0} :\ T \in L(U,H)\}$ (here $T|_{U_0}$ is the restriction of operator T to the space U_0). It is known [7] that $L(U,H)_0$ is a dense subset of the space of Hilbert–Schmidt operators $L_{HS}(U_0,H)$.

Theorem 3 [9], [10], [23]-[25]. *Suppose that $\{\phi_j(x)\}_{j=0}^{\infty}$ is an arbitrary complete orthonormal system of functions in the space $L_2([t,T])$ and $\psi_1(\tau),\ldots,\psi_k(\tau) \in L_2([t,T])$. Furthermore, let the following conditions be satisfied*:

1. *$Q \in L(U)$ is a nonnegative and symmetric trace class operator (λ_i and e_i ($i \in J$) are its eigenvalues and eigenfunctions (which form an orthonormal basis of U) correspondingly), and $\mathbf{W}_\tau$, $\tau \in [0,\bar{T}]$ is an U-valued Q-Wiener process.*
2. *$Z : \Omega \to H$ is an $\mathbf{F}_t/\mathcal{B}(H)$-measurable mapping.*
3. *$\Phi_1 \in L(U,H)_0$, $\Phi_2 \in L(H, L(U,H)_0)$, and $\Phi_k(v)(\ \ldots(\Phi_2(v)(\Phi_1(v)))\ldots\ )$ is a k-linear Hilbert–Schmidt operator mapping from $\underbrace{U_0\times\ldots\times U_0}_{k\ \text{times}}$ to H for all $v \in H$ such that*

$$\left\|\Phi_k(Z)\left(\ldots\left(\Phi_2(Z)\left(\Phi_1(Z)e_{r_1}\right)e_{r_2}\right)\ldots\right)e_{r_k}\right\|_H^2 \le L_k < \infty$$

w. p. 1 for all $r_1, r_2, \ldots, r_k \in J_M$, $M \in \mathbb{N}$. Then

$$
\mathsf{M}\left\{\left\|I[\Phi^{(k)}(Z),\psi^{(k)}]_{T,t}^{M}-I[\Phi^{(k)}(Z),\psi^{(k)}]_{T,t}^{M,p_1\ldots p_k}\right\|_H^2\right\}\le
$$

$$
\le L_k(k!)^2\left(\text{tr }Q\right)^k\left(I_k-\sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k}C_{j_k\ldots j_1}^2\right), \tag{47}
$$

where I_k *is defined by* (32), $\text{tr }Q=\sum\limits_{i\in J}\lambda_i$, *and*

$$
C_{j_k\ldots j_1}=\int\limits_{[t,T]^k}K(t_1,\ldots,t_k)\prod_{l=1}^{k}\phi_{j_l}(t_l)dt_1\ldots dt_k,
$$

$$
K(t_1,\ldots,t_k)=\begin{cases}\psi_1(t_1)\ldots\psi_k(t_k),\ t_1<\ldots<t_k\\ \\ 0,\ \text{otherwise}\end{cases}.
$$

Remark 2. *It should be noted that the right-hand side of the inequality* (47) *is independent of* M *and tends to zero if* $p_1,\ldots,p_k\to\infty$ *due to the Parseval equality.*

5. Approximation of Iterated Stochastic Integrals From the Exponential Milstein and Wagner–Platen Schemes for SPDEs

This section is devoted to the approximation of iterated stochastic integrals from the Milstein scheme (5) and Wagner–Platen scheme (6) for SPDEs. These integrals have the following form

$$
J_1[B(Z)]_{T,t}=\int\limits_t^T B(Z)d\mathbf{W}_s, \tag{48}
$$

$$
J_2[B(Z)]_{T,t}=A\left(\int\limits_t^T\int\limits_t^s B(Z)d\mathbf{W}_\tau ds-\frac{(T-t)}{2}\int\limits_t^T B(Z)d\mathbf{W}_s\right), \tag{49}
$$

$$
J_3[B(Z),F(Z)]_{T,t}=\int\limits_t^T B'(Z)\left(\int\limits_t^{t_2}\Bigl(AZ+F(Z)\Bigr)dt_1\right)d\mathbf{W}_{t_2}, \tag{50}
$$

$$
J_4[B(Z),F(Z)]_{T,t}=\int\limits_t^T F'(Z)\left(\int\limits_t^{t_2}B(Z)d\mathbf{W}_{t_1}\right)dt_2, \tag{51}
$$

$$I_1[B(Z)]_{T,t} = \int\limits_t^T B'(Z)\left(\int\limits_t^s B(Z)d\mathbf{W}_\tau\right)d\mathbf{W}_s, \tag{52}$$

$$I_2[B(Z)]_{T,t} = \int\limits_t^T B'(Z)\left(\int\limits_t^{t_3} B'(Z)\left(\int\limits_t^{t_2} B(Z)d\mathbf{W}_{t_1}\right)d\mathbf{W}_{t_2}\right)d\mathbf{W}_{t_3}, \tag{53}$$

$$I_3[B(Z)]_{T,t} = \int\limits_t^T B''(Z)\left(\int\limits_t^{t_2} B(Z)d\mathbf{W}_{t_1}, \int\limits_t^{t_2} B(Z)d\mathbf{W}_{t_1}\right)d\mathbf{W}_{t_2}, \tag{54}$$

where $Z:\Omega\to H$ is an $\mathbf{F}_t/\mathcal{B}(H)$-measurable mapping, $0\le t<T\le\bar{T}$.

Note that according to (7)–(10), (35), and (36) we can write w. p. 1

$$J_1[B(Z)]_{T,t}^M = \int\limits_t^T B(Z)d\mathbf{W}_s^M = (T-t)^{1/2}\sum_{r_1\in J_M} B(Z)e_{r_1}\sqrt{\lambda_{r_1}}\zeta_0^{(r_1)},$$

$$J_2[B(Z)]_{T,t}^M = A\left(\int\limits_t^T\int\limits_t^s B(Z)d\mathbf{W}_\tau^M ds - \frac{(T-t)}{2}\int\limits_t^T B(Z)d\mathbf{W}_s^M\right) =$$

$$= -\frac{(T-t)^{3/2}}{2\sqrt{3}}\sum_{r_1\in J_M} AB(Z)e_{r_1}\sqrt{\lambda_{r_1}}\zeta_1^{(r_1)}, \tag{55}$$

$$J_3[B(Z),F(Z)]_{T,t}^M = \int\limits_t^T B'(Z)\left(\int\limits_t^{t_2}\Bigl(AZ+F(Z)\Bigr)dt_1\right)d\mathbf{W}_{t_2}^M =$$

$$= \frac{(T-t)^{3/2}}{2}\sum_{r_1\in J_M} B'(Z)\Bigl(AZ+F(Z)\Bigr)e_{r_1}\sqrt{\lambda_{r_1}}\left(\zeta_0^{(r_1)}+\frac{1}{\sqrt{3}}\zeta_1^{(r_1)}\right), \tag{56}$$

$$J_4[B(Z),F(Z)]_{T,t}^M = \int\limits_t^T F'(Z)\left(\int\limits_t^{t_2} B(Z)d\mathbf{W}_{t_1}^M\right)dt_2 =$$

$$= \frac{(T-t)^{3/2}}{2}\sum_{r_1\in J_M} F'(Z)B(Z)e_{r_1}\sqrt{\lambda_{r_1}}\left(\zeta_0^{(r_1)}-\frac{1}{\sqrt{3}}\zeta_1^{(r_1)}\right), \tag{57}$$

where $\zeta_0^{(r_1)}$, $\zeta_1^{(r_1)}$ $(r_1\in J_M)$ are independent standard Gaussian random variables.

Let $I_1[B(Z)]_{T,t}^M$, $I_2[B(Z)]_{T,t}^M$, $I_3[B(Z)]_{T,t}^M$ be approximations of stochastic integrals (52)–(54), which have the following form (see (11), (12), and (16))

$$I_1[B(Z)]_{T,t}^M=\int\limits_t^T B'(Z)\left(\int\limits_t^s B(Z)d\mathbf{W}_\tau^M\right)d\mathbf{W}_s^M=$$

$$=\sum_{r_1,r_2\in J_M}B'(Z)\left(B(Z)e_{r_1}\right)e_{r_2}\sqrt{\lambda_{r_1}\lambda_{r_2}}I_{(11)T,t}^{(r_1r_2)}, \tag{58}$$

$$I_2[B(Z)]_{T,t}^M=\int\limits_t^T B'(Z)\left(\int\limits_t^{t_3} B'(Z)\left(\int\limits_t^{t_2} B(Z)d\mathbf{W}_{t_1}^M\right)d\mathbf{W}_{t_2}^M\right)d\mathbf{W}_{t_3}^M=$$

$$=\sum_{r_1,r_2,r_3\in J_M}B'(Z)\left(B'(Z)\left(B(Z)e_{r_1}\right)e_{r_2}\right)e_{r_3}\sqrt{\lambda_{r_1}\lambda_{r_2}\lambda_{r_3}}I_{(111)T,t}^{(r_1r_2r_3)}, \tag{59}$$

$$I_3[B(Z)]_{T,t}^M=\int\limits_t^T B''(Z)\left(\int\limits_t^{t_2} B(Z)d\mathbf{W}_{t_1}^M,\int\limits_t^{t_2} B(Z)d\mathbf{W}_{t_1}^M\right)d\mathbf{W}_{t_2}^M=$$

$$=\sum_{r_1,r_2,r_3\in J_M}B''(Z)\left(B(Z)e_{r_1},B(Z)e_{r_2}\right)e_{r_3}\sqrt{\lambda_{r_1}\lambda_{r_2}\lambda_{r_3}}\times$$

$$\times\left(I_{(111)T,t}^{(r_1r_2r_3)}+I_{(111)T,t}^{(r_2r_1r_3)}+\mathbf{1}_{\{r_1=r_2\}}I_{(01)T,t}^{(0r_3)}\right). \tag{60}$$

Let $I_1[B(Z)]_{T,t}^{M,q}$, $I_2[B(Z)]_{T,t}^{M,q}$, $I_3[B(Z)]_{T,t}^{M,q}$ be approximations of stochastic integrals (58)–(60), which are represented as follows

$$I_1[B(Z)]_{T,t}^{M,q}=\sum_{r_1,r_2\in J_M}B'(Z)\left(B(Z)e_{r_1}\right)e_{r_2}\sqrt{\lambda_{r_1}\lambda_{r_2}}I_{(11)T,t}^{(r_1r_2)q},$$

$$I_2[B(Z)]_{T,t}^{M,q}=\sum_{r_1,r_2,r_3\in J_M}B'(Z)\left(B'(Z)\left(B(Z)e_{r_1}\right)e_{r_2}\right)e_{r_3}\times$$

$$\times\sqrt{\lambda_{r_1}\lambda_{r_2}\lambda_{r_3}}I_{(111)T,t}^{(r_1r_2r_3)q}, \tag{61}$$

$$I_3[B(Z)]_{T,t}^{M,q}=\sum_{r_1,r_2,r_3\in J_M}B''(Z)\left(B(Z)e_{r_1},B(Z)e_{r_2}\right)e_{r_3}\sqrt{\lambda_{r_1}\lambda_{r_2}\lambda_{r_3}}\times$$

$$\times\left(I_{(111)T,t}^{(r_1r_2r_3)q}+I_{(111)T,t}^{(r_2r_1r_3)q}+\mathbf{1}_{\{r_1=r_2\}}I_{(01)T,t}^{(0r_3)q}\right), \tag{62}$$

where $q\ge 1$ and the approximations $I_{(11)T,t}^{(r_1r_2)q}$, $I_{(111)T,t}^{(r_1r_2r_3)q}$, $I_{(111)T,t}^{(r_2r_1r_3)q}$ are defined by (38), (39).

Recall that $L_{HS}(U_0,H)$ is a space of Hilbert–Schmidt operators mapping from U_0 to H. Let $L_{HS}^{(2)}(U_0,H)$ and $L_{HS}^{(3)}(U_0,H)$ be spaces of bilinear and 3-linear Hilbert–Schmidt operators mapping from $U_0\times U_0$ to H and from $U_0\times U_0\times U_0$ to H correspondingly. Furthermore, let $\|\cdot\|_{L_{HS}(U_0,H)}$, $\|\cdot\|_{L_{HS}^{(2)}(U_0,H)}$, and $\|\cdot\|_{L_{HS}^{(3)}(U_0,H)}$ be operator norms in these spaces.

Theorem 4 [59] (also see [23]-[25], [60]). *Let the conditions* 1, 2 *of Theorem* 3 *be fulfilled. Let* $B(v)$ *be a Hilbert–Schmidt operator mapping from* U_0 *to* H *for all* $v\in H$, $B'(v)(B(v))$ *be a bilinear Hilbert–Schmidt operator mapping from* $U_0\times U_0$ *to* H *for all* $v\in H$, *and* $B'(v)(B'(v)(B(v)))$, $B''(v)(B(v),B(v))$ *be* 3*-linear Hilbert–Schmidt operators mapping from* $U_0\times U_0\times U_0$ *to* H *for all* $v\in H$ (*we suppose that Frêchet derivatives* B', B'' *exist* (*see Sect.* 2)). *Moreover, let there exists a constant* C *such that w. p.* 1

$$\left\|B(Z)Q^{-\alpha}\right\|_{L_{HS}(U_0,H)}<C,\quad \left\|B'(Z)(B(Z))Q^{-\alpha}\right\|_{L_{HS}^{(2)}(U_0,H)}<C$$

$$\left\|B'(Z)(B'(Z)(B(Z)))Q^{-\alpha}\right\|_{L_{HS}^{(3)}(U_0,H)}<C,$$

$$\left\|B''(Z)(B(Z),B(Z))Q^{-\alpha}\right\|_{L_{HS}^{(3)}(U_0,H)}<C,$$

for some $\alpha>0$. *Then*

$$\mathsf{M}\left\{\left\|I_1[B(Z)]_{T,t}-I_1[B(Z)]_{T,t}^{M,q}\right\|_H^2\right\}\le$$

$$\le (T-t)^2\left(C_0\,(\text{tr }Q)^2\left(\frac{1}{2}-\sum_{j=1}^{q}\frac{1}{4j^2-1}\right)+K_Q\left(\sup_{i\in J\backslash J_M}\lambda_i\right)^{2\alpha}\right), \tag{63}$$

$$\mathsf{M}\left\{\left\|I_2[B(Z)]_{T,t}-I_2[B(Z)]_{T,t}^{M,q}\right\|_H^2\right\}\le$$

$$\le (T-t)^3\left(C_1\,(\text{tr }Q)^3\left(\frac{1}{6}-\sum_{j_1,j_2,j_3=0}^{q}\hat{C}_{j_3j_2j_1}^2\right)+L_Q\left(\sup_{i\in J\backslash J_M}\lambda_i\right)^{2\alpha}\right), \tag{64}$$

$$\mathsf{M}\left\{\left\|I_3[B(Z)]_{T,t}-I_3[B(Z)]_{T,t}^{M,q}\right\|_H^2\right\}\le$$

$$\le (T-t)^3\left(C_2\,(\mathrm{tr}\ Q)^3\left(\frac{1}{6}-\sum_{j_1,j_2,j_3=0}^{q}\hat{C}_{j_3j_2j_1}^2\right)+M_Q\left(\sup_{i\in J\backslash J_M}\lambda_i\right)^{2\alpha}\right), \tag{65}$$

where $q\in\mathbb{N},\ C_0,C_1,C_2,K_Q,L_Q,M_Q<\infty,$ *and*

$$\hat{C}_{j_3j_2j_1}=\frac{\sqrt{(2j_1+1)(2j_2+1)(2j_3+1)}}{8}\bar{C}_{j_3j_2j_1},$$

$$\bar{C}_{j_3j_2j_1}=\int\limits_{-1}^{1}P_{j_3}(z)\int\limits_{-1}^{z}P_{j_2}(y)\int\limits_{-1}^{y}P_{j_1}(x)dxdydz,$$

where $P_j(x)$ $(j=0,1,2,\ldots)$ *is the Legendre polynomial.*

Remark 3. *Note that the estimate like* (63) *has been derived in* [8] (*also see* [2]) *with the difference connected with the first term on the right-hand side of* (63). *In* [8] *the authors used the Karhunen–Loeve expansion of the Brownian bridge process for the approximation of iterated Itô stochastic integrals with respect to the scalar standard Wiener processes. In this article we apply Theorem* 1 *and the system of Legendre polynomials for obtainment the first term on the right-hand side of* (63).

Proof. The estimate (63) directly follows from Theorem 3 of this article (the first term on the right-hand side of (63)) and Theorem 1 from [8] (the second term on the right-hand side of (63)). Further C_3, C_4, ... denote various constants.

Let us prove the estimates (64), (65). Using the elementary inequality $(a+b)^2\le 2(a^2+b^2)$ and Theorem 3, we obtain

$$\mathsf{M}\left\{\left\|I_2[B(Z)]_{T,t}-I_2[B(Z)]_{T,t}^{M,q}\right\|_H^2\right\}\le$$

$$\le 2\left(\mathsf{M}\left\{\left\|I_2[B(Z)]_{T,t}-I_2[B(Z)]_{T,t}^{M}\right\|_H^2\right\}+\mathsf{M}\left\{\left\|I_2[B(Z)]_{T,t}^{M}-I_2[B(Z)]_{T,t}^{M,q}\right\|_H^2\right\}\right)\le$$

$$\le 2\mathsf{M}\left\{\left\|I_2[B(Z)]_{T,t}-I_2[B(Z)]_{T,t}^{M}\right\|_H^2\right\}+C_3(T-t)^3\,(\mathrm{tr}\ Q)^3\left(\frac{1}{6}-\sum_{j_1,j_2,j_3=0}^{q}\hat{C}_{j_3j_2j_1}^2\right), \tag{66}$$

$$\mathsf{M}\left\{\left\|I_3[B(Z)]_{T,t}-I_3[B(Z)]_{T,t}^{M,q}\right\|_H^2\right\}\le$$

$$\le 2\left(\mathsf{M}\left\{\left\|I_3[B(Z)]_{T,t}-I_3[B(Z)]_{T,t}^{M}\right\|_H^2\right\}+\mathsf{M}\left\{\left\|I_3[B(Z)]_{T,t}^{M}-I_3[B(Z)]_{T,t}^{M,q}\right\|_H^2\right\}\right). \tag{67}$$

Repeating with an insignificant modification the proof of Theorem 3 for the case $k=3$ (see for delails [9] (pp. 39–44) or [10], [23]-[25]), we have

$$\mathsf{M}\left\{\left\|I_3[B(Z)]_{T,t}^{M}-I_3[B(Z)]_{T,t}^{M,q}\right\|_H^2\right\}\le 4C(3!)^2\left(\text{tr }Q\right)^3(T-t)^3\left(\frac{1}{6}-\sum_{j_1,j_2,j_3=0}^{q}\hat{C}_{j_3j_2j_1}^2\right), \tag{68}$$

where constant C has the same meaning as constant L_k in Theorem 3 (k is the multiplicity of the iterated stochastic integral).

Combining (67) and (68), we obtain

$$\mathsf{M}\left\{\left\|I_3[B(Z)]_{T,t}-I_3[B(Z)]_{T,t}^{M,q}\right\|_H^2\right\}\le$$

$$\le 2\mathsf{M}\left\{\left\|I_3[B(Z)]_{T,t}-I_3[B(Z)]_{T,t}^{M}\right\|_H^2\right\}+C_4(T-t)^3\left(\text{tr }Q\right)^3\left(\frac{1}{6}-\sum_{j_1,j_2,j_3=0}^{q}\hat{C}_{j_3j_2j_1}^2\right). \tag{69}$$

Let us evaluate the values

$$\mathsf{M}\left\{\left\|I_2[B(Z)]_{T,t}-I_2[B(Z)]_{T,t}^{M}\right\|_H^2\right\},\quad \mathsf{M}\left\{\left\|I_3[B(Z)]_{T,t}-I_3[B(Z)]_{T,t}^{M}\right\|_H^2\right\}.$$

Using the elementary inequality $(a+b+c)^2\le 3(a^2+b^2+c^2)$, we have

$$\mathsf{M}\left\{\left\|I_2[B(Z)]_{T,t}-I_2[B(Z)]_{T,t}^{M}\right\|_H^2\right\}\le 3\left(E_{T,t}^{1,M}+E_{T,t}^{2,M}+E_{T,t}^{3,M}\right), \tag{70}$$

$$\mathsf{M}\left\{\left\|I_3[B(Z)]_{T,t}-I_3[B(Z)]_{T,t}^{M}\right\|_H^2\right\}\le 3\left(G_{T,t}^{1,M}+G_{T,t}^{2,M}+G_{T,t}^{3,M}\right), \tag{71}$$

where

$$E_{T,t}^{1,M}=\mathsf{M}\left\{\left\|\int\limits_t^T B'(Z)\left(\int\limits_t^{t_3} B'(Z)\left(\int\limits_t^{t_2} B(Z)d\left(\mathbf{W}_{t_1}-\mathbf{W}_{t_1}^M\right)\right)d\mathbf{W}_{t_2}\right)d\mathbf{W}_{t_3}\right\|_H^2\right\},$$

$$E_{T,t}^{2,M}=\mathsf{M}\left\{\left\|\int\limits_t^T B'(Z)\left(\int\limits_t^{t_3} B'(Z)\left(\int\limits_t^{t_2} B(Z)d\mathbf{W}_{t_1}^M\right)d\left(\mathbf{W}_{t_2}-\mathbf{W}_{t_2}^M\right)\right)d\mathbf{W}_{t_3}\right\|_H^2\right\},$$

$$E_{T,t}^{3,M}=\mathsf{M}\left\{\left\|\int\limits_t^T B'(Z)\left(\int\limits_t^{t_3} B'(Z)\left(\int\limits_t^{t_2} B(Z)d\mathbf{W}_{t_1}^M\right)d\mathbf{W}_{t_2}^M\right)d\left(\mathbf{W}_{t_3}-\mathbf{W}_{t_3}^M\right)\right\|_H^2\right\},$$

$$G_{T,t}^{1,M}=\mathsf{M}\left\{\left\|\int\limits_t^T B''(Z)\left(\int\limits_t^{t_2} B(Z)d\mathbf{W}_{t_1},\int\limits_t^{t_2} B(Z)d\left(\mathbf{W}_{t_1}-\mathbf{W}_{t_1}^M\right)\right)d\mathbf{W}_{t_2}\right\|_H^2\right\},$$

$$G_{T,t}^{2,M}=\mathsf{M}\left\{\left\|\int\limits_t^T B''(Z)\left(\int\limits_t^{t_2} B(Z)d\left(\mathbf{W}_{t_1}-\mathbf{W}_{t_1}^M\right),\int\limits_t^{t_2} B(Z)d\mathbf{W}_{t_1}^M\right)d\mathbf{W}_{t_2}\right\|_H^2\right\},$$

$$G_{T,t}^{3,M}=\mathsf{M}\left\{\left\|\int\limits_t^T B''(Z)\left(\int\limits_t^{t_2} B(Z)d\mathbf{W}_{t_1}^M,\int\limits_t^{t_2} B(Z)d\mathbf{W}_{t_1}^M\right)d\left(\mathbf{W}_{t_2}-\mathbf{W}_{t_2}^M\right)\right\|_H^2\right\}.$$

We have

$$E_{T,t}^{1,M}=\int\limits_t^T\mathsf{M}\left\{\left\|B'(Z)\left(\int\limits_t^{t_3} B'(Z)\left(\int\limits_t^{t_2} B(Z)d\left(\mathbf{W}_{t_1}-\mathbf{W}_{t_1}^M\right)\right)d\mathbf{W}_{t_2}\right)\right\|_{L_{HS}(U_0,H)}^2\right\}dt_3\le$$

$$\le C_5\int\limits_t^T\mathsf{M}\left\{\left\|\int\limits_t^{t_3} B'(Z)\left(\int\limits_t^{t_2} B(Z)d\left(\mathbf{W}_{t_1}-\mathbf{W}_{t_1}^M\right)\right)d\mathbf{W}_{t_2}\right\|_H^2\right\}dt_3=$$

$$=C_5\int\limits_t^T\int\limits_t^{t_3}\mathsf{M}\left\{\left\|B'(Z)\left(\int\limits_t^{t_2} B(Z)d\left(\mathbf{W}_{t_1}-\mathbf{W}_{t_1}^M\right)\right)\right\|_{L_{HS}(U_0,H)}^2\right\}dt_2dt_3\le$$

$$\leq C_6 \int\limits_t^T \int\limits_t^{t_3} \mathsf{M}\left\{\left\|\int\limits_t^{t_2} B(Z)d\left(\mathbf{W}_{t_1} - \mathbf{W}_{t_1}^M\right)\right\|_H^2\right\} dt_2 dt_3 \leq \tag{72}$$

$$\leq C_6 \left(\sup_{i\in J\backslash J_M} \lambda_i\right)^{2\alpha} \int\limits_t^T \int\limits_t^{t_3} \int\limits_t^{t_2} \mathsf{M}\left\{\left\|B(Z)Q^{-\alpha}\right\|_{L_{HS}(U_0,H)}^2\right\} dt_1 dt_2 dt_3 \leq \tag{73}$$

$$\leq C_7 \left(\sup_{i\in J\backslash J_M} \lambda_i\right)^{2\alpha} (T-t)^3. \tag{74}$$

Note that the transition from (72) to (73) was made by analogy with the proof of Theorem 1 in [8] (also see [2]). More precisely, taking into account the relation $Q^\alpha e_i = \lambda_i^\alpha e_i$, we have (see [8], Sect. 3.1)

$$\mathsf{M}\left\{\left\|\int\limits_t^{t_2} B(Z)d\left(\mathbf{W}_{t_1} - \mathbf{W}_{t_1}^M\right)\right\|_H^2\right\} =$$

$$= \mathsf{M}\left\{\left\|\sum_{i\in J\backslash J_M} \sqrt{\lambda_i} \int\limits_t^{t_2} B(Z)e_i d\mathbf{w}_{t_1}^{(i)}\right\|_H^2\right\} =$$

$$= \sum_{i\in J\backslash J_M} \lambda_i \int\limits_t^{t_2} \mathsf{M}\left\{\left\|B(Z)Q^{-\alpha}Q^\alpha e_i\right\|_H^2\right\} dt_1 =$$

$$= \sum_{i\in J\backslash J_M} \lambda_i^{1+2\alpha} \int\limits_t^{t_2} \mathsf{M}\left\{\left\|B(Z)Q^{-\alpha}e_i\right\|_H^2\right\} dt_1 =$$

$$= \left(\sup_{i\in J\backslash J_M} \lambda_i\right)^{2\alpha} \int\limits_t^{t_2} \mathsf{M}\left\{\sum_{i\in J\backslash J_M} \lambda_i \left\|B(Z)Q^{-\alpha}e_i\right\|_H^2\right\} dt_1 \leq$$

$$\leq \left(\sup_{i\in J\backslash J_M} \lambda_i\right)^{2\alpha} \int\limits_t^{t_2} \mathsf{M}\left\{\sum_{i\in J} \lambda_i \left\|B(Z)Q^{-\alpha}e_i\right\|_H^2\right\} dt_1 =$$

$$= \left(\sup_{i\in J\backslash J_M} \lambda_i\right)^{2\alpha} \int\limits_t^{t_2} \mathsf{M}\left\{\left\|B(Z)Q^{-\alpha}\right\|_{L_{HS}(U_0,H)}^2\right\} dt_1. \tag{75}$$

Further we also will use the estimate like (75). We have

$$E^{2,M}_{T,t} =$$

$$= \int\limits_t^T \mathsf{M}\left\{\left\|B'(Z)\left(\int\limits_t^{t_3} B'(Z)\left(\int\limits_t^{t_2} B(Z)d\mathbf{W}^M_{t_1}\right)d\left(\mathbf{W}_{t_2}-\mathbf{W}^M_{t_2}\right)\right)\right\|^2_{L_{HS}(U_0,H)}\right\}dt_3 \le$$

$$\le C_8\int\limits_t^T \mathsf{M}\left\{\left\|\int\limits_t^{t_3} B'(Z)\left(\int\limits_t^{t_2} B(Z)d\mathbf{W}^M_{t_1}\right)d\left(\mathbf{W}_{t_2}-\mathbf{W}^M_{t_2}\right)\right\|^2_{H}\right\}dt_3 \le$$

$$\le C_8\left(\sup_{i\in J\backslash J_M}\lambda_i\right)^{2\alpha}\int\limits_t^T\int\limits_t^{t_3} \mathsf{M}\left\{\left\|B'(Z)\left(\int\limits_t^{t_2} B(Z)d\mathbf{W}^M_{t_1}\right)Q^{-\alpha}\right\|^2_{L_{HS}(U_0,H)}\right\}dt_2dt_3 \le$$

$$\le C_8\left(\sup_{i\in J\backslash J_M}\lambda_i\right)^{2\alpha}\int\limits_t^T\int\limits_t^{t_3} \mathsf{M}\left\{\left\|B'(Z)\left(B(Z)\right)Q^{-\alpha}\right\|^2_{L^{(2)}_{HS}(U_0,H)}\right\}(t_2-t)dt_2dt_3 \le$$

$$\le C_9\left(\sup_{i\in J\backslash J_M}\lambda_i\right)^{2\alpha}(T-t)^3, \tag{76}$$

$$E^{3,M}_{T,t} \le \left(\sup_{i\in J\backslash J_M}\lambda_i\right)^{2\alpha}\times$$

$$\times\int\limits_t^T \mathsf{M}\left\{\left\|B'(Z)\left(\int\limits_t^{t_3} B'(Z)\left(\int\limits_t^{t_2} B(Z)d\mathbf{W}^M_{t_1}\right)d\mathbf{W}^M_{t_2}\right)Q^{-\alpha}\right\|^2_{L_{HS}(U_0,H)}\right\}dt_3 \le$$

$$\le C_{10}\left(\sup_{i\in J\backslash J_M}\lambda_i\right)^{2\alpha}\int\limits_t^T \mathsf{M}\left\{\left\|B'(Z)\left(B'(Z)\left(B(Z)\right)\right)Q^{-\alpha}\right\|^2_{L^{(3)}_{HS}(U_0,H)}\right\}\frac{(t_3-t)^2}{2}dt_3 \le$$

$$\le C_{11}\left(\sup_{i\in J\backslash J_M}\lambda_i\right)^{2\alpha}(T-t)^3. \tag{77}$$

Combining (66), (70), (74)–(77), we obtain (64). We have

$$G_{T,t}^{1,M}=\int\limits_t^T \mathsf{M}\left\{\left\|B''(Z)\left(\int\limits_t^{t_2}B(Z)d\mathbf{W}_{t_1},\int\limits_t^{t_2}B(Z)d\left(\mathbf{W}_{t_1}-\mathbf{W}_{t_1}^M\right)\right)\right\|_{L_{HS}(U_0,H)}^2\right\}dt_3\le$$

$$\le C_{12}\int\limits_t^T \mathsf{M}\left\{\left\|\int\limits_t^{t_2}B(Z)d\mathbf{W}_{t_1}\right\|_H^2\left\|\int\limits_t^{t_2}B(Z)d\left(\mathbf{W}_{t_1}-\mathbf{W}_{t_1}^M\right)\right\|_H^2\right\}dt_3\le$$

$$\le C_{12}\int\limits_t^T\left(\mathsf{M}\left\{\left\|\int\limits_t^{t_2}B(Z)d\mathbf{W}_{t_1}\right\|_H^4\right\}\right)^{1/2}\left(\mathsf{M}\left\{\left\|\int\limits_t^{t_2}B(Z)d\left(\mathbf{W}_{t_1}-\mathbf{W}_{t_1}^M\right)\right\|_H^4\right\}\right)^{1/2}dt_3\le$$

$$\le C_{13}\int\limits_t^T\int\limits_t^{t_2}\left(\mathsf{M}\left\{\left\|B(Z)\right\|_{L_{HS}(U_0,H)}^4\right\}\right)^{1/2}dt_1\left(\mathsf{M}\left\{\left\|\int\limits_t^{t_2}B(Z)d\left(\mathbf{W}_{t_1}-\mathbf{W}_{t_1}^M\right)\right\|_H^4\right\}\right)^{1/2}dt_3\le$$

$$\le C_{14}\int\limits_t^T(t_2-t)\left(\mathsf{M}\left\{\left\|\int\limits_t^{t_2}B(Z)d\left(\mathbf{W}_{t_1}-\mathbf{W}_{t_1}^M\right)\right\|_H^4\right\}\right)^{1/2}dt_3. \tag{78}$$

Let us estimate the right-hand side of (78). Let $s>t$. For fixed $M\in\mathbb{N}$ and for some $N>M$ ($N\in\mathbb{N}$) we have

$$\mathsf{M}\left\{\left\|\int\limits_t^{s}B(Z)d\left(\mathbf{W}_{t_1}^N-\mathbf{W}_{t_1}^M\right)\right\|_H^4\right\}=$$

$$=\mathsf{M}\left\{\left\langle\sum_{j\in J_N\setminus J_M}\sqrt{\lambda_j}B(Z)e_j\left(\mathbf{w}_s^{(j)}-\mathbf{w}_t^{(j)}\right),\sum_{j'\in J_N\setminus J_M}\sqrt{\lambda_{j'}}B(Z)e_{j'}\left(\mathbf{w}_s^{(j')}-\mathbf{w}_t^{(j')}\right)\right\rangle_H^2\right\}=$$

$$=\sum_{j,j',l,l'\in J_N\setminus J_M}\sqrt{\lambda_j\lambda_{j'}\lambda_l\lambda_{l'}}\ \ \mathsf{M}\left\{\left\langle B(Z)e_j,B(Z)e_{j'}\right\rangle_H\left\langle B(Z)e_l,B(Z)e_{l'}\right\rangle_H\times\right.$$

$$\left.\times\mathsf{M}\left\{\left(\mathbf{w}_s^{(j)}-\mathbf{w}_t^{(j)}\right)\left(\mathbf{w}_s^{(j')}-\mathbf{w}_t^{(j')}\right)\left(\mathbf{w}_s^{(l)}-\mathbf{w}_t^{(l)}\right)\left(\mathbf{w}_s^{(l')}-\mathbf{w}_t^{(l')}\right)\Big|\mathbf{F}_t\right\}\right\}=$$

$$= 3(s-t)^2 \sum_{j\in J_N\backslash J_M} \lambda_j^2 \mathsf{M}\left\{\Bigl\|B(Z)e_j\Bigr\|_H^4\right\} +$$

$$+(s-t)^2 \sum_{j,j'\in J_N\backslash J_M (j\ne j')} \lambda_j\lambda_{j'}\left(\mathsf{M}\left\{\Bigl\|B(Z)e_j\Bigr\|_H^2\Bigl\|B(Z)e_{j'}\Bigr\|_H^2\right\}+2\Bigl\langle B(Z)e_j, B(Z)e_{j'}\Bigr\rangle_H^2\right) \le$$

$$\le 3(s-t)^2\left(\sum_{j\in J_N\backslash J_M} \lambda_j^2 \mathsf{M}\left\{\Bigl\|B(Z)e_j\Bigr\|_H^4\right\} +\right.$$

$$\left.+\sum_{j,j'\in J_N\backslash J_M (j\ne j')} \lambda_j\lambda_{j'} \mathsf{M}\left\{\Bigl\|B(Z)e_j\Bigr\|_H^2\Bigl\|B(Z)e_{j'}\Bigr\|_H^2\right\}\right) =$$

$$= 3(s-t)^2 \mathsf{M}\left\{\left(\sum_{j\in J_N\backslash J_M} \lambda_j \Bigl\|B(Z)e_j\Bigr\|_H^2\right)^2\right\} \le$$

$$\le 3(s-t)^2\left(\sup_{i\in J_N\backslash J_M}\lambda_i\right)^{4\alpha} \mathsf{M}\left\{\left(\sum_{j\in J_N\backslash J_M} \lambda_j \Bigl\|B(Z)Q^{-\alpha}e_j\Bigr\|_H^2\right)^2\right\} \le$$

$$\le C_{15}(s-t)^2\left(\sup_{i\in J_N\backslash J_M}\lambda_i\right)^{4\alpha} \mathsf{M}\left\{\Bigl\|B(Z)Q^{-\alpha}\Bigr\|_{L_{HS}(U_0,H)}^4\right\}. \tag{79}$$

Performing the passage to the limit $\lim\limits_{N\to\infty}$ in (79) and using (78), we have

$$G_{T,t}^{1,M} \le C_{16}\left(\sup_{i\in J\backslash J_M}\lambda_i\right)^{2\alpha}(T-t)^3. \tag{80}$$

Absolutely analogously we obtain

$$G_{T,t}^{2,M} \le C_{17}\left(\sup_{i\in J\backslash J_M}\lambda_i\right)^{2\alpha}(T-t)^3. \tag{81}$$

Let us estimate $G_{T,t}^{3,M}$. We have

$$G_{T,t}^{3,M} \le \left(\sup_{i\in J\backslash J_M} \lambda_i\right)^{2\alpha} \times$$

$$\times \int\limits_t^T \mathsf{M}\left\{\left\|B''(Z)\left(\int\limits_t^{t_2} B(Z)d\mathbf{W}_{t_1}^M, \int\limits_t^{t_2} B(Z)d\mathbf{W}_{t_1}^M\right)Q^{-\alpha}\right\|_{L_{HS}(U_0,H)}^2\right\}dt_2 \le$$

$$\le \left(\sup_{i\in J\backslash J_M} \lambda_i\right)^{2\alpha} \sum_{i\in J}\sum_{j,l\in J_M} \lambda_i\lambda_j\lambda_l \int\limits_t^T (t_2-t)^2 \times$$

$$\times\Biggl(\mathsf{M}\left\{\left\|B''(Z)(B(Z)e_j, B(Z)e_l)Q^{-\alpha}e_i\right\|_H^2\right\}+$$

$$+\mathsf{M}\left\{\left\|B''(Z)(B(Z)e_j, B(Z)e_j)Q^{-\alpha}e_i\right\|_H \times\right.$$

$$\left.\times\left\|B''(Z)(B(Z)e_l, B(Z)e_l)Q^{-\alpha}e_i\right\|_H\right\}+$$

$$+\mathsf{M}\left\{\left\|B''(Z)(B(Z)e_j, B(Z)e_l)Q^{-\alpha}e_i\right\|_H \times\right.$$

$$\left.\times\left\|B''(Z)(B(Z)e_l, B(Z)e_j)Q^{-\alpha}e_i\right\|_H\right\}\Biggr)dt_2 \le$$

$$\le C_{18}\left(\sup_{i\in J\backslash J_M} \lambda_i\right)^{2\alpha} (T-t)^3. \tag{82}$$

Combaining (69), (71), and (80)–(82), we get (65). Theorem 4 is proved.

Let us consider the convergence analysis for the stochastic integrals (49)–(51) (convergence of the stochastic integral (48) follows from (75) (see Theorem 1 in [8] or [2])).

Using the Itô formula, we obtain w. p. 1 [3]

$$J_2[B(Z)]_{T,t} = \int\limits_t^T \left(\frac{T}{2} - s + \frac{t}{2}\right) AB(Z)d\mathbf{W}_s,$$

$$J_3[B(Z), F(Z)]_{T,t} = \int\limits_t^T (s-t)B'(Z)\Bigl(AZ + F(Z)\Bigr)d\mathbf{W}_s.$$

Suppose that

$$\mathsf{M}\left\{\left\|B'(Z)\Bigl(AZ+F(Z)\Bigr)Q^{-\alpha}\right\|^2_{L_{HS(U_0,H)}}\right\}<\infty,$$

$$\mathsf{M}\left\{\left\|AB(Z)Q^{-\alpha}\right\|^2_{L_{HS(U_0,H)}}\right\}<\infty$$

for some $\alpha>0$.

Then by analogy with (75) we get

$$\mathsf{M}\left\{\left\|J_2[B(Z)]_{T,t}-J_2[B(Z)]^M_{T,t}\right\|^2_H\right\}\le$$

$$\le C_{19}(T-t)^3\left(\sup_{i\in J\setminus J_M}\lambda_i\right)^{2\alpha},$$

$$\mathsf{M}\left\{\left\|J_3[B(Z),F(Z)]_{T,t}-J_3[B(Z),F(Z)]^M_{T,t}\right\|^2_H\right\}\le$$

$$\le C_{20}(T-t)^3\left(\sup_{i\in J\setminus J_M}\lambda_i\right)^{2\alpha},$$

where $J_2[B(Z)]^M_{T,t}$, $J_3[B(Z),F(Z)]^M_{T,t}$ are defined by (55), (56).

Moreover, in conditions of Theorem 4 we obtain

$$\mathsf{M}\left\{\left\|J_4[B(Z),F(Z)]_{T,t}-J_4[B(Z),F(Z)]^M_{T,t}\right\|^2_H\right\}=$$

$$=\mathsf{M}\left\{\left\|\int\limits_t^T F'(Z)\left(\int\limits_t^{t_2}B(Z)d\left(\mathbf{W}_{t_1}-\mathbf{W}^M_{t_1}\right)\right)dt_2\right\|^2_H\right\}\le$$

$$\le (T-t)\int\limits_t^T\mathsf{M}\left\{\left\|F'(Z)\left(\int\limits_t^{t_2}B(Z)d\left(\mathbf{W}_{t_1}-\mathbf{W}^M_{t_1}\right)\right)\right\|^2_H\right\}dt_2\le$$

$$\leq C_{21}(T-t)\int\limits_t^T \mathsf{M}\left\{\left\|\int\limits_t^{t_2} B(Z)d\left(\mathbf{W}_{t_1}-\mathbf{W}_{t_1}^M\right)\right\|_H^2\right\}dt_2 \leq$$

$$\leq C_{21}(T-t)\left(\sup_{i\in J\backslash J_M}\lambda_i\right)^{2\alpha}\int\limits_t^T\int\limits_t^{t_2}\mathsf{M}\left\{\left\|B(Z)Q^{-\alpha}\right\|_{L_{HS}(U_0,H)}^2\right\}dt_1 dt_2 \leq$$

$$\leq C_{22}(T-t)^3\left(\sup_{i\in J\backslash J_M}\lambda_i\right)^{2\alpha},$$

where $J_4[B(Z),F(Z)]_{T,t}^M$ is defined by (57).

Chapter 6.

Integration Order Replacement Technique for Iterated Ito Stochastic Integrals

INTEGRATION ORDER REPLACEMENT TECHNIQUE FOR ITERATED ITO STOCHASTIC INTEGRALS AND ITERATED STOCHASTIC INTEGRALS WITH RESPECT TO MARTINGALES

DMITRIY F. KUZNETSOV

Abstract. The article is devoted to the integration order replacement technique for iterated Ito stochastic integrals and iterated stochastic integrals with respect to martingales. We consider the class of iterated Ito stochastic integrals, for which with probability 1 the formulas of integration order replacement corresponding to the rules of classical integral calculus are correct. The theorems on integration order replacement for the class of iterated Ito stochastic integrals are proved. Many examples of this theorems usage have been considered. These results are generalized for the class of iterated stochastic integrals with respect to martingales.

Contents

Mathematics Subject Classification: 60H05.
Keywords: Iterated Ito stochastic integral, Iterated stochastic integral with respect to martingales, Integration order replacement technique, Ito formula.

1. Introduction

In this article, we performed rather laborious work connected with the theorems on integration order replacement for iterated Ito stochastic integrals. However, there may appear a question about a practical usefulness of this theory, since the significant part of its conclusions directly follows from the Ito formula [1].

It is not difficult to see that to obtain various relations for iterated Ito stochastic integrals (see, for example, Sect. 6) using the Ito formula, first of all these relations should be guessed. Then it is necessary to introduce corresponding Ito processes and afterwards to use the Ito formula. It is clear that this process requires intellectual expenses and it is not always trivial.

On the other hand, the technique on integration order replacement introduced in this article is formally comply with the similar technique for Riemann integrals, although it is related to Ito integrals, and it provides a possibility to perform transformations naturally (as with Riemann integrals) with iterated Ito stochastic integrals and to obtain various relations for them.

So, in order to implementation of transformations of the specific class of Ito processes, which is represented by iterated Ito stochastic integrals, it is more naturally and easier to use the theorems on integration order replacement, than the Ito formula.

Many examples of these theorems usage are presented in Sect. 6.

Note that in a lot of publications of the author [2]-[18] the integration order replacement technique for iterated Ito stochastic integrals has been successfully applied for the proof and development of the method of approximation of iterated Ito and Stratonovich stochastic integrals based on generalized multiple Fourier series as well as for the construction of the so-called unified Taylor–Ito and Taylor–Stratonovich expansions.

Let $(\Omega, \mathrm{F}, \mathsf{P})$ be a complete probability space and let $f(t,\omega) : [0,T]\times\Omega\to\mathbb{R}$ be the standard Wiener process defined on the probability space $(\Omega, \mathrm{F}, \mathsf{P})$. Further, we will use the following notation: $f(t,\omega) \stackrel{\rm def}{=} f_t$.

Let us consider the family of σ-algebras $\{\mathrm{F}_t,\ t\in[0,T]\}$ defined on the probability space $(\Omega, \mathrm{F}, \mathsf{P})$ and connected with the Wiener process f_t in such a way that

1. $\mathrm{F}_s\subset \mathrm{F}_t\subset \mathrm{F}$ for $s<t$.
2. The Wiener process f_t is F_t-measurable for all $t\in[0,T]$.
3. The process $f_{t+\Delta}-f_t$ for all $t\ge 0,$ $\Delta>0$ is independent with the events of σ-algebra F_t.

Let us introduce the class $\mathrm{M}_2([0,T])$ of functions $\xi : [0,T]\times\Omega\to\mathbb{R}$, which satisfy the conditions:

1. The function $\xi(t,\omega)$ is measurable with respect to the pair of variables (t,ω).
2. The function $\xi(t,\omega)$ is F_t-measurable for all $t\in[0,T]$ and $\xi(\tau,\omega)$ is independent with increments $f_{t+\Delta}-f_t$ for $t\ge\tau,$ $\Delta>0$.
3. The following relation is fulfilled

$$\int\limits_0^T \mathsf{M}\left\{\left(\xi(t,\omega)\right)^2\right\}dt<\infty.$$

4. $\mathsf{M}\left\{\left(\xi(t,\omega)\right)^2\right\}<\infty$ for all $t\in[0,T]$.

For any partition $\tau_j^{(N)},$ $j=0,1,\ldots,N$ of the interval $[0,T]$ such that

$$0=\tau_0^{(N)}<\tau_1^{(N)}<\ldots<\tau_N^{(N)}=T,\qquad \max_{0\le j\le N-1}\left|\tau_{j+1}^{(N)}-\tau_j^{(N)}\right|\to 0\ \ \text{if}\ \ N\to\infty \tag{1}$$

we will define the sequense of step functions

$$\xi^{(N)}(t,\omega)=\xi_j(\omega)\quad \text{w. p. 1}\quad \text{for}\quad t\in\left[\tau_j^{(N)},\tau_{j+1}^{(N)}\right),$$

where $j=0,1,\ldots,N-1,\ \ N=1,2,\ldots$. Here and further, w. p. 1 means with probability 1.

Let us define the Ito stochastic integral for $\xi(t,\omega)\in \mathrm{M}_2([0,T])$ as the following mean-square limit [1]

$$\underset{N\to\infty}{\text{l.i.m.}}\sum_{j=0}^{N-1}\xi^{(N)}\left(\tau_j^{(N)},\omega\right)\left(f\left(\tau_{j+1}^{(N)},\omega\right)-f\left(\tau_j^{(N)},\omega\right)\right)\stackrel{\text{def}}{=}\int\limits_0^T\xi_\tau df_\tau, \tag{2}$$

where $\xi^{(N)}(t,\omega)$ is any step function, which converges to the function $\xi(t,\omega)$ in the following sense

$$\lim_{N\to\infty}\int\limits_0^T\mathsf{M}\left\{\left|\xi^{(N)}(t,\omega)-\xi(t,\omega)\right|^2\right\}dt=0. \tag{3}$$

It is well known [1] that the Ito stochastic integral exists as the limit (2) and it does not depend on the selection of sequence $\xi^{(N)}(t,\omega)$. We suppose that standard properties of the Ito stochastic integral are well known to the reader (see, for example, [1]).

Let us define the stochastic integral for $\xi_\tau\in\mathrm{M}_2([0,T])$ as the following mean-square limit

$$\underset{N\to\infty}{\text{l.i.m.}}\sum_{j=0}^{N-1}\xi^{(N)}\left(\tau_j^{(N)},\omega\right)\left(\tau_{j+1}^{(N)}-\tau_j^{(N)}\right)\stackrel{\text{def}}{=}\int\limits_0^T\xi_\tau d\tau,$$

where $\xi^{(N)}(t,\omega)$ is any step function from the class $\mathrm{M}_2([0,T])$, which converges in the sense (3) to the function $\xi(t,\omega)$.

We will introduce the class $\mathrm{S}_2([0,T])$ of functions $\xi:[0,T]\times\Omega\to\mathbb{R}$, which satisfy the conditions:

1. $\xi(\tau,\omega)\in\mathrm{M}_2([0,T])$.
2. $\xi(\tau,\omega)$ is the mean-square continuous random process at the interval $[0,T]$.

As we noted above, the Ito stochastic integral exists in the mean-square sense (see (2)), if the random process $\xi(\tau,\omega)\in\mathrm{M}_2([0,T])$, i.e., perhaps this process does not satisfy the property of the mean-square continuity on the interval $[0,T]$. In this article we will formulate and prove the theorems on integration order replacement for the special class of iterated Ito stochastic integrals. At the same time, the condition of the mean-square continuity of integrand in the innermost stochastic integral will be significant.

Let us introduce the following class of iterated stochastic integrals

$$J[\phi,\psi^{(k)}]_{T,t}=\int\limits_t^T\psi_1(t_1)\ldots\int\limits_t^{t_{k-1}}\psi_k(t_k)\int\limits_t^{t_k}\phi_\tau dw_\tau^{(k+1)}dw_{t_k}^{(k)}\ldots dw_{t_1}^{(1)},$$

where $\phi(\tau,\omega)\stackrel{\text{def}}{=}\phi_\tau$, $\phi_\tau\in\mathrm{S}_2([t,T])$, every $\psi_l(\tau)$ $(l=1,\ldots,k)$ is a continous nonrandom function at the interval $[t,T]$, here and further $w_\tau^{(l)}=f_\tau$ or $w_\tau^{(l)}=\tau$ for $\tau\in[t,T]$ $(l=1,\ldots,k+1)$, $(\psi_1,\ldots,\psi_k)\stackrel{\text{def}}{=}\psi^{(k)}$, $\psi^{(1)}\stackrel{\text{def}}{=}\psi_1$.

We will call the stochastic integral $J[\phi,\psi^{(k)}]_{T,t}$ as the iterated Ito stochastic integral.

It is well known that for the iterated Riemann integral in the case of specific conditions the formula on integration order replacement is correct. In particular, if the nonrandom functions $f(x)$ and $g(x)$ are continuous at the interval $[a,b]$, then

$$\int\limits_a^b f(x)\int\limits_a^x g(y)dydx=\int\limits_a^b g(y)\int\limits_y^b f(x)dxdy. \tag{4}$$

If we suppose that for the Ito stochastic integral

$$J[\phi,\psi_1]_{T,t}=\int\limits_t^T \psi_1(s)\int\limits_t^s \phi_\tau dw_\tau^{(2)}dw_s^{(1)}$$

the formula on integration order replacement, which is similar to (4), is valid, then we will have

$$\int\limits_t^T \psi_1(s)\int\limits_t^s \phi_\tau dw_\tau^{(2)}dw_s^{(1)}=\int\limits_t^T \phi_\tau\int\limits_\tau^T \psi_1(s)dw_s^{(1)}dw_\tau^{(2)}. \tag{5}$$

If, in addition $w_s^{(1)},\ w_s^{(2)}=f_s\ (s\in[t,T])$ in (5), then the stochastic process

$$\eta_\tau=\phi_\tau\int\limits_\tau^T \psi_1(s)dw_s^{(1)}$$

does not belong to the class $\mathrm{M}_2([t,T])$, and, consequently, for the Ito stochastic integral

$$\int\limits_t^T \eta_\tau dw_\tau^{(2)}$$

on the right-hand side of (5) the conditions of its existence are not fulfilled.

At the same time

$$\int\limits_t^T df_s\int\limits_t^T ds=\int\limits_t^T (s-t)df_s+\int\limits_t^T (f_s-f_t)ds\quad \text{w. p. 1}, \tag{6}$$

and we can obtain this equality, for example, using the Ito formula, but (6) can be considered as a result of integration order replacement (see below).

Actually, we can demonstrate that

$$\int\limits_t^T (f_s-f_t)ds=\int\limits_t^T\int\limits_t^s df_\tau ds=\int\limits_t^T\int\limits_\tau^T dsdf_\tau\quad \text{w. p. 1}.$$

Then

$$\int\limits_t^T (s-t)df_s+\int\limits_t^T (f_s-f_t)ds=\int\limits_t^T\int\limits_t^\tau dsdf_\tau+\int\limits_t^T\int\limits_\tau^T dsdf_\tau=\int\limits_t^T df_s\int\limits_t^T ds\quad \text{w. p. 1}.$$

The aim of this article is to establish the strict mathematical sense of the formula (5) for the case $w_s^{(1)},\ w_s^{(2)}=f_s\ (s\in[t,T])$ as well as its analogue corresponding to the iterated Ito stochastic integral $J[\phi,\psi^{(k)}]_{T,t},\ k\ge 2$. At that, we will use the definition of the Ito stochastic integral which is more general than (2).

Let us consider the partition $\tau_j^{(N)},\ j=0,1,\ldots,N$ of the interval $[t,T]$ such that

$$t=\tau_0^{(N)}<\tau_1^{(N)}<\ldots<\tau_N^{(N)}=T,\qquad \max_{0\le j\le N-1}\left|\tau_{j+1}^{(N)}-\tau_j^{(N)}\right|\to 0\ \text{ if }\ N\to\infty. \tag{7}$$

In [19] Stratonovich R.L. introduced the definition of the so-called combined stochastic integral for the specific class of integrated processes. Taking this definition as a foundation, let us consider the following construction of stochastic integral

$$\underset{N\to\infty}{\text{l.i.m.}}\sum_{j=0}^{N-1}\phi_{\tau_j}\left(f_{\tau_{j+1}}-f_{\tau_j}\right)\theta_{\tau_{j+1}}\stackrel{\text{def}}{=}\int\limits_t^T\phi_\tau df_\tau\theta_\tau, \tag{8}$$

where $\phi_\tau,\ \theta_\tau\in\mathrm{S}_2([t,T])$, $\{\tau_j\}_{j=0}^N$ is the partition of the interval $[t,T]$, which satisfies to the condition (1) (for simplicity we write here and sometimes further τ_j instead of $\tau_j^{(N)}$).

Further, we will prove existence of the integral (8) for $\phi_\tau\in\mathrm{S}_2([t,T])$ and θ_τ from a little bit narrower class of processes than $\mathrm{S}_2([t,T])$. In addition, the integral defined by (8) will be used for the formulation and proof of the theorem on integration order replacement for the iterated Ito stochastic integrals $J[\phi,\psi^{(k)}]_{T,t},\ k\ge 1$.

Note that under the appropriate conditions the following properties of stochastic integrals defined by the formula (8) can be proved

$$\int\limits_t^T\phi_\tau df_\tau g(\tau)=\int\limits_t^T\phi_\tau g(\tau)df_\tau\quad\text{w. p. 1},$$

where $g(\tau)$ is a continuous nonrandom function at the interval $[t,T]$,

$$\int\limits_t^T\left(\alpha\phi_\tau+\beta\psi_\tau\right)df_\tau\theta_\tau=\alpha\int\limits_t^T\phi_\tau df_\tau\theta_\tau+\beta\int\limits_t^T\psi_\tau df_\tau\theta_\tau\quad\text{w. p. 1},$$

$$\int\limits_t^T\phi_\tau df_\tau\left(\alpha\theta_\tau+\beta\psi_\tau\right)=\alpha\int\limits_t^T\phi_\tau df_\tau\theta_\tau+\beta\int\limits_t^T\phi_\tau df_\tau\psi_\tau\quad\text{w. p. 1},$$

where $\alpha,\ \beta\in\mathbb{R}$.

At that, we suppose that the stochastic processes ϕ_τ, θ_τ, and ψ_τ are such that the integrals included in the mentioned properties exist.

2. Formulation of the Theorem on Integration Order Replacement for Iterated Ito Stochastic Integrals of Arbitrary Multiplicity

Let us define the stochastic integrals $\hat{I}[\psi^{(k)}]_{T,s},\ k\ge 1$ of the form

$$\hat{I}[\psi^{(k)}]_{T,s}=\int\limits_s^T\psi_k(t_k)dw_{t_k}^{(k)}\int\limits_{t_k}^T\psi_{k-1}(t_{k-1})dw_{t_{k-1}}^{(k-1)}\ldots\int\limits_{t_2}^T\psi_1(t_1)dw_{t_1}^{(1)}$$

in accordance with the definition (8) by the following recurrence relation

$$\hat{I}[\psi^{(k)}]_{T,t}\stackrel{\rm def}{=}\underset{N\to\infty}{\rm l.i.m.}\sum_{l=0}^{N-1}\psi_k(\tau_l)\Delta w_{\tau_l}^{(k)}\hat{I}[\psi^{(k-1)}]_{T,\tau_{l+1}}, \tag{9}$$

where $k\ge 1$, $\hat{I}[\psi^{(0)}]_{T,s}\stackrel{\rm def}{=}1$, $[s,T]\subseteq[t,T]$, here and further $\Delta w_{\tau_l}^{(i)}=w_{\tau_{l+1}}^{(i)}-w_{\tau_l}^{(i)},\ \ i=1,\ldots,k+1$, $l=0,1,\ldots,N-1$.

Then, we will define the iterated stochastic integral $\hat{J}[\phi,\psi^{(k)}]_{T,t}$, $k\ge 1$

$$\hat{J}[\phi,\psi^{(k)}]_{T,t}=\int\limits_t^T\phi_s dw_s^{(k+1)}\hat{I}[\psi^{(k)}]_{T,s}$$

similarly in accordance with the definition (8)

$$\hat{J}[\phi,\psi^{(k)}]_{T,t}\stackrel{\rm def}{=}\underset{N\to\infty}{\rm l.i.m.}\sum_{l=0}^{N-1}\phi_{\tau_l}\Delta w_{\tau_l}^{(k+1)}\hat{I}[\psi^{(k)}]_{T,\tau_{l+1}}.$$

Let us formulate the theorem on integration order replacement for iterated Ito stochastic integrals.

Theorem 1 [20], [21] (also see [2]-[7], [16]-[18]). *Suppose that $\phi_\tau\in{\rm S}_2([t,T])$ and every $\psi_l(\tau)$ $(l=1,\ldots,k)$ is a continuous nonrandom function at the interval $[t,T]$. Then, the stochastic integral $\hat{J}[\phi,\psi^{(k)}]_{T,t}$ $(k\ge 1)$ exists and*

$$J[\phi,\psi^{(k)}]_{T,t}=\hat{J}[\phi,\psi^{(k)}]_{T,t}\quad w.\ p.\ 1.$$

3. Proof of Theorem 1 for the Case of Iterated Ito Stochastic Integrals of Multiplicity 2

First, let us prove Theorem 1 for the case $k=1$. We have

$$J[\phi,\psi_1]_{T,t}\stackrel{\rm def}{=}\underset{N\to\infty}{\rm l.i.m.}\sum_{l=0}^{N-1}\psi_1(\tau_l)\Delta w_{\tau_l}^{(1)}\int\limits_t^{\tau_l}\phi_\tau dw_\tau^{(2)}=$$

$$=\underset{N\to\infty}{\rm l.i.m.}\sum_{l=0}^{N-1}\psi_1(\tau_l)\Delta w_{\tau_l}^{(1)}\sum_{j=0}^{l-1}\int\limits_{\tau_j}^{\tau_{j+1}}\phi_\tau dw_\tau^{(2)}, \tag{10}$$

$$\hat{J}[\phi,\psi_1]_{T,t} \stackrel{\rm def}{=} \underset{N\to\infty}{\rm l.i.m.} \sum_{j=0}^{N-1} \phi_{\tau_j} \Delta w_{\tau_j}^{(2)} \int\limits_{\tau_{j+1}}^{T} \psi_1(s) dw_s^{(1)} =$$

$$= \underset{N\to\infty}{\rm l.i.m.} \sum_{j=0}^{N-1} \phi_{\tau_j} \Delta w_{\tau_j}^{(2)} \sum_{l=j+1}^{N-1} \int\limits_{\tau_l}^{\tau_{l+1}} \psi_1(s) dw_s^{(1)} =$$

$$= \underset{N\to\infty}{\rm l.i.m.} \sum_{l=0}^{N-1} \int\limits_{\tau_l}^{\tau_{l+1}} \psi_1(s) dw_s^{(1)} \sum_{j=0}^{l-1} \phi_{\tau_j} \Delta w_{\tau_j}^{(2)}. \qquad (11)$$

It is clear that if the difference ε_N of prelimit expressions on the right-hand sides of (10) and (11) tends to zero when $N \to \infty$ in the mean-square sense, then the stochastic integral $\hat{J}[\phi,\psi_1]_{T,t}$ exists and

$$J[\phi,\psi_1]_{T,t} = \hat{J}[\phi,\psi_1]_{T,t} \quad \text{w. p. 1.}$$

The difference ε_N can be presented in the form $\varepsilon_N = \tilde{\varepsilon}_N + \hat{\varepsilon}_N$, where

$$\tilde{\varepsilon}_N = \sum_{l=0}^{N-1} \psi_1(\tau_l) \Delta w_{\tau_l}^{(1)} \sum_{j=0}^{l-1} \int\limits_{\tau_j}^{\tau_{j+1}} \left(\phi_\tau - \phi_{\tau_j}\right) dw_\tau^{(2)};$$

$$\hat{\varepsilon}_N = \sum_{l=0}^{N-1} \int\limits_{\tau_l}^{\tau_{l+1}} \left(\psi_1(\tau_l) - \psi_1(s)\right) dw_s^{(1)} \sum_{j=0}^{l-1} \phi_{\tau_j} \Delta w_{\tau_j}^{(2)}.$$

We will demonstrate that

$$\underset{N\to\infty}{\rm l.i.m.}\ \varepsilon_N = 0.$$

In order to do it we will analyze four cases:

1. $w_\tau^{(2)} = f_\tau,\ \Delta w_{\tau_l}^{(1)} = \Delta f_{\tau_l}$.
2. $w_\tau^{(2)} = \tau,\ \Delta w_{\tau_l}^{(1)} = \Delta f_{\tau_l}$.
3. $w_\tau^{(2)} = f_\tau,\ \Delta w_{\tau_l}^{(1)} = \Delta \tau_l$.
4. $w_\tau^{(2)} = \tau,\ \Delta w_{\tau_l}^{(1)} = \Delta \tau_l$.

Consider the well known standard moment properties of stochastic integrals [1]

$$\mathsf{M}\left\{\left|\int\limits_{t_0}^{t} \xi_\tau df_\tau\right|^2\right\} = \int\limits_{t_0}^{t} \mathsf{M}\left\{|\xi_\tau|^2\right\} d\tau,$$

$$\mathsf{M}\left\{\left|\int\limits_{t_0}^{t}\xi_\tau d\tau\right|^2\right\} \le (t-t_0)\int\limits_{t_0}^{t}\mathsf{M}\left\{|\xi_\tau|^2\right\}d\tau, \tag{12}$$

where $\xi_\tau \in \mathrm{M}_2([t_0, t])$.

For Case 1 using standard moment properties for the Ito stochastic integral as well as mean-square continuity (which means uniform mean-square continuity) of the process ϕ_τ on the interval $[t, T]$, we obtain

$$\mathsf{M}\left\{|\tilde{\varepsilon}_N|^2\right\} = \sum_{k=0}^{N-1}\psi_1^2(\tau_k)\Delta\tau_k\sum_{j=0}^{k-1}\int\limits_{\tau_j}^{\tau_{j+1}}\mathsf{M}\left\{\left|\phi_\tau - \phi_{\tau_j}\right|^2\right\}d\tau <$$

$$< C^2\varepsilon\sum_{k=0}^{N-1}\Delta\tau_k\sum_{j=0}^{k-1}\Delta\tau_j < C^2\varepsilon\frac{(T-t)^2}{2},$$

i.e. $\mathsf{M}\left\{|\tilde{\varepsilon}_N|^2\right\} \to 0$ when $N \to \infty$. Here $\Delta\tau_j < \delta(\varepsilon)$, $j = 0, 1, \ldots, N-1$ ($\delta(\varepsilon) > 0$ exists for any $\varepsilon > 0$ and it does not depend on τ), $|\psi_1(\tau)| < C$.

Let us consider Case 2. Using the Minkowski inequality, uniform mean-square continuity of the process ϕ_τ as well as the estimate (12) for the stochastic integral, we have

$$\mathsf{M}\left\{|\tilde{\varepsilon}_N|^2\right\} = \sum_{k=0}^{N-1}\psi_1^2(\tau_k)\Delta\tau_k\mathsf{M}\left\{\left(\sum_{j=0}^{k-1}\int\limits_{\tau_j}^{\tau_{j+1}}(\phi_\tau - \phi_{\tau_j})d\tau\right)^2\right\} \le$$

$$\le \sum_{k=0}^{N-1}\psi_1^2(\tau_k)\Delta\tau_k\left(\sum_{j=0}^{k-1}\left(\mathsf{M}\left\{\left(\int\limits_{\tau_j}^{\tau_{j+1}}(\phi_\tau - \phi_{\tau_j})d\tau\right)^2\right\}\right)^{1/2}\right)^2 <$$

$$< C^2\varepsilon\sum_{k=0}^{N-1}\Delta\tau_k\left(\sum_{j=0}^{k-1}\Delta\tau_j\right)^2 < C^2\varepsilon\frac{(T-t)^3}{3},$$

i.e. $\mathsf{M}\left\{|\tilde{\varepsilon}_N|^2\right\} \to 0$ when $N \to \infty$. Here $\Delta\tau_j < \delta(\varepsilon)$, $j = 0, 1, \ldots, N-1$ ($\delta(\varepsilon) > 0$ exists for any $\varepsilon > 0$ and it does not depend on τ), $|\psi_1(\tau)| < C$.

For Case 3 using the Minkowski inequality, standard moment properties for the Ito stochastic integral as well as uniform mean-square continuity of the process ϕ_τ, we find

$$\mathsf{M}\left\{|\tilde{\varepsilon}_N|^2\right\} \le \left(\sum_{k=0}^{N-1}|\psi_1(\tau_k)|\Delta\tau_k\left(\mathsf{M}\left\{\left(\sum_{j=0}^{k-1}\int\limits_{\tau_j}^{\tau_{j+1}}(\phi_\tau - \phi_{\tau_j})df_\tau\right)^2\right\}\right)^{1/2}\right)^2 =$$

$$= \left(\sum_{k=0}^{N-1} |\psi_1(\tau_k)| \Delta\tau_k \left(\sum_{j=0}^{k-1} \int\limits_{\tau_j}^{\tau_{j+1}} \mathsf{M}\left\{ |\phi_\tau - \phi_{\tau_j}|^2 \right\} d\tau \right)^{1/2} \right)^2 <$$

$$< C^2 \varepsilon \left(\sum_{k=0}^{N-1} \Delta\tau_k \left(\sum_{j=0}^{k-1} \Delta\tau_j \right)^{1/2} \right)^2 < C^2 \varepsilon \frac{4(T-t)^3}{9},$$

i.e. $\mathsf{M}\left\{ |\tilde{\varepsilon}_N|^2 \right\} \to 0$ when $N \to \infty$. Here $\Delta\tau_j < \delta(\varepsilon)$, $j = 0, 1, \ldots, N-1$ ($\delta(\varepsilon) > 0$ exists for any $\varepsilon > 0$ and it does not depend on τ), $|\psi_1(\tau)| < C$.

Finally, for Case 4 using the Minkowski inequality, uniform mean-square continuity of the process ϕ_τ as well as the estimate (12) for the stochastic integral, we obtain

$$\mathsf{M}\left\{ |\tilde{\varepsilon}_N|^2 \right\} \le \left(\sum_{k=0}^{N-1} \sum_{j=0}^{k-1} |\psi_1(\tau_k)| \Delta\tau_k \left(\mathsf{M}\left\{ \left(\int\limits_{\tau_j}^{\tau_{j+1}} (\phi_\tau - \phi_{\tau_j}) d\tau \right)^2 \right\} \right)^{1/2} \right)^2 <$$

$$< C^2 \varepsilon \left(\sum_{k=0}^{N-1} \Delta\tau_k \sum_{j=0}^{k-1} \Delta\tau_j \right)^2 < C^2 \varepsilon \frac{(T-t)^4}{4},$$

i.e. $\mathsf{M}\left\{ |\tilde{\varepsilon}_N|^2 \right\} \to 0$ when $N \to \infty$. Here $\Delta\tau_j < \delta(\varepsilon)$, $j = 0, 1, \ldots, N-1$ ($\delta(\varepsilon) > 0$ exists for any $\varepsilon > 0$ and it does not depend on τ), $|\psi_1(\tau)| < C$.

Thus, we have proved that

$$\underset{N\to\infty}{\text{l.i.m.}}\ \tilde{\varepsilon}_N = 0.$$

Analogously, taking into account the uniform continuity of the function $\psi_1(\tau)$ on the interval $[t, T]$, we can demonstrate that

$$\underset{N\to\infty}{\text{l.i.m.}}\ \hat{\varepsilon}_N = 0.$$

Consequently,

$$\underset{N\to\infty}{\text{l.i.m.}}\ \varepsilon_N = 0.$$

Theorem 1 is proved for the case $k = 1$.

Remark 1. *Proving Theorem* 1, *we used the fact that if the stochastic process ϕ_t is mean-square continuous at the interval $[t, T]$, then it is uniformly mean-square continuous at this interval, i.e. $\forall\ \varepsilon > 0\ \exists\ \delta(\varepsilon) > 0$ such that for all $t_1, t_2 \in [t, T]$ satisfying the condition $|t_1 - t_2| < \delta(\varepsilon)$ the inequality*

$$\mathsf{M}\left\{ |\phi_{t_1} - \phi_{t_2}|^2 \right\} < \varepsilon$$

is fulfilled (here $\delta(\varepsilon)$ does not depend on t_1 and t_2).

Proof. *Suppose that the stochastic process ϕ_t is mean-square continuous at the interval $[t, T]$, but not uniformly mean-square continuous at this interval. Then for some $\varepsilon > 0$ and $\forall\ \delta(\varepsilon) > 0\ \exists\ t_1, t_2 \in [t, T]$ such that $|t_1 - t_2| < \delta(\varepsilon)$, but*

$$\mathsf{M}\left\{|\phi_{t_1}-\phi_{t_2}|^2\right\}\ge\varepsilon.$$

Consequently, for $\delta=\delta_n=1/n$ $(n\in\mathbf{N})$ $\exists$ $t_1^{(n)}$, $t_2^{(n)}\in[t,T]$ *such that*

$$\left|t_1^{(n)}-t_2^{(n)}\right|<\frac{1}{n},$$

but

$$\mathsf{M}\left\{\left|\phi_{t_1^{(n)}}-\phi_{t_2^{(n)}}\right|^2\right\}\ge\varepsilon.$$

The sequence $t_1^{(n)}$ $(n\in\mathbf{N})$ *is bounded, consequently, according to the Bolzano–Weierstrass Theorem, we can choose from it the subsequence* $t_1^{(k_n)}$ $(n\in\mathbf{N})$ *that converges to a certain number* $\tilde t$ *(it is simple to demonstrate that* $\tilde t\in[t,T]$*). Similarly to it and in virtue of the inequality*

$$\left|t_1^{(n)}-t_2^{(n)}\right|<\frac{1}{n}$$

we have $t_2^{(k_n)}\to\tilde t$ *when* $n\to\infty$.

According to the mean-square continuity of the process ϕ_t *at the moment* $\tilde t$ *and the elementary inequality* $(a+b)^2\le 2(a^2+b^2)$, *we obtain*

$$0\le\mathsf{M}\left\{\left|\phi_{t_1^{(k_n)}}-\phi_{t_2^{(k_n)}}\right|^2\right\}\le$$

$$\le 2\left(\mathsf{M}\left\{\left|\phi_{t_1^{(k_n)}}-\phi_{\tilde t}\right|^2\right\}+\mathsf{M}\left\{\left|\phi_{t_2^{(k_n)}}-\phi_{\tilde t}\right|^2\right\}\right)\to 0$$

when $n\to\infty$. *Then*

$$\lim_{n\to\infty}\mathsf{M}\left\{\left|\phi_{t_1^{(k_n)}}-\phi_{t_2^{(k_n)}}\right|^2\right\}=0.$$

It is impossible by virtue of the fact that

$$\mathsf{M}\left\{\left|\phi_{t_1^{(k_n)}}-\phi_{t_2^{(k_n)}}\right|^2\right\}\ge\varepsilon>0.$$

The obtained contradiction proves the required statement.

4. Proof of Theorem 1 for the Case of Iterated Ito Stochastic Integrals of Arbitrary Multiplicity

Let us prove Theorem 1 for the case $k>1$. In order to do it we will introduce the following notations

$$I[\psi_q^{(r+1)}]_{\theta,s}\stackrel{\rm def}{=}\int\limits_s^{\theta}\psi_q(t_1)\ldots\int\limits_s^{t_r}\psi_{q+r}(t_{r+1})dw_{t_{r+1}}^{(q+r)}\ldots dw_{t_1}^{(q)},$$

$$J[\phi,\psi_q^{(r+1)}]_{\theta,s} \stackrel{\rm def}{=} \int\limits_s^{\theta} \psi_q(t_1)\ldots \int\limits_s^{t_r} \psi_{q+r}(t_{r+1}) \int\limits_s^{t_{r+1}} \phi_\tau dw_\tau^{(q+r+1)} dw_{t_{r+1}}^{(q+r)} \ldots dw_{t_1}^{(q)},$$

$$G[\psi_q^{(r+1)}]_{n,m} = \sum_{j_q=m}^{n-1} \sum_{j_{q+1}=m}^{j_q-1} \ldots \sum_{j_{q+r}=m}^{j_{q+r-1}-1} \prod_{l=q}^{r+q} I[\psi_l]_{\tau_{j_l+1},\tau_{j_l}},$$

$$(\psi_q,\ldots,\psi_{q+r}) \stackrel{\rm def}{=} \psi_q^{(r+1)}, \quad \psi_q^{(1)} \stackrel{\rm def}{=} \psi_q,$$

$$(\psi_1,\ldots,\psi_{r+1}) \stackrel{\rm def}{=} \psi_1^{(r+1)}, \quad \psi_1^{(r+1)} \stackrel{\rm def}{=} \psi^{(r+1)}$$

Note that according to notations introduced above

$$I[\psi_l]_{s,\theta} = \int\limits_{\theta}^{s} \psi_l(\tau) dw_\tau^{(l)}.$$

To prove Theorem 1 for $k>1$ it is enough to show that

$$J[\phi,\psi^{(k)}]_{T,t} = \underset{N\to\infty}{\rm l.i.m.}\ S[\phi,\psi^{(k)}]_N = \hat{J}[\phi,\psi^{(k)}]_{T,t} \quad \text{w. p. 1}, \tag{13}$$

where

$$S[\phi,\psi^{(k)}]_N = G[\psi^{(k)}]_{N,0} \sum_{l=0}^{j_k-1} \phi_{\tau_l} \Delta w_{\tau_l}^{(k+1)},$$

where $\Delta w_{\tau_l}^{(k+1)} = w_{\tau_{l+1}}^{(k+1)} - w_{\tau_l}^{(k+1)}$.

First, let us prove the right equality in (13). We have

$$\hat{J}[\phi,\psi^{(k)}]_{T,t} \stackrel{\rm def}{=} \underset{N\to\infty}{\rm l.i.m.} \sum_{l=0}^{N-1} \phi_{\tau_l} \Delta w_{\tau_l}^{(k+1)} \hat{I}[\psi^{(k)}]_{T,\tau_{l+1}}. \tag{14}$$

On the basis of the inductive hypothesis we obtain that

$$I[\psi^{(k)}]_{T,\tau_{l+1}} = \hat{I}[\psi^{(k)}]_{T,\tau_{l+1}} \quad \text{w. p. 1}, \tag{15}$$

where $\hat{I}[\psi^{(k)}]_{T,s}$ is defined in accordance with (9) and

$$I[\psi^{(k)}]_{T,s} = \int\limits_s^T \psi_1(t_1)\ldots \int\limits_s^{t_{k-2}} \psi_{k-1}(t_{k-1}) \int\limits_s^{t_{k-1}} \psi_k(t_k) dw_{t_k}^{(k)} dw_{t_{k-1}}^{(k-1)} \ldots dw_{t_1}^{(1)}.$$

Let us note that when $k \ge 4$ (for $k=2,\ 3$ the arguments are similar) due to additivity of the Ito stochastic integral the following equalities are correct

$$I[\psi^{(k)}]_{T,\tau_{l+1}}=\sum_{j_1=l+1}^{N-1}\int\limits_{\tau_{j_1}}^{\tau_{j_1+1}}\psi_1(t_1)\int\limits_{\tau_{l+1}}^{t_1}\psi_2(t_2)I[\psi_3^{(k-2)}]_{t_2,\tau_{l+1}}dw_{t_2}^{(2)}dw_{t_1}^{(1)}=$$

$$=\sum_{j_1=l+1}^{N-1}\int\limits_{\tau_{j_1}}^{\tau_{j_1+1}}\psi_1(t_1)\left(\sum_{j_2=l+1}^{j_1-1}\int\limits_{\tau_{j_2}}^{\tau_{j_2+1}}+\int\limits_{\tau_{j_1}}^{t_1}\right)\psi_2(t_2)I[\psi_3^{(k-2)}]_{t_2,\tau_{l+1}}dw_{t_2}^{(2)}dw_{t_1}^{(1)}=$$

$$=\ldots=G[\psi^{(k)}]_{N,l+1}+H[\psi^{(k)}]_{N,l+1}\quad \text{w. p. 1,} \tag{16}$$

where

$$H[\psi^{(k)}]_{N,l+1}=\sum_{j_1=l+1}^{N-1}\int\limits_{\tau_{j_1}}^{\tau_{j_1+1}}\psi_1(s)\int\limits_{\tau_{j_1}}^{s}\psi_2(\tau)I[\psi_3^{(k-2)}]_{\tau,\tau_{l+1}}dw_{\tau}^{(2)}dw_{s}^{(1)}+$$

$$+\sum_{r=2}^{k-2}G[\psi^{(r-1)}]_{N,l+1}\sum_{j_r=l+1}^{j_{r-1}-1}\int\limits_{\tau_{j_r}}^{\tau_{j_r+1}}\psi_r(s)\int\limits_{\tau_{j_r}}^{s}\psi_{r+1}(\tau)I[\psi_{r+2}^{(k-r-1)}]_{\tau,\tau_{l+1}}dw_{\tau}^{(r+1)}dw_{s}^{(r)}+$$

$$+G[\psi^{(k-2)}]_{N,l+1}\sum_{j_{k-1}=l+1}^{j_{k-2}-1}I[\psi_{k-1}^{(2)}]_{\tau_{j_{k-1}+1},\tau_{j_{k-1}}}. \tag{17}$$

Let us substitute (16) into (15) and (15) into (14). Then w. p. 1

$$\hat{J}[\phi,\psi^{(k)}]_{T,t}=\underset{N\to\infty}{\text{l.i.m.}}\sum_{l=0}^{N-1}\phi_{\tau_l}\Delta w_{\tau_l}^{(k+1)}\left(G[\psi^{(k)}]_{N,l+1}+H[\psi^{(k)}]_{N,l+1}\right). \tag{18}$$

Since

$$\sum_{j_1=0}^{N-1}\sum_{j_2=0}^{j_1-1}\ldots\sum_{j_k=0}^{j_{k-1}-1}a_{j_1\ldots j_k}=\sum_{j_k=0}^{N-1}\sum_{j_{k-1}=j_k+1}^{N-1}\ldots\sum_{j_1=j_2+1}^{N-1}a_{j_1\ldots j_k}, \tag{19}$$

where $a_{j_1\ldots j_k}$ are scalars, then

$$G[\psi^{(k)}]_{N,l+1}=\sum_{j_k=l+1}^{N-1}\ldots\sum_{j_1=j_2+1}^{N-1}\prod_{l=1}^{k}I[\psi_l]_{\tau_{j_l+1},\tau_{j_l}}. \tag{20}$$

Let us substitute (20) into

$$\sum_{l=0}^{N-1}\phi_{\tau_l}\Delta w_{\tau_l}^{(k+1)}G[\psi^{(k)}]_{N,l+1}$$

and again use the formula (19). Then

$$\sum_{l=0}^{N-1} \phi_{\tau_l} \Delta w_{\tau_l}^{(k+1)} G[\psi^{(k)}]_{N,l+1} = S[\phi, \psi^{(k)}]_N. \tag{21}$$

Let us suppose that the limit

$$\underset{N\to\infty}{\text{l.i.m.}}\ S[\phi, \psi^{(k)}]_N \tag{22}$$

exists (its existence will be proved further).

Then from (21) and (18) it follows that for proof of the right equality in (13) we have to demonstrate that w. p. 1

$$\underset{N\to\infty}{\text{l.i.m.}} \sum_{l=0}^{N-1} \phi_{\tau_l} \Delta w_{\tau_l}^{(k+1)} H[\psi^{(k)}]_{N,l+1} = 0. \tag{23}$$

Analyzing the second moment of the prelimit expression on the left-hand side of (23) and taking into account (17), the independence of ϕ_{τ_l}, $\Delta w_{\tau_l}^{(k+1)}$, and $H[\psi^{(k)}]_{N,l+1}$ as well as the standard estimates for second moments of stochastic integrals and the Minkowski inequality, we find that (23) is correct. Thus, by the assumption of existence of the limit (22) we obtain that the right equality in (13) is fulfilled.

Let us demonstrate that the left equality in (13) is also fulfilled.

We have

$$J[\phi, \psi^{(k)}]_{T,t} \stackrel{\text{def}}{=} \underset{N\to\infty}{\text{l.i.m.}} \sum_{l=0}^{N-1} \psi_1(\tau_l) \Delta w_{\tau_l}^{(1)} J[\phi, \psi_2^{(k-1)}]_{\tau_l,t}. \tag{24}$$

Let us use for the integral $J[\phi, \psi_2^{(k-1)}]_{\tau_l,t}$ in (24) the same arguments, which resulted to the relation (16) for the integral $I[\psi^{(k)}]_{T,\tau_{l+1}}$. After that let us substitute the expression obtained for the integral $J[\phi, \psi_2^{(k-1)}]_{\tau_l,t}$ into (24).

Further, using the Minkowski inequality and standard estimates for second moments of stochastic integrals it is easy to obtain that

$$J[\phi, \psi^{(k)}]_{T,t} = \underset{N\to\infty}{\text{l.i.m.}}\ R[\phi, \psi^{(k)}]_N \quad \text{w. p. 1}, \tag{25}$$

where

$$R[\phi, \psi^{(k)}]_N = \sum_{j_1=0}^{N-1} \psi_1(\tau_{j_1}) \Delta w_{\tau_{j_1}}^{(1)} G[\psi_2^{(k-1)}]_{j_1,0} \sum_{l=0}^{j_k-1} \int\limits_{\tau_l}^{\tau_{l+1}} \phi_\tau dw_\tau^{(k+1)}.$$

We will demonstrate that

$$\underset{N\to\infty}{\text{l.i.m.}}\ R[\phi, \psi^{(k)}]_N = \underset{N\to\infty}{\text{l.i.m.}}\ S[\phi, \psi^{(k)}]_N \quad \text{w. p. 1}. \tag{26}$$

It is easy to see that

$$R[\phi, \psi^{(k)}]_N = U[\phi, \psi^{(k)}]_N + V[\phi, \psi^{(k)}]_N + S[\phi, \psi^{(k)}]_N \quad \text{w. p. 1}, \tag{27}$$

where

$$U[\phi,\psi^{(k)}]_N=\sum_{j_1=0}^{N-1}\psi_1(\tau_{j_1})\Delta w_{\tau_{j_1}}^{(1)}G[\psi_2^{(k-1)}]_{j_1,0}\sum_{l=0}^{j_k-1}I[\Delta\phi]_{\tau_{l+1},\tau_l},$$

$$V[\phi,\psi^{(k)}]_N=\sum_{j_1=0}^{N-1}I[\Delta\psi_1]_{\tau_{j_1+1},\tau_{j_1}}G[\psi_2^{(k-1)}]_{j_1,0}\sum_{l=0}^{j_k-1}\phi_{\tau_l}\Delta w_{\tau_l}^{(k+1)},$$

$$I[\Delta\psi_1]_{\tau_{j_1+1},\tau_{j_1}}=\int\limits_{\tau_{j_1}}^{\tau_{j_1+1}}(\psi_1(\tau_{j_1})-\psi_1(\tau))dw_{\tau}^{(1)},$$

$$I[\Delta\phi]_{\tau_{l+1},\tau_l}=\int\limits_{\tau_l}^{\tau_{l+1}}(\phi_\tau-\phi_{\tau_l})dw_{\tau}^{(k+1)}.$$

Using the Minkowski inequality, standard estimates for second moments of stochastic integrals, the condition that the process ϕ_τ belongs to the class $\mathrm{S}_2([t,T])$ as well as continuity (which means uniform continuity) of the function $\psi_1(\tau)$, we obtain that

$$\underset{N\to\infty}{\text{l.i.m.}}\ V[\phi,\psi^{(k)}]_N=\underset{N\to\infty}{\text{l.i.m.}}\ U[\phi,\psi^{(k)}]_N=0\quad \text{w. p. 1}.$$

Then, considering (27), we obtain (26). From (26) and (25) it follows that the left equality in (13) is fulfilled.

Note that the limit (22) exists because it is equal to the stochastic integral $J[\phi,\psi^{(k)}]_{T,t}$, which exists under the conditions of Theorem 1. So, the chain of equalities (13) is proved. Theorem 1 is proved.

5. Corollaries and Generalizations of Theorem 1

Denote $D_k=\{(t_1,\ldots,t_k): t\le t_1<\ldots<t_k\le T\}$. We will use the same symbol D_k to denote the open and closed domains corresponding to the domain D_k. However, we always specify what domain we consider (open or closed).

Suppose that the following conditions are fulfilled:

AI. $\xi_\tau\in\mathrm{S}_2([t,T])$.

AII. $\Phi(t_1,\ldots,t_{k-1})$ is a continuous nonrandom function in the closed domain D_{k-1}.

Let us define the following stochastic integrals

$$\hat{J}[\xi,\Phi]_{T,t}^{(k)}=\int\limits_t^T\xi_{t_k}d\mathbf{w}_{t_k}^{(i_k)}\ldots\int\limits_{t_3}^T d\mathbf{w}_{t_2}^{(i_2)}\int\limits_{t_2}^T\Phi(t_1,t_2,\ldots,t_{k-1})d\mathbf{w}_{t_1}^{(i_1)}\stackrel{\text{def}}{=}$$

$$\stackrel{\text{def}}{=}\underset{N\to\infty}{\text{l.i.m.}}\sum_{l=0}^{N-1}\xi_{\tau_l}\Delta\mathbf{w}_{\tau_l}^{(i_k)}\int\limits_{\tau_{l+1}}^T d\mathbf{w}_{t_{k-1}}^{(i_{k-1})}\ldots\int\limits_{t_3}^T d\mathbf{w}_{t_2}^{(i_2)}\int\limits_{t_2}^T\Phi(t_1,t_2,\ldots,t_{k-1})d\mathbf{w}_{t_1}^{(i_1)}$$

for $k\ge 3$ and

$$\hat J[\xi,\Phi]_{T,t}^{(2)}=\int\limits_t^T \xi_{t_2}d{\bf w}_{t_2}^{(i_2)}\int\limits_{t_2}^T \Phi(t_1)d{\bf w}_{t_1}^{(i_1)} \stackrel{\rm def}{=}$$

$$\stackrel{\rm def}{=}\hbox{\vtop{\offinterlineskip\halign{\hfil#\hfil\cr {\rm l.i.m.}\cr \hbox{$\scriptstyle N\to\infty$}\cr}}}\sum_{l=0}^{N-1}\xi_{\tau_l}\Delta{\bf w}_{\tau_l}^{(i_2)}\int\limits_{\tau_{l+1}}^T \Phi(t_1)d{\bf w}_{t_1}^{(i_1)}$$

for $k=2$. Here ${\bf w}_{\tau}^{(i)}={\bf f}_{\tau}^{(i)}$ if $i=1,\ldots,m$ and ${\bf w}_{\tau}^{(0)}=\tau,$ ${\bf f}_{\tau}^{(i)}$ $(i=1,\ldots,m)$ are ${\rm F}_{\tau}$-measurable for all $\tau\in[0,T]$ $(0\le t<T)$ independent standard Wiener processes, $i_1,\ldots,i_k=0,1,\ldots,m.$

Let us denote

$$J[\xi,\Phi]_{T,t}^{(k)}=\int\limits_t^T\ldots\int\limits_t^{t_{k-1}}\Phi(t_1,\ldots,t_{k-1})\xi_{t_k}d{\bf w}_{t_k}^{(i_k)}\ldots d{\bf w}_{t_1}^{(i_1)},\quad k\ge 2, \tag{28}$$

where the right-hand side of (28) is the iterated Ito stochastic integral.

Let us introduce the following iterated stochastic integrals

$$\tilde J[\Phi]_{T,t}^{(k-1)}=\int\limits_t^T d{\bf w}_{t_{k-1}}^{(i_{k-1})}\ldots\int\limits_{t_3}^T d{\bf w}_{t_2}^{(i_2)}\int\limits_{t_2}^T \Phi(t_1,t_2,\ldots,t_{k-1})d{\bf w}_{t_1}^{(i_1)}\stackrel{\rm def}{=}$$

$$\stackrel{\rm def}{=}\hbox{\vtop{\offinterlineskip\halign{\hfil#\hfil\cr {\rm l.i.m.}\cr \hbox{$\scriptstyle N\to\infty$}\cr}}}\sum_{l=0}^{N-1}\Delta{\bf w}_{\tau_l}^{(i_{k-1})}\int\limits_{\tau_{l+1}}^T d{\bf w}_{t_{k-2}}^{(i_{k-2})}\ldots\int\limits_{t_3}^T d{\bf w}_{t_2}^{(i_2)}\int\limits_{t_2}^T \Phi(t_1,t_2,\ldots,t_{k-1})d{\bf w}_{t_1}^{(i_1)},$$

$$J'[\Phi]_{T,t}^{(k-1)}=\int\limits_t^T\ldots\int\limits_t^{t_{k-2}}\Phi(t_1,\ldots,t_{k-1})d{\bf w}_{t_{k-1}}^{(i_{k-1})}\ldots d{\bf w}_{t_1}^{(i_1)},\quad k\ge 2.$$

Similarly to the proof of Theorem 1 it is easy to demonstrate that under the condition AII the stochastic integral $\tilde J[\Phi]_{T,t}^{(k-1)}$ exists and

$$J'[\Phi]_{T,t}^{(k-1)}=\tilde J[\Phi]_{T,t}^{(k-1)}\quad \hbox{w. p. 1}. \tag{29}$$

Moreover, using (29) the following generalization of Theorem 1 can be proved similarly to the proof of Theorem 1.

Theorem 2 [20], [21] (also see [2]-[7], [16]-[18]). *Suppose that the conditions* AI, AII *of this section are fulfilled. Then, the stochastic integral* $\hat J[\xi,\Phi]_{T,t}^{(k)}$ *exists and for* $k\ge 2$

$$J[\xi,\Phi]_{T,t}^{(k)}=\hat J[\xi,\Phi]_{T,t}^{(k)}\quad \hbox{w. p. 1}.$$

Let us consider the following stochastic integrals

$$I=\int\limits_t^T d\mathbf{f}_{t_2}^{(i_2)}\int\limits_{t_2}^T \Phi_1(t_1,t_2)d\mathbf{f}_{t_1}^{(i_1)},\quad J=\int\limits_t^T\int\limits_t^{t_2}\Phi_2(t_1,t_2)d\mathbf{f}_{t_1}^{(i_1)}d\mathbf{f}_{t_2}^{(i_2)}.$$

If we consider

$$\int\limits_{t_2}^T \Phi_1(t_1,t_2)d\mathbf{f}_{t_1}^{(i_1)}$$

as the integrand of I and

$$\int\limits_{t}^{t_2} \Phi_2(t_1,t_2)d\mathbf{f}_{t_1}^{(i_1)}$$

as the integrand of J, then, due to independence of these integrands we may mistakenly think that $\mathsf{M}\{IJ\}=0$.

But it is not the fact. Actually, using the integration order replacement technique in the stochastic integral I, we have w. p. 1

$$I=\int\limits_t^T\int\limits_t^{t_1}\Phi_1(t_1,t_2)d\mathbf{f}_{t_2}^{(i_2)}d\mathbf{f}_{t_1}^{(i_1)}=\int\limits_t^T\int\limits_t^{t_2}\Phi_1(t_2,t_1)d\mathbf{f}_{t_1}^{(i_2)}d\mathbf{f}_{t_2}^{(i_1)}.$$

So, using the standard properties of the Ito stochastic integral [1], we get

$$\mathsf{M}\{IJ\}=\mathbf{1}_{\{i_1=i_2\}}\int\limits_t^T\int\limits_t^{t_2}\Phi_1(t_2,t_1)\Phi_2(t_1,t_2)dt_1dt_2,$$

where $\mathbf{1}_{\{A\}}$ is the indicator of the set A.

Let us consider the following statement.

Theorem 3 [20], [21] (also see [2]-[7], [16]-[18]). *Let the conditions of Theorem* 1 *are fulfilled and $h(\tau)$ is a continuous nonrandom function at the interval $[t,T]$. Then*

$$\int\limits_t^T \phi_\tau dw_\tau^{(k+1)}h(\tau)\hat{I}[\psi^{(k)}]_{T,\tau}=\int\limits_t^T \phi_\tau h(\tau)dw_\tau^{(k+1)}\hat{I}[\psi^{(k)}]_{T,\tau}\quad \text{w. p. 1}, \tag{30}$$

where stochastic integrals on the left-hand side of (30) *as well as on the right-hand side of* (30) *exist.*

Proof. According to Theorem 1, the iterated stochastic integral on the right-hand side of (30) exists. In addition

$$\int\limits_t^T \phi_\tau h(\tau)dw_\tau^{(k+1)}\hat{I}[\psi^{(k)}]_{T,\tau}=\int\limits_t^T \phi_\tau dw_\tau^{(k+1)}h(\tau)\hat{I}[\psi^{(k)}]_{T,\tau}-$$

$$-\underset{N\to\infty}{\text{l.i.m.}}\sum_{j=0}^{N-1}\phi_{\tau_j}\Delta h(\tau_j)\Delta w_{\tau_j}^{(k+1)}\hat{I}[\psi^{(k)}]_{T,\tau_{j+1}}\quad \text{w. p. 1},$$

where $\Delta h(\tau_j)=h(\tau_{j+1})-h(\tau_j)$.

Using the arguments which resulted to the right equality in (13), we obtain

$$\underset{N\to\infty}{\text{l.i.m.}}\sum_{l=0}^{N-1}\phi_{\tau_l}\Delta h(\tau_l)\Delta w_{\tau_l}^{(k+1)}\hat{I}[\psi^{(k)}]_{T,\tau_{l+1}}=$$

$$=\underset{N\to\infty}{\text{l.i.m.}}\ G[\psi^{(k)}]_{N,0}\sum_{l=0}^{j_k-1}\phi_{\tau_l}\Delta h(\tau_l)\Delta w_{\tau_l}^{(k+1)}\quad \text{w. p. 1.} \tag{31}$$

Using the Minkowski inequality, standard estimates for second moments of stochastic integrals as well as continuity of the function $h(\tau)$, we obtain that the second moment of the prelimit expression on the right-hand side of (31) tends to zero when $N\to\infty$. Theorem is proved.

Let us consider one corollary of Theorem 1.

Theorem 4 [20], [21] (also see [2]-[7], [16]-[18]). *Under the conditions of Theorem* 3 *the following equality is fulfilled*

$$\int\limits_t^T h(t_1)\int\limits_t^{t_1}\phi_\tau dw_\tau^{(k+2)}dw_{t_1}^{(k+1)}\hat{I}[\psi^{(k)}]_{T,t_1}=$$

$$=\int\limits_t^T\phi_\tau dw_\tau^{(k+2)}\int\limits_\tau^T h(t_1)dw_{t_1}^{(k+1)}\hat{I}[\psi^{(k)}]_{T,t_1}\quad \textit{w. p.}\ 1. \tag{32}$$

Moreover, the stochastic integrals in (32) *exist.*

Proof. Using Theorem 1 two times, we obtain

$$\int\limits_t^T\phi_\tau dw_\tau^{(k+2)}\int\limits_\tau^T h(t_1)dw_{t_1}^{(k+1)}\hat{I}[\psi^{(k)}]_{T,t_1}=$$

$$=\int\limits_t^T\psi_1(t_1)\ldots\int\limits_t^{t_{k-1}}\psi_k(t_k)\int\limits_t^{t_k}\rho_\tau dw_\tau^{(k+1)}dw_{t_k}^{(k)}\ldots dw_{t_1}^{(1)}=$$

$$=\int\limits_t^T\rho_\tau dw_\tau^{(k+1)}\int\limits_\tau^T\psi_k(t_k)dw_{t_k}^{(k)}\ldots\int\limits_{t_2}^T\psi_1(t_1)dw_{t_1}^{(1)}\quad \text{w. p. 1},$$

where

$$\rho_\tau\stackrel{\text{def}}{=}h(\tau)\int\limits_t^\tau\phi_s dw_s^{(k+2)}.$$

Theorem 4 is proved.

6. Examples of Integration Order Replacement Technique for the Concrete Iterated Ito Stochastic Integrals

As we mentioned above, the formulas from this section could be obtained using the Ito formula. However, the method based on Theorem 1 is more simple and familiar, since it deals with usual rules of the integration order replacement for Riemann integrals.

Using the integration order replacement technique for iterated Ito stochastic integrals (Theorem 1), we obtain the following equalities which are fulfilled w. p. 1

$$\int_t^T \int_t^{t_2} df_{t_1} dt_2 = \int_t^T (T-t_1) df_{t_1},$$

$$\int_t^T \cos(t_2-T) \int_t^{t_2} df_{t_1} dt_2 = \int_t^T \sin(T-t_1) df_{t_1},$$

$$\int_t^T \sin(t_2-T) \int_t^{t_2} df_{t_1} dt_2 = \int_t^T \left(\cos(T-t_1)-1\right) df_{t_1},$$

$$\int_t^T e^{\alpha(t_2-T)} \int_t^{t_2} df_{t_1} dt_2 = \frac{1}{\alpha}\int_t^T \left(1-e^{\alpha(t_1-T)}\right) df_{t_1}, \quad \alpha\neq 0,$$

$$\int_t^T (t_2-T)^{\alpha} \int_t^{t_2} df_{t_1} dt_2 = -\frac{1}{\alpha+1}\int_t^T (t_1-T)^{\alpha+1} df_{t_1}, \quad \alpha\neq -1,$$

$$J_{(100)T,t} = \frac{1}{2}\int_t^T (T-t_1)^2 df_{t_1},$$

$$J_{(010)T,t} = \int_t^T (t_1-t)(T-t_1) df_{t_1},$$

(33) $$J_{(110)T,t} = \int_t^T (T-t_2)\int_t^{t_2} df_{t_1} df_{t_2},$$

$$J_{(101)T,t} = \int_t^T \int_t^{t_2} (t_2-t_1) df_{t_1} df_{t_2},$$

$$J_{(1011)T,t} = \int_t^T \int_t^{t_3} \int_t^{t_2} (t_2-t_1) df_{t_1} df_{t_2} df_{t_3},$$

$$J_{(1101)T,t}=\int\limits_t^T\int\limits_t^{t_3}(t_3-t_2)\int\limits_t^{t_2}df_{t_1}df_{t_2}df_{t_3},$$

$$J_{(1110)T,t}=\int\limits_t^T(T-t_3)\int\limits_t^{t_3}\int\limits_t^{t_2}df_{t_1}df_{t_2}df_{t_3},$$

$$J_{(1100)T,t}=\frac{1}{2}\int\limits_t^T(T-t_2)^2\int\limits_t^{t_2}df_{t_1}df_{t_2},$$

$$J_{(1001)T,t}=\frac{1}{2}\int\limits_t^T\int\limits_t^{t_2}(t_2-t_1)^2df_{t_1}df_{t_2},$$

(34)
$$J_{(1010)T,t}=\int\limits_t^T(T-t_2)\int\limits_t^{t_2}(t_2-t_1)df_{t_1}df_{t_2},$$

$$J_{(0110)T,t}=\int\limits_t^T(T-t_2)\int\limits_t^{t_2}(t_1-t)df_{t_1}df_{t_2},$$

$$J_{(0101)T,t}=\int\limits_t^T\int\limits_t^{t_2}(t_2-t_1)(t_1-t)df_{t_1}df_{t_2},$$

$$J_{(0010)T,t}=\frac{1}{2}\int\limits_t^T(T-t_1)(t_1-t)^2df_{t_1},$$

$$J_{(0100)T,t}=\frac{1}{2}\int\limits_t^T(T-t_1)^2(t_1-t)df_{t_1},$$

$$J_{(1000)T,t}=\frac{1}{3!}\int\limits_t^T(T-t_1)^3df_{t_1},$$

$$J_{(1\underbrace{0\ldots0}_{k-1})T,t}=\frac{1}{(k-1)!}\int\limits_t^T(T-t_1)^{k-1}df_{t_1},$$

$$J_{(11\underbrace{0\ldots0}_{k-2})T,t}=\frac{1}{(k-2)!}\int\limits_t^T(T-t_2)^{k-2}\int\limits_t^{t_2}df_{t_1}df_{t_2},$$

$$J_{(\underbrace{1\ldots 1}_{k-1}0)T,t}=\int\limits_t^T(T-t_1)J_{(\underbrace{1\ldots 1}_{k-2})t_1,t}df_{t_1},$$

$$J_{(1\underbrace{0\ldots 0}_{k-2}1)T,t}=\frac{1}{(k-2)!}\int\limits_t^T\int\limits_t^{t_2}(t_2-t_1)^{k-2}df_{t_1}df_{t_2},$$

$$J_{(10\underbrace{1\ldots 1}_{k-2})T,t}=\int\limits_t^T\ldots\int\limits_t^{t_3}\int\limits_t^{t_2}(t_2-t_1)df_{t_1}df_{t_2}\ldots df_{t_{k-1}},$$

$$J_{(\underbrace{1\ldots 1}_{k-2}01)T,t}=\int\limits_t^T\int\limits_t^{t_{k-1}}(t_{k-1}-t_{k-2})\int\limits_t^{t_{k-2}}\ldots\int\limits_t^{t_2}df_{t_1}\ldots df_{t_{k-3}}df_{t_{k-2}}df_{t_{k-1}},$$

$$J_{(10)T,t}+J_{(01)T,t}=(T-t)J_{(1)T,t},$$

$$J_{(110)T,t}+J_{(101)T,t}+J_{(011)T,t}=(T-t)J_{(11)T,t},$$

$$J_{(001)T,t}+J_{(010)T,t}+J_{(100)T,t}=\frac{(T-t)^2}{2}J_{(1)T,t},$$

$$J_{(1100)T,t}+J_{(1010)T,t}+J_{(1001)T,t}+J_{(0110)T,t}+$$

$$+J_{(0101)T,t}+J_{(0011)T,t}=\frac{(T-t)^2}{2}J_{(11)T,t},$$

$$J_{(1000)T,t}+J_{(0100)T,t}+J_{(0010)T,t}+J_{(0001)T,t}=\frac{(T-t)^3}{3!}J_{(1)T,t},$$

$$J_{(1110)T,t}+J_{(1101)T,t}+J_{(1011)T,t}+J_{(0111)T,t}=(T-t)J_{(111)T,t},$$

$$\sum_{l=1}^{k}J_{(\underbrace{0\ldots 0}_{l-1}1\underbrace{0\ldots 0}_{k-l})T,t}=\frac{1}{(k-1)!}(T-t)^{k-1}J_{(1)T,t},$$

$$\sum_{l=1}^{k}J_{(\underbrace{1\ldots 1}_{l-1}0\underbrace{1\ldots 1}_{k-l})T,t}=(T-t)J_{(\underbrace{1\ldots 1}_{k-1})T,t},$$

$$\sum_{\substack{l_1+\ldots+l_k=m\\ l_i\in\{0,\ 1\},\ i=1,\ldots,k}} J_{(l_1\ldots l_k)T,t}=\frac{(T-t)^{k-m}}{(k-m)!}J_{(\underbrace{1\ldots 1}_{m})T,t},$$

where

$$J_{(l_1\ldots l_k)T,t}=\int\limits_t^T\ldots\int\limits_t^{t_2}dw_{t_1}^{(1)}\ldots dw_{t_k}^{(k)},$$

$l_i=1$ when $w_{t_i}^{(i)}=f_{t_i}$ and $l_i=0$ when $w_{t_i}^{(i)}=t_i$ $(i=1,\ldots,k)$, f_τ is a standard Wiener process.

Let us consider two examples and show explicitly the technique on integration order replacement for iterated Ito stochastic integrals.

Example 1. *Let us prove the equality* (33). *Using Theorems* 1 *and* 3, *we obtain*

$$J_{(110)T,t}\stackrel{\rm def}{=}\int\limits_t^T\int\limits_t^{t_3}\int\limits_t^{t_2}df_{t_1}df_{t_2}dt_3=$$

$$=\int\limits_t^T df_{t_1}\int\limits_{t_1}^T df_{t_2}\int\limits_{t_2}^T dt_3=$$

$$=\int\limits_t^T df_{t_1}\int\limits_{t_1}^T df_{t_2}(T-t_2)=$$

$$=\int\limits_t^T df_{t_1}\int\limits_{t_1}^T (T-t_2)df_{t_2}=$$

$$=\int\limits_t^T(T-t_2)\int\limits_t^{t_2}df_{t_1}df_{t_2}\quad \text{w. p. 1.}$$

Example 2. *Let us prove the equality* (34). *Using Theorems* 1 *and* 3, *we obtain*

$$J_{(1010)T,t}\stackrel{\rm def}{=}\int\limits_t^T\int\limits_t^{t_4}\int\limits_t^{t_3}\int\limits_t^{t_2}df_{t_1}dt_2df_{t_3}dt_4=$$

$$=\int\limits_t^T df_{t_1}\int\limits_{t_1}^T dt_2\int\limits_{t_2}^T df_{t_3}\int\limits_{t_3}^T dt_4=$$

$$=\int\limits_t^T df_{t_1}\int\limits_{t_1}^T dt_2\int\limits_{t_2}^T df_{t_3}(T-t_3)=$$

$$=\int\limits_t^T df_{t_1}\int\limits_{t_1}^T dt_2\int\limits_{t_2}^T (T-t_3)df_{t_3}=$$

$$=\int\limits_t^T (T-t_3)\int\limits_t^{t_3}\int\limits_t^{t_2} df_{t_1}dt_2 df_{t_3}=$$

$$=\int\limits_t^T (T-t_3)\left(\int\limits_t^{t_3}\int\limits_t^{t_2} df_{t_1}dt_2\right)df_{t_3}=$$

$$=\int\limits_t^T (T-t_3)\left(\int\limits_t^{t_3} df_{t_1}\int\limits_{t_1}^{t_3} dt_2\right)df_{t_3}=$$

$$=\int\limits_t^T (T-t_3)\left(\int\limits_t^{t_3} df_{t_1}(t_3-t_1)\right)df_{t_3}=$$

$$=\int\limits_t^T (T-t_3)\left(\int\limits_t^{t_3} (t_3-t_1)df_{t_1}\right)df_{t_3}=$$

$$=\int\limits_t^T (T-t_2)\int\limits_t^{t_2} (t_2-t_1)df_{t_1}df_{t_2}\quad \text{w. p. 1.}$$

7. Integration Order Replacement Technique for Iterated Stochastic Integrals With Respect to Martingale

In this section, we will generalize the theorems on integration order replacement for iterated Ito stochastic integrals to the class of iterated stochastic integrals with respect to martingale.

Let $(\Omega, \text{F}, \mathsf{P})$ be a complete probability space and let $\{\text{F}_t, t\in[0,T]\}$ be a nondecreasing family of σ-algebras defined on the probability space $(\Omega, \text{F}, \mathsf{P})$. Suppose that $M_t,\ t\in[0,T]$ is an F_t-measurable martingale for all $t\in[0,T]$, which satisfies the condition $\mathsf{M}\left\{|M_t|\right\}<\infty.$ Moreover, for all $t\in[0,T]$ there exists an F_t- measurable and nonnegative w. p. 1 stochastic process $\rho_t,\ t\in[0,T]$ such that

$$\mathsf{M}\left\{\left(M_s-M_t\right)^2 \mid \text{F}_t\right\}=\mathsf{M}\left\{\int\limits_t^s \rho_\tau d\tau\bigg|\text{F}_t\right\}\quad \text{w. p. 1},$$

where $0\le t<s\le T.$

Let us consider the class $H_2(\rho,[0,T])$ of stochastic processes $\varphi_t,\ t\in[0,T]$, which are F_t-measurable for all $t\in[0,T]$ and satisfy the condition

$$\mathsf{M}\left\{\int\limits_0^T \varphi_t^2\rho_t dt\right\}<\infty.$$

For any partition $\tau_j^{(N)}$, $j=0,1,\ldots,N$ of the interval $[0,T]$ such that

$$0=\tau_0^{(N)}<\tau_1^{(N)}<\ldots<\tau_N^{(N)}=T,\qquad \max_{0\le j\le N-1}\left|\tau_{j+1}^{(N)}-\tau_j^{(N)}\right|\to 0\ \text{ if }\ N\to\infty \tag{35}$$

we will define the sequence of step functions

$$\varphi^{(N)}(t,\omega)=\varphi_j(\omega)\quad \text{w. p. 1}\quad \text{for}\quad t\in\left[\tau_j^{(N)},\tau_{j+1}^{(N)}\right),$$

where $j=0,1,\ldots,N-1$, $N=1,2,\ldots$

Let us define the stochastic integral with respect to martingale for $\varphi(t,\omega)\in H_2(\rho,[0,T])$ as the following mean-square limit [1]

$$\underset{N\to\infty}{\text{l.i.m.}}\sum_{j=0}^{N-1}\varphi^{(N)}\left(\tau_j^{(N)},\omega\right)\left(M\left(\tau_{j+1}^{(N)},\omega\right)-M\left(\tau_j^{(N)},\omega\right)\right)\stackrel{\text{def}}{=}\int\limits_0^T\varphi_\tau dM_\tau,$$

where $\varphi^{(N)}(t,\omega)$ is any step function from the class $H_2(\rho,[0,T])$, which converges to the function $\varphi(t,\omega)$ in the following sense

$$\lim_{N\to\infty}\int\limits_0^T\mathsf{M}\left\{\left|\varphi^{(N)}(t,\omega)-\varphi(t,\omega)\right|^2\right\}\rho_t dt=0.$$

It is well known [1] that the stochastic integral

$$\int\limits_0^T\varphi_\tau dM_\tau$$

exists and it does not depend on the selection of sequence $\varphi^{(N)}(t,\omega)$.

Let $\tilde{H}_2(\rho,[0,T])$ be the class of stochastic processes φ_τ, $\tau\in[0,T]$, which are mean-square continuous for all $\tau\in[0,T]$ and belong to the class $H_2(\rho,[0,T])$.

Let us consider the following iterated stochastic integrals

$$S[\phi,\psi^{(k)}]_{T,t}=\int\limits_t^T\psi_1(t_1)\ldots\int\limits_t^{t_{k-1}}\psi_k(t_k)\int\limits_t^{t_k}\phi_\tau dM_\tau^{(k+1)}dM_{t_k}^{(k)}\ldots dM_{t_1}^{(1)}, \tag{36}$$

$$S[\psi^{(k)}]_{T,t}=\int\limits_t^T\psi_1(t_1)\ldots\int\limits_t^{t_{k-1}}\psi_k(t_k)dM_{t_k}^{(k)}\ldots dM_{t_1}^{(1)}. \tag{37}$$

Here $\phi_\tau\in\tilde{H}_2(\rho,[t,T])$ and $\psi_1(\tau),\ldots,\psi_k(\tau)$ are continuous nonrandom functions at the interval $[t,T]$, $M_\tau^{(l)}=M_\tau$ or $M_\tau^{(l)}=\tau$ if $\tau\in[t,T]$, $l=1,\ldots,k+1$, M_τ is the martingale defined above.

Let us define the iterated stochastic integral $\hat{S}[\psi^{(k)}]_{T,s}$, $0\le t\le s\le T$, $k\ge 1$ with respect to martingale

$$\hat{S}[\psi^{(k)}]_{T,s}=\int\limits_s^T\psi_k(t_k)dM_{t_k}^{(k)}\ldots\int\limits_{t_2}^T\psi_1(t_1)dM_{t_1}^{(1)}$$

by the following recurrence relation

$$\hat{S}[\psi^{(k)}]_{T,t} \stackrel{\text{def}}{=} \underset{N\to\infty}{\text{l.i.m.}} \sum_{l=0}^{N-1} \psi_k(\tau_l)\Delta M_{\tau_l}^{(k)} \hat{S}[\psi^{(k-1)}]_{T,\tau_{l+1}}, \tag{38}$$

where $k \ge 1$, $\hat{S}[\psi^{(0)}]_{T,s} \stackrel{\text{def}}{=} 1$, $[s,T] \subseteq [t,T]$, here and further $\Delta M_{\tau_l}^{(i)} = M_{\tau_{l+1}}^{(i)} - M_{\tau_l}^{(i)}$, $i = 1,\ldots,k+1$, $l = 0,1,\ldots,N-1$, $\{\tau_l\}_{l=0}^{N}$ is the partition of the interval $[t,T]$, which satisfies the condition similar to (35), another notations are the same as in (36), (37).

Further, let us define the iterated stochastic integral $\hat{S}[\phi,\psi^{(k)}]_{T,t}$, $k \ge 1$ of the form

$$\hat{S}[\phi,\psi^{(k)}]_{T,t} = \int\limits_t^T \phi_s dM_s^{(k+1)} \hat{S}[\psi^{(k)}]_{T,s}$$

by the equality

$$\hat{S}[\phi,\psi^{(k)}]_{T,t} \stackrel{\text{def}}{=} \underset{N\to\infty}{\text{l.i.m.}} \sum_{l=0}^{N-1} \phi_{\tau_l}\Delta M_{\tau_l}^{(k+1)} \hat{S}[\psi^{(k)}]_{T,\tau_{l+1}},$$

where the sense of notations included in (36)–(38) is saved.

Let us formulate the theorem on integration order replacement for the iterated stochastic integrals with respect to martingale, which is the generalization of Theorem 1.

Theorem 5 [20], [21] (also see [2]-[7], [16]-[18]). *Let $\phi_\tau \in \tilde{H}_2(\rho,[t,T])$, every $\psi_l(\tau)$ $(l = 1,\ldots,k)$ is a continuous nonrandom function at the interval $[t,T]$, and $|\rho_\tau| \le K < \infty$ w. p. 1 for all $\tau \in [t,T]$. Then, the stochastic integral $\hat{S}[\phi,\psi^{(k)}]_{T,t}$ exists and*

$$S[\phi,\psi^{(k)}]_{T,t} = \hat{S}[\phi,\psi^{(k)}]_{T,t} \quad \text{w. p. 1}.$$

The proof of Theorem 5 is similar to the proof of Theorem 1.

Remark 2. *Let us note that we can propose another variant of the conditions in Theorem* 5. *For example, if we not require the boundedness of the process ρ_τ, then it is necessary to require the fulfillment of the following additional conditions*:

1. $\mathsf{M}\{|\rho_\tau|\} < \infty$ *for all* $\tau \in [t,T]$.
2. *The process ρ_τ is independent with the processes ϕ_τ and M_τ.*

Remark 3. *Note that it is well known the construction of stochastic integral with respect to the Wiener process with integrable process, which is not an F_τ-measurable stochastic process — the so-called Stratonovich stochastic integral* [19].

The stochastic integral $\hat{S}[\phi,\psi^{(k)}]_{T,t}$ is also the stochastic integral with integrable process, which is not an F_τ-measurable stochastic process. However, under the conditions of Theorem 5

$$S[\phi,\psi^{(k)}]_{T,t} = \hat{S}[\phi,\psi^{(k)}]_{T,t} \quad \text{w. p. 1},$$

where $S[\phi,\psi^{(k)}]_{T,t}$ is a usual iterated stochastic integral with respect to martingale. If, for example, $M_\tau, \tau \in [t,T]$ is the Wiener process, then the question on connection between stochastic integral $\hat{S}[\phi,\psi^{(k)}]_{T,t}$ and Stratonovich stochastic integral is solving as a standard question on connection between Stratonovich and Ito stochastic integrals [19].

Let us consider several statements, which are the generalizations of theorems formulated in the previous sections.

Assume that $D_k = \{(t_1,\ldots,t_k):\ t \le t_1 < \ldots < t_k \le T\}$ and the following conditions are met:

BI. $\xi_\tau \in \tilde{H}_2(\rho,[t,T])$.

BII. $\Phi(t_1,\ldots,t_{k-1})$ is a continuous nonrandom function in the closed domain D_{k-1} (recall that we use the same symbol D_{k-1} to denote the open and closed domains corresponding to the domain D_{k-1}; however, we always specify what domain we consider (open or closed)).

Let us define the following stochastic integrals with respect to martingale

$$\hat{S}[\xi,\Phi]^{(k)}_{T,t} = \int\limits_t^T \xi_{t_k} dM^{(k)}_{t_k} \ldots \int\limits_{t_3}^T dM^{(2)}_{t_2} \int\limits_{t_2}^T \Phi(t_1,t_2,\ldots,t_{k-1}) dM^{(1)}_{t_1} \stackrel{\rm def}{=}$$

$$\stackrel{\rm def}{=} \mathop{\hbox{\rm l.i.m.}}\limits_{N\to\infty} \sum_{l=0}^{N-1} \xi_{\tau_l} \Delta M^{(k)}_{\tau_l} \int\limits_{\tau_{l+1}}^T dM^{(k-1)}_{t_{k-1}} \ldots \int\limits_{t_3}^T dM^{(2)}_{t_2} \int\limits_{t_2}^T \Phi(t_1,t_2,\ldots,t_{k-1}) dM^{(1)}_{t_1}$$

for $k \ge 3$ and

$$\hat{S}[\xi,\Phi]^{(2)}_{T,t} = \int\limits_t^T \xi_{t_2} dM^{(2)}_{t_2} \int\limits_{t_2}^T \Phi(t_1) dM^{(1)}_{t_1} \stackrel{\rm def}{=}$$

$$\stackrel{\rm def}{=} \mathop{\hbox{\rm l.i.m.}}\limits_{N\to\infty} \sum_{l=0}^{N-1} \xi_{\tau_l} \Delta M^{(2)}_{\tau_l} \int\limits_{\tau_{l+1}}^T \Phi(t_1) dM^{(1)}_{t_1}$$

for $k = 2$, where the sense of notations included in (36)–(38) is saved. Moreover, the stochastic process ξ_τ, $\tau \in [t,T]$ belongs to the class $\tilde{H}_2(\rho,[t,T])$.

In addition, let

$$S[\xi,\Phi]^{(k)}_{T,t} = \int\limits_t^T \ldots \int\limits_t^{t_{k-1}} \Phi(t_1,\ldots,t_{k-1}) \xi_{t_k} dM^{(k)}_{t_k} \ldots dM^{(1)}_{t_1}, \quad k \ge 2, \tag{39}$$

where the right-hand side of (39) is the iterated stochastic integral with respect to martingale.

Let us introduce the following iterated stochastic integrals with respect to martingale

$$\tilde{S}[\Phi]^{(k-1)}_{T,t} = \int\limits_t^T dM^{(k-1)}_{t_{k-1}} \ldots \int\limits_{t_3}^T dM^{(2)}_{t_2} \int\limits_{t_2}^T \Phi(t_1,t_2,\ldots,t_{k-1}) dM^{(1)}_{t_1} \stackrel{\rm def}{=}$$

$$\stackrel{\rm def}{=} \mathop{\hbox{\rm l.i.m.}}\limits_{N\to\infty} \sum_{l=0}^{N-1} \Delta M^{(k-1)}_{\tau_l} \int\limits_{\tau_{l+1}}^T dM^{(k-2)}_{t_{k-2}} \ldots \int\limits_{t_3}^T dM^{(2)}_{t_2} \int\limits_{t_2}^T \Phi(t_1,t_2,\ldots,t_{k-1}) dM^{(1)}_{t_1},$$

$$S'[\Phi]^{(k-1)}_{T,t} = \int\limits_t^T \ldots \int\limits_t^{t_{k-2}} \Phi(t_1,\ldots,t_{k-1}) dM^{(k-1)}_{t_{k-1}} \ldots dM^{(1)}_{t_1}, \quad k \ge 2.$$

It is easy to demonstrate similarly to the proof of Theorem 5 that under the condition BII the stochastic integral $\tilde{S}[\Phi]_{T,t}^{(k-1)}$ exists and

$$S'[\Phi]_{T,t}^{(k-1)} = \tilde{S}[\Phi]_{T,t}^{(k-1)} \quad \text{w. p. } 1.$$

In its turn, using this fact we can prove the following theorem similarly to the proof of Theorem 5.

Theorem 6 [20], [21] (also see [2]-[7], [16]-[18]). *Let the conditions* BI, BII *of this section are fulfilled and* $|\rho_\tau| \le K < \infty$ *w. p.* 1 *for all* $\tau \in [t, T]$. *Then, the stochastic integral* $\hat{S}[\xi, \Phi]_{T,t}^{(k)}$ *exists and for* $k \ge 2$

$$S[\xi, \Phi]_{T,t}^{(k)} = \hat{S}[\xi, \Phi]_{T,t}^{(k)} \quad \textit{w. p. } 1.$$

Theorem 6 is the generalization of Theorem 2 for the case of iterated stochastic integrals with respect to martingale.

Let us consider two statements.

Theorem 7 [20], [21] (also see [2]-[7], [16]-[18]). *Let the conditions of Theorem* 5 *are fulfilled and* $h(\tau)$ *is a continuous nonrandom function at the interval* $[t, T]$. *Then*

$$\int\limits_t^T \phi_\tau dM_\tau^{(k+1)} h(\tau) \hat{S}[\psi^{(k)}]_{T,\tau} = \int\limits_t^T \phi_\tau h(\tau) dM_\tau^{(k+1)} \hat{S}[\psi^{(k)}]_{T,\tau} \quad \textit{w. p. } 1 \tag{40}$$

and stochastic integrals on the left-hand side of (40) *as well as on the right-hand side of* (40) *exist.*

Theorem 8 [20], [21] (also see [2]-[7], [16]-[18]). *Under the conditions of Theorem* 7

$$\int\limits_t^T h(t_1) \int\limits_t^{t_1} \phi_\tau dM_\tau^{(k+2)} dM_{t_1}^{(k+1)} \hat{S}[\psi^{(k)}]_{T,t_1} =$$

$$= \int\limits_t^T \phi_\tau dM_\tau^{(k+2)} \int\limits_\tau^T h(t_1) dM_{t_1}^{(k+1)} \hat{S}[\psi^{(k)}]_{T,t_1} \ \text{w. p. } 1. \tag{41}$$

Moreover, the stochastic integrals in (41) *exist.*

The proofs of Theorems 7 and 8 are similar to the proofs of Theorems 3 and 4 correspondingly.

Remark 4. *The integration order replacement technique for iterated Ito stochastic integrals* (*Theorems* 1–4) [2]-[15], [16]-[18] *has been successfully applied for construction of the so-called unified Taylor–Ito and Taylor–Stratonovich expansions* [16]-[18] (*see references therein*) *as well as for proof and development of the mean-square approximation method for iterated Ito and Stratonovich stochastic integrals based on generalized multiple Fourier series* [16]-[18] (*see references therein*).

Chapter 7.

Implementation to the High-Order Strong Numerical Methods for Ito SDEs

OPTIMIZATION OF THE MEAN-SQUARE APPROXIMATION PROCEDURES FOR ITERATED ITO STOCHASTIC INTEGRALS OF MULTIPLICITIES 1 TO 5 FROM THE UNIFIED TAYLOR–ITO EXPANSION BASED ON MULTIPLE FOURIER–LEGENDRE SERIES

MIKHAIL D. KUZNETSOV AND DMITRIY F. KUZNETSOV

Abstract. The article is devoted to optimization of the mean-square approximation procedures for iterated Ito stochastic integrals of multiplicities 1 to 5. The mentioned stochastic integrals are part of strong numerical methods with convergence orders 1.0, 1.5, 2.0, and 2.5 for Ito stochastic differential equations with multidimensional non-commutative noise based on the unified Taylor–Ito expansion and multiple Fourier–Legendre series converging in the sense of norm in Hilbert space $L_2([t,T]^k)$ $(k = 1,\ldots,5)$. In this article we use multiple Fourier–Legendre series within the framework of the method of expansion and mean-square approximation of iterated Ito stochastic integrals based on generalized multiple Fourier series. We show that the lengths of sequences of independent standard Gaussian random variables required for the mean-square approximation of iterated Ito stochastic integrals of multiplicities 1 to 5 can be significantly reduced without the loss of the mean-square accuracy of approximation for these stochastic integrals.

Mathematics Subject Classification: 60H05, 60H10, 42B05, 42C10.

Keywords: Iterated Ito stochastic integral, Iterated Stratonovich stochastic integral, Generalized multiple Fourier series, Multiple Fourier–Legendre series, Multiple trigonometric Fourier series, Ito stochastic differential equation, Taylor–Ito expansion, Numerical solution, Mean-square approximation, Convergence with propability 1, Expansion.

1. Explicit One-Step Strong Numerical Methods with Convergence Orders 1.0, 1.5, 2.0, and 2.5 for Ito SDEs Based on the Unified Taylor–Ito Expansion

Let $(\Omega,\ \mathrm{F},\ \mathsf{P})$ be a complete probability space, let $\{\mathrm{F}_t, t\in[0,T]\}$ be a nondecreasing right-continuous family of σ-algebras of F, and let $\mathbf{f}_t$ be a standard m-dimensional Wiener stochastic process, which is F_t-measurable for any $t\in[0,T]$. We assume that the components $\mathbf{f}_t^{(i)}$ $(i=1,\ldots,m)$ of this process are independent. Consider an Ito stochastic differential equation (SDE) in the integral form

$$\mathbf{x}_t=\mathbf{x}_0+\int\limits_0^t \mathbf{a}(\mathbf{x}_\tau,\tau)d\tau+\sum_{i=1}^m\int\limits_0^t B_i(\mathbf{x}_\tau,\tau)d\mathbf{f}_\tau^{(i)},\quad \mathbf{x}_0=\mathbf{x}(0,\omega). \tag{1}$$

Here $\mathbf{x}_t$ is some n-dimensional stochastic process satisfying the Ito SDE (1). The nonrandom functions $\mathbf{a}(\mathbf{x},t):\mathbb{R}^n\times[0,T]\to\mathbb{R}^n$, $B(\mathbf{x},t):\mathbb{R}^n\times[0,T]\to\mathbb{R}^{n\times m}$ guarantee the existence and uniqueness up to stochastic equivalence of a solution of the Ito SDE (1) [1]. The second integral on the right-hand side of (1) is interpreted as an Ito stochastic integral and $B_i(\mathbf{x},t)$ is the ith colomn of the matrix function $B(\mathbf{x},t)$. Let $\mathbf{x}_0$ be an n-dimensional random variable, which is F_0-measurable and $\mathsf{M}\bigl\{|\mathbf{x}_0|^2\bigr\}<\infty$ (M is an expectation operator). We assume that $\mathbf{x}_0$ and $\mathbf{f}_t-\mathbf{f}_0$ are independent when $t>0$.

It is well known that one of the promising approaches to the numerical integration of Ito SDEs is an approach based on the stochastic Taylor expansions [2]-[10]. The essential feature of such stochastic expansions is a presence in them of the so-called iterated Ito and Stratonovich stochastic integrals, which play the key role for solving the problem of numerical integration of Ito SDEs and have the following form

$$J[\psi^{(k)}]_{T,t}=\int\limits_t^T\psi_k(t_k)\ldots\int\limits_t^{t_2}\psi_1(t_1)d\mathbf{w}_{t_1}^{(i_1)}\ldots d\mathbf{w}_{t_k}^{(i_k)}, \tag{2}$$

$$J^*[\psi^{(k)}]_{T,t}=\int\limits_t^{*T}\psi_k(t_k)\ldots\int\limits_t^{*t_2}\psi_1(t_1)d\mathbf{w}_{t_1}^{(i_1)}\ldots d\mathbf{w}_{t_k}^{(i_k)}, \tag{3}$$

where every $\psi_l(\tau)$ $(l=1,\ldots,k)$ is a nonrandom function on $[t,T]$, $\mathbf{w}_\tau^{(i)}=\mathbf{f}_\tau^{(i)}$ for $i=1,\ldots,m$ and $\mathbf{w}_\tau^{(0)}=\tau$,

$$\int\ \text{and}\ \int\limits^{*}$$

denote Ito and Stratonovich stochastic integrals, respectively; $i_1,\ldots,i_k=0,1,\ldots,m$ (in this paper, we use the definition of the Stratonovich stochastic integral from [3]).

Note that $\psi_l(\tau)\equiv 1$ $(l=1,\ldots,k)$ and $i_1,\ldots,i_k=0,1,\ldots,m$ in the classical Taylor–Ito and Taylor–Stratonovich expansions [3], [4]. At the same time $\psi_l(\tau)\equiv(t-\tau)^{q_l}$ $(l=1,\ldots,k;\ q_1,\ldots,q_k=0,1,2,\ldots)$ and $i_1,\ldots,i_k=1,\ldots,m$ in the unified Taylor–Ito and Taylor–Stratonovich expansions [5]-[14].

Let $C^{2,1}(\mathbb{R}^n\times[0,T])$ be the space of functions $R(\mathbf{x},t):\mathbb{R}^n\times[0,T]\to\mathbb{R}^1$ with the following property: these functions are twice continuously differentiable in $\mathbf{x}$ and have one continuous derivative in t. Let us consider the following differential operators on the space $C^{2,1}(\mathbb{R}^n\times[0,T])$

$$L=\frac{\partial}{\partial t}+\sum_{i=1}^{n}a^{(i)}(\mathbf{x},t)\frac{\partial}{\partial\mathbf{x}^{(i)}}+\frac{1}{2}\sum_{j=1}^{m}\sum_{l,i=1}^{n}B^{(lj)}(\mathbf{x},t)B^{(ij)}(\mathbf{x},t)\frac{\partial^2}{\partial\mathbf{x}^{(l)}\partial\mathbf{x}^{(i)}},\qquad(4)$$

$$G_0^{(i)}=\sum_{j=1}^{n}B^{(ji)}(\mathbf{x},t)\frac{\partial}{\partial\mathbf{x}^{(j)}},\quad i=1,\ldots,m,\qquad(5)$$

where $a^{(i)}(\mathbf{x},t)$ is the ith component of the vector function $a(\mathbf{x},t)$ and $B^{(ij)}(\mathbf{x},t)$ is the ijth element of the matrix function $B(\mathbf{x},t)$.

Consider the following sequence of differential operators

$$G_p^{(i)}=\frac{1}{p}\left(G_{p-1}^{(i)}L-LG_{p-1}^{(i)}\right),\quad p=1,2,\ldots,\quad i=1,\ldots,m,$$

where L and $G_0^{(i)}$, $i=1,\ldots,m$ are defined by the equalities (4), (5).

For the further consideration, we need to introduce the following set of iterated Ito stochastic integrals

$$I_{(l_1\ldots l_k)s,t}^{(i_1\ldots i_k)}=\int\limits_t^s(t-t_k)^{l_k}\ldots\int\limits_t^{t_2}(t-t_1)^{l_1}d\mathbf{f}_{t_1}^{(i_1)}\ldots d\mathbf{f}_{t_k}^{(i_k)},\qquad(6)$$

where $l_1,\ldots,l_k=0,1,\ldots$ and $i_1,\ldots,l_k=1,\ldots,m$.

Assume that $R(\mathbf{x},t)$, $\mathbf{a}(\mathbf{x},t)$, and $B_i(\mathbf{x},t)$, $i=1,\ldots,m$ are enough smooth functions with respect to the variables $\mathbf{x}$ and t. Then for all $s,t\in[0,T]$ such that $s>t$ we can write the following unified Taylor–Ito expansion [5]-[14]

$$R(\mathbf{x}_s,s)=R(\mathbf{x}_t,t)+\sum_{q=1}^{r}\sum_{(k,j,l_1,\ldots,l_k)\in\mathrm{D}_q}\frac{(s-t)^j}{j!}\sum_{i_1,\ldots,i_k=1}^{m}G_{l_1}^{(i_1)}\ldots G_{l_k}^{(i_k)}L^jR(\mathbf{x}_t,t)\ I_{(l_1\ldots l_k)s,t}^{(i_1\ldots i_k)}+$$

$$+\left(H_{r+1}\right)_{s,t}\quad\text{w. p. 1},\qquad(7)$$

where

$$L^jR(\mathbf{x},t)\stackrel{\sf def}{=}\begin{cases}\underbrace{L\ldots L}_{j}R(\mathbf{x},t) & \text{for } j\ge 1\\ \\ R(\mathbf{x},t) & \text{for } j=0\end{cases},$$

(8) $$\mathrm{D}_q=\left\{(k,j,l_1,\ldots,l_k):\ k+2\left(j+\sum_{p=1}^{k}l_p\right)=q;\ k,j,l_1,\ldots,l_k=0,1,\ldots\right\},$$

and $(H_{r+1})_{s,t}$ is the remainder term in integral form [5]-[14].

Consider the partition $\{\tau_p\}_{p=0}^{N}$ of the interval $[0,T]$ such that

(9) $$0=\tau_0<\tau_1<\ldots<\tau_N=T,\quad \Delta_N=\max_{0\le j\le N-1}|\tau_{j+1}-\tau_j|.$$

Let $\mathbf{y}_{\tau_j}\stackrel{\mathsf{def}}{=}\mathbf{y}_j$, $j=0,1,\ldots,N$ be a time discrete approximation of the process $\mathbf{x}_t$, $t\in[0,T]$, which is a solution of the Ito SDE (1).

Definiton 1 [3]. *We will say that a time discrete approximation* $\mathbf{y}_j$, $j=0,1,\ldots,N$, *corresponding to the maximal step of discretization* Δ_N, *converges strongly with order* $\gamma>0$ *at time moment* T *to the process* $\mathbf{x}_t$, $t\in[0,T]$, *if there exists a constant* $C>0$, *which does not depend on* Δ_N, *and a* $\delta>0$ *such that*

$$\mathsf{M}\{|\mathbf{x}_T-\mathbf{y}_T|\}\le C(\Delta_N)^{\gamma}$$

for each $\Delta_N\in(0,\delta)$.

From (7) for $s=\tau_{p+1}$ and $t=\tau_p$ we obtain the following representation for family of explicit one-step strong numerical schemes for the Ito SDE (1)

$$\mathbf{y}_{p+1}=\mathbf{y}_p+\sum_{q=1}^{r}\sum_{(k,j,l_1,\ldots,l_k)\in\mathrm{D}_q}\frac{(\tau_{p+1}-\tau_p)^j}{j!}\sum_{i_1,\ldots,i_k=1}^{m}G_{l_1}^{(i_1)}\ldots G_{l_k}^{(i_k)}L^j\,\mathbf{y}_p\ \hat{I}_{(l_1\ldots l_k)\tau_{p+1},\tau_p}^{(i_1\ldots i_k)}+$$

(10) $$+\mathbf{1}_{\{r=2d-1,d\in\mathbb{N}\}}\frac{(\tau_{p+1}-\tau_p)^{(r+1)/2}}{((r+1)/2)!}L^{(r+1)/2}\mathbf{y}_p,$$

where $\hat{I}_{(l_1\ldots l_k)\tau_{p+1},\tau_p}^{(i_1\ldots i_k)}$ is an approximation of the iterated Ito stochastic integral (6). The equality (10) should be understood componentwise with respect to the components $\mathbf{y}_p^{(i)}$ of the column $\mathbf{y}_p$. Let for simplicity $\tau_p=p\Delta$, $\Delta=T/N$, $T=\tau_N$, $p=0,1,\ldots,N$.

It is known [3] that under the standard conditions the numerical scheme (10) has strong order of convergence $r/2$ $(r\in\mathbb{N})$.

Further, we consider particular cases of the numerical scheme (10) for $r=2,3,4,$ and 5, i.e. explicit one-step strong numerical schemes with convergence orders $1.0, 1.5, 2.0,$ and 2.5 for the Ito SDE (1). At that for simplicity we will write $\mathbf{a}$, $L\mathbf{a}$, B_i, $G_0^{(i)}B_j$ etc. instead of $\mathbf{a}(\mathbf{y}_p,\tau_p)$, $L\mathbf{a}(\mathbf{y}_p,\tau_p)$, $B_i(\mathbf{y}_p,\tau_p)$, $G_0^{(i)}B_j(\mathbf{y}_p,\tau_p)$ etc. correspondingly. Here L and $G_0^{(i)}$, $i=1,\ldots,m$ are defined by the equalities (4), (5). Thus, we obtain the following numerical schemes.

Milstein scheme (Scheme with strong order 1.0)

(11) $$\mathbf{y}_{p+1}=\mathbf{y}_p+\sum_{i_1=1}^{m}B_{i_1}\hat{I}_{(0)\tau_{p+1},\tau_p}^{(i_1)}+\Delta\mathbf{a}+\sum_{i_1,i_2=1}^{m}G_0^{(i_1)}B_{i_2}\hat{I}_{(00)\tau_{p+1},\tau_p}^{(i_1 i_2)}.$$

Scheme with strong order 1.5

$$\mathbf{y}_{p+1}=\mathbf{y}_p+\sum_{i_1=1}^{m}B_{i_1}\hat I_{(0)\tau_{p+1},\tau_p}^{(i_1)}+\Delta\mathbf{a}+\sum_{i_1,i_2=1}^{m}G_0^{(i_1)}B_{i_2}\hat I_{(00)\tau_{p+1},\tau_p}^{(i_1i_2)}+$$

$$+\sum_{i_1=1}^{m}\left[G_0^{(i_1)}\mathbf{a}\left(\Delta\hat I_{(0)\tau_{p+1},\tau_p}^{(i_1)}+\hat I_{(1)\tau_{p+1},\tau_p}^{(i_1)}\right)-LB_{i_1}\hat I_{(1)\tau_{p+1},\tau_p}^{(i_1)}\right]+$$

$$+\sum_{i_1,i_2,i_3=1}^{m}G_0^{(i_1)}G_0^{(i_2)}B_{i_3}\hat I_{(000)\tau_{p+1},\tau_p}^{(i_1i_2i_3)}+\frac{\Delta^2}{2}L\mathbf{a}. \tag{12}$$

Scheme with strong order 2.0

$$\mathbf{y}_{p+1}=\mathbf{y}_p+\sum_{i_1=1}^{m}B_{i_1}\hat I_{(0)\tau_{p+1},\tau_p}^{(i_1)}+\Delta\mathbf{a}+\sum_{i_1,i_2=1}^{m}G_0^{(i_1)}B_{i_2}\hat I_{(00)\tau_{p+1},\tau_p}^{(i_1i_2)}+$$

$$+\sum_{i_1=1}^{m}\left[G_0^{(i_1)}\mathbf{a}\left(\Delta\hat I_{(0)\tau_{p+1},\tau_p}^{(i_1)}+\hat I_{(1)\tau_{p+1},\tau_p}^{(i_1)}\right)-LB_{i_1}\hat I_{(1)\tau_{p+1},\tau_p}^{(i_1)}\right]+$$

$$+\sum_{i_1,i_2,i_3=1}^{m}G_0^{(i_1)}G_0^{(i_2)}B_{i_3}\hat I_{(000)\tau_{p+1},\tau_p}^{(i_1i_2i_3)}+\frac{\Delta^2}{2}L\mathbf{a}+$$

$$+\sum_{i_1,i_2=1}^{m}\left[G_0^{(i_1)}LB_{i_2}\left(\hat I_{(10)\tau_{p+1},\tau_p}^{(i_1i_2)}-\hat I_{(01)\tau_{p+1},\tau_p}^{(i_1i_2)}\right)-LG_0^{(i_1)}B_{i_2}\hat I_{(10)\tau_{p+1},\tau_p}^{(i_1i_2)}+\right.$$

$$\left.+G_0^{(i_1)}G_0^{(i_2)}\mathbf{a}\left(\hat I_{(01)\tau_{p+1},\tau_p}^{(i_1i_2)}+\Delta\hat I_{(00)\tau_{p+1},\tau_p}^{(i_1i_2)}\right)\right]+$$

$$+\sum_{i_1,i_2,i_3,i_4=1}^{m}G_0^{(i_1)}G_0^{(i_2)}G_0^{(i_3)}B_{i_4}\hat I_{(0000)\tau_{p+1},\tau_p}^{(i_1i_2i_3i_4)}. \tag{13}$$

Scheme with strong order 2.5

$$\mathbf{y}_{p+1}=\mathbf{y}_p+\sum_{i_1=1}^{m}B_{i_1}\hat I_{(0)\tau_{p+1},\tau_p}^{(i_1)}+\Delta\mathbf{a}+\sum_{i_1,i_2=1}^{m}G_0^{(i_1)}B_{i_2}\hat I_{(00)\tau_{p+1},\tau_p}^{(i_1i_2)}+$$

$$+\sum_{i_1=1}^{m}\left[G_0^{(i_1)}\mathbf{a}\left(\Delta\hat I_{(0)\tau_{p+1},\tau_p}^{(i_1)}+\hat I_{(1)\tau_{p+1},\tau_p}^{(i_1)}\right)-LB_{i_1}\hat I_{(1)\tau_{p+1},\tau_p}^{(i_1)}\right]+$$

$$+\sum_{i_1,i_2,i_3=1}^{m} G_0^{(i_1)}G_0^{(i_2)}B_{i_3}\hat{I}_{(000)\tau_{p+1},\tau_p}^{(i_1 i_2 i_3)} + \frac{\Delta^2}{2}L\mathbf{a}+$$

$$+\sum_{i_1,i_2=1}^{m}\Biggl[G_0^{(i_1)}LB_{i_2}\left(\hat{I}_{(10)\tau_{p+1},\tau_p}^{(i_1 i_2)} - \hat{I}_{(01)\tau_{p+1},\tau_p}^{(i_1 i_2)}\right) - LG_0^{(i_1)}B_{i_2}\hat{I}_{(10)\tau_{p+1},\tau_p}^{(i_1 i_2)}+$$

$$+G_0^{(i_1)}G_0^{(i_2)}\mathbf{a}\left(\hat{I}_{(01)\tau_{p+1},\tau_p}^{(i_1 i_2)} + \Delta\hat{I}_{(00)\tau_{p+1},\tau_p}^{(i_1 i_2)}\right)\Biggr]+$$

$$+\sum_{i_1,i_2,i_3,i_4=1}^{m} G_0^{(i_1)}G_0^{(i_2)}G_0^{(i_3)}B_{i_4}\hat{I}_{(0000)\tau_{p+1},\tau_p}^{(i_1 i_2 i_3 i_4)}+$$

$$+\sum_{i_1=1}^{m}\Biggl[G_0^{(i_1)}L\mathbf{a}\left(\frac{1}{2}\hat{I}_{(2)\tau_{p+1},\tau_p}^{(i_1)} + \Delta\hat{I}_{(1)\tau_{p+1},\tau_p}^{(i_1)} + \frac{\Delta^2}{2}\hat{I}_{(0)\tau_{p+1},\tau_p}^{(i_1)}\right)+$$

$$+\frac{1}{2}LLB_{i_1}\hat{I}_{(2)\tau_{p+1},\tau_p}^{(i_1)} - LG_0^{(i_1)}\mathbf{a}\left(\hat{I}_{(2)\tau_{p+1},\tau_p}^{(i_1)} + \Delta\hat{I}_{(1)\tau_{p+1},\tau_p}^{(i_1)}\right)\Biggr]+$$

$$+\sum_{i_1,i_2,i_3=1}^{m}\Biggl[G_0^{(i_1)}LG_0^{(i_2)}B_{i_3}\left(\hat{I}_{(100)\tau_{p+1},\tau_p}^{(i_1 i_2 i_3)} - \hat{I}_{(010)\tau_{p+1},\tau_p}^{(i_1 i_2 i_3)}\right)+$$

$$+G_0^{(i_1)}G_0^{(i_2)}LB_{i_3}\left(\hat{I}_{(010)\tau_{p+1},\tau_p}^{(i_1 i_2 i_3)} - \hat{I}_{(001)\tau_{p+1},\tau_p}^{(i_1 i_2 i_3)}\right)+$$

$$+G_0^{(i_1)}G_0^{(i_2)}G_0^{(i_3)}\mathbf{a}\left(\Delta\hat{I}_{(000)\tau_{p+1},\tau_p}^{(i_1 i_2 i_3)} + \hat{I}_{(001)\tau_{p+1},\tau_p}^{(i_1 i_2 i_3)}\right)-$$

$$-LG_0^{(i_1)}G_0^{(i_2)}B_{i_3}\hat{I}_{(100)\tau_{p+1},\tau_p}^{(i_1 i_2 i_3)}\Biggr]+$$

$$+\sum_{i_1,i_2,i_3,i_4,i_5=1}^{m} G_0^{(i_1)}G_0^{(i_2)}G_0^{(i_3)}G_0^{(i_4)}B_{i_5}\hat{I}_{(00000)\tau_{p+1},\tau_p}^{(i_1 i_2 i_3 i_4 i_5)}+$$

$$+\frac{\Delta^3}{6}LL\mathbf{a}. \tag{14}$$

It is well known [3] that under the standard conditions the numerical schemes (12)–(14) have strong orders of convergence 1.0, 1.5, 2.0, and 2.5 correspondingly. Among these conditions we consider only the condition for approximations of iterated Ito stochastic integrals from the numerical schemes (12)–(14) [3] (also see [6])

$$\mathsf{M}\left\{\left(I_{(l_1\ldots l_k)\tau_{p+1},\tau_p}^{(i_1\ldots i_k)} - \hat{I}_{(l_1\ldots l_k)\tau_{p+1},\tau_p}^{(i_1\ldots i_k)}\right)^2\right\} \le C\Delta^{r+1}, \tag{15}$$

where constant C is independent of Δ and $r/2$ is the strong order of convergence for the numerical schemes (12)–(14), i.e. $r/2 = 1.0, 1.5, 2.0,$ and 2.5.

Note that the numerical schemes (11)–(14) are unrealizable in practice without effective procedures for the numerical simulation of iterated Ito stochastic integrals from (10). That is why in the next section, we consider the effective method of the mean-square approximation of iterated Ito and Stratonovich stochastic integrals of arbitrary multiplicity k ($k \in \mathbb{N}$).

2. Method of Expansion and Mean-Square Approximation of Iterated Ito and Stratonovich Stochastic Integrals Based on Generalized Multiple Fourier Series

Let us consider the effective approach to expansion and mean-square approximation of iterated Ito stochastic integrals [6] (2006), [7]-[14], [17]-[47] (the so-called method of generalized multiple Fourier series).

The idea of this method is as follows: the iterated Ito stochastic integral (2) of the multiplicity k ($k \in \mathbb{N}$) is represented as the multiple stochastic integral from the certain discontinuous nonrandom function of k variables defined on the hypercube $[t,T]^k$. Here $[t,T]$ is the interval of integration of the iterated Ito stochastic integral (2). Then, the mentioned nonrandom function of k variables is expanded in the hypercube $[t,T]^k$ into the generalized multiple Fourier series converging in the mean-square sense in the space $L_2([t,T]^k)$. After a number of nontrivial transformations we come to the mean-square converging expansion of the iterated Ito stochastic integral (2) into the multiple series of products of standard Gaussian random variables. The coefficients of this series are the coefficients of generalized multiple Fourier series for the mentioned nonrandom function of k variables, which can be calculated using the explicit formula regardless of the multiplicity k of the iterated Ito stochastic integral (2).

Suppose that $\psi_1(\tau),\ldots,\psi_k(\tau) \in L_2([t,T])$. Define the following function on the hypercube $[t,T]^k$

$$K(t_1,\ldots,t_k) = \begin{cases} \psi_1(t_1)\ldots\psi_k(t_k) & \text{for} \quad t_1 < \ldots < t_k \\ \\ 0 & \text{otherwise} \end{cases}, \quad t_1,\ldots,t_k \in [t,T], \quad k \geq 2, \tag{16}$$

and $K(t_1) \equiv \psi_1(t_1)$ for $t_1 \in [t,T]$.

Suppose that $\{\phi_j(x)\}_{j=0}^{\infty}$ is a complete orthonormal system of functions in the space $L_2([t,T])$. The function $K(t_1,\ldots,t_k)$ belongs to the space $L_2([t,T]^k)$. At this situation it is well known that the generalized multiple Fourier series of $K(t_1,\ldots,t_k) \in L_2([t,T]^k)$ is converging to $K(t_1,\ldots,t_k)$ in the hypercube $[t,T]^k$ in the mean-square sense, i.e.

$$\lim_{p_1,\ldots,p_k\to\infty} \left\| K(t_1,\ldots,t_k) - \sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k} C_{j_k\ldots j_1}\prod_{l=1}^{k}\phi_{j_l}(t_l)\right\|_{L_2([t,T]^k)} = 0,$$

where

$$C_{j_k\ldots j_1} = \int\limits_{[t,T]^k} K(t_1,\ldots,t_k)\prod_{l=1}^{k}\phi_{j_l}(t_l)dt_1\ldots dt_k \tag{17}$$

is the Fourier coefficient,

$$\|f\|_{L_2([t,T]^k)} = \left(\int\limits_{[t,T]^k} f^2(t_1,\ldots,t_k)dt_1\ldots dt_k \right)^{1/2}.$$

Consider the partition $\{\tau_j\}_{j=0}^N$ of the interval $[t,T]$ such that

$$t=\tau_0<\ldots<\tau_N=T,\quad \Delta_N=\max_{0\le j\le N-1}\Delta\tau_j\to 0\ \text{ if }\ N\to\infty,\quad \Delta\tau_j=\tau_{j+1}-\tau_j. \tag{18}$$

Theorem 1 [6] (2006), [7]-[14], [17]-[47]. *Suppose that every $\psi_l(\tau)$ $(l=1,\ldots,k)$ is a continuous nonrandom function on $[t,T]$ and $\{\phi_j(x)\}_{j=0}^\infty$ is a complete orthonormal system of continuous functions in the space $L_2([t,T])$. Then*

$$J[\psi^{(k)}]_{T,t} \ = \underset{p_1,\ldots,p_k\to\infty}{\text{l.i.m.}} \sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k} C_{j_k\ldots j_1}\left(\prod_{l=1}^k \zeta_{j_l}^{(i_l)} - \right.$$

$$\left. - \underset{N\to\infty}{\text{l.i.m.}} \sum_{(l_1,\ldots,l_k)\in \text{G}_k} \phi_{j_1}(\tau_{l_1})\Delta\mathbf{w}_{\tau_{l_1}}^{(i_1)}\ldots\phi_{j_k}(\tau_{l_k})\Delta\mathbf{w}_{\tau_{l_k}}^{(i_k)}\right), \tag{19}$$

where $J[\psi^{(k)}]_{T,t}$ is defined by (2),

$$\text{G}_k=\text{H}_k\backslash\text{L}_k,\quad \text{H}_k=\{(l_1,\ldots,l_k):\ l_1,\ldots,l_k=0,\ 1,\ldots,N-1\},$$

$$\text{L}_k=\{(l_1,\ldots,l_k):\ l_1,\ldots,l_k=0,\ 1,\ldots,N-1;\ l_g\ne l_r\ (g\ne r);\ g,r=1,\ldots,k\},$$

l.i.m. *is a limit in the mean-square sense,* $i_1,\ldots,i_k=0,1,\ldots,m$,

$$\zeta_j^{(i)} = \int\limits_t^T \phi_j(s)d\mathbf{w}_s^{(i)} \tag{20}$$

are independent standard Gaussian random variables for various i or j (if $i\ne 0$), $C_{j_k\ldots j_1}$ is the Fourier coefficient (17), $\Delta\mathbf{w}_{\tau_j}^{(i)}=\mathbf{w}_{\tau_{j+1}}^{(i)}-\mathbf{w}_{\tau_j}^{(i)}$ $(i=0,1,\ldots,m)$, $\{\tau_j\}_{j=0}^N$ *is a partition of the interval* $[t,T]$, *which satisfies the condition* (18).

Note that the adaptation of Theorem 1 for complete orthonormal systems of Haar and Rademacher–Walsh functions in the space $L_2([t,T])$ can be found in [6]-[14], [17]-[21], [24]-[26].

In order to evaluate the significance of Theorem 1 for practice we will demonstrate its transformed particular cases for $k=1,\ldots,6$ [6]-[14], [17]-[47]

$$J[\psi^{(1)}]_{T,t} = \underset{p_1\to\infty}{\text{l.i.m.}} \sum_{j_1=0}^{p_1} C_{j_1}\zeta_{j_1}^{(i_1)}, \tag{21}$$

where $\mathbf{1}_A$ is the indicator of the set A.

Thus, we obtain the following advantages and new possibilities of the method of generalized multiple Fourier series (Theorem 1) in comparison with the well known methods of approximation of iterated stochastic integrals [2]-[4], [48]-[58].

1. There is an explicit formula (see (17)) for calculation of expansion coefficients of the iterated Ito stochastic integral (2) with any fixed multiplicity k ($k \in \mathbb{N}$).

2. We have new possibilities for exact calculation and effective estimation of the mean-square approximation error of iterated Ito stochastic integral [12]-[14], [24], [25], [32] (see Sect. 3, 4).

3. Since the used multiple Fourier series is a generalized in the sense that it is built using various complete orthonormal systems of functions in the space $L_2([t,T])$, then we have new possibilities for approximation — we can use not only trigonometric functions as in [2]-[4], [48], [54], [55], [57], [58], but Legendre polynomials.

4. As it turned out [12]-[14], [28] (also see [5]-[11], [15]-[25], [30], [34]-[36], [38]-[41], [45])-[47]) it is more convenient to work with the Legendre polynomials for constructing of approximations of the iterated Ito stochastic integrals (2). Approximations based on the Legendre polynomials essentially simpler than their analogues based on the trigonometric functions (see [2]-[4], [48]-[58]). Another advantages of the application of Legendre polynomials in the framework of the mentioned problem are considered in [12]-[14] (Sect. 5.3), [35], [36].

5. The approach to expansion of iterated stochastic integrals based on the Karhunen–Loeve expansion of the Brownian bridge process [2]-[4], [48], [54], [55], [57], [58] leads to iterated application of the operation of limit transition (the operation of limit transition is implemented only once in Theorem 1) starting from the second multiplicity (in the general case) and third multiplicity (for the case $\psi_1(s),\psi_2(s),\psi_3(s)\equiv 1$; $i_1,i_2,i_3=0,1,\ldots,m$) of the iterated Ito stochastic integrals (2). The same problem (iterated application of the operation of limit transition) also appears in the method of expansion of iterated stochastic integrals based on the Wiener process series expansion using various complete orthonormal system of functions in the space $L_2([t,T])$ [49], [50]. Multiple series (the operation of limit transition is implemented only once) are more convenient for approximation than the

iterated ones (iterated application of the operation of limit transition), since partial sums of multiple series converge for any possible case of convergence to infinity of their upper limits of summation (let us denote them as $p_1, \ldots, p_k$). For example, when $p_1 = \ldots = p_k = p \to \infty$. For iterated series, the condition $p_1 = \ldots = p_k = p \to \infty$ obviously does not guarantee the convergence of this series. However, in [3] (Sect. 5.8, pp. 202–204), [4] (pp. 82-84), [48] (pp. 438-439), [55] (pp. 263-264) the authors use (without rigorous proof) the condition $p_1 = p_2 = p_3 = p \to \infty$ within the frames of the mentioned approach based on the Karhunen–Loeve expansion of the Brownian bridge process [2] together with the Wong–Zakai approximation [59]-[61] (see discussions in [12] (Sect. 2.18, 6.2), [13] (Sect. 2.6.2, 6.2), [14] (Sect. 2.6.2, 6.2), [26] (Sect. 11), [27] (Sect. 6), [28] (Sect. 8), [29] (Sect. 6) for detail).

6. Constructing the expansions of iterated Ito stochastic integrals from Theorem 1, we saved all information about these integrals. That is why it is natural to expect that the mentioned expansions will converge with probability 1 and in the mean of degree $2n$ ($n \in \mathbb{N}$). The convergence with probability 1 in Theorem 1 is proved [12]-[14], [26], [28], [32], [45] for complete orthonormal systems of Legendre polynomials and trigonometric functions in the space $L_2([t,T])$. Furthermore, the convergence in the mean of degree $2n$ ($n \in \mathbb{N}$) in Theorem 1 is proved in [8]-[14], [17]-[21], [24]-[26].

7. The versions of Theorem 1 for complete orthonormal with weight $r(t_1)\ldots r(t_k)$ systems of functions in the space $L_2([t,T]^k)$ ($k \in \mathbb{N}$) as well as for some other types of iterated stochastic integrals (iterated stochastic integrals with respect to martingale Poisson measures and iterated stochastic integrals with respect to martingales) were obtained in [12]-[14], [37] (also see [6]-[10], [17]-[21], [24], [25]).

8. The adaptation of Theorem 1 for iterated Stratonovich stochastic integrals of multiplicities 1 to 6 is realized in [12]-[14], [17]-[21], [24], [25], [27], [29], [31], [33] (see Theorems 3–7 below).

9. Application of Theorem 1 and Theorem 2 (see below) for the mean-square approximation of iterated stochastic integrals with respect to the infinite-dimensional Q-Wiener process can be found in the monographs [12]-[14] (Chapter 7) and in [38]-[41].

For further consideration, let us consider the generalization of formulas (21)–(26) for the case of an arbitrary multiplicity k ($k \in \mathbb{N}$) of the iterated Ito stochastic integral $J[\psi^{(k)}]_{T,t}$ defined by (2) as well as for the case of an arbitrary complete orthonormal systems of functions in $L_2([t,T])$ and $\psi_1(\tau), \ldots, \psi_k(\tau) \in L_2([t,T])$. In order to do this, let us introduce some notations. Consider the unordered set $\{1, 2, \ldots, k\}$ and separate it into two parts: the first part consists of r unordered pairs (sequence order of these pairs is also unimportant) and the second one consists of the remaining $k-2r$ numbers. So, we have

$$
(\{\underbrace{\{g_1, g_2\}, \ldots, \{g_{2r-1}, g_{2r}\}}_{\text{part 1}}\}, \{\underbrace{q_1, \ldots, q_{k-2r}}_{\text{part 2}}\}), \tag{27}
$$

where

$$
\{g_1, g_2, \ldots, g_{2r-1}, g_{2r}, q_1, \ldots, q_{k-2r}\} = \{1, 2, \ldots, k\},
$$

braces mean an unordered set, and parentheses mean an ordered set.

We will say that (27) is a partition and consider the sum with respect to all possible partitions

$$
\sum_{\substack{(\{\{g_1,g_2\},\ldots,\{g_{2r-1},g_{2r}\}\},\{q_1,\ldots,q_{k-2r}\}) \\ \{g_1,g_2,\ldots,g_{2r-1},g_{2r},q_1,\ldots,q_{k-2r}\}=\{1,2,\ldots,k\}}} a_{g_1 g_2,\ldots,g_{2r-1} g_{2r},q_1 \ldots q_{k-2r}}. \tag{28}
$$

Below there are several examples of sums in the form (28)

$$\sum_{\substack{(\{g_1,g_2\})\\ \{g_1,g_2\}=\{1,2\}}} a_{g_1g_2}=a_{12},$$

$$\sum_{\substack{(\{\{g_1,g_2\},\{g_3,g_4\}\})\\ \{g_1,g_2,g_3,g_4\}=\{1,2,3,4\}}} a_{g_1g_2g_3g_4}=a_{1234}+a_{1324}+a_{2314},$$

$$\sum_{\substack{(\{g_1,g_2\},\{q_1,q_2\})\\ \{g_1,g_2,q_1,q_2\}=\{1,2,3,4\}}} a_{g_1g_2,q_1q_2}=$$

$$=a_{12,34}+a_{13,24}+a_{14,23}+a_{23,14}+a_{24,13}+a_{34,12},$$

$$\sum_{\substack{(\{g_1,g_2\},\{q_1,q_2,q_3\})\\ \{g_1,g_2,q_1,q_2,q_3\}=\{1,2,3,4,5\}}} a_{g_1g_2,q_1q_2q_3}=$$

$$=a_{12,345}+a_{13,245}+a_{14,235}+a_{15,234}+a_{23,145}+a_{24,135}+$$
$$+a_{25,134}+a_{34,125}+a_{35,124}+a_{45,123},$$

$$\sum_{\substack{(\{\{g_1,g_2\},\{g_3,g_4\}\},\{q_1\})\\ \{g_1,g_2,g_3,g_4,q_1\}=\{1,2,3,4,5\}}} a_{g_1g_2,g_3g_4,q_1}=$$

$$=a_{12,34,5}+a_{13,24,5}+a_{14,23,5}+a_{12,35,4}+a_{13,25,4}+a_{15,23,4}+$$
$$+a_{12,54,3}+a_{15,24,3}+a_{14,25,3}+a_{15,34,2}+a_{13,54,2}+a_{14,53,2}+$$
$$+a_{52,34,1}+a_{53,24,1}+a_{54,23,1}.$$

Now we can formulate the following generalization of Theorem 1.

Theorem 2 [12] (Sect. 1.11), [26] (Sect. 15). *Suppose that $\psi_1(\tau),\ldots,\psi_k(\tau)\in L_2([t,T])$ and $\{\phi_j(x)\}_{j=0}^{\infty}$ is an arbitrary complete orthonormal system of functions in the space $L_2([t,T])$. Then the following expansion*

$$J[\psi^{(k)}]_{T,t}=\underset{p_1,\ldots,p_k\to\infty}{\text{l.i.m.}}\sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k}C_{j_k\ldots j_1}\Biggl(\prod_{l=1}^{k}\zeta_{j_l}^{(i_l)}+\sum_{r=1}^{[k/2]}(-1)^r\times$$

$$\times\sum_{\substack{(\{\{g_1,g_2\},\ldots,\{g_{2r-1},g_{2r}\}\},\{q_1,\ldots,q_{k-2r}\})\\ \{g_1,g_2,\ldots,g_{2r-1},g_{2r},q_1,\ldots,q_{k-2r}\}=\{1,2,\ldots,k\}}}\prod_{s=1}^{r}\mathbf{1}_{\{i_{g_{2s-1}}=\,i_{g_{2s}}\neq 0\}}\mathbf{1}_{\{j_{g_{2s-1}}=\,j_{g_{2s}}\}}\prod_{l=1}^{k-2r}\zeta_{j_{q_l}}^{(i_{q_l})}\Biggr) \quad (29)$$

converging in the mean-square sense is valid, where $[x]$ is an integer part of a real number x; another notations are the same as in Theorem 1.

It should be noted that an analogue of Theorem 2 was considered in [62]. Note that we use another notations [12] (Sect. 1.11), [26] (Sect. 15) in comparison with [62]. Moreover, the proof of an analogue of Theorem 2 from [62] is somewhat different from the proof given in [12] (Sect. 1.11), [26] (Sect. 15).

As we mentioned above, in a number of works [12]-[14], [17]-[21], [24], [25], [27], [29], [31], [33] Theorem 1 is adapted for the iterated Stratonovich stochastic integrals (3) of multiplicities 2 to 6 (the case of multiplicity 1 is given by (21)). Let as collect some old results in the following theorem.

Theorem 3 [12]-[14], [17]-[21], [24], [25], [27], [29], [31], [33]. *Suppose that* $\{\phi_j(x)\}_{j=0}^{\infty}$ *is a complete orthonormal system of Legendre polynomials or trigonometric functions in the space* $L_2([t,T])$. *At the same time* $\psi_2(\tau)$ *is a continuously differentiable function on* $[t,T]$ *and* $\psi_1(\tau)$, $\psi_3(\tau)$ *are twice continuously differentiable functions on* $[t,T]$. *Then*

$$J^*[\psi^{(2)}]_{T,t} = \underset{p_1,p_2\to\infty}{\text{l.i.m.}} \sum_{j_1=0}^{p_1}\sum_{j_2=0}^{p_2} C_{j_2j_1}\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)} \quad (i_1,i_2=1,\ldots,m), \tag{30}$$

$$J^*[\psi^{(3)}]_{T,t} = \underset{p_1,p_2,p_3\to\infty}{\text{l.i.m.}} \sum_{j_1=0}^{p_1}\sum_{j_2=0}^{p_2}\sum_{j_3=0}^{p_3} C_{j_3j_2j_1}\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}\zeta_{j_3}^{(i_3)} \quad (i_1,i_2,i_3=0,1,\ldots,m), \tag{31}$$

$$J^*[\psi^{(3)}]_{T,t} = \underset{p\to\infty}{\text{l.i.m.}} \sum_{j_1,j_2,j_3=0}^{p} C_{j_3j_2j_1}\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}\zeta_{j_3}^{(i_3)} \quad (i_1,i_2,i_3=1,\ldots,m), \tag{32}$$

$$J^*[\psi^{(4)}]_{T,t} = \underset{p\to\infty}{\text{l.i.m.}} \sum_{j_1,\ldots,j_4=0}^{p} C_{j_4j_3j_2j_1}\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}\zeta_{j_3}^{(i_3)}\zeta_{j_4}^{(i_4)} \quad (i_1,\ldots,i_4=0,1,\ldots,m), \tag{33}$$

where $J^*[\psi^{(k)}]_{T,t}$ *is defined by* (3), *and* $\psi_l(\tau)\equiv 1$ $(l=1,\ldots,4)$ *in* (31), (33); *another notations are the same as in Theorems* 1, 2.

Recently, a new approach to the expansion and mean-square approximation of iterated Stratonovich stochastic integrals has been obtained [12] (Sect. 2.10–2.16), [27] (Sect. 13–19), [31] (Sect. 5–11), [44] (Sect. 7–13), [63] (Sect. 4–9). Let us formulate four theorems that were obtained using this approach.

Theorem 4 [12], [27], [31], [44], [63]. *Suppose that* $\{\phi_j(x)\}_{j=0}^{\infty}$ *is a complete orthonormal system of Legendre polynomials or trigonometric functions in the space* $L_2([t,T])$. *Furthermore, let* $\psi_1(\tau),\psi_2(\tau)$, $\psi_3(\tau)$ *are continuously differentiable nonrandom functions on* $[t,T]$. *Then, for the iterated Stratonovich stochastic integral of third multiplicity*

$$J^*[\psi^{(3)}]_{T,t} = \int\limits_t^{*T}\psi_3(t_3)\int\limits_t^{*t_3}\psi_2(t_2)\int\limits_t^{*t_2}\psi_1(t_1)d\mathbf{w}_{t_1}^{(i_1)}d\mathbf{w}_{t_2}^{(i_2)}d\mathbf{w}_{t_3}^{(i_3)} \quad (i_1,i_2,i_3=0,1,\ldots,m)$$

the following relations

$$J^*[\psi^{(3)}]_{T,t} = \underset{p\to\infty}{\text{l.i.m.}} \sum_{j_1,j_2,j_3=0}^{p} C_{j_3j_2j_1}\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}\zeta_{j_3}^{(i_3)}, \tag{34}$$

$$\mathsf{M}\left\{\left(J^*[\psi^{(3)}]_{T,t} - \sum_{j_1,j_2,j_3=0}^{p} C_{j_3j_2j_1}\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}\zeta_{j_3}^{(i_3)}\right)^2\right\} \le \frac{C}{p} \tag{35}$$

are fulfilled, where $i_1,i_2,i_3=0,1,\ldots,m$ *in* (34) *and* $i_1,i_2,i_3=1,\ldots,m$ *in* (35), *constant* C *is independent of* p,

$$C_{j_3j_2j_1}=\int\limits_t^T\psi_3(t_3)\phi_{j_3}(t_3)\int\limits_t^{t_3}\psi_2(t_2)\phi_{j_2}(t_2)\int\limits_t^{t_2}\psi_1(t_1)\phi_{j_1}(t_1)dt_1dt_2dt_3$$

and

$$\zeta_j^{(i)}=\int\limits_t^T\phi_j(\tau)d\mathbf{f}_\tau^{(i)}$$

are independent standard Gaussian random variables for various i or j (in the case when $i\neq 0$); another notations are the same as in Theorems 1, 2.

Theorem 5 [12], [27], [31], [44], [63]. *Let $\{\phi_j(x)\}_{j=0}^{\infty}$ be a complete orthonormal system of Legendre polynomials or trigonometric functions in the space $L_2([t,T])$. $$\mathsf{M}\left\{\left(J^*[\psi^{(5)}]_{T,t} - \sum_{j_1,\ldots,j_5=0}^{p} C_{j_5\ldots j_1}\zeta_{j_1}^{(i_1)}\ldots\zeta_{j_5}^{(i_5)}\right)^2\right\} \le \frac{C}{p^{1-\varepsilon}} \tag{41}$$

are fulfilled, where $i_1,\ldots,i_5 = 0,1,\ldots,m$ *in* (39), (40) *and* $i_1,\ldots,i_5 = 1,\ldots,m$ *in* (41), *constant* C *is independent of* p, ε *is an arbitrary small positive real number for the case of complete orthonormal system of Legendre polynomials in the space* $L_2([t,T])$ *and* $\varepsilon = 0$ *for the case of complete orthonormal system of trigonometric functions in the space* $L_2([t,T])$,

$$C_{j_5\ldots j_1} = \int\limits_t^T \psi_5(t_5)\phi_{j_5}(t_5)\ldots\int\limits_t^{t_2}\psi_1(t_1)\phi_{j_1}(t_1)dt_1\ldots dt_5;$$

another notations are the same as in Theorems 4, 5.

Theorem 7 [12], [27], [31], [44]. *Suppose that* $\{\phi_j(x)\}_{j=0}^{\infty}$ *is a complete orthonormal system of Legendre polynomials or trigonometric functions in the space* $L_2([t,T])$. *Then, for the iterated Stratonovich stochastic integral of sixth multiplicity*

$$J_{T,t}^{*(i_1\ldots i_6)} = \int\limits_t^{*T}\ldots\int\limits_t^{*t_2} d\mathbf{w}_{t_1}^{(i_1)}\ldots d\mathbf{w}_{t_6}^{(i_6)}$$

the following expansion

$$J_{T,t}^{*(i_1\ldots i_6)} = \underset{p\to\infty}{\text{l.i.m.}} \sum_{j_1,\ldots,j_6=0}^{p} C_{j_6\ldots j_1}\zeta_{j_1}^{(i_1)}\ldots\zeta_{j_6}^{(i_6)}$$

that converges in the mean-square sense is valid, where $i_1,\ldots,i_6 = 0,1,\ldots,m$,

$$C_{j_6\ldots j_1} = \int\limits_t^T \phi_{j_6}(t_6)\ldots\int\limits_t^{t_2}\phi_{j_1}(t_1)dt_1\ldots dt_6;$$

another notations are the same as in Theorems 4–6.

3. Estimate for the Mean-Square Approximation Error in the Method of Approximation of Iterated Ito Stochastic Integrals Based on Generalized Multiple Fourier Series

Assume that $J[\psi^{(k)}]_{T,t}^p$ is the approximation of (2), which is the expression on the right-hand side of (29) before passing to the limit $\underset{p_1,\ldots,p_k\to\infty}{\text{l.i.m.}}$ for the case $p_1 = \ldots = p_k = p$, i.e.

$$
J[\psi^{(k)}]_{T,t}^p = \sum_{j_1,\ldots,j_k=0}^{p} C_{j_k\ldots j_1}\Biggl(\prod_{l=1}^{k}\zeta_{j_l}^{(i_l)} + \sum_{r=1}^{[k/2]}(-1)^r \times
$$

$$
\times \sum_{\substack{(\{\{g_1,g_2\},\ldots,\{g_{2r-1},g_{2r}\}\},\{q_1,\ldots,q_{k-2r}\})\\ \{g_1,g_2,\ldots,g_{2r-1},g_{2r},q_1,\ldots,q_{k-2r}\}=\{1,2,\ldots,k\}}} \prod_{s=1}^{r}\mathbf{1}_{\{i_{g_{2s-1}}=\ i_{g_{2s}}\neq 0\}}\mathbf{1}_{\{j_{g_{2s-1}}=\ j_{g_{2s}}\}}\prod_{l=1}^{k-2r}\zeta_{j_{q_l}}^{(i_{q_l})}\Biggr).
$$

Let us denote

$$
\mathsf{M}\left\{\left(J[\psi^{(k)}]_{T,t} - J[\psi^{(k)}]_{T,t}^p\right)^2\right\} \stackrel{\rm def}{=} E_k^p,
$$

$$
\|K\|_{L_2([t,T]^k)}^2 = \int\limits_{[t,T]^k} K^2(t_1,\ldots,t_k)dt_1\ldots dt_k \stackrel{\rm def}{=} I_k.
$$

When proving Theorems 1 and 2 [12]-[14] (also see [21]-[26]), we have proved the following estimate

$$
E_k^p \le k!\left(I_k - \sum_{j_1,\ldots,j_k=0}^{p} C_{j_k\ldots j_1}^2\right), \tag{42}
$$

where $i_1,\ldots,i_k = 1,\ldots,m$ for $T-t\in(0,\infty)$ and $i_1,\ldots,i_k = 0,1,\ldots,m$ for $T-t\in(0,1)$; another notations are the same as in Theorems 1, 2.

Combining the estimates (15) and (42), we obtain

$$
k!\left(I_k - \sum_{j_1,\ldots,j_k=0}^{p} C_{j_k\ldots j_1}^2\right) \le C(T-t)^{r+1}, \tag{43}
$$

where constant C is independent of $T-t$.

It is not difficult to see that the multiplier factor $k!$ on the left-hand side of (43) leads to a significant increase of the minimal natural number p satisfying the estimate (43). For example, for the numerical methods (11)–(14) we will have the following multiplier factors on the left-hand side of the inequality (43): $2!=2$, $3!=6$, $4!=24$, $5!=120$.

As we will see in the next section, the mentioned problem can be partially overcome if we calculate the mean-square approximation error E_k^p exactly.

4. Exact Formulas for the Mean-Square Approximation Error in the Method of Approximation of Iterated Ito Stochastic Integrals Based on Generalized Multiple Fourier Series

This section is devoted to exact expressions for the mean-square approximation error in Theorems 1, 2 for iterated Ito stochastic integrals of arbitrary multiplicity k ($k\in\mathbb{N}$).

As it turned out, the value E_k^p can be calculated exactly.

Theorem 8 [12] (Sect. 1.12), [32] (Sect. 6). *Suppose that* $\{\phi_j(x)\}_{j=0}^{\infty}$ *is an arbitrary complete orthonormal system of functions in the space* $L_2([t,T])$ *and* $\psi_1(\tau),\ldots,\psi_k(\tau)\in L_2([t,T])$, $i_1,\ldots,i_k=1,\ldots,m$. *Then*

$$E_k^p = I_k - \sum_{j_1,\ldots,j_k=0}^{p} C_{j_k\ldots j_1}\mathsf{M}\left\{J[\psi^{(k)}]_{T,t}\sum_{(j_1,\ldots,j_k)}\int\limits_t^T \phi_{j_k}(t_k)\ldots\int\limits_t^{t_2}\phi_{j_1}(t_1)d\mathbf{f}_{t_1}^{(i_1)}\ldots d\mathbf{f}_{t_k}^{(i_k)}\right\}, \tag{44}$$

where $i_1,\ldots,i_k=1,\ldots,m$; *the expression*

$$\sum_{(j_1,\ldots,j_k)}$$

means the sum with respect to all possible permutations $(j_1,\ldots,j_k)$. *At the same time if* j_r *swapped with* j_q *in the permutation* $(j_1,\ldots,j_k)$, *then* i_r *swapped with* i_q *in the permutation* $(i_1,\ldots,i_k)$; *another notations are the same as in Theorems* 1, 2.

Note that

$$\mathsf{M}\left\{J[\psi^{(k)}]_{T,t}\int\limits_t^T \phi_{j_k}(t_k)\ldots\int\limits_t^{t_2}\phi_{j_1}(t_1)d\mathbf{f}_{t_1}^{(i_1)}\ldots d\mathbf{f}_{t_k}^{(i_k)}\right\} = C_{j_k\ldots j_1}.$$

Then we can obtain the following particular cases of Theorem 8 for $k=1,\ldots,5$ and $i_1,\ldots,i_5=1,\ldots,m$ [12]-[14], [22], [25], [32].

The case $k=1$

$$E_1^p = I_1 - \sum_{j_1=0}^{p} C_{j_1}^2.$$

The case $k=2$

(I). $i_1\ne i_2$:

$$E_2^p = I_2 - \sum_{j_1,j_2=0}^{p} C_{j_2j_1}^2. \tag{45}$$

(II). $i_1=i_2$:

$$E_2^p = I_2 - \sum_{j_1,j_2=0}^{p} C_{j_2j_1}^2 - \sum_{j_1,j_2=0}^{p} C_{j_2j_1}C_{j_1j_2}. \tag{46}$$

The case $k=3$

(I). $i_1\ne i_2, i_1\ne i_3, i_2\ne i_3$:

$$E_3^p = I_3 - \sum_{j_1,j_2,j_3=0}^{p} C_{j_3j_2j_1}^2. \tag{47}$$

(II). $i_1 = i_2 = i_3$:

$$E_3^p = I_3 - \sum_{j_1,j_2,j_3=0}^{p} C_{j_3j_2j_1}\Biggl(\sum_{(j_1,j_2,j_3)} C_{j_3j_2j_1}\Biggr). \tag{48}$$

(III).1. $i_1 = i_2 \neq i_3$:

$$E_3^p = I_3 - \sum_{j_1,j_2,j_3=0}^{p} C_{j_3j_2j_1}^2 - \sum_{j_1,j_2,j_3=0}^{p} C_{j_3j_1j_2}C_{j_3j_2j_1}. \tag{49}$$

(III).2. $i_1 \neq i_2 = i_3$:

$$E_3^p = I_3 - \sum_{j_1,j_2,j_3=0}^{p} C_{j_3j_2j_1}^2 - \sum_{j_1,j_2,j_3=0}^{p} C_{j_2j_3j_1}C_{j_3j_2j_1}. \tag{50}$$

(III).3. $i_1 = i_3 \neq i_2$:

$$E_3^p = I_3 - \sum_{j_1,j_2,j_3=0}^{p} C_{j_3j_2j_1}^2 - \sum_{j_1,j_2,j_3=0}^{p} C_{j_3j_2j_1}C_{j_1j_2j_3}. \tag{51}$$

The case $k = 4$

(I). $i_1, \ldots, i_4$ are pairwise different:

$$E_4^p = I_4 - \sum_{j_1,\ldots,j_4=0}^{p} C_{j_4\ldots j_1}^2. \tag{52}$$

(II). $i_1 = i_2 = i_3 = i_4$:

$$E_4^p = I_4 - \sum_{j_1,\ldots,j_4=0}^{p} C_{j_4\ldots j_1}\Biggl(\sum_{(j_1,\ldots,j_4)} C_{j_4\ldots j_1}\Biggr). \tag{53}$$

(III).1. $i_1 = i_2 \neq i_3, i_4;\ i_3 \neq i_4$:

$$E_4^p = I_4 - \sum_{j_1,\ldots,j_4=0}^{p} C_{j_4\ldots j_1}\Biggl(\sum_{(j_1,j_2)} C_{j_4\ldots j_1}\Biggr). \tag{54}$$

(III).2. $i_1 = i_3 \neq i_2, i_4;\ i_2 \neq i_4$:

$$E_4^p = I_4 - \sum_{j_1,\ldots,j_4=0}^{p} C_{j_4\ldots j_1}\Biggl(\sum_{(j_1,j_3)} C_{j_4\ldots j_1}\Biggr). \tag{55}$$

(III).3. $i_1 = i_4 \neq i_2, i_3;\ i_2 \neq i_3$:

$$E_4^p = I_4 - \sum_{j_1,\ldots,j_4=0}^{p} C_{j_4\ldots j_1}\Biggl(\sum_{(j_1,j_4)} C_{j_4\ldots j_1}\Biggr). \tag{56}$$

(III).4. $i_2 = i_3 \neq i_1, i_4;\ i_1 \neq i_4:$

$$E_4^p = I_4 - \sum_{j_1,\ldots,j_4=0}^{p} C_{j_4\ldots j_1} \left(\sum_{(j_2,j_3)} C_{j_4\ldots j_1} \right). \tag{57}$$

(III).5. $i_2 = i_4 \neq i_1, i_3;\ i_1 \neq i_3:$

$$E_4^p = I_4 - \sum_{j_1,\ldots,j_4=0}^{p} C_{j_4\ldots j_1} \left(\sum_{(j_2,j_4)} C_{j_4\ldots j_1} \right). \tag{58}$$

(III).6. $i_3 = i_4 \neq i_1, i_2;\ i_1 \neq i_2:$

$$E_4^p = I_4 - \sum_{j_1,\ldots,j_4=0}^{p} C_{j_4\ldots j_1} \left(\sum_{(j_3,j_4)} C_{j_4\ldots j_1} \right). \tag{59}$$

(IV).1. $i_1 = i_2 = i_3 \neq i_4$:

$$E_4^p = I_4 - \sum_{j_1,\ldots,j_4=0}^{p} C_{j_4\ldots j_1} \left(\sum_{(j_1,j_2,j_3)} C_{j_4\ldots j_1} \right). \tag{60}$$

(IV).2. $i_2 = i_3 = i_4 \neq i_1$:

$$E_4^p = I_4 - \sum_{j_1,\ldots,j_4=0}^{p} C_{j_4\ldots j_1} \left(\sum_{(j_2,j_3,j_4)} C_{j_4\ldots j_1} \right). \tag{61}$$

(IV).3. $i_1 = i_2 = i_4 \neq i_3$:

$$E_4^p = I_4 - \sum_{j_1,\ldots,j_4=0}^{p} C_{j_4\ldots j_1} \left(\sum_{(j_1,j_2,j_4)} C_{j_4\ldots j_1} \right). \tag{62}$$

(IV).4. $i_1 = i_3 = i_4 \neq i_2$:

$$E_4^p = I_4 - \sum_{j_1,\ldots,j_4=0}^{p} C_{j_4\ldots j_1} \left(\sum_{(j_1,j_3,j_4)} C_{j_4\ldots j_1} \right). \tag{63}$$

(V).1. $i_1 = i_2 \neq i_3 = i_4$:

$$E_4^p = I_4 - \sum_{j_1,\ldots,j_4=0}^{p} C_{j_4\ldots j_1} \left(\sum_{(j_1,j_2)} \left(\sum_{(j_3,j_4)} C_{j_4\ldots j_1} \right) \right). \tag{64}$$

(V).2. $i_1 = i_3 \neq i_2 = i_4$:

$$E_4^p = I_4 - \sum_{j_1,\ldots,j_4=0}^{p} C_{j_4\ldots j_1} \left(\sum_{(j_1,j_3)} \left(\sum_{(j_2,j_4)} C_{j_4\ldots j_1} \right) \right). \tag{65}$$

(V).3. $i_1 = i_4 \neq i_2 = i_3$:

$$E_4^p = I_4 - \sum_{j_1,\ldots,j_4=0}^{p} C_{j_4\ldots j_1} \left(\sum_{(j_1,j_4)} \left(\sum_{(j_2,j_3)} C_{j_4\ldots j_1} \right) \right). \tag{66}$$

The case $k = 5$

(I). $i_1, \ldots, i_5$ are pairwise different:

$$E_5^p = I_5 - \sum_{j_1,\ldots,j_5=0}^{p} C_{j_5\ldots j_1}^2. \tag{67}$$

(II). $i_1 = i_2 = i_3 = i_4 = i_5$:

$$E_5^p = I_5 - \sum_{j_1,\ldots,j_5=0}^{p} C_{j_5\ldots j_1} \left(\sum_{(j_1,\ldots,j_5)} C_{j_5\ldots j_1} \right). \tag{68}$$

(III).1. $i_1 = i_2 \neq i_3, i_4, i_5$ (i_3, i_4, i_5 are pairwise different):

$$E_5^p = I_5 - \sum_{j_1,\ldots,j_5=0}^{p} C_{j_5\ldots j_1} \left(\sum_{(j_1,j_2)} C_{j_5\ldots j_1} \right). \tag{69}$$

(III).2. $i_1 = i_3 \neq i_2, i_4, i_5$ (i_2, i_4, i_5 are pairwise different):

$$E_5^p = I_5 - \sum_{j_1,\ldots,j_5=0}^{p} C_{j_5\ldots j_1} \left(\sum_{(j_1,j_3)} C_{j_5\ldots j_1} \right). \tag{70}$$

(III).3. $i_1 = i_4 \neq i_2, i_3, i_5$ (i_2, i_3, i_5 are pairwise different):

$$E_5^p = I_5 - \sum_{j_1,\ldots,j_5=0}^{p} C_{j_5\ldots j_1} \left(\sum_{(j_1,j_4)} C_{j_5\ldots j_1} \right). \tag{71}$$

(III).4. $i_1 = i_5 \neq i_2, i_3, i_4$ (i_2, i_3, i_4 are pairwise different):

$$E_5^p = I_5 - \sum_{j_1,\ldots,j_5=0}^{p} C_{j_5\ldots j_1} \left(\sum_{(j_1,j_5)} C_{j_5\ldots j_1} \right). \tag{72}$$

(III).5. $i_2 = i_3 \neq i_1, i_4, i_5$ (i_1, i_4, i_5 are pairwise different):

$$E_5^p = I_5 - \sum_{j_1,\ldots,j_5=0}^{p} C_{j_5\ldots j_1} \left(\sum_{(j_2,j_3)} C_{j_5\ldots j_1} \right). \tag{73}$$

(III).6. $i_2 = i_4 \neq i_1, i_3, i_5$ (i_1, i_3, i_5 are pairwise different):

$$E_5^p = I_5 - \sum_{j_1,\ldots,j_5=0}^{p} C_{j_5\ldots j_1} \Biggl(\sum_{(j_2,j_4)} C_{j_5\ldots j_1} \Biggr). \tag{74}$$

(III).7. $i_2 = i_5 \neq i_1, i_3, i_4$ (i_1, i_3, i_4 are pairwise different):

$$E_5^p = I_5 - \sum_{j_1,\ldots,j_5=0}^{p} C_{j_5\ldots j_1} \Biggl(\sum_{(j_2,j_5)} C_{j_5\ldots j_1} \Biggr). \tag{75}$$

(III).8. $i_3 = i_4 \neq i_1, i_2, i_5$ (i_1, i_2, i_5 are pairwise different):

$$E_5^p = I_5 - \sum_{j_1,\ldots,j_5=0}^{p} C_{j_5\ldots j_1} \Biggl(\sum_{(j_3,j_4)} C_{j_5\ldots j_1} \Biggr). \tag{76}$$

(III).9. $i_3 = i_5 \neq i_1, i_2, i_4$ (i_1, i_2, i_4 are pairwise different):

$$E_5^p = I_5 - \sum_{j_1,\ldots,j_5=0}^{p} C_{j_5\ldots j_1} \Biggl(\sum_{(j_3,j_5)} C_{j_5\ldots j_1} \Biggr). \tag{77}$$

(III).10. $i_4 = i_5 \neq i_1, i_2, i_3$ (i_1, i_2, i_3 are pairwise different):

$$E_5^p = I_5 - \sum_{j_1,\ldots,j_5=0}^{p} C_{j_5\ldots j_1} \Biggl(\sum_{(j_4,j_5)} C_{j_5\ldots j_1} \Biggr). \tag{78}$$

(IV).1. $i_1 = i_2 = i_3 \neq i_4, i_5$ ($i_4 \neq i_5$):

$$E_5^p = I_5 - \sum_{j_1,\ldots,j_5=0}^{p} C_{j_5\ldots j_1} \Biggl(\sum_{(j_1,j_2,j_3)} C_{j_5\ldots j_1} \Biggr). \tag{79}$$

(IV).2. $i_1 = i_2 = i_4 \neq i_3, i_5$ ($i_3 \neq i_5$):

$$E_5^p = I_5 - \sum_{j_1,\ldots,j_5=0}^{p} C_{j_5\ldots j_1} \Biggl(\sum_{(j_1,j_2,j_4)} C_{j_5\ldots j_1} \Biggr). \tag{80}$$

(IV).3. $i_1 = i_2 = i_5 \neq i_3, i_4$ ($i_3 \neq i_4$):

$$E_5^p = I_5 - \sum_{j_1,\ldots,j_5=0}^{p} C_{j_5\ldots j_1} \Biggl(\sum_{(j_1,j_2,j_5)} C_{j_5\ldots j_1} \Biggr). \tag{81}$$

(IV).4. $i_2 = i_3 = i_4 \neq i_1, i_5$ ($i_1 \neq i_5$):

$$E_5^p = I_5 - \sum_{j_1,\ldots,j_5=0}^{p} C_{j_5\ldots j_1} \Biggl(\sum_{(j_2,j_3,j_4)} C_{j_5\ldots j_1} \Biggr). \tag{82}$$

(IV).5. $i_2 = i_3 = i_5 \neq i_1, i_4$ $(i_1 \neq i_4)$:

$$E_5^p = I_5 - \sum_{j_1,\ldots,j_5=0}^{p} C_{j_5\ldots j_1}\left(\sum_{(j_2,j_3,j_5)} C_{j_5\ldots j_1}\right). \tag{83}$$

(VII).9. $i_1 = i_3 = i_4 \neq i_2 = i_5$:

$$E_5^p = I_5 - \sum_{j_1,\ldots,j_5=0}^{p} C_{j_5\ldots j_1}\left(\sum_{(j_2,j_5)}\left(\sum_{(j_1,j_3,j_4)} C_{j_5\ldots j_1}\right)\right). \tag{117}$$

(VII).10. $i_1 = i_4 = i_5 \neq i_2 = i_3$:

$$E_5^p = I_5 - \sum_{j_1,\ldots,j_5=0}^{p} C_{j_5\ldots j_1}\left(\sum_{(j_2,j_3)}\left(\sum_{(j_1,j_4,j_5)} C_{j_5\ldots j_1}\right)\right). \tag{118}$$

Obviously, the above formulas do not contain multiplier factors 2!, 3!, 4!, and 5! in contrast to the estimate (42). However, the number of the mentioned conditions is quite large, which is inconvenient for practical calculations.

In the papers [46] and [47], it was proposed the hypothesis that all the formulas (45)-(118) can be replaced by the following equalities

$$E_2^p = I_2 - \sum_{j_1,j_2=0}^{p} C_{j_2 j_1}^2,$$

$$E_3^p = I_3 - \sum_{j_1,j_2,j_3=0}^{p} C_{j_3 j_2 j_1}^2,$$

$$E_4^p = I_4 - \sum_{j_1,\ldots,j_4=0}^{p} C_{j_4\ldots j_1}^2,$$

$$E_5^p = I_5 - \sum_{j_1,\ldots,j_5=0}^{p} C_{j_5\ldots j_1}^2,$$

where $i_1,\ldots,i_5 = 1,\ldots,m$.

At that, the specified replacement will not lead to a noticeable loss of the mean-square accuracy of approximation of iterated Ito stochastic integrals from the family (6).

This paper is devoted to the detailed confirmation of the hypothesis from [46], [47] for the case of multiple Fourier–Legendre series.

It should be noted that unlike the method based on Theorems 1 and 2, existing approaches to the mean-square approximation of iterated stochastic integrals (see, for example, [2]-[4], [48]-[58]) do not allow choosing different numbers p for approximations of different iterated stochastic integrals. Moreover, the noted approaches [2]-[4], [48]-[58] exclude the possibility for obtaining of approximate and exact expressions for the mean-square approximation error similar to the formulas (42), (44).

5. Approximations of Iterated Ito Stochastic Integrals from the Numerical Schemes (11)–(14) Using Legendre Polynomials

In this section, we consider the approximations of the iterated Ito stochastic integrals (6) of multiplicities 1 to 5 based on Theorems 1, 2 and multiple Fourier–Legendre series.

The numerical schemes (11)–(14) contain the following set (see (6)) of iterated Ito stochastic integrals

$$I_{(0)T,t}^{(i_1)},\quad I_{(1)T,t}^{(i_1)},\quad I_{(2)T,t}^{(i_1)},\quad I_{(00)T,t}^{(i_1 i_2)},\quad I_{(10)T,t}^{(i_1 i_2)},\quad I_{(01)T,t}^{(i_1 i_2)},\quad I_{(000)T,t}^{(i_1 i_2 i_3)},\quad I_{(0000)T,t}^{(i_1 i_2 i_3 i_4)}, \tag{119}$$

$$I_{(00000)T,t}^{(i_1 i_2 i_3 i_4 i_5)},\quad I_{(100)T,t}^{(i_1 i_2 i_3)},\quad I_{(010)T,t}^{(i_1 i_2 i_3)},\quad I_{(001)T,t}^{(i_1 i_2 i_3)}. \tag{120}$$

Let us consider the complete orthonormal system of Legendre polynomials in the space $L_2([t,T])$

$$\phi_j(x)=\sqrt{\frac{2j+1}{T-t}}P_j\left(\left(x-\frac{T+t}{2}\right)\frac{2}{T-t}\right),\quad j=0,1,2,\ldots, \tag{121}$$

where $P_j(x)$ is the Legendre polynomial

$$P_j(x)=\frac{1}{2^j j!}\frac{d^j}{dx^j}\left(x^2-1\right)^j.$$

Using Theorems 1, 2 and the system of functions (121), we obtain the following formulas for numerical modeling of the stochastic integrals (119), (120) [5]-[47]

$$I_{(0)T,t}^{(i_1)}=\sqrt{T-t}\zeta_0^{(i_1)},$$

$$I_{(1)T,t}^{(i_1)}=-\frac{(T-t)^{3/2}}{2}\left(\zeta_0^{(i_1)}+\frac{1}{\sqrt{3}}\zeta_1^{(i_1)}\right),$$

$$I_{(2)T,t}^{(i_1)}=\frac{(T-t)^{5/2}}{3}\left(\zeta_0^{(i_1)}+\frac{\sqrt{3}}{2}\zeta_1^{(i_1)}+\frac{1}{2\sqrt{5}}\zeta_2^{(i_1)}\right),$$

$$I_{(00)T,t}^{(i_1i_2)q}=\frac{T-t}{2}\left(\zeta_0^{(i_1)}\zeta_0^{(i_2)}+\sum_{i=1}^{q}\frac{1}{\sqrt{4i^2-1}}\left(\zeta_{i-1}^{(i_1)}\zeta_i^{(i_2)}-\zeta_i^{(i_1)}\zeta_{i-1}^{(i_2)}\right)-\mathbf{1}_{\{i_1=i_2\}}\right), \tag{122}$$

$$I_{(000)T,t}^{(i_1i_2i_3)q_1}=\sum_{j_1,j_2,j_3=0}^{q_1}C_{j_3j_2j_1}^{000}\Biggl(\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}\zeta_{j_3}^{(i_3)}-\mathbf{1}_{\{i_1=i_2\}}\mathbf{1}_{\{j_1=j_2\}}\zeta_{j_3}^{(i_3)}-$$

$$-\mathbf{1}_{\{i_2=i_3\}}\mathbf{1}_{\{j_2=j_3\}}\zeta_{j_1}^{(i_1)}-\mathbf{1}_{\{i_1=i_3\}}\mathbf{1}_{\{j_1=j_3\}}\zeta_{j_2}^{(i_2)}\Biggr),$$

$$I_{(10)T,t}^{(i_1i_2)q_2}=\sum_{j_1,j_2=0}^{q_2}C_{j_2j_1}^{10}\left(\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}-\mathbf{1}_{\{i_1=i_2\}}\mathbf{1}_{\{j_1=j_2\}}\right), \tag{123}$$

another notations are the same as in Theorems 1, 2.

6. Optimization of Approximations of Iterated Ito Stochastic Integrals from the Numerical Schemes (11)–(14)

This section is devoted to the optimization of approximations of iterated Ito stochastic integrals from the numerical schemes (11)–(14). More precisely, we discuss how minimize the numbers $q, q_1, q_2, \ldots, q_7$ from Sect. 5.

Let us combine the relations (122), (125)-(140) with (45)-(118). Thus, we have the following formulas.

The case $k=2$ for the integral $I_{(00)T,t}^{(i_1i_2)}$

2.1.a. $i_1 \neq i_2$:

$$E_2^p = (T-t)^2\left(\frac{1}{2}-\frac{1}{4}-\frac{1}{2}\sum_{i=1}^{p}\frac{1}{4i^2-1}\right) = \frac{(T-t)^2}{2}\left(\frac{1}{2}-\sum_{i=1}^{p}\frac{1}{4i^2-1}\right). \tag{141}$$

2.2.a. $i_1 = i_2$:

$$E_2^p = (T-t)^2 \left(\frac{1}{2} - \frac{1}{16} \sum_{j_1,j_2=0}^{p} (2j_1+1)(2j_2+1) \bar{C}_{j_2j_1}^{00} \left(\sum_{(j_1,j_2)} \bar{C}_{j_2j_1}^{00} \right) \right) \equiv 0.$$

The case $k = 2$ for the integral $I_{(01)T,t}^{(i_1i_2)}$

2.1.b. $i_1 \neq i_2$:

$$E_2^p = (T-t)^4 \left(\frac{1}{4} - \frac{1}{64} \sum_{j_1,j_2=0}^{p} (2j_1+1)(2j_2+1) \left(\bar{C}_{j_2j_1}^{01} \right)^2 \right). \tag{142}$$

2.2.b. $i_1 = i_2$:

$$E_2^p = (T-t)^4 \left(\frac{1}{4} - \frac{1}{64} \sum_{j_1,j_2=0}^{p} (2j_1+1)(2j_2+1) \bar{C}_{j_2j_1}^{01} \left(\sum_{(j_1,j_2)} \bar{C}_{j_2j_1}^{01} \right) \right). \tag{143}$$

The case $k = 2$ for the integral $I_{(10)T,t}^{(i_1i_2)}$

2.1.c. $i_1 \neq i_2$:

$$E_2^p = (T-t)^4 \left(\frac{1}{12} - \frac{1}{64} \sum_{j_1,j_2=0}^{p} (2j_1+1)(2j_2+1) \left(\bar{C}_{j_2j_1}^{10} \right)^2 \right). \tag{144}$$

2.2.c. $i_1 = i_2$:

$$E_2^p = (T-t)^4 \left(\frac{1}{12} - \frac{1}{64} \sum_{j_1,j_2=0}^{p} (2j_1+1)(2j_2+1) \bar{C}_{j_2j_1}^{10} \left(\sum_{(j_1,j_2)} \bar{C}_{j_2j_1}^{10} \right) \right). \tag{145}$$

The case $k = 3$ for the integral $I_{(000)T,t}^{(i_1i_2i_3)}$

3.1.a. $i_1 \neq i_2, i_1 \neq i_3, i_2 \neq i_3$:

$$E_3^p = (T-t)^3 \left(\frac{1}{6} - \frac{1}{64} \sum_{j_1,j_2,j_3=0}^{p} (2j_1+1)(2j_2+1)(2j_3+1) \left(\bar{C}_{j_3j_2j_1}^{000} \right)^2 \right). \tag{146}$$

3.2.a. $i_1 = i_2 = i_3$:

$$E_3^p = (T-t)^3 \left(\frac{1}{6} - \frac{1}{64} \sum_{j_1,j_2,j_3=0}^{p} (2j_1+1)(2j_2+1)(2j_3+1) \bar{C}_{j_3j_2j_1}^{000} \left(\sum_{(j_1,j_2,j_3)} \bar{C}_{j_3j_2j_1}^{000} \right) \right) \equiv 0.$$

3.3.1.a. $i_1 = i_2 \ne i_3$:

$$E_3^p = (T-t)^3 \left(\frac{1}{6} - \frac{1}{64} \sum_{j_1,j_2,j_3=0}^{p} (2j_1+1)(2j_2+1)(2j_3+1) \left(\left(\bar{C}_{j_3j_2j_1}^{000} \right)^2 + \bar{C}_{j_3j_1j_2}^{000} \bar{C}_{j_3j_2j_1}^{000} \right) \right). \tag{147}$$

3.3.2.a. $i_1 \ne i_2 = i_3$:

$$E_3^p = (T-t)^3 \left(\frac{1}{6} - \frac{1}{64} \sum_{j_1,j_2,j_3=0}^{p} (2j_1+1)(2j_2+1)(2j_3+1) \left(\left(\bar{C}_{j_3j_2j_1}^{000} \right)^2 + \bar{C}_{j_2j_3j_1}^{000} \bar{C}_{j_3j_2j_1}^{000} \right) \right). \tag{148}$$

3.3.3.a. $i_1 = i_3 \ne i_2$:

$$E_3^p = (T-t)^3 \left(\frac{1}{6} - \frac{1}{64} \sum_{j_1,j_2,j_3=0}^{p} (2j_1+1)(2j_2+1)(2j_3+1) \left(\left(\bar{C}_{j_3j_2j_1}^{000} \right)^2 + \bar{C}_{j_3j_2j_1}^{000} \bar{C}_{j_1j_2j_3}^{000} \right) \right). \tag{149}$$

The case $k = 3$ for the integral $I_{(001)T,t}^{(i_1i_2i_3)}$

3.1.b. $i_1 \ne i_2, i_1 \ne i_3, i_2 \ne i_3$:

$$E_3^p = (T-t)^5 \left(\frac{1}{10} - \frac{1}{256} \sum_{j_1,j_2,j_3=0}^{p} (2j_1+1)(2j_2+1)(2j_3+1) \left(\bar{C}_{j_3j_2j_1}^{001} \right)^2 \right). \tag{150}$$

3.2.b. $i_1 = i_2 = i_3$:

$$E_3^p = (T-t)^5 \left(\frac{1}{10} - \frac{1}{256} \sum_{j_1,j_2,j_3=0}^{p} (2j_1+1)(2j_2+1)(2j_3+1) \bar{C}_{j_3j_2j_1}^{001} \left(\sum_{(j_1,j_2,j_3)} \bar{C}_{j_3j_2j_1}^{001} \right) \right). \tag{151}$$

3.3.1.b. $i_1 = i_2 \ne i_3$:

$$E_3^p = (T-t)^5 \left(\frac{1}{10} - \frac{1}{256} \sum_{j_1,j_2,j_3=0}^{p} (2j_1+1)(2j_2+1)(2j_3+1) \left(\left(\bar{C}_{j_3j_2j_1}^{001} \right)^2 + \bar{C}_{j_3j_1j_2}^{001} \bar{C}_{j_3j_2j_1}^{001} \right) \right). \tag{152}$$

$$E_5^p = (T-t)^5 \left(\frac{1}{120} - \frac{1}{32^2} \sum_{j_1,\ldots,j_5=0}^{p} \left(\prod_{l=1}^{5} (2j_l+1) \right) \cdot \bar{C}_{j_5\ldots j_1}^{00000} \left(\sum_{(j_2,j_4)} \left(\sum_{(j_1,j_3,j_5)} \bar{C}_{j_5\ldots j_1}^{00000} \right) \right) \right). \tag{227}$$

5.7.9. $i_1 = i_3 = i_4 \neq i_2 = i_5$:

$$E_5^p = (T-t)^5 \left(\frac{1}{120} - \frac{1}{32^2} \sum_{j_1,\ldots,j_5=0}^{p} \left(\prod_{l=1}^{5} (2j_l+1) \right) \cdot \bar{C}_{j_5\ldots j_1}^{00000} \left(\sum_{(j_2,j_5)} \left(\sum_{(j_1,j_3,j_4)} \bar{C}_{j_5\ldots j_1}^{00000} \right) \right) \right). \tag{228}$$

5.7.10. $i_1 = i_4 = i_5 \neq i_2 = i_3$:

$$E_5^p = (T-t)^5 \left(\frac{1}{120} - \frac{1}{32^2} \sum_{j_1,\ldots,j_5=0}^{p} \left(\prod_{l=1}^{5} (2j_l+1) \right) \cdot \bar{C}_{j_5\ldots j_1}^{00000} \left(\sum_{(j_2,j_3)} \left(\sum_{(j_1,j_4,j_5)} \bar{C}_{j_5\ldots j_1}^{00000} \right) \right) \right). \tag{229}$$

Denote $q(\alpha)$ the numbers p from the formulas (141)-(229), where α are the numbers of the cases corresponding to the formulas (141)-(229). For example, $q(\mathbf{2}.2.b)$ is the number p from the formula (143), $q(\mathbf{5}.7.10)$ is the number p from the formula (229), etc.

Let

$$E_2^p \le (T-t)^4, \quad E_3^p \le (T-t)^4 \tag{230}$$

where E_2^p is defined by (141) and E_3^p is defined by (146)-(149).

Let

$$E_2^p \le (T-t)^5, \quad E_3^p \le (T-t)^5, \quad E_4^p \le (T-t)^5 \tag{231}$$

where E_2^p is defined by (141)-(145), E_3^p is defined by (146)-(149), and E_4^p is defined by (165)-(178).

Let

$$E_2^p \le (T-t)^6, \quad E_3^p \le (T-t)^6, \quad E_4^p \le (T-t)^6, \quad E_5^p \le (T-t)^6, \tag{232}$$

where E_2^p is defined by (141)-(145), E_3^p is defined by (146)-(164), E_4^p is defined by (165)-(178), and E_5^p is defined by (179)-(229).

Note that the conditions (230)-(232) are particular cases of (15) for $r = 3, 4$, and 5.

Let us show by numerical experiments (see Tables 1–13) that in most situations the following inequalities are fullfilled (under conditions (230)-(232))

TABLE 1. Stochastic integral $I_{(000)T,t}^{(i_1 i_2 i_3)}$. The condition (230).

$$q(\mathbf{5}.1) \geq q(\mathbf{5}.6.1),\ \ldots,\ q(\mathbf{5}.6.15),\ q(\mathbf{5}.7.1),\ \ldots,\ q(\mathbf{5}.7.10), \tag{240}$$

where all numbers in the inequalities (233)-(240) are minimal natural numbers satisfying the conditions (230)-(232).

In Tables 1–13, we can see the results of numerical experiments. These results confirm (in most situations) the inequalities (233)-(240)).

Let us show by numerical experiments that we can choose the minimal natural numbers p satisfying the inequalities (230)-(232) only for the values E_2^p, E_3^p, E_4^p, E_5^p defined by the relations (141), (142),

TABLE 3. $T - t = 0.01$. The condition (232).

(144), (146), (150), (155), (160), (165), (179). At that, we can suppose $i_1, \ldots, i_5 = 1, \ldots, m$ in these relations and use the above numbers p for all remaining cases. This means that we can ignore all the formulas (143), (145), (147)-(149), (151)-(154), (156)-(159), (161)-(164), (166)-(178), (180)-(229). As a result, we will not get a noticeable loss of the mean-square approximation accuracy for iterated Ito stochastic integrals. The detailed numerical confirmation of the above hypothesis can be found in Tables 14–22.

Taking into account the results of this article, we can recommend the following conditions for choosing the minimal natural numbers $q, q_1, q_2, \ldots, q_7$ (see Sect. 5) for the numerical schemes (11)–(14) (constant C (see below) has the same meaning as in the condition (15)).

Milstein scheme (11)

$$\frac{(T-t)^2}{2}\left(\frac{1}{2} - \sum_{i=1}^{q} \frac{1}{4i^2 - 1}\right) \le C(T-t)^3.$$

$$(T-t)^4\left(\frac{1}{120}-\frac{1}{32^2}\sum_{j_1,\ldots,j_5=0}^{r}(2j_1+1)(2j_2+1)(2j_3+1)(2j_4+1)(2j_5+1)\left(\bar{C}_{j_5\ldots j_1}^{00000}\right)^2\right)\le$$

$$\le (T-t)^6, \tag{245}$$

$$120(T-t)^4\left(\frac{1}{120}-\frac{1}{32^2}\sum_{j_1,\ldots,j_5=0}^{r'}(2j_1+1)(2j_2+1)(2j_3+1)(2j_4+1)(2j_5+1)\left(\bar{C}_{j_5\ldots j_1}^{00000}\right)^2\right)\le$$

$$\le (T-t)^6, \tag{246}$$

where the inequalities (242), (244), (246) are particular cases of the formula (43) for $r = 3, 4$, and 5.

In Tables 23–25, we can see the numerical comparison of the conditions (241), (243), (245) with the conditions (242), (244), (246), respectively. Obviously, the conditions (241), (243), (245) (i.e. conditions without the multiplier factors 3!, 4!, and 5!) essentially reduce the calculation costs for the mean-square approximations of iterated Ito stochastic integrals

$$I_{(000)T,t}^{(i_1 i_2 i_3)}, \quad I_{(0000)T,t}^{(i_1 i_2 i_3 i_4)}, \quad I_{(00000)T,t}^{(i_1 i_2 i_3 i_4 i_5)} \quad (i_1, i_2, i_3, i_4, i_5 = 1, \ldots, m).$$

Abstract. The article is devoted to the implementation of strong numerical methods with convergence orders 0.5, 1.0, 1.5, 2.0, 2.5, and 3.0 for Itô stochastic differential equations with multidimensional non-commutative noise based on multiple Fourier–Legendre series and unified Taylor–Itô and Taylor–Stratonovich expansions. Algorithms for the implementation of these methods

are constructed and a package of programs in the Python programming language is presented. An important part of this software package concerning the mean-square approximation of iterated Itô and Stratonovich stochastic integrals of multiplicities 1 to 6 with respect to components of the multidimensional Wiener process is based on the method of generalized multiple Fourier series. More precisely, we used multiple Fourier–Legendre series converging in the sense of norm in Hilbert space for the mean-square approximation of iterated Itô and Stratonovich stochastic integrals.
Key words: Software package, Python programming language, numerical method, strong convergence, Itô stochastic differential equation, multidimensional Wiener process, non-commutative noise, unified Taylor–Itô expansion, unified Taylor–Stratonovich expansion, Milstein scheme, high-order strong numerical scheme, iterated Itô stochastic integral, iterated Stratonovich stochastic integral, mean-square approximation, generalized multiple Fourier series, multiple Fourier–Legendre series, Legendre polynomial.

1 Introduction

As known, Itô stochastic differential equations (SDEs) have appeared in the theory of random processes relatively recently [1] (1951). Nevertheless, to date, a large number of mathematical models for dynamical systems of different physical nature under the influence of random perturbations have been built on the basis of such equations [2]-[16]. Among them we note mathematical models in stochastic financial mathematics [5]-[7], [10]-[12], geophysics [2], [4], genetics [13], hydrology [2], epidemiology [9], chemical kinetics [2], [9], biology [8], [15], seismology [2], electrodynamics [16] and many other fields [2], [9], [14]. In addition, Itô SDEs arise when solving a number of mathematical problems, such as filtration [2], [3], [17]-[21], stochastic control [2], [17], stochastic stability [2], parameter estimation of stochastic systems [2], [3], [22].

Exact solutions of Itô SDEs are known in rare cases. For this reason, it becomes necessary to construct numerical methods for Itô SDEs. Moreover, the problem of numerical solution of Itô SDEs often occurs even in cases when the exact solution of Itô SDE is known. This means that in some cases, knowing the exact solution of the Itô SDE does not allow us to simulate it numerically in a simple way.

This article is devoted to the implementation of high-order strong numerical methods for systems of Itô SDEs with multidimensional non-commutative noise. More precisely, we consider strong numerical methods with convergence orders 1.0, 1.5, 2.0, 2.5, and 3.0. The article also considers the Euler method, which under suitable conditions [2] has the order 0.5 of strong convergence. To construct the mentioned numerical methods in this article, we use the so-called unified Taylor–Itô and Taylor–Stratonovich expansions [24]-[27], [68]. The important components of these expansions are the iterated Itô and Stratonovich stochastic integrals, which are functionals of a complex structure with respect to the components of a multidimensional Wiener process.

It should be noted that it is impossible to construct a numerical method for Itô SDE in a general case (multidimensional non-commutative noise) that includes only increments of the multidimensional Wiener processes, but has a higher order of convergence (in the mean-square sense) than the Euler method (simplest numerical method for Itô SDEs). This result is known as the "Clark–Cameron paradox" [23] (1980) and well explains the need to use high-order numerical methods for Itô SDEs, since the accuracy of the Euler method is insufficient for solving a number of practical problems related to Itô SDEs [2].

According to the "Clark–Cameron paradox" [23], avoidance of the problem of mean-square approximation of the mentioned iterated stochastic integrals is impossible in the general case when constructing high-order strong numerical methods for Itô SDEs.

The problem of mean-square approximation of iterated Itô and Stratonovich stochastic integrals in the context of the numerical integration of Itô SDEs was considered in a number of works [2], [3], [7], [8], [28]-[40].

It should be explained why the results of these works are insufficient for constructing effective procedures for the implementation of strong numerical methods of order 1.5 and higher for Itô SDEs.

There exists an approach to the mean-square approximation of iterated stochastic integrals based on integral sums [28], [35], [36]. Note that one of the variants of this method is based on reducing the problem of mean-square approximation of iterated stochastic integrals to the numerical integration of systems of linear Itô SDEs by the Euler method [40]. However, this approach [28], [35], [36], [40] implies the partitioning of the interval of integration for iterated stochastic integrals. It should be noted that the length of this interval is an integration step for numerical methods for Itô SDEs, which is already a fairly small value even without additional partitioning. Computational experiments show that the numerical modeling of iterated stochastic integrals by the method of integral sums [28], [35], [36], [40] leads to unacceptably high computational cost and accumulation of computation errors [43].

More efficient approach of the mean-square approximation of iterated stochastic integrals is based on the expansion of the so-called Brownian bridge process into the trigonometric Fourier series with random terms (version of the so-called Karhunen–Loève expansion) [2], [3], [7], [28], [29], [34], [35], [38], [39]. However, in [28], [34], [35], [39], this approach was used to approximate only iterated stochastic integrals of multiplicities 1 and 2, which makes it possible to implement numerical method with order 1.0 of strong convergence for Itô SDEs (Milstein method [28]). In papers [2], [3], [7], [29], the approximation of iterated stochastic integrals of multiplicities 1 to 3 was considered by the above approach, which makes it possible to implement numerical methods with orders 1.0 and 1.5 of strong convergence for Itô SDEs. However, formulas concerning integrals of multiplicity 3 turned out to be too complicated and did not find wide application in practice. Moreover, these formulas (for iterated stochastic integrals of multiplicity 3) were obtained without strict theoretical justification and exclude the possibility of effective estimation of the mean-square error of approximation (see discussion in [26] (Sect. 2.6.2, 6.2) for details).

It should be noted that in papers [30], [31], a similar approach was used to approximate iterated stochastic integrals of multiplicities 1 to 3 based on the series expansion of the Wiener process using trigonometric functions and Haar functions. In [41] orthonormal expansions of functions in terms of Walsh series were used to represent the iterated stochastic integrals.

Note that the iterated stochastic integrals under consideration are the random variables with unknown density functions. The only exception is the iterated Itô stochastic integral with multiplicity 2 [32]. However, the knowledge of density function of the mentioned stochastic integral gives no simple way of its approximation [32].

In this work, we use a more efficient method of the mean-square approximation of iterated Itô and Stratonovich stochastic integrals than the methods considered above. This method (the so-called method of generalized multiple Fourier series) is based on the theory constructed in Chapters 1, 2, and 5 of monographs [26], [27], [68] (also see bibliography therein). The method of generalized multiple Fourier series made it possible in this work to successfully implement the procedures for the mean-square approximation of iterated Itô and Stratonovich stochastic integrals of multiplicities 1 to 6. In this case, we use multiple Fourier–Legendre series, that is, we have chosen Legendre polynomials as a basis system of functions for approximating iterated stochastic integrals. It is important to note that the Legendre polynomials were first applied in the context of this problem in [44] (1997), while in the works of other authors Legendre polynomials were not considered as a system of basis functions for approximating iterated stochastic integrals (an exception is work [37]). As shown in [45], the Legendre polynomials are an optimal system of basis functions for approximating iterated Itô and Stratonovich stochastic integrals.

In this article, to build the SDE-MATH software package in the Python programming language, we use a database with 270,000 exactly calculated Fourier–Legendre coefficients to approximate iterated Itô and Stratonovich stochastic integrals of multiplicities 1 to 6. It should be noted that the procedures for the mean-square approximation of iterated stochastic integrals of multiplicities 4, 5, and 6 constructed in this work have no analogues in the literature. At the same time, we propose a much more convenient procedure for the mean-square approximation of iterated stochastic integrals of multiplicity 3 than in works [2], [3], [7], [29]. This procedure provides an accurate calculation of the mean-square error of approximation of the mentioned stochastic integrals.

Another important feature of the presented software package is the use of unified Taylor–Itô and Taylor–Stratonovich expansions [24]-[27], [68] for constructing strong numerical methods with convergence orders 1.5, 2.0, 2.5, and 3.0 for Itô SDEs. Unified Taylor–Itô and Taylor—Stratonovich expansions make it possible (in contrast with its classical analogues [2]) to use the minimal sets of iterated Itô and Stratonovich stochastic integrals. This property well explains the motive for using the mentioned unified expansions.

The results of this work on the approximation of iterated stochastic integrals can be used to numerically solve various types of SDEs. For example, for semilinear SPDEs with multiplicative trace class noise [26], [27], [68] (Chapter 7), [46], [47]. This is due to the fact that iterated stochastic integrals are a universal tool for constructing high-order strong numerical methods for various types of SDEs. In recent years, the mentioned numerical methods have been constructed for SDEs with jumps [7], SPDEs with multiplicative trace class noise [48]-[50], McKean SDEs [51], SDEs with switchings [52], mean-field SDEs [53], Itô–Volterra stochastic integral equations [50], etc.

There are many publications in which codes of programs in various programming languages are given for the numerical solution of SDEs [3], [9], [14], [54]-[62]. Among them, we note the software described in [3], [55], [57], [61]. Some of the mentioned works [3], [55], [57], [58], [61] are based on the results of monograph [2] on the approximation of iterated stochastic integrals (see above discusson on the disadvantages of approach [2]). Other publications [9], [14], [54], [56] do not use the modeling of iterated stochastic integrals for the case of multidimensional non-commutative noise at all.

In this article, we develop software for the numerical integration of Itô SDEs based on theoretical results and MATLAB codes from monographs [59], [62] for modeling iterated stochastic integrals of multiplicities 1 to 6 (the case of multidimensional non-commutative noise). In addition, we provide software (as a part of the SDE-MATH software package) for the numerical integration of linear stationary systems of Itô SDEs based on the results of article [63] and MATLAB codes from monographs [59], [62].

In Sect. 7 we discuss possible directions for the development of the SDE-MATH software package. In particular, the parallelization of computations, the implementation of methods of the Runge–Kutta type [2], [7], [43], [62] and multistep numerical methods for Itô SDEs [2], [7], [43], [62], the development of a part of the software package for solving filtering problem and stochastic optimal control problem [2], as well as improvement of the graphical user interface.

2 Theoretical Results Underlying the SDE-MATH Software Package

2.1 Strong Numerical Methods with Convergence Orders 0.5, 1.0, 1.5, 2.0, 2.5, and 3.0 for Itô SDEs Based on the Unified Taylor–Itô Expansion

Let $(\Omega,\ \mathrm{F},\ \mathsf{P})$ be a complete probability space and let $\{\mathrm{F}_t, t\in[0,T]\}$ be a nondecreasing right-continuous family of σ-algebras of F. Let $\mathbf{w}_t$ be a standard m-dimensional Wiener stochastic process with independent components $\mathbf{w}_t^{(i)}$ $(i=1,\ldots,m)$, which is F_t-measurable for any $t\in[0,T]$. Consider an Itô SDE in the integral form

$$\mathbf{x}_t=\mathbf{x}_0+\int\limits_0^t \mathbf{a}(\mathbf{x}_\tau,\tau)d\tau+\sum_{i=1}^m\int\limits_0^t B_i(\mathbf{x}_\tau,\tau)d\mathbf{w}_\tau^{(i)},\quad \mathbf{x}_0=\mathbf{x}(0,\omega), \tag{1}$$

where $\mathbf{x}_t\in\mathbb{R}^n$ is a solution of the Itô SDE (1), the nonrandom functions $\mathbf{a}(\mathbf{x},t):\mathbb{R}^n\times[0,T]\to\mathbb{R}^n$, $B(\mathbf{x},t):\mathbb{R}^n\times[0,T]\to\mathbb{R}^{n\times m}$ guarantee the existence and uniqueness up to stochastic equivalence of a solution of (1) [64], the second integral on the right-hand side of (1) is interpreted as an Itô stochastic integral, $B_i(\mathbf{x},t)$ is the ith colomn of the matrix function $B(\mathbf{x},t)$, $\mathbf{x}_0$ is an n-dimensional and F_0-measurable random variable, $\mathsf{M}\bigl\{|\mathbf{x}_0|^2\bigr\}<\infty$ (M is an expectation operator). We assume that $\mathbf{x}_0$ and $\mathbf{w}_t-\mathbf{w}_0$ are independent when $t>0$.

It is well known that one of the effective approaches to the numerical integration of Itô SDEs is an approach based on the Taylor–Itô and Taylor–Stratonovich expansions [2], [7], [43]. The essential feature of such expansions is the so-called iterated Itô and Stratonovich stochastic integrals, which have the form

$$J[\psi^{(k)}]_{T,t}=\int\limits_t^T\psi_k(t_k)\ldots\int\limits_t^{t_2}\psi_1(t_1)d\mathbf{w}_{t_1}^{(i_1)}\ldots d\mathbf{w}_{t_k}^{(i_k)}, \tag{2}$$

$$J^*[\psi^{(k)}]_{T,t}=\int\limits_t^{*T}\psi_k(t_k)\ldots\int\limits_t^{*t_2}\psi_1(t_1)d\mathbf{w}_{t_1}^{(i_1)}\ldots d\mathbf{w}_{t_k}^{(i_k)}, \tag{3}$$

where every $\psi_l(\tau)$ $(l=1,\ldots,k)$ is a nonrandom function on $[t,T]$, $\mathbf{w}_\tau^{(i)}$ $(i=$

$1,\ldots,m$) are independent standard Wiener processes and $\mathbf{w}_{\tau}^{(0)} \stackrel{\sf def}{=} \tau$,

$$\int \ \text{and} \ \int\limits^{*}$$

denote Itô and Stratonovich stochastic integrals, respectively; $i_1,\ldots,i_k = 0,1,\ldots,m$ (see definitions in [2]).

Note that $\psi_l(\tau) \equiv 1$ $(l=1,\ldots,k)$ and $i_1,\ldots,i_k = 0,1,\ldots,m$ in the classical Taylor–Itô and Taylor–Stratonovich expansions [2]. At the same time $\psi_l(\tau) \equiv (t-\tau)^{q_l}$ $(l=1,\ldots,k;\ q_1,\ldots,q_k = 0,1,2,\ldots)$ and $i_1,\ldots,i_k = 1,\ldots,m$ in the unified Taylor–Itô and Taylor–Stratonovich expansions [24], [25] (also see [26], [27], [68], Chapter 4).

Let $C^{2,1}(\mathbb{R}^n \times [0,T])$ be the space of functions $R(\mathbf{x},t): \mathbb{R}^n \times [0,T] \rightarrow \mathbb{R}^1$ with the following property: these functions are twice continuously differentiable in $\mathbf{x}$ and have one continuous derivative in t. Let us consider the following differential operators on the space $C^{2,1}(\mathbb{R}^n \times [0,T])$

$$L = \frac{\partial}{\partial t} + \sum_{i=1}^{n} \mathbf{a}^{(i)}(\mathbf{x},t)\frac{\partial}{\partial \mathbf{x}^{(i)}} + \frac{1}{2}\sum_{j=1}^{m}\sum_{l,i=1}^{n} B^{(lj)}(\mathbf{x},t)B^{(ij)}(\mathbf{x},t)\frac{\partial^2}{\partial \mathbf{x}^{(l)}\partial \mathbf{x}^{(i)}}, \qquad (4)$$

$$G_0^{(i)} = \sum_{j=1}^{n} B^{(ji)}(\mathbf{x},t)\frac{\partial}{\partial \mathbf{x}^{(j)}}, \quad i=1,\ldots,m, \qquad (5)$$

where $\mathbf{a}^{(i)}(\mathbf{x},t)$ is the ith component of the vector function $\mathbf{a}(\mathbf{x},t)$ and $B^{(ij)}(\mathbf{x},t)$ is the ijth component of the matrix function $B(\mathbf{x},t)$.

Consider the following sequence of differential operators

$$G_p^{(i)} = \frac{1}{p}\left(G_{p-1}^{(i)}L - LG_{p-1}^{(i)}\right), \quad p=1,2,\ldots, \quad i=1,\ldots,m,$$

where L and $G_0^{(i)}$, $i=1,\ldots,m$ are defined by (4), (5).

For the further consideration, we need to introduce the following set of iterated Itô stochastic integrals

$$I_{(l_1\ldots l_k)s,t}^{(i_1\ldots i_k)} = \int\limits_t^s (t-t_k)^{l_k}\ldots\int\limits_t^{t_2}(t-t_1)^{l_1}d\mathbf{w}_{t_1}^{(i_1)}\ldots d\mathbf{w}_{t_k}^{(i_k)}, \qquad (6)$$

where $l_1,\ldots,l_k = 0,1,\ldots$ and $i_1,\ldots,i_k = 1,\ldots,m$.

Assume that $R(\mathbf{x},t)$, $\mathbf{a}(\mathbf{x},t)$, and $B_i(\mathbf{x},t)$, $i=1,\ldots,m$ are enough smooth functions with respect to the variables $\mathbf{x}$ and t. Then for all $s,t\in[0,T]$ such that $s>t$ we can write the following unified Taylor–Itô expansion [24] (also see [26], [27], [68], Chapter 4)

$$R(\mathbf{x}_s,s)=$$

$$=R(\mathbf{x}_t,t)+\sum_{q=1}^{r}\sum_{(k,j,l_1,\ldots,l_k)\in\mathrm{D}_q}\frac{(s-t)^j}{j!}\sum_{i_1,\ldots,i_k=1}^{m}G_{l_1}^{(i_1)}\ldots G_{l_k}^{(i_k)}L^jR(\mathbf{x}_t,t)\ I_{(l_1\ldots l_k)s,t}^{(i_1\ldots i_k)}+$$

$$+\left(H_{r+1}\right)_{s,t}\quad \text{w. p. 1}, \tag{7}$$

where

$$L^jR(\mathbf{x},t)\stackrel{\mathsf{def}}{=}\begin{cases}\underbrace{L\ldots L}_{j}R(\mathbf{x},t) & \text{for } j\ge 1\\ \\ R(\mathbf{x},t) & \text{for } j=0\end{cases},$$

$$\mathrm{D}_q=\left\{(k,j,l_1,\ldots,l_k):\ k+2\left(j+\sum_{p=1}^{k}l_p\right)=q;\ k,j,l_1,\ldots,l_k=0,1,\ldots\right\}, \tag{8}$$

and $\left(H_{r+1}\right)_{s,t}$ is the remainder term in integral form [26], [27], [68].

Consider the partition $\{\tau_p\}_{p=0}^{N}$ of the interval $[0,T]$ such that

$$0=\tau_0<\tau_1<\ldots<\tau_N=T,\quad \Delta_N=\max_{0\le j\le N-1}\left|\tau_{j+1}-\tau_j\right|. \tag{9}$$

Let $\mathbf{y}_{\tau_j}\stackrel{\mathsf{def}}{=}\mathbf{y}_j$, $j=0,1,\ldots,N$ be a time discrete approximation of the process $\mathbf{x}_t$, $t\in[0,T]$, which is a solution of the Itô SDE (1).

Definiton 1 [2]. *We will say that a time discrete approximation* $\mathbf{y}_j$, $j=0,1,\ldots,N$, *corresponding to the maximal step of discretization* Δ_N, *converges strongly with order* $\gamma>0$ *at time moment* T *to the process* $\mathbf{x}_t$, $t\in[0,T]$, *if there exists a constant* $C>0$, *which does not depend on* Δ_N, *and a* $\delta>0$ *such that* $\mathsf{M}\{|\mathbf{x}_T-\mathbf{y}_T|\}\le C(\Delta_N)^{\gamma}$ *for each* $\Delta_N\in(0,\delta)$.

From (7) for $s=\tau_{p+1}$ and $t=\tau_p$ we obtain the following representation of explicit one-step strong numerical scheme for the Itô SDE (1)

$$\mathbf{y}_{p+1}=\mathbf{y}_p+\sum_{q=1}^{r}\sum_{(k,j,l_1,\ldots,l_k)\in\mathrm{D}_q}\frac{(\tau_{p+1}-\tau_p)^j}{j!}\sum_{i_1,\ldots,i_k=1}^{m}G_{l_1}^{(i_1)}\ldots G_{l_k}^{(i_k)}L^j\mathbf{y}_p\ \hat{I}_{(l_1\ldots l_k)\tau_{p+1},\tau_p}^{(i_1\ldots i_k)}+$$

$$+\mathbf{1}_{\{r=2d-1,d\in\mathbb{N}\}}\frac{(\tau_{p+1}-\tau_p)^{(r+1)/2}}{((r+1)/2)!}L^{(r+1)/2}\mathbf{y}_p, \qquad (10)$$

where $\hat{I}^{(i_1\ldots i_k)}_{(l_1\ldots l_k)\tau_{p+1},\tau_p}$ is an approximation of the iterated Itô stochastic integral (6) and $\mathbf{1}_A$ is the indicator of the set A. Note that we understand the equality (10) componentwise with respect to the components $\mathbf{y}_p^{(i)}$ of the column $\mathbf{y}_p$. Also for simplicity we put $\tau_p = p\Delta$, $\Delta = T/N$, $p = 0, 1, \ldots, N$.

Under the appropriate conditions [2] the numerical scheme (10) has strong order $r/2$ ($r \in \mathbb{N}$) of convergence.

Below we consider particular cases of the numerical scheme (10) for $r = 1, 2, 3, 4, 5,$ and 6, i.e. explicit one-step strong numerical schemes with convergence orders $0.5, 1.0, 1.5, 2.0, 2.5,$ and 3.0 for the Itô SDE (1) [26], [27], [65], [66]. At that for simplicity we will write $\mathbf{a}$, $L\mathbf{a}$, B_i, $G_0^{(i)}B_j$ etc. instead of $\mathbf{a}(\mathbf{y}_p,\tau_p)$, $L\mathbf{a}(\mathbf{y}_p,\tau_p)$, $B_i(\mathbf{y}_p,\tau_p)$, $G_0^{(i)}B_j(\mathbf{y}_p,\tau_p)$ etc. correspondingly. Moreover, the operators L and $G_0^{(i)}$, $i = 1,\ldots,m$ are defined by (4), (5).

Scheme with strong order 0.5 (Euler scheme)

$$\mathbf{y}_{p+1} = \mathbf{y}_p + \sum_{i_1=1}^{m} B_{i_1}\hat{I}^{(i_1)}_{(0)\tau_{p+1},\tau_p} + \Delta\mathbf{a}. \qquad (11)$$

Scheme with strong order 1.0 (Milstein scheme)

$$\mathbf{y}_{p+1} = \mathbf{y}_p + \sum_{i_1=1}^{m} B_{i_1}\hat{I}^{(i_1)}_{(0)\tau_{p+1},\tau_p} + \Delta\mathbf{a} + \sum_{i_1,i_2=1}^{m} G_0^{(i_1)}B_{i_2}\hat{I}^{(i_1i_2)}_{(00)\tau_{p+1},\tau_p}. \qquad (12)$$

Scheme with strong order 1.5

$$\mathbf{y}_{p+1} = \mathbf{y}_p + \sum_{i_1=1}^{m} B_{i_1}\hat{I}^{(i_1)}_{(0)\tau_{p+1},\tau_p} + \Delta\mathbf{a} + \sum_{i_1,i_2=1}^{m} G_0^{(i_1)}B_{i_2}\hat{I}^{(i_1i_2)}_{(00)\tau_{p+1},\tau_p} +$$

$$+\sum_{i_1=1}^{m}\left[G_0^{(i_1)}\mathbf{a}\left(\Delta\hat{I}^{(i_1)}_{(0)\tau_{p+1},\tau_p} + \hat{I}^{(i_1)}_{(1)\tau_{p+1},\tau_p}\right) - LB_{i_1}\hat{I}^{(i_1)}_{(1)\tau_{p+1},\tau_p}\right] +$$

$$+\sum_{i_1,i_2,i_3=1}^{m} G_0^{(i_1)}G_0^{(i_2)}B_{i_3}\hat{I}^{(i_1i_2i_3)}_{(000)\tau_{p+1},\tau_p} + \frac{\Delta^2}{2}L\mathbf{a}. \qquad (13)$$

Scheme with strong order 2.0

$$\mathbf{y}_{p+1} = \mathbf{y}_p + \sum_{i_1=1}^{m} B_{i_1}\hat{I}_{(0)\tau_{p+1},\tau_p}^{(i_1)} + \Delta\mathbf{a} + \sum_{i_1,i_2=1}^{m} G_0^{(i_1)} B_{i_2}\hat{I}_{(00)\tau_{p+1},\tau_p}^{(i_1 i_2)} +$$

$$+\sum_{i_1=1}^{m}\left[G_0^{(i_1)}\mathbf{a}\left(\Delta\hat{I}_{(0)\tau_{p+1},\tau_p}^{(i_1)} + \hat{I}_{(1)\tau_{p+1},\tau_p}^{(i_1)}\right) - LB_{i_1}\hat{I}_{(1)\tau_{p+1},\tau_p}^{(i_1)}\right] +$$

$$+\sum_{i_1,i_2,i_3=1}^{m} G_0^{(i_1)}G_0^{(i_2)}B_{i_3}\hat{I}_{(000)\tau_{p+1},\tau_p}^{(i_1 i_2 i_3)} + \frac{\Delta^2}{2}L\mathbf{a} +$$

$$+\sum_{i_1,i_2=1}^{m}\left[G_0^{(i_1)}LB_{i_2}\left(\hat{I}_{(10)\tau_{p+1},\tau_p}^{(i_1 i_2)} - \hat{I}_{(01)\tau_{p+1},\tau_p}^{(i_1 i_2)}\right) - LG_0^{(i_1)}B_{i_2}\hat{I}_{(10)\tau_{p+1},\tau_p}^{(i_1 i_2)} +\right.$$

$$\left.+G_0^{(i_1)}G_0^{(i_2)}\mathbf{a}\left(\hat{I}_{(01)\tau_{p+1},\tau_p}^{(i_1 i_2)} + \Delta\hat{I}_{(00)\tau_{p+1},\tau_p}^{(i_1 i_2)}\right)\right] +$$

$$+\sum_{i_1,i_2,i_3,i_4=1}^{m} G_0^{(i_1)}G_0^{(i_2)}G_0^{(i_3)}B_{i_4}\hat{I}_{(0000)\tau_{p+1},\tau_p}^{(i_1 i_2 i_3 i_4)}. \tag{14}$$

Scheme with strong order 2.5

$$\mathbf{y}_{p+1} = \mathbf{y}_p + \sum_{i_1=1}^{m} B_{i_1}\hat{I}_{(0)\tau_{p+1},\tau_p}^{(i_1)} + \Delta\mathbf{a} + \sum_{i_1,i_2=1}^{m} G_0^{(i_1)} B_{i_2}\hat{I}_{(00)\tau_{p+1},\tau_p}^{(i_1 i_2)} +$$

$$+\sum_{i_1=1}^{m}\left[G_0^{(i_1)}\mathbf{a}\left(\Delta\hat{I}_{(0)\tau_{p+1},\tau_p}^{(i_1)} + \hat{I}_{(1)\tau_{p+1},\tau_p}^{(i_1)}\right) - LB_{i_1}\hat{I}_{(1)\tau_{p+1},\tau_p}^{(i_1)}\right] +$$

$$+\sum_{i_1,i_2,i_3=1}^{m} G_0^{(i_1)}G_0^{(i_2)}B_{i_3}\hat{I}_{(000)\tau_{p+1},\tau_p}^{(i_1 i_2 i_3)} + \frac{\Delta^2}{2}L\mathbf{a} +$$

$$+\sum_{i_1,i_2=1}^{m}\left[G_0^{(i_1)}LB_{i_2}\left(\hat{I}_{(10)\tau_{p+1},\tau_p}^{(i_1 i_2)} - \hat{I}_{(01)\tau_{p+1},\tau_p}^{(i_1 i_2)}\right) - LG_0^{(i_1)}B_{i_2}\hat{I}_{(10)\tau_{p+1},\tau_p}^{(i_1 i_2)} +\right.$$

$$\left.+G_0^{(i_1)}G_0^{(i_2)}\mathbf{a}\left(\hat{I}_{(01)\tau_{p+1},\tau_p}^{(i_1 i_2)} + \Delta\hat{I}_{(00)\tau_{p+1},\tau_p}^{(i_1 i_2)}\right)\right] +$$

$$+\sum_{i_1,i_2,i_3,i_4=1}^{m} G_0^{(i_1)}G_0^{(i_2)}G_0^{(i_3)}B_{i_4}\hat{I}_{(0000)\tau_{p+1},\tau_p}^{(i_1 i_2 i_3 i_4)} +$$

$$+\sum_{i_1=1}^{m}\Biggl[G_0^{(i_1)}L\mathbf{a}\left(\frac{1}{2}\hat{I}_{(2)\tau_{p+1},\tau_p}^{(i_1)}+\Delta\hat{I}_{(1)\tau_{p+1},\tau_p}^{(i_1)}+\frac{\Delta^2}{2}\hat{I}_{(0)\tau_{p+1},\tau_p}^{(i_1)}\right)+$$

$$+\frac{1}{2}LLB_{i_1}\hat{I}_{(2)\tau_{p+1},\tau_p}^{(i_1)}-LG_0^{(i_1)}\mathbf{a}\Bigl(\hat{I}_{(2)\tau_{p+1},\tau_p}^{(i_1)}+\Delta\hat{I}_{(1)\tau_{p+1},\tau_p}^{(i_1)}\Bigr)\Biggr]+$$

$$+\sum_{i_1,i_2,i_3=1}^{m}\Bigl[G_0^{(i_1)}LG_0^{(i_2)}B_{i_3}\left(\hat{I}_{(100)\tau_{p+1},\tau_p}^{(i_1i_2i_3)}-\hat{I}_{(010)\tau_{p+1},\tau_p}^{(i_1i_2i_3)}\right)+$$

$$+G_0^{(i_1)}G_0^{(i_2)}LB_{i_3}\left(\hat{I}_{(010)\tau_{p+1},\tau_p}^{(i_1i_2i_3)}-\hat{I}_{(001)\tau_{p+1},\tau_p}^{(i_1i_2i_3)}\right)+$$

$$+G_0^{(i_1)}G_0^{(i_2)}G_0^{(i_3)}\mathbf{a}\left(\Delta\hat{I}_{(000)\tau_{p+1},\tau_p}^{(i_1i_2i_3)}+\hat{I}_{(001)\tau_{p+1},\tau_p}^{(i_1i_2i_3)}\right)-$$

$$-LG_0^{(i_1)}G_0^{(i_2)}B_{i_3}\hat{I}_{(100)\tau_{p+1},\tau_p}^{(i_1i_2i_3)}\Bigr]+$$

$$+\sum_{i_1,i_2,i_3,i_4,i_5=1}^{m}G_0^{(i_1)}G_0^{(i_2)}G_0^{(i_3)}G_0^{(i_4)}B_{i_5}\hat{I}_{(00000)\tau_{p+1},\tau_p}^{(i_1i_2i_3i_4i_5)}+$$

$$+\frac{\Delta^3}{6}LL\mathbf{a}. \qquad (15)$$

Scheme with strong order 3.0

$$\mathbf{y}_{p+1}=\mathbf{y}_p+\sum_{i_1=1}^{m}B_{i_1}\hat{I}_{(0)\tau_{p+1},\tau_p}^{(i_1)}+\Delta\mathbf{a}+\sum_{i_1,i_2=1}^{m}G_0^{(i_1)}B_{i_2}\hat{I}_{(00)\tau_{p+1},\tau_p}^{(i_1i_2)}+$$

$$+\sum_{i_1=1}^{m}\Bigl[G_0^{(i_1)}\mathbf{a}\left(\Delta\hat{I}_{(0)\tau_{p+1},\tau_p}^{(i_1)}+\hat{I}_{(1)\tau_{p+1},\tau_p}^{(i_1)}\right)-LB_{i_1}\hat{I}_{(1)\tau_{p+1},\tau_p}^{(i_1)}\Bigr]+$$

$$+\sum_{i_1,i_2,i_3=1}^{m}G_0^{(i_1)}G_0^{(i_2)}B_{i_3}\hat{I}_{(000)\tau_{p+1},\tau_p}^{(i_1i_2i_3)}+\frac{\Delta^2}{2}L\mathbf{a}+$$

$$+\sum_{i_1,i_2=1}^{m}\Bigl[G_0^{(i_1)}LB_{i_2}\left(\hat{I}_{(10)\tau_{p+1},\tau_p}^{(i_1i_2)}-\hat{I}_{(01)\tau_{p+1},\tau_p}^{(i_1i_2)}\right)-LG_0^{(i_1)}B_{i_2}\hat{I}_{(10)\tau_{p+1},\tau_p}^{(i_1i_2)}+$$

$$+G_0^{(i_1)}G_0^{(i_2)}\mathbf{a}\left(\hat{I}_{(01)\tau_{p+1},\tau_p}^{(i_1i_2)}+\Delta\hat{I}_{(00)\tau_{p+1},\tau_p}^{(i_1i_2)}\right)\Bigr]+$$

$$+\sum_{i_1,i_2,i_3,i_4=1}^{m}G_0^{(i_1)}G_0^{(i_2)}G_0^{(i_3)}B_{i_4}\hat{I}_{(0000)\tau_{p+1},\tau_p}^{(i_1i_2i_3i_4)}+\mathbf{q}_{p+1,p}+\mathbf{r}_{p+1,p}, \qquad (16)$$

where

$$\mathbf{q}_{p+1,p} = \sum_{i_1=1}^{m}\Biggl[G_0^{(i_1)}L\mathbf{a}\left(\frac{1}{2}\hat{I}_{(2)\tau_{p+1},\tau_p}^{(i_1)} + \Delta\hat{I}_{(1)\tau_{p+1},\tau_p}^{(i_1)} + \frac{\Delta^2}{2}\hat{I}_{(0)\tau_{p+1},\tau_p}^{(i_1)}\right)+$$

$$+\frac{1}{2}LLB_{i_1}\hat{I}_{(2)\tau_{p+1},\tau_p}^{(i_1)} - LG_0^{(i_1)}\mathbf{a}\Bigl(\hat{I}_{(2)\tau_{p+1},\tau_p}^{(i_1)} + \Delta\hat{I}_{(1)\tau_{p+1},\tau_p}^{(i_1)}\Bigr)\Biggr]+$$

$$

Under the suitable conditions [2] the numerical schemes (12)–(16) have strong orders 1.0, 1.5, 2.0, 2.5, and 3.0 of convergence correspondingly. Among these conditions we consider only the condition for approximations of iterated Itô stochastic integrals from (12)–(16) [2] (also see [43])

$$
\mathsf{M}\left\{\left(I_{(l_1\ldots l_k)\tau_{p+1},\tau_p}^{(i_1\ldots i_k)}-\hat{I}_{(l_1\ldots l_k)\tau_{p+1},\tau_p}^{(i_1\ldots i_k)}\right)^2\right\}\le C\Delta^{r+1}, \tag{17}
$$

where constant C is independent of Δ and $r/2$ are the strong convergence orders for the numerical schemes (12)–(16), i.e. $r/2=1.0, 1.5,\ 2.0, 2.5,$ and 3.0.

Note that the numerical schemes (12)–(16) are unrealizable in practice without procedures for the numerical simulation of iterated Itô stochastic integrals from (10). In Sect. 2.3 we give a brief overview of the effective method of the mean-square approximation of iterated Itô and Stratonovich stochastic integrals of arbitrary multiplicity k ($k\in\mathbb{N}$).

2.2 Strong Numerical Methods with Convergence Orders 1.0, 1.5, 2.0, 2.5, and 3.0 for Itô SDEs Based on the Unified Taylor–Stratonovich Expansion

Let us consider the following differential operator on the space $C^{2,1}(\mathbb{R}^n\times[0,T])$

$$\bar{L} = L - \frac{1}{2}\sum_{i=1}^{m} G_0^{(i)} G_0^{(i)}, \tag{18}$$

where operators L and $G_0^{(i)}$, $i = 1, \ldots, m$ are defined by (4), (5).

Define the following sequence of differential operators

$$\bar{G}_p^{(i)} \stackrel{\textsf{def}}{=} \frac{1}{p}\left(\bar{G}_{p-1}^{(i)}\bar{L} - \bar{L}\bar{G}_{p-1}^{(i)}\right), \quad p = 1, 2, \ldots, \quad i = 1, \ldots, m, \tag{19}$$

where $\bar{G}_0^{(i)} \stackrel{\textsf{def}}{=} G_0^{(i)}$, $i = 1, \ldots, m$. The operators $\bar{L}$ and $G_0^{(i)}$, $i = 1, \ldots, m$ are defined by (18) and (5) correspondingly.

For the further consideration, we need to introduce the following set of iterated Stratonovich stochastic integrals

$$I_{(l_1\ldots l_k)s,t}^{*(i_1\ldots i_k)} = \int\limits_t^{*s} (t - t_k)^{l_k} \ldots \int\limits_t^{*t_2} (t - t_1)^{l_1} d\mathbf{w}_{t_1}^{(i_1)} \ldots d\mathbf{w}_{t_k}^{(i_k)}, \tag{20}$$

where $l_1, \ldots, l_k = 0, 1, \ldots$ and $i_1, \ldots, i_k = 1, \ldots, m$.

Assume that $R(\mathbf{x}, t)$, $\mathbf{a}(\mathbf{x}, t)$, and $B_i(\mathbf{x}, t)$, $i = 1, \ldots, m$ are enough smooth functions with respect to the variables $\mathbf{x}$ and t. Then for all $s, t \in [0, T]$ such that $s > t$ we can write the following unified Taylor–Stratonovich expansion [25] (also see [26], [27], [68], Chapter 4)

$$R(\mathbf{x}_s, s) =$$

$$= R(\mathbf{x}_t, t) + \sum_{q=1}^{r} \sum_{(k,j,l_1,\ldots,l_k)\in \mathrm{D}_q} \frac{(s-t)^j}{j!} \sum_{i_1,\ldots,i_k=1}^{m} \bar{G}_{l_1}^{(i_1)} \ldots \bar{G}_{l_k}^{(i_k)} \bar{L}^j R(\mathbf{x}_t, t)\ I_{(l_1\ldots l_k)s,t}^{*(i_1\ldots i_k)} +$$

$$+ \left(\bar{H}_{r+1}\right)_{s,t} \quad \text{w. p. 1}, \tag{21}$$

where

$$\bar{L}^j R(\mathbf{x}, t) \stackrel{\textsf{def}}{=} \begin{cases} \underbrace{\bar{L} \ldots \bar{L}}_{j} R(\mathbf{x}, t) & \text{for } j \geq 1 \\ \\ R(\mathbf{x}, t) & \text{for } j = 0 \end{cases},$$

the set D_q is defined by the equality (8) and $\left(\bar{H}_{r+1}\right)_{s,t}$ is the remainder term in integral form [25] (also see [26], [27], [68], Chapter 4).

Consider the partition (9) of the interval $[0, T]$. From (21) for $s = \tau_{p+1}$ and $t = \tau_p$ we obtain the following representation of explicit one-step strong numerical scheme for the Itô SDE (1)

$$\mathbf{y}_{p+1} = \mathbf{y}_p + \sum_{q=1}^{r} \sum_{(k,j,l_1,\ldots,l_k)\in \mathrm{D}_q} \frac{(\tau_{p+1}-\tau_p)^j}{j!} \sum_{i_1,\ldots,i_k=1}^{m} \bar{G}_{l_1}^{(i_1)} \ldots \bar{G}_{l_k}^{(i_k)} \bar{L}^j \mathbf{y}_p \ \hat{I}^{*(i_1\ldots i_k)}_{(l_1\ldots l_k)\tau_{p+1},\tau_p} +$$

$$+ \mathbf{1}_{\{r=2d-1, d\in N\}} \frac{(\tau_{p+1}-\tau_p)^{(r+1)/2}}{((r+1)/2)!} L^{(r+1)/2} \mathbf{y}_p, \qquad (22)$$

where $\hat{I}^{*(i_1\ldots i_k)}_{(l_1\ldots l_k)\tau_{p+1},\tau_p}$ is an approximation of the iterated Stratonovich stochastic integral (20) and $\mathbf{1}_A$ is the indicator of the set A. Note that we understand the equality (22) componentwise with respect to the components $\mathbf{y}_p^{(i)}$ of the column $\mathbf{y}_p$. Also for simplicity we put $\tau_p = p\Delta$, $\Delta = T/N$, $p = 0, 1, \ldots, N$.

Under the appropriate conditions [2] the numerical scheme (22) has strong order $r/2$ ($r \in \mathbb{N}$) of convergence.

Denote

$$\bar{\mathbf{a}}(\mathbf{x}, t) = \mathbf{a}(\mathbf{x}, t) - \frac{1}{2} \sum_{j=1}^{m} G_0^{(j)} B_j(\mathbf{x}, t),$$

where $B_j(\mathbf{x}, t)$ is the jth column of the matrix function $B(\mathbf{x}, t)$.

It is not difficult to show that (see (18))

$$\bar{L} = \frac{\partial}{\partial t} + \sum_{i=1}^{n} \bar{\mathbf{a}}^{(i)}(\mathbf{x}, t) \frac{\partial}{\partial \mathbf{x}^{(i)}}, \qquad (23)$$

where $\bar{\mathbf{a}}^{(i)}(\mathbf{x}, t)$ is the ith component of the vector function $\bar{\mathbf{a}}(\mathbf{x}, t)$.

Below we consider particular cases of the numerical scheme (22) for $r = 2, 3, 4, 5$, and 6, i.e. explicit one-step strong numerical schemes with convergence orders $1.0, 1.5, 2.0, 2.5$, and 3.0 for the Itô SDE (1) [26], [27], [67], [68]. At that for simplicity we will write $\bar{\mathbf{a}}$, $\bar{L}\bar{\mathbf{a}}$, $L\mathbf{a}$, B_i, $G_0^{(i)} B_j$ etc. instead of $\bar{\mathbf{a}}(\mathbf{y}_p, \tau_p)$, $\bar{L}\bar{\mathbf{a}}(\mathbf{y}_p, \tau_p)$, $L\mathbf{a}(\mathbf{y}_p, \tau_p)$, $B_i(\mathbf{y}_p, \tau_p)$, $G_0^{(i)} B_j(\mathbf{y}_p, \tau_p)$ etc. correspondingly.

Scheme with strong order 1.0

$$\mathbf{y}_{p+1} = \mathbf{y}_p + \sum_{i_1=1}^{m} B_{i_1} \hat{I}^{*(i_1)}_{(0)\tau_{p+1},\tau_p} + \Delta \bar{\mathbf{a}} + \sum_{i_1,i_2=1}^{m} G_0^{(i_1)} B_{i_2} \hat{I}^{*(i_1 i_2)}_{(00)\tau_{p+1},\tau_p}. \qquad (24)$$

Scheme with strong order 1.5

Under the suitable conditions [2] the numerical schemes (24)–(28) have strong orders 1.0, 1.5, 2.0, 2.5, and 3.0 of convergence correspondingly. Among these conditions we consider only the condition for approximations of iterated Stratonovich stochastic integrals from (24)–(28) [2] (also see [43])

$$\mathsf{M}\left\{\left(I^{*(i_1\ldots i_k)}_{(l_1\ldots l_k)\tau_{p+1},\tau_p}-\hat{I}^{*(i_1\ldots i_k)}_{(l_1\ldots l_k)\tau_{p+1},\tau_p}\right)^2\right\}\le C\Delta^{r+1}, \tag{29}$$

where constant C is independent of Δ and $r/2$ are the strong convergence orders for the numerical schemes (24)–(28), i.e. $r/2 = 1.0, 1.5,\ 2.0, 2.5,$ and 3.0.

Note that the numerical schemes (24)–(28) are unrealizable in practice without procedures for the numerical simulation of iterated Stratonovich stochastic integrals from (22). The next section is devoted to the effective method of the mean-square approximation of iterated Itô and Stratonovich stochastic integrals of arbitrary multiplicity k ($k \in \mathbb{N}$).

2.3 Method of Expansion and Approximation of Iterated Itô and Stratonovich Stochastic Integrals Based on Generalized Multiple Fourier Series

Let us consider the effective approach to expansion of iterated Itô stochastic integrals [43] (2006) (also see [26], [27], [45]-[47], [59], [62], [68], [69]). This method is reffered to as the method of generalized multiple Fourier series.

Suppose that every $\psi_l(\tau)$ ($l = 1, \ldots, k$) is a nonrandom function from the space $L_2([t, T])$. Define the following function on the hypercube $[t, T]^k$

$$K(t_1, \ldots, t_k) = \begin{cases} \psi_1(t_1) \ldots \psi_k(t_k) & \text{for} \ \ t_1 < \ldots < t_k \\ \\ 0 & \text{otherwise} \end{cases}, \quad t_1, \ldots, t_k \in [t, T], \tag{30}$$

where $k \ge 2$ and $K(t_1) \equiv \psi_1(t_1)$ for $t_1 \in [t, T]$.

Suppose that $\{\phi_j(x)\}_{j=0}^{\infty}$ is a complete orthonormal system of functions in the space $L_2([t, T])$.

The function $K(t_1, \ldots, t_k)$ belongs to the space $L_2([t, T]^k)$. At this situation it is well known that the generalized multiple Fourier series of $K(t_1, \ldots, t_k) \in L_2([t, T]^k)$ is converging to $K(t_1, \ldots, t_k)$ in the hypercube $[t, T]^k$ in the mean-square sense, i.e.

$$\lim_{p_1, \ldots, p_k \to \infty} \left\| K(t_1, \ldots, t_k) - \sum_{j_1=0}^{p_1} \ldots \sum_{j_k=0}^{p_k} C_{j_k \ldots j_1} \prod_{l=1}^{k} \phi_{j_l}(t_l) \right\|_{L_2([t,T]^k)} = 0,$$

where

$$C_{j_k \ldots j_1} = \int\limits_{[t,T]^k} K(t_1, \ldots, t_k) \prod_{l=1}^{k} \phi_{j_l}(t_l) dt_1 \ldots dt_k \tag{31}$$

is the Fourier coefficient and

$$\|f\|_{L_2([t,T]^k)} = \left(\int\limits_{[t,T]^k} f^2(t_1, \ldots, t_k) dt_1 \ldots dt_k \right)^{1/2}.$$

Consider the partition $\{\tau_j\}_{j=0}^{N}$ of the interval $[t,T]$ such that

$$t=\tau_0<\ldots<\tau_N=T,\quad \Delta_N=\max_{0\le j\le N-1}\Delta\tau_j\to 0\ \text{ if }\ N\to\infty,\quad \Delta\tau_j=\tau_{j+1}-\tau_j. \tag{32}$$

Theorem 1 [43] (2006) (also see [26], [27], [45]-[47], [59], [62], [68], [69]). *Suppose that every $\psi_l(\tau)$ $(l=1,\ldots,k)$ is a continuous nonrandom function on $[t,T]$ and $\{\phi_j(x)\}_{j=0}^{\infty}$ is a complete orthonormal system of continuous functions in the space $L_2([t,T])$. Then*

$$J[\psi^{(k)}]_{T,t} = \underset{p_1,\ldots,p_k\to\infty}{\text{l.i.m.}}\sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k}C_{j_k\ldots j_1}\Biggl(\prod_{l=1}^{k}\zeta_{j_l}^{(i_l)} - $$
$$- \underset{N\to\infty}{\text{l.i.m.}}\sum_{(l_1,\ldots,l_k)\in \mathrm{G}_k}\phi_{j_1}(\tau_{l_1})\Delta\mathbf{w}_{\tau_{l_1}}^{(i_1)}\ldots\phi_{j_k}(\tau_{l_k})\Delta\mathbf{w}_{\tau_{l_k}}^{(i_k)}\Biggr), \tag{33}$$

where $J[\psi^{(k)}]_{T,t}$ is defined by (2),

$$\mathrm{G}_k=\mathrm{H}_k\backslash\mathrm{L}_k,\quad \mathrm{H}_k=\{(l_1,\ldots,l_k):\ l_1,\ldots,l_k=0,1,\ldots,N-1\},$$

$$\mathrm{L}_k=\{(l_1,\ldots,l_k):\ l_1,\ldots,l_k=0,1,\ldots,N-1;\ l_g\ne l_r\ (g\ne r);\ g,r=1,\ldots,k\},$$

l.i.m. *is a limit in the mean-square sense,* $i_1,\ldots,i_k=0,1,\ldots,m,$

$$\zeta_j^{(i)}=\int\limits_t^T\phi_j(s)d\mathbf{w}_s^{(i)} \tag{34}$$

are independent standard Gaussian random variables for various i or j (in the case when $i\ne 0$), $C_{j_k\ldots j_1}$ is the Fourier coefficient (31), $\Delta\mathbf{w}_{\tau_j}^{(i)}=\mathbf{w}_{\tau_{j+1}}^{(i)}-\mathbf{w}_{\tau_j}^{(i)}$ $(i=0,1,\ldots,m)$, $\{\tau_j\}_{j=0}^{N}$ is a partition of the interval $[t,T]$, which satisfies the condition (32).

Note that a number of modifications and generalizations of Theorem 1 can be found in [26], [27], [68].

Consider transformed particular cases of (33) for $k=1,\ldots,6$ [26], [27], [59], [62], [68], [69]

$$J[\psi^{(1)}]_{T,t}=\underset{p_1\to\infty}{\text{l.i.m.}}\sum_{j_1=0}^{p_1}C_{j_1}\zeta_{j_1}^{(i_1)}, \tag{35}$$

$$

where $\mathbf{1}_A$ is the indicator of the set A.

A detailed discussion of advantages of the method based on Theorem 1 over the approximation methods from works [2], [3], [7], [8], [28]-[36], [38]-[40] can be found in [26] (Sect. 1.1.10) or in [27], [68].

For further consideration, let us consider the generalization of formulas (35)–(40) for the case of an arbitrary multiplicity k ($k \in \mathbb{N}$) of the iterated Ito stochastic integral $J[\psi^{(k)}]_{T,t}$ defined by (2). In order to do this, let us introduce some notations. Consider the unordered set $\{1, 2, \ldots, k\}$ and separate it into two parts: the first part consists of r unordered pairs (sequence order of these pairs is also unimportant) and the second one consists of the remaining $k - 2r$ numbers. So, we have

$$(\{\underbrace{\{g_1, g_2\}, \ldots, \{g_{2r-1}, g_{2r}\}}_{\text{part 1}}\}, \{\underbrace{q_1, \ldots, q_{k-2r}}_{\text{part 2}}\}), \tag{41}$$

where

$$\{g_1, g_2, \ldots, g_{2r-1}, g_{2r}, q_1, \ldots, q_{k-2r}\} = \{1, 2, \ldots, k\},$$

braces mean an unordered set, and parentheses mean an ordered set.

We will say that (41) is a partition and consider the sum with respect to all possible partitions

$$\sum_{\substack{(\{\{g_1,g_2\},\ldots,\{g_{2r-1},g_{2r}\}\},\{q_1,\ldots,q_{k-2r}\}) \\ \{g_1,g_2,\ldots,g_{2r-1},g_{2r},q_1,\ldots,q_{k-2r}\}=\{1,2,\ldots,k\}}} a_{g_1 g_2,\ldots,g_{2r-1} g_{2r},q_1\ldots q_{k-2r}}. \tag{42}$$

Below there are several examples of sums in the form (42)

$$\sum_{\substack{(\{g_1,g_2\}) \\ \{g_1,g_2\}=\{1,2\}}} a_{g_1 g_2} = a_{12},$$

$$\sum_{\substack{(\{\{g_1,g_2\},\{g_3,g_4\}\}) \\ \{g_1,g_2,g_3,g_4\}=\{1,2,3,4\}}} a_{g_1 g_2 g_3 g_4} = a_{1234} + a_{1324} + a_{2314},$$

$$\sum_{\substack{(\{g_1,g_2\},\{q_1,q_2\}) \\ \{g_1,g_2,q_1,q_2\}=\{1,2,3,4\}}} a_{g_1 g_2,q_1 q_2} =$$

$$= a_{12,34} + a_{13,24} + a_{14,23} + a_{23,14} + a_{24,13} + a_{34,12},$$

$$\sum_{\substack{(\{g_1,g_2\},\{q_1,q_2,q_3\})\\ \{g_1,g_2,q_1,q_2,q_3\}=\{1,2,3,4,5\}}} a_{g_1g_2,q_1q_2q_3} =$$

$$= a_{12,345} + a_{13,245} + a_{14,235} + a_{15,234} + a_{23,145} + a_{24,135} +$$

$$+ a_{25,134} + a_{34,125} + a_{35,124} + a_{45,123},$$

$$\sum_{\substack{(\{\{g_1,g_2\},\{g_3,g_4\}\},\{q_1\})\\ \{g_1,g_2,g_3,g_4,q_1\}=\{1,2,3,4,5\}}} a_{g_1g_2,g_3g_4,q_1} =$$

$$= a_{12,34,5} + a_{13,24,5} + a_{14,23,5} + a_{12,35,4} + a_{13,25,4} + a_{15,23,4} +$$

$$+ a_{12,54,3} + a_{15,24,3} + a_{14,25,3} + a_{15,34,2} + a_{13,54,2} + a_{14,53,2} +$$

$$+ a_{52,34,1} + a_{53,24,1} + a_{54,23,1}.$$

Now we can write (33) as

$$J[\psi^{(k)}]_{T,t} = \underset{p_1,\ldots,p_k\to\infty}{\text{l.i.m.}} \sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k} C_{j_k\ldots j_1}\Biggl(\prod_{l=1}^{k}\zeta_{j_l}^{(i_l)} + \sum_{r=1}^{[k/2]}(-1)^r \times$$

$$\times \sum_{\substack{(\{\{g_1,g_2\},\ldots,\{g_{2r-1},g_{2r}\}\},\{q_1,\ldots,q_{k-2r}\})\\ \{g_1,g_2,\ldots,g_{2r-1},g_{2r},q_1,\ldots,q_{k-2r}\}=\{1,2,\ldots,k\}}} \prod_{s=1}^{r} \mathbf{1}_{\{i_{g_{2s-1}}=\ i_{g_{2s}}\neq 0\}}\mathbf{1}_{\{j_{g_{2s-1}}=\ j_{g_{2s}}\}} \prod_{l=1}^{k-2r}\zeta_{j_{q_l}}^{(i_{q_l})}\Biggr), \quad (43)$$

where $[x]$ is an integer part of a real number x; another notations are the same as in Theorem 1.

In particular, from (43) for $k=5$ we obtain

$$J[\psi^{(5)}]_{T,t} = \underset{p_1,\ldots,p_5\to\infty}{\text{l.i.m.}} \sum_{j_1=0}^{p_1}\ldots\sum_{j_5=0}^{p_5} C_{j_5\ldots j_1}\Biggl(\prod_{l=1}^{5}\zeta_{j_l}^{(i_l)} -$$

$$- \sum_{\substack{(\{g_1,g_2\},\{q_1,q_2,q_3\})\\ \{g_1,g_2,q_1,q_2,q_3\}=\{1,2,3,4,5\}}} \mathbf{1}_{\{i_{g_1}=\ i_{g_2}\neq 0\}}\mathbf{1}_{\{j_{g_1}=\ j_{g_2}\}} \prod_{l=1}^{3}\zeta_{j_{q_l}}^{(i_{q_l})} +$$

$$+ \sum_{\substack{(\{\{g_1,g_2\},\{g_3,g_4\}\},\{q_1\})\\ \{g_1,g_2,g_3,g_4,q_1\}=\{1,2,3,4,5\}}} \mathbf{1}_{\{i_{g_1}=\ i_{g_2}\neq 0\}}\mathbf{1}_{\{j_{g_1}=\ j_{g_2}\}}\mathbf{1}_{\{i_{g_3}=\ i_{g_4}\neq 0\}}\mathbf{1}_{\{j_{g_3}=\ j_{g_4}\}}\zeta_{j_{q_1}}^{(i_{q_1})}\Biggr).$$

The last equality obviously agrees with (39).

Let us consider the generalization of Theorem 1 for the case of an arbitrary complete orthonormal systems of functions in the space $L_2([t,T])$ and $\psi_1(\tau),\ldots,\psi_k(\tau)\in L_2([t,T])$.

Theorem 2 [68] (Sect. 1.11), [89] (Sect. 15). *Suppose that $\psi_1(\tau),\ldots,\psi_k(\tau)\in L_2([t,T])$ and $\{\phi_j(x)\}_{j=0}^{\infty}$ is an arbitrary complete orthonormal system of functions in the space $L_2([t,T])$. Then the following expansion*

$$J[\psi^{(k)}]_{T,t}=\underset{p_1,\ldots,p_k\to\infty}{\text{l.i.m.}}\sum_{j_1=0}^{p_1}\ldots\sum_{j_k=0}^{p_k}C_{j_k\ldots j_1}\Biggl(\prod_{l=1}^{k}\zeta_{j_l}^{(i_l)}+\sum_{r=1}^{[k/2]}(-1)^r\times$$

$$\times\sum_{\substack{(\{\{g_1,g_2\},\ldots,\{g_{2r-1},g_{2r}\}\},\{q_1,\ldots,q_{k-2r}\})\\ \{g_1,g_2,\ldots,g_{2r-1},g_{2r},q_1,\ldots,q_{k-2r}\}=\{1,2,\ldots,k\}}}\prod_{s=1}^{r}\mathbf{1}_{\{i_{g_{2s-1}}=\ i_{g_{2s}}\neq 0\}}\mathbf{1}_{\{j_{g_{2s-1}}=\ j_{g_{2s}}\}}\prod_{l=1}^{k-2r}\zeta_{j_{q_l}}^{(i_{q_l})}\Biggr)\qquad(44)$$

converging in the mean-square sense is valid, where $[x]$ is an integer part of a real number x; another notations are the same as in Theorem 1.

It should be noted that an analogue of Theorem 2 was considered in [123]. Note that we use another notations [68] (Sect. 1.11), [89] (Sect. 15) in comparison with [123]. Moreover, the proof of an analogue of Theorem 2 from [123] is somewhat different from the proof given in [68] (Sect. 1.11), [89] (Sect. 15).

As it turned out, Theorems 1, 2 can be adapted for the iterated Stratonovich stochastic integrals (3) of multiplicities 1 to 6 [26], [27], [68]-[70] (also see bibliography therein). Let as collect some old results in the following theorem.

Theorem 3 [26], [27], [68]-[70]. *Suppose that $\{\phi_j(x)\}_{j=0}^{\infty}$ is a complete orthonormal system of Legendre polynomials or trigonometric functions in the space $L_2([t,T])$. At the same time $\psi_2(\tau)$ is a continuously differentiable function on $[t,T]$ and $\psi_1(\tau)$, $\psi_3(\tau)$ are twice continuously differentiable functions on $[t,T]$. Then*

$$J^*[\psi^{(2)}]_{T,t}=\underset{p_1,p_2\to\infty}{\text{l.i.m.}}\sum_{j_1=0}^{p_1}\sum_{j_2=0}^{p_2}C_{j_2j_1}\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}\quad(i_1,i_2=1,\ldots,m),\qquad(45)$$

$$J^*[\psi^{(3)}]_{T,t}=\underset{p_1,p_2,p_3\to\infty}{\text{l.i.m.}}\sum_{j_1=0}^{p_1}\sum_{j_2=0}^{p_2}\sum_{j_3=0}^{p_3}C_{j_3j_2j_1}\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}\zeta_{j_3}^{(i_3)}\quad(i_1,i_2,i_3=0,1,\ldots,m),\qquad(46)$$

$$J^*[\psi^{(3)}]_{T,t} = \underset{p\to\infty}{\text{l.i.m.}} \sum_{j_1,j_2,j_3=0}^{p} C_{j_3j_2j_1}\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}\zeta_{j_3}^{(i_3)} \quad (i_1,i_2,i_3=1,\ldots,m), \tag{47}$$

$$J^*[\psi^{(4)}]_{T,t} = \underset{p\to\infty}{\text{l.i.m.}} \sum_{j_1,\ldots,j_4=0}^{p} C_{j_4j_3j_2j_1}\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}\zeta_{j_3}^{(i_3)}\zeta_{j_4}^{(i_4)} \quad (i_1,\ldots,i_4=0,1,\ldots,m), \tag{48}$$

where $J^*[\psi^{(k)}]_{T,t}$ *is defined by* (3), *and* $\psi_l(\tau)\equiv 1$ $(l=1,\ldots,4)$ *in* (46), (48); *another notations are the same as in Theorems* 1, 2.

Recently, a new approach to the expansion and mean-square approximation of iterated Stratonovich stochastic integrals has been obtained [68] (Sect. 2.10–2.16), [93] (Sect. 13–19), [98] (Sect. 5–11), [99] (Sect. 7–13), [100] (Sect. 4–9).

Let us formulate four theorems that were obtained using this approach.

Theorem 4 [68], [93], [98], [99], [100]. *Suppose that* $\{\phi_j(x)\}_{j=0}^{\infty}$ *is a complete orthonormal system of Legendre polynomials or trigonometric functions in the space* $L_2([t,T])$. *Furthermore, let* $\psi_1(\tau),\psi_2(\tau),\psi_3(\tau)$ *are continuously differentiable nonrandom functions on* $[t,T]$. *Then, for the iterated Stratonovich stochastic integral of third multiplicity*

$$J^*[\psi^{(3)}]_{T,t} = \int\limits_t^{*T}\psi_3(t_3)\int\limits_t^{*t_3}\psi_2(t_2)\int\limits_t^{*t_2}\psi_1(t_1)d\mathbf{w}_{t_1}^{(i_1)}d\mathbf{w}_{t_2}^{(i_2)}d\mathbf{w}_{t_3}^{(i_3)} \tag{49}$$

the following relations

$$J^*[\psi^{(3)}]_{T,t} = \underset{p\to\infty}{\text{l.i.m.}} \sum_{j_1,j_2,j_3=0}^{p} C_{j_3j_2j_1}\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}\zeta_{j_3}^{(i_3)}, \tag{50}$$

$$\mathsf{M}\left\{\left(J^*[\psi^{(3)}]_{T,t} - \sum_{j_1,j_2,j_3=0}^{p} C_{j_3j_2j_1}\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}\zeta_{j_3}^{(i_3)}\right)^2\right\} \le \frac{C}{p} \tag{51}$$

are fulfilled, where $i_1,i_2,i_3=0,1,\ldots,m$ *in* (49), (50) *and* $i_1,i_2,i_3=1,\ldots,m$ *in* (51), *constant* C *is independent of* p,

$$C_{j_3j_2j_1} = \int\limits_t^{T}\psi_3(t_3)\phi_{j_3}(t_3)\int\limits_t^{t_3}\psi_2(t_2)\phi_{j_2}(t_2)\int\limits_t^{t_2}\psi_1(t_1)\phi_{j_1}(t_1)dt_1dt_2dt_3$$

and

$$\zeta_j^{(i)} = \int\limits_t^T \phi_j(\tau) d\mathbf{f}_\tau^{(i)}$$

are independent standard Gaussian random variables for various i *or* j *(in the case when* $i \neq 0$*); another notations are the same as in Theorems* 1, 2.

Theorem 5 [68], [93], [98], [99], [100]. *Let* $\{\phi_j(x)\}_{j=0}^{\infty}$ *be a complete orthonormal system of Legendre polynomials or trigonometric functions in the space* $L_2([t,T])$*. Furthermore, let* $\psi_1(\tau),\ldots,\psi_4(\tau)$ *be continuously differentiable nonrandom functions on* $[t,T]$*. Then, for the iterated Stratonovich stochastic integral of fourth multiplicity*

$$J^*[\psi^{(4)}]_{T,t} = \int\limits_t^{*T} \psi_4(t_4) \int\limits_t^{*t_4} \psi_3(t_3) \int\limits_t^{*t_3} \psi_2(t_2) \int\limits_t^{*t_2} \psi_1(t_1) d\mathbf{w}_{t_1}^{(i_1)} d\mathbf{w}_{t_2}^{(i_2)} d\mathbf{w}_{t_3}^{(i_3)} d\mathbf{w}_{t_4}^{(i_4)} \tag{52}$$

the following relations

$$J^*[\psi^{(4)}]_{T,t} = \underset{p\to\infty}{\text{l.i.m.}} \sum_{j_1,j_2,j_3,j_4=0}^{p} C_{j_4 j_3 j_2 j_1} \zeta_{j_1}^{(i_1)} \zeta_{j_2}^{(i_2)} \zeta_{j_3}^{(i_3)} \zeta_{j_4}^{(i_4)}, \tag{53}$$

$$\mathsf{M}\left\{\left(J^*[\psi^{(4)}]_{T,t} - \sum_{j_1,j_2,j_3,j_4=0}^{p} C_{j_4 j_3 j_2 j_1} \zeta_{j_1}^{(i_1)} \zeta_{j_2}^{(i_2)} \zeta_{j_3}^{(i_3)} \zeta_{j_4}^{(i_4)}\right)^2\right\} \le \frac{C}{p^{1-\varepsilon}} \tag{54}$$

are fulfilled, where $i_1,\ldots,i_4 = 0,1,\ldots,m$ *in* (52), (53) *and* $i_1,\ldots,i_4 = 1,\ldots,m$ *in* (54)*, constant* C *does not depend on* p*,* ε *is an arbitrary small positive real number for the case of complete orthonormal system of Legendre polynomials in the space* $L_2([t,T])$ *and* $\varepsilon = 0$ *for the case of complete orthonormal system of trigonometric functions in the space* $L_2([t,T])$*,*

$$C_{j_4 j_3 j_2 j_1} =$$

$$= \int\limits_t^T \psi_4(t_4)\phi_{j_4}(t_4) \int\limits_t^{t_4} \psi_3(t_3)\phi_{j_3}(t_3) \int\limits_t^{t_3} \psi_2(t_2)\phi_{j_2}(t_2) \int\limits_t^{t_2} \psi_1(t_1)\phi_{j_1}(t_1) dt_1 dt_2 dt_3 dt_4;$$

another notations are the same as in Theorem 4.

Theorem 6 [68], [93], [98], [99], [100]. *Assume that* $\{\phi_j(x)\}_{j=0}^{\infty}$ *is a complete orthonormal system of Legendre polynomials or trigonometric functions in the space* $L_2([t,T])$ *and* $\psi_1(\tau),\ldots,\psi_5(\tau)$ *are continuously differentiable nonrandom functions on* $[t,T]$. *Then, for the iterated Stratonovich stochastic integral of fifth multiplicity*

$$J^*[\psi^{(5)}]_{T,t}=$$

$$=\int\limits_t^{*T}\psi_5(t_5)\int\limits_t^{*t_5}\psi_4(t_4)\int\limits_t^{*t_4}\psi_3(t_3)\int\limits_t^{*t_3}\psi_2(t_2)\int\limits_t^{*t_2}\psi_1(t_1)d\mathbf{w}_{t_1}^{(i_1)}d\mathbf{w}_{t_2}^{(i_2)}d\mathbf{w}_{t_3}^{(i_3)}d\mathbf{w}_{t_4}^{(i_4)}d\mathbf{w}_{t_5}^{(i_5)} \tag{55}$$

the following relations

$$J^*[\psi^{(5)}]_{T,t}=\underset{p\to\infty}{\text{l.i.m.}}\sum_{j_1,j_2,j_3,j_4,j_5=0}^{p}C_{j_5j_4j_3j_2j_1}\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}\zeta_{j_3}^{(i_3)}\zeta_{j_4}^{(i_4)}\zeta_{j_5}^{(i_5)}, \tag{56}$$

$$\mathsf{M}\left\{\left(J^*[\psi^{(5)}]_{T,t}-\sum_{j_1,j_2,j_3,j_4,j_5=0}^{p}C_{j_5j_4j_3j_2j_1}\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}\zeta_{j_3}^{(i_3)}\zeta_{j_4}^{(i_4)}\zeta_{j_5}^{(i_5)}\right)^2\right\}\le$$

$$\le\frac{C}{p^{1-\varepsilon}} \tag{57}$$

are fulfilled, where $i_1,\ldots,i_5=0,1,\ldots,m$ *in* (55), (56) *and* $i_1,\ldots,i_5=1,\ldots,m$ *in* (57), *constant* C *is independent of* p, ε *is an arbitrary small positive real number for the case of complete orthonormal system of Legendre polynomials in the space* $L_2([t,T])$ *and* $\varepsilon=0$ *for the case of complete orthonormal system of trigonometric functions in the space* $L_2([t,T])$,

$$C_{j_5j_4j_3j_2j_1}=\int\limits_t^T\psi_5(t_5)\phi_{j_5}(t_5)\int\limits_t^{t_5}\psi_4(t_4)\phi_{j_4}(t_4)\int\limits_t^{t_4}\psi_3(t_3)\phi_{j_3}(t_3)\times$$

$$\times\int\limits_t^{t_3}\psi_2(t_2)\phi_{j_2}(t_2)\int\limits_t^{t_2}\psi_1(t_1)\phi_{j_1}(t_1)dt_1dt_2dt_3dt_4dt_5;$$

another notations are the same as in Theorems 4, 5.

Theorem 7 [68], [93], [98], [99]. *Suppose that* $\{\phi_j(x)\}_{j=0}^{\infty}$ *is a complete orthonormal system of Legendre polynomials or trigonometric functions in the space* $L_2([t,T])$. *Then, for the iterated Stratonovich stochastic integral of sixth multiplicity*

$$I_{T,t}^{*(i_1 i_2 i_3 i_4 i_5 i_6)} =$$

$$= \int\limits_t^{*T} \int\limits_t^{*t_6} \int\limits_t^{*t_5} \int\limits_t^{*t_4} \int\limits_t^{*t_3} \int\limits_t^{*t_2} d\mathbf{w}_{t_1}^{(i_1)} d\mathbf{w}_{t_2}^{(i_2)} d\mathbf{w}_{t_3}^{(i_3)} d\mathbf{w}_{t_4}^{(i_4)} d\mathbf{w}_{t_5}^{(i_5)} d\mathbf{w}_{t_6}^{(i_6)}$$

the following expansion

$$I_{T,t}^{*(i_1 i_2 i_3 i_4 i_5 i_6)} =$$

$$= \underset{p\to\infty}{\text{l.i.m.}} \sum_{j_1,j_2,j_3,j_4,j_5,j_6=0}^{p} C_{j_6 j_5 j_4 j_3 j_2 j_1} \zeta_{j_1}^{(i_1)} \zeta_{j_2}^{(i_2)} \zeta_{j_3}^{(i_3)} \zeta_{j_4}^{(i_4)} \zeta_{j_5}^{(i_5)} \zeta_{j_6}^{(i_6)}$$

that converges in the mean-square sense is valid, where $i_1,\ldots,i_6 = 0,1,\ldots,m,$

$$C_{j_6 j_5 j_4 j_3 j_2 j_1} =$$

$$= \int\limits_t^T \phi_{j_6}(t_6) \int\limits_t^{t_6} \phi_{j_5}(t_5) \int\limits_t^{t_5} \phi_{j_4}(t_4) \int\limits_t^{t_4} \phi_{j_3}(t_3) \int\limits_t^{t_3} \phi_{j_2}(t_2) \int\limits_t^{t_2} \phi_{j_1}(t_1) dt_1 dt_2 dt_3 dt_4 dt_5 dt_6;$$

another notations are the same as in Theorems 4–6.

Consider the following Hypothesis on expansion of the iterated Stratonovich stochastic integrals (3) of arbitrary multiplicity k ($k \in \mathbb{N}$).

Hypothesis 1 [26], [27], [68], [69]. *Assume that* $\{\phi_j(x)\}_{j=0}^{\infty}$ *is a complete orthonormal system of Legendre polynomials or trigonometric functions in the space* $L_2([t,T])$. *Moreover, every* $\psi_l(\tau)$ ($l = 1,\ldots,k$) *is an enough smooth nonrandom function on* $[t,T]$. *Then, for the iterated Stratonovich stochastic integral* (3) *of multiplicity* k *the following expansion*

$$J^*[\psi^{(k)}]_{T,t} = \underset{p\to\infty}{\text{l.i.m.}} \sum_{j_1,\ldots j_k=0}^{p} C_{j_k\ldots j_1} \prod_{l=1}^{k} \zeta_{j_l}^{(i_l)} \tag{58}$$

that converges in the mean-square sense is valid, where notations are the same as in Theorems 1, 2.

Hypothesis 1 allows to approximate the iterated Stratonovich stochastic integral $J^*[\psi^{(k)}]_{T,t}$ by the sum

$$J^*[\psi^{(k)}]_{T,t}^p = \sum_{j_1,\ldots j_k=0}^{p} C_{j_k\ldots j_1} \prod_{l=1}^{k} \zeta_{j_l}^{(i_l)}, \tag{59}$$

where

$$\lim_{p\to\infty} \mathsf{M}\left\{\left(J^*[\psi^{(k)}]_{T,t} - J^*[\psi^{(k)}]_{T,t}^p\right)^2\right\} = 0.$$

Note that Hypothesis 1 is proved in [68] (Sect. 2.10) under the condition of convergence of trace series (also see [93], [98], [99]).

Assume that $J[\psi^{(k)}]_{T,t}^p$ is the approximation of (2), which is the expression on the right-hand side of (44) before passing to the limit for the case $p_1 = \ldots = p_k = p$, i.e.

$$J[\psi^{(k)}]_{T,t}^p = \sum_{j_1,\ldots,j_k=0}^{p} C_{j_k\ldots j_1}\Biggl(\prod_{l=1}^{k} \zeta_{j_l}^{(i_l)} + \sum_{r=1}^{[k/2]} (-1)^r \times$$

$$\times \sum_{\substack{(\{\{g_1,g_2\},\ldots,\{g_{2r-1},g_{2r}\}\},\{q_1,\ldots,q_{k-2r}\})\\ \{g_1,g_2,\ldots,g_{2r-1},g_{2r},q_1,\ldots,q_{k-2r}\}=\{1,2,\ldots,k\}}} \prod_{s=1}^{r} \mathbf{1}_{\{i_{g_{2s-1}}=\ i_{g_{2s}}\neq 0\}} \mathbf{1}_{\{j_{g_{2s-1}}=\ j_{g_{2s}}\}} \prod_{l=1}^{k-2r} \zeta_{j_{q_l}}^{(i_{q_l})}\Biggr), \tag{60}$$

where $[x]$ is an integer part of a real number x; another notations are the same as in Theorems 1, 2.

Let us denote

$$\mathsf{M}\left\{\left(J[\psi^{(k)}]_{T,t} - J[\psi^{(k)}]_{T,t}^p\right)^2\right\} \stackrel{\text{def}}{=} E_k^p,$$

$$\|K\|_{L_2([t,T]^k)}^2 = \int\limits_{[t,T]^k} K^2(t_1,\ldots,t_k)dt_1\ldots dt_k \stackrel{\text{def}}{=} I_k.$$

For the futher consideration, we need the following useful estimate [26], [27], [68]

$$E_k^p \le k!\left(I_k - \sum_{j_1,\ldots,j_k=0}^{p} C_{j_k\ldots j_1}^2\right), \tag{61}$$

where $i_1,\ldots,i_k = 1,\ldots,m$ for $T-t \in (0,\infty)$ and $i_1,\ldots,i_k = 0,1,\ldots,m$ for $T-t\in(0,1)$; another notations are the same as in Theorems 1, 2.

The value E_k^p can be calculated exactly.

Theorem 8 [68] (Sect. 1.12), [91] (Sect. 6). *Suppose that* $\{\phi_j(x)\}_{j=0}^{\infty}$ *is an arbitrary complete orthonormal system of functions in the space* $L_2([t,T])$ *and* $\psi_1(\tau),\ldots,\psi_k(\tau)\in L_2([t,T])$, $i_1,\ldots,i_k=1,\ldots,m$. *Then*

$$E_k^p=I_k-$$

$$=\sum_{j_1,\ldots,j_k=0}^{p}C_{j_k\ldots j_1}\mathsf{M}\left\{J[\psi^{(k)}]_{T,t}\sum_{(j_1,\ldots,j_k)}\int\limits_t^T\phi_{j_k}(t_k)\ldots\int\limits_t^{t_2}\phi_{j_1}(t_1)d\mathbf{f}_{t_1}^{(i_1)}\ldots d\mathbf{f}_{t_k}^{(i_k)}\right\}, \tag{62}$$

where $i_1,\ldots,i_k=1,\ldots,m$; *the expression*

$$\sum_{(j_1,\ldots,j_k)}$$

means the sum with respect to all possible permutations $(j_1,\ldots,j_k)$. *At the same time if* j_r *swapped with* j_q *in the permutation* $(j_1,\ldots,j_k)$, *then* i_r *swapped with* i_q *in the permutation* $(i_1,\ldots,i_k)$; *another notations are the same as in Theorems* 1, 2.

Note that

$$\mathsf{M}\left\{J[\psi^{(k)}]_{T,t}\int\limits_t^T\phi_{j_k}(t_k)\ldots\int\limits_t^{t_2}\phi_{j_1}(t_1)d\mathbf{f}_{t_1}^{(i_1)}\ldots d\mathbf{f}_{t_k}^{(i_k)}\right\}=C_{j_k\ldots j_1}.$$

Then from Theorem 8 we obtain

$$E_k^p=I_k-\sum_{j_1,\ldots,j_k=0}^{p}C_{j_k\ldots j_1}^2\quad (i_1,\ldots,i_k \text{ are pairwise different}), \tag{63}$$

$$E_k^p=I_k-\sum_{j_1,\ldots,j_k=0}^{p}C_{j_k\ldots j_1}\left(\sum_{(j_1,\ldots,j_k)}C_{j_k\ldots j_1}\right)\quad (i_1=\ldots=i_k). \tag{64}$$

Consider some examples of the application of Theorem 8 ($i_1,\ldots,i_5=1,\ldots,m$):

$$E_2^p=I_2-\sum_{j_1,j_2=0}^{p}C_{j_2j_1}^2-\sum_{j_1,j_2=0}^{p}C_{j_2j_1}C_{j_1j_2}\quad (i_1=i_2), \tag{65}$$

$$E_3^p = I_3 - \sum_{j_3,j_2,j_1=0}^{p} C_{j_3j_2j_1}^2 - \sum_{j_3,j_2,j_1=0}^{p} C_{j_3j_1j_2}C_{j_3j_2j_1} \quad (i_1 = i_2 \neq i_3), \tag{66}$$

$$E_3^p = I_3 - \sum_{j_3,j_2,j_1=0}^{p} C_{j_3j_2j_1}^2 - \sum_{j_3,j_2,j_1=0}^{p} C_{j_2j_3j_1}C_{j_3j_2j_1} \quad (i_1 \neq i_2 = i_3), \tag{67}$$

$$E_3^p = I_3 - \sum_{j_3,j_2,j_1=0}^{p} C_{j_3j_2j_1}^2 - \sum_{j_3,j_2,j_1=0}^{p} C_{j_3j_2j_1}C_{j_1j_2j_3} \quad (i_1 = i_3 \neq i_2), \tag{68}$$

$$E_4^p = I_4 - \sum_{j_1,\ldots,j_4=0}^{p} C_{j_4\ldots j_1} \left(\sum_{(j_1,j_2)} C_{j_4\ldots j_1} \right) \quad (i_1 = i_2 \neq i_3, i_4;\ i_3 \neq i_4), \tag{69}$$

$$E_4^p = I_4 - \sum_{j_1,\ldots,j_4=0}^{p} C_{j_4\ldots j_1} \left(\sum_{(j_1,j_3)} C_{j_4\ldots j_1} \right) \quad (i_1 = i_3 \neq i_2, i_4;\ i_2 \neq i_4), \tag{70}$$

$$E_4^p = I_4 - \sum_{j_1,\ldots,j_4=0}^{p} C_{j_4\ldots j_1} \left(\sum_{(j_2,j_3)} C_{j_4\ldots j_1} \right) \quad (i_2 = i_3 \neq i_1, i_4;\ i_1 \neq i_4), \tag{71}$$

$$E_4^p = I_4 - \sum_{j_1,\ldots,j_4=0}^{p} C_{j_4\ldots j_1} \left(\sum_{(j_1,j_4)} C_{j_4\ldots j_1} \right) \quad (i_1 = i_4 \neq i_2, i_3;\ i_2 \neq i_3), \tag{72}$$

$$E_4^p = I_4 - \sum_{j_1,\ldots,j_4=0}^{p} C_{j_4\ldots j_1} \left(\sum_{(j_1,j_4)} \left(\sum_{(j_2,j_3)} C_{j_4\ldots j_1} \right) \right) \quad (i_1 = i_4 \neq i_2 = i_3), \tag{73}$$

$$E_4^p = I_4 - \sum_{j_1,\ldots,j_4=0}^{p} C_{j_4\ldots j_1} \left(\sum_{(j_1,j_2,j_3)} C_{j_4\ldots j_1} \right) \quad (i_1 = i_2 = i_3 \neq i_4), \tag{74}$$

$$E_4^p = I_4 - \sum_{j_1,\ldots,j_4=0}^{p} C_{j_4\ldots j_1} \left(\sum_{(j_2,j_3,j_4)} C_{j_4\ldots j_1} \right) \quad (i_2 = i_3 = i_4 \neq i_1), \tag{75}$$

$$E_4^p = I_4 - \sum_{j_1,\ldots,j_4=0}^{p} C_{j_4\ldots j_1} \left(\sum_{(j_1,j_2,j_4)} C_{j_4\ldots j_1} \right), \quad (i_1 = i_2 = i_4 \ne i_3), \tag{76}$$

$$E_4^p = I_4 - \sum_{j_1,\ldots,j_4=0}^{p} C_{j_4\ldots j_1} \left(\sum_{(j_1,j_3,j_4)} C_{j_4\ldots j_1} \right) \quad (i_1 = i_3 = i_4 \ne i_2), \tag{77}$$

$$E_5^p = I_5 - \sum_{j_1,\ldots,j_5=0}^{p} C_{j_5\ldots j_1} \left(\sum_{(j_1,j_2)} C_{j_5\ldots j_1} \right), \tag{78}$$

where $i_1 = i_2 \ne i_3, i_4, i_5$ and i_3, i_4, i_5 are pairwise different,

$$E_5^p = I_5 - \sum_{j_1,\ldots,j_5=0}^{p} C_{j_5\ldots j_1} \left(\sum_{(j_2,j_3)} C_{j_5\ldots j_1} \right), \tag{79}$$

where $i_2 = i_3 \ne i_1, i_4, i_5$ and i_1, i_4, i_5 are pairwise different,

$$E_5^p = I_5 - \sum_{j_1,\ldots,j_5=0}^{p} C_{j_5\ldots j_1} \left(\sum_{(j_1,j_3)} C_{j_5\ldots j_1} \right), \tag{80}$$

where $i_1 = i_3 \ne i_2, i_4, i_5$ and i_2, i_4, i_5 are pairwise different,

2.4 Approximations of Iterated Itô Stochastic Integrals from the Numerical Schemes (11)–(16) Using Legendre Polynomials

This section is devoted to approximation of the iterated Itô stochastic integrals (6) of multiplicities 1 to 6 based on Theorems 1, 2. At that we will use multiple Fourier–Legendre series for approximation of the mentioned stochastic integrals.

The numerical schemes (11)–(16) contain the following set (see (6)) of iterated Itô stochastic integrals

$$I_{(0)T,t}^{(i_1)},\quad I_{(1)T,t}^{(i_1)},\quad I_{(2)T,t}^{(i_1)},\quad I_{(00)T,t}^{(i_1 i_2)},\quad I_{(10)T,t}^{(i_1 i_2)},\quad I_{(01)T,t}^{(i_1 i_2)},\quad I_{(000)T,t}^{(i_1 i_2 i_3)},\quad I_{(0000)T,t}^{(i_1 i_2 i_3 i_4)}, \tag{86}$$

$$I_{(00000)T,t}^{(i_1 i_2 i_3 i_4 i_5)},\quad I_{(02)T,t}^{(i_1 i_2)},\quad I_{(20)T,t}^{(i_1 i_2)},\quad I_{(11)T,t}^{(i_1 i_2)},\quad I_{(100)T,t}^{(i_1 i_2 i_3)},\quad I_{(010)T,t}^{(i_1 i_2 i_3)},\quad I_{(001)T,t}^{(i_1 i_2 i_3)}, \tag{87}$$

$$I_{(0001)T,t}^{(i_1 i_2 i_3 i_4)},\quad I_{(0010)T,t}^{(i_1 i_2 i_3 i_4)},\quad I_{(0100)T,t}^{(i_1 i_2 i_3 i_4)},\quad I_{(1000)T,t}^{(i_1 i_2 i_3 i_4)},\quad I_{(000000)T,t}^{(i_1 i_2 i_3 i_4 i_5 i_6)}. \tag{88}$$

Let us consider the complete orthonormal system of Legendre polynomials in the space $L_2([t,T])$

$$\phi_j(x) = \sqrt{\frac{2j+1}{T-t}} P_j \left(\left(x - \frac{T+t}{2} \right) \frac{2}{T-t} \right), \quad j = 0, 1, 2, \ldots, \tag{89}$$

where $P_j(x)$ is the Legendre polynomial

$$P_j(x) = \frac{1}{2^j j!} \frac{d^j}{dx^j} \left(x^2 - 1 \right)^j.$$

Using Theorems 1, 2 and well known properties of the Legendre polynomials, we obtain the following formulas for numerical modeling of the stochastic integrals (86)–(88) [26], [27], [43]-[47], [68], [69], [71]-[73]

$$I_{(0)T,t}^{(i_1)} = \sqrt{T-t}\,\zeta_0^{(i_1)}, \tag{90}$$

$$I_{(1)T,t}^{(i_1)} = -\frac{(T-t)^{3/2}}{2}\left(\zeta_0^{(i_1)} + \frac{1}{\sqrt{3}}\zeta_1^{(i_1)}\right), \tag{91}$$

$$I_{(2)T,t}^{(i_1)} = \frac{(T-t)^{5/2}}{3}\left(\zeta_0^{(i_1)} + \frac{\sqrt{3}}{2}\zeta_1^{(i_1)} + \frac{1}{2\sqrt{5}}\zeta_2^{(i_1)}\right), \tag{92}$$

$$I_{(00)T,t}^{(i_1 i_2)q} = \frac{T-t}{2}\left(\zeta_0^{(i_1)}\zeta_0^{(i_2)} + \sum_{i=1}^{q}\frac{1}{\sqrt{4i^2-1}}\left(\zeta_{i-1}^{(i_1)}\zeta_i^{(i_2)} - \zeta_i^{(i_1)}\zeta_{i-1}^{(i_2)}\right) - \mathbf{1}_{\{i_1=i_2\}}\right), \tag{93}$$

$$I_{(000)T,t}^{(i_1 i_2 i_3)q_1} = \sum_{j_1,j_2,j_3=0}^{q_1} C_{j_3 j_2 j_1}^{000}\Biggl(\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}\zeta_{j_3}^{(i_3)} - \mathbf{1}_{\{i_1=i_2\}}\mathbf{1}_{\{j_1=j_2\}}\zeta_{j_3}^{(i_3)} -$$

$$-\mathbf{1}_{\{i_2=i_3\}}\mathbf{1}_{\{j_2=j_3\}}\zeta_{j_1}^{(i_1)} - \mathbf{1}_{\{i_1=i_3\}}\mathbf{1}_{\{j_1=j_3\}}\zeta_{j_2}^{(i_2)}\Biggr), \tag{94}$$

$$I_{(10)T,t}^{(i_1 i_2)q_2} = \sum_{j_1,j_2=0}^{q_2} C_{j_2 j_1}^{10}\left(\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)} - \mathbf{1}_{\{i_1=i_2\}}\mathbf{1}_{\{j_1=j_2\}}\right), \tag{95}$$

2.5 Optimization of Approximations of Iterated Itô Stochastic Integrals from the Numerical Schemes (12)–(16)

This section is devoted to the optimization of approximations of iterated Itô stochastic integrals from the numerical schemes (12)–(16). More precisely, we discuss how to minimize the numbers $q, q_1, q_2, \ldots, q_{15}$ from Sect. 2.4.

Suppose that $\varepsilon > 0$ is the mean-square accuracy of approximation of the iterated Itô stochastic integrals (6), i.e.

$$E_{(l_1\ldots l_k)T,t}^{(i_1\ldots i_k)p} \stackrel{\mathsf{def}}{=} \mathsf{M}\left\{\left(I_{(l_1\ldots l_k)T,t}^{(i_1\ldots i_k)} - I_{(l_1\ldots l_k)T,t}^{(i_1\ldots i_k)p}\right)^2\right\} \le \varepsilon,$$

where $I_{(l_1\ldots l_k)T,t}^{(i_1\ldots i_k)p}$, $p \in \mathbb{N}$ is the approximation of the iterated Itô stochastic integral $I_{(l_1\ldots l_k)T,t}^{(i_1\ldots i_k)}$. Then from (93) and (61) we obtain the following conditions for choosing the numbers $q, q_1, q_2, \ldots, q_{15}$ for approximations of the iterated Itô stochastic integrals (86)–(88) [26], [27], [68]

$$E_{(00)T,t}^{(i_1 i_2)q} = \frac{(T-t)^2}{2}\left(\frac{1}{2} - \sum_{i=1}^{q}\frac{1}{4i^2-1}\right) \le \varepsilon \quad (i_1 \ne i_2), \tag{142}$$

$$E_{(000)T,t}^{(i_1 i_2 i_3)q_1} \le 6\left(\frac{(T-t)^3}{6} - \sum_{j_1,j_2,j_3=0}^{q_1}\left(C_{j_3 j_2 j_1}^{000}\right)^2\right) \le \varepsilon, \tag{143}$$

$$E_{(01)T,t}^{(i_1 i_2)q_2} \le 2\left(\frac{(T-t)^4}{4} - \sum_{j_1,j_2=0}^{q_2}\left(C_{j_2 j_1}^{01}\right)^2\right) \le \varepsilon, \tag{144}$$

$$E_{(10)T,t}^{(i_1 i_2)q_2} \le 2\left(\frac{(T-t)^4}{12} - \sum_{j_1,j_2=0}^{q_2}\left(C_{j_2 j_1}^{10}\right)^2\right) \le \varepsilon, \tag{145}$$

$$E_{(0000)T,t}^{(i_1 \ldots i_4)q_3} \le 24\left(\frac{(T-t)^4}{24} - \sum_{j_1,j_2,j_3,j_4=0}^{q_3}\left(C_{j_4 j_3 j_2 j_1}^{0000}\right)^2\right) \le \varepsilon, \tag{146}$$

$$E_{(00000)T,t}^{(i_1 \ldots i_5)q_4} \le 120\left(\frac{(T-t)^5}{120} - \sum_{j_1,j_2,j_3,j_4,j_5=0}^{q_4}\left(C_{j_5 j_4 j_3 j_2 j_1}^{00000}\right)^2\right) \le \varepsilon, \tag{147}$$

$$E_{(20)T,t}^{(i_1 i_2)q_5} \le 2\left(\frac{(T-t)^6}{30} - \sum_{j_2,j_1=0}^{q_5}\left(C_{j_2 j_1}^{20}\right)^2\right) \le \varepsilon, \tag{148}$$

$$E_{(11)T,t}^{(i_1 i_2)q_6} \le 2\left(\frac{(T-t)^6}{18} - \sum_{j_2,j_1=0}^{q_6}\left(C_{j_2 j_1}^{11}\right)^2\right) \le \varepsilon, \tag{149}$$

$$E_{(02)T,t}^{(i_1 i_2)q_7} \le 2\left(\frac{(T-t)^6}{6} - \sum_{j_2,j_1=0}^{q_7}\left(C_{j_2 j_1}^{02}\right)^2\right) \le \varepsilon, \tag{150}$$

$$E_{(001)T,t}^{(i_1 i_2 i_3)q_8} \le 6\left(\frac{(T-t)^5}{10} - \sum_{j_1,j_2,j_3=0}^{q_8}\left(C_{j_3 j_2 j_1}^{001}\right)^2\right) \le \varepsilon, \tag{151}$$

$$E_{(010)T,t}^{(i_1 i_2 i_3)q_9} \le 6\left(\frac{(T-t)^5}{20} - \sum_{j_1,j_2,j_3=0}^{q_9}\left(C_{j_3 j_2 j_1}^{010}\right)^2\right) \le \varepsilon, \tag{152}$$

$$E_{(100)T,t}^{(i_1 i_2 i_3)q_{10}} \le 6\left(\frac{(T-t)^5}{60} - \sum_{j_1,j_2,j_3=0}^{q_{10}}\left(C_{j_3 j_2 j_1}^{100}\right)^2\right) \le \varepsilon, \tag{153}$$

$$E_{(0001)T,t}^{(i_1\ldots i_4)q_{11}} \le 24\left(\frac{(T-t)^6}{36} - \sum_{j_1,j_2,j_3,j_4=0}^{q_{11}} \left(C_{j_4j_3j_2j_1}^{0001}\right)^2\right) \le \varepsilon, \tag{154}$$

$$E_{(0010)T,t}^{(i_1\ldots i_4)q_{12}} \le 24\left(\frac{(T-t)^6}{60} - \sum_{j_1,j_2,j_3,j_4=0}^{q_{12}} \left(C_{j_4j_3j_2j_1}^{0010}\right)^2\right) \le \varepsilon, \tag{155}$$

$$E_{(0100)T,t}^{(i_1\ldots i_4)q_{13}} \le 24\left(\frac{(T-t)^6}{120} - \sum_{j_1,j_2,j_3,j_4=0}^{q_{13}} \left(C_{j_4j_3j_2j_1}^{0100}\right)^2\right) \le \varepsilon, \tag{156}$$

$$E_{(1000)T,t}^{(i_1\ldots i_4)q_{14}} \le 24\left(\frac{(T-t)^6}{360} - \sum_{j_1,j_2,j_3,j_4=0}^{q_{14}} \left(C_{j_4j_3j_2j_1}^{1000}\right)^2\right) \le \varepsilon, \tag{157}$$

$$E_{(000000)T,t}^{(i_1\ldots i_6)q_{15}} \le 720\left(\frac{(T-t)^6}{720} - \sum_{j_1,j_2,j_3,j_4,j_5,j_6=0}^{q_{15}} \left(C_{j_6j_5j_4j_3j_2j_1}\right)^2\right) \le \varepsilon. \tag{158}$$

Taking into account (17) and (110)–(141), (142)–(158), we obtain the following conditions for choosing the numbers $q, q_1, q_2, \ldots, q_{15}$ for the numerical schemes (12)–(16) (constant C is independent of $T-t$ (see below)).

Milstein scheme (12)

$$\frac{1}{2}\left(\frac{1}{2} - \sum_{i=1}^{q}\frac{1}{4i^2-1}\right) \le C(T-t).$$

Strong Taylor–Itô scheme (13) with convergence order 1.5

$$\frac{1}{2}\left(\frac{1}{2} - \sum_{i=1}^{q}\frac{1}{4i^2-1}\right) \le C(T-t)^2,$$

$$6\left(\frac{1}{6} - \frac{1}{64}\sum_{j_1,j_2,j_3=0}^{q_1}(2j_1+1)(2j_2+1)(2j_3+1)\left(\bar{C}_{j_3j_2j_1}^{000}\right)^2\right) \le C(T-t). \tag{159}$$

Strong Taylor–Itô scheme (14) with convergence order 2.0

$$\frac{1}{2}\left(\frac{1}{2} - \sum_{i=1}^{q}\frac{1}{4i^2-1}\right) \le C(T-t)^3,$$

$$6\left(\frac{1}{6}-\frac{1}{64}\sum_{j_1,j_2,j_3=0}^{q_1}(2j_1+1)(2j_2+1)(2j_3+1)\left(\bar{C}_{j_3j_2j_1}^{000}\right)^2\right)\le C(T-t)^2, \quad (160)$$

$$2\left(\frac{1}{4}-\frac{1}{64}\sum_{j_1,j_2=0}^{q_2}(2j_1+1)(2j_2+1)\left(\bar{C}_{j_2j_1}^{01}\right)^2\right)\le C(T-t), \quad (161)$$

$$2\left(\frac{1}{12}-\frac{1}{64}\sum_{j_1,j_2=0}^{q_2}(2j_1+1)(2j_2+1)\left(\bar{C}_{j_2j_1}^{10}\right)^2\right)\le C(T-t), \quad (162)$$

$$24\left(\frac{1}{24}-\frac{1}{256}\sum_{j_1,\ldots,j_4=0}^{q_3}(2j_1+1)(2j_2+1)(2j_3+1)(2j_4+1)\left(\bar{C}_{j_4\ldots j_1}^{0000}\right)^2\right)\le$$
$$\le C(T-t). \quad (163)$$

Strong Taylor–Itô scheme (15) with convergence order 2.5

$$
$$
\times\left(\bar C_{j_6\ldots j_1}^{000000}\right)^2\Biggr)\le C(T-t). \tag{187}
$$

Taking into account Theorem 8 and the results of Listings 5 and 6 (see Sect. 5) we decided to exclude the multiplier factors $k!$ from the left-hand sides of (159), (160)–(163), (164)–(171), (172)–(187). The detailed numerical confirmation of the mentioned possibility can be found in [74]. This means that we will use the following conditions for choosing the numbers $q, q_1, q_2, \ldots, q_{15}$ for the numerical schemes (12)–(16) (constant C is independent of $T-t$ (see below)).

Milstein scheme (12)

$$
\frac{1}{2}\left(\frac{1}{2}-\sum_{i=1}^{q}\frac{1}{4i^2-1}\right)\le C(T-t). \tag{188}
$$

Strong Taylor–Itô scheme (13) with convergence order 1.5

$$
\frac{1}{2}\left(\frac{1}{2}-\sum_{i=1}^{q}\frac{1}{4i^2-1}\right)\le C(T-t)^2, \tag{189}
$$

$$
\frac{1}{6}-\frac{1}{64}\sum_{j_1,j_2,j_3=0}^{q_1}(2j_1+1)(2j_2+1)(2j_3+1)\left(\bar C_{j_3j_2j_1}^{000}\right)^2\le C(T-t). \tag{190}
$$

Strong Taylor–Itô scheme (14) with convergence order 2.0

$$
\frac{1}{2}\left(\frac{1}{2}-\sum_{i=1}^{q}\frac{1}{4i^2-1}\right)\le C(T-t)^3, \tag{191}
$$

$$
\frac{1}{6}-\frac{1}{64}\sum_{j_1,j_2,j_3=0}^{q_1}(2j_1+1)(2j_2+1)(2j_3+1)\left(\bar C_{j_3j_2j_1}^{000}\right)^2\le C(T-t)^2, \tag{192}
$$

$$\frac{1}{4} - \frac{1}{64}\sum_{j_1,j_2=0}^{q_2}(2j_1+1)(2j_2+1)\left(\bar{C}_{j_2j_1}^{01}\right)^2 \le C(T-t), \tag{193}$$

$$\frac{1}{12} - \frac{1}{64}\sum_{j_1,j_2=0}^{q_2}(2j_1+1)(2j_2+1)\left(\bar{C}_{j_2j_1}^{10}\right)^2 \le C(T-t), \tag{194}$$

$$\frac{1}{24} - \frac{1}{256}\sum_{j_1,\ldots,j_4=0}^{q_3}(2j_1+1)(2j_2+1)(2j_3+1)(2j_4+1)\left(\bar{C}_{j_4\ldots j_1}^{0000}\right)^2 \le C(T-t). \tag{195}$$

Strong Taylor–Itô scheme (15) with convergence order 2.5

$$\frac{1}{2}\left(\frac{1}{2} - \sum_{i=1}^{q}\frac{1}{4i^2-1}\right) \le C(T-t)^4, \tag{196}$$

$$\frac{1}{6} - \frac{1}{64}\sum_{j_1,j_2,j_3=0}^{q_1}(2j_1+1)(2j_2+1)(2j_3+1)\left(\bar{C}_{j_3j_2j_1}^{000}\right)^2 \le C(T-t)^3, \tag{197}$$

2.6 Approximations of Iterated Stratonovich Stochastic Integrals from the Numerical Schemes (24)–(28) Using Legendre Polynomials

This section is devoted to approximation of the Stratonovich stochastic integrals (20) of multiplicities 1 to 6 based on Theorems 3–7. At that we will use multiple Fourier–Legendre series for approximation of the mentioned stochastic integrals.

The numerical schemes (24)–(28) contain the following set (see (20)) of iterated Stratonovich stochastic integrals

$$I_{(0)T,t}^{*(i_1)},\quad I_{(1)T,t}^{*(i_1)},\quad I_{(2)T,t}^{*(i_1)},\quad I_{(00)T,t}^{*(i_1i_2)},\quad I_{(10)T,t}^{*(i_1i_2)},\quad I_{(01)T,t}^{*(i_1i_2)},\quad I_{(000)T,t}^{*(i_1i_2i_3)},\quad I_{(0000)T,t}^{*(i_1i_2i_3i_4)}, \quad (222)$$

$$I_{(00000)T,t}^{*(i_1i_2i_3i_4i_5)},\quad I_{(02)T,t}^{*(i_1i_2)},\quad I_{(20)T,t}^{*(i_1i_2)},\quad I_{(11)T,t}^{*(i_1i_2)},\quad I_{(100)T,t}^{*(i_1i_2i_3)},\quad I_{(010)T,t}^{*(i_1i_2i_3)},\quad I_{(001)T,t}^{*(i_1i_2i_3)}, \quad (223)$$

$$I_{(0001)T,t}^{*(i_1i_2i_3i_4)},\quad I_{(0010)T,t}^{*(i_1i_2i_3i_4)},\quad I_{(0100)T,t}^{*(i_1i_2i_3i_4)},\quad I_{(1000)T,t}^{*(i_1i_2i_3i_4)},\quad I_{(000000)T,t}^{*(i_1i_2i_3i_4i_5i_6)}. \quad (224)$$

Using Theorems 3–7 and well known properties of the Legendre polynomials, we obtain the following formulas for numerical modeling of the stochastic integrals (222)–(224) [26], [27], [43]-[47], [68], [69], [71]-[73]

$$I_{(0)T,t}^{*(i_1)}=\sqrt{T-t}\zeta_0^{(i_1)}, \quad (225)$$

$$I_{(1)T,t}^{*(i_1)} = -\frac{(T-t)^{3/2}}{2}\left(\zeta_0^{(i_1)} + \frac{1}{\sqrt{3}}\zeta_1^{(i_1)}\right), \tag{226}$$

$$I_{(2)T,t}^{*(i_1)} = \frac{(T-t)^{5/2}}{3}\left(\zeta_0^{(i_1)} + \frac{\sqrt{3}}{2}\zeta_1^{(i_1)} + \frac{1}{2\sqrt{5}}\zeta_2^{(i_1)}\right), \tag{227}$$

$$I_{(00)T,t}^{*(i_1 i_2)q} = \frac{T-t}{2}\left(\zeta_0^{(i_1)}\zeta_0^{(i_2)} + \sum_{i=1}^{q}\frac{1}{\sqrt{4i^2-1}}\left(\zeta_{i-1}^{(i_1)}\zeta_i^{(i_2)} - \zeta_i^{(i_1)}\zeta_{i-1}^{(i_2)}\right)\right), \tag{228}$$

$$I_{(000)T,t}^{*(i_1 i_2 i_3)q_1} = \sum_{j_1,j_2,j_3=0}^{q_1} C_{j_3 j_2 j_1}^{000}\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}\zeta_{j_3}^{(i_3)}, \tag{229}$$

$$I_{(10)T,t}^{*(i_1 i_2)q_2} = \sum_{j_1,j_2=0}^{q_2} C_{j_2 j_1}^{10}\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}, \tag{230}$$

$$I_{(01)T,t}^{*(i_1 i_2)q_2} = \sum_{j_1,j_2=0}^{q_2} C_{j_2 j_1}^{01}\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}, \tag{231}$$

$$I_{(0000)T,t}^{(i_1 i_2 i_3 i_4)q_3} = \sum_{j_1,j_2,j_3,j_4=0}^{q_3} C_{j_4 j_3 j_2 j_1}^{0000}\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}\zeta_{j_3}^{(i_3)}\zeta_{j_4}^{(i_4)}, \tag{232}$$

$$I_{(00000)T,t}^{(i_1 i_2 i_3 i_4 i_5)q_4} = \sum_{j_1,j_2,j_3,j_4,j_5=0}^{q_4} C_{j_5 j_4 j_3 j_2 j_1}^{00000}\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}\zeta_{j_3}^{(i_3)}\zeta_{j_4}^{(i_4)}\zeta_{j_5}^{(i_5)}, \tag{233}$$

$$I_{(20)T,t}^{*(i_1 i_2)q_5} = \sum_{j_1,j_2=0}^{q_5} C_{j_2 j_1}^{20}\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}, \tag{234}$$

$$I_{(11)T,t}^{(i_1 i_2)q_6} = \sum_{j_1,j_2=0}^{q_6} C_{j_2 j_1}^{11}\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}, \tag{235}$$

$$I_{(02)T,t}^{(i_1 i_2)q_7} = \sum_{j_1,j_2=0}^{q_7} C_{j_2 j_1}^{02}\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}, \tag{236}$$

$$I_{(001)T,t}^{*(i_1 i_2 i_3)q_8} = \sum_{j_1,j_2,j_3=0}^{q_8} C_{j_3 j_2 j_1}^{001}\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}\zeta_{j_3}^{(i_3)}, \tag{237}$$

$$I_{(010)T,t}^{(i_1 i_2 i_3)q_9} = \sum_{j_1,j_2,j_3=0}^{q_9} C_{j_3 j_2 j_1}^{010}\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}\zeta_{j_3}^{(i_3)}, \tag{238}$$

$$I_{(100)T,t}^{(i_1i_2i_3)q_{10}} = \sum_{j_1,j_2,j_3=0}^{q_{10}} C_{j_3j_2j_1}^{100}\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}\zeta_{j_3}^{(i_3)}, \qquad (239)$$

$$I_{(0001)T,t}^{(i_1i_2i_3i_4)q_{11}} = \sum_{j_1,j_2,j_3,j_4=0}^{q_{11}} C_{j_4j_3j_2j_1}^{0001}\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}\zeta_{j_3}^{(i_3)}\zeta_{j_4}^{(i_4)}, \qquad (240)$$

$$I_{(0010)T,t}^{(i_1i_2i_3i_4)q_{12}} = \sum_{j_1,j_2,j_3,j_4=0}^{q_{12}} C_{j_4j_3j_2j_1}^{0010}\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}\zeta_{j_3}^{(i_3)}\zeta_{j_4}^{(i_4)}, \qquad (241)$$

$$I_{(0100)T,t}^{(i_1i_2i_3i_4)q_{13}} = \sum_{j_1,j_2,j_3,j_4=0}^{q_{13}} C_{j_4j_3j_2j_1}^{0100}\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}\zeta_{j_3}^{(i_3)}\zeta_{j_4}^{(i_4)}, \qquad (242)$$

$$I_{(1000)T,t}^{(i_1i_2i_3i_4)q_{14}} = \sum_{j_1,j_2,j_3,j_4=0}^{q_{14}} C_{j_4j_3j_2j_1}^{1000}\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}\zeta_{j_3}^{(i_3)}\zeta_{j_4}^{(i_4)}, \qquad (243)$$

$$I_{(000000)T,t}^{(i_1i_2i_3i_4i_5i_6)q_{15}} = \sum_{j_1,j_2,j_3,j_4,j_5,j_6=0}^{q_{15}} C_{j_6j_5j_4j_3j_2j_1}^{000000}\zeta_{j_1}^{(i_1)}\zeta_{j_2}^{(i_2)}\zeta_{j_3}^{(i_3)}\zeta_{j_4}^{(i_4)}\zeta_{j_5}^{(i_5)}\zeta_{j_6}^{(i_6)}, \qquad (244)$$

where $\mathbf{1}_A$ is the indicator of the set A; another notations are the same as in Sect. 2.4.

The question on choosing the numbers $q_1, q_2, \ldots, q_{15}$ in (229)–(244) turned out to be nontrivial [26], [27], [68] (Chapter 5). The expansions (229)–(244) for iterated Stratonovich stochastic integrals are simpler than their analogues (94)–(109) for iterated Itô stochastic integrals. However, the calculation of the mean-square approximation error for iterated Stratonovich stochastic integrals turns out to be much more difficult than for iterated Itô stochastic integrals [26], [27], [68] (Chapter 5). Below we give some reasoning regarding this problem.

Denote

$$E_{(l_1\ldots l_k)T,t}^{*(i_1\ldots i_k)p} \stackrel{\text{def}}{=} \mathsf{M}\left\{\left(I_{(l_1\ldots l_k)T,t}^{*(i_1\ldots i_k)} - I_{(l_1\ldots l_k)T,t}^{*(i_1\ldots i_k)p}\right)^2\right\},$$

where $I_{(l_1\ldots l_k)T,t}^{*(i_1\ldots i_k)p}$, $p \in \mathbb{N}$ is the approximation of the iterated Stratonovich stochastic integral $I_{(l_1\ldots l_k)T,t}^{*(i_1\ldots i_k)}$.

From (228) for $i_1 \neq i_2$ we obtain [26], [27], [68]

$$E_{(00)T,t}^{*(i_1i_2)q} = \frac{(T-t)^2}{2}\sum_{i=q+1}^{\infty}\frac{1}{4i^2-1} \leq \frac{(T-t)^2}{2}\int\limits_q^{\infty}\frac{1}{4x^2-1}dx =$$

$$= -\frac{(T-t)^2}{8}\ln\left|1-\frac{2}{2q+1}\right| \le C_1\frac{(T-t)^2}{q}, \tag{245}$$

where constant C_1 is independent of q.

It is easy to notice that for a sufficiently small $T-t$ (recall that $T-t \ll 1$ since it is a step of integration for numerical schemes for Itô SDEs) there exists a constant C_2 such that

$$E^{*(i_1\ldots i_k)q}_{(l_1\ldots l_k)T,t} \le C_2 E^{*(i_1 i_2)q}_{(00)T,t}. \tag{246}$$

From (245) and (246) we finally obtain

$$E^{*(i_1\ldots i_k)q}_{(l_1\ldots l_k)T,t} \le C\frac{(T-t)^2}{q}, \tag{247}$$

where constant C does not depend on $T-t$. The same idea can be found in [2] in the framework of the method based on the trigonometric expansion of the Brownian bridge process. Note that, in contrast to (247), the constant C in Theorems 4–6 does not depend on q.

Obviously, we can get more information about the numbers $q_1, q_2, \ldots, q_{15}$ (these numbers are different for different iterated Stratonovich stochastic integrals) using the another approach. Since

$$J^*[\psi^{(k)}]_{T,t} = J[\psi^{(k)}]_{T,t} \quad \text{w. p. 1}$$

for pairwise different $i_1, \ldots, i_k = 1, \ldots, m$, where $J[\psi^{(k)}]_{T,t}$, $J^*[\psi^{(k)}]_{T,t}$ are defined by (2) and (3) correspondingly, then for pairwise different $i_1, \ldots, i_6 = 1, \ldots, m$ from (63) we obtain [26], [27], [68]

$$E^{*(i_1 i_2)q}_{(00)T,t} = \frac{(T-t)^2}{2}\left(\frac{1}{2} - \sum_{i=1}^{q}\frac{1}{4i^2-1}\right), \tag{248}$$

$$E^{*(i_1 i_2 i_3)q_1}_{(000)T,t} = \frac{(T-t)^3}{6} - \sum_{j_3,j_2,j_1=0}^{q_1}\left(C^{000}_{j_3 j_2 j_1}\right)^2, \tag{249}$$

$$E^{*(i_1 i_2)q_2}_{(01)T,t} = \frac{(T-t)^4}{4} - \sum_{j_1,j_2=0}^{q_2}\left(C^{01}_{j_2 j_1}\right)^2, \tag{250}$$

$$E^{*(i_1 i_2)q_2}_{(10)T,t} = \frac{(T-t)^4}{12} - \sum_{j_1,j_2=0}^{q_2}\left(C^{10}_{j_2 j_1}\right)^2, \tag{251}$$

$$E^{*(i_1\ldots i_4)q_3}_{(0000)T,t} = \frac{(T-t)^4}{24} - \sum_{j_1,j_2,j_3,j_4=0}^{q_3} \left(C^{0000}_{j_4j_3j_2j_1}\right)^2, \tag{252}$$

$$E^{*(i_1\ldots i_5)q_4}_{(00000)T,t} = \frac{(T-t)^5}{120} - \sum_{j_1,j_2,j_3,j_4,j_5=0}^{q_4} \left(C^{00000}_{j_5i_4i_3i_2j_1}\right)^2, \tag{253}$$

$$E^{*(i_1i_2)q_5}_{(20)T,t} = \frac{(T-t)^6}{30} - \sum_{j_2,j_1=0}^{q_5} \left(C^{20}_{j_2j_1}\right)^2, \tag{254}$$

$$E^{*(i_1i_2)q_6}_{(11)T,t} = \frac{(T-t)^6}{18} - \sum_{j_2,j_1=0}^{q_6} \left(C^{11}_{j_2j_1}\right)^2, \tag{255}$$

$$E^{*(i_1i_2)q_7}_{(02)T,t} = \frac{(T-t)^6}{6} - \sum_{j_2,j_1=0}^{q_7} \left(C^{02}_{j_2j_1}\right)^2, \tag{256}$$

$$E^{*(i_1i_2i_3)q_8}_{(001)T,t} = \frac{(T-t)^5}{10} - \sum_{j_1,j_2,j_3=0}^{q_8} \left(C^{001}_{j_3j_2j_1}\right)^2, \tag{257}$$

$$E^{*(i_1i_2i_3)q_9}_{(010)T,t} = \frac{(T-t)^5}{20} - \sum_{j_1,j_2,j_3=0}^{q_9} \left(C^{010}_{j_3j_2j_1}\right)^2, \tag{258}$$

$$E^{*(i_1i_2i_3)q_{10}}_{(100)T,t} = \frac{(T-t)^5}{60} - \sum_{j_1,j_2,j_3=0}^{q_{10}} \left(C^{100}_{j_3j_2j_1}\right)^2, \tag{259}$$

$$E^{*(i_1\ldots i_4)q_{11}}_{(0001)T,t} = \frac{(T-t)^6}{36} - \sum_{j_1,j_2,j_3,j_4=0}^{q_{11}} \left(C^{0001}_{j_4j_3j_2j_1}\right)^2, \tag{260}$$

$$E^{*(i_1\ldots i_4)q_{12}}_{(0010)T,t} = \frac{(T-t)^6}{60} - \sum_{j_1,j_2,j_3,j_4=0}^{q_{12}} \left(C^{0010}_{j_4j_3j_2j_1}\right)^2, \tag{261}$$

$$E^{*(i_1\ldots i_4)q_{13}}_{(0100)T,t} = \frac{(T-t)^6}{120} - \sum_{j_1,j_2,j_3,j_4=0}^{q_{13}} \left(C^{0100}_{j_4j_3j_2j_1}\right)^2, \tag{262}$$

$$E^{*(i_1\ldots i_4)q_{14}}_{(1000)T,t} = \frac{(T-t)^6}{360} - \sum_{j_1,j_2,j_3,j_4=0}^{q_{14}} \left(C^{1000}_{j_4j_3j_2j_1}\right)^2, \tag{263}$$

$$E^{*(i_1\ldots i_6)q_{15}}_{(000000)T,t} = \frac{(T-t)^6}{720} - \sum_{j_1,j_2,j_3,j_4,j_5,j_6=0}^{q_{15}} \left(C^{000000}_{j_6j_5j_4j_3j_2j_1}\right)^2. \tag{264}$$

Table 1. High-order strong Taylor–Stratonovich schemes.

Order of convergence	Scheme	Conditions for choosing the numbers $q, q_1, \ldots, q_{15}$
1.0	(24)	(188)
1.5	(25)	(189), (190)
2.0	(26)	(191)–(195)
2.5	(27)	(196)–(204)
3.0	(28)	(205)–(221)

Taking into account (248)–(264) and the results of paper [74], we use in the SDE-MATH software package the conditions from Table 1 for choosing the numbers $q, q_1, q_2, \ldots, q_{15}$ for the numerical schemes (24)–(28).

Note that in the SDE-MATH software package, which is presented in the following sections, we use the following upper bounds b on the numbers $q_1, \ldots, q_{15}$

$$b = 56 \quad \text{for} \quad q_1, \qquad b = 15 \quad \text{for} \quad q_2,\ q_3, \qquad b = 6 \quad \text{for} \quad q_4,\ q_8,\ q_9,\ q_{10},$$

$$b = 2 \quad \text{for} \quad q_5,\ q_6,\ q_7,\ q_{11},\ q_{12},\ q_{13},\ q_{14},\ q_{15}.$$

This means that for the implementing of the numerical methods (13)–(16) and (25)–(28) we use in the SDE-MATH software package the following quantities of the exactly calculated Fourier–Legendre coefficients

$$57^3 = 185{,}193 \quad \text{for} \quad C_{j_3j_2j_1}^{000},$$

$$16^3 = 4{,}096 \quad \text{for each of} \quad C_{j_2j_1}^{10},\ C_{j_2j_1}^{01},$$

$$16^4 = 65{,}536 \quad \text{for} \quad C_{j_4j_3j_2j_1}^{0000},$$

$$7^3 = 343 \quad \text{for each of} \quad C_{j_3j_2j_1}^{100},\ C_{j_3j_2j_1}^{010},\ C_{j_3j_2j_1}^{001},$$

$$7^5 = 16{,}807 \quad \text{for} \quad C_{j_5j_4j_3j_2j_1}^{00000},$$

$$3^2 = 9 \quad \text{for each of} \quad C_{j_2j_1}^{20},\ C_{j_2j_1}^{02},\ C_{j_2j_1}^{11},$$

$$3^4 = 81 \quad \text{for each of} \quad C_{j_4j_3j_2j_1}^{1000},\ C_{j_4j_3j_2j_1}^{0100},\ C_{j_4j_3j_2j_1}^{0010},\ C_{j_4j_3j_2j_1}^{0001},$$

$$3^6 = 729 \quad \text{for} \quad C_{j_6j_5j_4j_3j_2j_1}^{000000}.$$

It should be noted that unlike the method based on Theorems 1–8, existing and well-known approaches to the mean-square approximation of iterated stochastic integrals based on the trigonometric basis functions [2], [3], [7], [28],

[29], [35], [38] do not allow choosing theoretically different numbers q for approximations of different iterated stochastic integrals (starting form the multiplicity 2 of stochastic integrals). Moreover, the noted approaches [2], [3], [7], [28], [29], [35], [38] exclude the possibility for obtaining of approximate and exact expressions for the mean-square approximation error similar to the formulas (61), (62).

2.7 Numerical Algorithm for Linear Stationary Systems of Itô SDEs Based on Spectral Decomposition

Consider the following linear stationary system of Itô SDEs

$$d\mathbf{x}_t = (A\mathbf{x}_t + B\mathbf{u}(t))\,dt + F\,d\mathbf{w}_t, \quad \mathbf{x}_0 = \mathbf{x}(0), \quad t \in [0, T], \tag{265}$$

where $\mathbf{x}_t \in \mathbb{R}^n$ is a solution of the system (265), $\mathbf{u}(t) : [0, T] \to \mathbb{R}^k$ is a nonrandom function, $A \in \mathbb{R}^{n\times n}$, $F \in \mathbb{R}^{n\times m}$, $B \in \mathbb{R}^{n\times k}$, and $\mathbf{w}_t$ is a standard m-dimensional Wiener process with independent components $\mathbf{w}_t^{(i)}$, $i = 1, \ldots, m$. Also we suppose that n, m, $k \ge 1$. The process $\mathbf{y}_t = H\mathbf{x}_t \in \mathbb{R}^1$ is interpreted as an output process of the system (265), where $H \in \mathbb{R}^{1\times n}$.

It is well-known that the solution of (265) has the form [4]

$$\mathbf{x}_t = e^{A(t-t_0)}\mathbf{x}_{t_0} + \int\limits_{t_0}^{t} e^{A(t-s)}B\mathbf{u}(s)ds + \int\limits_{t_0}^{t} e^{A(t-s)}F\,d\mathbf{w}_s, \quad 0 \le t_0 \le t \le T, \tag{266}$$

where e^C is a matrix exponent

$$\sum_{j=0}^{\infty} \frac{C^j}{j!} \stackrel{\mathsf{def}}{=} e^C,$$

C is a square matrix, and $C^0 \stackrel{\mathsf{def}}{=} I$ is a unity matrix.

Consider the partition $\{\tau_p\}_{p=0}^{N}$ of $[0, T]$ such that $\tau_p = p\Delta$, $\Delta > 0$. For simplicity, we will suppose that $\mathbf{u}(s)$, $s \in [0, T]$ can be approximated by the step function, i.e. $\mathbf{u}(s) \approx \hat{\mathbf{u}}(s)$, $s \in [0, T]$, where $\hat{\mathbf{u}}(s) = \mathbf{u}(\tau_p)$ for $s \in [\tau_p, \tau_{p+1})$, $p = 0, 1, \ldots, N-1$ (more accurate approximations of $\mathbf{u}(s)$ are discussed in [63] (also see [59], [62])). Substituting $t = \tau_{p+1}$, $t_0 = \tau_p$, and $\hat{\mathbf{u}}(s)$ instead of $\mathbf{u}(s)$ into (266), we obtain

$$\hat{\mathbf{x}}_{p+1} = e^{A\Delta}\hat{\mathbf{x}}_p + A^{-1}\bigl(e^{A\Delta} - I\bigr)B\mathbf{u}(p\Delta) + \tilde{\mathbf{w}}_{p+1}(\Delta), \quad \mathbf{x}_0 = \mathbf{x}(0), \tag{267}$$

where $\hat{\mathbf{x}}_p$ is the approximation of $\mathbf{x}_{\tau_p}$ and

$$\int_0^{\Delta} e^{A(\Delta-s)} F d\mathbf{w}_{s+p\Delta} \stackrel{\mathsf{def}}{=} \tilde{\mathbf{w}}_{p+1}(\Delta).$$

Also we assume that $\hat{\mathbf{y}}_p = H\hat{\mathbf{x}}_p$, where $\hat{\mathbf{y}}_p$ is the approximation of $\mathbf{y}_{\tau_p}$. The random column $\tilde{\mathbf{w}}_{p+1}(\Delta)$ admits the following representation [4]

$$\tilde{\mathbf{w}}_{p+1}(\Delta) = S_D(\Delta)\Lambda_D(\Delta)\bar{\mathbf{w}}_{p+1}, \tag{268}$$

where $\bar{\mathbf{w}}_p \in \mathbb{R}^n$ is a column of independent standard Gaussian random variables such that $\mathsf{M}\left\{\bar{\mathbf{w}}_p\bar{\mathbf{w}}_q^{\mathsf{T}}\right\} = \mathcal{O}$ for $p \ne q$, $\mathcal{O}$ is a zero matrix of size $n \times n$, $S_D(\Delta)$ is a matrix of orthonormal eigenvectors of the matrix $D_f(\Delta)$ and $\Lambda_D^2(\Delta)$ is a diagonal matrix on the main diagonal of which are the eigenvalues of the matrix $D_f(\Delta)$, the matrix $D_f(\Delta)$ is defined by

$$D_f(\Delta) = \mathsf{M}\left\{\tilde{\mathbf{w}}_{p+1}(\Delta)\tilde{\mathbf{w}}_{p+1}^{\mathsf{T}}(\Delta)\right\} = \int_0^{\Delta} \exp(A(\Delta-s))FF^{\mathsf{T}}\exp(A^{\mathsf{T}}(\Delta-s))ds,$$

where C^{T} is a transposed matrix C. Moreover, $D_f(\Delta) = D_f(t)\big|_{t=\Delta}$, where $D_f(t)$ is a solution of the following Cauchy problem [4]

$$\frac{dD_f}{dt}(t) = AD_f(t) + D_f(t)A^{\mathsf{T}} + FF^{\mathsf{T}}, \quad D_f(0) = \mathcal{O}.$$

In the SDE-MATH software package, we implement the numerical modeling of the system (265) by the formulas (267), (268). At that we use Algorithms 2.3–2.6 from [63] (also see [62], Chapter 11) for the implemetation of (268).

3 The Structure of the SDE-MATH Software Package

3.1 Development Tools

The software package was implemented with Python programming language. The main reason to use it is a huge community and significant amount of helpful libraries for calculations and mathematics. The development was performed in free to use Atom text editor[1].

[1]All programs in Python programming language from this paper were written by the first author

3.2 Dependency Libraries

In the development of the SDE-MATH software package such libraries as SymPy, NumPy, PyQt5, and Matplotlib were involved. All these libraries and tools are free and open source.

- SymPy is a Python library able to perform symbolic algebra calculations.
- NumPy is a library which specialization is efficient mathematical calculations. Most part of this library is written in C programming language that guarantees high calculation performance.
- The database is SQLite3. This is a tiny database for a local usage on one machine.
- Matplotlib library is a piece of software used to present obtained results in a best way.
- PyQt5 is a library used to build graphical user interface for the SDE-MATH software package.

3.3 Architecture

Taking into account, that the SDE-MATH software package is oriented on a numerical modeling its architecture is clear. There are two main statements. The first is that mathematical formulas are strongly integrated with SymPy library. By that we mean that they completely rely on SymPy. And the second is usage of database to make some calculations able for caching. The architecture itself is provided on Figure 1. Here all parts of the software package can be seen.

The main package is responsible for startup, so it decides which part of the software package must be started. The software package has several modes of operation. The objectives now are

- Run program to calculate and store the Fourier–Legendre coefficients in few text files with further loading in database.
- Run program with graphical user interface. This is the main program entry for the SDE-MATH software package.

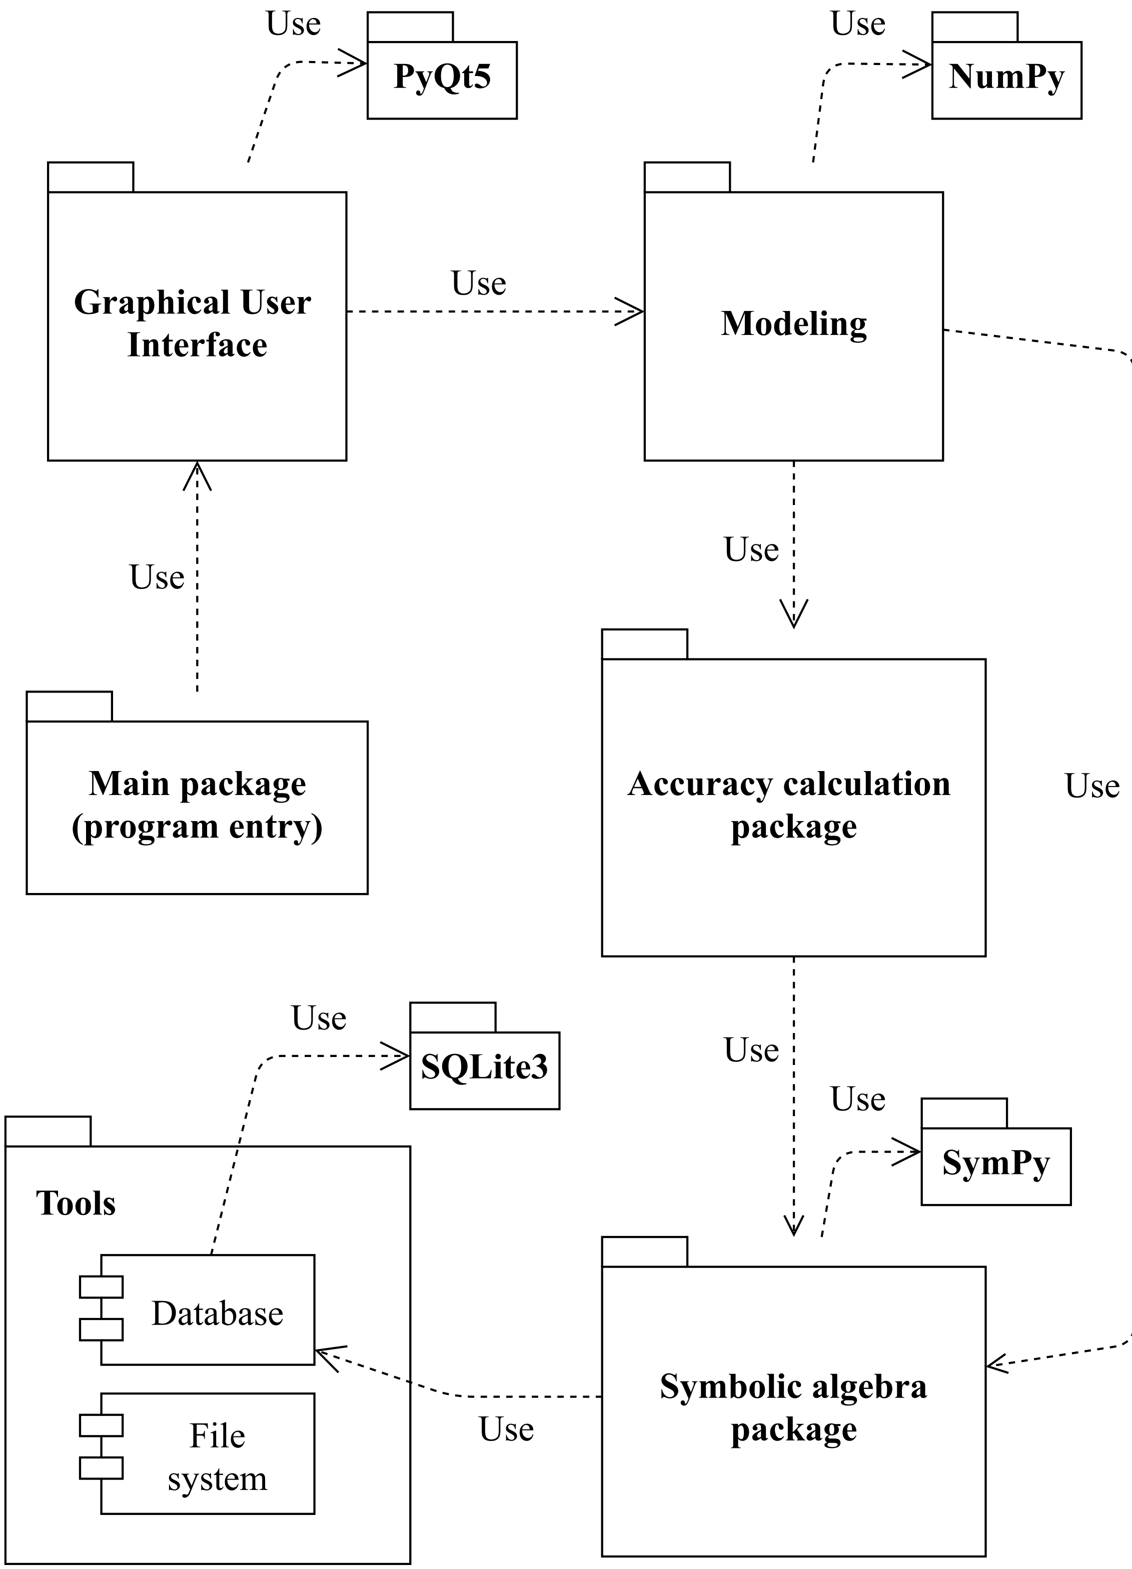

Figure 1: The SDE-MATH software package architecture

On the current state of development the main entry package booting up PyQt5 library with all necessary widgets. More detailed description of this process will be provided later.

Moving further, the modeling package comes up. This package responsible for all work referenced to modeling including initialization of modeling environment, calculations loops and more. Also, it depends on accuracy calculation module deciding which amount of members in each approximation of iterated stochastic integral should be used in modeling of the Itô SDE (1) solution.

Accuracy calculation module accepts the order of strong numerical scheme for the Itô SDE (1) and its integration step and then calculates necessary amount of members in approximations of iterated Itô and Stratonovich stochastic integrals.

Symbolic algebra module is the construction part which combines many supplementary differential operators with strong numerical schemes for the Itô SDE (1). Having these components combined this module performs simplification of resulting formula so the modeling package can do its modeling work.

Tools module provides some functionality related to bootstrap of runtime environment and external instruments such as database and file system.

3.3.1 Integration with SymPy

Class inheritance tree was extended to implement strong numerical schemes for Itô SDEs. While numerical schemes for Itô SDEs were being implemented it was also necessary to implement supplementary subprograms. SymPy is a Python library able to perform symbolic algebra calculations. This is a core part of the project since it is differentiates input functions, builds and simplifies strong numerical schemes for Itô SDEs to model the Itô SDE (1) solution. Without this part the program package cannot be able to provide such flexible input of data.

3.3.2 Purpose of NumPy

NumPy is a library that helps with calculation optimizations in this project. The library specialization is efficient mathematical calculations. The main usage case is to calculate compiled symbolic formulas with it. It has integration with SymPy to replace symbolic functions with high performance numerical functions.

3.3.3 Purpose of SQLite Database

The database was used to store the precalculated Fourier–Legendre coefficients, so getting them from there made numerical modeling much faster, because calculation process for these Fourier–Legendre coefficients involve high-cost symbolic operations. The database contains only one table, and might be thought redundant, but modeling needs hundreds (or even thousands) of precalculated coefficients. Obviously, calculation of them at runtime is terribly inefficient, but text files also not the best choice. Text files provide a sequential access memory and combining different accuracy values $q_1, \ldots, q_{15}$ it causes sequential search which extends time to give the result. That is where database comes up. The random access allows to get any Fourier–Legendre coefficient or any quantity of them which makes solution as flexible as it possible.

The download of precalculated Fourier–Legendre coefficients is built in supplemental subprograms to provide fluent calculation pipeline. Having the precalculated Fourier–Legendre coefficient not found, subprogram initiates calculation for it with following store in the database.

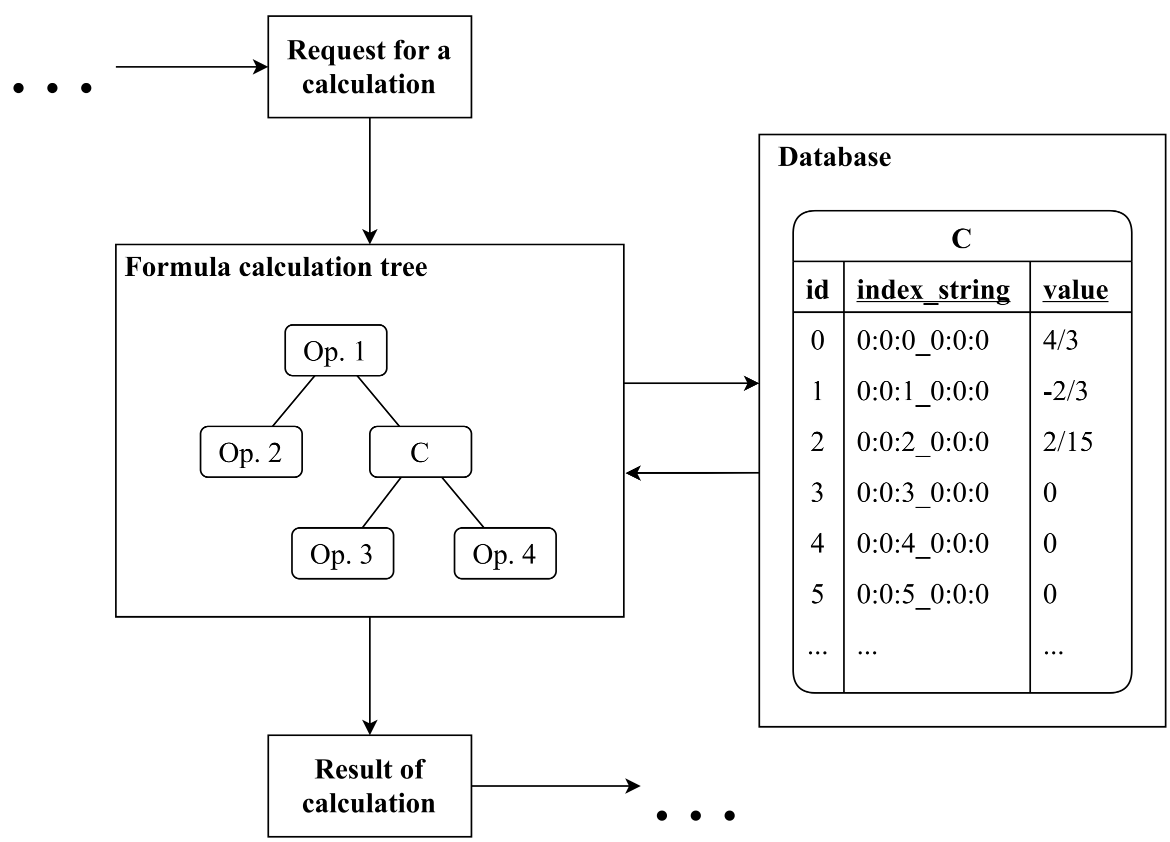

Figure 2: Fourier–Legendre coefficients calculations explanation

It is an interesting note that having mentioned earlier optimization done, the calculations performance were increased in several times. Now the most heavy operation is symbolic simplifications before modeling. The actual modeling takes seconds, for thousands of iterations on m components of stochastic process, so it is not such important how long modeling period of time, as the accuracy that needs to be accomplished.

The scheme of calculation process is presented on Figure 2.

3.3.4 Purpose of Matplotlib

Matplotlib library is a piece of software used to present obtained results in a best way. This library has many features, but feature that needed in this project is to print charts with modeling results in a PyQt5 widget. Thus the data visualization is integrated in graphical user interface.

3.4 Implementation Plan

The implementation of SDE-MATH software package was performed sequentially. The components of SDE-MATH software package were implemented in order of their necessity for calculation pipeline completion.

3.4.1 Calculation of the Fourier–Legendre Coefficients

The Fourier–Legendre coefficients for the approximations of iterated Itô and Stratonovich stochastic integrals were implemented and placed in Listings 43–61. This was the first step since the Fourier–Legendre coefficients involved almost in every strong numerical scheme for the Itô SDE (1).

Also it is important to note that the SDE-MATH software package contains a Python script intended for generating of Fourier–Legendre coefficients using multiprocessing. This script placed in Listing 62 and already contains tasks that were performed to generate about 300,000 Fourier–Legendre coefficients. Similarly, user can run and calculate additional Fourier–Legendre coefficients if they are needed. To determine which Fourier–Legendre coefficients will be calculated user must specify pairs of starting and ending values of components in lower multi-index and specify upper multi-index of the Fourier–Legendre coefficient. For example $(((0,15),(0,15),(0,15)),(0,1,0))$. This means that program calculates the Fourier–Legendre coefficients $C^{010}_{j_3 j_2 j_1}$, where $j_1, j_2, j_3 \in \{0, 1, \ldots, 14\}$.

3.4.2 Differential Operators L, $\bar{L}$, $G_0^{(i)}$, $i = 1, \ldots, m$

Moving further, strong numerical schemes for Itô SDEs rely on the differential operators (4), (5), and (23). They were implemented and placed in Listings 64–67.

3.4.3 Approximations of Iterated Stochastic Integrals

The next step is implementation of approximations of iterated Itô and Stratonovich stochastic integrals for the numerical schemes (12)–(16), (24)–(28). They are implemented and definition of their classes are placed in Listings 69–108.

3.4.4 Strong Numerical Schemes for Itô SDEs

The strong numerical schemes (12)–(16), (24)–(28) for Itô SDEs were implemented. They are placed in Listings 110–131.

3.4.5 Graphical User Interface

Finally, the graphical user interface was implemented. The source codes referenced to graphical user interface are placed in Listings 7–42.

4 Software Package Graphical User Interface

For the SDE-MATH software package mentioned above the graphical user interface was developed. The graphical user interface is important and massive part of SDE-MATH software package because it allows user to perform modeling experiments without programming skills and understanding of program package architecture and principles of work.

4.1 Information Model of The Graphical User Interface

The development of graphical user interface was started from consideration of

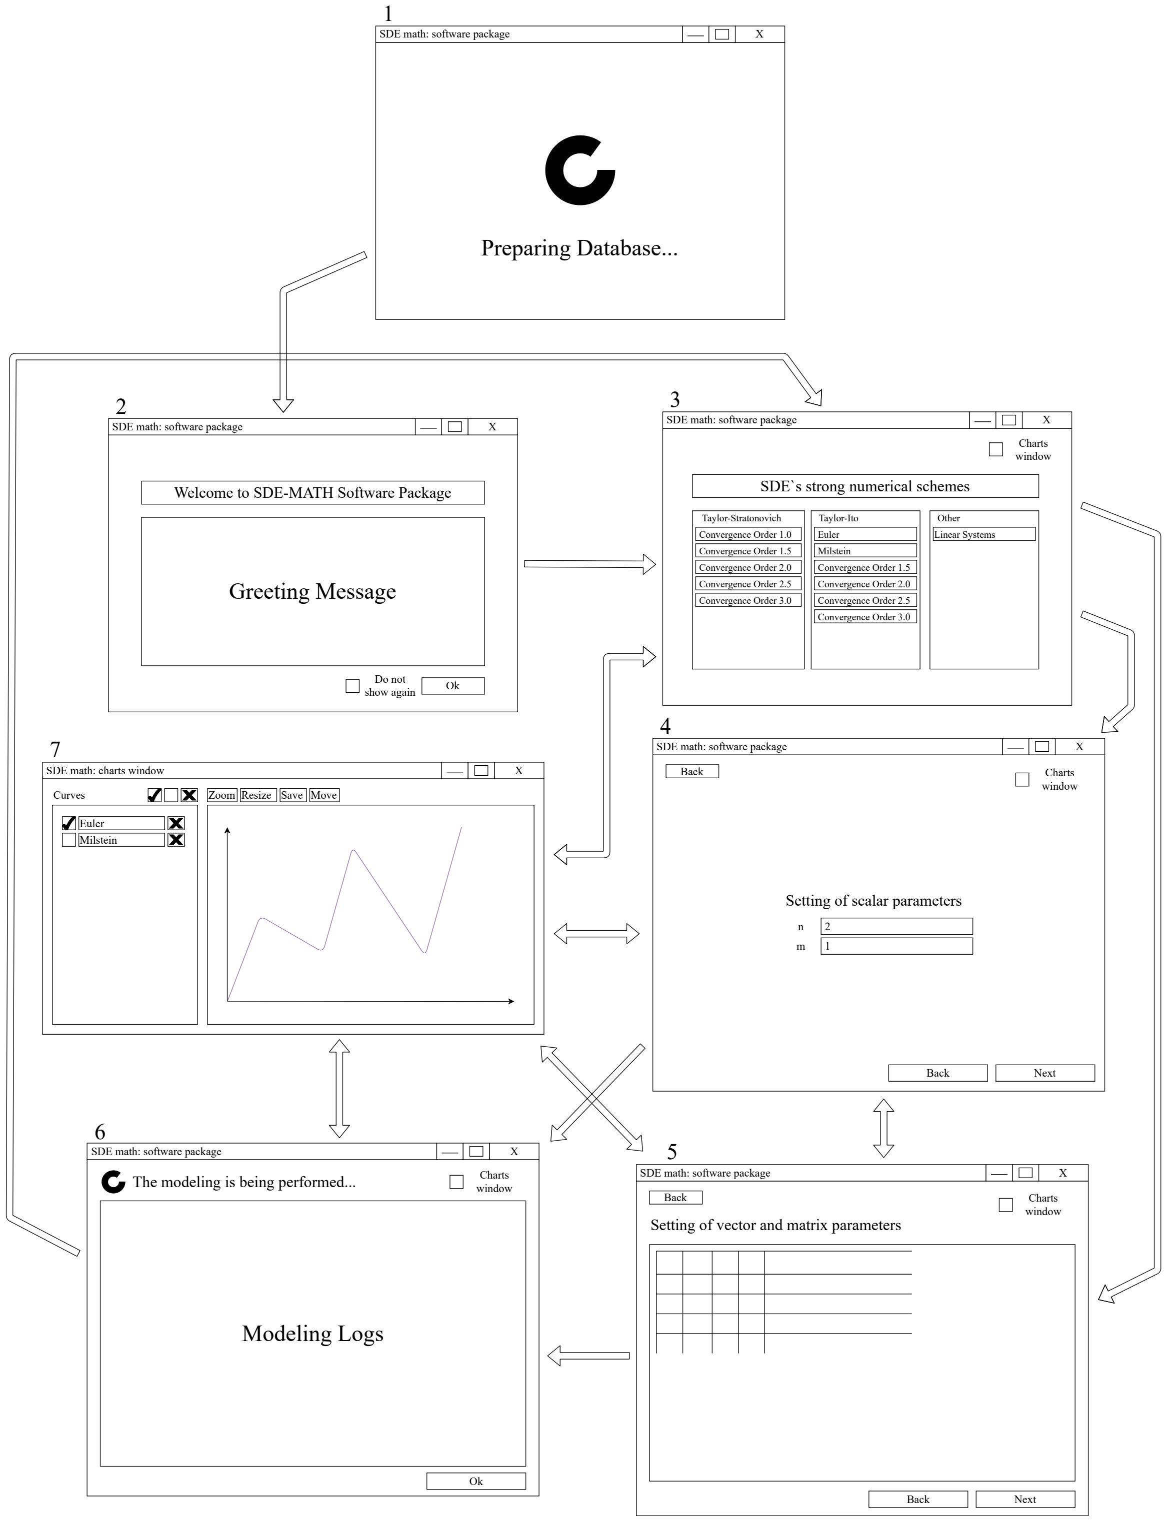

Figure 3: Information model of graphical user interface

experiments and routines which can be performed with the SDE-MATH software package. The graphical user interface is aimed on provision of user capabilities to perform nonlinear and linear systems of Itô SDEs modeling experiments. The information model which schematically describes the graphical user interface structure is presented on Figure 3.

4.1.1 Processing Screens

To represent long duration processes the graphical user interface has two dialogs which can be seen on Figure 3, in Windows 1 and 6. The first one represents database preparing process on application very first run. During this process the Fourier–Legendre coefficients are being loaded into the SQLite database. This screen appears also when user calculates new Fourier–Legendre coefficients. The other screen shows logs during modeling experiment.

4.1.2 Greetings Dialog

After the SDE-MATH software package has completed the database preparation, it shows greeting dialog which represents short information about its purposes. The greeting dialog can be seen on Figure 3 in Window 2.

4.1.3 Main Menu Dialog

In the main menu of the SDE-MATH software package user can choose one of strong numerical schemes for Itô SDEs to perform modeling experiments. The main menu dialog can be seen on Figure 3 in Window 3.

4.1.4 Visualization Tool

It is important to note that the main SDE-MATH software package window has a checkbox in right upper corner which do switching on and off charts window. In any time user can call this window or hide it if it is not needed. The charts window is universal utility for modeling experiments results visualization. This window has few instruments on it. The left side bar contains all curves labels, and control elements for hiding, showing, and deleting curves. On the right side of the window there are plot which draws the curves. The charts window can be seen on Figure 3, it is Window 3.

4.1.5 Data Input Dialogs

Since the software package has options to perform linear Itô SDEs modeling experiments it is necessary to provide user with input fields for numerical data both scalar and matrix. On the other side, for nonlinear Itô SDEs it is necessary to provide symbolic input. The choice of control elements is conditioned by the above obstacles. On Figure 3, and especially in Windows 4 and 5, these input controls can be seen. There are "LineEditWidget" and "TableWidget" which are sufficient to provide input abilities. The topic of input data validation is also important but to be more accurate referenced to user experience rather than to information model, so it will be described further.

4.2 The User Experience and Implementation Results

The above part represents the structure of software package but not the dynamics and user experience of it. Let us discuss the SDE-MATH software package user experience on few examples provided further on Figures 4–36. This examples represent two scenarios of the SDE-MATH software package use.

The database preparation screen is presented on Figure 4. During the database preparation this screen displays informational message and spinning visualizer of process continuation.

The screen that presented on Figure 5 appears every time when software package runs unless user presses "Ok" button with marked checkbox. In such case this message screen will not be shown again.

On Figure 6 the main menu dialog is presented. In this dialog user can choose any strong numerical scheme for Itô SDEs to perform modeling experiment.

The tooltip example can be seen on Figure 7. Such tooltips displayed with characteristic icon are placed all over software package interface to help user with explanations.

As noted earlier, the dedicated charts window is universal tool for visualization. The specific examples of such visualization are presented on Figure 8,19, 34–36.

The initial state of input dialogs for nonlinear and linear Itô SDEs are displayed on Figures 9 and 20. At that moment user can start to input the data.

The example of wrong scalar data input is presented on Figures 10, 15, 21, and 31. When user input wrong data the error message appears and "Next" or "Perform modeling" button is blocked. The input field is being checked all the user data input process, and as soon as wrong character is entered notification pops up.

If scalar data is correct the "Next" button is automatically unblocked. On Figures 11, 16, 22, and 32 the examples of scenario are displayed.

On Figures 12, 13, and 28 the example of correct matrix data input is presented. In this particular case the input is symbolic. Symbolic algebra input errors are much harder to determine so this is done on further stages, in modeling runtime.

In the other case when matrix input data are numerical, the validation is performed right after user has finished input. The examples of incorrect matrix numerical input can be found on Figure 24.

When user finishes input with a success the "Next" or "Perform modeling" button is automatically unblocked. On Figures 23, 25–27, 29, and 30 that can be clearly seen.

The Figures 17, 18, and 33 displays sequence of log messages emerged during the modeling process.

After modeling has been done the focus moves to the charts window where obtained modeling results can be seen. The results of modeling is displayed on Figures 19, 34–36. On Figures 35 and 36 the expectations and variances of obtained components of solution are displayed.

5 The Results Obtained Using the SDE-MATH Software Package

This section represents the results that were obtained with the SDE-MATH software package at the current stage of the development.

5.1 The Calculated Fourier–Legendre Coefficients

When application runs first time it performs loading of Fourier–Legendre coefficients basic pack in the database from the files. Further, in Listings 1–4 few examples of them can be seen.

```

5.2 Accuracy Settings

From Theorem 7 (see formulas (63)–(85)) it follows that the number p in the formula (60) should be chosen individually for various combinations of indices $i_1, \ldots, i_k \in \{1, \ldots, m\}$. As follows from Listing 5 (see below) and the results of work [74], these numbers p in the overwhelming majority of cases do not exceed the number p from the formula (63). Moreover, all the mentioned numbers p are many times less than the number p selected using the formula (61) (due to the presence of the multiplier factor $k!$ on the left-hand side of (61)).

In this work, we have replaced the mentioned numbers p for all possible combinations of indices $i_1, \ldots, i_k \in \{1, \ldots, m\}$ with the number p according to the formula (63). This is possible due to the results of Listing 6. This listing shows that the above replacement does not lead to noticeable accuracy loss of the mean square approximation of iterated Itô stochastic integrals (for more details see [74]).

Thus, in this paper we decided to exclude the multiplier factor $k!$ in the conditions for choosing the numbers $q_1, \ldots, q_{15}$ (see (188)–(221)). Recall that these numbers are used to construct the approximations of iterated Itô and Stratonovich stochastic integrals from the numerical schemes (13)–(16), (25)–(28). The test script was written. The results of its work are presented in Listings 5 and 6, where

1. dt is the integration step;
2. q1(1,2) means p from (66), q1(2,3) means p from (67), q1(1,3) means p from (68), q1 means p from (63) for $k = 3$;
3. $C = 1$ (see (17) and (29));
4. error 1 means the left-hand side of (190);
5. error 2 means the left-hand side of (66) divided by $(T - t)^3$;
6. error 3 means the left-hand side of (68) divided by $(T - t)^3$;
7. error 4 means the left-hand side of (67) divided by $(T - t)^3$.

The above idea of calculation of the numbers $q_1, \ldots, q_{15}$ is described in Listing 109.

5.3 Testing Example (Nonlinear System of Itô SDEs)

The input data for testing of the SDE-MATH software package correspond to the autonomous variant of nonlinear system of Itô SDE (1) with multidimensional non-commutative noise. More precisely, we choose $n = 2$, $m = 2$, $\mathbf{x}_0^{(1)} = 1$, $\mathbf{x}_0^{(2)} = 1.5$,

$$\mathbf{a}\left(\mathbf{x}^{(1)},\mathbf{x}^{(2)}\right)=\begin{pmatrix}-5\mathbf{x}^{(1)}\\ \\ -5\mathbf{x}^{(2)}\end{pmatrix},$$

$$B\left(\mathbf{x}^{(1)},\mathbf{x}^{(2)}\right)=\begin{pmatrix}0.5\cdot\sin\left(\mathbf{x}^{(1)}\right) & \mathbf{x}^{(2)}\\ \\ \mathbf{x}^{(2)} & 0.5\cdot\cos\left(\mathbf{x}^{(1)}\right)\end{pmatrix}.$$

Figures 37–92 related to the strong high-order Taylor–Itô and Taylor–Stratonovich schemes (12)–(16), (24)–(28) for the Itô SDE (1) represent modeling results.

Test machine specifications are CPU with maximum core frequency 4.2 GHz and 16GB of RAM.

5.4 Visualization and Numerical Results for Nonlinear System of Itô SDEs Obtained via the SDE-MATH Software Package

This subsection is fully devoted to modeling logs and results visualization. They are presented on Figures 37–91.

5.5 Example of Linear System of Itô SDEs (Solar Activity)

Consider a mathematical model of the solar activity without its average value in a form of the system of linear Itô SDEs (265) [4]. In (265) we choose [4] $n=2$, $m=1$, $k=2$, $\mathbf{x}_0^{(1)}=7$, $\mathbf{x}_0^{(2)}=-0.25$,

$$A=\begin{pmatrix}0 & 1\\ \\ -0.3205 & -0.14\end{pmatrix},\quad B=\begin{pmatrix}0 & 0\\ \\ 0 & 0\end{pmatrix},\tag{269}$$

$$\mathbf{u}(t)\equiv\begin{pmatrix}0\\ \\ 0\end{pmatrix},\quad F=\begin{pmatrix}0\\ \\ 5.08\end{pmatrix}.\tag{270}$$

5.6 Visualization and Numerical Results for Solar Activity Model

This subsection is devoted to the visualization and numerical results for the model of solar activity (265), (269), (270).

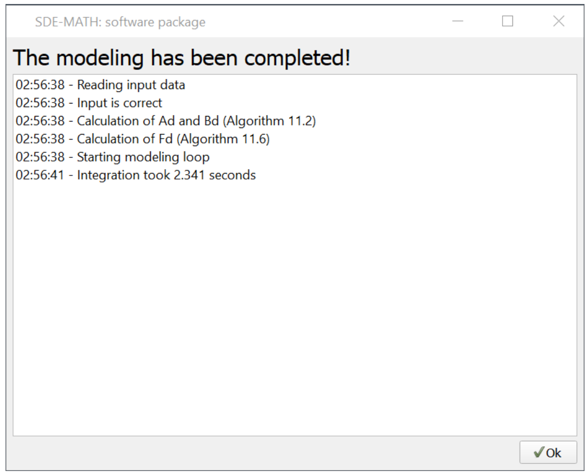

Figure 93: Modeling logs for solar activity model

5.7 Example of Abstract Linear System of Itô SDEs

Now consider the system of linear Itô SDEs (265) with the following data

$$n = 4, \quad m = 5, \quad k = 3, \quad \mathbf{x}_0^{(1)} = 1, \quad \mathbf{x}_0^{(2)} = 2, \quad \mathbf{x}_0^{(3)} = -1, \quad \mathbf{x}_0^{(4)} = -2, \tag{271}$$

$$A = \begin{pmatrix} -1 & 0 & 0 & 0 \\ 0 & -2 & 0 & 0 \\ 0 & 0 & -3 & 0 \\ 0 & 0 & 0 & -4 \end{pmatrix}, \quad B = \begin{pmatrix} 1 & 1 & 1 \\ 1 & 1 & 1 \\ 1 & 1 & 1 \\ 1 & 1 & 1 \end{pmatrix}, \quad F = \begin{pmatrix} 0.2 & 0.1 & 0.1 & 0.1 & 0.1 \\ 0.1 & 0.2 & 0.1 & 0.1 & 0.1 \\ 0.1 & 0.1 & 0.2 & 0.1 & 0.1 \\ 0.1 & 0.1 & 0.1 & 0.2 & 0.1 \end{pmatrix}, \tag{272}$$

$$\mathbf{u}(t) \equiv \begin{pmatrix} 0 & 0 & 0 \end{pmatrix}^{\mathsf{T}}, \quad H = \begin{pmatrix} 0.1 & 0.1 & 0.1 & 0.1 \end{pmatrix}. \tag{273}$$

5.8 Visualization and Numerical Results for Abstract Linear System of Itô SDEs Obtained via the SDE-MATH Software Package

This subsection is devoted to the visualization and numerical results for the model (265), (271)–(273).

7 Future Work

Considering the future work, it is important to say that symbolic algebra gives a wide field for optimizations of modeling process. Symbolic operations is actually operations with strings. Such operations has relatively high complexity and slows down modeling process significantly. One of possible ways to improve modeling performance is to parallelize computations. Since strong numerical schemes for Itô SDEs have massive amount of terms this idea appears justified.

The strong numerical schemes for Itô SDEs seem to be easily optimizable, on the other hand, superpositions of the differential operators (4), (5), and (23) are not. They are called recursively during calculation process which is more difficult to parallelize than strong numerical schemes for Itô SDEs. Differential operators obviously include differentiating which is high cost and optimization of them is a dedicated issue.

In the future, it is possible to improve the SDE-MATH software package in a number of other directions. In particular, high-order strong numerical methods of the Runge-Kutta type [2], [7], [43], [62] (including multistep numerical methods [2], [7], [43], [62]) for Itô SDEs can be implemented. In addition, software for solving the filtering problem and the problem of stochastic optimal control can also be developed. These improvements will lead to changes of the graphical user interface due to new features.
